Introduction .....	40
Obtaining User Documentation .....	42
New Products .....	43
CentreCOM XS900MX Series .....	43
AR2010V .....	43
IE300 series.....	43
New Features and Enhancements .....	44
Managed L2TPv2 Peer-to-Peer tunnels .....	44
Support for RED curves in Traffic Control .....	44
USB cellular modem diagnostics.....	44
SMTP support in Malware Protection.....	44
IPsec enhancements.....	45
Support for terminating old PPPoE sessions with PADT .....	45
Secure Mode on x930 Series switches .....	46

Enhancements to PKI Certificate Management.....	47
RADIUS over TLS.....	47
Syslog over TLS.....	47
Remote-mirroring.....	47
SBx81XLEM: Support for more L3 routes, L3 hosts and forwarding database entries.....	48
Allied Telesis Management Framework (AMF) subscription licenses.....	51
Support for renaming the AMF network without rebooting.....	54
Improved AMF support for x600 Series switches.....	55
NTP enhancements.....	56
Support for user-created web authentication login page.....	58
Configure VLAN classifiers on aggregators.....	59
Clear the PPPoE Access Concentrator statistics counters.....	59
Ensure that MAC addresses are learnt by all VCStack members.....	59
Limit the number of IGMP group entries per port.....	60
Enhancement to EPSR Superloop Protection.....	61
Support 100 local RADIUS server users on x230 and x310 Series switches.....	61
Restrict access to “show log” command.....	61
Combine ARP security and Private VLANs.....	61
IE200: Support for IPv6 Hardware ACLs.....	61
DC2552XS/L3: Support for Active Fiber Monitoring.....	62
DC2552XS/L3: Support for AMF restricted-login.....	62
DC2552XS/L3: Support for services like Microsoft Network Load Balancing (MS-NLB).....	62
Support for multiple circuit-failover interfaces per VRRP instance.....	65
Important Considerations Before Upgrading.....	66
Bootloader compatibility for SBx81CFC960.....	66
Licensing.....	66
Upgrading a VCStack with reboot rolling.....	67
Forming or extending a VCStack with auto-synchronization.....	67
Upgrading an SBx8100 chassis or adding a CFC to an SBx8100 chassis.....	68
AMF software version compatibility.....	70
Upgrading all switches in an AMF network.....	70
ISSU (In-Service Software Upgrade) on SBx8100 with CFC960.....	71
Verifying the Release File for x930 Series Switches.....	72
Licensing this Software Version on an SBx908 Switch.....	73
Licensing this Software Version on a Control Card for an SBx8100 Series Switch.....	75
Installing this Software Version.....	77
Installing the Switch GUI.....	79

## Introduction

This release note describes the new features and enhancements in AlliedWare Plus software version 5.4.6-2.x. For more information, see the Command Reference for your switch or AR-series firewall. Software file details for this version are listed in [Table 1](#) below.

You can obtain the software files from the [Software Download area of the Allied Telesis website](#). Log in using your assigned email address and password.

**Caution: Software version 5.4.6 requires a release license for the SBx908 and SBx8100 switches. If you are using either of these switches, make sure that each switch has a 5.4.6 license certificate before you upgrade.**

If an SBx908 or SBx8100 switch already has a version 5.4.6 license installed, that license also covers 5.4.6-2.x versions. Such switches do not need a new license before upgrading to version 5.4.6-2.x.

Contact your authorized Allied Telesis support center to obtain a license. For details, see:

- [“Licensing this Software Version on an SBx908 Switch” on page 28](#) and
- [“Licensing this Software Version on a Control Card for an SBx8100 Series Switch” on page 30](#).

The first 5.4.6-2.x software version is numbered 5.4.6-2.1. The following table lists model names and software files for this version.

**Table 1: Models and software file names**

Under version 5.4.6, not all models of XEM are supported in the SwitchBlade x908. The following table lists which XEMs are and are not supported under version 5.4.6.

**Table 2: Support of XEM modules for the SwitchBlade x908 in version 5.4.6-x.x**

Product	Supported in version 5.4.6-x.x
XEM-1XP	No
XEM-2XP	Yes
XEM-2XS	Yes
XEM-2XT	Yes
XEM-12S	No
XEM-12T	No
XEM-12Sv2	Yes
XEM-12Tv2	Yes
XEM-24T	Yes

**Caution:** Using a software version file for the wrong switch or AR-series firewall model may cause unpredictable results, including disruption to the network. Information in this release note is subject to change without notice and does not represent a commitment on the part of Allied Telesis, Inc. While every effort has been made to ensure that the information contained within this document and the features and changes described are accurate, Allied Telesis, Inc. can not accept any type of liability for errors in, or omissions arising from, the use of this information.

## Obtaining User Documentation

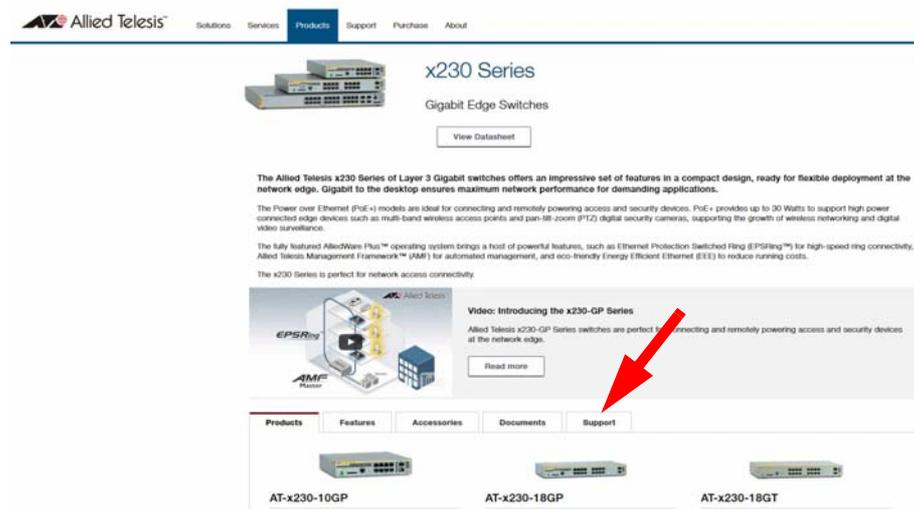

For full documentation about all features on your switch or AR-series firewall, see the Support tab of your product series web page. Product series web pages are available on our website from:

- [alliedtelesis.com/products/switches](http://alliedtelesis.com/products/switches) (for switches) or
- [alliedtelesis.com/products/securityapps](http://alliedtelesis.com/products/securityapps) (for AR-series firewalls)

For each product series, the Support tab includes the following documents:

- the **Installation Guide**,
- a detailed **Command Reference**, and
- **Feature Overview and Configuration Guides** for each supported feature.

For example, the arrow in the following figure shows the location of the Support tab on the x230 Series web page.

Product datasheets are also available on the product series web pages, along with a range of helpful case studies, solution guides, whitepapers and videos.

## New Products

AlliedWare Plus version 5.4.6-2.x supports the following recently-released products.

### CentreCOM FS980M Series

#### ***Fast Ethernet Managed Access Switches***

FS980M switches provide high-performance Fast Ethernet connectivity right where you need it—at the network edge. Flexible and robust, the FS980M series provide total security and management features for enterprises of all sizes. They also support video surveillance and Point of Sale (POS) applications.

With both PoE and non-PoE copper-port models, the FS980M Series has the ideal solution for your network. Models are available with 8, 16, 24 or 48 × 10/100TX Fast Ethernet ports. PoE models support the IEEE 802.3at (PoE+) standard, delivering up to 30 Watts of power per port for video surveillance and security applications.

For more information, see [alliedtelesis.com/products/fs980m-series](http://alliedtelesis.com/products/fs980m-series).

## New Features and Enhancements

This section summarises the new features in 5.4.6-2.x.

To see how to find full documentation about all features on your product, see [“Obtaining User Documentation”](#) on page 5.

### Simplified Installation of Licenses from the Allied Telesis Download Center

*Available on all AlliedWare Plus devices that support subscription licenses*

Version 5.4.6-2.x enables you to add or update subscription licenses from [the Allied Telesis Download Center](#) by running a single command.

This applies to the following licenses: subscriptions to advanced threat management features on the AR3050S and AR4050S firewalls, subscriptions to AMF masters and controllers, and OpenFlow licenses.

Previously, to add or update a license you needed to log into [the Allied Telesis Download Center](#), download a license file, copy the file to the device, and then run a command to activate the license.

With version 5.4.6-2.x, to add or update a license, simply run the following command:

```
awplus#license update online
```

When the command **license update online** is entered, the device will

1. Connect to the Download Center
2. Check if new or changed licenses are available for the device, keyed to the device's serial number
3. For each such license it finds, download and install the license.

Note that AlliedWare Plus devices do not automatically connect to the Download Center and check whether licenses are available. They only check when you run the **license update online** command.

On VCStacks, running **license update online** updates all stack members. Each stack member individually checks for licenses on the Download Center and installs any that are found.

On SBx8100 systems, running **license update online** updates all CFCs that are present, including all CFCs on both chassis in a stack. Each CFC individually checks for licenses on the Download Center and installs any that are found.

**Firewall rule** AR-series firewalls block all traffic by default, so you need to configure a firewall rule to allow the licensing connection attempt to pass through the firewall. The following figure shows a recommended example configuration, when the WAN interface to the Internet is configured as a ppp0 interface:

```
zone public
network wan
ip subnet 0.0.0.0/0 interface ppp0
host ppp0
ip address dynamic interface ppp0

firewall
rule 10 permit dns from public.wan.ppp0 to public.wan
rule 20 permit https from public.wan.ppp0 to public.wan
protect
```

This rule permits DNS and HTTPS packets to any destination IP address, if:

- the source IP address of the packets is the IP address of the ppp0 interface, and
- the packets are egressing the firewall through interface ppp0.

DNS packets are permitted so that the device can look up the address of the Download Center. HTTPS packets are permitted so the secure communication session with the Download Center can proceed.

The rule uses a subnet of 0.0.0.0/0 to match on any destination IP address.

The “from” part of the rule uses “public.wan.ppp0” because the firewall itself is originating the connection to the Download Center, rather than allowing traffic to flow through it, as is the case for most firewall rules. Hence, the traffic that is involved in the connection to the Download Center originates from the IP address of the PPP interface.

### Verifying the update

The update process normally takes approximately 5 seconds.

If the console does not respond for 10 or more seconds after typing the command, a network, routing or firewall configuration error is probably preventing the connection from establishing. If this happens, you can abort the command by pressing Ctrl-C, or wait for the command to time out after 30 seconds.

If the connection to the Download Centers fails and times out, an error message will be generated on the CLI to indicate the problem. If you abort the command, no error message is displayed.

If the update is successful, the device will produce log messages to say which features have had their licensing state updated (activated, deactivated, number of items changed, or expiry date changed). If the command completes successfully but there are no licenses available for the device, or no change in the licenses already on the device, no log messages will be produced.

You can also use the **show license external** command to confirm which licenses are active on the device after the update has been applied.

## VRF-Lite for AR-Series Firewalls

*Newly available on AR4050S, AR3050S, AR2050V and AR2010V firewalls*

Version 5.4.6-2.x adds support for VRF-Lite on the AR-Series firewalls.

VRF-lite is used for isolating customer networks—it allows multiple secure customer routing domains, which remain completely isolated from each other, to co-exist in one physical device simultaneously.

VRF-lite also allows the re-use of IP addresses on the same physical device. An IP address range in one network interface used in one VRF domain can simultaneously be used in another network interface in a different VRF domain within the same device. While VRF-lite will segregate traffic from different customers/clients, VRF-lite can also allow access between VRF domains (inter-VRF communication), by using static inter-VRF routes. This provides controlled access from one VRF routing domain to another where the IP address ranges do not overlap.

VRF-lite can be used in conjunction with firewall features while maintaining security. Additionally, VRF routing domains can be transported across Virtual Private Networks, by associating individual VPNs with one or more VRF instances.

For more information and configuration details, see the [VRF-lite Feature Overview and Configuration Guide](#). This guide describes VRF-lite support and how to configure it on the AR-Series firewalls. It provides examples showing how to configure:

- VRF-lite in a device with firewall protection,
- VRF-lite over a Virtual Tunnel Interface with or without firewall and NAT protection,
- multiple VRF-instances over an IPsec VPN using Ethernet pseudowires (unmanaged L2TPv3 tunnels), and
- VRF instances between a central site and multiple remote sites.

These examples are followed by discussion of static inter-VRF routing, VRF-aware DNS Relay, and VRF-aware static ARP. Finally, a list of commands that are useful for diagnosing VRF-related issues concludes the document.

## Firewall Control for VRRP and High Availability

*Available on AR-Series firewalls*

Version 5.4.6-2.x adds firewall control for IPv4 VRRP packets received by the AR-series firewall.

This means that if you are using VRRP and you have the firewall enabled, you need to create a firewall rule to allow IPv4 VRRP packets. High Availability (HA) uses VRRP, so if you are using High Availability and the firewall, you also need to create a firewall rule to allow IPv4 VRRP packets.

The rule needs to permit packets to IP subnet 224.0.0.18/32, which is the VRRP multicast address. You can limit the rule so that it only applies to the VRRP application (protocol 112).

For example, if the firewall is enabled, and VRRP is configured on VLAN1, and VLAN1 has an IP address in the 172.20.10.0/24 subnet, the following configuration will allow VRRP packets to be received:

```
application vrrp
  protocol 112

zone private
  network vlan1
    ip subnet 172.20.10.0/24 interface vlan1
  network vrrp_subnet
    ip subnet 224.0.0.18/32

firewall
  rule 10 permit vrrp from private.vlan1 to private.vrrp_subnet
  protect
```

Note that the firewall only controls incoming VRRP packets. Outgoing VRRP packets are not processed by the firewall. They will be sent regardless of the firewall configuration.

## TACACS+ Command Authorisation

*Available on x230, x310, IX5, x510, x510DP, x510L, x610, x930, DC2552XS, SBx908, SBx8100, AR2010V, AR2050V, AR3050S and AR4050S*

Version 5.4.6-2.x supports TACACS+ command authorization, which along with authentication and accounting provides a full AAA solution. Command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once it is enabled with the new **aaa authorization commands** command, all commands entered by a user are encrypted, along with the user name, and sent to a TACACS+ server for authorization. The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device, which will then either execute the command or notify the user that authorization has failed.

By default, TACACS+ authorization applies to commands issued in exec mode only. Another new command, **aaa authorization config-commands**, allows you to enable authorization of configuration mode commands.

You can configure multiple TACACS+ servers for redundancy. In addition, you can configure a local fall-back in case all the TACACS+ servers become unreachable. Commands are then authorized based on the user's privilege level; the same behaviour as if command authorization had not been configured. If a local fall-back is not enabled and the servers become unreachable, all commands will be denied, except **logout**, **exit**, and **quit**.

## TACACS+ Source Interface

*Available on x230, x310, IX5, x510, x510DP, x510L, x610, x930, DC2552XS, SBx908, SBx8100, AR2010V, AR2050V, AR3050S and AR4050S*

Version 5.4.6-2.x enables you to change the source IP address for TACACS+ packets. By default, the source IP address of TACACS+ packets is the IP address of egress interface via which they are transmitted. There may be reasons why you do not wish to use this default choice of source IP address. For example:

- You may have a network policy that only allows access to the TACACS+ server from particular IP subnets, and the egress interface on your unit is not in one of those subnets (but another interface on the unit is)
- If there are multiple paths between a device and a TACACS+ server then packets may egress the device on different interfaces and it will appear to the TACACS+ server as if they are coming from different devices.

Therefore, the software provides you with the ability to choose a source IP address other than that on the egress interface. This ensures that all packets will have the same source IP address. To set the source address, use the following commands:

```
awplus#configure terminal
awplus(config)#ip tacacs source-interface {<interface-name>|<ipadd>}
```

## AMF enhancements

Available on all AlliedWare Plus devices

### Support for 300-node AMF networks

Version 5.4.6-2.x supports AMF networks of up to 300 nodes in a single area, as long as the AMF master is an AT-SBx81CFC960 or the Virtual AMF Appliance (VAA).

Restricted login must also be enabled on areas over 126 nodes in size, by using the commands:

```
awplus#configure terminal
awplus(config)#atmf restricted-login
```

When restricted-login is enabled, only the AMF master nodes are able to create working sets. Rolling-reboot is also only available from master nodes, because it uses working sets.

300-node AMF networks are only available if every node in your network is running version 5.4.6-2.1 or later.

### Support for Node Map Exchange

Version 5.4.6-2.x supports node map exchange, which improves the tracking of nodes joining and leaving an AMF network. This improves the efficiency of AMF networks.

This enhancement is only available if every node in your AMF network is running version 5.4.6-2.1 or later. We recommend that you upgrade all nodes in your AMF network, so you can receive the benefit of this enhancement.

You can see whether all nodes in your network support node map exchange by entering the command **show atmf nodes** and looking for information like the following:

If all nodes support node map exchange:

```
Node map exchange is active
```

If one or more nodes do not support node map exchange:

```
Node map exchange is inactive
Firmware on some nodes does not support node map exchange, eg node1
```

Note that node map exchange is automatically enabled in the network if all nodes are running v5.4.6-2.1 or higher. There is no need to enter a command to enable this feature. Similarly, there is no command to disable the feature.

### Changes to AMF user account requirements

Version 5.4.6-2.x enables privileged users to create working-sets and use **atmf remote-login** to log into any AMF nodes, even if they do not have an account on all the nodes.

This can be limited with the **atmf restricted-login** command so that:

- only users logged in to the AMF master node can create working-sets and
- any remote-login attempts from a member node require a password.

As local users no longer need to be created for AMF, authentication can now be managed using a RADIUS or TACACS+ server.

## Enhanced Thermal Shutdown

*Available on IE300 and IE200 Series switches*

Version 5.4.6-2.x has enhanced the thermal shutdown performance of IE300 and IE200 Series switches. Previously, the switch raised an alarm when it neared a critical temperature and then powered off when the critical temperature was exceeded. With this enhancement, the switch has a multi-phase response as the temperature increases above a series of thresholds:

- When the temperature exceeds the first threshold, the switch raises an alarm;
- When the temperature exceeds the second threshold, the switch shuts down non-critical POE services;
- When the temperature exceeds the third threshold, the switch shuts down critical POE services; and finally
- When the temperature exceeds the fourth threshold, the switch powers off.

By shutting down some or all POE services, the switch may stop the temperature increase and be able to keep operating otherwise.

Two new SNMP traps have been created in the atEnvMon MIB, to enable communication of the new thresholds:

- The new trap "atEnvMonv2TempCriticalLevel1" fires when the switch reaches the first phase of services shutdown. On IE200 and IE300 switches, non-critical POE ports stop delivering power at this point.
- The new trap "atEnvMonv2TempCriticalLevel2" fires when the switch reaches the second phase of services shutdown. On IE200 and IE300 switches, all POE ports stop delivering power at this point.

When the temperature drops to its operational range, the switch powers back up, restores shut-down services, and clears the alarms and traps.

To specify that a POE port is a critical POE service, use the following commands:

```
awplus#configure terminal
awplus(config)#interface <port-number>
awplus(config-if)#power-inline priority critical
```

## OpenFlow Enhancements

Version 5.4.6-2.x supports three extensions to OpenFlow:

1. OpenFlow is now supported on all ports of 52-port x510 and x310 Series switches.
2. Support for LAG ports has been added. You can create a static channel group on 2 to 8 switch ports, and configure that static channel group to run OpenFlow.
3. The licensing of OpenFlow has been modified in the following ways:
  - « Licensing is now offered on a subscription basis, for 1 or 5 years
  - « A new license called SES has been added for CentreCom switches that operate in conjunction with SESC, the Allied Telesis OpenFlow controller
  - « OpenFlow licenses are now managed through the Allied Telesis Download Center (see [“Simplified Installation of Licenses from the Allied Telesis Download Center”](#) on page 7).

## High Availability Network Power (HANP)

*Available on IE200 and IE300 Series switches only*

Version 5.4.6-2.x adds support for High Availability Network Power (HANP). HANP enables the switches to perform actions such as software upgrades without forcing the Powered Devices to power cycle. This means network connectivity losses are kept to a minimum when the switch is performing actions such as software reloads.

You can configure HANP on a global or per port level. To enable it globally, use the commands:

```
awplus#configure terminal
awplus(config)#power-inline hanp
```

To enable it on a port or ports, use the commands:

```
awplus#configure terminal
awplus(config)#interface <port-range>
awplus(config-if)#power-inline hanp
```

## Per-VLAN ACLs

Available on SBx908, SBx8100, x230, x310, x510, x510DP, x510L, IX5, x610, x930, DC2552XS, IE200, IE300 and IE510 Series switches. Also available on SBx908 v1 XEMs and x900 Series switches running software version 5.4.4 (starting at 5.4.4-4.11).

Version 5.4.6-2.x enables you to filter traffic as it ingresses VLANs, by attaching ACLs to VLANs.

To do this, first create your ACLs, then apply the ACLs to a VLAN access-map, and then apply the map to the desired VLANs. The following example shows the commands to use:

**Example** To deny all packets on VLAN 48 and 49, use the following steps:

1. Create VLANs 48 and 49, if they do not already exist.

```
awplus(config)# vlan database
awplus(config-vlan)# vlan 48
awplus(config-vlan)# vlan 49
```

2. Create an ACL to block packets from any source MAC address to any destination MAC address.

```
awplus(config)# access-list 4000 deny any any
```

3. Create a VLAN access-map called (for example) "deny\_all" and match this ACL

```
awplus(config)# vlan access-map deny_all
awplus(config-vlan-access-map)# match access-group 4000
awplus(config-vlan-access-map)# exit
```

4. Apply this ACL by applying the access map to VLAN 48 and 49

```
awplus(config)# vlan filter deny_all vlan-list 48-49 input
```

Per-VLAN ACL rules will be applied to all ports on which the VLAN is active. This means they will be applied to all ports that are access ports in the VLAN, all trunk ports that allow packets tagged for the VLAN, and all trunk ports whose native VLAN is this VLAN.

## Number of rules

### SBx908 and SBx8100 switches

On SBx908 and SBx8100 switches, each VLAN ACL uses one ACL rule entry per VLAN it is filtering, per port it is applied to. For example, the following situation uses 6 entries:

- rule A is applied to VLAN1, and 3 ports are active in VLAN1, and
- rule B is applied to VLAN2 and 3 ports are active in VLAN2.

### Other switches

On other switches, each VLAN ACL uses one ACL rule entry per VLAN it is filtering. For example, the following situation uses 2 entries:

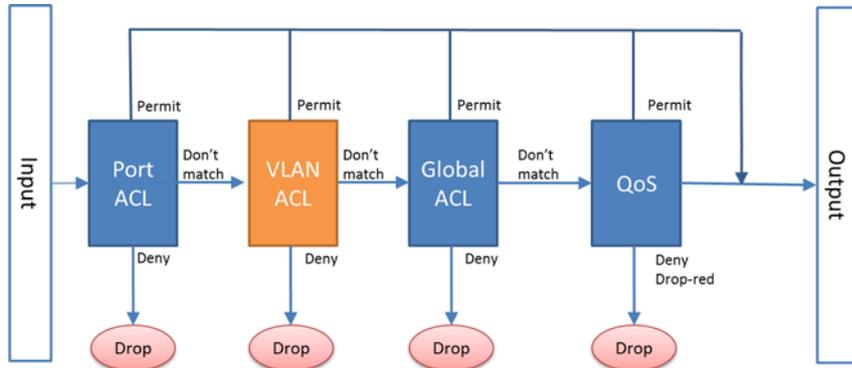

- rule A is applied to VLAN1, and 3 ports are active in VLAN1, and
- rule B is applied to VLAN2 and 3 ports are active in VLAN2.

The maximum number of ACL rules available depends on the switch model and port type. To see the available number of ACLs, use the **show platform classifier statistics utilization brief** command.

## Rule precedence

### SBx908 and SBx8100 switches

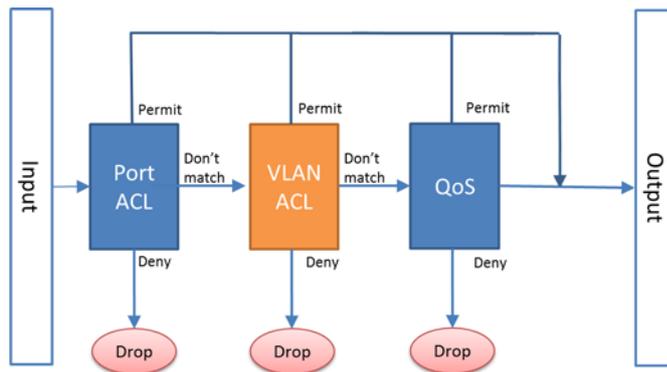

On SBx908 and SBx8100 switches, the switch checks packets against ACLs in the following order on ingress:

Once a packet matches an ACL (either a permit or deny match), the SBx908 or SBx8100 switch stops checking it against further ACLs.

### IE200 Series switches

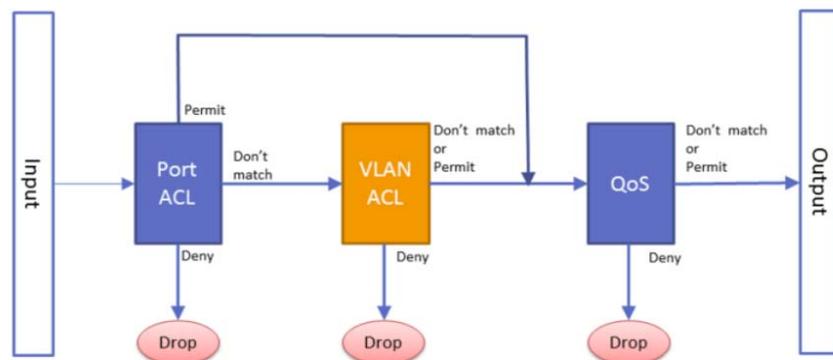

On IE200 Series switches, the switch checks packets against ACLs in the following order on ingress:

Once a packet matches an ACL (either a permit or deny match), the IE200 Series switch stops checking it against further ACLs.

### Other switches

On other switches, the switch checks packets against ACLs in the following order on ingress:

On these switches, once an ACL denies a packet, the switch stops checking against further ACLs and drops the packet. If a port ACL permits the packet, the switch does not check VLAN ACLs. If either a port ACL or VLAN ACL permits the packet, the switch checks the packet against QoS ACLs.

## Displaying information about per-VLAN ACLs

This enhancement has two new show commands:

- `show vlan access-map`
- `show vlan filter`

### show vlan access-map

Use this command to display information about the configured VLAN access-maps. VLAN access-maps contain a series of ACLs and enable you to filter traffic that ingresses specified VLANs.

**Syntax** `show vlan access-map [<access-map-name>]`

**Output** Example output from **show vlan access-map**

```
awplus#show vlan access-map
Vlan access map : deny_all
Hardware MAC access list 4000
 10 deny any any

Vlan access map : ip_range
Hardware IP access list 3000
 10 deny ip 192.168.1.1/24 any
```

### show vlan filter

Use this command to display information about the configured VLAN filters. VLAN filters apply access-maps (and therefore ACLs) to VLANs. This enables you to filter traffic that ingresses specified VLANs.

**Syntax** `show vlan filter [<access-map-name>]`

**Output** Example output from **show vlan filter** for the access-map named **deny\_all**

```
awplus#show vlan filter deny_all
Vlan filter : deny_all
  direction : ingress
  vlan list : 48-49
  access map : deny_all
Hardware MAC access list 4000
 10 deny any any
```

## ACL Option to Send Packets to a Port in a VLAN

Available on x930, x610, x510, x510DP, x510L, IX5, x310 and x230 Series switches

Version 5.4.6-2.x adds support for a hardware ACL action named "send-to-vlan-port", which allows you to specify a port that belongs to a specified VLAN. Matching packets will be sent to the specified port, tagged with the specified VLAN.

The send-to-vlan-port action applies to numbered and named IP, MAC and IPv6 hardware ACLs, so you can create ACLs to redirect packets on the basis of IP settings, IPv6 settings, or MAC address.

For example, to create an ACL that will redirect packets from the MAC address `aaaa.bbbb.00a0` to port `1.0.1` on VLAN `200`, use the commands:

```
awplus#configure terminal
awplus(config)#access-list 4000 send-to-vlan-port vlan 200 port
port1.0.1 aaaa.bbbb.00a0 0000.0000.0000 any
```

You can apply the ACL directly to an ingress port, or by using QoS class maps.

## Configuring Web Control default action on a per-entity basis

If you have multiple firewall entities configured in your device (such as multiple firewall zones), then version 5.4.6-2.x enables you to configure different default actions for each individual entity for any URLs that do not match your filter rules.

To do this, a new reserved keyword **any** has been added to the `<category>` parameter in the **rule** command. A rule with this reserved keyword overrides the default Web Control action for the specific entity that it is associated with. Rules containing this reserved keyword can be applied to all types of firewall entities, including zone, network and host entities.

## ISO 8601 Compliant Date Format in Log Messages

*Available on AR-series firewalls*

Version 5.4.6-2.x enables the date on log messages to be displayed in ISO 8601 compliant format. To select the ISO 8601 compliant format, use the commands:

```
awplus#configure terminal
awplus(config)#log date-format iso
```

The ISO 8601 compliant date format is "YYYY-MM-DDThh:mm:ssTZD", where a T separates the date from the time, and the time is followed by the timezone offset from UTC time. For example, this is a log message with an ISO 8601 compliant date:

```
2016-09-29T08:55:43+13:00 user.notice Gateway IMISH[1983]: [manager@
ttyS0]show run
```

To return to the default date format, use the commands:

```
awplus#configure terminal
awplus(config)#log date-format default
```

The default date format is "YYYY MMM DD HH:MM:SS" (except when using **terminal monitor**, when it is "HH:MM:SS"). For example, this is a log message with the default date format:

```
2016 Sep 29 08:55:43 user.notice Gateway IMISH[1983]: [manager@ttyS0]
show run
```

The date format setting affects all log messages, no matter where the messages are stored or displayed.

## Specifying Maximum Burst Size with Egress Rate Limiting

Available on IE510, IE300, x510, x510DP, x510L, x310 Series switches

Version 5.4.6-2.x enables you to specify a maximum burst size as well as a rate limit for egress rate limiting.

Previously, egress rate limiting did not limit how high traffic could burst, only its average rate. Traffic could burst at a high enough rate that upstream devices would meter and drop it. The maximum burst size prevents this problem; it enables the switch to groom upstream traffic so that it meets the requirements of upstream devices.

Egress rate limiting uses a token bucket system. The rate limit represents how fast the bucket fills and the maximum burst size represents its maximum depth.

To configure the maximum burst size, use the following commands:

```
awplus#configure terminal
awplus(config)#interface <port-number>
awplus(config-if)#egress-rate-limit <rate-limit> max-burst-size
<burst-size>
```

The minimum value for the max-burst-size is 64 KB (kilobytes). Only certain values are valid; if you enter an invalid value, the max-burst size will be rounded to the nearest valid value. The default value is the number of bytes that would be transmitted in one full second of transmission at the rate limit.

We recommend setting the maximum burst size to approximately the number of bytes that would be transmitted in one-third of a second of transmission at the rate limit. This means entering a value of approximately  $rate\text{-}limit/24$ .

The default unit is KB (k), but MB (m) or GB (g) can also be specified. The command syntax is not case sensitive, so a value such as 20m or 20M will be interpreted as 20 megabytes.

For example, if you enter the command:

```
awplus(config-if)#egress-rate-limit 5m max-burst-size 200k
```

then a burst of up to approximately 200KB can be sent at line rate (100 or 1000Mbps) if there are packets in the queues to send.

Once the 200KB burst has been sent and traffic is still sitting in the queues, then that traffic will be only transmitted at 5Mbps, not at line rate.

If the average egress traffic rate is over 5Mbps, then the queues will fill up over time. When the queues become full, the switch will drop packets and/or send pause frames to the traffic source. You can enable the switch to send pause frames by entering the command **flowcontrol**.

# Important Considerations Before Upgrading

## Firewall Control for VRRP and High Availability

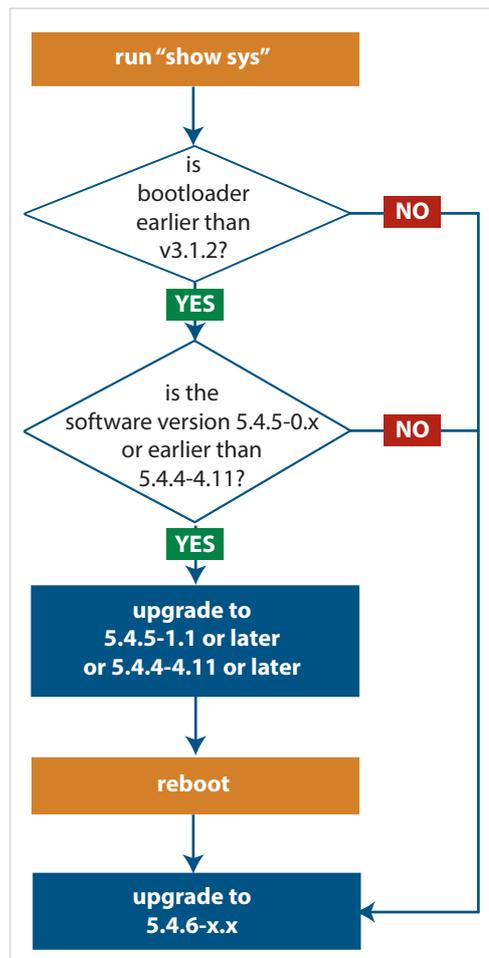

On AR4050S, AR3050S, AR2050V and AR2010V firewalls, Version 5.4.6-2.x introduces firewall control for VRRPv4 packets received by the firewall.

This means that if you are using VRRP and the firewall, you need to create a firewall rule to allow IPv4 VRRP packets. High Availability (HA) uses VRRP, so if you are using High Availability and the firewall, you also need to create a firewall rule.

See “Firewall Control for VRRP and High Availability” on page 10 for an example of the rule to create.

## Bootloader compatibility for SBx81CFC960

On the AT-SBx81CFC960, please check your bootloader and current software version before you upgrade to AlliedWare Plus software version 5.4.6.

If your bootloader is older than 3.1.2, you can only upgrade to 5.4.6 from the following software versions:

- ▶ 5.4.5-1.1 or higher (including 5.4.5-2.x and 5.4.5-3.x)
- ▶ 5.4.4-4.11 or higher

If your bootloader is older than 3.1.2, your switch must be running one of the above versions when you upgrade to 5.4.6.

**Note that you cannot upgrade to 5.4.6 directly from 5.4.5-0.x.**

To see your bootloader and current software version, check the "Bootloader version" and "Software version" fields in the command:

```
awplus# show system
```

If you experience issues when upgrading, please contact your Allied Telesis support team. See our website at [alliedtelesis.com/support](http://alliedtelesis.com/support).

## Licensing

From software version 5.4.4-0.4 onwards, AlliedWare Plus software releases need to be licensed for SBx908 and SBx8100 switches.

If you are upgrading to 5.4.6-1.x on your SBx908 or SBx8100 switch, please ensure you have a 5.4.6 license on your switch. To obtain a license, contact your authorized Allied Telesis support center. You will need to provide the MAC addresses of the switches you want to license. For details, see:

- [“Licensing this Software Version on an SBx908 Switch” on page 28](#) and
- [“Licensing this Software Version on a Control Card for an SBx8100 Series Switch” on page 30.](#)

## Upgrading a VCStack with reboot rolling

This version supports VCStack “reboot rolling” upgrades. With the **reboot rolling** command, you can reduce downtime when upgrading a VCStack.

You can use the **reboot rolling** command to upgrade to any 5.4.6-2.x version from:

- 5.4.6-0.x, or
- 5.4.6-1.x, or
- 5.4.5-x.x, or
- 5.4.4-1.x or later.

To use reboot rolling, first enter the **boot system** command, which will install the new release file on all stack members. Then enter the **reboot rolling** command. Note that reboot rolling is not supported on SBx8100.

You cannot use rolling reboot to upgrade directly to 5.4.6-2.x from 5.4.4-0.x or earlier versions. If you wish to use rolling reboot, follow these steps:

- For releases 5.4.3-x.x or earlier, first upgrade to 5.4.4-0.x
- Next, upgrade from 5.4.4-0.x to any 5.4.5-x.x version
- Finally, upgrade from 5.4.5-x.x to 5.4.6-1.x.

## Forming or extending a VCStack with auto-synchronization

If you create a VCStack from switches that are running different software versions, auto-synchronization ensures that all members will run the same software version when they boot up.

Auto-synchronization is supported between 5.4.6-2.x, and 5.4.6-1.2 and all later 5.4.6-1.x versions.

It is not supported between 5.4.6-2.x and 5.4.6-1.1 or **any** earlier releases.

## If your switch is currently running 5.4.6-1.1 or earlier...

### On VCStacks

If you are working with a VCStack:

- If you want to upgrade an existing VCStack to 5.4.6-2.x, this should not cause any problems. The **boot system** command will automatically copy the new software release to all stack members. Do not reboot any individual stack members after installing the new release - instead reboot the stack as a whole.

If you encounter any errors from the **boot system** command, then check that the release file was copied to all stack members before rebooting. If it was not, then address any problems reported, such as freeing up space in Flash for the new release file, and then repeat the **boot system** command again.

- If a stack is running v5.4.6-2.x, and you connect a switch running 5.4.6-1.1 or earlier to the stack, then the v5.4.6-2.x software will not be automatically copied over to the newly-added stack member, even if **stack software-auto-synchronize** has been enabled on the stack. Instead, upgrade the switch that is to be added to the stack to v5.4.6-2.x before you add it to the stack.
- If a stack is running 5.4.6-1.1 or earlier, and you connect a switch running v5.4.6-2.x to the stack, then the older software cannot be automatically copied over to the newly-added stack member, even if **stack software-auto-synchronize** has been enabled on the stack. Instead, downgrade the switch that is to be added to the stack to the older release before you add it to the stack.
- If you do boot up a stack with a switch running an incompatible version, the incompatible switch will boot up as a standalone unit. To recover, simply leave the incompatible switch cabled into the stack, log into it, upgrade or downgrade it to the desired release, and reboot the switch.

### On a VCStack Plus Pair of SBx8100 chassis

If you are working with a VCStack Plus, what you need to do depends on whether you are installing a new CFC or a whole new chassis:

- If you want to upgrade an existing SBx8100 VCStack Plus system to 5.4.6-2.x, this should not cause any problems. The **boot system** command will automatically copy the new software release to all stack members. Do not reboot any individual CFCs or stack members after installing the new release - instead reboot the stack as a whole.

If you encounter any errors from the **boot system** command, then check that the release file was copied to all CFCs. If it was not, then address any problems reported, such as freeing up space in Flash for the new release file, and then repeat the **boot system** command again.

- If you want to insert a new dual CFC into a chassis that is part of an existing VCStack Plus system, refer to [“Upgrading an SBx8100 chassis or adding a CFC to an SBx8100 chassis”](#) below.
- If you want to insert a new SBx8100 chassis into a VCStack Plus system, refer to [“On VCStacks”](#) on page 23 above.

## AMF software version compatibility

We strongly recommend that all nodes in an AMF network run the same software release.

In particular, we recommend you upgrade all nodes to 5.4.6-2.x, to take advantage of the increased efficiency offered by Node Map Exchange (see [“Support for Node Map Exchange”](#) on page 12).

If this is not possible, nodes running version 5.4.6-2.x are compatible with nodes running:

- 5.4.6-1.x
- 5.4.6-0.x
- 5.4.5-x.x
- 5.4.4-x.x, and
- 5.4.3-2.6 or later.

However, if you are using Vista Manager and any AMF members are running 5.4.6-x.x, the AMF Master or Controller must also run 5.4.6-x.x. Otherwise Vista Manager will not operate correctly.

## Upgrading all switches in an AMF network

**This version supports upgrades across AMF networks.** There are two methods for upgrading firmware on an AMF network:

- Reboot-rolling, which upgrades and reboots each node in turn
- Distribute firmware, which upgrades each node, but does not reboot them. This lets you reboot the nodes at a minimally-disruptive time.

You can use either of these methods to upgrade to this software version.

You can use these methods to upgrade to this version from 5.4.3-2.6 and later.

In summary, the process for upgrading firmware on an AMF network is:

1. Copy the release .rel files for each product family to the media location you intend to upgrade from (Flash memory, SD card, USB stick etc).
2. Decide which AMF upgrade method is most suitable.
3. Initiate the AMF network upgrade using the selected method. To do this:
  - a. create a working-set of the nodes you want to upgrade
  - b. enter the command **atmf reboot-rolling <location>** or **atmf distribute-firmware <location>** where **<location>** is the location of the .rel files.
  - c. Check the console messages to make sure that all nodes are “release ready”. If they are, follow the prompts to perform the upgrade.

## ISSU (In-Service Software Upgrade) on SBx8100 with CFC960

ISSU is available on standalone SBx8100 Series switches with dual CFC960 control cards, and on switches using VCStack Plus™ to create a single virtual unit out of two chassis (where each chassis has a pair of CFC960 control cards). ISSU allows you to upgrade the software release running on the CFCs with no disruption to network traffic passing through the chassis.

You cannot use ISSU to upgrade to 5.4.6-2.1 from any previous software version.

## Verifying the Release File for x930 Series Switches

On x930 Series switches, to ensure that the release file has not been corrupted or interfered with during download, you can verify the release file. To do this, enter Global Configuration mode and enter the following command to verify the SHA256 checksum of the file:

```
awplus(config)# crypto verify <filename> <hash-value>
```

where *<hash-value>* is the known correct checksum of the file.

This command compares the SHA256 checksum of the release file with the correct checksum for the file.

The correct checksum is listed in the *x930-[<relnum>.sha256sum](#)* file, which is available on the Software Downloads page.

The following command contains the hash for 5.4.6-2.1, so you can simply copy and paste that command into the CLI if you wish to verify the file *x930-5.4.6-2.1.rel*:

```
crypto verify x930-5.4.6-2.1.rel 4b4fd003a1c62d7c9d8bf41aa5b70c20b702c87a4936ea0ea290b15b29bd44a2
```

### Caution

If the verification fails, the following error message will be generated:

“% Verification Failed”

In the case of verification failure, please delete the release file and contact Allied Telesis support.

All x930 Series switch models run the same release file and therefore have the same checksum. See [Table 1 on page 2](#) for a list of models.

## Verifying the release on subsequent boot-ups

Once the switch has successfully verified the release file, it adds the **crypto verify** command to the running configuration.

If the switch is in secure mode, it will verify the release file every time it boots up. To do this, it runs the **crypto verify** command while booting. Therefore, you need to copy the **crypto verify** command to the startup configuration, by using the command:

```
awplus# copy running-config startup-config
```

If the **crypto verify** command is not in the startup configuration, the switch will report a verification error at bootup.

If there is a verification error at bootup, the switch produces an error message and finishes booting up. If this happens, run the **crypto verify** command after bootup finishes, to verify the running release file. If verification of the running release file fails, delete the release file and contact Allied Telesis support.

## Licensing this Software Version on an SBx908 Switch

Release licenses are applied with the **license certificate** command, then validated with the **show license** or **show license brief** commands. Follow these steps:

- Obtain the MAC address for a switch
- Obtain a release license for a switch
- Apply a release license on a switch
- Confirm release license application

### Step 1: Obtain the MAC address for a switch

A release license is tied to the MAC address of the switch.

Switches may have several MAC addresses. Use the **show system mac license** command to show the switch MAC address for release licensing:

```
awplus# show system mac license
MAC address for licensing:
eccd.6d9d.4eed
```

### Step 2: Obtain a release license for a switch

Contact your authorized Allied Telesis support center to obtain a release license.

### Step 3: Apply a release license on a switch

Use the **license certificate** command to apply a release license to your switch.

Note the license certificate file can be stored on internal flash memory, or an external SD card, or on a server accessible by the TFTP, SCP or HTTP protocols.

Entering a valid release license changes the console message displayed about licensing:

```
11:04:56 awplus IMI[1696]: SFL: The current software is not licensed.
awplus#license certificate demo1.csv
A restart of affected modules may be required.
Would you like to continue? (y/n): y
11:58:14 awplus IMI[1696]: SFL: The current software is licensed. Exiting
unlicensed mode.

Stack member 1 installed 1 license
1 license installed.
```

## Step 4: Confirm release license application

On a stand-alone switch, use the commands **show license** or **show license brief** to confirm release license application.

On a stacked switch, use the command **show license member** or **show license brief member** to confirm release license application.

The **show license** command displays the base feature license and any other feature and release licenses installed on AlliedWare Plus switches:

```
awplus# show license
OEM Territory : ATI USA
Software Licenses
-----
Index                : 1
License name         : Base License
Customer name        : ABC Consulting
Quantity of licenses : 1
Type of license      : Full
License issue date   : 20-Mar-2016
License expiry date  : N/A
Features included    : EPSR-MASTER, IPv6Basic, MLDSnoop, OSPF-64,
                     RADIUS-100, RIP, VRRP

Index                : 2
License name         : 5.4.6-rl
Customer name        : ABC Consulting
Quantity of licenses : -
Type of license      : Full
License issue date   : 20-Mar-2016
License expiry date  : N/A
Release              : 5.4.6
```

# Licensing this Software Version on a Control Card for an SBx8100 Series Switch

Release licenses are applied with the **license certificate** command, then validated with the **show license** or **show license brief** commands. Follow these steps:

- Obtain the MAC address for a control card
- Obtain a release license for a control card
- Apply a release license on a control card
- Confirm release license application

If your control card is in a stacked chassis, you do not need to perform these steps on each chassis in the stack, only on the stack master.

If your license certificate contains release licenses for each control card present in a stacked chassis, entering the **license certificate** command on the stack master will automatically apply the release licenses to all the control cards within the stack.

## Step 1: Obtain the MAC address for a control card

A release license is tied to the control card MAC address in a chassis.

Chassis may have several MAC addresses. Use the **show system mac license** command to show the control card MAC address for release licensing. Note the MAC addresses for each control card in the chassis. The chassis MAC address is not used for release licensing. Use the card MAC address for release licensing.

```
awplus#show system mac license
MAC address for licensing:

Card                MAC Address
-----
1.5                  eccd.6d9e.3312
1.6                  eccd.6db3.58e7

Chassis MAC Address eccd.6d7b.3bc2
```

## Step 2: Obtain a release license for a control card

Contact your authorized Allied Telesis support center to obtain a release license.

## Step 3: Apply a release license on a control card

Use the **license certificate** command to apply a release license to each control card installed in your chassis or stack.

Note the license certificate file can be stored on internal flash memory, a USB drive, or on a server accessible by the TFTP, SCP or HTTP protocols.

Entering a valid release license changes the console message displayed about licensing:

```
11:04:56 awplus IMI[1696]: SFL: The current software is not licensed.
awplus# license certificate demo1.csv
A restart of affected modules may be required.
Would you like to continue? (y/n): y
11:58:14 awplus IMI[1696]: SFL: The current software is licensed. Exiting
unlicensed mode.

Stack member 1 installed 1 license

1 license installed.
```

#### Step 4: Confirm release license application

On a stand-alone chassis, use the commands **show license** or **show license brief** to confirm release license application.

On a stacked chassis, use the command **show license member** or **show license brief member** to confirm release license application.

The **show license** command displays the base feature license and any other feature and release licenses installed on AlliedWare Plus chassis:

```
awplus# show license
OEM Territory : ATI USA
Software Licenses
-----
Index                : 1
License name         : Base License
Customer name        : ABC Consulting
Quantity of licenses : 1
Type of license      : Full
License issue date   : 20-Mar-2016
License expiry date  : N/A
Features included    : IPv6Basic, LAG-FULL, MLDSnoop, RADIUS-100
                    : Virtual-MAC, VRRP

Index                : 2
License name         : 5.4.6-r1
Customer name        : ABC Consulting
Quantity of licenses : -
Type of license      : Full
License issue date   : 20-Mar-2016
License expiry date  : N/A
Release              : 5.4.6
```

## Installing this Software Version

**Caution:** Software versions 5.4.6-x.x require a release license for the SBx908 and SBx8100 switches. Contact your authorized Allied Telesis support center to obtain a license. For details, see:

- [“Licensing this Software Version on an SBx908 Switch” on page 28](#) and
- [“Licensing this Software Version on a Control Card for an SBx8100 Series Switch” on page 30.](#)

To install and enable this software version, use the following steps:

1. Copy the software version file (.rel) onto your TFTP server.
2. If necessary, delete or move files to create space in the switch’s Flash memory for the new file. To see the memory usage, use the command:

```
awplus# show file systems
```

To list files, use the command:

```
awplus# dir
```

To delete files, use the command:

```
awplus# del <filename>
```

You cannot delete the current boot file.

3. Copy the new release from your TFTP server onto the switch.

```
awplus# copy tftp flash
```

Follow the onscreen prompts to specify the server and file.

4. Move from Privileged Exec mode to Global Configuration mode, using:

```
awplus# configure terminal
```

Then set the switch to reboot with the new software version. For example, for 5.4.6-2.1, use one of the following commands:

Product	Command
FS980M series <sup>1</sup>	<code>awplus(config)# boot system FS980-5.4.6-2.2.rel</code>
GS900MX/MPX series	<code>awplus(config)# boot system GS900-5.4.6-2.1.rel</code>
XS900MX series	<code>awplus(config)# boot system XS900-5.4.6-2.1.rel</code>
x210 series	<code>awplus(config)# boot system x210-5.4.6-2.1.rel</code>
x230 series	<code>awplus(config)# boot system x230-5.4.6-2.1.rel</code>
IE200 series	<code>awplus(config)# boot system IE200-5.4.6-2.1.rel</code>
x310 series	<code>awplus(config)# boot system x310-5.4.6-2.1.rel</code>
IE300 series	<code>awplus(config)# boot system IE300-5.4.6-2.1.rel</code>
IX5-28GPX	<code>awplus(config)# boot system IX5-5.4.6-2.1.rel</code>
x510 series	<code>awplus(config)# boot system x510-5.4.6-2.1.rel</code>
IE510-28GSX	<code>awplus(config)# boot system IE510-5.4.6-2.1.rel</code>

Product	Command
x610 series	<code>awplus(config)# boot system x610-5.4.6-2.1.rel</code>
SBx908	<code>awplus(config)# boot system SBx908-5.4.6-2.1.rel</code>
x930 series	<code>awplus(config)# boot system SBx930-5.4.6-2.1.rel</code>
DC2552XS/L3	<code>awplus(config)# boot system DC2500-5.4.6-2.1.rel</code>
SBx8100 with CFC400	<code>awplus(config)# boot system SBx81CFC400-5.4.6-2.1.rel</code>
SBx8100 with CFC960	<code>awplus(config)# boot system SBx81CFC960-5.4.6-2.1.rel</code>
AR2010V	<code>awplus(config)# boot system AR2010V-5.4.6-2.1.rel</code>
AR2050V	<code>awplus(config)# boot system AR2050V-5.4.6-2.1.rel</code>
AR3050S	<code>awplus(config)# boot system AR3050S-5.4.6-2.1.rel</code>
AR4050S	<code>awplus(config)# boot system AR4050S-5.4.6-2.1.rel</code>

1. Supported from version 5.4.6-2.2 onwards
5. Return to Privileged Exec mode and check the boot settings, using:
 

```
awplus(config)# exit
awplus# show boot
```
6. Reboot using the new software version.
 

```
awplus# reload
```

## Accessing the AR-Series Firewall GUI

This section describes how to access the firewall GUI, to manage and monitor your AR-series firewall.

The GUI provides setup of the firewall, enabling the configuration of entities (Zones, Networks and Hosts) and then creating firewall and NAT rules for traffic between these entities. Advanced firewall features can be enabled, configured and customized for a comprehensive security solution, such as Application control and Web control, as well as threat management features such as Intrusion Prevention, Malware protection, and Antivirus. Various other features can be managed through the GUI, and the dashboard provides at-a-glance monitoring of traffic, application use, and threat protection statistics.

If your AR-series firewall came with the GUI pre-installed, perform the following steps to browse to the GUI:

1. Connect to any of the LAN switch ports
2. Open a web browser and browse to `https://192.168.1.1`. This is the pre-configured IP address of VLAN1. The default username is *manager* and the default password is *friend*.

If your AR-series firewall did not come with the GUI pre-installed, perform the following steps through the command-line interface:

1. Create one or more IP interfaces and assign them IP addresses, including configuring WAN connectivity. For information about configuring PPP, see the [PPP Feature Overview and Configuration Guide](#). For information about configuring IP, see the [IP Feature Overview and Configuration Guide](#).
2. If you plan to enable the firewall functionality, first create a firewall rule to allow traffic from the Update Manager to pass through the firewall. This is needed because AR-series firewalls block all traffic by default. The following figure shows a recommended example configuration, when WAN connectivity is through ppp0:

```
zone public
network wan
  ip subnet 0.0.0.0/0 interface ppp0
  host ppp0
  ip address dynamic interface ppp0

firewall
rule 10 permit dns from public.wan.ppp0 to public.wan
rule 20 permit https from public.wan.ppp0 to public.wan
protect
```

3. Use the following command to download and install the GUI:

```
awplus# update webgui now
```

4. Enable the HTTP service:

```
awplus# configure terminal
awplus(config)# service http
```

5. Log into the GUI.

Start a browser and browse to the firewall's IP address, using HTTPS. You can access the GUI via any reachable IP address on any interface.

The GUI starts up and displays a login screen. Log in with your username and password.

## Installing the Switch GUI

This section describes how to install and set up the java-based GUI for switches. The GUI enables you to monitor and manage your AlliedWare Plus switch from your browser.

To install and run the GUI, you need the following system products and setup:

- PC Platform:  
Windows XP SP2 and up / Windows Vista SP1 and up
- Browser: (must support Java Runtime Environment (JRE) version 6)  
Microsoft Internet Explorer 7.0 and up / Mozilla Firefox 2.0 and up

To install the GUI on your switch, use the following steps:

1. Copy to the GUI Java applet file (**.jar** extension) onto your TFTP server, SD card or USB storage device.
2. Connect to the switch's management port, then log into the switch.
3. If necessary, delete or move files to create space in the switch's Flash memory for the new file.

To see the memory usage, use the command:

```
awplus# show file systems
```

To list files, use the command:

```
awplus# dir
```

To delete files, use the command:

```
awplus# del <filename>
```

You cannot delete the current boot file.

4. Assign an IP address for connecting to the GUI. Use the commands:

```
awplus# configure terminal
```

```
awplus(config)# interface vlan1
```

```
awplus(config-if)# ip address <address>/<prefix-length>
```

Where *<address>* is the IP address that you will subsequently browse to when you connect to the GUI Java applet. For example, to give the switch an IP address of 192.168.2.6, with a subnet mask of 255.255.255.0, use the command:

```
awplus(config-if)# ip address 192.168.2.6/24
```

5. If required, configure a default gateway for the switch.

```
awplus(config-if)# exit
```

```
awplus(config)# ip route 0.0.0.0/0 <gateway-address>
```

Where *<gateway-address>* is the IP address for your gateway device. You do not need to define a default gateway if you browse to the switch from within its own subnet.

6. Copy the GUI file onto your switch from the TFTP server, SD card, or USB storage device.

**TFTP server:** Use the command:

```
awplus# copy tftp://<server-address>/<filename.jar> flash:/
```

**SD card:** use the command:

```
awplus# copy card:/<filename.jar> flash:/
```

**USB storage device:** use the command:

```
awplus# copy usb:/<filename.jar> flash:/
```

where <server-address> is the IP address of the TFTP server, and where <filename.jar> is the filename of the GUI Java applet.

7. Ensure the HTTP service is enabled on your switch. Use the commands:

```
awplus# configure terminal
```

```
awplus(config)# service http
```

The HTTP service needs to be enabled on the switch before it accepts connections from a web browser. The HTTP service is enabled by default. However, if the HTTP has been disabled then you must enable the HTTP service again.

8. Create a user account for logging into the GUI.

```
awplus(config)# username <username> privilege 15 password  
                <password>
```

You can create multiple users to log into the GUI. For information about the **username** command, see the AlliedWare Plus Command Reference for your switch.

9. Start the Java Control Panel, to enable Java within a browser

On your PC, start the Java Control Panel by opening the Windows Control Panel from the Windows Start menu. Then enter Java Control Panel in the search field to display and open the Java Control Panel.

Next, click on the 'Security' tab. Ensure the 'Enable Java content in the browser' checkbox is selected on this tab.

10. Enter the URL in the Java Control Panel Exception Site List

Click on the 'Edit Site List' button in the Java Control Panel dialog Security tab to enter a URL in the Exception Site List dialog. In the 'Exception Site List' dialog, enter the IP address you configured in Step 4, with a http:// prefix.

After entering the URL click the Add button then click OK.

11. Log into the GUI.

# AlliedWare Plus Version 5.4.6-1.x

For:

SwitchBlade x8100 Series  
 SwitchBlade x908  
 DC2552XS/L3  
 x930 Series  
 x610 Series  
 x510 Series  
 IX5-28GPX  
 IE510-28GSX-80  
 x310 Series  
 IE300 Series

x230 Series  
 IE200 Series  
 x210 Series

## Introduction

This release note describes the new features and enhancements in AlliedWare Plus software version 5.4.6-1.x. For more information, see the Command Reference for your switch or AR-series firewall. Software file details for this version are listed in [Table 1](#) below.

You can obtain the software files from the [Software Download area of the Allied Telesis website](#). Log in using your assigned email address and password.

**Caution:** Software version 5.4.6 requires a release license for the SBx908 and SBx8100 switches. If you are using either of these switches, make sure that each switch has a 5.4.6 license certificate before you upgrade.

If an SBx908 or SBx8100 switch already has a version 5.4.6 license installed, that license also covers 5.4.6-1.x versions. Such switches do not need a new license before upgrading to version 5.4.6-1.x.

Contact your authorized Allied Telesis support center to obtain a license. For details, see:

- [“Licensing this Software Version on an SBx908 Switch” on page 73](#) and
- [“Licensing this Software Version on a Control Card for an SBx8100 Series Switch” on page 75](#).

The first 5.4.6-1.x software version is numbered 5.4.6-1.1, except for SBx8100 Series switches. The following table lists model names and software files for this version.

**Table 1: Models and software file names**

Under version 5.4.6, not all models of XEM are supported in the SwitchBlade x908. The following table lists which XEMs are and are not supported under version 5.4.6.

**Table 2: Support of XEM modules for the SwitchBlade x908 in version 5.4.6-x.x**

Product	Supported in version 5.4.6-x.x
XEM-1XP	No
XEM-2XP	Yes
XEM-2XS	Yes
XEM-2XT	Yes
XEM-12S	No

Product	Supported in version 5.4.6-x.x
XEM-12T	No
XEM-12Sv2	Yes
XEM-12Tv2	Yes
XEM-24T	Yes

**Caution:** Using a software version file for the wrong switch or AR-series firewall model may cause unpredictable results, including disruption to the network. Information in this release note is subject to change without notice and does not represent a commitment on the part of Allied Telesis, Inc. While every effort has been made to ensure that the information contained within this document and the features and changes described are accurate, Allied Telesis, Inc. can not accept any type of liability for errors in, or omissions arising from, the use of this information.

## Obtaining User Documentation

For full documentation about all features on your switch or AR-series firewall, see the Support tab of your product series web page. Product series web pages are available on our website from:

- [alliedtelesis.com/products/switches](http://alliedtelesis.com/products/switches) (for switches) or
- [alliedtelesis.com/products/securityapps](http://alliedtelesis.com/products/securityapps) (for AR-series firewalls)

For each product series, the Support tab includes the following documents:

- the **Installation Guide**,
- a detailed **Command Reference**, and
- **Feature Overview and Configuration Guides** for each supported feature.

For example, the arrow in the following figure shows the location of the Support tab on the x230 Series web page.

Product datasheets are also available on the product series web pages, along with a range of helpful case studies, solution guides, whitepapers and videos.

## New Products

AlliedWare Plus version 5.4.6-1.x supports the following recently-released products.

### CentreCOM XS900MX Series

#### **Layer 3 10G Stackable Managed Switches**

The AT-XS916MXT and AT-XS916MXS switches offer cost effective, high-speed 10G connectivity for servers and storage, and support 100/1000 connections for existing networks. The XS900MX Series enable a highly flexible and reliable network, which can easily scale to meet increasing traffic demands.

For more information, see [alliedtelesis.com/products/xs900mx-series](http://alliedtelesis.com/products/xs900mx-series).

### AR2010V

#### **Compact VPN Firewall**

Allied Telesis Virtual Private Network (VPN) Firewalls are ideal for branch office and remote device connectivity, supporting the move towards smarter cities and the Internet of Things (IoT).

The compact AR2010V has a small form factor and extended temperature range, making it perfect for Machine to Machine (M2M) connectivity. Applications such as traffic control, video surveillance, vending and ticketing, and remote telemetry, provide real-time data to enhance the quality of urban services in today's Smart Cities.

For more information, see [alliedtelesis.com/products/securityapps](http://alliedtelesis.com/products/securityapps).

### IE300 series

#### **Industrial Ethernet, Layer 3 Switches**

Our ruggedized IE300 Industrial Ethernet switches are built for enduring performance in harsh environments, such as those found in manufacturing, transportation and physical security. Offering high throughput, rich functionality and advanced security features, IE300 switches deliver the performance and reliability demanded by industrial deployments in the Internet of Things (IoT) age.

Ruggedized to meet the latest industrial Ethernet standards for temperature, vibration, and electrical noise, IE300 switches are certified to operate in temperatures ranging from -40°C (-40°F) to 75°C (-167°F).

For more information, see [alliedtelesis.com/products/ie300-series](http://alliedtelesis.com/products/ie300-series).

## New Features and Enhancements

This section describes the new features in 5.4.6-1.x.

Unless otherwise stated, all new features and enhancements are available on all switch and AR-series firewall models running this version of AlliedWare Plus.

For information about finding full documentation about all features on your product, see [“Obtaining User Documentation” on page 42](#).

### Managed L2TPv2 Peer-to-Peer tunnels

*Available on AR-series firewalls*

Version 5.4.6-1.x adds support for managed L2TPv2 Peer-to-Peer tunnels.

For more information and configuration examples, see the [L2TP Feature Overview and Configuration Guide](#).

### Support for RED curves in Traffic Control

*Available on AR3050S and AR4050S NGFWs*

Version 5.4.6-1.x adds support for RED (Random Early Dropping) curves to Traffic Control.

The goal of using RED curves in a traffic-control configuration is to cause TCP flows to back off early by occasionally dropping a packet, rather than causing all flows to back off at the same time when the queue overflows.

For more information and configuration details, see the [Traffic Control Feature Overview and Configuration Guide](#).

### USB cellular modem diagnostics

*Available on AR-series firewalls*

Version 5.4.6-1.x expands the diagnostic information available about USB cellular modems. It also supports manual mode-switching and use of custom chat-scripts.

For more information and configuration examples, see the [USB Cellular Modem Feature Overview and Configuration Guide](#).

### SMTP support in Malware Protection

*Available on AR3050S and AR4050S NGFWs*

In Version 5.4.6-1.x, AlliedWare Plus Malware Protection provides MD5 scanning of SMTP. Malware Protection uses stream-based scanning to compare the MD5 hash to values provided by the Kaspersky Safestream II list of malicious objects. Streams that match the MD5 hash of known malware will be blocked. POP and IMAP do not use the MD5 hash, and are instead scanned by a byte-stream process signature analysis process.

For more information, see the [Malware Protection Feature Overview and Configuration Guide](#).

---

## IPsec enhancements

*Available on AR-series firewalls*

Version 5.4.6-1.x enables you to configure customizable user-defined ISAKMP and IPSEC profiles. These customizable profiles allow you to configure a specific set of non-default options to support interoperation with legacy devices using less secure cryptographic options.

The ability to configure negotiation of specific source and destination network address traffic selectors as the method to filter which traffic can traverse a VPN is also now supported.

Lastly, encrypted VPNs can also now be negotiated with Peers whose WAN address is dynamically allocated. This can be useful for Hub-and-spoke topologies where there is a central site with fixed IP negotiating encrypted VPNs to remote sites which have their WAN IP address dynamically allocated.

For configuration examples, see the [Internet Protocol Security \(IPsec\) Feature Overview and Configuration Guide](#).

## Support for terminating old PPPoE sessions with PADT

*Available on AR-series firewalls*

Version 5.4.6-1.x improves handling of old PPPoE sessions that are still considered active by the device at the other end of the link. Previously, if an AR-series firewall needed to reconnect a PPPoE session, for example because there was some data loss via the WAN connection, or because the ISP reset the PPP connection, the firewall might have to wait until the the device at the other end of the link timed the session out.

With version 5.4.6-1.x, the firewall will actively send a PADT (Active Discovery Terminate packet) to the source of the message to terminate that session. This allows PPPoE to reconnect faster because it does not have to wait for the device at the other end to time out the old session.

## Secure Mode on x930 Series switches

*Available on x930 Series switches*

Version 5.4.6-1.x supports Secure Mode on x930 Series switches. When in Secure Mode, the following are disabled:

- Telnet
- SSHv1
- SNMPv1/v2
- All privilege levels except 1 and 15
- Weak cryptographic algorithms e.g. MD5, RSA1, DSA, etc.

Before entering secure mode, the flash should first be erased completely using the bootloader. To do this, on boot-up, use Ctrl-D to enter the diagnostic menu, select option 7 'Bootup stage 2 diagnostics menu', and then select option 4 'Erase FLASH (Filesystem only)').

The switch should be rebooted after completion of the erase process.

Use the following commands to enter secure mode:

```
awplus# configure terminal
awplus(config)# crypto secure-mode
awplus(config)# exit
awplus# write
awplus# reboot
```

Use the following command to confirm that the switch is in secure mode:

```
awplus# show secure-mode
```

The following message should be displayed:

```
Secure mode is enabled
```

### Leaving Secure Mode

If you wish to leave secure mode, you should delete all sensitive information first. This means deleting all trustpoints (one by one), by using the commands:

```
awplus# configure terminal
awplus(config)# no crypto pki trustpoint <name>
```

Also, delete all public/private key pairs, by using the commands:

```
awplus# configure terminal
awplus(config)# crypto key zeroize all
```

Turn off secure mode, by using the commands:

```
awplus# configure terminal
awplus(config)# no crypto secure-mode
awplus(config)# exit
awplus# write
awplus# reboot
```

The switch **must** be rebooted after secure mode is turned off, and ideally Flash memory should be erased via the bootloader.

---

## Enhancements to PKI Certificate Management

*Available on all AlliedWare Plus devices*

Version 5.4.6-1.x expands the PKI Certificate Management support, to support externally-signed X.509 root and device certificates, and multiple trustpoints. This allows for flexible use of security credentials for multiple Transport Layer Security (TLS) connections to different external systems.

For examples of configurations that use the new functionality, see the

- [RADIUS Feature Overview and Configuration Guide](#)
- [Logging Feature Overview and Configuration Guide](#)

## RADIUS over TLS

*Available on all AlliedWare Plus devices*

Version 5.4.6-1.x supports RADIUS over TLS using Radsec Proxy , which is an extension to the RADIUS authentication protocol. It uses Transport Layer Security (TLS) protocol for encrypting all messages between the NACs and RADIUS Servers.

For more information and configuration examples, see the [RADIUS Feature Overview and Configuration Guide](#) and the [Local RADIUS Server Feature Overview and Configuration Guide](#).

## Syslog over TLS

*Available on all AlliedWare Plus devices*

Version 5.4.6-1.x supports Syslog over TLS, which secures the connection between the AlliedWare Plus device and a Syslog server.

For more information and a configuration example, see the [Logging Feature Overview and Configuration Guide](#).

## Remote-mirroring

*Available on x230, x310, IX5, x510, x930 and SBx8100 Series switches*

Remote-mirroring allows traffic being transmitted or received on a port on one device to be duplicated and forwarded over the network on a special VLAN to be analysed via a port on a remote switch. Remote-mirroring is also known as RSPAN.

For configuration examples, see the [Remote-Mirroring Feature Overview and Configuration Guide](#).

## SBx81XLEM: Support for more L3 routes, L3 hosts and forwarding database entries

Available on SBx8100 Series switches, from version 5.4.6-1.2 onwards

With version 5.4.6-1.x, you can increase the size of the switching and routing silicon tables of an SBx8100 system consisting of SBx81CFC960 controller cards and SBx81XLEM line cards. There are two new modes:

- L2 Switching / L3 Routing Mode
- Host Mode

These modes increase the number of host entries and routes, as shown in the following table:

	L2 Switching / L3 Routing Mode		Host Mode	
MAC address entries	maximum:	128K	maximum:	64K
IPv4 host entries	maximum:	22K (see note 1)	maximum:	64K (see note 2)
	recommended:	22K	recommended:	32K
IPv6 host entries	maximum:	22K (see note 1)	maximum:	32K (see note 2)
	recommended:	16K	recommended:	16K
Next hop for prefixes	maximum:	22K (see note 1)	maximum:	22K (see note 3)
IPv4 prefixes	maximum:	128K	maximum:	128K
IPv6 prefixes	maximum:	64K	maximum:	64K
OSPFv2 routes	maximum:	10,000	maximum:	10,000
	recommended:	5,000	recommended:	5,000
OSPFv3 routes	maximum:	10,000	maximum:	10,000
	recommended:	5,000	recommended:	5,000
BGP4 routes (for IPv4)	maximum:	100,000	maximum:	100,000
	recommended:	50,000	recommended:	50,000
BGP4+ routes (for IPv6)	maximum:	50,000	maximum:	50,000
	recommended:	25,000	recommended:	25,000

**note 1:** Entries are shared between IPv4 and IPv6 entries, and between hosts and nexthops for prefixes. Sharing is on a first-come-first-served basis.

**note 2:** Entries are shared between IPv4 and IPv6 hosts. Sharing is on a first-come-first-served basis.

**note 3:** A nexthop for prefixes will probably also consume a host entry.

There are a number of factors to be aware of with these new modes:

- The new modes are only available with SBx81CFC960 controller cards and SBx81XLEM line cards. If other line cards are present, they will be disabled.
- The modes are not available if the controller card or cards in the chassis are SBx81CFC400.
- The modes are mutually exclusive. Only one can be enabled at a time.
- By default, both modes are disabled.
- When either of these modes is enabled, the SBx81CFC960 front panel ports can only be used as stacking ports, not network ports. The front panel ports will not appear in **show interface** output.
- In Host Mode, if a host entry cannot fit into the FDB, the SBx81XLEM will put it into the Hardware Route Table. Therefore, it will consume a route entry.
- The **platform routingratio** command is not available with these modes.

## Enabling L2 Switching / L3 Routing Mode

L2 Switching / L3 Routing Mode is the default mode under Silicon Profile 3. Therefore, changing to L2 Switching / L3 Routing Mode is simply a matter of enabling Silicon Profile 3. To do this, set the silicon profile to **profile3** and reboot, by using the commands:

```
awplus# configure terminal
awplus(config)# silicon-profile profile3
awplus(config)# exit
awplus# copy running-config startup-config
awplus# reboot
```

## Enabling Host Mode

To change to Host Mode, use the following steps:

### Step 1: Set the silicon profile to profile3 and reboot

Use the commands:

```
awplus# configure terminal
awplus(config)# silicon-profile profile3
awplus(config)# exit
```

### Step 2: Turn on host mode

Use the commands:

```
awplus# configure terminal
awplus(config)# platform fdb-l3-hosts
awplus# copy running-config startup-config
awplus# reboot
```

## Using the SBx81XLEM with BGP

The Premium License (AT-FL-CFC960-01) now supports up to 100,000 BGP routes in L2 Switching / L3 Routing Mode. If your license is older than August 3rd 2016, contact your Allied Telesis representative to obtain a new one.

If you are using large numbers of routes with BGP with silicon profile 3, then you need to set the graceful-restart timer to at least 400 seconds. To do this (for ASN 1 in this example), use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 1
awplus(config-router)# bgp graceful-restart restart-time 400
```

Also, note that the **show tech** command may take a long time to run if the tables are very full.

## Allied Telesis Management Framework (AMF) subscription licenses

Available on all AlliedWare Plus devices that can act as an AMF controller or master (SBx8100, SBx908, DC2552XS/L3, x930, x610, x510, IX5-28GPX-80, AR4050S, AMF Cloud)

Allied Telesis Management Framework (AMF) greatly reduces the time and cost of managing network infrastructure.

Version 5.4.6-1.x adds support for AMF subscription licenses. To see the available licenses, check your device's datasheet, which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

To subscribe to AMF and manage your licenses, use the following steps.

### Step 1: Obtain the serial number for your AMF master and/or controller devices

Subscription licenses are tied to the serial number of the device.

Use the **show system serialnumber** command to show the serial number:

```
awplus# show system serialnumber
A05050G144700002
```

### Step 2: Obtain the subscription license

To buy a subscription license, contact your authorized Allied Telesis representative. You will need to supply the device serial number.

### Step 3: Download the subscription license

Subscription licenses are contained in a Capability Response File (CRF). You can download the CRF from the [Allied Telesis Download center](#) by logging into your account.

Once you have reached the **Download Central Homepage**, you can locate your device type by clicking **Search Devices** from the **Devices** menu on the left. You can select your specific device by clicking the serial number from the **Serial Number** list.

From the **View Device** page, you can download a CRF by clicking the **Download Capability Response** link. CRFs are saved as .bin files.

### Step 4: Load the subscription license onto the device

After you have downloaded your CRF, you can transfer it onto the device's Flash storage by any preferred method. For example, you can use the **copy** command to copy the CRF file from a USB device to your Flash storage:

```
awplus#copy usb flash
```

Output 1: Example from **copy usb flash**

```
awplus#copy usb flash
Enter source path with file name[:A05050G144700002.bin
Copying...
Successful operation
```

## Step 5: Activate the license

Display the filename of the CRF in Flash storage, by using the following command:

```
awplus#dir *.bin
```

Then activate it by using the following command.

```
awplus#license update <CRF-filename>
```

This command copies license entitlements from the CRF into the device's internal encrypted license library. You can then safely delete the CRF from the device.

For this command to successfully activate the license, the CRF must be valid and be tied to the serial number of the device.

## Step 6: Verify your CRF activation

You can verify the license by using the following command:

```
awplus#show license external
```

This displays the license name, the serial number of the device, and the license's valid dates.

## Updating subscription licenses

If a subscription license expires, the device immediately reverts to the 3-node AMF Starter license.

Warning messages will be printed in the device log 28 days, 21 days, 14 days, 7 days, and 1 day prior to a license expiring. The Allied Telesis Download Center will also send you an email reminder prior to your license expiring.

To renew your license, contact your Allied Telesis representative. You can use the command **show license external** to confirm the serial number of the device.

After renewing the license, follow steps 3-6 above to download and activate it.

## Subscription licenses on VCStacks

If you are licensing a VCStack, you only need to purchase a license for one member of the stack. This does not need to be the VCStack master.

To load the license onto the stack, follow the steps above on the stack master. The software checks that the CRF is valid for one of the stack members and applies the license entitlement to all members of the stack. The command **show license external stored** shows which stack member is the source of the license entitlement.

#### Output 2: Example from **show license external stored**

```
awplus#show license external stored

Feature entitlements sourced from license file on local flash:

Stack member 1, serial A04435H101200015
No valid entitlements found

Stack member 2, serial C20YB7309

AMF Master

      Start date:                25 Apr 2016 00:00
      Expiry date:                19 Apr 2017 23:59
      Maximum nodes:              10

Stack member 3, serial B04435H101200015
No valid entitlements found
```

If you need to modify the license, for example to extend the date or change the number of nodes under management, make sure you modify the license for the same device as the original license. Do not create a new license for a different stack member instead.

#### **If a device leaves the stack**

If the device that is the source of the license entitlement leaves the stack, the following happens:

- a warning message alerts you to this event. The message displays on the console, is logged, and appears in the **show license external** output
- the remaining members of the stack retain their entitlement and continue to operate as an AMF controller/master without any disruption in service
- if the remaining partial stack reboots, it loses access to the license when it restarts.

If you need to permanently replace the device that is the source of the license entitlement, you can transfer the license to another stack member. To do this:

1. On the [Allied Telesis Download center](#), transfer the license to the other stack member's serial number
2. Follow steps 3-4 above to transfer the CRF to the stack member
3. Force the stack to re-synchronise its license entitlement by using the command:

```
awplus#license redistribute
```

#### **Multiple copies of a license on a stack**

As said above, you only need to purchase a single license for multiple stack members, and therefore you only need to activate one CRF for the whole stack.

However, if you activate multiple CRFs for the same feature on the stack, the stack will obtain its license entitlements from the device with the lowest stack-ID. Note that stack-ID is the only factor that determines which license is used; factors such as license expiry date are not checked.

This means that it is possible (but not recommended) to have multiple CRFs for the same feature, where those CRFs have different expiry dates or support a different number of nodes. In that situation, it is possible for the stack to obtain the wrong license entitlements.

If the stack obtains the wrong license entitlements, enter the **license redistribute** command.

If that does not resolve the issue, then renumber the stack members so that the device with the preferred license entitlements has the lowest stack-ID amongst the devices that have any license installed, and reboot the renumbered devices. Once the stack has fully reformed, if licenses are still not as desired, enter the **license redistribute** command again.

## Support for renaming the AMF network without rebooting

*Available on all AlliedWare Plus devices*

In earlier software versions, if you renamed the AMF network on an AlliedWare Plus device, we recommended you reboot your device. Version 5.4.6-1.x removes the need to reboot.

To rename the AMF network, use the command:

```
node_1(config)# atmf network-name <new-name>
```

## Improved AMF support for x600 Series switches

*Available on all AlliedWare Plus devices*

AMF networks that are running Version 5.4.6-1.x are now more seamlessly integrated with AlliedWare Plus x600 Series switches, as long as the x600 Series switch is running version 5.4.2-3.16 or later<sup>1</sup>.

The x600 Series switch must be directly connected to an AMF node that is running 5.4.6-1.x or later.

The x600 Series switch provides the following information to the AMF node that it is connected to:

- The MAC address of the port connected to the AMF node
- The IPv4 address
- The IPv6 address
- The name/type of the device (Allied Telesis x600)
- The name of the current firmware
- The version of the current firmware
- The configuration name

Previous software versions made most of this information available from x600 Series switches, but it was necessary to configure the x600 as an AMF Guest Node (so it needed to be configured with DHCP and/or LLDP). With version 5.4.2-3.16 or later, as soon the x600 is connected to an appropriately configured port of an AMF node, it is immediately integrated into the AMF network.

To configure the new functionality, use the following steps.

### Step 1: Upgrade the software version on the x600 Series switch

The x600 Series switch must be running version 5.4.2-3.16 or later.

### Step 2: Configure the link to the x600 Series switch

On the AMF node to which the x600 Series switch is connected, configure the link to the x600, using the command:

```
node_1(config-if)# switchport atmf-agentlink
```

### Step 3: Monitor the x600 Series switch

On the AMF node to which the x600 Series switch is connected, you can see the details of the x600 by running the following command:

```
node_1# show atmf links guest detail
```

---

1. Available soon from [www.alliedtelesis.com/support/software](http://www.alliedtelesis.com/support/software)

## NTP enhancements

Available on all AlliedWare Plus devices

Version 5.4.6-1.x includes enhancements to NTP to increase the security options and make it easier to configure.

### Restricting NTP functionality

Version 5.4.6-1.x enables you to restrict NTP functionality for a host or hosts, and to ignore NTP messages if they arrive at greater than a specified frequency. To configure this, use the new commands:

```
awplus(config)# ntp restrict
    {default-v4|default-v6|<host-address>|<host-subnet>} ignore
```

```
awplus(config)# ntp restrict
    {default-v4|default-v6|<host-address>|<host-subnet>}
    [limited [kod]] {nomodify|noquery|nopeer|noserve|notrust}
```

```
awplus(config)# ntp discard minimum <1-60>
```

```
awplus(config)# ntp discard average <1-16>
```

In the **ntp discard** commands, the parameters have the following meanings:

Parameter	Description
minimum <1-60>	The minimum time between NTP packets, in seconds.
average <1-16>	The minimum average time between NTP packets, in units of log2(value).

In the **ntp restrict** commands, the parameters have the following meanings:

Parameter	Description
default-v4	Apply this restriction to all IPv4 hosts.
default-v6	Apply this restriction to all IPv6 hosts.
<host-address>	Apply this restriction to the specified IPv4 or IPv6 host. Enter an IPv4 address in the format A.B.C.D. Enter an IPv6 address in the format X::X:X.
<host-subnet>	Apply this restriction to the specified IPv4 subnet or IPv6 prefix. Enter an IPv4 subnet in the format A.B.C.D/M. Enter an IPv6 prefix in the format X::X:X/X.
ignore	Block all NTP connections, including time polls, from matching hosts.
limited	Apply frequency limits to matching hosts. To specify the frequency limits, use the command <b>ntp discard</b> .
kod	Send kiss-of-death packets when the rate limit is exceeded. If you do not specify this, NTP packets are dropped without further processing.
nomodify	Prevent matching hosts from modifying the NTP configuration, even if they have a trusted key.

Parameter	Description
noquery	Prevent matching hosts from querying this device's NTP status. This option does not block time queries. We recommend using this option on publicly-accessible systems, because it blocks ntpq and ntpdc queries, which can be used in amplification attacks.
nopeer	Prevent matching hosts from becoming NTP peers of this device.
noserve	Do not serve the time to matching hosts.
notrust	Require that matching hosts authenticate NTP sessions with this device. If you use this option, the device will drop all unsigned NTP packets from matching hosts.

To prevent all hosts from using NTP except for the host 192.0.2.1 and the subnet 192.168.1.0/16, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict default-v4 ignore
awplus(config)# ntp restrict default-v6 ignore
awplus(config)# no ntp restrict 192.0.2.1
awplus(config)# no ntp restrict 192.168.1.0/16
```

To force the host 192.0.2.1 and the subnet 192.168.1.0/16 to authenticate NTP sessions with this device, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 192.0.2.1 notrust
awplus(config)# ntp restrict 192.168.1.0/16 notrust
```

To ignore NTP messages from the 192.168.1.0/16 subnet if they arrive more frequently than every 5 seconds, and also send kiss-of-death messages, use the commands:

```
awplus# configure terminal
awplus(config)# ntp discard minimum 5
awplus(config)# ntp restrict 192.168.1.0/16 limited kod
```

To silently ignore all NTP messages if they arrive more frequently than once a second on average ( $\log_2(2)$ ), use the commands:

```
awplus# configure terminal
awplus(config)# ntp discard average 2
awplus(config)# ntp restrict default-v4 limited
awplus(config)# ntp restrict default-v6 limited
```

### Authentication keys

Version 5.4.6-1.x enables you to authenticate NTP sessions with SHA1 keys instead of MD5.

Also, previously, it was necessary to configure authentication keys and then separately specify a list of trusted keys. Now you can declare that a key is trusted at the time you configure it, by using one of the following commands:

```
awplus(config)# ntp authentication-key <keynumber> md5 <key> trusted
awplus(config)# ntp authentication-key <keynumber> sha1 <key> trusted
```

#### Default stratum value

When entering the command **ntp master**, if you do not enter a stratum value, a default of **12** is now used and displayed in output of the **show running-config** command. Previously, the default value was either 12 or 14 depending on the device.

#### Improved show commands

The following **show** commands have been improved:

Command	Improvement
show ntp association	Format of output improved
show ntp status	Format of output improved
show ntp counters	Replaced by <b>show ntp counters</b>
show ntp counters associations	New command

#### Deprecated commands

The following commands have been deprecated as part of this project:

Command	Replacement
ntp trustedkey	ntp authentication-key
ntp access-group	ntp restrict
show ntp associations detail	show ntp association show ntp counters associations

## Support for user-created web authentication login page

*Available on all AlliedWare Plus devices*

Version 5.4.6-1.1 enables you to create your own web authentication login page. Prior to this, you could only customise the logo and some of the text on the page.

To create your own login page, follow these steps:

### Step 1: Create the page

Write the page in HTML. Note that it must include the following login form code:

```
<form action="/index.cgi" autocomplete="off" target="_self" name="AUTH" method="POST">
<div>User name</div>
<div><input size="30" type="text" maxlength="64" name="USERNAME"></div>
<div>Password</div>
<div><input size="30" type="password" maxlength="64" name="PASSWORD"></div>
<div>
<input type="submit" name="ACTION" value="login">
<input type="reset" name="RESET" value="Reset">
</div>
</form>
```

If you do not include the above login form, the page will display in the client browser but will not perform web authentication.

## Step 2: Save the page onto the switch

Name the file **login\_page.html** and save it in the folder **/flash/web-auth/**

## Configure VLAN classifiers on aggregators

*Available on SBx8100, SBx908, DC2552XS/L3, x930, x610, x510, IE510, IX5, x310, IE300, XS900MX and GS900MX/MPX Series switches*

Version 5.4.6-1.x enables you to activate VLAN classifier rules on link aggregation groups. Previously, you had to activate them on each individual port in the aggregator instead.

For example, to activate VLAN classifier group 1 on the LACP aggregator po3, use the commands:

```
awplus# configure terminal
awplus(config)# interface po3
awplus(config-if)# vlan classifier activate 1
```

## Clear the PPPoE Access Concentrator statistics counters

*Available on AR-series firewalls only*

Version 5.4.6-1.x enables you to zero the PPPoE Access Concentrator statistics counters, by using the new command **clear pppoe-ac statistics**. This command sets all the counters to zero and restarts the statistics counting.

For example, to clear the PPPoE AC statistics counters, use the command:

```
awplus# clear pppoe-ac statistics
```

## Ensure that MAC addresses are learnt by all VCStack members

*Available on x930, x610, x510, IX5, and x310 Series switches*

MAC addresses are automatically learnt by stack members when a packet is seen by that stack member. Normally this is sufficient to make sure that all stack members that need the MAC address learn it.

If aggregators are used, it is possible for the path taken by packets travelling from host A to B to traverse different stack members than packets travelling from host B to A. In this case, the MAC addresses may not be learnt and traffic could be flooded. Even in this case, a broadcast packet from each unit, such as an ARP packet, would be enough to cause all stack members to learn these MAC addresses.

However, in very unusual cases, the automatic learning can still lead to some flooding. Version 5.4.6-1.x adds a new command that allows a MAC address learnt on one stack member to be used on any other stack member. This will prevent the flooding that would otherwise occur in these unusual cases.

To enable this feature, use the command:

```
awplus# mac address-table vcs-sync-mode
```

Note that enabling this feature has a small impact on CPU performance, because it slightly increases the numbers of packets sent to the CPU.

## Limit the number of IGMP group entries per port

*Available on all AlliedWare Plus devices except AR2010V firewalls*

Version 5.4.6-1.x enables you to set a limit, per switch port, on the number of IGMP groups clients can join. This stops a single client from using all the switch's available group-entry resources, and ensures that clients on all ports have a chance to join IGMP groups.

To set the limit, go into interface mode for the switch port or ports and use the command:

```
awplus(config-if)# ip igmp maximum-groups <0-65535>
```

The default is 0, which means no limit.

We recommend using this with IGMP snooping fast leave on the relevant VLANs. To enable fast leave, use the command:

```
awplus(config-if)# ip igmp snooping fast-leave
```

The device keeps count of the number of groups learned by each port. This counter is incremented when group joins are received via IGMP reports. It is decremented when:

- Group leaves are received via leave messages or reports
- Group memberships time out

Also, the port's group counter is cleared when:

- The port goes down
- You run the command **clear ip igmp group \***
- The port is removed from a VLAN
- The port is on a VCStack back-up member, and that member reboots or otherwise leaves the stack.

You can see the current value of the group counter by using either of the commands:

```
awplus# show ip igmp snooping statistics interface <port-list>
```

```
awplus# show ip igmp interface <port>
```

For example, to display information about port1.0.3, use either of the following commands:

```
awplus# show ip igmp snooping statistics interface port1.0.3
```

```
IGMP Snooping statistics for port1.0.3
Maximum groups limit set: 10
Number of groups port belongs to: 0
```

```
awplus# show ip igmp interface port1.0.3
```

```
IGMP information for port1.0.3
Maximum groups limit set: 10
Number of groups port belongs to: 0
```

## Enhancement to EPSR Superloop Protection

*Available on all AlliedWare Plus devices that can act as an EPSR master*

Version 5.4.6-1.x extends EPSR Superloop Protection (SLP) to allow multiple ring EPSR scenarios where there are multiple ring masters on a common segment, as long as none of the master secondary ports are on the common segment.

However, in such scenarios, it is not advisable to use EPSR Enhanced Recovery on transit nodes.

## Support 100 local RADIUS server users on x230 and x310 Series switches

*Available on x230 and x310 Series switches. Already supported in earlier software versions on AR-series firewalls, SBx8100, SBx908, DC2552XS/L3, x930, x610, IX5, IE500 and x510 Series switches.*

Version 5.4.6-1.x increases the supported number of local RADIUS server users to 100 on x230 and x310 Series switches.

For more information about the local RADIUS server, see the [Local RADIUS Server Feature Overview and Configuration Guide](#).

## Restrict access to “show log” command

*Available on all AlliedWare Plus devices*

Version 5.4.6-1.x makes the command **show log** only available to users at privilege level 7 and above. This change enhances network security.

To set a user’s privilege level, use the command

```
awplus(config)# username <name> privilege <1-15>
```

## Combine ARP security and Private VLANs

*Available on all AlliedWare Plus switches*

Version 5.4.6-1.x enables you to configure ARP security and Private VLANs at the same time, for Type-2 Private VLANs only. Previously, this combination was not supported.

## IE200: Support for IPv6 Hardware ACLs

*Newly supported on IE200 switches*

Version 5.4.6-1.x adds support for IPv6 hardware ACLs on IE200 Series switches. Hardware ACLs are ACLs that you can apply directly to an interface, or use for QoS classifications

For more information and configuration details, see the [ACL Feature Overview and Configuration Guide](#).

## DC2552XS/L3: Support for Active Fiber Monitoring

*Newly supported on DC2552XS/L3 switches.*

Version 5.4.6-1.x enables DC2552XS/L3 switches to support active fiber monitoring.

The active fiber monitoring feature monitors fiber ports to see if the received optical power falls below a configurable baseline by a threshold amount. This may indicate physical bending of the fiber cable, which could arise when there is a physical intrusion. If this happens, the device can perform a configurable action.

For more information and a configuration example, see the [Pluggables and Cabling Feature Overview and Configuration Guide](#).

## DC2552XS/L3: Support for AMF restricted-login

*Newly supported on DC2552XS/L3 switches.*

Version 5.4.6-1.x enables DC2552XS/L3 switches to support AMF restricted-login.

By default, a user logged into any node on an AMF network is able to manage any other node by using either working-sets or AMF remote login (provided the login username exists on all nodes). Where the access provided by this feature is too wide, or contravenes network security restrictions, this access can be limited by running the command **atmf restricted-login**.

This command will not be saved in the running configuration; it is a network property that can be enabled or disabled from any AMF Master. The status of restricted login will be retained over a reboot.

When restricted login is enabled on the Area, only the AMF Master nodes are able to create working-sets or manage other devices via AMF remote-logins. Other nodes may remote login to the AMF Master, but they will require password authentication on that Master, and will then be able to create working-sets originating from the Master.

Note that once you have run the command **atmf restricted-login**, certain other commands that utilize the AMF working-set command will operate only on Master nodes. Such commands include the **atmf reboot-rolling** and **show atmf group members** commands.

## DC2552XS/L3: Support for services like Microsoft Network Load Balancing (MS-NLB)

*Newly supported on DC2552XS/L3 switches.*

Version 5.4.6-1.x enables DC2552XS/L3 switches to support services like Microsoft Network Load Balancing (MS-NLB).

Such services use ARP with disparate MAC addresses to ensure that packets destined for a server cluster virtual address are sent to all servers in the cluster. Disparate MAC addresses mean that the MAC address in the "sender hardware address" field of an ARP reply is different to the MAC address in the "Source MAC address" field of the Ethernet header that the ARP packet is encapsulated in.

To configure this, use the following command.

**Syntax**

```
arp-mac-disparity {multicast|multicast-igmp|unicast}
no arp-mac-disparity {multicast|multicast-igmp|unicast}
```

Parameter	Description
multicast	Enables support of server clusters operating in multicast mode. Packets destined for the server cluster are flooded to all ports in the VLAN.
multicast-igmp	Enables support of server clusters operating in multicast/IGMP mode. In multicast/IGMP mode, the MS-NLB server cluster uses IGMP reports to forward server traffic to a limited set of ports.
unicast	Enables support of server clusters operating in unicast mode. Packets destined for the server cluster are flooded to all ports in the VLAN.

**Default** ARP-MAC disparity support is disabled and:

- If the disparate ARP has a multicast MAC address in the ARP reply, the switch drops the ARP reply and does not learn any associated addresses
- If the disparate ARP has a unicast MAC address in the ARP reply, the switch learns the address in the ARP reply. The learned ARP entry points to the single port that the ARP reply arrived on. Matching traffic will go out this port.

**Mode** Interface Configuration for a VLAN interface.

**Usage** When you are using **multicast** mode, you can limit the number of ports that packets are flooded to, instead of flooding to all ports in the VLAN. To do this, specify the list of ports when creating the ARP entry.

For example, to flood only port1.0.1 to port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp 10.10.1.100 010e.11ff.2222 port1.0.1-port1.0.3
```

**Examples** To enable support for MS-NLB in unicast mode on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-mac-disparity unicast
```

To disable support for MS-NLB in unicast mode on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no arp-mac-disparity unicast
```

#### Further information about Multicast Mode with IGMP

In multicast mode with the IGMP option selected, the only difference to standard multicast mode is that the reception of IGMP reports now controls the ports to which the L3 switch floods traffic. That is, rather than simply flooding each packet destined for the NLB cluster IP address to all ports on the egress VLAN, those packets are only sent to the switchports in the VLAN that have received IGMP reports for the multicast group corresponding to the NLB cluster MAC address.

This mode is enabled by using the command **arp-mac-disparity multicast-igmp**.

Like the command **arp-mac-disparity multicast**, the command **arp-mac-disparity multicast-igmp** puts the switch into a mode where it will accept disparate ARP responses. Similarly, upon receiving a disparate ARP response, an ARP entry is created for the IP/MAC in the content of the ARP packet. The difference with the **arp-mac-disparity multicast-igmp** command is that the egress port is set to the subset of ports in the VLAN that have received IGMP reports for the NLB cluster MAC address. Note that the ARP entry is updated as ports join/leave the IGMP group.

If no ports have received IGMP reports for the NLB cluster MAC address then the ARP entry will have no egress ports and will simply drop packets destined for the NLB cluster IP address.

Again, no FDB entry is created in response to receiving the ARP packet. However, since the NLB server is operating in multicast mode with the IGMP option set and is sending IGMP reports, an FDB entry will already exist for the IGMP group (and, as a result, the NLB cluster MAC address).

When the **arp-mac-disparity multicast-igmp** command is configured on the VLAN, ARP entries appear in the output of the command **show arp** like this:

```
awplus#show arp
IP Address   MAC Address   Interface  Port          Type
10.100.0.56  0100.5e7f.0038  vlan200    igmp-group    dynamic
```

## Support for multiple circuit-failover interfaces per VRRP instance

*Available on all AlliedWare Plus devices that support VRRP.*

Version 5.4.6-1.x enables VRRP to use Circuit Failover to monitor up to 32 interfaces per VRRP instance, by using the **circuit-failover** command.

If a VRRP instance is configured to monitor multiple interfaces, the VRRP priority will be cumulatively decremented by the configured delta for each interface as it goes down.

For example, if VRRP is configured to monitor VLAN2 and VLAN3 with the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip address 192.168.1.1/24
awplus(config-if)# exit
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# virtual-ip 192.168.1.10 backup
awplus(config-router)# priority 100
awplus(config-router)# circuit-failover vlan2 10
awplus(config-router)# circuit-failover vlan3 20
```

then the following examples explain the effect of each VLAN going down:

- If only VLAN2 fails, then the VRRP priority will be decremented by 10. VRRP priority would be adjusted to become 90, because  $100 - 10 = 90$ .
- If only VLAN3 fails, then the VRRP priority will be decremented by 20. VRRP priority would be adjusted to become 80, because  $100 - 20 = 80$ .
- If both VLAN2 and VLAN3 fail, then the VRRP priority will be decremented by the cumulative delta values of all monitored interfaces. VRRP priority would therefore be adjusted to become 70, because  $100 - 10 - 20 = 70$ .

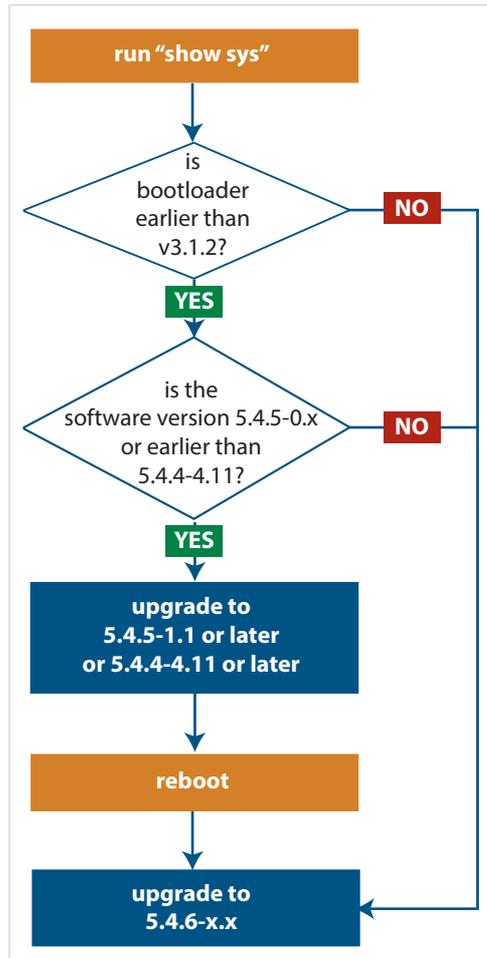

As each monitored interface recovers, the VRRP priority is incremented by the same delta value.

When you configure the delta values of the monitored interfaces, make sure their sum is high enough to ensure that the VRRP priority stays above zero if all the interfaces go down.

# Important Considerations Before Upgrading

## Bootloader compatibility for SBx81CFC960

On the AT-SBx81CFC960, please check your bootloader and current software version before you upgrade to AlliedWare Plus software version 5.4.6.

If your bootloader is older than 3.1.2, you can only upgrade to 5.4.6 from the following software versions:

- ▶ 5.4.5-1.1 or higher (including 5.4.5-2.x and 5.4.5-3.x)
- ▶ 5.4.4-4.11 or higher

If your bootloader is older than 3.1.2, your switch must be running one of the above versions when you upgrade to 5.4.6.

**Note that you cannot upgrade to 5.4.6 directly from 5.4.5-0.x.**

To see your bootloader and current software version, check the "Bootloader version" and "Software version" fields in the command:

```
awplus# show system
```

If you experience issues when upgrading, please contact your Allied Telesis support team. See our website at [alliedtelesis.com/support](http://alliedtelesis.com/support).

## Licensing

From software version 5.4.4-0.4 onwards, AlliedWare Plus software releases need to be licensed for SBx908 and SBx8100 switches.

If you are upgrading to 5.4.6-1.x on your SBx908 or SBx8100 switch, please ensure you have a 5.4.6 license on your switch. To obtain a license, contact your authorized Allied Telesis support center. You will need to provide the MAC addresses of the switches you want to license. For details, see:

- "Licensing this Software Version on an SBx908 Switch" on page 73 and
- "Licensing this Software Version on a Control Card for an SBx8100 Series Switch" on page 75.

## Upgrading a VCStack with reboot rolling

This version supports VCStack “reboot rolling” upgrades. With the **reboot rolling** command, you can reduce downtime when upgrading a VCStack.

You can use the **reboot rolling** command to upgrade to any 5.4.6-1.x version from:

- 5.4.6-0.x, or
- 5.4.5-x.x, or
- 5.4.4-1.x or later.

To use reboot rolling, first enter the **boot system** command, which will install the new release file on all stack members. Then enter the **reboot rolling** command. Note that reboot rolling is not supported on SBx8100.

You cannot use rolling reboot to upgrade directly to 5.4.6-1.x from 5.4.4-0.x or earlier versions. If you wish to use rolling reboot, follow these steps:

- For releases 5.4.3-x.x or earlier, first upgrade to 5.4.4-0.x
- Next, upgrade from 5.4.4-0.x to any 5.4.5-x.x version
- Finally, upgrade from 5.4.5-x.x to 5.4.6-1.x.

## Forming or extending a VCStack with auto-synchronization

If you create a VCStack from switches that are running different software versions, auto-synchronization ensures that all members will run the same software version when they boot up.

Auto-synchronization compatibility changed between version 5.4.6-1.1 and version 5.4.6-1.2. See the following sections for details.

### 5.4.6-1.1

The following versions are compatible with 5.4.6-1.1 for auto-synchronization:

- 5.4.6-0.x, and
- 5.4.5-x.x, and
- 5.4.4-2.x or later.

Auto-synchronization is not supported between 5.4.6-1.1 and 5.4.4-1.x or 5.4.4-0.x.

### 5.4.6-1.2

Auto-synchronization is not supported between 5.4.6-1.2 and any previous software version (including v5.4.6-1.1).

#### Consequences for VCStacks

On VCStacks, the loss of auto-synchronization means:

- If you want to upgrade an existing VCStack to 5.4.6-1.2, this should not cause any problems. The **boot system** command will automatically copy the new software release to all stack members. Do not reboot any individual stack members after installing the new release - instead reboot the stack as a whole.

If you encounter any errors from the **boot system** command, then check that the release file was copied to all stack members before booting. If it was not, then

address any problems reported, such as freeing up space in Flash for the new release file, and then repeat the **boot system** command again.

- If a stack is running v5.4.6-1.2, and you connect a switch running an older release to the stack, then the v5.4.6-1.2 software will not be automatically copied over to the newly-added stack member, even if **stack software-auto-synchronize** has been enabled on the stack. Instead, upgrade the switch that is to be added to the stack to v5.4.6-1.2 before you add it to the stack.
- If a stack is running an older release, and you connect a switch running v5.4.6-1.2 to the stack, then the older software cannot be automatically copied over to the newly-added stack member, even if **stack software-auto-synchronize** has been enabled on the stack. Instead, downgrade the switch that is to be added to the stack to the older release before you add it to the stack.
- If you do boot up a stack with a switch running an incompatible version, the incompatible switch will boot up as a standalone unit. To recover, simply leave the incompatible switch cabled into the stack, log into it, upgrade or downgrade it to the desired release, and reboot the switch.

### Consequences for a VCStack Plus Pair of SBx8100 chassis

If you are dealing with VCStack Plus, the effect of the loss of auto-synchronization depends on whether you are installing a new CFC or a whole new chassis:

- If you want to upgrade an existing SBx8100 VCStack Plus system to 5.4.6-1.2, this should not cause any problems. The **boot system** command will automatically copy the new software release to all stack members. Do not reboot any individual CFCs or stack members after installing the new release - instead reboot the stack as a whole.

If you encounter any errors from the **boot system** command, then check that the release file was copied to all CFCs. If it was not, then address any problems reported, such as freeing up space in Flash for the new release file, and then repeat the **boot system** command again.

- If you want to insert a new dual CFC into a chassis that is part of an existing VCStack Plus system, refer to [“Upgrading an SBx8100 chassis or adding a CFC to an SBx8100 chassis”](#) below.
- If you want to insert a new SBx8100 chassis into a VCStack Plus system, refer to [“Consequences for VCStacks”](#) on page 67.

## Upgrading an SBx8100 chassis or adding a CFC to an SBx8100 chassis

If you want to upgrade an existing SBx8100 that has two CFCs installed to 5.4.6-1.2, this should not cause any problems. The **boot system** command will automatically copy the new software release to both CFCs. Do not reboot any individual CFCs after installing the new release - instead reboot the chassis as a whole.

If you encounter any errors from the **boot system** command, then check that the release file was copied to both CFCs. If it was not, then address any problems reported, such as freeing up space in Flash for the new release file, and then repeat the **boot system** command again.

If you want to insert a new CFC into a chassis, the loss of auto-synchronization means:

- If a standalone SBx8100 has a CFC installed that is running an older release, and you add a CFC running v5.4.6-1.2 to the chassis, then the older software cannot be automatically copied over to the newly-added CFC.
- If a standalone SBx8100 has a CFC installed that is running v5.4.6-1.2, and you add a CFC running an older release to the chassis, then the v5.4.6-1.2 software cannot be automatically copied over to the newly-added CFC.
- If you connect a CFC running an incompatible release to an SBx8100 chassis, you will be unable to log into the added CFC. For example, if the Active CFC is running 5.4.6-1.2 and another CFC joins with 5.4.6-0.x, the error you get is:

```

=====
cfc960 login: manager
Password:
Last login: Thu Aug 18 02:15:21 UTC 2016 on ttyS0
All 1 lines for VR:PVR are busy. Try again later
=====

```

To recover from this situation, see [“Upgrading/downgrading a CFC”](#) below.

To determine what release a CFC is running without logging in, look for the “Current release filename” console output when the CFC first boots up, e.g.

```

      /\      /\      /\      /\      /\      /\      /\      /\      /\      /\
     /  \    /  \    /  \    /  \    /  \    /  \    /  \    /  \    /  \
    /    \  /    \  /    \  /    \  /    \  /    \  /    \  /    \  /    \
   /      \ /      \ /      \ /      \ /      \ /      \ /      \ /      \
  /        \ /        \ /        \ /        \ /        \ /        \ /        \
 /          \ /          \ /          \ /          \ /          \ /          \
/            \ /            \ /            \ /            \ /            \ /            \
\            / \            / \            / \            / \            / \            /
 \          / \          / \          / \          / \          / \          / \          /
  \        / \        / \        / \        / \        / \        / \        / \        /
   \      / \      / \      / \      / \      / \      / \      / \      / \      /

```

## Upgrading/downgrading a CFC

Because auto-synchronization does not work, you have manually upgrade or downgrade the CFC to match your existing SBx8100. This section describes two different ways to do this:

- Option 1** Insert the new CFC into the chassis. Load the desired software version onto a USB stick and insert the USB stick into the chassis. Via the bootloader menu (CTRL+B), perform a one-off boot (option 1), select USB, then select the desired software version. Both CFCs should detect each other. Log in and enter **boot system** to ensure the desired software version is set on the new CFC.
- Option 2** Remove the new CFC if you had already inserted it. Upgrade or downgrade the existing SBx8100 so that it is running the same software version as the new CFC. Reinsert the new CFC. Both CFCs should then detect each other successfully. You can then log in and set the desired software version on both CFCs.

## AMF software version compatibility

We strongly recommend that all nodes in an AMF network run the same software release.

If this is not possible, nodes running version 5.4.6-1.x are compatible with nodes running:

- 5.4.6-0.x
- 5.4.5-x.x
- 5.4.4-x.x, and
- 5.4.3-2.6 or later.

However, if you are using Vista Manager and any AMF members are running 5.4.6-x.x, the AMF Master or Controller must also run 5.4.6-x.x. Otherwise Vista Manager will not operate correctly.

## Upgrading all switches in an AMF network

**This version supports upgrades across AMF networks.** There are two methods for upgrading firmware on an AMF network:

- Reboot-rolling, which upgrades and reboots each node in turn
- Distribute firmware, which upgrades each node, but does not reboot them. This lets you reboot the nodes at a minimally-disruptive time.

You can use either of these methods to upgrade to this software version.

You can use these methods to upgrade to this version from 5.4.3-2.6 and later.

In summary, the process for upgrading firmware on an AMF network is:

1. Copy the release .rel files for each product family to the media location you intend to upgrade from (Flash memory, SD card, USB stick etc).
2. Decide which AMF upgrade method is most suitable.
3. Initiate the AMF network upgrade using the selected method. To do this:
  - a. create a working-set of the nodes you want to upgrade
  - b. enter the command **atmf reboot-rolling <location>** or **atmf distribute-firmware <location>** where **<location>** is the location of the .rel files.
  - c. Check the console messages to make sure that all nodes are “release ready”. If they are, follow the prompts to perform the upgrade.

## ISSU (In-Service Software Upgrade) on SBx8100 with CFC960

ISSU is available on standalone SBx8100 Series switches with dual CFC960 control cards, and on switches using VCStack Plus™ to create a single virtual unit out of two chassis (where each chassis has a pair of CFC960 control cards). ISSU allows you to upgrade the software release running on the CFCs with no disruption to network traffic passing through the chassis.

You cannot use ISSU to upgrade to 5.4.6-1.2 from any previous software version.

## Verifying the Release File for x930 Series Switches

On x930 Series switches, to ensure that the release file has not been corrupted or interfered with during download, you can verify the release file. To do this, use the following command:

```
awplus# crypto verify x930-5.4.6-1.1.rel  
66d22003b876b2ac993251df29d326697f3e2fcbfe170357c62feba5d4815899
```

This command compares the SHA256 checksum of the release file with the correct checksum for the file.

All x930 Series switch models run the same release file and therefore have the same checksum. See [Table 1 on page 40](#) for a list of models.

## Licensing this Software Version on an SBx908 Switch

Release licenses are applied with the **license certificate** command, then validated with the **show license** or **show license brief** commands. Follow these steps:

- Obtain the MAC address for a switch
- Obtain a release license for a switch
- Apply a release license on a switch
- Confirm release license application

### Step 1: Obtain the MAC address for a switch

A release license is tied to the MAC address of the switch.

Switches may have several MAC addresses. Use the **show system mac license** command to show the switch MAC address for release licensing:

```
awplus# show system mac license
MAC address for licensing:
eccd.6d9d.4eed
```

### Step 2: Obtain a release license for a switch

Contact your authorized Allied Telesis support center to obtain a release license.

### Step 3: Apply a release license on a switch

Use the **license certificate** command to apply a release license to your switch.

Note the license certificate file can be stored on internal flash memory, or an external SD card, or on a server accessible by the TFTP, SCP or HTTP protocols.

Entering a valid release license changes the console message displayed about licensing:

```
11:04:56 awplus IMI[1696]: SFL: The current software is not licensed.
awplus#license certificate demo1.csv
A restart of affected modules may be required.
Would you like to continue? (y/n): y
11:58:14 awplus IMI[1696]: SFL: The current software is licensed. Exiting
unlicensed mode.

Stack member 1 installed 1 license

1 license installed.
```

## Step 4: Confirm release license application

On a stand-alone switch, use the commands **show license** or **show license brief** to confirm release license application.

On a stacked switch, use the command **show license member** or **show license brief member** to confirm release license application.

The **show license** command displays the base feature license and any other feature and release licenses installed on AlliedWare Plus switches:

```
awplus# show license
OEM Territory : ATI USA
Software Licenses
-----
Index          : 1
License name   : Base License
Customer name  : ABC Consulting
Quantity of licenses : 1
Type of license : Full
License issue date : 20-Mar-2016
License expiry date : N/A
Features included : EPSR-MASTER, IPv6Basic, MLDSnoop, OSPF-64,
                  RADIUS-100, RIP, VRRP

Index          : 2
License name   : 5.4.6-r1
Customer name  : ABC Consulting
Quantity of licenses : -
Type of license : Full
License issue date : 20-Mar-2016
License expiry date : N/A
Release       : 5.4.6
```

# Licensing this Software Version on a Control Card for an SBx8100 Series Switch

Release licenses are applied with the **license certificate** command, then validated with the **show license** or **show license brief** commands. Follow these steps:

- Obtain the MAC address for a control card
- Obtain a release license for a control card
- Apply a release license on a control card
- Confirm release license application

If your control card is in a stacked chassis, you do not need to perform these steps on each chassis in the stack, only on the stack master.

If your license certificate contains release licenses for each control card present in a stacked chassis, entering the **license certificate** command on the stack master will automatically apply the release licenses to all the control cards within the stack.

## Step 1: Obtain the MAC address for a control card

A release license is tied to the control card MAC address in a chassis.

Chassis may have several MAC addresses. Use the **show system mac license** command to show the control card MAC address for release licensing. Note the MAC addresses for each control card in the chassis. The chassis MAC address is not used for release licensing. Use the card MAC address for release licensing.

```
awplus#show system mac license
MAC address for licensing:

Card                MAC Address
-----
1.5                 eccd.6d9e.3312
1.6                 eccd.6db3.58e7

Chassis MAC Address eccd.6d7b.3bc2
```

## Step 2: Obtain a release license for a control card

Contact your authorized Allied Telesis support center to obtain a release license.

## Step 3: Apply a release license on a control card

Use the **license certificate** command to apply a release license to each control card installed in your chassis or stack.

Note the license certificate file can be stored on internal flash memory, a USB drive, or on a server accessible by the TFTP, SCP or HTTP protocols.

Entering a valid release license changes the console message displayed about licensing:

```
11:04:56 awplus IMI[1696]: SFL: The current software is not licensed.
awplus# license certificate demol.csv
A restart of affected modules may be required.
Would you like to continue? (y/n): y
11:58:14 awplus IMI[1696]: SFL: The current software is licensed. Exiting
unlicensed mode.

Stack member 1 installed 1 license

1 license installed.
```

#### Step 4: Confirm release license application

On a stand-alone chassis, use the commands **show license** or **show license brief** to confirm release license application.

On a stacked chassis, use the command **show license member** or **show license brief member** to confirm release license application.

The **show license** command displays the base feature license and any other feature and release licenses installed on AlliedWare Plus chassis:

```
awplus# show license
OEM Territory : ATI USA
Software Licenses
-----
Index                : 1
License name         : Base License
Customer name        : ABC Consulting
Quantity of licenses : 1
Type of license      : Full
License issue date   : 20-Mar-2016
License expiry date  : N/A
Features included    : IPv6Basic, LAG-FULL, MLDSnoop, RADIUS-100
                     : Virtual-MAC, VRRP

Index                : 2
License name         : 5.4.6-rl
Customer name        : ABC Consulting
Quantity of licenses : -
Type of license      : Full
License issue date   : 20-Mar-2016
License expiry date  : N/A
Release              : 5.4.6
```

## Installing this Software Version

**Caution:** Software versions 5.4.6-x.x require a release license for the SBx908 and SBx8100 switches. Contact your authorized Allied Telesis support center to obtain a license. For details, see:

- “Licensing this Software Version on an SBx908 Switch” on page 73 and
- “Licensing this Software Version on a Control Card for an SBx8100 Series Switch” on page 75.

To install and enable this software version, use the following steps:

1. Copy the software version file (.rel) onto your TFTP server.
2. If necessary, delete or move files to create space in the switch’s Flash memory for the new file. To see the memory usage, use the command:

```
awplus# show file systems
```

To list files, use the command:

```
awplus# dir
```

To delete files, use the command:

```
awplus# del <filename>
```

You cannot delete the current boot file.

3. Copy the new release from your TFTP server onto the switch.

```
awplus# copy tftp flash
```

Follow the onscreen prompts to specify the server and file.

4. Move from Privileged Exec mode to Global Configuration mode, using:

```
awplus# configure terminal
```

Then set the switch to reboot with the new software version. For example, for 5.4.6-1.1, use one of the following commands:

Product	Command
GS900MX/ MPX series	awplus(config)# boot system GS900-5.4.6-1.1.rel
XS900MX series	awplus(config)# boot system XS900-5.4.6-1.1.rel
x210 series	awplus(config)# boot system x210-5.4.6-1.1.rel
x230 series	awplus(config)# boot system x230-5.4.6-1.1.rel
IE200 series	awplus(config)# boot system IE200-5.4.6-1.1.rel
x310 series	awplus(config)# boot system x310-5.4.6-1.1.rel
IE300 series	awplus(config)# boot system IE300-5.4.6-1.1.rel
IX5-28GPX	awplus(config)# boot system IX5-5.4.6-1.1.rel
x510 series	awplus(config)# boot system x510-5.4.6-1.1.rel
IE510-28GSX	awplus(config)# boot system IE510-5.4.6-1.1.rel
x610 series	awplus(config)# boot system x610-5.4.6-1.1.rel
SBx908	awplus(config)# boot system SBx908-5.4.6-1.1.rel

Product	Command
x930 series	<code>awplus(config)# boot system SBx930-5.4.6-1.1.rel</code>
DC2552XS/L3	<code>awplus(config)# boot system DC2500-5.4.6-1.1.rel</code>
SBx8100 with CFC400 <sup>1</sup>	<code>awplus(config)# boot system SBx81CFC400-5.4.6-1.2.rel</code>
SBx8100 with CFC960 <sup>1</sup>	<code>awplus(config)# boot system SBx81CFC960-5.4.6-1.2.rel</code>
AR2010V	<code>awplus(config)# boot system AR2010V-5.4.6-1.1.rel</code>
AR2050V	<code>awplus(config)# boot system AR2050V-5.4.6-1.1.rel</code>
AR3050S	<code>awplus(config)# boot system AR3050S-5.4.6-1.1.rel</code>
AR4050S	<code>awplus(config)# boot system AR4050S-5.4.6-1.1.rel</code>

1. Supported from version 5.4.6-1.2 onwards

- Return to Privileged Exec mode and check the boot settings, using:

```
awplus(config)# exit
```

```
awplus# show boot
```

- Reboot using the new software version.

```
awplus# reload
```

## Installing the Switch GUI

This section describes how to install and set up the java-based GUI for switches. The GUI enables you to monitor and manage your AlliedWare Plus switch from your browser.

To install and run the GUI, you need the following system products and setup:

- PC Platform:  
Windows XP SP2 and up / Windows Vista SP1 and up
- Browser: (must support Java Runtime Environment (JRE) version 6)  
Microsoft Internet Explorer 7.0 and up / Mozilla Firefox 2.0 and up

To install the GUI on your switch, use the following steps:

1. Copy to the GUI Java applet file (**.jar** extension) onto your TFTP server, SD card or USB storage device.
2. Connect to the switch's management port, then log into the switch.
3. If necessary, delete or move files to create space in the switch's Flash memory for the new file.

To see the memory usage, use the command:

```
awplus# show file systems
```

To list files, use the command:

```
awplus# dir
```

To delete files, use the command:

```
awplus# del <filename>
```

You cannot delete the current boot file.

4. Assign an IP address for connecting to the GUI. Use the commands:

```
awplus# configure terminal
```

```
awplus(config)# interface vlan1
```

```
awplus(config-if)# ip address <address>/<prefix-length>
```

Where *<address>* is the IP address that you will subsequently browse to when you connect to the GUI Java applet. For example, to give the switch an IP address of 192.168.2.6, with a subnet mask of 255.255.255.0, use the command:

```
awplus(config-if)# ip address 192.168.2.6/24
```

5. If required, configure a default gateway for the switch.

```
awplus(config-if)# exit
```

```
awplus(config)# ip route 0.0.0.0/0 <gateway-address>
```

Where *<gateway-address>* is the IP address for your gateway device. You do not need to define a default gateway if you browse to the switch from within its own subnet.

6. Copy the GUI file onto your switch from the TFTP server, SD card, or USB storage device.

**TFTP server:** Use the command:

```
awplus# copy tftp://<server-address>/<filename.jar> flash:/
```

**SD card:** use the command:

```
awplus# copy card:/<filename.jar> flash:/
```

USB storage device: use the command:

```
awplus# copy usb:/<filename.jar> flash:/
```

where <server-address> is the IP address of the TFTP server, and where <filename.jar> is the filename of the GUI Java applet.

7. Ensure the HTTP service is enabled on your switch. Use the commands:

```
awplus# configure terminal
```

```
awplus(config)# service http
```

The HTTP service needs to be enabled on the switch before it accepts connections from a web browser. The HTTP service is enabled by default. However, if the HTTP has been disabled then you must enable the HTTP service again.

8. Create a user account for logging into the GUI.

```
awplus(config)# username <username> privilege 15 password  
                <password>
```

You can create multiple users to log into the GUI. For information about the **username** command, see the AlliedWare Plus Command Reference for your switch.

9. Start the Java Control Panel, to enable Java within a browser

On your PC, start the Java Control Panel by opening the Windows Control Panel from the Windows Start menu. Then enter Java Control Panel in the search field to display and open the Java Control Panel.

Next, click on the 'Security' tab. Ensure the 'Enable Java content in the browser' checkbox is selected on this tab.

10. Enter the URL in the Java Control Panel Exception Site List

Click on the 'Edit Site List' button in the Java Control Panel dialog Security tab to enter a URL in the Exception Site List dialog. In the 'Exception Site List' dialog, enter the IP address you configured in Step 4, with a http:// prefix.

After entering the URL click the Add button then click OK.

11. Log into the GUI.

Start a browser and enter the switch's IP address. The GUI starts up and displays a login screen. Log in with the username and password specified in the previous step.

# AlliedWare Plus Version 5.4.6-0.x

For:

SwitchBlade x8100 Series  
 SwitchBlade x908  
 DC2552XS/L3  
 x930 Series  
 x610 Series  
 x510 Series

# Introduction

This release note describes the new features and enhancements in AlliedWare Plus software version 5.4.6-0.x. For more information, see the Command Reference for your switch or AR-series firewall. Software file details for this version are listed in [Table 1](#) below.

**Caution: Software version 5.4.6 requires a release license for the SBx908 and SBx8100 switches. If you are using either of these switches, make sure that each switch has a 5.4.6 license certificate before you upgrade.**

Contact your authorized Allied Telesis support center to obtain a license. For details, see:

- [“Licensing this Software Version on an SBx908 Switch” on page 106](#) and
- [“Licensing this Software Version on a Control Card for an SBx8100 Series Switch” on page 108.](#)

The first 5.4.6-0.x software version is numbered 5.4.6-0.1. The following table lists model names and software files for this version.

**Table 1: Models and software file names**

Models	Family	Date	Software File	GUI File
x210-9GT x210-16GT x210-24GT	x210 Series	03/2016	x210-5.4.6-0.1.rel	x210-gui_546_02.jar

AR4050S AR3050S AR2050V	AR-series firewall	03/2016	AR4050S-5.4.6-0.1.rel AR3050S-5.4.6-0.1.rel AR2050V-5.4.6-0.1.rel	n/a - use the web-based GUI instead
AMF Cloud		03/2016	vaa-5.4.6-0.1.iso	n/a

Under version 5.4.6, not all models of XEM are supported in the SwitchBlade x908. The following table lists which XEMs are and are not supported under version 5.4.6.

**Table 2: Support of XEM modules for the SwitchBlade x908 in version 5.4.6-x.x**

Product	Supported in version 5.4.6-x.x
XEM-1XP	No
XEM-2XP	Yes
XEM-2XS	Yes
XEM-2XT	Yes
XEM-12S	No
XEM-12T	No
XEM-12Sv2	Yes
XEM-12Tv2	Yes
XEM-24T	Yes

**Caution:** Using a software version file for the wrong switch or AR-series firewall model may cause unpredictable results, including disruption to the network. Information in this release note is subject to change without notice and does not represent a commitment on the part of Allied Telesis, Inc. While every effort has been made to ensure that the information contained within this document and the features and changes described are accurate, Allied Telesis, Inc. can not accept any type of liability for errors in, or omissions arising from, the use of this information.

---

## New Features and Enhancements

This section describes the new features in 5.4.6-0.x.

For more information about all features on the switch or AR-series firewall, see the Command Reference for your switch or AR-series firewall.

Unless otherwise stated, all new features and enhancements are available on all switch and AR-series firewall models running this version of AlliedWare Plus.

### AMF guest nodes

*Available on all AlliedWare Plus devices - a guest node can be connected to any AMF edge node*

The AMF guest node feature provides an extension to AMF's management capabilities by providing a limited degree of management capability to devices (guest nodes) that either do not run the AlliedWare Plus operating system or run a version that does not support AMF. This feature offers guest nodes limited participation in an AMF network without the need to modify their operating systems. Essentially any device that has either an IPv4 or IPv6 address can become an AMF guest node.

AMF nodes within the network can recognize the presence of a guest node either dynamically, if they use protocols such as DHCP or LLDP, or statically, from the switchport `atmf-guestlink` command. Once recognized, the AMF node is then able to provide some, albeit limited, level of management support to these devices.

For details, see your device's Command Reference and the [AMF Feature Overview and Configuration Guide](#).

### AMF Cloud on Amazon Web Service

*Available on AMF Cloud*

AMF Cloud is a virtualized implementation of Allied Telesis Management Framework (AMF) that allows you to install AMF Masters and/or Controllers on a server. Having AMF Masters and Controllers available as virtual machines adds flexibility to the options available for AMF network designs.

AMF Cloud supports a variety of hosting options, now including support for Amazon's AWS (Amazon Web Services) Cloud service.

A step-by-step Installation Guide will be available shortly from our website at [alliedtelesis.com/amf](http://alliedtelesis.com/amf).

## Traffic control for AR-series firewalls

*Available on AR-series firewalls only*

Traffic Control (often referred to as Quality of Service or QoS) optimizes the service provided to users when interfaces become oversubscribed. This means creating policies that:

- identify which traffic belongs to which services
- apply different control parameters to the traffic belonging to different services

These control parameters are applied to traffic to optimize the services and can be applied in a variety of combinations:

- prioritization
- bandwidth limiting
- marking
- egress scheduling

Traffic Control replaces the existing feature called Traffic Shaping.

For details, see your device's Command Reference and the [Traffic Control Feature Overview and Configuration Guide](#).

## Tunneling of PPP via L2TP

*Available on AR-series firewalls only.*

Version 5.4.6-0.x enables you to configure the AR-series firewall PPPoE Access concentrator to terminate multiple incoming PPPoE client connections and tunnel their PPP sessions via the L2TP LAC to one or more remote L2TP LNS devices. You can set the device to determine each L2TP tunnel destination by using static configuration or performing RADIUS or DNS lookups, based on the domain information contained within each PPPoE client username.

For details, see your device's Command Reference and the [L2TP Feature Overview and Configuration Guide](#).

## Increased number of firewall connections on AR4050S

*Available on AR4050S only*

Version 5.4.6-0.x increases the number of simultaneous firewall sessions to 300000 on AR4050S NGFWs.

The limit remains 100000 for AR3050S and AR2050V firewalls.

## Limiting the number of firewall connections

*Available on AR-series firewalls only*

Version 5.4.6-0.x enables you to limit the number of firewall sessions associated with a specific entity. The limit will be applied to each host on that entity, and to both IPv4 and IPv6.

Use the following commands to configure and manage firewall connections:

- connection-limit
- clear firewall connections
- show firewall connections
- show firewall connections limits
- show firewall connections limits config-check

For details, see your device's Command Reference.

## URL filtering

*Available on AR-series firewalls only.*

URL Filtering blocks all HTTP access to a list of websites. You can either specify a short list of websites to block (up to 1000 blacklist and 1000 whitelist rules), or subscribe to the blacklist service offered by Kaspersky.

If you subscribe to the Kaspersky service, you can create additional blacklists to block extra URLs or whitelists to allow URLs that the Kaspersky service blocks.

For details, see your device's Command Reference and the [URL Filtering Feature Overview and Configuration Guide](#).

## Increased number of bridge instances

*Available on AR-series firewalls only*

In version 5.4.6-0.x the maximum number of bridges that can be configured on an AR-series firewall has been increased from 16 to 64.

## Limited local proxy ARP

*Available on all AlliedWare Plus devices*

Version 5.4.6-0.x supports limited local proxy ARP, which allows you to stop MAC address resolution for specified hosts. Limited local proxy ARP works by intercepting ARP requests for the specified hosts and responding with your device's own MAC address details instead of the destination host's details. This stops hosts from learning the MAC address of the other hosts through ARP requests.

Limited local proxy ARP ensures that the specified devices cannot send traffic that bypasses Layer 3 routing on your device. This gives you control over which hosts may communicate with one another.

On AR-series firewalls, limited local proxy ARP supports Static NAT configurations in which the NAT configuration's public address is different to the ethernet interface's address.

To configure limited local proxy ARP, use the following new commands.

### ip limited-local-proxy-arp

**Overview** Use this command to enable local proxy ARP, but only for a specified set of IP addresses. This makes the device respond to ARP requests for those IP addresses when the addresses are reachable via the interface you are configuring.

To specify the IP addresses, use the command **local-proxy-arp**.

Use the **no** variant of this command to disable limited local proxy ARP. This stops your device from intercepting and responding to ARP requests for the specified hosts. This allows the hosts to use MAC address resolution to communicate directly with one another.

**Syntax** `ip limited-local-proxy-arp`  
`no ip limited-local-proxy-arp`

**Default** Limited local proxy ARP is disabled by default.

**Mode** Interface Configuration

**Usage** Limited local proxy ARP supports Static NAT configurations in which the NAT configuration's public address is different to the ethernet interface's address.

On such ethernet interfaces, the device needs to respond to ARP requests for the public address so that it will receive packets targeted at that address.

Limited local proxy ARP makes this possible. It is especially useful when you have a number of 1-1 NAT configurations and each public address falls within the public interface's subnet. If you enable limited local proxy ARP on the public interface and specify suitable addresses, the device will respond to ARP requests for those addresses, as long as the addresses are routed out the interface the ARP requests are received on. The device responds with its own MAC address.

**Example** The following configuration snippet shows how to use limited local proxy ARP, if you are using NAT for an HTTP server with an address of 172.22.0.3 connected via eth1, and eth1 has an address of 172.22.0.1:

```

! Create a private zone for the HTTP server with address 172.22.200.3:
zone private
network vlan1
ip subnet 172.22.200.0/24
host http_server
ip address 172.22.200.3
!
! Create a public zone for the HTTP server with address 172.22.0.3:
zone public
network eth1
ip subnet 0.0.0.0/0 interface eth1
host http_server
ip address 172.22.0.3
!
! Create a NAT rule to map from the public to the private zone:
nat
rule 10 portfwd http from public.eth1 to public.eth1.http_server with dst
private.vlan1.http_server
enable
!
! Configure eth1. It has a different public address than the HTTP server:
interface eth1
ip limited local-proxy-arp
ip address 172.22.0.1/24
!
! Configure vlan1:
interface vlan1
ip address 172.22.200.5/24
!
! Tell the device to respond to ARPs for the HTTP server public address:
local-proxy-arp 172.22.0.3/32

```

## local-proxy-arp

**Overview** Use this command to specify an IP subnet for use with limited local proxy ARP. When limited local proxy ARP is enabled with the command **ip limited-local-proxy-arp**, the device will respond to ARP requests for addresses in that subnet. Use the **no** variant of this command to stop specifying a subnet for use with limited local proxy ARP.

**Syntax** `local-proxy-arp [<ip-add/mask>]`  
`no local-proxy-arp [<ip-add/mask>]`

Parameter	Description
<i>&lt;ip-add/mask&gt;</i>	The IP subnet to use with limited local proxy ARP, in dotted decimal format (A.B.C.D/M). To specify a single IP address, use a 32-bit mask.

**Default** No subnets are specified for use with limited local proxy ARP.

**Mode** Global Configuration

## Null encryption option for IPsec

Available on AR-series firewalls only

Version 5.4.6-0.x adds the option **null** to the encryption options for IPsec, via the command:

```
awplus(config-ipsec-profile)# transform <1-255> protocol esp
integrity {sha1|sha256|sha512} encryption null
```

This option is not intended for use in a live network. It should only be used for testing purposes.

## Flexible RADIUS group selection

Available on SBx8100, SBx908, DC2552XS, x930, x610, x510, IX5, x310 and x230 Series switches and AR-series firewalls. Note that AR-series firewalls do not support 802.1x.

Version 5.4.6 enables you to create user-defined named method lists and apply these lists to authentication and accounting configurations for the three device authentication types: IEEE 802.1x-based, Web-based, and MAC-based authentication.

Previously only the default method list could be configured for device authentication and accounting.

Method lists are configured using the appropriate **aaa authentication** or **aaa accounting** command for the authentication type you wish to configure. They are applied to an interface using the relevant **authentication** or **accounting** command (see below for a list of newly created and updated commands).

Use the **show aaa server group** command to display a device's configured method lists and the **show radius server group** command to display radius server groups.

**Commands** The flexible RADIUS group selection feature introduces the following new commands:

Commands	Purpose
dot1x authentication auth-web authentication auth-mac authentication	Applies a named authentication method list to an interface, overriding the default method list, for the specified authentication type.
dot1x accounting auth-web accounting auth-mac accounting	Applies a named accounting method list to an interface, overriding the default method list, for the specified authentication type.
show aaa server group	Shows the AAA users and associated method lists.
show radius server group	Shows the RADIUS server group/s configuration.

These commands have been updated for managing named method lists:

Commands	Purpose
aaa authentication dot1x aaa authentication auth-web aaa authentication auth-mac	Use to configure the <b>default</b> or a named authentication method list. Previously only the <b>default</b> method list was available.
aaa accounting dot1x aaa accounting auth-web aaa accounting auth-mac	Use to configure the <b>default</b> or a named accounting method list. Previously only the <b>default</b> method list was available.
show auth supplicant	Updated to show which server and server group are selected for a supplicant (client).

**Example** In this example we add two radius server groups 'rad\_group\_vlan10' and 'rad\_group\_vlan20', create two authentication method lists, which reference these server groups, and then apply these method lists to vlan10 and vlan20.

The example illustrates how to do this for MAC-based device authentication but the process is identical for the other device authentication types (namely 802.1x-based and Web-based authentication) as well as for accounting on all authentication types.

### Step 1: Add the RADIUS servers

```
awplus#configure terminal
awplus(config)#radius-server host 192.168.1.101 key allied
awplus(config)#radius-server host 192.168.1.102 key allied
```

### Step 2: Create RADIUS server groups

```
awplus(config)#aaa group server radius rad_group_vlan10
awplus(config-sg)#server 192.168.1.101
awplus(config-sg)#exit
awplus(config)#aaa group server radius rad_group_vlan20
awplus(config-sg)#server 192.168.1.102
awplus(config-sg)#exit
```

### Step 3: Create the named authentication method lists

```
awplus(config)#aaa authentication auth-mac default group radius
awplus(config)#aaa authentication auth-mac vlan10_auth group
rad_group_vlan10
awplus(config)#aaa authentication auth-mac vlan20_auth group
rad_group_vlan20
```

### Step 4: Enable MAC authentication on the interfaces

```
awplus(config)#int port1.0.10-1.0.19
awplus(config-if)#switchport access vlan 10
awplus(config-if)#auth-mac enable
awplus(config-if)#exit
awplus(config)#int port1.0.20-1.0.29
awplus(config-if)#switchport access vlan 20
awplus(config-if)#auth-mac enable
awplus(config-if)#exit
awplus(config)#int port1.0.30
awplus(config-if)#switchport mode trunk
awplus(config-if)#switchport trunk allowed vlan add 10,20,30
awplus(config-if)#exit
```

## Step 5: Apply named method list to the interfaces

```
awplus(config)#int vlan10
awplus(config-if)#auth-mac authentication vlan10_auth
awplus(config-if)#exit
awplus(config)#int vlan20
awplus(config-if)#auth-mac authentication vlan20_auth
awplus(config-if)#exit
```

## Packet forwarding to a specified network for unauthorized supplicants

*Available on all AlliedWare Plus devices*

Version 5.4.6-0.x supports packet forwarding to a network destination for unauthorized clients using Web-based authentication.

The following commands have been updated to accept a masked IP address parameter where previously they only allowed for a single IP host to be supplied:

```
auth-web forward [<ip-address>|<ip-address/mask>] {arp|dhcp|dns|tcp
<1-65535>|udp <1-65535>}
auth guest-vlan forward {<ip-address>|<ip-address/mask>} [dns|
tcp <1-65535>|udp <1-65535>]
```

**Example** To enable packet forwarding of TCP port 137 traffic from the guest vlan to the 10.0.0.0/24 subnet, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(conf-if)# auth guest-vlan forward 10.0.0.0/24 tcp 137
```

## Openflow support

*Available on DC2552XS/L3, x930, x510, x310 and x230 Series switches*

OpenFlow is a protocol that enables Software-defined Networking (SDN). SDN is a network architecture that allows network administrators to control traffic from a centralized SDN controller without managing individual switches. SDN is materialized by decoupling the network control function (control plane) and forwarding function (data plane). OpenFlow is a protocol for the control plane to communicate with the data plane in SDN.

Openflow support is available with a feature licence. To purchase a licence, contact your local authorized Allied Telesis sales center.

For details, see your device's Command Reference.

## Support for new features on x230 series switches

*Available on x230 Series switches*

Version 5.4.6-0.x adds support for the following features on x230 Series switches:

- RIP and static routing
- Q-in-Q (VLAN double tagging)
- DHCP relay

These features are available with a feature licence. To purchase a licence, contact your local authorized Allied Telesis sales center.

## Support for new features on DC2552XS/L3 switches

*Available on DC2552XS/L3 switches*

Version 5.4.6-0.x adds support for the following features on DC2552XS/L3 switches:

- IPv6 ACLs
- Management ACL (the commands **vtv ipv6 access-class** and **vtv access-class**).

## Support for the management ACL on IE200 series switches

*Newly available on IE200 Series switches*

Version 5.4.6-0.x adds support for the Management ACL, which restricts who is allowed remote access to your device using Telnet or SSH. This Management ACL is a simple security feature that binds an ACL (Access Control List) to the VTY's (Virtual Terminal Lines). This will allow or deny IP addresses included in the ACL to create a connection to your device. The commands are:

- **vtv ipv6 access-class** and
- **vtv access-class**.

Both commands have a **no** variant.

To check the ACLs' setting run the **show running-config** command.

## VLAN translation

Available on IE510, x510, IX5, x310 Series switches

Version 5.4.6-0.x supports VLAN translation, which translates a VLAN's VLAN-ID to another value for use on the wire.

In Metro networks, it is common for the Network Service Provider to give each customer their own unique VLAN, yet at the customer location, give all the customers the same VLAN-ID for tagged packets to use on the wire. VLAN-ID translation can be used by the Service Provider to change the tagged packet's VLAN-ID at the customer location to the VLAN-ID for tagged packets to use within the NSP's network.

VLAN-ID translation is also useful in Enterprise environments where it can be used to merge two networks together without manually reconfiguring the VLAN numbering scheme. This situation can occur if two companies have merged and the same VLAN-ID is used for two different purposes.

Similarly within a Network Service Provider's network, Layer 2 networks may need to be rearranged, and VLAN translations make such rearrangement more convenient.

To configure VLAN translation, use the following commands.

### switchport vlan translation vlan vlan

Use this command to create a VLAN translation entry on an interface. The translation entry translates a packet's VLAN-ID as seen on the wire.

Use the **no** variant to remove all translation entries or a specific entry.

This command can be applied to a switch port or a static channel group, or a dynamic (LACP) channel group. The interface must be in a mode that supports tagged packets.

**Syntax** `switchport vlan translation vlan <wire-vid> vlan <vid>`  
`no switchport vlan translation [all|vlan <wire-vid>]`

Parameter	Description
<code>vlan &lt;wire-vid&gt;</code>	VLAN-ID of the packet as you want it to be seen on the wire.
<code>vlan &lt;vid&gt;</code>	VLAN-ID of the VLAN as it was assigned when the VLAN was created.
<code>all</code>	Delete all translation entries.

**Default** None (by default, no translation entries exist)

**Mode** Interface Configuration for a switch port or a static channel group, or a dynamic (LACP) channel group. The interface must be in a mode that supports tagged packets.

**Example** To translate VLAN100 to VLAN200 on port 1.0.1, use the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#switchport vlan translation vlan 200 vlan 100
```

## switchport vlan translation default drop

Use this command to configure a default behavior of dropping inbound tagged packets that have a VLAN-ID that does not match any entries in the VLAN translation table for an interface.

Use the **no** variant to stop dropping non-matching inbound packets and let them be accepted as is for further processing.

**Syntax** switchport vlan translation default drop  
no switchport vlan translation default drop

**Default** Do not drop packets

**Mode** Interface Configuration for a switch port or a static channel group, or a dynamic (LACP) channel group. The interface must be in a mode that supports tagged packets.

**Example** To drop inbound tagged packets if they do not match a VLAN translation entry, use the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#switchport vlan translation default drop
```

## show interface switchport vlan translation

Use this command to display VLAN translation information for some or all interfaces.

**Syntax** show interface switchport vlan translation [<interface-list>]

**Mode** Privileged Exec / User Exec

**Example** To display VLAN translation information for port1.0.1 and port1.0.2, use the command:

```
awplus#show interface switchport vlan translation port1.0.1-
port1.0.2
```

### Output

```
awplus#show interface switchport vlan translation port1.0.1-
port1.0.2
Interface: port1.0.1
VLAN on Wire    VLAN
-----
    1649         100
    default     drop

Interface: port1.0.2
VLAN on Wire    VLAN
-----
    1650         100
    default     accept
```

## Logging enhancements

Available on all AlliedWare Plus devices

### Logging facilities

Version 5.4.6-0.x enables you to configure an outgoing syslog facility. This determines where the syslog server will store the log messages.

The syntax of the new command is:

```
log facility {kern|user|mail|daemon|auth|syslog|lpr|news|uucp|
cron|authpriv|ftp|local0|local1|local2|local3|local4|local5|
local6|local7}
```

The facility is displayed in the output of the **show log config** command.

### Specifying a source interface or IP address for syslog messages

Version 5.4.6-0.x enables you to specify a source interface or IP address for the device to send syslog messages from. You can specify any one of an interface name, an IPv4 address or an IPv6 address.

This is useful if the device can reach the syslog server via multiple interfaces or addresses and you want to control which interface/address the device uses.

The syntax of the new command is:

```
log host source {<interface-name>|<ipv4-addr>|<ipv6-addr>}
```

The source interface/address is displayed in the output of the **show log config** command.

### Filtering out categories of log messages

Version 5.4.6-0.x adds a new parameter to logging filter commands, which enables the device to drop unwanted log messages.

The new option is intended to drop low-priority log messages if they are over-filling the log files. Use it with caution, to avoid dropping important messages.

To configure the device to drop logs, specify the level, program, facility or message text you want to drop, and then use the new **exclude** parameter to specify to drop them.

The option is available for the following log commands:

- log buffered
- log console
- log email
- log host
- log monitor
- log permanent

For example, the syntax for the **log buffered** command is:

```
log buffered [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
exclude {level|facility|program|msgtext}
```

## Support for services like Microsoft Network Load Balancing (MS-NLB)

*Newly supported on x930, IE510, x510, IX5, x310 and x230 Series switches. Already supported on SBx908 and SBx8100 Series switches in earlier software versions.*

Version 5.4.6-0.x enables the switch to support services like Microsoft Network Load Balancing (MS-NLB).

Such services use ARP with disparate MAC addresses to ensure that packets destined for a server cluster virtual address are sent to all servers in the cluster. Disparate MAC addresses mean that the MAC address in the “sender hardware address” field of an ARP reply is different to the MAC address in the “Source MAC address” field of the Ethernet header that the ARP packet is encapsulated in.

To configure support for such services, use the following commands.

### arp-mac-disparity

**Syntax** `arp-mac-disparity {multicast|multicast-igmp|unicast}`  
`no arp-mac-disparity {multicast|multicast-igmp|unicast}`

Parameter	Description
multicast	Enables support of server clusters operating in multicast mode. Packets destined for the server cluster are flooded to all ports in the VLAN.
multicast-igmp	Enables support of server clusters operating in multicast/IGMP mode. In multicast/IGMP mode, the MS-NLB server cluster uses IGMP reports to forward server traffic to a limited set of ports.
unicast	Enables support of server clusters operating in unicast mode. Packets destined for the server cluster are flooded to all ports in the VLAN.

**Default** ARP-MAC disparity support is disabled and:

- If the disparate ARP has a multicast MAC address in the ARP reply, the switch drops the ARP reply and does not learn any associated addresses
- If the disparate ARP has a unicast MAC address in the ARP reply, the switch learns the address in the ARP reply. The learned ARP entry points to the single port that the ARP reply arrived on. Matching traffic will go out this port.

**Mode** Interface Configuration for a VLAN interface.

**Usage** When you are using **multicast** mode, you can limit the number of ports that packets are flooded to, instead of flooding to all ports in the VLAN. To do this, specify the list of ports when creating the ARP entry.

For example, to flood only port1.0.1 to port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp 10.10.1.100 010e.11ff.2222 port1.0.1-
port1.0.3
```

**Example** To enable support for MS-NLB in unicast mode on interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-mac-disparity unicast
```

## Rate limiting ICMP error messages

*Available on SBx8100, SBx908, DC2552XS, x930, x610, x510, IE510, IX5, x310 and x230 Series switches and AR-series firewalls.*

Version 5.4.6-0.x enables you to rate limit ICMP error messages in both IPv4 and IPv6.

Rate limiting ICMP messages may protect your network from some DoS attacks. Some DoS attacks send a flood of traffic to devices that do not exist, causing an intervening router to reply with an ICMP unreachable message for each unknown destination. ICMP rate limiting prevents the router from generating an overwhelming number of ICMP error messages in such attacks.

To configure ICMP rate limiting, configure the interval between error messages with the following new commands:

**Syntax** `ip icmp error-interval <0-2147483647>`  
`ipv6 icmp error-interval <0-2147483647>`

where `<0-2147483647>` is the interval between replies, in milliseconds.

**Default** The default interval is 1000ms (1 second).

**Mode** Global configuration

**Example** To reply to IPv4 ICMP messages only once every 5 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip icmp error-interval 5000
```

## Per-interface ICMP redirect setting

*Newly supported on DC2552XS/L3, x930, IE510, x510, IX5, x310 and x230 Series switches.  
Already supported on SBx908 and SBx8100 Series switches in earlier software versions.*

The **ip redirects** command enables the device to send ICMP redirect messages. These messages are used to notify hosts that a better route is available to a destination.

With version 5.4.6-0.x, this functionality can be turned on and off individual interfaces, on SBx8100, SBx908, DC2552XS/L3, x930, IE510, x510, IX5, x310 and x230 Series switches.

Note that this functionality can be enabled globally on x610 Series switches and AR-series firewalls.

## Disable ICMP type 3, destination unreachable, messages

*Available on all AlliedWare Plus devices*

Version 5.4.6 supports the disabling of ICMP type 3, destination unreachable, messages for IPv4 and IPv6. This prevents an attacker from using destination unreachable messages to discover the topology of your network.

If ICMP unreachable messages are disabled, any application that depends on them will not work. Traceroute, for example, does not work when ICMP unreachable messages are disabled.

**Syntax** ip unreachable  
no ip unreachable  
ipv6 unreachable  
no ipv6 unreachable

**Default** ICMP destination unreachable messages are enabled by default.

**Mode** Global configuration

**Example** To disable ICMP unreachable messages on IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 unreachable
```

To enable ICMP unreachable, messages for IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 unreachable
```

## Processing of ARP replies with a broadcast destination MAC

*Available on all AlliedWare Plus devices*

Version 5.4.6 supports processing of ARP replies that arrive with a broadcast destination MAC (ffff.ffff.ffff). This makes neighbors reachable if they send ARP replies that contain a broadcast destination MAC.

To enable this feature, use the command:

```
awplus(config-if)# arp-reply-bc-dmac
```

**Example** To allow processing of ARP replies that arrive on VLAN2 with a broadcast destination MAC, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-reply-bc-dmac
```

## Logging of changes to the MAC address table

Available on SBx908, x930, x610, x510, IX5, x310, IE200 and x230 Series switches.

Version 5.4.6-0.x adds the option of creating log entries when the content of the FDB (forwarding database) changes. Log messages are produced when a MAC address is added to or removed from the FDB.

*caution: MAC address table logging may impact the performance of the switch. Only enable it when necessary as a debug tool.*

Use the **no** variant of this command to stop creating log entries when the content of the FDB changes.

To enable logging, use the following new command.

### mac address-table logging

**Syntax** mac address-table logging  
no mac address-table logging

**Default** MAC address table logging is disabled by default.

**Mode** User Exec/Privileged Exec

**Usage** When MAC address table logging is enabled, the switch produces the following messages on SBx908 switches:

Change	Message format	Example
MAC added	MAC add <mac> <port> <vlan>	MAC add eccd.6db5.68a7 port1.1.1 vlan2
MAC deleted	MAC delete <mac> <port> <vlan>	MAC delete eccd.6db5.68a7 port1.1.1 vlan2
MAC aged out	MAC age-out <mac> <port> <vlan>	MAC age-out eccd.6db5.68a7 port1.1.1 vlan2

When MAC address table logging is enabled, the switch produces the following messages on x930, x610, x510, IX5, x310, IE200 and x230 Series switches:

Change	Message format	Example
MAC added	MAC add <mac> <port> <vlan>	MAC add eccd.6db5.68a7 port1.0.1 vlan2
MAC removed	MAC remove <mac> <port> <vlan>	MAC remove eccd.6db5.68a7 port1.0.1 vlan2

On x930, x610, x510, IX5, x310, IE200 and x230 Series switches, rapid changes may not be logged. For example, if an entry is added and then removed within a few seconds, those actions may not be logged.

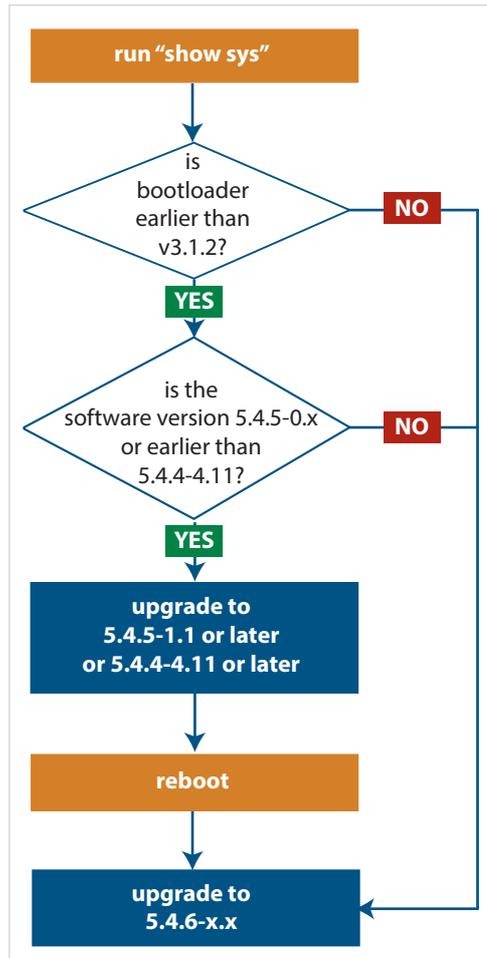

**Example** To create log messages when the content of the FDB changes, use the command:

```
awplus# mac address-table logging
```

# Important Considerations Before Upgrading

## Bootloader compatibility for SBx81CFC960

On the AT-SBx81CFC960, please check your bootloader and current software version before you upgrade to AlliedWare Plus software version 5.4.6.

If your bootloader is older than 3.1.2, you can only upgrade to 5.4.6 from the following software versions:

- ▶ 5.4.5-1.1 or higher (including 5.4.5-2.x and 5.4.5-3.x)
- ▶ 5.4.4-4.11 or higher

If your bootloader is older than 3.1.2, your switch must be running one of the above versions when you upgrade to 5.4.6.

**Note that you cannot upgrade to 5.4.6 directly from 5.4.5-0.x.**

To see your bootloader and current software version, check the "Bootloader version" and "Software version" fields in the command:

```
awplus# show system
```

If you experience issues when upgrading, please contact your Allied Telesis support team. See our website at [alliedtelesis.com/support](http://alliedtelesis.com/support).

## Licensing

From software version 5.4.4-0.4 onwards, AlliedWare Plus software releases need to be licensed for SBx908 and SBx8100 switches.

If you are upgrading to 5.4.6-0.x on your SBx908 or SBx8100 switch, please ensure you have a 5.4.6 license on your switch. To obtain a license, contact your authorized Allied Telesis support center. You will need to provide the MAC addresses of the switches you want to license. For details, see:

- "Licensing this Software Version on an SBx908 Switch" on page 106 and
- "Licensing this Software Version on a Control Card for an SBx8100 Series Switch" on page 108.

## Upgrading a VCStack

This version supports VCStack “reboot rolling” upgrades. With the **reboot rolling** command, you can reduce downtime when upgrading a VCStack.

You can use the **reboot rolling** command to upgrade to any 5.4.6-0.x version from:

- 5.4.5-x.x, or
- 5.4.4-1.x or later.

You cannot use rolling reboot to upgrade directly to 5.4.6-0.x from 5.4.4-0.x or earlier versions. If you wish to use rolling reboot, follow these steps:

- For releases 5.4.3-x.x or earlier, first upgrade to 5.4.4-0.x
- Next, upgrade from 5.4.4-0.x to any 5.4.5-x.x version
- Finally, upgrade from 5.4.5-x.x to 5.4.6-0.x.

## Forming or extending a VCStack

If you create a VCStack from switches that are running different software versions, auto-synchronization ensures that all members will run the same software version when they boot up.

Auto-synchronization is supported between 5.4.6-0.x and:

- 5.4.5-x.x, and
- 5.4.4-2.x or later.

Autosynchronisation is not supported between 5.4.6-0.x and 5.4.4-1.x or 5.4.4-0.x.

Before you add a new switch to a stack, make sure the new switch’s software version is compatible with the stack’s version. If the new switch is running an incompatible version, it cannot join the stack until you have manually upgraded it.

## AMF software version compatibility

We strongly recommend that all nodes in an AMF network run the same software release.

If this is not possible, nodes running version 5.4.6-0.x are compatible with nodes running:

- 5.4.5-x.x
- 5.4.4-x.x, and
- 5.4.3-2.6 or later.

However, if you are using Vista Manager and any AMF members are running 5.4.6-x.x, the AMF Master or Controller must also run 5.4.6-x.x. Otherwise Vista Manager will not operate correctly.

## Upgrading all switches in an AMF network

**This version supports upgrades across AMF networks.** There are two methods for upgrading firmware on an AMF network:

- Reboot-rolling, which upgrades and reboots each node in turn
- Distribute firmware, which upgrades each node, but does not reboot them. This lets you reboot the nodes at a minimally-disruptive time.

You can use either of these methods to upgrade to this software version.

You can use these methods to upgrade to this version from 5.4.3-2.6 and later.

In summary, the process for upgrading firmware on an AMF network is:

1. Copy the release .rel files for each product family to the media location you intend to upgrade from (Flash memory, SD card, USB stick etc).
2. Decide which AMF upgrade method is most suitable.
3. Initiate the AMF network upgrade using the selected method. To do this:
  - a. create a working-set of the nodes you want to upgrade
  - b. enter the command **atmf reboot-rolling <location>** or **atmf distribute-firmware <location>** where **<location>** is the location of the .rel files.
  - c. Check the console messages to make sure that all nodes are "release ready". If they are, follow the prompts to perform the upgrade.

## ISSU (In-Service Software Upgrade) on SBx8100 with CFC960

ISSU is available on standalone SBx8100 Series switches with dual CFC960 control cards, and on switches using VCStack Plus™ to create a single virtual unit out of two chassis (where each chassis has a pair of CFC960 control cards). ISSU allows you to upgrade the software release running on the CFCs with no disruption to network traffic passing through the chassis.

You cannot use ISSU to upgrade to 5.4.6-0.1 from any previous software version.

## Licensing this Software Version on an SBx908 Switch

Release licenses are applied with the **license certificate** command, then validated with the **show license** or **show license brief** commands. Follow these steps:

- Obtain the MAC address for a switch
- Obtain a release license for a switch
- Apply a release license on a switch
- Confirm release license application

### Step 1: Obtain the MAC address for a switch

A release license is tied to the MAC address of the switch.

Switches may have several MAC addresses. Use the **show system mac license** command to show the switch MAC address for release licensing:

```
awplus# show system mac license
MAC address for licensing:
eccd.6d9d.4eed
```

### Step 2: Obtain a release license for a switch

Contact your authorized Allied Telesis support center to obtain a release license.

### Step 3: Apply a release license on a switch

Use the **license certificate** command to apply a release license to your switch.

Note the license certificate file can be stored on internal flash memory, or an external SD card, or on a server accessible by the TFTP, SCP or HTTP protocols.

Entering a valid release license changes the console message displayed about licensing:

```
11:04:56 awplus IMI[1696]: SFL: The current software is not licensed.
awplus#license certificate demo1.csv
A restart of affected modules may be required.
Would you like to continue? (y/n): y
11:58:14 awplus IMI[1696]: SFL: The current software is licensed. Exiting
unlicensed mode.

Stack member 1 installed 1 license

1 license installed.
```

## Step 4: Confirm release license application

On a stand-alone switch, use the commands **show license** or **show license brief** to confirm release license application.

On a stacked switch, use the command **show license member** or **show license brief member** to confirm release license application.

The **show license** command displays the base feature license and any other feature and release licenses installed on AlliedWare Plus switches:

```
awplus# show license
OEM Territory : ATI USA
Software Licenses
-----
Index                : 1
License name         : Base License
Customer name        : ABC Consulting
Quantity of licenses : 1
Type of license      : Full
License issue date   : 20-Mar-2016
License expiry date  : N/A
Features included    : EPSR-MASTER, IPv6Basic, MLDSnoop, OSPF-64,
                      RADIUS-100, RIP, VRRP

Index                : 2
License name         : 5.4.6-r1
Customer name        : ABC Consulting
Quantity of licenses : -
Type of license      : Full
License issue date   : 20-Mar-2016
License expiry date  : N/A
Release              : 5.4.6
```

# Licensing this Software Version on a Control Card for an SBx8100 Series Switch

Release licenses are applied with the **license certificate** command, then validated with the **show license** or **show license brief** commands. Follow these steps:

- Obtain the MAC address for a control card
- Obtain a release license for a control card
- Apply a release license on a control card
- Confirm release license application

If your control card is in a stacked chassis, you do not need to perform these steps on each chassis in the stack, only on the stack master.

If your license certificate contains release licenses for each control card present in a stacked chassis, entering the **license certificate** command on the stack master will automatically apply the release licenses to all the control cards within the stack.

## Step 1: Obtain the MAC address for a control card

A release license is tied to the control card MAC address in a chassis.

Chassis may have several MAC addresses. Use the **show system mac license** command to show the control card MAC address for release licensing. Note the MAC addresses for each control card in the chassis. The chassis MAC address is not used for release licensing. Use the card MAC address for release licensing.

```
awplus#show system mac license
MAC address for licensing:

Card                MAC Address
-----
1.5                 eccd.6d9e.3312
1.6                 eccd.6db3.58e7

Chassis MAC Address eccd.6d7b.3bc2
```

## Step 2: Obtain a release license for a control card

Contact your authorized Allied Telesis support center to obtain a release license.

## Step 3: Apply a release license on a control card

Use the **license certificate** command to apply a release license to each control card installed in your chassis or stack.

Note the license certificate file can be stored on internal flash memory, a USB drive, or on a server accessible by the TFTP, SCP or HTTP protocols.

Entering a valid release license changes the console message displayed about licensing:

```
11:04:56 awplus IMI[1696]: SFL: The current software is not licensed.
awplus# license certificate demol.csv
A restart of affected modules may be required.
Would you like to continue? (y/n): y
11:58:14 awplus IMI[1696]: SFL: The current software is licensed. Exiting
unlicensed mode.

Stack member 1 installed 1 license

1 license installed.
```

#### Step 4: Confirm release license application

On a stand-alone chassis, use the commands **show license** or **show license brief** to confirm release license application.

On a stacked chassis, use the command **show license member** or **show license brief member** to confirm release license application.

The **show license** command displays the base feature license and any other feature and release licenses installed on AlliedWare Plus chassis:

```
awplus# show license
OEM Territory : ATI USA
Software Licenses
-----
Index                : 1
License name         : Base License
Customer name        : ABC Consulting
Quantity of licenses : 1
Type of license      : Full
License issue date   : 20-Mar-2016
License expiry date  : N/A
Features included    : IPv6Basic, LAG-FULL, MLDSnoop, RADIUS-100
                     : Virtual-MAC, VRRP

Index                : 2
License name         : 5.4.6-rl
Customer name        : ABC Consulting
Quantity of licenses : -
Type of license      : Full
License issue date   : 20-Mar-2016
License expiry date  : N/A
Release              : 5.4.6
```

## Installing this Software Version

**Caution:** Software versions 5.4.6-x.x require a release license for the SBx908 and SBx8100 switches. Contact your authorized Allied Telesis support center to obtain a license. For details, see:

- “Licensing this Software Version on an SBx908 Switch” on page 106 and
- “Licensing this Software Version on a Control Card for an SBx8100 Series Switch” on page 108.

To install and enable this software version, use the following steps:

1. Copy the software version file (.rel) onto your TFTP server.
2. If necessary, delete or move files to create space in the switch’s Flash memory for the new file. To see the memory usage, use the command:

```
awplus# show file systems
```

To list files, use the command:

```
awplus# dir
```

To delete files, use the command:

```
awplus# del <filename>
```

You cannot delete the current boot file.

3. Copy the new release from your TFTP server onto the switch.

```
awplus# copy tftp flash
```

Follow the onscreen prompts to specify the server and file.

4. Move from Privileged Exec mode to Global Configuration mode, using:

```
awplus# configure terminal
```

Then set the switch to reboot with the new software version. For example, for 5.4.6-0.1, use one of the following commands:

Product	Command
x210 series	awplus(config)# boot system x210-5.4.6-0.1.rel
x230 series	awplus(config)# boot system x230-5.4.6-0.1.rel
IE200 series	awplus(config)# boot system IE200-5.4.6-0.1.rel
x310 series	awplus(config)# boot system x310-5.4.6-0.1.rel
IX5-28GPX	awplus(config)# boot system IX5-5.4.6-0.1.rel
x510 series	awplus(config)# boot system x510-5.4.6-0.1.rel
IE510-28GSX	awplus(config)# boot system IE510-5.4.6-0.1.rel
x610 series	awplus(config)# boot system x610-5.4.6-0.1.rel
SBx908	awplus(config)# boot system SBx908-5.4.6-0.1.rel
x930 series	awplus(config)# boot system SBx930-5.4.6-0.1.rel
DC2552XS/L3	awplus(config)# boot system DC2500-5.4.6-0.1.rel
SBx8100 with CFC400	awplus(config)# boot system SBx81CFC400-5.4.6-0.1.rel

Product	Command
SBx8100 with CFC960	<code>awplus(config)# boot system SBx81CFC960-5.4.6-0.1.rel</code>
AR2050V	<code>awplus(config)# boot system AR2050V-5.4.6-0.1.rel</code>
AR3050S	<code>awplus(config)# boot system AR3050S-5.4.6-0.1.rel</code>
AR4050S	<code>awplus(config)# boot system AR4050S-5.4.6-0.1.rel</code>

5. Return to Privileged Exec mode and check the boot settings, using:

```
awplus(config)# exit
awplus# show boot
```

6. Reboot using the new software version.

```
awplus# reload
```

## Installing the Switch GUI

This section describes how to install and set up the java-based GUI for switches. The GUI enables you to monitor and manage your AlliedWare Plus switch from your browser.

To install and run the GUI, you need the following system products and setup:

- PC Platform:  
Windows XP SP2 and up / Windows Vista SP1 and up
- Browser: (must support Java Runtime Environment (JRE) version 6)  
Microsoft Internet Explorer 7.0 and up / Mozilla Firefox 2.0 and up

To install the GUI on your switch, use the following steps:

1. Copy to the GUI Java applet file (**.jar** extension) onto your TFTP server, SD card or USB storage device.
2. Connect to the switch's management port, then log into the switch.
3. If necessary, delete or move files to create space in the switch's Flash memory for the new file.

To see the memory usage, use the command:

```
awplus# show file systems
```

To list files, use the command:

```
awplus# dir
```

To delete files, use the command:

```
awplus# del <filename>
```

You cannot delete the current boot file.

4. Assign an IP address for connecting to the GUI. Use the commands:

```
awplus# configure terminal
```

```
awplus(config)# interface vlan1
```

```
awplus(config-if)# ip address <address>/<prefix-length>
```

Where *<address>* is the IP address that you will subsequently browse to when you connect to the GUI Java applet. For example, to give the switch an IP address of 192.168.2.6, with a subnet mask of 255.255.255.0, use the command:

```
awplus(config-if)# ip address 192.168.2.6/24
```

5. If required, configure a default gateway for the switch.

```
awplus(config-if)# exit
```

```
awplus(config)# ip route 0.0.0.0/0 <gateway-address>
```

Where *<gateway-address>* is the IP address for your gateway device. You do not need to define a default gateway if you browse to the switch from within its own subnet.

6. Copy the GUI file onto your switch from the TFTP server, SD card, or USB storage device.

**TFTP server:** Use the command:

```
awplus# copy tftp://<server-address>/<filename.jar> flash:/
```

**SD card:** use the command:

```
awplus# copy card:/<filename.jar> flash:/
```

USB storage device: use the command:

```
awplus# copy usb:/<filename.jar> flash:/
```

where <server-address> is the IP address of the TFTP server, and where <filename.jar> is the filename of the GUI Java applet.

7. Ensure the HTTP service is enabled on your switch. Use the commands:

```
awplus# configure terminal
```

```
awplus(config)# service http
```

The HTTP service needs to be enabled on the switch before it accepts connections from a web browser. The HTTP service is enabled by default. However, if the HTTP has been disabled then you must enable the HTTP service again.

8. Create a user account for logging into the GUI.

```
awplus(config)# username <username> privilege 15 password  
                <password>
```

You can create multiple users to log into the GUI. For information about the **username** command, see the AlliedWare Plus Command Reference.

9. Start the Java Control Panel, to enable Java within a browser

On your PC, start the Java Control Panel by opening the Windows Control Panel from the Windows Start menu. Then enter Java Control Panel in the search field to display and open the Java Control Panel.

Next, click on the 'Security' tab. Ensure the 'Enable Java content in the browser' checkbox is selected on this tab.

10. Enter the URL in the Java Control Panel Exception Site List

Click on the 'Edit Site List' button in the Java Control Panel dialog Security tab to enter a URL in the Exception Site List dialog. In the 'Exception Site List' dialog, enter the IP address you configured in Step 4, with a http:// prefix.

After entering the URL click the Add button then click OK.

11. Log into the GUI.

Start a browser and enter the switch's IP address. The GUI starts up and displays a login screen. Log in with the username and password specified in the previous step.
