| ipv6       | Keyword used prior to specifying an IPv6 address                                                                                           |
| <hostname> | IPv4/IPv6 address or hostname of a remote server in the format a.b.c.d for an IPv4 address, or in the format x:x::x:x for an IPv6 address. |
| rsa        | Specify the RSA public key of the server to be added to the known host database.                                                           |
| dsa        | Specify the DSA public key of the server to be added to the known host database.                                                           |
| rsa1       | Specify the SSHv1 public key of the server to be added to the know host database.                                                          |
| <1-65535>  | Specify a key identifier when removing a key using the <b>no</b> parameter.                                                                |

**Default** If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

**Mode** Privilege Exec

**Usage** This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

**Examples** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

**Examples (VRF-lite)** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 in VRF red to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts vrf red 192.0.2.11
```

To delete the second entry in the known host database in VRF red, use the command:

```
awplus# no crypto key pubkey-chain knownhosts vrf red 2
```

**Validation Commands** [show crypto key pubkey-chain knownhosts](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# default-metric (RIP)

**Overview** Use this command to specify the metrics to be assigned to redistributed RIP routes. Use the **no** variant of this command to reset the RIP metric back to its default (1).

**Syntax** `default-metric <metric>`  
`no default-metric [<metric>]`

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| <metric>  | <1-16> Specifies the value of the default metric. |

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** This command is used with the [redistribute \(RIP\)](#) command to make the routing protocol use the specified metric value for all redistributed routes, regardless of the original protocol that the route has been redistributed from.

**Examples** This example assigns the cost of 10 to the routes that are redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-metric 10
awplus(config-router)# redistribute ospf
awplus(config-router)# redistribute connected
```

**Example (VRF-lite)** This example assigns the cost of 10 to the routes which are redistributed into RIP for the VRF instance blue.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 vrf blue
awplus(config-router-af)# default-metric 10
awplus(config-router-af)# redistribute ospf
awplus(config-router-af)# redistribute connected
```

**Related Commands** [redistribute \(RIP\)](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# description (VRF)

**Overview** Use this command to add text that describes a specific VRF instance. Descriptions can be up to 80 characters long.

The **no** variant of this command removes the description of the selected VRF instance.

**Syntax** `description <descriptive-text>`  
`no description`

| Parameter                             | Description                                                      |
|---------------------------------------|------------------------------------------------------------------|
| <code>&lt;descriptive-text&gt;</code> | A string of up to 80 characters that describes the VRF instance. |

**Mode** VRF Configuration

**Example** To add the description for a VRF instance named blue, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# description the text description of vrf
blue
```

**Related Commands** [show ip vrf](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# distance (RIP)

**Overview** This command sets the administrative distance for RIP routes. Your device uses this value to select between two or more routes to the same destination obtained from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). For more information, see the [Route Selection Feature Overview and Configuration Guide](#).

The **no** variant of this command sets the administrative distance for the RIP route to the default of 120.

**Syntax** `distance <1-255> [<ip-addr/prefix-length>]`  
`no distance [<1-255>] [<ip-addr/prefix-length>]`

| Parameter               | Description                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------|
| <1-255>                 | The administrative distance value you are setting for this RIP route.                           |
| <ip-addr/prefix-length> | The network IP address and prefix-length that you are changing the administrative distance for. |

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Examples** To set the administrative distance to 8 for the RIP routes within the 10.0.0.0/8 network, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distance 8 10.0.0.0/8
```

To set the administrative distance to the default of 120 for the RIP routes within the 10.0.0.0/8 network, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no distance 8 10.0.0.0/8
```

**Example (VRF-lite)** This example assigns a cost of 10 to the routes for the VRF instance blue, when redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 blue
awplus(config-router-af)# distance 10
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# distribute-list (RIP)

**Overview** Use this command to filter incoming or outgoing route updates using the prefix-list.

When running VRF-lite, this command can be applied to a specific VRF instance.

Use the **no** variant of this command to disable this feature.

**Syntax** `distribute-list prefix <prefix-list> {in|out} [<interface>]`  
`no distribute-list prefix <prefix-list> {in|out} [<interface>]`

| Parameter     | Description                                                                      |
|---------------|----------------------------------------------------------------------------------|
| prefix        | Filter prefixes in routing updates.                                              |
| <prefix-list> | Specifies the name of the IPv4 prefix-list to use.                               |
| in            | Filter incoming routing updates.                                                 |
| out           | Filter outgoing routing updates.                                                 |
| <interface>   | The interface on which distribute-list applies. For instance: <code>vlan2</code> |

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** Filter out incoming or outgoing route updates using prefix-list. If you do not specify the name of the interface, the filter will be applied to all interfaces.

**Examples** In this example the following commands are used to apply a prefix list called myfilter to filter incoming routing updates in `vlan2`

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list prefix myfilter in vlan2
```

**Example (VRF-lite)** This example applies the commands of the previous example, but to a specific VRF named blue:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# distribute-list prefix myfilter in
vlan2
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# export map

**Overview** This command associates a route map with a specific VRF instance. It provides a finer control over the routes that are exported out of a VRF instance by the **route-target** command. Note, however, that this command does not replace the need for a route-target export in the VRF configuration.

The **no** variant of this command disables the capability to export route map entries for a specified VRF instance.

**Syntax** `export map <route-map>`  
`no export map`

| Parameter                      | Description         |
|--------------------------------|---------------------|
| <code>&lt;route-map&gt;</code> | The route-map name. |

**Mode** VRF Configuration

**Usage** Use this command to export route-map entries in VRF configuration mode.

**Example** To export the route map named routemap2 for the VRF instance named blue, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# export map routemap2
```

**Related Commands** [import map](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# fullupdate (RIP)

**Overview** Use this command to specify which routes RIP should advertise when performing a triggered update. By default, when a triggered update is sent, RIP will only advertise those routes that have changed since the last update. When **fullupdate** is configured, the device advertises the full RIP route table in outgoing triggered updates, including routes that have not changed. This enables faster convergence times, or allows inter-operation with legacy network equipment, but at the expense of larger update messages.

Use the **no** variant of this command to disable this feature.

**Syntax** fullupdate  
no fullupdate

**Default** By default this feature is disabled.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage (VRF-lite)** If VRF-lite is configured, you can apply this command for either the global routing environment, or to a specific VRF instance.

**Example** To enable the fullupdate (RIP) function, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# fullupdate
```

**Example (VRF-lite)** To enable the full update (RIP) function on the VRF instance named 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# fullupdate
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# import map

**Overview** The import map command associates a route map with a specific VRF instance. The import map command does not replace the need for a route-target import in the VRF configuration. It provides a finer control over the routes imported into a VRF instance by the **route-target** command.

The **no** variant of this command disables the capability to import route map entries for a specified VRF instance.

**Syntax** `import map <route-map>`  
`no import map`

| Parameter                      | Description         |
|--------------------------------|---------------------|
| <code>&lt;route-map&gt;</code> | The route-map name. |

**Mode** VRF Configuration

**Usage** Use this command to import route-map entries into the specified VRF instance.

**Example** To import the route map named `routemap2` for the VRF instance named `blue`, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# import map routemap2
```

**Related Commands** [export map](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# ip route static inter-vrf

**Overview** Applying this command enables static inter-VRF routing. Note that static inter-VRF routing must be enabled before you can use the **ip route** command to create a static inter-VRF route.

The **no** variant of this command disables static inter-VRF routing.

**Syntax** `ip route static inter-vrf`  
`no ip route static inter-vrf`

**Mode** VRF Configuration

**Default** Static inter-VRF routing is enabled.

**Example** To enable static inter-VRF routing, use the following commands:

```
awplus# config terminal
awplus(config)# ip route static inter-vrf
```

**Related Commands** [ip route](#)  
[show ip route](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# ip route

**Overview** This command adds a static route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

When using VRF (Virtual Routing and Forwarding), you can use this command to configure a static inter-VRF route to a destination network that is reachable by a remote gateway located in a different VRF instance. Note that to apply the command in this way, the `ip route static inter-vrf` command must be enabled (its default condition). For more information about VRF, see the [VRF Feature Overview and Configuration Guide](#) and the [VRF-lite Commands](#) chapter.

The **no** variant of this command removes the static route from the RIB and FIB.

**Syntax** `ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]`  
`no ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]`

**Syntax (VRF-lite)** `ip route [vrf <vrf-name>] <subnet&mask> [<gateway-ip>] [<interface>] [<distance>]`  
`no ip route [vrf <vrf-name>] <subnet&mask> [<gateway-ip>] [<interface>] [<distance>]`

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;subnet&amp;mask&gt;</code> | The IPv4 address of the destination subnet defined using either a prefix length or a separate mask specified in one of the following formats: <ul style="list-style-type: none"> <li>The IPv4 subnet address in dotted decimal notation followed by the subnet mask, also in dotted decimal notation.</li> <li>The IPv4 subnet address in dotted decimal notation, followed by a forward slash, then the prefix length</li> </ul>                                                                                                                     |
| <code>&lt;gateway-ip&gt;</code>      | The IPv4 address of the gateway device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>&lt;interface&gt;</code>       | The interface that connects your device to the network. Enter the name of the VLAN or its VID. You can also enter 'null' as an interface. Specify a 'null' interface to add a null or blackhole route to the switch.<br>The gateway IP address or the interface is required if VRF-lite is not configured.<br>If VRF-lite is configured: When adding a static intra-VRF route, you must specify either the gateway IP address or the interface. When adding a static inter-VRF route, you must specify both the gateway IP address and the interface. |
| <code>&lt;distance&gt;</code>        | The administrative distance for the static route in the range <1-255>. Static routes by default have an administrative distance of 1.                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Parameter  | Description                                                         |
|------------|---------------------------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance.                  |
| <vrf-name> | The name of the VRF instance to enter IPv4 Address-Family mode for. |

**Mode** Global Configuration

**Default** The default administrative distance for a static route is 1 for priority over non-static routes.

**Usage** Administrative distance can be modified so that static routes do not take priority over other routes.

Specify a 'Null' interface to add a null or blackhole route to the switch. A null or blackhole route is a routing table entry that does not forward packets, so any packets sent to it are dropped.

**Examples** To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To remove the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# no ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To specify a null or blackhole route 192.168.4.0/24, so packets forwarded to this route are dropped, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.4.0/24 null
```

To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with an administrative distance of 128, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
128
```

**Examples (VRF-lite)** To create a static route from source VRF instance red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6, use the following commands for static intra-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
```

To remove a static route from source VRF red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6, use the following commands for static intra-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# no ip route vrf red 192.168.50.0/24
192.168.20.6
```

To create a static route from source VRF red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6 via vlan10, use the following commands for static inter-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
vlan10
```

**Related  
Commands** [show ip route](#)  
[show ip route database](#)

**Command  
changes** Version 5.4.6-2.1: VRF-lite support added.

## ip vrf

**Overview** This command creates a VRF instance and specifies its unique name. You can also optionally specify a VRF ID. If you do not specify the VRF ID, a unique ID will automatically be created and assigned to the VRF instance.

The **no** variant of this command removes a selected VRF instance. All interfaces previously belonging to the removed instance are then returned to the global routing and forwarding environment.

**Syntax** `ip vrf <vrf-name> [<vrf-inst-id>]`  
`no ip vrf <vrf-name> [<vrf-inst-id>]`

| Parameter                        | Description                                               |
|----------------------------------|-----------------------------------------------------------|
| <code>&lt;vrf-name&gt;</code>    | The name of the VRF instance.                             |
| <code>&lt;vrf-inst-id&gt;</code> | The ID of the VRF instance, a number in the range 1 to 8. |

**Mode** Global Configuration

**Default** Static inter-VRF routing is enabled.

**Example** To create a VRF instance named `vrf blue` and assign it the ID number `2`, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue 2
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# ip vrf forwarding

**Overview** This command associates a VRF instance with an interface.  
The **no** variant of this command disassociates the VRF instance from its interface.

**Syntax** `ip vrf forwarding <vrf-name>`  
`no ip vrf <vrf-name>`

| Parameter                     | Description                   |
|-------------------------------|-------------------------------|
| <code>&lt;vrf-name&gt;</code> | The name of the VRF instance. |

**Mode** Interface Configuration

**Default** The default for an interface is the global routing table.

**Examples** For LAN interfaces, to associate the VRF instance named `blue` with the VLAN interface `vlan-admin`, use the following commands:

```
awplus# config terminal
awplus(config)# interface vlan-admin
awplus(config-if)# ip vrf forwarding blue
```

**Related Commands** `show ip vrf`  
`show ip vrf detail`

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# max-fib-routes (VRF)

**Overview** This command now enables you to control the maximum number of FIB routes configured for a VRF instance. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds.

**NOTE:** This command applies to a user-defined VRF instance; to set the max-fib-routes for the Global VRF instance use the [max-fib-routes](#) command. For static routes use the [max-static-routes](#) command for the Global VRF instance and the [max-static-routes \(VRF\)](#) command for a user-defined VRF instance.

Use the **no** variant of this command to set the maximum number of FIB routes to the default of 4294967294 FIB routes.

**Syntax** `max-fib-routes <1-4294967294> [<1-100>|warning-only]`  
`no max-fib-routes`

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>max-fib-routes</code>       | The maximum number of routes that can be stored in Forwarding Information dataBase for either the Global VRF or a VRF instance.                                                                                                                                                                                                              |
| <code>&lt;1-4294967294&gt;</code> | The allowable configurable range for setting the maximum number of FIB-routes.                                                                                                                                                                                                                                                               |
| <code>&lt;1-100&gt;</code>        | This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached. |
| <code>warning-only</code>         | This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value configured. Routes can continue to be added until your switch reaches either the maximum capacity value of 4294967294, or a practical system limit.                                  |

**Mode** VRF Configuration

**Default** Sets the maximum number of dynamic routes to 4294967294 and no warning threshold.

**Examples** To set the maximum number of dynamic routes to 2000 and warning threshold of 75% on VRF instance blue, use the commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# max-fib-routes 2000 75
```

**Related  
Commands** [max-fib-routes](#)  
[show ip route](#)

**Command  
changes** Version 5.4.6-2.1: VRF-lite support added.

# max-static-routes (VRF)

**Overview** Use this command to set the maximum number of static routes (excluding FIB—Forwarding Information Base routes) for VRF instances. A limit of 1000 static routes can be assigned to each individual VRF instance. For example you can assign 800 static routes to the Global VRF, then also assign 600 static routes to VRF instance Blue, and a further 600 routes to VRF instance Green.

**NOTE:** This command applies to a user-defined VRF instance; to set the max-static-routes for the Global VRF instance use the [max-static-routes](#) command. For FIB routes use the [max-fib-routes](#) command for the Global VRF instance and the [max-fib-routes \(VRF\)](#) command for a user-defined VRF instance.

Use the **no** variant of this command to reset the maximum number of static routes to the default value of 1000.

**Syntax** max-static-routes <1-1000>  
no max-static-routes

**Default** The default number of static routes is the maximum number of static routes (1000).

**Mode** VRF Configuration

**Example** To assign 200 static routes to VRF instance Blue, use the following commands:

```
awplus# configure terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# max-static-routes 200
```

**NOTE:** Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

**Related Commands** [max-fib-routes \(VRF\)](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# neighbor next-hop-self

**Overview** Use this command to configure the BGP or BGP4+ router as the next hop for a BGP or BGP4+ speaking neighbor or peer group.

Use the **no** variant of this command to disable this feature.

**Syntax** `neighbor <neighborid> next-hop-self`  
`no neighbor <neighborid> next-hop-self`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   <ipv6-addr>   <peer-group> }                                                                                                                                                                                                                                                                              |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** This command allows a BGP or BGP4+ router to change the next hop information that is sent to the iBGP peer. The next hop information is set to the IP address of the interface used to communicate with the neighbor.

This command can be run for a specific VRF instance.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 next-hop-self
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
next-hop-self

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
next-hop-self

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 next-hop-self

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 next-hop-self
```

**Related**  
**Commands**

[neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

# neighbor remote-as

**Overview** Use this command to configure an internal or external BGP or BGP4+ (iBGP or eBGP) peering relationship with another router.

Use the **no** variant of this command to remove a previously configured BGP or BGP4+ peering relationship.

**Syntax** `neighbor <neighborid> remote-as <as-number>`  
`no neighbor <neighborid> remote-as <as-number>`

**Syntax (VRF- lite)** `neighbor <neighborid> remote-as <as-number> [global|vrf <vrf-name>]`  
`no neighbor <neighborid> remote-as <as-number>`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | {<ip-address>   ipv6-addr   <peer-group>}                                                                                                                                                                                                                                                                                  |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <as-number>  | <1-4294967295> Neighbor's Autonomous System (AS) number.                                                                                                                                                                                                                                                                   |
| global       | Specify that the remote neighbor exists locally within the device, in the global routing domain                                                                                                                                                                                                                            |
| vrf          | Specify that the remote neighbor exists locally within the device, in the specified VRF instance.                                                                                                                                                                                                                          |
| <vrf-name>   | The name of the VRF instance.                                                                                                                                                                                                                                                                                              |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** This command is used to configure iBGP and eBGP peering relationships with other BGP or BGP4+ neighbors. A peer-group support of this command is configured only after creating a specific peer-group. Use the **no** variant of this command to remove a previously configured BGP peering relationship.

The **vrf** and **global** parameters are used to create internal 'loopback' BGP connections within the device between two VRF instances. This is used to leak BGP routes between a named VRF instance and the global routing instance. This requires BGP neighbors to be configured in both the global routing instance and in the named VRF instance.

**Examples [BGP]** To configure a BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 from another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 remote-as 10
```

To configure a BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Examples [BGP4+]** To configure a BGP4+ peering relationship with another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 345
```

To remove a configured BGP4+ peering relationship from another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# no neighbor 2001:0db8:010d::1 remote-as 345
```

To configure a BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Command  
changes**

Version 5.4.6-2.1: VRF-lite support added.

# neighbor password

**Overview** Use this command to enable MD5 authentication on a TCP connection between BGP and BGP4+ neighbors. No authentication is applied by default. To setup authentication for the session, you must first apply authentication on each connected peer for the session.

Use the **no** variant of this command to disable this function.

**Syntax [BGP]** `neighbor {<ip-address>|<peer-group-name>} password <password>`  
`no neighbor {<ip-address>|<peer-group-name>} password`  
`[<password>]`

**Syntax [BGP4+]** `neighbor {<ipv6-addr>|<peer-group-name>} password <password>`  
`no neighbor {<ipv6-addr>|<peer-group-name>} password`  
`[<password>]`

| Parameter                            | Description                                                                                                                             |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code>      | Specifies the IP address of the BGP neighbor, in A.B.C.D format.                                                                        |
| <code>&lt;ipv6-addr&gt;</code>       | Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                        |
| <code>&lt;peer-group-name&gt;</code> | Name of an existing peer-group. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;password&gt;</code>        | An alphanumeric string of characters to be used as password.                                                                            |

**Default** No authentication is applied by default.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** When using the `<peer-group-name>` parameter with this command (to apply this command to all peers in the group), see the related commands [neighbor peer-group \(add a neighbor\)](#) and [neighbor route-map](#) for information about how to create peer groups first.

**Examples [BGP]** This example specifies the encryption type and the password 'manager' for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 password manager
```

This example removes the password set for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 password
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

**Examples  
(VRF-lite)**

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor 10.10.10.1 password manager
```

This example removes the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# no neighbor 10.10.10.1 password
manager
```

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor group1 password manager
```

**Examples [BGP4+]** This example specifies the encryption type and the password 'manager' for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor password manager
2001:0db8:010d::1
```

This example removes the password set for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor password 2001:0db8:010d::1
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor remote-as 102001:0db8:010d::1
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor peer-group group1
2001:0db8:010d::1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

**Related Commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# network (RIP)

**Overview** Use this command to activate the transmission of RIP routing information on the defined network.

Use the **no** variant of this command to remove the specified network or VLAN as one that runs RIP.

**Syntax** `network {<network-address>[/<subnet-mask>] | <vlan-name>}`  
`no network {<network-address>[/<subnet-mask>] | <vlan-name>}`

| Parameter                                                                   | Description                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;network-address&gt;</code><br><code>[/&lt;subnet-mask&gt;]</code> | Specifies the network address to run RIP. Entering a subnet mask (or prefix length) for the network address is optional. Where no mask is entered, the device will attempt to apply a mask that is appropriate to the class (A, B, or C) of the address entered, e.g. an IP address of 10.0.0.0 will have a prefix length of 8 applied to it. |
| <code>&lt;vlan-name&gt;</code>                                              | Specify a VLAN name with up to 32 alphanumeric characters to run RIP.                                                                                                                                                                                                                                                                         |

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** Use this command to specify networks, or VLANs, to which routing updates will be sent and received. The connected routes corresponding to the specified network, or VLANs, will be automatically advertised in RIP updates. RIP updates will be sent and received within the specified network or VLAN.

When running VRF-lite, this command can be applied to a VRF instance.

**Example** Use the following commands to activate RIP routing updates on network 172.16.20.0/24:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# network 172.16.20.0/24
```

**Example (VRF-lite)** To activate RIP routing updates on vlan3 for VRF instance 'blue'.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# network vlan3
```

**Related  
Commands** show ip rip  
show running-config  
clear ip rip route

**Command  
changes** Version 5.4.6-2.1: VRF-lite support added.

# passive-interface (RIP)

**Overview** Use this command to block RIP broadcasts on the interface.  
Use the **no** variant of this command to disable this function.

**Syntax** `passive-interface <interface>`  
`no passive-interface <interface>`

| Parameter                      | Description                   |
|--------------------------------|-------------------------------|
| <code>&lt;interface&gt;</code> | Specifies the interface name. |

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Example** Use the following commands to block RIP broadcasts on vlan20:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan20
```

**Example (VRF-lite)** To apply this above example to a specific VRF instance named 'green', use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# passive-interface vlan20
```

**Related Commands** [show ip rip](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# ping

**Overview** This command sends a query to another IPv4 host (send Echo Request messages).

**Syntax** ping [ip] <host> [broadcast] [df-bit {yes|no}] [interval <0-128>] [pattern <hex-data-pattern>] [repeat {<1-2147483647>|continuous}] [size <36-18024>] [source <ip-addr>] [timeout <1-65535>] [tos <0-255>]

**Syntax (VRF-lite)** ping [vrf <vrf-name>] [ip] <host> [broadcast] [df-bit {yes|no}] [interval <0-128>] [pattern <hex-data-pattern>] [repeat {<1-2147483647>|continuous}] [size <36-18024>] [source <ip-addr>] [timeout <1-65535>] [tos <0-255>]

| Parameter                  | Description                                                                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <host>                     | The destination IP address or hostname.                                                                                                                                                                              |
| broadcast                  | Allow pinging of a broadcast address.                                                                                                                                                                                |
| df-bit                     | Enable or disable the do-not-fragment bit in the IP header.                                                                                                                                                          |
| interval <0-128>           | Specify the time interval in seconds between sending ping packets. The default is 1. You can use decimal places to specify fractions of a second. For example, to ping every millisecond, set the interval to 0.001. |
| pattern <hex-data-pattern> | Specify the hex data pattern.                                                                                                                                                                                        |
| repeat                     | Specify the number of ping packets to send.                                                                                                                                                                          |
| <1-2147483647>             | Specify repeat count. The default is 5.                                                                                                                                                                              |
| continuous                 | Continuous ping                                                                                                                                                                                                      |
| size <36-18024>            | The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).                                                                                                          |
| source <ip-addr>           | The IP address of a configured IP interface to use as the source in the IP header of the ping packet.                                                                                                                |
| timeout <1-65535>          | The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.                                                 |
| tos <0-255>                | The value of the type of service in the IP header.                                                                                                                                                                   |
| vrf                        | Apply the command to the specified VRF instance.                                                                                                                                                                     |
| <vrf-name>                 | The name of the VRF instance.                                                                                                                                                                                        |

**Mode** User Exec and Privileged Exec

**Example** To ping the IP address 10.10.0.5 use the following command:

```
awplus# ping 10.10.0.5
```

**Example (VRF-lite)** To ping the IP address 10.10.0.5 from VRF instance 'red', use the following command:

```
awplus# ping vrf red 10.10.0.5
```

**NOTE:** *Unless a cross-domain static or leaked route exists to the destination IP address, you must run this command from within the same routing domain as the address being pinged.*

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# rd (route distinguisher)

**Overview** This command creates a Route Distinguisher (RD). The RD forms part of the route table creation process for a VRF instance and is implemented only when using BGP routing.

**Syntax** `rd {<ASN:n>|<ip-address:n>}`

**CAUTION:** This command does not have a “no” variant. To remove the RD requires deleting the VRF instance to which it is assigned. Therefore, it is important that you carefully enter the correct value for the RD.

| Parameter      | Description                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ASN:n>        | The RD reference number. This is based on the formal RD format structure of ASN number:Ref number.<br>The ASN value can be any number between 1 and 4294967295, and the value n can be any number between 1 and 65535. |
| <ip-address:n> | The RD reference number. This is based on the formal RD format structure of IP-address:Ref number.<br>The IP-address must be in IPv4 format. The value n can be any number between 1 and 65535.                        |

**NOTE:** The above table refers to an ASN or Autonomous System Number. If you have a formal ASN number assigned to your BGP network, you should enter this value. Alternatively; because the Route Distinguisher has limited functionality in VRF-lite, you can use an unofficial value for your ASN when configuring this particular command.

**Mode** VRF Configuration

**Usage** For the implementation of VRF-lite installed on your switch, this command has little practical functionality. However, the switch does check certain components of the RD that you enter. For this reason, the RD syntax must comply with the structural formats defined above, and each value that you assign to a VRF instance must be unique on the switch. Good networking practice is to use common values for the RD and RT within a VRF instance.

**Default** No default RD is configured.

**Example** To create an RD 100:2 that is associated with VRF “red” use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf red
awplus(config-vrf)# rd 100:2
```

**Related Commands** [show ip vrf](#)

# redistribute (into BGP or BGP4+)

**Overview** Use this command to inject routes from one routing process into a BGP or BGP4+ routing table.

Use the **no** variant of this command to disable this function.

**Syntax** `redistribute {ospf|rip|connected|static} [route-map <route-map-entry-pointer>]`  
`no redistribute {ospf|rip|connected|static} [route-map <route-map-entry-pointer>]`

| Parameter                 | Description                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------|
| connected                 | Specifies the redistribution of connected routes for both BGP and BGP4+.                  |
| ospf                      | Specifies the redistribution of OSPF information for BGP or OSPFv3 information for BGP4+. |
| rip                       | Specifies the redistribution of RIP information for BGP or RIPng information for BGP4+.   |
| static                    | Specifies the redistribution of Static routes for both BGP and BGP4+.                     |
| route-map                 | Route map reference for both BGP and BGP4+.                                               |
| <route-map-entry-pointer> | Pointer to route-map entries.                                                             |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration or IPv6 Address Family Configuration

**Usage** Redistribution is used by routing protocols to advertise routes that are learned by some other means, such as by another routing protocol or by static routes. Since all internal routes are dumped into BGP, careful filtering is applied to make sure that only routes to be advertised reach the internet, not everything. This command allows redistribution by injecting prefixes from one routing protocol into another routing protocol.

**Examples [BGP/ BGP+]** The following example shows the configuration of a route-map named `rmap1`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 1
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 12
awplus(config-router)# redistribute ospf route-map rmap1
```

To apply the above example to a specific VRF instance named `blue`, use the following commands:

```
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute ospf route-map rmap1
```

The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp route-map rmap2
```

Note that configuring a route-map and applying it with the `redistribute route-map` command allows you to filter which routes are distributed from another routing protocol (such as OSPF with BGP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# redistribute (OSPF)

**Overview** Use this command to redistribute routes from other routing protocols, static routes and connected routes into an OSPF routing table.

Use the **no** variant of this command to disable this function.

**Syntax**

```
redistribute {bgp|connected|rip|static} {metric
<0-16777214>|metric-type {1|2}|route-map <name>|tag
<0-4294967295>}

no redistribute {bgp|connected|rip|static} {metric
<0-16777214>|metric-type {1|2}|route-map <name>|tag
<0-4294967295>}
```

| Parameter   | Description                                                            |
|-------------|------------------------------------------------------------------------|
| bgp         | Specifies that this applies to the redistribution of BGP routes.       |
| connected   | Specifies that this applies to the redistribution of connected routes. |
| rip         | Specifies that this applies to the redistribution of RIP routes.       |
| static      | Specifies that this applies to the redistribution of static routes.    |
| metric      | Specifies the external metric.                                         |
| metric-type | Specifies the external metric-type.                                    |
| route-map   | Specifies name of the route-map.                                       |
| tag         | Specifies the external route tag.                                      |

**Default** The default metric value for routes redistributed into OSPF is 20. The metric can also be defined using the [set metric](#) command for a route map. Note that a metric defined using the [set metric](#) command for a route map overrides a metric defined with this command.

**Mode** Router Configuration

**Usage** You use this command to inject routes, learned from other routing protocols, into the OSPF domain to generate AS-external-LSAs. If a route-map is configured by this command, then that route-map is used to control which routes are redistributed and can set metric and tag values on particular routes.

The metric, metric-type, and tag values specified on this command are applied to any redistributed routes that are not explicitly given a different metric, metric-type, or tag value by the route map.

See the [OSPF Feature Overview and Configuration Guide](#) for more information about metrics, and about behavior when configured in route maps.

Note that this command does not redistribute the default route. To redistribute the default route, use the [default-information originate](#) command.

**Example** The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command, so routes learned via interface `vlan1` can be redistributed as type-1 external LSAs:

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistributebgp rip route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which routes are distributed from another routing protocol (such as RIP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

**Related Commands**

- [match interface](#)
- [route-map](#)
- [show ip ospf database external](#)

# redistribute (RIP)

**Overview** Use this command to redistribute information from other routing protocols into RIP.

When using VRF-lite, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **route-map** may be used on this command, but have no effect.

**Syntax** `redistribute {connected|static|ospf|bgp} [metric <0-16>]  
[route-map <route-map>]`  
`no redistribute {connected|static|ospf|bgp} [metric] [route-map]`

| Parameter     | Description                                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| route-map     | Optional. Specifies route-map that controls how routes are redistributed.                                                                                                                                                                             |
| <route-map>   | Optional. The name of the route map.                                                                                                                                                                                                                  |
| connected     | Redistribute from connected routes.                                                                                                                                                                                                                   |
| static        | Redistribute from static routes.                                                                                                                                                                                                                      |
| ospf          | Redistribute from Open Shortest Path First (OSPF).                                                                                                                                                                                                    |
| bgp           | Redistribute from Border Gateway Protocol (BGP).                                                                                                                                                                                                      |
| metric <0-16> | Optional. Sets the value of the metric that will be applied to routes redistributed into RIP from other protocols. If a value is not specified, and no value is specified using the <a href="#">default-metric (RIP)</a> command, the default is one. |

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Example** To apply the metric value 15 to static routes being redistributed into RIP, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# redistribute static metric 15
```

**Example (VRF-lite)** To apply the metric value 15 to static routes in address-family ipv4 VRF instance blue being redistributed into RIP, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute static metric 15
```

**Related Commands** [default-metric \(RIP\)](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# route (RIP)

**Overview** Use this command to add a static RIP route.  
Use the **no** variant of this command to remove a static RIP route.

**Syntax** `route <ip-addr/prefix-length>`  
`no route <ip-addr/prefix-length>`

| Parameter                                  | Description                         |
|--------------------------------------------|-------------------------------------|
| <code>&lt;ip-addr/prefix-length&gt;</code> | The IPv4 address and prefix length. |

**Default** No static RIP route is added by default.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** Use this command to add a static RIP route. After adding the RIP route, the route can be checked in the RIP routing table.

**Example** To create a static RIP route to IP subnet 192.168.1.0/24, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# route 192.168.1.0/24
```

**Example (VRF-lite)** To create a static RIP route to IP subnet 192.168.1.0/24, for the VRF instance red, use the following commands

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# route 192.168.1.0/24
```

**Related Commands** [show ip rip](#)  
[clear ip rip route](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# route-target

**Overview** Use this command within a specific VRF instance, to create a route-target within the BGP extended communities path attribute field. This value can then be included in a list of import and export route target extended communities for the specified VRF instance. Learned routes that carry a specific route-target extended community are then imported into all VRFs configured with that extended community as an imported route-target.

The **no** variant of this command removes a route-target extended community for the VRF instance specified.

**Syntax** `route-target {import|export|both} {ASN:n|ip-address:n}`  
`no route-target {import|export|both} {ASN:n|ip-address:n}`

| Parameter                         | Description                                                                                                                                                                                                                                                                                                       |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>route-target</code>         | Specifies a BGP extended community as a route-target.                                                                                                                                                                                                                                                             |
| <code>import</code>               | Adds the route target to its import list.                                                                                                                                                                                                                                                                         |
| <code>export</code>               | Adds the route target to its export list.                                                                                                                                                                                                                                                                         |
| <code>both</code>                 | Adds the route target to both the import and export lists.                                                                                                                                                                                                                                                        |
| <code>&lt;ASN:n&gt;</code>        | The route target reference number. This uses the same structure that is defined for the RD. This being, ASN number:Ref number. The ASN value can be any number between 1 and 65535, and the value n can be any number between 1 and 4294967295.                                                                   |
| <code>&lt;ip-address:n&gt;</code> | The route target reference number. This uses the same structure that is defined for the RD (Route Distinguisher). This being IP-address:Ref number. In practice, the IP-address can be an entry in IPv4 format, or an integer number between 1 and 4294967295. The value n can be any number between 1 and 65535. |

**Mode** VRF Configuration

**Default** No route-target community attributes are associated with a VRF instance.

**Usage** In VRF systems that use MPLS, there is an close relationship between the Route Target (RT) and the Route Distinguisher (RD) values. For VRF-lite however, this relationship is only implicit in that they share the same format structure.

**Example** Use the following commands to create a route-target extended community for ASN value 200, and a Reference number of 3, within the VRF instance blue:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# route-target import 200:1
```

**Related  
Commands** [ip vrf](#)  
[show ip vrf](#)

# router ospf

**Overview** Use this command to enter Router Configuration mode to configure an OSPF routing process. You must specify the process ID with this command for multiple OSPF routing processes on the device.

Use the **no** variant of this command to terminate an OSPF routing process.

Use the **no** parameter with the **process-id** parameter, to terminate and delete a specific OSPF routing process. If no **process-id** is specified on the **no** variant of this command, then all OSPF routing processes are terminated, and all OSPF configuration is removed.

**Syntax** `router ospf [<process-id>]`  
`no router ospf [<process-id>]`

**Syntax (VRF-lite)** `router ospf [<process-id>] [<vrf-instance>]`  
`no router ospf [<process-id>]`

| Parameter      | Description                                                                  |
|----------------|------------------------------------------------------------------------------|
| <process-id>   | A positive number from 1 to 65535, that is used to define a routing process. |
| <vrf-instance> | The VRF instance to be associated with the OSPF routing process.             |

**Default** No routing process is defined by default.

**Mode** Global Configuration

**Usage** The process ID of OSPF is an optional parameter for the **no** variant of this command only. When removing all instances of OSPF, you do not need to specify each Process ID, but when removing particular instances of OSPF you must specify each Process ID to be removed.

When using VRF-lite, this command can be used to associate a process-id with a VRF instance that has been created using the [ip vrf](#) command.

**Example** To enter Router Configuration mode to configure an existing OSPF routing process 100, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)#
```

**Example (VRF-lite)** To enter Router Configuration mode to configure an existing OSPF routing process 100 for VRF instance `red`, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100 red
awplus(config-router)#
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

## router-id (VRF)

**Overview** Use this command to specify a router identifier (in IP address format). When using VRF-Lite, the router-id is configured for the specified VRF instance.

Use the **no** variant of this command to force OSPF to use the previous OSPF router-id behavior.

**Syntax** `router-id <ip-address>`  
`no router-id`

| Parameter                       | Description                                     |
|---------------------------------|-------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | Specifies the router ID in IPv4 address format. |

**Mode** Router Configuration

**Usage** Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id is used at the next reload or when you restart OSPF manually.

**Example** The following example shows a fixed router ID 10.10.10.60 for the VRF instance red:

```
awplus# configure terminal
awplus(config)# ip vrf red
awplus(config-router)# router-id 10.10.10.60
```

**Related  
Commands** [show ip ospf](#)  
[show ip vrf](#)

# show arp

**Overview** Use this command to display entries in the ARP routing and forwarding table—the ARP cache contains mappings of IP addresses to physical addresses for hosts. To have a dynamic entry in the ARP cache, a host must have used the ARP protocol to access another host.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show arp [security [interface [<interface-list>]]`  
`show arp [statistics [detail][interface [<interface-list>]]]`

**Syntax (VRF-lite)** `show arp [global|security|vrf <vrf-name>]`

| Parameter                           | Description                                                                                |
|-------------------------------------|--------------------------------------------------------------------------------------------|
| <code>security</code>               | Specify the DHCP Snooping ARP security output option.                                      |
| <code>interface</code>              | Specify an interface list for DHCP Snooping ARP security output.                           |
| <code>&lt;interface-list&gt;</code> | Specify a single Layer 3 interface name, or a range of interfaces.                         |
| <code>statistics</code>             | Specify brief DHCP Snooping ARP security statistics.                                       |
| <code>detail</code>                 | Specify detailed DHCP Snooping ARP security statistics.                                    |
| <code>global</code>                 | When VRF-lite is configured, apply this command to the global routing and forwarding table |
| <code>vrf</code>                    | Apply this command to the specified VRF instance.                                          |
| <code>&lt;vrf-name&gt;</code>       | The VRF instance name                                                                      |

**Mode** User Exec and Privileged Exec

**Usage** Running this command with no additional parameters will display all entries in the ARP routing and forwarding table.

With VRF-lite configured, and no additional parameters entered, the command output displays all entries, listed by their VRF instance. By adding either a specific VRF instance or global parameter entry, you can selectively list ARP entries by their membership of a specific VRF instance.

**Example** To display all ARP entries in the ARP cache, use the following command:

```
awplus# show arp
```

**Output** Figure 34-1: Example output from the **show arp** command

```
awplus#show arp
IP Address MAC Address Interface Port Type
192.168.10.2 0015.77ad.fad8 vlan1 port1.0.1 dynamic
192.168.20.2 0015.77ad.fa48 vlan2 port1.0.2 dynamic
192.168.1.100 00d0.6b04.2a42 vlan2 port1.0.6 static
```

**Example (VRF-lite)** To display the dynamic ARP entries in the global routing instance, use the command:

```
awplus# show arp global
```

**Output** Figure 34-2: Example output from the **show arp global** command

```
awplus#show arp global
IP Address MAC Address Interface Port Type
192.168.10.2 0015.77ad.fad8 vlan1 port1.0.1 dynamic
192.168.20.2 0015.77ad.fa48 vlan2 port1.0.2 dynamic
192.168.1.100 00d0.6b04.2a42 vlan2 port1.0.8 static
```

**Example (VRF-lite)** To display the dynamic ARP entries for a VRF instance 'red', use the command:

```
awplus# show arp vrf red
```

**Output** Figure 34-3: Example output from the **show arp vrf red** command

```
awplus# show arp vrf red
[VRF: red]
IP Address MAC Address Interface Port Type
192.168.10.2 0015.77ad.fad8 vlan1 port1.0.1 dynamic
```

**Table 1:** Parameters in the output of the **show arp** command

| Parameter   | Meaning                                                                                                                                                                                                |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address  | IP address of the network device this entry maps to.                                                                                                                                                   |
| MAC Address | Hardware address of the network device.                                                                                                                                                                |
| Interface   | Interface over which the network device is accessed.                                                                                                                                                   |
| Port        | Physical port that the network device is attached to.                                                                                                                                                  |
| Type        | Whether the entry is a static or dynamic entry. Static entries are added using the <a href="#">arp (IP address MAC)</a> command. Dynamic entries are learned from ARP request/reply message exchanges. |
| VRF         | The name of the VRF instance. The VRF-lite components only display when VRF-lite is configured.                                                                                                        |

**Command  
changes** Version 5.4.6-2.1: VRF-lite support added.

# show crypto key pubkey-chain knownhosts

**Overview** This command displays the list of public keys maintained in the known host database on the device.

**Syntax** `show crypto key pubkey-chain knownhosts [<1-65535>]`

**Syntax (VRF-lite)** `show crypto key pubkey-chain knownhosts [vrf <vrf-name>|global] [<1-65535>]`

| Parameter               | Description                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------|
| global                  | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf                     | Apply the command to the specified VRF instance.                                           |
| <i>&lt;vrf-name&gt;</i> | The name of the VRF instance.                                                              |
| <i>&lt;1-65535&gt;</i>  | Key identifier for a specific key. Displays the public key of the entry if specified.      |

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

When VRF-lite is configured:

- If **vrf** is specified, this command displays the known host database from the specified VRF instance.
- If **global** is specified, this command displays the known host database from the global routing environment.
- If neither **vrf** nor **global** is specified, this command displays the known host database from the global routing environment and each configured VRF.

For more information about VRF, see the [VRF Lite Feature Overview and Configuration Guide](#).

**Examples** To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

**Output** Figure 34-4: Example output from the **show crypto key public-chain knownhosts** command

| No | Hostname                                | Type | Fingerprint                                     |
|----|-----------------------------------------|------|-------------------------------------------------|
| 1  | 172.16.23.1                             | rsa  | c8:33:b1:fe:6f:d3:8c:81:4e:f7:2a:aa:a5:be:df:18 |
| 2  | 172.16.23.10                            | rsa  | c4:79:86:65:ee:a0:1d:a5:6a:e8:fd:1d:d3:4e:37:bd |

**Table 2:** Parameters in the output of the **show crypto key public-chain knownhosts** command

| Parameter   | Description                             |
|-------------|-----------------------------------------|
| No          | Number ID of the key.                   |
| Hostname    | Host name of the known SSH server.      |
| Type        | The algorithm used to generate the key. |
| Fingerprint | Checksum value for the public key.      |

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip bgp cidr-only (BGP only)

**Overview** Use this command to display routes with non-natural network masks.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp cidr-only`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] cidr-only`

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                           |
| <vrf-name> | The name of the VRF instance.                                                              |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp cidr-only`  
`awplus# show ip bgp vrf red cidr-only`

**Output** Figure 34-5: Example output from the **show ip bgp cidr-only** command

```
BGP table version is 0, local router ID is 10.10.10.50

Status codes: s suppressed, d damped, h history, p stale, *
valid, > best, i - internal

Origin codes: i - IGP, e - EGP, ? - incomplete

 Network Next Hop Metric LocPrf Weight Path
*> 3.3.3.0/24 10.10.10.10 0 11 i
*> 6.6.6.0/24 0.0.0.0 32768 i

Total number of prefixes 2
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip bgp community (BGP only)

**Overview** Use this command to display routes that match specified communities from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

You may use any combination and repetition of parameters listed in the *<type>* placeholder.

**Syntax** `show ip bgp community [<type>] [exact-match]`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] community [<type>] [exact-match]`

| Parameter               | Description                                                                                                 |
|-------------------------|-------------------------------------------------------------------------------------------------------------|
| global                  | When VRF-lite is configured, apply the command to the global routing and forwarding table.                  |
| vrf                     | Apply the command to the specified VRF instance.                                                            |
| <i>&lt;vrf-name&gt;</i> | The name of the VRF instance.                                                                               |
| <i>&lt;type&gt;</i>     | {[ <i>AA:NN</i> ] [ <i>local-AS</i> ] [ <i>no-advertise</i> ] [ <i>no-export</i> ] }                        |
| <i>AA:NN</i>            | Specifies the Autonomous System (AS) community number, in AA:NN format.                                     |
| <i>local-AS</i>         | Do not send outside local Autonomous Systems (well-known community).                                        |
| <i>no-advertise</i>     | Do not advertise to any peer (well-known community).                                                        |
| <i>no-export</i>        | Do not export to next AS (well-known community).                                                            |
| <i>exact-match</i>      | Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated. |

**Mode** User Exec and Privileged Exec

**Examples** Note that the AS numbers shown are examples only.

```
awplus# show ip bgp community 64497:64499 exact-match
awplus# show ip bgp community 64497:64499 64500:64501

# show ip bgp community-list (BGP only)

**Overview** Use this command to display routes that match the given community-list from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community-list \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp community-list <listname> [exact-match]`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] community-list <listname> [exact-match]`

| Parameter   | Description                                                                                |
|-------------|--------------------------------------------------------------------------------------------|
| global      | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf         | Apply the command to the specified VRF instance.                                           |
| <vrf-name>  | The name of the VRF instance.                                                              |
| <listname>  | Specifies the community list name.                                                         |
| exact-match | Displays only routes that have exactly the same specified communities.                     |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp community-list mylist exact-match
awplus# show ip bgp vrf red community-list myCommunity
awplus# show ip bgp global community-list myExactCommunity
exact-match
```

**Related Commands** [show bgp ipv6 community-list \(BGP4+ only\)](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip bgp dampening (BGP only)

**Overview** Use this command to show dampened routes from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 dampening \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp dampening  
{dampened-paths|flap-statistics|parameters}`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] dampening  
{dampened-paths|flap-statistics|parameters}`

| Parameter       | Description                                                                                |
|-----------------|--------------------------------------------------------------------------------------------|
| global          | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf             | Apply the command to the specified VRF instance.                                           |
| <vrf-name>      | The name of the VRF instance.                                                              |
| dampened-paths  | Display paths suppressed due to dampening.                                                 |
| flap-statistics | Display flap statistics of routes.                                                         |
| parameters      | Display details of configured dampening parameters.                                        |

**Mode** User Exec and Privileged Exec

**Usage** Enable BGP dampening to maintain dampened-path information in memory.

**Examples** `awplus# show ip bgp dampening dampened-paths  
awplus# show ip bgp vrf red dampening dampened-paths  
awplus# show ip bgp global dampening flap-statistics`

**Output** Figure 34-6: Example output from the **show ip bgp dampening** command

```
dampening 15 750 2000 60 15
 Reachability Half-Life time : 15 min
 Reuse penalty : 750
 Suppress penalty : 2000
 Max suppress time : 60 min
 Un-reachability Half-Life time : 15 min
 Max penalty (ceil) : 11999
 Min penalty (floor) : 375
```

The following example output shows that the internal route (i), has flapped 3 times and is now categorized as history (h).

Figure 34-7: Example output from the **show ip bgp dampening flap-statistics** command

```
awplus# show ip bgp dampening flap-statistics

```

**Related Commands** [show bgp ipv6 dampening \(BGP4+ only\)](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip bgp filter-list (BGP only)

**Overview** Use this command to display routes conforming to the filter-list within an IPv4 environment. Use the [show bgp ipv6 filter-list \(BGP4+ only\)](#) command to display routes conforming to the filter-list within an IPv6 environment

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp filter-list <listname>`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] filter-list <listname>`

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                           |
| <vrf-name> | The name of the VRF instance.                                                              |
| <listname> | Specifies the regular-expression access list name.                                         |

**Mode** User Exec and Privileged Exec

**Example**  
`awplus# show ip bgp filter-list mylist`  
`awplus# show ip bgp vrf red filter-list mylist`

**Related Commands** [show bgp ipv6 filter-list \(BGP4+ only\)](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip bgp inconsistent-as (BGP only)

**Overview** Use this command to display routes with inconsistent AS Paths within an IPv4 environment. Use the [show bgp ipv6 inconsistent-as \(BGP4+ only\)](#) command to display routes with inconsistent AS paths within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp inconsistent-as`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] inconsistent-as`

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                           |
| <vrf-name> | The name of the VRF instance.                                                              |

**Mode** User Exec and Privileged Exec

**Example**  
`awplus# show ip bgp inconsistent-as`  
`awplus# show ip bgp global inconsistent-as`

**Related Commands** [show bgp ipv6 inconsistent-as \(BGP4+ only\)](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip bgp longer-prefixes (BGP only)

**Overview** Use this command to display the route of the local BGP routing table for a specific prefix with a specific mask, or for any prefix having a longer mask than the one specified.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp <ip-address/m> longer-prefixes`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] <ip-address/m> longer-prefixes`

| Parameter      | Description                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------|
| global         | When VRF-lite is configured, apply the command to the global routing and forwarding table.               |
| vrf            | Apply the command to the specified VRF instance.                                                         |
| <vrf-name>     | The name of the VRF instance.                                                                            |
| <ip-address/m> | Neighbor's IP address and subnet mask, entered in the form A.B.C.D/M, where M is the subnet mask length. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp 10.10.0.10/24 longer-prefixes
awplus# show ip bgp vrf red 172.16.4.0/24
awplus# show ip bgp global 172.16.0.0/16 longer-prefixes
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip bgp prefix-list (BGP only)

**Overview** Use this command to display routes matching the prefix-list within an IPv4 environment. Use the [show bgp ipv6 prefix-list \(BGP4+ only\)](#) command to display routes matching the prefix-list within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp prefix-list <list>`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] prefix-list <list>`

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                           |
| <vrf-name> | The name of the VRF instance.                                                              |
| <list>     | Specifies the name of the IP prefix list.                                                  |

**Mode** User Exec and Privileged Exec

**Examples**  
`awplus# show ip bgp prefix-list mylist`  
`awplus# show ip bgp vrf red prefix-list myPrefixes`

**Related Commands** [show bgp ipv6 prefix-list \(BGP4+ only\)](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip bgp quote-regexp (BGP only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 quote-regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

| Symbol | Character     | Meaning                                                                                                                            |
|--------|---------------|------------------------------------------------------------------------------------------------------------------------------------|
| ^      | Caret         | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$     | Dollar sign   | Used to match the end of the input string.                                                                                         |
| .      | Period        | Used to match a single character (white spaces included).                                                                          |
| *      | Asterisk      | Used to match none or more sequences of a pattern.                                                                                 |
| +      | Plus sign     | Used to match one or more sequences of a pattern.                                                                                  |
| ?      | Question mark | Used to match none or one occurrence of a pattern.                                                                                 |
| _      | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.                                    |
| [ ]    | Brackets      | Specifies a range of single-characters.                                                                                            |
| -      | Hyphen        | Separates the end points of a range.                                                                                               |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp quote-regexp <expression>`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] quote-regexp <expression>`

| Parameter    | Description                                                                                |
|--------------|--------------------------------------------------------------------------------------------|
| global       | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf          | Apply the command to the specified VRF instance.                                           |
| <vrf-name>   | The name of the VRF instance.                                                              |
| <expression> | Specifies a regular-expression to match the BGP AS paths.                                  |

**Mode** User Exec and Privileged Exec

**Examples** awplus# show ip bgp quote-regexp myexpression  
awplus# show ip bgp global quote-regexp 65550 65555

**Related Commands** [show bgp ipv6 quote-regexp \(BGP4+ only\)](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip bgp regexp (BGP only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Use the regular expressions listed below with the *<expression>* parameter:

| Symbol | Character     | Meaning                                                                                                                            |
|--------|---------------|------------------------------------------------------------------------------------------------------------------------------------|
| ^      | Caret         | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$     | Dollar sign   | Used to match the end of the input string.                                                                                         |
| .      | Period        | Used to match a single character (white spaces included).                                                                          |
| *      | Asterisk      | Used to match none or more sequences of a pattern.                                                                                 |
| +      | Plus sign     | Used to match one or more sequences of a pattern.                                                                                  |
| ?      | Question mark | Used to match none or one occurrence of a pattern.                                                                                 |
| _      | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.                                    |
| [ ]    | Brackets      | Specifies a range of single-characters.                                                                                            |
| -      | Hyphen        | Separates the end points of a range.                                                                                               |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp regexp <expression>`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] regexp <expression>`

| Parameter    | Description                                                                                |
|--------------|--------------------------------------------------------------------------------------------|
| global       | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf          | Apply the command to the specified VRF instance.                                           |
| <vrf-name>   | The name of the VRF instance.                                                              |
| <expression> | Specifies a regular-expression to match the BGP AS paths.                                  |

**Mode** User Exec and Privileged Exec

**Examples** awplus# show ip bgp regexp myexpression  
awplus# show ip bgp vrf red regexp 65550 65555

**Related Commands** [show bgp ipv6 regexp \(BGP4+ only\)](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip bgp route-map (BGP only)

**Overview** Use this command to display BGP routes that match the specified route-map within an IPv4 environment. Use the [show bgp ipv6 route-map \(BGP4+ only\)](#) command to display BGP4+ routes that match the specified route-map within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp route-map <route-map>`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] route-map <route-map>`

| Parameter   | Description                                                                                |
|-------------|--------------------------------------------------------------------------------------------|
| global      | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf         | Apply the command to the specified VRF instance.                                           |
| <vrf-name>  | The name of the VRF instance.                                                              |
| <route-map> | Specifies a route-map that is matched.                                                     |

**Mode** User Exec and Privileged Exec

**Examples** To show routes that match the route-map `myRouteMap` for the global routing instance, use the command:

```
awplus# show ip bgp global route-map myRouteMap
```

To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show ip bgp route-map myRouteMap
```

**Related Commands** [show bgp ipv6 route-map \(BGP4+ only\)](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip bgp summary (BGP only)

**Overview** Use this command to display a summary of a BGP neighbor status within an IPv4 environment. Use the [show bgp ipv6 summary \(BGP4+ only\)](#) command to display a summary of BGP4+ neighbors.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp summary`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] summary`

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                           |
| <vrf-name> | The name of the VRF instance.                                                              |

**Mode** User Exec and Privileged Exec

**Examples**  
`awplus# show ip bgp summary`  
`awplus# show ip bgp vrf red summary`

**Output** Figure 34-9: Example output from the **show ip bgp summary** command

```
awplus>show ip bgp summary

BGP router identifier 1.0.0.1, local AS number 65541
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries

Neighbor V AS MsgRc MsgSnt TblVer InOutQ Up/Down State/PfxRcd
192.168.3.2 4 65544 20 24 11 0/0 00:07:19 1
192.168.4.2 4 65545 0 0 0 0/0 never Active
192.168.11.2 4 65542 34 40 0 0/0 00:00:04 Active
192.168.21.2 4 65543 29 32 11 0/0 00:07:03 13

Number of neighbors 4
```

The Up/Down column in this output is a timer that shows:

- "never" if the peer session has never been established
- The up time, if the peer session is currently up
- The down time, if the peer session is currently down.

In the example above, the session with 192.168.11.2 has been down for 4 seconds, and the session with 192.168.4.2 has never been established.

**Related Commands** [show bgp ipv6 summary \(BGP4+ only\)](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip interface vrf

**Overview** Use this command to display protocol and status information about configured interfaces and their assigned IP addresses in VRF instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip interface [vrf <vrf-name>|global]`

| Parameter  | Description                              |
|------------|------------------------------------------|
| vrf        | A VRF instance.                          |
| <vrf-name> | The name of a specific VRF instance.     |
| global     | The global routing and forwarding table. |

**Mode** User Exec and Privileged Exec

**Examples** To display all interfaces and IP addresses associated with a VRF instance ‘red’, use the command:

```
awplus# show ip interface vrf red
```

**Output** Figure 34-10: Example output from **show ip interface vrf red**

| Interface | IP-Address      | Status   | Protocol |
|-----------|-----------------|----------|----------|
| lol       | unassigned      | admin up | running  |
| vlan1     | 192.168.10.1/24 | admin up | running  |

**Example** To display all interfaces and IP addresses associated with all VRF instances, use the command:

```
awplus# show ip interface
```

**Output** Figure 34-11: Example output from the **show ip interface** with VRF-lite configured

|             |                |          |          |
|-------------|----------------|----------|----------|
| Interface   | IP-Address     | Status   | Protocol |
| eth0        | unassigned     | admin up | down     |
| lo          | unassigned     | admin up | running  |
| vlan1       | 192.168.1.1/24 | admin up | running  |
| vlan4       | 172.30.4.43/24 | admin up | down     |
| [VRF: red]  |                |          |          |
| Interface   | IP-Address     | Status   | Protocol |
| lo1         | unassigned     | admin up | running  |
| [VRF: blue] |                |          |          |
| Interface   | IP-Address     | Status   | Protocol |
| lo2         | unassigned     | admin up | running  |

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip rip vrf database

**Overview** Use this command to display information about the RIP database that is associated with a specific VRF instance.

Entering this command with the **full** option included, will display information about the full RIP database (including sub-optimal routes) associated with a specific VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip rip {vrf <vrf-name>|global} database [full]`

| Parameter  | Description                                                     |
|------------|-----------------------------------------------------------------|
| vrf        | Specific VRF instance.                                          |
| <vrf-name> | The name of the VRF instance.                                   |
| global     | The global routing and forwarding table.                        |
| full       | Specify the full RIP database including sub-optimal RIP routes. |

**Mode** User Exec and Privileged Exec

**Example** To display information about the RIP database associated with a VRF instance 'blue', use the command:

```
awplus# show ip rip vrf blue database
```

**Output** Figure 34-12: Example output from the **show ip rip vrf blue database** command

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
 C - Connected, S - Static, O - OSPF, B - BGP
```

| Network            | Next Hop     | Metric | From         | If    | Time  |
|--------------------|--------------|--------|--------------|-------|-------|
| Rc 192.168.30.0/24 |              | 1      |              | vlan3 |       |
| R 192.168.45.0/24  | 192.168.30.1 | 2      | 192.168.30.1 | vlan3 | 02:46 |

**Related Commands** [show ip rip](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip rip vrf interface

**Overview** Use this command to display information about the RIP interfaces that are associated with a specific VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip rip {vrf <vrf-name>|global} interface [<interface-name>]`

| Parameter        | Description                              |
|------------------|------------------------------------------|
| vrf              | Specific VRF instance.                   |
| <vrf-name>       | The name of the VRF instance.            |
| global           | The global routing and forwarding table. |
| <interface-name> | The IP RIP interface (VLAN).             |

**Mode** User Exec and Privileged Exec

**Example** To display information about the RIP database associated with a VRF instance 'blue', use the command:

```
awplus# show ip rip vrf blue interface
```

**Output** Figure 34-13: Example output from **show ip rip vrf blue interface vlan3**

|                                                     |                 |                |              |       |       |
|-----------------------------------------------------|-----------------|----------------|--------------|-------|-------|
| Codes: R - RIP, Rc - RIP connected, Rs - RIP static |                 |                |              |       |       |
| C - Connected, S - Static, O - OSPF, B - BGP        |                 |                |              |       |       |
|                                                     | Network         | Next Hop       | Metric From  | If    | Time  |
| Rc                                                  | 192.168.30.0/24 |                | 1            | vlan3 |       |
| R                                                   | 192.168.45.0/24 | 192.168.30.1 2 | 192.168.30.1 | vlan3 | 02:46 |

**NOTE:** The Time parameter operates as follows:

- RIP updates occur approximately every 30 seconds.
- Each update resets a count-down timer to 180 seconds (3 minutes).
- The Time parameter displays the count-down from the last reset.

**Related Commands** [show ip rip](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip route

**Overview** Use this command to display routing entries in the FIB (Forwarding Information Base). The FIB contains the best routes to a destination, and your device uses these routes when forwarding traffic. You can display a subset of the entries in the FIB based on protocol.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**VRF-lite** If VRF-lite is configured, you can display routing entries in the FIB associated with either the global routing domain or a named VRF.

**Syntax** `show ip route [bgp|connected|ospf|rip|static|<ip-addr>|<ip-addr/prefix-length>]`

**Syntax (VRF-lite)** `show ip route {vrf <vrf-name>|global}  
[bgp|connected|ospf|rip|static]`

| Parameter               | Description                                                                              |
|-------------------------|------------------------------------------------------------------------------------------|
| global                  | If VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf                     | Apply the command to the specified VRF instance.                                         |
| <vrf-name>              | The name of the VRF instance.                                                            |
| bgp                     | Displays only the routes learned from BGP.                                               |
| connected               | Displays only the routes learned from connected interfaces.                              |
| ospf                    | Displays only the routes learned from OSPF.                                              |
| rip                     | Displays only the routes learned from RIP.                                               |
| static                  | Displays only the static routes you have configured.                                     |
| <ip-addr>               | Displays the routes for the specified address. Enter an IPv4 address.                    |
| <ip-addr/prefix-length> | Displays the routes for the specified network. Enter an IPv4 address and prefix length.  |

**Mode** User Exec and Privileged Exec

**Example** To display the static routes in the FIB, use the command:

```
awplus# show ip route static
```

To display the OSPF routes in the FIB, use the command:

```
awplus# show ip route ospf
```

**Example (VRF-lite)** To display all routing entries in the FIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red
```

**Output** Each entry in the output from this command has a code preceding it, indicating the source of the routing entry. For example, O indicates OSPF as the origin of the route. The first few lines of the output list the possible codes that may be seen with the route entries.

Typically, route entries are composed of the following elements:

- code
- a second label indicating the sub-type of the route
- network or host IP address
- administrative distance and metric
- next hop IP address
- outgoing interface name
- time since route entry was added

Figure 34-14: Example output from the **show ip route** command

```
Codes: C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
* - candidate default

O 10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
C 3.3.3.0/24 is directly connected, vlan1
C 10.10.31.0/24 is directly connected, vlan2
C 10.70.0.0/24 is directly connected, vlan4
O E2 14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
C 33.33.33.33/32 is directly connected, lo
```

**Connected Route** The connected route entry consists of:

```
C 10.10.31.0/24 is directly connected, vlan2
```

This route entry denotes:

- Route entries for network `10.10.31.0/24` are derived from the IP address of local interface `vlan2`.
- These routes are marked as Connected routes (C) and always preferred over routes for the same network learned from other routing protocols.

**OSPF Route** The OSPF route entry consists of:

```
O 10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
```

This route entry denotes:

- This route in the network 10.10.37.0/24 was added by OSPF.
- This route has an administrative distance of 110 and metric/cost of 11.
- This route is reachable via next hop 10.10.31.16.
- The outgoing local interface for this route is `vlan2`.
- This route was added 20 minutes and 54 seconds ago.

### OSPF External Route

The OSPF external route entry consists of:

```
O E2 14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
```

This route entry denotes that this route is the same as the other OSPF route explained above; the main difference is that it is a Type 2 External OSPF route.

### Command changes

Version 5.4.6-2.1: VRF-lite support added.

# show ip route database

**Overview** This command displays the routing entries in the RIB (Routing Information Base).

When multiple entries are available for the same prefix, RIB uses the routes' administrative distances to choose the best route. All best routes are entered into the FIB (Forwarding Information Base). To view the routes in the FIB, use the [show ip route](#) command.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**Syntax** `show ip route database [bgp|connected|ospf|rip|static]`

**Syntax (VRF-lite)** `show ip route [vrf <vrf-name>|global] database [bgp|connected|ospf|rip|static]`

| Parameter  | Description                                                                              |
|------------|------------------------------------------------------------------------------------------|
| global     | If VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                         |
| <vrf-name> | The name of the VRF instance.                                                            |
| bgp        | Displays only the routes learned from BGP.                                               |
| connected  | Displays only the routes learned from connected interfaces.                              |
| ospf       | Displays only the routes learned from OSPF.                                              |
| rip        | Displays only the routes learned from RIP.                                               |
| static     | Displays only the static routes you have configured.                                     |

**Mode** User Exec and Privileged Exec

**Example** To display the static routes in the RIB, use the command:

```
awplus# show ip route database static
```

**Output** Figure 34-15: Example output from the **show ip route database** command

```
Codes: C - connected, S - static, R - RIP, B - BGP
 O - OSPF, IA - OSPF inter area
 N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
 E1 - OSPF external type 1, E2 - OSPF external type 2
 > - selected route, * - FIB route, p - stale info

O *> 9.9.9.9/32 [110/31] via 10.10.31.16, vlan2, 00:19:21

C *> 45.45.45.45/32 is directly connected, lo
O *> 55.55.55.55/32 [110/21] via 10.10.31.16, vlan2, 00:21:19
C *> 127.0.0.0/8 is directly connected, lo
```

**Example (VRF-lite)** To display all routing entries in the RIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red database
```

**Output** Figure 34-16: Example output from the **show ip route vrf red database** command

```
[VRF: red]
Codes: C - connected, S - static, R - RIP, B - BGP
 O - OSPF, IA - OSPF inter area
 N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
 E1 - OSPF external type 1, E2 - OSPF external type 2
 > - selected route, * - FIB route, p - stale info

O 192.168.10.0/24 [110/1] is directly connected, vlan1, 06:45:51
C *> 192.168.10.0/24 is directly connected, vlan1
B > 192.168.33.0/24 [20/0] via 192.168.30.3, 06:45:52
O E2 *> 192.168.110.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
O E2 *> 192.168.111.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
```

The routes added to the FIB are marked with a \*. When multiple routes are available for the same prefix, the best route is indicated with the > symbol. All unselected routes have neither the \* nor the > symbol.

```
S *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O 10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
```

These route entries denote:

- The same prefix was learned from OSPF and from static route configuration.

- Since this static route has a lower administrative distance than the OSPF route (110), the static route (1) is selected and installed in the FIB.

If the static route becomes unavailable, then the device automatically selects the OSPF route and installs it in the FIB.

**Related  
Commands** [maximum-paths](#)

route-target export 500:1
route-target export 500:4
import map red 43
!
```

**Related  
Commands** [show ip vrf](#)

# ssh

**Overview** This command initiates a Secure Shell connection to a remote SSH server.

If the server requests a password for the user login, the user needs to type in the correct password on "Password:" prompt.

SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

**NOTE:** Note that a hostname specified with SSH cannot begin with a hyphen (-) character.

**Syntax** `ssh [ip|ipv6][[user <username>]|[port <1-65535>]|[version {1|2}]] <hostname> [<line>]`

**Syntax (VRF-lite)** `ssh [vrf <vrf-name>] [ip|ipv6][[user <username>]|[port <1-65535>]|[version {1|2}]] <hostname> [<line>]`

| Parameter  | Description                                                                                                                                                                                                                                                                                                               |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vrf        | Apply the command to the specified VRF instance.                                                                                                                                                                                                                                                                          |
| <vrf-name> | The name of the VRF instance.                                                                                                                                                                                                                                                                                             |
| ip         | Specify IPv4 SSH.                                                                                                                                                                                                                                                                                                         |
| ipv6       | Specify IPv6 SSH.                                                                                                                                                                                                                                                                                                         |
| user       | Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.<br><br><username> User name to login on the remote server.                                                                                       |
| port       | SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Other- wise, the client port configured by "ssh client" command or the default TCP port (22) is used.<br><br><1-65535> TCP port.                                                                     |
| version    | SSH client version. If version is specified, the SSH client supports only the specified SSH version. By default, SSH client uses SSHv2 first. If the server does not support SSHv2, it will try SSHv1. The default version can be configured by "ssh client" command.<br><br>1 Use SSH version 1.<br>2 Use SSH version 2. |

| Parameter                     | Description                                                                                                                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;hostname&gt;</code> | IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character. |
| <code>&lt;line&gt;</code>     | A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.                                                     |

**Mode** User Exec and Privileged Exec

**Examples** To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user "manager", use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server with example\_host using IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

**Example (VRF-lite)** To login to the remote SSH server at 192.168.1.1 on VRF "red", use the command:

```
awplus# ssh vrf red 192.168.1.1
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# tcpdump

**Overview** Use this command to start a tcpdump, which gives the same output as the Unix-like **tcpdump** command to display TCP/IP traffic. Press <ctrl> + c to stop a running tcpdump.

**Syntax** `tcpdump <line>`

**Syntax (VRF-lite)** `tcpdump [vrf <vrf-name>] <line>`

| Parameter  | Description                                                                                                                                                                          |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <line>     | Specify the dump options. For more information on the options for this placeholder see <a href="http://www.tcpdump.org/tcpdump_man.html">http://www.tcpdump.org/tcpdump_man.html</a> |
| vrf        | Apply the command to the specified VRF instance.                                                                                                                                     |
| <vrf-name> | The name of the VRF instance.                                                                                                                                                        |

**Mode** Privileged Exec

**Example** To start a tcpdump running to capture IP packets, enter the command:

```
awplus# tcpdump ip
```

**Example (VRF-lite)** To start a tcpdump on interface vlan2 associated with a VRF instance red, enter the command:

```
awplus# tcpdump vrf red vlan2
```

**Output** Figure 34-24: Example output from the **tcpdump** command

```
03:40:33.221337 IP 192.168.1.1 > 224.0.0.13: PIMv2, Hello,
length: 34
1 packets captured
2 packets received by filter
0 packets dropped by kernel
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# telnet

**Overview** Use this command to open a telnet session to a remote device.

**Syntax** `telnet {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [  
<port>]`

**Syntax (VRF-lite)** `telnet [vrf <vrf-name>] {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [  
<port>]`

| Parameter   | Description                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| vrf         | Apply this command to a VRF instance.                                                                                                     |
| <vrf-name>  | The name of the VRF instance.                                                                                                             |
| <hostname>  | The host name of the remote system.                                                                                                       |
| ip          | Keyword used to specify the IPv4 address or host name of a remote system.                                                                 |
| <ipv4-addr> | An IPv4 address of the remote system.                                                                                                     |
| ipv6        | Keyword used to specify the IPv6 address of a remote system                                                                               |
| <ipv6-addr> | Placeholder for an IPv6 address in the format x:x::x:x, for example, 2001:db8::8a2e:7334                                                  |
| <port>      | Specify a TCP port number (well known ports are in the range 1-1023, registered ports are 1024-49151, and private ports are 49152-65535). |

**Mode** User Exec and Privileged Exec

**Examples** To connect to TCP port 2602 on the device at 10.2.2.2, use the command:

```
awplus# telnet 10.2.2.2 2602
```

To connect to the telnet server `host.example`, use the command:

```
awplus# telnet host.example
```

To connect to the telnet server `host.example` on TCP port 100, use the command:

```
awplus# telnet host.example 100
```

**Example (VRF-lite)** To open a telnet session to a remote host 192.168.0.1 associated with VRF instance `red`, use the command:

```
awplus# telnet vrf red ip 192.168.0.1
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# timers (RIP)

**Overview** Use this command to adjust routing network timers.  
Use the **no** variant of this command to restore the defaults.

**Syntax** `timers basic <update> <timeout> <garbage>`  
`no timers basic`

| Parameter                    | Description                                                                                                                                                                                                                          |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;update&gt;</code>  | <code>&lt;5-2147483647&gt;</code><br>Specifies the period at which RIP route update packets are transmitted. The default is 30 seconds.                                                                                              |
| <code>&lt;timeout&gt;</code> | <code>&lt;5-2147483647&gt;</code><br>Specifies the routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid. |
| <code>&lt;garbage&gt;</code> | <code>&lt;5-2147483647&gt;</code><br>Specifies the routing garbage collection timer in seconds. The default is 120 seconds.                                                                                                          |

**Default** Enabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** This command adjusts the RIP timing parameters.

The update timer is the time between sending out updates, that contain the complete routing table, to every neighboring router.

If an update for a given route has not been seen for the time specified by the timeout parameter, that route is no longer valid. However, it is retained in the routing table for a short time, with metric 16, so that neighbors are notified that the route has been dropped.

When the time specified by the garbage parameter expires the metric 16 route is finally removed from the routing table. Until the garbage time expires, the route is included in all updates sent by the router.

All the routers in the network must have the same timers to ensure the smooth operation of RIP throughout the network.

**Examples** To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# timers basic 30 180 120
```

To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120 with VRF, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# timers basic 30 180 120
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# traceroute

**Overview** Use this command to trace the route to the specified IPv4 host.

**Syntax** `traceroute {<ip-addr>|<hostname>}`

**Syntax (VRF-lite)** `traceroute [vrf <vrf-name>] {<ip-addr>|<hostname>}`

| Parameter                     | Description                                                             |
|-------------------------------|-------------------------------------------------------------------------|
| <code>&lt;ip-addr&gt;</code>  | The destination IPv4 address. The IPv4 address uses the format A.B.C.D. |
| <code>&lt;hostname&gt;</code> | The destination hostname.                                               |
| <code>vrf</code>              | Apply the command to the specified VRF instance.                        |
| <code>&lt;vrf-name&gt;</code> | The name of the VRF instance.                                           |

**Mode** User Exec and Privileged Exec

**Example** `awplus# traceroute 10.10.0.5`

**Example (VRF-lite)** `awplus# traceroute vrf red 192.168.0.1`

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# version (RIP)

**Overview** Use this command to specify a RIP version used globally by the router.

If VRF-lite is configured, you can specify a RIP version either globally, or for a particular VRF instance.

Use the **no** variant of this command to restore the default version.

**Syntax** `version {1|2}`  
`no version`

| Parameter | Description                              |
|-----------|------------------------------------------|
| 1 2       | Specifies the version of RIP processing. |

**Default** Version 2

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Setting the version command has no impact on receiving updates, only on sending them. The `ip rip send version` command overrides the value set by the `version (RIP)` command on an interface-specific basis. The `ip rip receive version` command allows you to configure a specific interface to accept only packets of the specified RIP version. The `ip rip receive version` command and the `ip rip send version` command override the value set by this command.

**Examples** To specify a RIP version, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
```

To specify a RIP version with VRF, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# version 1
```

**Related Commands** [ip rip receive version](#)  
[ip rip send version](#)  
[show running-config](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# Part 4: Multicast Applications

# 35

# IGMP and IGMP Snooping Commands

## Introduction

**Overview** Devices running AlliedWare Plus use IGMP (Internet Group Management Protocol) and MLD (Multicast Listener Discovery) to track which multicast groups their clients belong to. This enables them to send the correct multimedia streams to the correct destinations. IGMP is used for IPv4 multicasting, and MLD is used for IPv6 multicasting.

This chapter describes the commands to configure IGMP Querier behaviour and selection, IGMP Snooping and IGMP Proxy.

# clear ip igmp

**Overview** Use this command to clear all IGMP group membership records on all VLAN interfaces.

**Syntax** `clear ip igmp`

**Mode** Privileged Exec

**Example** `awplus# clear ip igmp`

**Related  
Commands**

- `clear ip igmp group`
- `clear ip igmp interface`
- `show ip igmp interface`
- `show running-config`

# clear ip igmp group

**Overview** Use this command to clear IGMP group membership records for a specific group on either all interfaces, a single interface, or for a range of interfaces.

**Syntax** `clear ip igmp group *`  
`clear ip igmp group <ip-address> <interface>`

| Parameter    | Description                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------|
| *            | Clears all groups on all interfaces. This has the same effect as the <b>clear ip igmp</b> command.             |
| <ip-address> | Specifies the group whose membership records will be cleared from all interfaces, entered in the form A.B.C.D. |
| <interface>  | Specifies the name of the interface; all groups learned on this interface are deleted.                         |

**Mode** Privileged Exec

**Usage** This command applies to groups learned by IGMP or IGMP Snooping. In addition to the group, an interface can be specified. Specifying this will mean that only entries with the group learned on the interface will be deleted.

**Examples** To delete all group records, use the command:

```
awplus# clear ip igmp group *
```

To delete records for 224.1.1.1 on vlan1, use the command:

```
awplus# clear ip igmp group 224.1.1.1 vlan1
```

**Related Commands**

- [clear ip igmp](#)
- [clear ip igmp interface](#)
- [show ip igmp interface](#)
- [show running-config](#)

# clear ip igmp interface

**Overview** Use this command to clear IGMP group membership records on a particular interface.

**Syntax** `clear ip igmp interface <interface>`

| Parameter                      | Description                                                                            |
|--------------------------------|----------------------------------------------------------------------------------------|
| <code>&lt;interface&gt;</code> | Specifies the name of the interface. All groups learned on this interface are deleted. |

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for IGMP or IGMP Snooping.

**Example** To delete records for vlan1, use the command:

```
awplus# clear ip igmp interface vlan1
```

**Related Commands**

- [clear ip igmp](#)
- [clear ip igmp group](#)
- [show ip igmp interface](#)
- [show running-config](#)

# debug igmp

**Overview** Use this command to enable debugging of either all IGMP or a specific component of IGMP.

Use the **no** variant of this command to disable all IGMP debugging, or debugging of a specific component of IGMP.

**Syntax** `debug igmp {all|decode|encode|events|fsm|tib}`  
`no debug igmp {all|decode|encode|events|fsm|tib}`

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| all       | Enable or disable all debug options for IGMP  |
| decode    | Debug of IGMP packets that have been received |
| encode    | Debug of IGMP packets that have been sent     |
| events    | Debug IGMP events                             |
| fsm       | Debug IGMP Finite State Machine (FSM)         |
| tib       | Debug IGMP Tree Information Base (TIB)        |

**Modes** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug igmp all`

**Related Commands** [show debugging igmp](#)  
[undebug igmp](#)

# ip igmp

**Overview** Use this command to enable IGMP on an interface. The command configures the device as an IGMP querier.

Use the **no** variant of this command to return all IGMP related configuration to the default on this interface.

**Syntax** ip igmp  
no ip igmp

**Default** Disabled

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage** An IP address must be assigned to the interface first, before this command will work.

**Example** To specify an interface as an IGMP querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp
```

**Validation  
Commands** show ip igmp interface  
show running-config

# ip igmp flood specific-query

**Overview** Use this command if you want IGMP to flood specific queries to all VLAN member ports, instead of only sending the queries to multicast group member ports.

Use the **no** variant of this command if you want IGMP to only send the queries to multicast group member ports.

**Syntax** `ip igmp flood specific-query`  
`no ip igmp flood specific-query`

**Default** By default, specific queries are flooded to all VLAN member ports.

**Mode** Global Configuration

**Usage** In an L2 switched network running IGMP, it is considered more robust to flood all specific queries. In most cases, the benefit of flooding specific queries to all VLAN member ports outweighs the disadvantages.

However, sometimes this is not the case. For example, if hosts with very low CPU capability receive specific queries for multicast groups they are not members of, their performance may degrade unacceptably. In this situation, it is desirable for IGMP to send specific queries to known member ports only. This minimizes the performance degradation of such hosts. In those circumstances, use this command to turn off flooding of specific queries.

**Example** To cause IGMP to flood specific queries only to multicast group member ports, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp flood specific-query
```

**Related Commands** [show ip igmp interface](#)

# ip igmp last-member-query-count

**Overview** Use this command to set the last-member query-count value for an interface.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ip igmp last-member-query-count <2-7>`  
`no ip igmp last-member-query-count`

| Parameter | Description                    |
|-----------|--------------------------------|
| <2-7>     | Last member query count value. |

**Default** The default last member query count value is 2.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage** This command applies to Eth interfaces configured for IGMP and VLAN interfaces configured for IGMP or IGMP Snooping.

**Example** To set the last-member query-count to 3 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-count 3
```

**Related Commands** [ip igmp last-member-query-interval](#)  
[ip igmp startup-query-count](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp last-member-query-interval

**Overview** Use this command to configure the frequency at which the router sends IGMP group specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

**Syntax** `ip igmp last-member-query-interval <interval>`  
`no ip igmp last-member-query-interval`

| Parameter                     | Description                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interval&gt;</code> | The frequency in milliseconds at which IGMP group-specific host query messages are sent, in the range 1000-25500. |

**Default** 1000 milliseconds

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage** This command applies to Eth interfaces configured for IGMP and VLAN interfaces configured for IGMP or IGMP Snooping.

**Example** To change the IGMP group-specific host query message interval to 2 seconds (2000 milliseconds) on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-interval 2000
```

**Related Commands** [ip igmp last-member-query-count](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp maximum-groups

**Overview** Use this command to set a limit, per switch port, on the number of IGMP groups clients can join. This stops a single client from using all the switch's available group-entry resources, and ensures that clients on all ports have a chance to join IGMP groups.

Use the **no** variant of this command to remove the limit.

**Syntax** `ip igmp maximum-groups <0-65535>`  
`no ip igmp maximum-groups`

| Parameter                    | Description                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------|
| <code>&lt;0-65535&gt;</code> | The maximum number of IGMP groups clients can join on this switch port. 0 means no limit. |

**Default** The default is 0, which means no limit

**Mode** Interface mode for a switch port

**Usage** We recommend using this command with IGMP snooping fast leave on the relevant VLANs. To enable fast leave, use the command:

```
awplus(config-if)# ip igmp snooping fast-leave
```

The device keeps count of the number of groups learned by each port. This counter is incremented when group joins are received via IGMP reports. It is decremented when:

- Group memberships time out
- Group leaves are received via leave messages or reports

Also, the port's group counter is cleared when:

- The port goes down
- You run the command **clear ip igmp group \***
- The port is removed from a VLAN

You can see the current value of the group counter by using either of the commands:

```
awplus# show ip igmp snooping statistics interface <port-list>
```

```
awplus# show ip igmp interface <port>
```

**Example** To limit clients to 10 groups on port 1.0.1, which is in vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip igmp maximum-groups 10
awplus(config-if)# exit
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping fast-leave
```

**Related  
Commands**

- clear ip igmp group
- ip igmp snooping fast-leave
- show ip igmp interface
- show ip igmp snooping statistics

# ip igmp mroute-proxy

**Overview** Use this command to enable IGMP mroute proxy on this downstream interface and associate it with the upstream proxy service interface.

Use the **no** variant of this command to remove the association with the proxy-service interface.

**Syntax** `ip igmp mroute-proxy <interface>`  
`no ip igmp mroute-proxy`

| Parameter                      | Description                |
|--------------------------------|----------------------------|
| <code>&lt;interface&gt;</code> | The name of the interface. |

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage** This command applies to Eth interfaces and VLAN interfaces configured for IGMP Proxy.

You must also enable the IGMP proxy service on the upstream interface, using the [ip igmp proxy-service](#) command. You can associate one or more downstream mroute proxy interfaces on the device with a single upstream proxy service interface. This downstream mroute proxy interface listens for IGMP reports, and forwards them to the upstream IGMP proxy service interface.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

**Example** To configure vlan2 as the upstream proxy-service interface for the downstream vlan3 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp mroute-proxy vlan2
```

**Related Commands** [ip igmp proxy-service](#)

# ip igmp proxy-service

**Overview** Use this command to enable the VLAN interface to be the upstream IGMP proxy-service interface for the device. All associated downstream IGMP mroute proxy interfaces on this device will have their memberships consolidated on this proxy service interface, according to IGMP host-side functionality.

Use the **no** variant of this command to remove the designation of the VLAN interface as an upstream proxy-service interface.

**Syntax** `ip igmp proxy-service`  
`no ip igmp proxy-service`

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage** This command applies to Eth interfaces and VLAN interfaces configured for IGMP Proxy.

This command is used with the [ip igmp mroute-proxy](#) command to enable forwarding of IGMP reports to a proxy service interface for all forwarding entries for this interface. You must also enable the downstream IGMP mroute proxy interfaces on this device using the command [ip igmp mroute-proxy](#).

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

From version 5.4.7-1.1 onwards, IGMP mroute proxy interfaces do not have to be configured with an IP address before they can operate. Instead, it is possible to have an address-less interface operate as an IGMP mroute proxy interface.

This feature is useful when IGMP Proxy needs to run on many downstream interfaces. For example, you may want to use it if your device has one subscriber (multicast receiver) per VLAN, and many receivers (many VLANs) connected to the device. In such a situation, assigning IP addresses to each VLAN may not be practicable.

Note that for such interface to be able to send queries to hosts directly attached to the interface, it is necessary to enable IGMP snooping querier on the interface, using the command [ip igmp snooping querier](#).

**Example** To designate VLAN1 as the upstream proxy-service interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp proxy-service
```

**Related Commands** [ip igmp mroute-proxy](#)  
[ip igmp snooping querier](#)

**Command changes** Version 5.4.7-1.1: Address-less interface support added.

# ip igmp querier-timeout

**Overview** Use this command to configure the timeout period before the device takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

**Syntax** `ip igmp querier-timeout <timeout>`  
`no ip igmp querier-timeout`

| Parameter                    | Description                                                           |
|------------------------------|-----------------------------------------------------------------------|
| <code>&lt;timeout&gt;</code> | IGMP querier timeout interval value in seconds, in the range 1-65535. |

**Default** The default timeout interval is 255 seconds.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage** This command applies to Eth and VLAN interfaces configured for IGMP.

The timeout value should not be less than the current active querier's general query interval.

**Example** To configure the device to wait 130 seconds from the time it received the last query before it takes over as the querier for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp querier-timeout 130
```

**Related Commands** `ip igmp query-interval`  
`show ip igmp interface`  
`show running-config`

# ip igmp query-holdtime

**Overview** This command sets the time that an IGMP Querier waits after receiving a query solicitation before it sends an IGMP Query. IGMP General Query messages will not be sent during the hold time interval.

Use the **no** variant of this command to return to the default query hold time period.

**Syntax** `ip igmp query-holdtime <interval>`  
`no ip igmp query-holdtime`

| Parameter  | Description                                                    |
|------------|----------------------------------------------------------------|
| <interval> | Query interval value in milliseconds, in the range <100-5000>. |

**Default** By default the delay before sending IGMP General Query messages is 500 milliseconds.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage** Use this command to configure a value for the IGMP query hold time in the current network. IGMP Queries can be generated after receiving Query Solicitation (QS) packets and there is a possibility of a DoS (Denial of Service) attack if a stream of Query Solicitation (QS) packets are sent to the IGMP Querier, eliciting a rapid stream of IGMP Queries. This command applies to interfaces on which the device is acting as an IGMP Querier.

Use the `ip igmp query-interval` command when a delay for IGMP general query messages is required and IGMP general query messages are required. The **ip igmp query-holdtime** command stops IGMP query messages during the configured holdtime interval, so the rate of IGMP Queries that can be sent out of an interface can be restricted.

See the [IGMP Feature Overview and Configuration Guide](#) for introductory information about the Query Solicitation feature.

**Examples** To set the IGMP query holdtime to 900 ms for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-holdtime 900
```

To reset the IGMP query holdtime to the default (500 ms) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-holdtime
```

**Related  
Commands**

- ip igmp query-interval
- ip igmp snooping tcn query solicit
- show ip igmp interface
- show running-config

# ip igmp query-interval

**Overview** Use this command to configure the period for sending IGMP General Query messages.

The IGMP query interval specifies the time between IGMP General Query messages being sent.

Use the **no** variant of this command to return to the default query interval period.

**NOTE:** The IGMP query interval must be greater than IGMP query maximum response time.

**Syntax** `ip igmp query-interval <interval>`  
`no ip igmp query-interval`

| Parameter  | Description                                              |
|------------|----------------------------------------------------------|
| <interval> | Query interval value in seconds, in the range <2-18000>. |

**Default** The default IGMP query interval is 125 seconds.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage** This command applies to interfaces configured for IGMP. Note that the IGMP query interval is automatically set to a greater value than the IGMP query max response time.

For example, if you set the IGMP query max response time to 2 seconds using the [ip igmp query-max-response-time](#) command, and the IGMP query interval is currently less than 3 seconds, then the IGMP query interval period will be automatically reconfigured to be 3 seconds, so it is greater than the IGMP query maximum response time.

Use the **ip igmp query-interval** command when a non-default interval for IGMP General Query messages is required.

The [ip igmp query-holdtime](#) command can occasionally delay the sending of IGMP Queries.

**Examples** To set the period between IGMP host-query messages to 3 minutes (180 seconds) for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-interval 180
```

To reset the period between sending IGMP host-query messages to the default (125 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-interval
```

**Related  
Commands**

[ip igmp query-holdtime](#)  
[ip igmp query-max-response-time](#)  
[ip igmp startup-query-interval](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp query-max-response-time

**Overview** Use this command to configure the maximum response time advertised in IGMP Queries.

Use the **no** variant of this command to restore the default.

**NOTE:** The IGMP query maximum response time must be less than the IGMP query interval.

**Syntax** `ip igmp query-max-response-time <response-time>`  
`no ip igmp query-max-response-time`

| Parameter                          | Description                                          |
|------------------------------------|------------------------------------------------------|
| <code>&lt;response-time&gt;</code> | Response time value in seconds, in the range 1-3180. |

**Default** The default IGMP query maximum response time is 10 seconds.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage** This command applies to interfaces configured for IGMP.

Note that the IGMP query interval is automatically set to a greater value than the IGMP query maximum response time.

For example, if you set the IGMP query interval to 3 seconds using the `ip igmp query-interval` command, and the current IGMP query interval is less than 3 seconds, then the IGMP query maximum response time will be automatically reconfigured to be 2 seconds, so it is less than the IGMP query interval time.

To get the network to converge faster, use the **ip igmp query-max-response-time** command and set a low response time value, such as one or two seconds, so that the clients will respond immediately with a report as a response to the IGMP Queries.

**Examples** To set a maximum response time of 8 seconds for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-max-response-time 8
```

To reset the default maximum response time to the default (10 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-max-response-time
```

**Related  
Commands** ip igmp query-interval  
show ip igmp interface  
show running-config

## ip igmp ra-option

**Overview** Use this command to enable strict Router Alert (RA) option validation. With strict RA option enabled, IGMP packets without RA options are ignored.

Use the **no** variant of this command to disable strict RA option validation.

**Syntax** `ip igmp ra-option`  
`no ip igmp ra-option`

**Default** The default state of RA validation is unset.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage** This command applies to interfaces configured for IGMP and IGMP Snooping.

**Examples** To enable strict Router Alert (RA) option validation on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp ra-option
```

# ip igmp robustness-variable

**Overview** Use this command to change the robustness variable value on an interface.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ip igmp robustness-variable <1-7>`  
`no ip igmp robustness-variable`

| Parameter | Description                    |
|-----------|--------------------------------|
| <1-7>     | The robustness variable value. |

**Default** The default robustness variable value is 2.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage** This command applies to interfaces configured for IGMP and IGMP Snooping.

**Examples** To set the robustness variable to 3 on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp robustness-variable 3
```

**Related  
Commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping

**Overview** Use this command to enable IGMP Snooping. When this command is used in the Global Configuration mode, IGMP Snooping is enabled at the device level. When this command is used in Interface Configuration mode, IGMP Snooping is enabled for the specified VLANs.

Use the **no** variant of this command to either globally disable IGMP Snooping, or disable IGMP Snooping on a specified interface.

**NOTE:** *IGMP snooping cannot be disabled on an interface if IGMP snooping has already been disabled globally. IGMP snooping can be disabled on both an interface and globally if disabled on the interface first and then disabled globally.*

**Syntax** `ip igmp snooping`  
`no ip igmp snooping`

**Default** By default, IGMP Snooping is enabled both globally and on all VLANs.

**Mode** Global Configuration and Interface Configuration for a VLAN interface.

**Usage** For IGMP snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default.)

Both IGMP snooping and MLD snooping must be enabled globally on the device for IGMP snooping to operate. MLD snooping is also enabled by default. To enable it if it has been disabled, use the [ipv6 mld snooping](#) command in Global Configuration mode.

**Examples** To enable IGMP Snooping on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping
```

**Related Commands** [ipv6 mld snooping](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping fast-leave

**Overview** Use this command to enable IGMP Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing. The IGMP group-membership entry is removed as soon as an IGMP leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

**Syntax** `ip igmp snooping fast-leave`  
`no ip igmp snooping fast-leave`

**Default** IGMP Snooping fast-leave processing is disabled.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This IGMP Snooping command can only be configured on VLAN interfaces.

**Example** To enable fast-leave processing on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping fast-leave
```

**Related Commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping mrouter

**Overview** Use this command to statically configure the specified port as a multicast router port for IGMP Snooping for an interface. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to remove the static configuration of the port as a multicast router port.

**Syntax** `ip igmp snooping mrouter interface <port>`  
`no ip igmp snooping mrouter interface <port>`

| Parameter                 | Description                                                                                                                                                                |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;port&gt;</code> | The port may be a device port (e.g. <code>port1.0.4</code> ), a static channel group (e.g. <code>sa3</code> ), or a dynamic (LACP) channel group (e.g. <code>po4</code> ). |

**Mode** Interface Configuration for a VLAN interface.

**Example** To configure `port1.0.2` statically as a multicast router interface for `vlan2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping mrouter interface port1.0.2
```

**Related Commands** [show ip igmp snooping mrouter](#)

# ip igmp snooping querier

**Overview** Use this command to enable IGMP querier operation when no multicast routing protocol is configured. When enabled, the IGMP Snooping querier sends out periodic IGMP queries for all interfaces. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to disable IGMP querier configuration.

**Syntax** `ip igmp snooping querier`  
`no ip igmp snooping querier`

**Mode** Interface Configuration for a VLAN interface.

**Usage** The IGMP Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as a proxy IGMP querier for faster network convergence.

It does not start, or automatically cease, the IGMP Querier operation if it detects query message(s) from a multicast router.

If an IP address is assigned to a VLAN, which has IGMP querier enabled on it, then the IGMP Snooping querier uses the VLAN's IP address as the Source IP Address in IGMP queries.

The IGMP Snooping Querier will not stop sending IGMP Queries if there is another IGMP Snooping Querier in the network with a lower Source IP Address.

**NOTE:** Do not enable the IGMP Snooping Querier feature on a Layer 2 device when there is an operational IGMP Querier in the network.

**Example** To configure vlan2 as a Snooping querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping querier
```

**Related Commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping report-suppression

**Overview** Use this command to enable report suppression for IGMP versions 1 and 2. This command applies to interfaces configured for IGMP Snooping.

Report suppression stops reports being sent to an upstream multicast router port when there are already downstream ports for this group on this interface.

Use the **no** variant of this command to disable report suppression.

**Syntax** `ip igmp snooping report-suppression`  
`no ip igmp snooping report-suppression`

**Default** Report suppression does not apply to IGMPv3, and is turned on by default for IGMPv1 and IGMPv2 reports.

**Mode** Interface Configuration for a VLAN interface.

**Example** To enable report suppression for IGMPv2 reports for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
awplus(config-if)# ip igmp snooping report-suppression
```

**Related Commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping routermode

**Overview** Use this command to set the destination IP addresses as router multicast addresses.

Use the **no** variant of this command to set it to the default. You can also remove a specified IP address from a custom list of multicast addresses.

**Syntax** ip igmp snooping routermode  
{all|default|ip|multicastrouter|address <ip-address>}  
no ip igmp snooping routermode [address <ip-address>]

| Parameter            | Description                                                                                                                                                                                           |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all                  | All reserved multicast addresses (224.0.0.x). Packets from all possible addresses in range 224.0.0.x are treated as coming from routers.                                                              |
| default              | Default set of reserved multicast addresses. Packets from 224.0.0.1, 224.0.0.2, 224.0.0.4, 224.0.0.5, 224.0.0.6, 224.0.0.9, 224.0.0.13, 224.0.0.15 and 224.0.0.24 are treated as coming from routers. |
| ip                   | Custom reserved multicast addresses. Packets from custom IP address in the 224.0.0.x range are treated as coming from routers.                                                                        |
| multicastrouter      | Packets from DVMRP (224.0.0.4) and PIM (224.0.0.13) multicast addresses are treated as coming from routers.                                                                                           |
| address <ip-address> | Packets from the specified multicast address are treated as coming from routers. The address must be in the 224.0.0.x range.                                                                          |

**Default** The default routermode is **default** (not **all**) and shows the following reserved multicast addresses:

```
Router mode.....Def
Reserved multicast address
224.0.0.1
224.0.0.2
224.0.0.4
224.0.0.5
224.0.0.6
224.0.0.9
224.0.0.13
224.0.0.15
224.0.0.24
```

**Mode** Global Configuration

**Examples** To set **ip igmp snooping routermode** for all default reserved addresses enter:

```
awplus(config)# ip igmp snooping routermode default
```

To remove the multicast address 224.0.0.5 from the custom list of multicast addresses enter:

```
awplus(config)# no ip igmp snooping routermode address
224.0.0.5
```

**Related commands** [ip igmp trusted](#)  
[show ip igmp snooping routermode](#)

# ip igmp snooping source-timeout

**Overview** Use this command to set the global IGMP Snooping source time-out value (in seconds) on the switch.

Use the **no** variant of this command to set the source time-out value to be the same as the group membership timeout.

**Syntax** `ip igmp snooping source-timeout <timeout>`  
`no ip igmp snooping source-timeout <timeout>`

| Parameter                    | Description                                            |
|------------------------------|--------------------------------------------------------|
| <code>&lt;timeout&gt;</code> | Time-out value in seconds <code>&lt;0-86400&gt;</code> |

**Default** Global IGMP Snooping source-timeout is disabled by default, and unregistered multicast will be timed-out like normal entries.

Interface IGMP Snooping source timeout is disabled by default, and unregistered multicast will be timed-out like normal entries.

**Mode** Interface/Global Configuration

**Usage** The timeout determines how long unregistered multicast entries will be kept for. If the value '0' is specified, then effectively all unregistered multicast entries will never be timed out, and can only be cleared by using the command **clear ip igmp group**. The interface settings will always take precedence over the global setting.

**Example** To configure IGMP Snooping source timeout globally on a switch, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping source-timeout 200
```

**Related Commands** [show ip igmp snooping source-timeout](#)

# ip igmp snooping tcn query solicit

**Overview** Use this command to enable IGMP (Internet Group Management Protocol) Snooping TCN (Topology Change Notification) Query Solicitation feature. When this command is used in the Global Configuration mode, Query Solicitation is enabled.

Use the **no** variant of this command to disable IGMP Snooping TCN Query Solicitation. When the **no** variant of this command is used in Interface Configuration mode, this overrides the Global Configuration mode setting and Query Solicitation is disabled.

**Syntax** `ip igmp snooping tcn query solicit`  
`no ip igmp snooping tcn query solicit`

**Default** IGMP Snooping TCN Query Solicitation is disabled by default on the device, unless the device is the Master Node in an EPSR ring, or is the Root Bridge in a Spanning Tree.

When the device is the Master Node in an EPSR ring, or the device is the Root Bridge in a Spanning Tree, then IGMP Snooping TCN Query Solicitation is enabled by default and cannot be disabled using the Global Configuration mode command. However, Query Solicitation can be disabled for specified interfaces using the **no** variant of this command from the Interface Configuration mode.

**Mode** Global Configuration, and Interface Configuration for a VLAN interface.

**Usage** Once enabled, if the device is not an IGMP Querier, on detecting a topology change, the device generates IGMP Query Solicit messages that are sent to all the ports of the vlan configured for IGMP Snooping on the device.

On a device that is not the Master Node in an EPSR ring or the Root Bridge in a Spanning Tree, Query Solicitation can be disabled using the **no** variant of this command after being enabled.

If the device that detects a topology change is an IGMP Querier then the device will generate an IGMP Query message.

Note that the **no** variant of this command when issued in Global Configuration mode has no effect on a device that is the Master Node in an EPSR ring or on a device that is a Root Bridge in a Spanning Tree. Query Solicitation is not disabled for the device these instances. However, Query Solicitation can be disabled on a per-vlan basis from the Interface Configuration mode.

See the following state table that shows when Query Solicit messages are sent in these instances:

| Command issued from Global Configuration | Command issued from Interface Configuration | Device is STP Root Bridge or the ERSR Master Node | IGMP Query Solicit message sent on VLAN |
|------------------------------------------|---------------------------------------------|---------------------------------------------------|-----------------------------------------|
| No                                       | Yes                                         | Yes                                               | Yes                                     |
| Yes                                      | No                                          | Yes                                               | No                                      |
| Yes                                      | Yes                                         | Yes                                               | Yes                                     |

See the [IGMP Feature Overview and Configuration Guide](#) for introductory information about the Query Solicitation feature.

**Examples** To enable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp snooping tcn query solicit
```

To enable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp snooping tcn query solicit
```

- [ip igmp query-holdtime](#)
- [show ip igmp interface](#)
- [show running-config](#)

# ip igmp source-address-check

**Overview** This command enables the checking of the Source Address for an IGMP Report, rejecting any IGMP Reports originating on devices outside of the local subnet.

Use the **no** variant of this command to disable the checking of the Source Address for an IGMP Report, which allows IGMP Reports from devices outside of the local subnet.

**Syntax** `ip igmp source-address-check`  
`no ip igmp source-address-check`

**Default** Source address checking for IGMP Reports is enabled by default.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage** This is a security feature, and should be enabled unless IGMP Reports from outside the local subnet are expected, for example, if Multicast VLAN Registration is active in the network.

The no variant of this command is required to disable the IGMP Report source address checking feature in networks that use Multicast VLAN Registration to allow IGMP Reports from devices outside of the local subnet.

**Examples** To deny IGMP Reports from outside the current subnet for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp source-address-check
```

To allow IGMP Reports from outside the current subnet for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp source-address-check
```

**Validation  
Commands** `show ip igmp interface`  
`show running-config`

# ip igmp startup-query-count

**Overview** Use this command to configure the IGMP startup query count for an interface. The IGMP startup query count is the number of IGMP General Query messages sent by a querier at startup. The default IGMP startup query count is 2.

Use the **no** variant of this command to return an interface's configured IGMP startup query count to the default.

**Syntax** `ip igmp startup-query-count <startup-query-count>`  
`no ip igmp startup-query-count`

| Parameter                                | Description                                              |
|------------------------------------------|----------------------------------------------------------|
| <code>&lt;startup-query-count&gt;</code> | Specify the IGMP startup query count, in the range 2-10. |

**Default** The default IGMP startup query count is 2.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Example** To set the IGMP startup query count to 4 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp startup-query-count 4
```

**Related Commands** [ip igmp last-member-query-count](#)  
[ip igmp startup-query-interval](#)

# ip igmp startup-query-interval

**Overview** Use this command to configure the IGMP startup query interval for an interface. The IGMP startup query interval is the amount of time in seconds between successive IGMP General Query messages sent by a querier during startup. The default IGMP startup query interval is one quarter of the IGMP query interval value.

Use the **no** variant of this command to return an interface's configured IGMP startup query interval to the default.

**Syntax** `ip igmp startup-query-interval <startup-query-interval>`  
`no ip igmp startup-query-interval`

| Parameter                                   | Description                                                                                                                              |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;startup-query-interval&gt;</code> | Specify the IGMP startup query interval, in the range of 2-1800 seconds. The value must be one quarter of the IGMP query interval value. |

**Default** The default IGMP startup query interval is one quarter of the IGMP query interval value.

**NOTE:** *The IGMP startup query interval must be one quarter of the IGMP query interval.*

**Mode** Interface Configuration for a VLAN or Eth interface.

**Example** To set the IGMP startup query interval to 15 seconds for vlan2, which is one quarter of the IGMP query interval of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp query-interval 60
awplus(config-if)# ip igmp startup-query-interval 15
```

**Related Commands** [ip igmp last-member-query-interval](#)  
[ip igmp query-interval](#)  
[ip igmp startup-query-count](#)

# ip igmp trusted

**Overview** Use this command to allow IGMP to process packets received on certain trusted ports only.

Use the **no** variant of this command to stop IGMP from processing specified packets if the packets are received on the specified ports or aggregator.

**Syntax** `ip igmp trusted {all|query|report|routermode}`  
`no ip igmp trusted {all|query|report|routermode}`

| Parameter  | Description                                                                                        |
|------------|----------------------------------------------------------------------------------------------------|
| all        | Specifies whether or not the interface is allowed to receive all IGMP and other routermode packets |
| query      | Specifies whether or not the interface is allowed to receive IGMP queries                          |
| report     | Specifies whether or not the interface is allowed to receive IGMP membership reports               |
| routermode | Specifies whether or not the interface is allowed to receive routermode packets                    |

**Default** By default, all ports and aggregators are trusted interfaces, so IGMP is allowed to process all IGMP query, report, and router mode packets arriving on all interfaces.

**Mode** Interface mode for one or more switch ports or aggregators

**Usage** Because all ports are trusted by default, use this command in its **no** variant to stop IGMP processing packets on ports you do not trust.

For example, you can use this command to make sure that only ports attached to approved IGMP routers are treated as router ports.

**Example** To stop ports port1.0.3-port1.0.6 from being treated as router ports by IGMP, use the commands:

```
awplus(config)# interface port1.0.3-port1.0.6
awplus(config-if)# no ip igmp trusted routermode
```

**Related Commands** [ip igmp snooping routermode](#)

# ip igmp version

**Overview** Use this command to set the current IGMP version (IGMP version 1, 2 or 3) on an interface.

Use the **no** variant of this command to return to the default version.

**Syntax** ip igmp version <1-3>  
no ip igmp version

| Parameter     | Description                  |
|---------------|------------------------------|
| version <1-3> | IGMP protocol version number |

**Default** The default IGMP version is 3.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Example** To set the IGMP version to 2 for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
```

**Related Commands** [show ip igmp interface](#)

# show debugging igmp

**Overview** Use this command to display the IGMP debugging options set.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging igmp`

**Mode** User Exec and Privileged Exec

**Example** To display the IGMP debugging options set, enter the command:

```
awplus# show debugging igmp
```

**Output** Figure 35-1: Example output from the **show debugging igmp** command

```
IGMP Debugging status:
IGMP Decoder debugging is on
IGMP Encoder debugging is on
IGMP Events debugging is on
IGMP FSM debugging is on
IGMP Tree-Info-Base (TIB) debugging is on
```

**Related Commands** [debug igmp](#)

# show ip igmp groups

**Overview** Use this command to display the multicast groups with receivers directly connected to the router, and learned through IGMP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp groups [<ip-address>|<interface> detail]`

| Parameter    | Description                                                  |
|--------------|--------------------------------------------------------------|
| <ip-address> | Address of the multicast group, entered in the form A.B.C.D. |
| <interface>  | Interface name for which to display local information.       |

**Mode** User Exec and Privileged Exec

**Example** The following command displays local-membership information for all ports in all interfaces:

```
awplus# show ip igmp groups
```

**Output** Figure 35-2: Example output from **show ip igmp groups**

| IGMP Connected Group Membership |            |          |          |               |  |
|---------------------------------|------------|----------|----------|---------------|--|
| Group Address                   | Interface  | Uptime   | Expires  | Last Reporter |  |
| 224.0.1.1                       | port1.0.1  | 00:00:09 | 00:04:17 | 10.10.0.82    |  |
| 224.0.1.24                      | port1.0.2  | 00:00:06 | 00:04:14 | 10.10.0.84    |  |
| 224.0.1.40                      | port1.0.3  | 00:00:09 | 00:04:15 | 10.10.0.91    |  |
| 224.0.1.60                      | port1.0.3  | 00:00:05 | 00:04:15 | 10.10.0.7     |  |
| 224.100.100.100                 | port1.0.1  | 00:00:11 | 00:04:13 | 10.10.0.91    |  |
| 228.5.16.8                      | port1.0.3  | 00:00:11 | 00:04:16 | 10.10.0.91    |  |
| 228.81.16.8                     | port1.0.7  | 00:00:05 | 00:04:15 | 10.10.0.91    |  |
| 228.249.13.8                    | port1.0.3  | 00:00:08 | 00:04:17 | 10.10.0.91    |  |
| 235.80.68.83                    | port1.0.11 | 00:00:12 | 00:04:15 | 10.10.0.40    |  |
| 239.255.255.250                 | port1.0.3  | 00:00:12 | 00:04:15 | 10.10.0.228   |  |
| 239.255.255.254                 | port1.0.12 | 00:00:08 | 00:04:13 | 10.10.0.84    |  |

Table 35-1: Parameters in the output of **show ip igmp groups**

| Parameter     | Description                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------|
| Group Address | Address of the multicast group.                                                                              |
| Interface     | Port through which the group is reachable.                                                                   |
| Uptime        | The time in weeks, days, hours, minutes, and seconds that this multicast group has been known to the device. |

Table 35-1: Parameters in the output of **show ip igmp groups** (cont.)

| Parameter     | Description                                                    |
|---------------|----------------------------------------------------------------|
| Expires       | Time (in hours, minutes, and seconds) until the entry expires. |
| Last Reporter | Last host to report being a member of the multicast group.     |

# show ip igmp interface

**Overview** Use this command to display the state of IGMP, IGMP Proxy service, and IGMP Snooping for a specified VLAN, or all VLANs. IGMP is shown as Active or Disabled in the show output. You can also display the number of groups a switch port belongs to.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip igmp interface [<interface>]

| Parameter   | Description                                                                                                                                                                                                                                              |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface> | The name of the interface.<br>If you specify a switch port number, the output displays the number of groups the port belongs to, and the port’s group membership limit, if a limit has been set (with the command <code>ip igmp maximum-groups</code> ). |

**Mode** User Exec and Privileged Exec

**Output** The following output shows IGMP interface status for vlan2 with IGMP Snooping enabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
 IGMP Disabled, Inactive, Version 3 (default)
 IGMP interface has 0 group-record states
 IGMP activity: 0 joins, 0 leaves
 IGMP robustness variable is 2
 IGMP last member query count is 2
 IGMP query interval is 125 seconds
 IGMP query holdtime is 500 milliseconds
 IGMP querier timeout is 255 seconds
 IGMP max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 Strict IGMPv3 ToS checking is disabled on this interface
 Source Address checking is enabled
 IGMP Snooping is globally enabled
 IGMP Snooping query solicitation is globally disabled
 Num. query-solicit packets: 57 sent, 0 recvd
 IGMP Snooping is enabled on this interface
 IGMP Snooping fast-leave is not enabled
 IGMP Snooping querier is not enabled
 IGMP Snooping report suppression is enabled
```

The following output shows IGMP interface status for vlan2 with IGMP Snooping disabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
 IGMP Disabled, Inactive, Version 3 (default)
 IGMP interface has 0 group-record states
 IGMP activity: 0 joins, 0 leaves
 IGMP robustness variable is 2
 IGMP last member query count is 2
 IGMP query interval is 125 seconds
 IGMP query holdtime is 500 milliseconds
 IGMP querier timeout is 255 seconds
 IGMP max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 Strict IGMPv3 ToS checking is disabled on this interface
 Source Address checking is enabled
 IGMP Snooping is globally enabled
 IGMP Snooping query solicitation is globally disabled
 Num. query-solicit packets: 57 sent, 0 recvd
 IGMP Snooping is not enabled on this interface
 IGMP Snooping fast-leave is not enabled
 IGMP Snooping querier is not enabled
 IGMP Snooping report suppression is enabled
```

The following output displays membership information for port1.0.1:

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
 Maximum groups limit set: 10
 Number of groups port belongs to: 0
```

# show ip igmp proxy

**Overview** Use this command to display the state of IGMP Proxy services for a specified interface or for all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax**

```
show ip igmp proxy
show ip igmp proxy groups [detail]
show ip igmp proxy groups <multicast-group> [detail]
show ip igmp proxy groups <vlan> [detail]
show ip igmp proxy groups <vlan> <multicast-group> [detail]
```

| Parameter         | Description                                                                |
|-------------------|----------------------------------------------------------------------------|
| groups            | Specify IGMP proxy group membership information.                           |
| detail            | Specify detailed IGMPv3 source information.                                |
| <vlan>            | Specify the name of a single VLAN interface, for example <b>vlan1</b> .    |
| <multicast-group> | Specify the IPv4 address in of the multicast group, in the format A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** To display the state of IGMP Proxy services for all interfaces, enter the command:

```
awplus# show ip igmp proxy
```

To display the state of IGMP Proxy services for VLAN interface **vlan1**, enter the command:

```
awplus# show ip igmp proxy groups vlan1
```

To display the detailed state of IGMP Proxy services for VLAN interface **vlan1**, enter the command:

```
awplus# show ip igmp proxy groups vlan1 detail
```

**Related Commands** [ip igmp proxy-service](#)

# show ip igmp snooping mrouter

**Overview** Use this command to display the multicast router ports, both static and dynamic, in a VLAN.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp snooping mrouter [interface <interface>]`

| Parameter   | Description                     |
|-------------|---------------------------------|
| interface   | A specific interface.           |
| <interface> | The name of the VLAN interface. |

**Mode** User Exec and Privileged Exec

**Example** To show all multicast router interfaces, use the command:

```
awplus# show ip igmp snooping mrouter
```

To show the multicast router interfaces in `vlan1`, use the command:

```
awplus# show ip igmp snooping mrouter interface vlan1
```

**Output** Figure 35-3: Example output from **show ip igmp snooping mrouter**

| VLAN | Interface | Static/Dynamic        |
|------|-----------|-----------------------|
| 1    | port1.0.5 | Statically configured |
| 200  | port1.0.2 | Statically configured |

Figure 35-4: Example output from **show ip igmp snooping mrouter interface vlan1**

| VLAN | Interface | Static/Dynamic        |
|------|-----------|-----------------------|
| 1    | port1.0.5 | Statically configured |

**Related Commands** [ip igmp snooping mrouter](#)

# show ip igmp snooping routermode

**Overview** Use this command to display the current router mode and the list of IP addresses set as router multicast addresses from the [ip igmp snooping routermode](#) command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp snooping routermode`

**Mode** User Exec and Privileged Exec

**Example** To show the router mode and the list of router multicast addresses, use the command:

```
awplus# show ip igmp snooping routermode
```

**Output** Figure 35-5: Example output from **show ip igmp snooping routermode**

```
awplus#show ip igmp snooping routermode
Router mode.....Def
Reserved multicast address

 224.0.0.1
 224.0.0.2
 224.0.0.4
 224.0.0.5
 224.0.0.6
 224.0.0.9
 224.0.0.13
 224.0.0.15
 224.0.0.24
```

**Related Commands** [ip igmp snooping routermode](#)

# show ip igmp snooping source-timeout

**Overview** Use this command to display the configured IGMP snooping source timeouts for a specified VLAN or VLAN range.

**Syntax** `show ip igmp snooping source-timeout [interface|<interface-range>]`

| Parameter                            | Description                                  |
|--------------------------------------|----------------------------------------------|
| <code>&lt;interface-range&gt;</code> | The name of the VLAN interface or VLAN range |

**Mode** Privileged Exec

**Example** To display the configured IGMP snooping source timeouts for all VLANs, use the command:

```
awplus# show ip igmp snooping source-timeout
```

**Output** Figure 35-6: Example output from **show ip igmp snooping source-timeout**

```
awplus#show ip igmp snooping source-timeout
Global IGMP snooping source-timeout is enabled (60 secs)

vlan1 enabled (300 secs)
vlan2 inherits global setting
vlan1000 inherits global settingawplus#show ip igmp
snooping source-timeout int vlan1
Global IGMP snooping source-timeout is enabled (60 secs)vlan1
enabled (300 secs)
```

**Related Commands** [ip igmp snooping source-timeout](#)

# show ip igmp snooping statistics

**Overview** Use this command to display IGMP Snooping statistics data.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp snooping statistics interface <interface-range>  
[group [<ip-address>]]`

| Parameter    | Description                                                                                                                                                                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address> | Optionally specify the address of the multicast group, entered in the form A.B.C.D.                                                                                                                                                                                      |
| <interface>  | Specify the name of the interface or interface range. If you specify a port number, the output displays the number of groups the port belongs to, and the port’s group membership limit, if a limit has been set (with the command <code>ip igmp maximum-groups</code> ) |

**Mode** Privileged Exec

**Example** To display IGMP statistical information for **vlan1** and **vlan2**, use the command:

```
awplus# show ip igmp snooping statistics interface vlan1-vlan2
```

**Output** Figure 35-7: Example output from the **show ip igmp snooping statistics** command for VLANs

```
awplus#show ip igmp interface vlan1-vlan2
IGMP Snooping statistics for vlan1
Interface: port1.0.3
Group: 224.1.1.1
Uptime: 00:00:09
Group mode: Exclude (Expires: 00:04:10)
Last reporter: 10.4.4.5
Source list is empty
IGMP Snooping statistics for vlan2
Interface: port1.0.4
Group: 224.1.1.2
Uptime: 00:00:19
Group mode: Exclude (Expires: 00:05:10)
Last reporter: 10.4.4.6
Source list is empty
```

Figure 35-8: Example output from the **show ip igmp snooping statistics** command for a switch port

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
 Maximum groups limit set: 10
 Number of groups port belongs to: 0
```

# undebug igmp

**Overview** This command applies the functionality of the no `debug igmp` command.

# 36

# MLD and MLD Snooping Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of configuration, clear, and show commands related to MLD and MLD Snooping.

The Multicast Listener Discovery (MLD) module includes the MLD Proxy service and MLD Snooping functionality. Some of the following commands may have commonalities and restrictions; these are described under the Usage section for each command.

MLD and MLD Snooping commands only apply to switch ports, not ETH interfaces.

Before using PIM-SMv6:

- IPv6 must be enabled on an interface ([ipv6 enable](#)),
- IPv6 forwarding must be enabled globally for routing IPv6 ([ipv6 forwarding](#)), and
- IPv6 multicasting must be enabled globally ([ipv6 multicast-routing](#)).

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

# clear ipv6 mld

**Overview** Use this command to clear all MLD local memberships on all interfaces.

**Syntax** `clear ipv6 mld`

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

**Example** `awplus# clear ipv6 mld`

**Related  
Commands** `clear ipv6 mld group`  
`clear ipv6 mld interface`

# clear ipv6 mld group

**Overview** Use this command to clear MLD specific local-membership(s) on all interfaces, for a particular group.

**Syntax** `clear ipv6 mld group {*|<ipv6-address>}`

| Parameter      | Description                                                                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| *              | Clears all groups on all interfaces. This is an alias to the <a href="#">clear ipv6 mld</a> command.                                                                            |
| <ipv6-address> | Specify the group address for which MLD local-memberships are to be cleared from all interfaces. Specify the IPv6 multicast group address in the format in the format X:X::X:X. |

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

**Example** `awplus# clear ipv6 mld group *`

**Related Commands** [clear ipv6 mld](#)  
[clear ipv6 mld interface](#)

# clear ipv6 mld interface

**Overview** Use this command to clear MLD interface entries.

**Syntax** `clear ipv6 mld interface <interface>`

| Parameter                      | Description                                                                          |
|--------------------------------|--------------------------------------------------------------------------------------|
| <code>&lt;interface&gt;</code> | Specifies name of the interface; all groups learned from this interface are deleted. |

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

**Example** `awplus# clear ipv6 mld interface vlan2`

**Related Commands** [clear ipv6 mld](#)  
[clear ipv6 mld group](#)

# debug mld

**Overview** Use this command to enable all MLD debugging modes, or a specific MLD debugging mode.

Use the **no** variant of this command to disable all MLD debugging modes, or a specific MLD debugging mode.

**Syntax** `debug mld {all|decode|encode|events|fsm|tib}`  
`no debug mld {all|decode|encode|events|fsm|tib}`

| Parameter | Description                            |
|-----------|----------------------------------------|
| all       | Debug all MLD.                         |
| decode    | Debug MLD decoding.                    |
| encode    | Debug MLD encoding.                    |
| events    | Debug MLD events.                      |
| fsm       | Debug MLD Finite State Machine (FSM).  |
| tib       | Debug MLD Tree Information Base (TIB). |

**Mode** Privileged Exec and Global Configuration

**Usage** This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

**Examples**

```
awplus# configure terminal
awplus(config)# debug mld all
awplus# configure terminal
awplus(config)# debug mld decode
awplus# configure terminal
awplus(config)# debug mld encode
awplus# configure terminal
awplus(config)# debug mld events
```

**Related Commands** [show debugging mld](#)

# ipv6 mld

**Overview** Use this command to enable the MLD protocol operation on an interface. This command enables MLD protocol operation in stand-alone mode, and can be used to learn local-membership information prior to enabling a multicast routing protocol on the interface.

Use the **no** variant of this command to return all MLD related configuration to the default (including MLD Snooping).

**Syntax** `ipv6 mld`  
`no ipv6 mld`

**Default** MLD is disabled by default.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld
```

# ipv6 mld last-member-query-count

**Overview** Use this command to set the last-member query-count value.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ipv6 mld last-member-query-count <value>`  
`no ipv6 mld last-member-query-count`

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <value>   | Count value. Valid values are from 2 to 7. |

**Default** The default last-member query-count value is 2.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-count 3
```

# ipv6 mld last-member-query-interval

**Overview** Use this command to configure the interval at which the router sends MLD group-specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

**Syntax** `ipv6 mld last-member-query-interval <milliseconds>`  
`no ipv6 mld last-member-query-interval`

| Parameter                         | Description                                                                                                           |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <code>&lt;milliseconds&gt;</code> | The time delay between successive query messages (in milliseconds). Valid values are from 1000 to 25500 milliseconds. |

**Default** 1000 milliseconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-interval 2000
```

# ipv6 mld querier-timeout

**Overview** Use this command to configure the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

**Syntax** `ipv6 mld querier-timeout <seconds>`  
`no ipv6 mld querier-timeout`

| Parameter                    | Description                                                                                                                                                            |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;seconds&gt;</code> | Number of seconds that the router waits after the previous querier has stopped querying before it takes over as the querier. Valid values are from 2 to 65535 seconds. |

**Default** 255 seconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols.

**Example** The following example configures the router to wait 120 seconds from the time it received the last query before it takes over as the querier for the interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld querier-timeout 120
```

**Related Commands** [ipv6 mld query-interval](#)

# ipv6 mld query-interval

**Overview** Use this command to configure the frequency of sending MLD host query messages.

Use the **no** variant of this command to return to the default frequency.

**Syntax** `ipv6 mld query-interval <seconds>`  
`no ipv6 mld query-interval`

| Parameter                    | Description                                                                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;seconds&gt;</code> | Variable that specifies the time delay between successive MLD host query messages (in seconds). Valid values are from 1 to 18000 seconds. |

**Default** The default query interval is 125 seconds.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols.

**Example** The following example changes the frequency of sending MLD host-query messages to 2 minutes:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-interval 120
```

**Related Commands** [ipv6 mld querier-timeout](#)

# ipv6 mld query-max-response-time

**Overview** Use this command to configure the maximum response time advertised in MLD queries.

Use the **no** variant of with this command to restore the default.

**Syntax** `ipv6 mld query-max-response-time <seconds>`  
`no ipv6 mld query-max-response-time`

| Parameter                    | Description                                                                                           |
|------------------------------|-------------------------------------------------------------------------------------------------------|
| <code>&lt;seconds&gt;</code> | Maximum response time (in seconds) advertised in MLD queries. Valid values are from 1 to 240 seconds. |

**Default** 10 seconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols.

**Example** The following example configures a maximum response time of 8 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-max-response-time 8
```

# ipv6 mld robustness-variable

**Overview** Use this command to change the robustness variable value on an interface.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ipv6 mld robustness-variable <value>`  
`no ipv6 mld robustness-variable`

**Default** The default robustness variable value is 2.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld robustness-variable 3
```

# ipv6 mld snooping

**Overview** Use this command to enable MLD Snooping. When this command is issued in the Global Configuration mode, MLD Snooping is enabled globally for the device. When this command is issued in Interface mode for a VLAN then MLD Snooping is enabled for the specified VLAN. Note that MLD Snooping is enabled on the VLAN only if it is enabled globally and on the VLAN.

Use the **no** variant of this command to globally disable MLD Snooping in Global Configuration mode, or for the specified VLAN interface in Interface mode.

**Syntax** `ipv6 mld snooping`  
`no ipv6 mld snooping`

**Default** By default, MLD Snooping is enabled both globally and on all VLANs.

**Mode** Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** For MLD Snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default).

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

**Examples** To configure MLD Snooping on the VLAN interfaces `vlan2-vlan4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interfaces `vlan2-vlan4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config)# no ipv6 mld snooping
```

To configure MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 mld snooping
```

To disable MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 mld snooping
```

# ipv6 mld snooping fast-leave

**Overview** Use this command to enable MLD Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing; the MLD group-membership is removed as soon as an MLD leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

**Syntax** `ipv6 mld snooping fast-leave`  
`no ipv6 mld snooping fast-leave`

**Default** MLD Snooping fast-leave processing is disabled.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This MLD Snooping command can only be configured on VLAN interfaces.

**Examples** This example shows how to enable fast-leave processing on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping fast-leave
```

This example shows how to enable fast-leave processing on the VLAN interface `vlan2- vlan4`.

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping fast-leave
```

# ipv6 mld snooping mrouter

**Overview** Use this command to statically configure the specified port as a Multicast Router interface for MLD Snooping within the specified VLAN.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to remove the static configuration of the interface as a Multicast Router interface.

**Syntax** `ipv6 mld snooping mrouter interface <port>`  
`no ipv6 mld snooping mrouter interface <port>`

| Parameter | Description                   |
|-----------|-------------------------------|
| <port>    | Specify the name of the port. |

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This MLD Snooping command statically configures a switch port as a Multicast Router interface.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if port1.0.1 and port1.0.6 are ports on an EPSR data VLAN vlan101, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

**Output** Figure 36-1: Example **ipv6 mld snooping mrouter** commands when static IPv6 multicast routing is being used and the destination VLAN is an EPSR data VLAN:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.6
```

**Examples** This example shows how to specify the next-hop interface to the multicast router for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping mrrouter interface
port1.0.5
```

This example shows how to specify the next-hop interface to the multicast router for VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping mrrouter interface
port1.0.5
```

**Related  
Commands** [ipv6 multicast route](#)

# ipv6 mld snooping querier

**Overview** Use this command to enable MLD querier operation on a subnet (VLAN) when no multicast routing protocol is configured in the subnet (VLAN). When enabled, the MLD Snooping querier sends out periodic MLD queries for all interfaces on that VLAN.

Use the **no** variant of this command to disable MLD querier configuration.

**Syntax** `ipv6 mld snooping querier`  
`no ipv6 mld snooping querier`

**Mode** Interface Configuration for a specified VLAN interface.

**Usage** This command can only be configured on a single VLAN interface - not on multiple VLANs.

The MLD Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as an MLD querier for faster network convergence.

The MLD Snooping querier does not start, or automatically cease, the MLD Querier operation if it detects query message(s) from a multicast router. It restarts as an MLD Snooping querier if no queries are seen within the other querier interval.

Do not enable MLD Snooping querier if you have already enabled MLD on your device.

Do not enable MLD Snooping querier on your device and then enable MLD afterwards.

**Example**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping querier
```

# ipv6 mld snooping report-suppression

**Overview** Use this command to enable report suppression from hosts for Multicast Listener Discovery version 1 (MLDv1) on a VLAN in Interface Configuration mode.

Use the **no** variant of this command to disable report suppression on a VLAN in Interface Configuration mode.

**Syntax** `ipv6 mld snooping report-suppression`  
`no ipv6 mld snooping report-suppression`

**Default** Report suppression does not apply to MLDv2, and is turned on by default for MLDv1 reports.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This MLD Snooping command can only be configured on VLAN interfaces. MLDv1 Snooping maybe configured to suppress reports from hosts. When a querier sends a query, only the first report for particular set of group(s) from a host will be forwarded to the querier by the MLD Snooping device. Similar reports (to the same set of groups) from other hosts, which would not change group memberships in the querier, will be suppressed by the MLD Snooping device to prevent 'flooding' of query responses.

**Examples** This example shows how to enable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 mld snooping report-suppression
```

This example shows how to enable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ipv6 mld snooping report-suppression
```

# ipv6 mld ssm-map enable

**Overview** Use this command to enable the Source Specific Multicast (SSM) mapping feature on the device.

Use the **no** variant of this command to disable the SSM mapping feature on the device.

**Syntax** `ipv6 mld ssm-map enable`  
`no ipv6 mld ssm-map enable`

**Mode** Global Configuration

**Usage** This command enables the SSM mapping feature for group members in the defined SSM range.

**Example** This example shows how to enable the MLD SSM mapping feature on the device.

```
awplus# configure terminal
awplus(config)# ipv6 mld ssm-map enable
```

# ipv6 mld static-group

**Overview** Use this command to statically configure IPv6 group membership entries on an interface. To statically add only a group membership, do not specify any parameters.

Use the **no** variant of this command to delete static group membership entries.

**Syntax** `ipv6 mld static-group <ipv6-group-address> [source <ipv6-source-address>] [interface <port>]`  
`no ipv6 mld static-group <ipv6-group-address> [source <ipv6-source-address>] [interface <port>]`

| Parameter                                | Description                                                                                                                                                                                                                                                             |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-group-address&gt;</code>  | Specify a standard IPv6 Multicast group address to be configured as a static group member. The IPv6 address uses the format X:X::X:X.                                                                                                                                   |
| <code>&lt;ipv6-source-address&gt;</code> | Optional. Specify a standard IPv6 source address to be configured as a static source from where multicast packets originate. The IPv6 address uses the format X:X::X:X.                                                                                                 |
| <code>&lt;port&gt;</code>                | Optional. Physical interface. This parameter specifies a physical port. If this parameter is used, the static configuration is applied to just to that physical interface. If this parameter is not used, the static configuration is applied on all ports in the VLAN. |

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to MLD Snooping on a VLAN interface to statically add groups and/or source records.

**Examples** To add a static group record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10
```

To add a static group and source record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
fe80::2fd:6cff:fe1c:b
```

To add a static group record on a specific port on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 interface
port1.0.4
```

# ipv6 mld version

**Overview** Use this command to set the current MLD protocol version on an interface.  
Use the **no** variant of this command to return to the default version on an interface.

**Syntax** `ipv6 mld version <version>`  
`no ipv6 mld version`

| Parameter                    | Description                                                    |
|------------------------------|----------------------------------------------------------------|
| <code>&lt;version&gt;</code> | MLD protocol version number. Valid version numbers are 1 and 2 |

**Default** The default MLD protocol version number is 2.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols and MLD Snooping. Note this command is intended for use where there is another querier (when there is another device with MLD enabled) on the same link that can only operate with MLD version 1. Otherwise, the default MLD version 2 is recommended for performance.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld version 1
```

# show debugging mld

**Overview** Use this command to display the MLD debugging modes enabled with the [debug mld](#) command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging mld`

**Mode** Privileged Exec

**Example** `awplus# show debugging mld`

## Output

```
show debugging mld
MLD Debugging status:
 MLD Decoder debugging is on
 MLD Encoder debugging is on
 MLD Events debugging is on
 MLD FSM debugging is on
 MLD Tree-Info-Base (TIB) debugging is on
```

**Related Commands** [debug mld](#)

# show ipv6 mld groups

**Overview** Use this command to display the multicast groups that have receivers directly connected to the router and learned through MLD.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 mld groups [<ipv6-address>|<interface>] [detail]`

| Parameter                         | Description                                                                  |
|-----------------------------------|------------------------------------------------------------------------------|
| <code>&lt;ipv6-address&gt;</code> | Optional. Specify Address of the multicast group in format X:X::X:X.         |
| <code>&lt;interface&gt;</code>    | Optional. Specify the Interface name for which to display local information. |

**Mode** User Exec and Privileged Exec

**Examples** The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups
```

**Output** Figure 36-2: Example output for **show ipv6 mld groups**

```
awplus#show ipv6 mld groups
MLD Connected Group Membership
Group Address Interface Uptime Expires
 Last Reporter
ff08::1 vlan10 (port1.0.1) 00:07:27 00:03:10
 fe80::200:1ff:fe20:b5ac
```

The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups detail
```

# show ipv6 mld interface

**Overview** Use this command to display the state of MLD and MLD Snooping for a specified interface, or all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 mld interface [<interface>]`

| Parameter   | Description     |
|-------------|-----------------|
| <interface> | Interface name. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays MLD interface status on all interfaces enabled for MLD:

```
awplus# show ipv6 mld interface
```

## Output

```
awplus#show ipv6 mld interface
Interface vlan1 (Index 301)
 MLD Enabled, Active, Querier, Version 2 (default)
 Internet address is fe80::215:77ff:fec9:7468
 MLD interface has 0 group-record states
 MLD activity: 0 joins, 0 leaves
 MLD robustness variable is 2
 MLD last member query count is 2
 MLD query interval is 125 seconds
 MLD querier timeout is 255 seconds
 MLD max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 MLD Snooping is globally enabled
 MLD Snooping is enabled on this interface
 MLD Snooping fast-leave is not enabled
 MLD Snooping querier is enabled
 MLD Snooping report suppression is enabled
```

# show ipv6 mld snooping mrouter

**Overview** Use this command to display the multicast router interfaces, both configured and learned, in a VLAN. If you do not specify a VLAN interface then all the VLAN interfaces are displayed.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 mld snooping mrouter [<interface>]`

| Parameter   | Description                                                                                                                                |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <interface> | Optional. Specify the name of the VLAN interface. Note: If you do not specify a single VLAN interface, then all VLAN interfaces are shown. |

**Mode** User Exec and Privileged Exec

**Examples** The following command displays the multicast router interfaces in `vlan2`:

```
awplus# show ipv6 mld snooping mrouter vlan2
```

## Output

```
awplus#show ipv6 mld snooping mrouter vlan2
VLAN Interface Static/Dynamic
2 port1.0.2 Dynamically Learned
2 port1.0.3 Dynamically Learned
```

The following command displays the multicast router interfaces for all VLAN interfaces:

```
awplus# show ipv6 mld snooping mrouter
```

## Output

```
awplus#show ipv6 mld snooping mrouter
VLAN Interface Static/Dynamic
2 port1.0.2 Dynamically Learned
2 port1.0.3 Dynamically Learned
3 port1.0.4 Statically Assigned
3 port1.0.5 Statically Assigned
```

# show ipv6 mld snooping statistics

**Overview** Use this command to display MLD Snooping statistics data.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 mld snooping statistics interface <interface>`

| Parameter   | Description                     |
|-------------|---------------------------------|
| <interface> | The name of the VLAN interface. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays MLDv2 statistical information for `vlan1`:

```
awplus# show ipv6 mld snooping statistics interface vlan1
```

## Output

```
awplus#show ipv6 mld snooping statistics interface vlan1
MLD Snooping statistics for vlan1
Interface: port1.0.1
Group: ff08::1
Uptime: 00:02:18
Group mode: Include ()
Last reporter: fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static)
Source Address Uptime v2 Exp Fwd Flags
2001:db8::1 00:02:18 00:02:02 Yes R
2001:db8::3 00:02:18 00:02:02 Yes R
```

# 37

# Multicast Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of multicast commands for configuring:

- IPv4 and IPv6 multicast forwarding
- IPv4 and IPv6 static multicast routes
- mroutes (routes back to a multicast source)

For commands for other multicast protocols, see:

- [IGMP and IGMP Snooping Commands](#)
- [MLD and MLD Snooping Commands](#)
- [PIM-SM Commands](#)
- [PIM-SMv6 Commands](#)

**NOTE:** Before using PIM-SMv6 commands, IPv6 must be enabled on an interface with the *ipv6 enable* command, IPv6 forwarding must be enabled globally for routing IPv6 with the *ipv6 forwarding* command, and IPv6 multicasting must be enabled globally with the *ipv6 multicast-routing* command.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the *clear ipv6 mroute* command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPv6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

*The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.*

# clear ip mroute

**Overview** Use this command to delete entries from the IPv4 multicast routing table.

**NOTE:** If you use this command, you should also use the [clear ip igmp group](#) command to clear IGMP group membership records.

**Syntax** `clear ip mroute {*|<ipv4-group-address>  
<ipv4-source-address>} [pim sparse-mode]`

| Parameter             | Description                                                            |
|-----------------------|------------------------------------------------------------------------|
| *                     | Deletes all multicast routes.                                          |
| <ipv4-group-address>  | Group IPv4 address, in dotted decimal notation in the format A.B.C.D.  |
| <ipv4-source-address> | Source IPv4 address, in dotted decimal notation in the format A.B.C.D. |
| pim sparse-mode       | Clear specified IPv4 multicast route(s) for PIM Sparse Mode only.      |

**Mode** Privileged Exec

**Usage** When this command is used, the Multicast Routing Information Base (MRIB) clears the IPv4 multicast route entries in its IPv4 multicast route table, and removes the entries from the multicast forwarder. The MRIB sends a "clear" message to the multicast protocols. Each multicast protocol has its own "clear" multicast route command. The protocol-specific "clear" command clears multicast routes from PIM Sparse Mode, and also clears the routes from the MRIB.

**Examples** `awplus# clear ip mroute 225.1.1.1 192.168.3.3`  
`awplus# clear ip mroute *`

**Related Commands** [ip multicast route](#)  
[show ip mroute](#)

# clear ip mroute statistics

**Overview** Use this command to delete multicast route statistics entries from the IP multicast routing table.

**Syntax** `clear ip mroute statistics {*|<ipv4-group-addr>  
[<ipv4-source-addr>]}`

| Parameter          | Description                                                            |
|--------------------|------------------------------------------------------------------------|
| *                  | All multicast route entries.                                           |
| <ipv4-group-addr>  | Group IPv4 address, in dotted decimal notation in the format A.B.C.D.  |
| <ipv4-source-addr> | Source IPv4 address, in dotted decimal notation in the format A.B.C.D. |

**Mode** Privileged Exec

**Example** `awplus# clear ip mroute statistics 225.1.1.2 192.168.4.4`  
`awplus# clear ip mroute statistics *`

# clear ipv6 mroute

**Overview** Use this command to delete one or more dynamically-added route entries from the IPv6 multicast routing table.

You need to do this, for example, if you want to create a static route instead of an existing dynamic route.

**Syntax** `clear ipv6 mroute {*|<ipv6-group-address>  
[<ipv6-source-address>]}`

| Parameter             | Description                                                          |
|-----------------------|----------------------------------------------------------------------|
| *                     | Deletes all dynamically-learned IPv6 multicast routes.               |
| <ipv6-group-address>  | Group IPv6 address, in hexadecimal notation in the format X.X::X.X.  |
| <ipv6-source-address> | Source IPv6 address, in hexadecimal notation in the format X.X::X.X. |

**Mode** Privileged Exec

**Usage** When this command is used, the Multicast Routing Information Base (MRIB) clears the relevant IPv6 multicast route entries in its IPv6 multicast route table, and removes the entries from the multicast forwarder. The MRIB sends a "clear" message to the multicast protocols. Each multicast protocol has its own "clear" multicast route command.

This command does not remove static routes from the routing table or the configuration. To remove static routes, use the **no** parameter of the command [ipv6 multicast route](#).

**Example** `awplus# clear ipv6 mroute 2001::2 ff08::1`

**Related Commands** [ipv6 multicast route](#)  
[show ipv6 mroute](#)

# clear ipv6 mroute statistics

**Overview** Use this command to delete multicast route statistics entries from the IPv6 multicast routing table.

**NOTE:** *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the `clear ipv6 mroute` command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

**Syntax** `clear ipv6 mroute statistics {*|<ipv6-group-address> [<ipv6-source-address>]}`

| Parameter          | Description                                                          |
|--------------------|----------------------------------------------------------------------|
| *                  | All multicast route entries.                                         |
| <ipv6-group-addr>  | Group IPv6 address, in hexadecimal notation in the format X.X::X.X.  |
| <ipv6-source-addr> | Source IPv6 address, in hexadecimal notation in the format X.X::X.X. |

**Mode** Privileged Exec

**Examples**

```
awplus# clear ipv6 mroute statistics 2001::2 ff08::1
awplus# clear ipv6 mroute statistics *
```

# debug nsm mcast

**Overview** Use this command to debug IPv4 events in the Multicast Routing Information Base (MRIB).

This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

**Syntax** `debug nsm mcast`  
{all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}

| Parameter     | Description                                 |
|---------------|---------------------------------------------|
| all           | All IPv4 multicast debugging.               |
| fib-msg       | Forwarding Information Base (FIB) messages. |
| mrt           | Multicast routes.                           |
| mtrace        | Multicast traceroute.                       |
| mtrace-detail | Multicast traceroute detailed debugging.    |
| register      | Multicast PIM register messages.            |
| stats         | Multicast statistics.                       |
| vif           | Multicast interface.                        |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging of all multicast route events, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast all
```

To enable debugging of PIM register entries, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast register
```

# debug nsm mcast6

**Overview** Use this command to debug IPv6 events in the Multicast Routing Information Base (MRIB).

This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

**Syntax** debug nsm mcast6 {all|fib-msg|mrt|register|stats|vif}  
no debug nsm mcast6 {all|fib-msg|mrt|register|stats|vif}

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| all       | All IPv6 multicast route debugging.         |
| fib-msg   | Forwarding Information Base (FIB) messages. |
| mrt       | Multicast routes.                           |
| register  | Multicast PIM register messages.            |
| stats     | Multicast statistics.                       |
| vif       | Multicast interfaces.                       |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging of all multicast route events, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 all
```

To enable debugging of PIM register entries, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 register
```

# ip mroute

**Overview** Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv4 multicast source.

Use the **no** variant of this command to delete a route to an IPv4 multicast source.

**Syntax**

```
ip mroute <ipv4-source-address/mask-length>
[bgp|ospf|rip|static] <rpf-address> [<admin-distance>]

no ip mroute <ipv4-source-address/mask-length>
[bgp|ospf|rip|static]
```

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv4-source-address/mask-length> | A multicast source IPv4 address and mask length, in dotted decimal notation in the format A.B.C.D/M.                                                                                                                                                                                                                                           |
| bgp                               | BGP unicast routing protocol.                                                                                                                                                                                                                                                                                                                  |
| ospf                              | OSPF unicast routing protocol.                                                                                                                                                                                                                                                                                                                 |
| rip                               | RIP unicast routing protocol.                                                                                                                                                                                                                                                                                                                  |
| static                            | Specifies a static route.                                                                                                                                                                                                                                                                                                                      |
| <rpf-address>                     | A.B.C.D<br>The closest known address on the multicast route back to the specified source. This host IPv4 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the next hop address on the path to this host. |
| <admin-distance>                  | The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is 0 and the range available is 0-255.               |

**Mode** Global Configuration

**Usage** Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to an IPv4 multicast source, it uses the unicast route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the device with “multicast routes” back to given sources. When performing the RPF check on a stream from a given IPv4 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest

administrative distance - whether a static "multicast route" or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term "multicast route" does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

**Examples** The following example creates a static multicast IPv4 route back to the sources in the 10.10.3.0/24 subnet. The multicast route is via the host 192.168.2.3, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ip mroute 10.10.3.0/24 static 2 192.168.2.3 2
```

The following example creates a static multicast IPv4 route back to the sources in the 192.168.3.0/24 subnet. The multicast route is via the host 10.10.10.50. The administrative distance on this route has the default value of 0:

```
awplus# configure terminal
awplus(config)# ip mroute 192.168.3.0/24 10.10.10.50
```

**Validation  
Commands** `show ip rpf`

# ip multicast route

**Overview** Use this command to add an IPv4 static multicast route for a specific multicast source and group IPv4 address to the multicast Routing Information Base (RIB). This IPv4 multicast route is used to forward multicast traffic from a specific source and group ingress on an upstream VLAN to a single or range of downstream VLANs.

Use the **no** variant of this command to either remove an IPv4 static multicast route set with this command or to remove a specific downstream VLAN interface from an IPv4 static multicast route for a specific multicast source and group IPv4 address.

**Syntax**

```
ip multicast route <ipv4-source-addr> <ipv4-group-addr>
<upstream-vlan-id> [<downstream-vlan-id>]

no ip multicast route <ipv4-source-addr> <ipv4-group-addr>
[<upstream-vlan-id> <downstream-vlan-id>]
```

| Parameter            | Description                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------|
| <ipv4-source-addr>   | Source IPv4 address, in dotted decimal notation in the format A.B.C.D.                         |
| <ipv4-group-addr>    | Group IPv4 address, in dotted decimal notation in the format A.B.C.D.                          |
| <upstream-vlan-id>   | Upstream VLAN interface on which the multicast packets ingress.                                |
| <downstream-vlan-id> | Downstream VLAN interface or range of VLAN interfaces to which the multicast packets are sent. |

**Default** By default, this feature is disabled.

**Mode** Global Configuration

**Usage** Only one multicast route entry per IPv4 address and multicast group can be specified. Therefore, if one entry for a static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists you cannot create a static multicast route with same source IPv4 address, group IPv4 address, upstream VLAN and downstream VLANs. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to timeout or clear the dynamic multicast route with the [clear ip mroute](#) command.

To update an existing static multicast route entry with more or a new set of downstream VLANs, you must firstly remove the existing static multicast route and then add the new static multicast route with all downstream VLANs specified. If you attempt to update an existing static multicast route entry with an additional VLAN or VLANs an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream VLAN are dropped rather than

forwarded, do not specify the optional `<downstream-vlan-id>` parameter when entering this command.

To remove a specific downstream VLAN from an existing static multicast route entry, specify the VLAN you want to remove with the `<downstream-vlan-id>` parameter when entering the **no** variant of this command.

**Examples** To create a static multicast route for the multicast source IPv4 address `2.2.2.2` and group IPv4 address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN interface as `vlan20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20
```

To create a blackhole route for the multicast source IPv4 address `2.2.2.2` and group IPv4 address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10`, use the following commands:

To create an IPv4 static multicast route for the multicast source IPv4 address `2.2.2.2` and group IP address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN range as `vlan20-25`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20-25
```

To remove the downstream VLAN 23 from the IPv4 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
vlan10 vlan23
```

To delete an IPv4 static multicast route for the multicast source IP address `2.2.2.2` and group IP address `224.9.10.11`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
```

**Related  
Commands** [clear ip mroute](#)  
[show ip mroute](#)

# ip multicast route-limit

**Overview** Use this command to limit the number of multicast routes that can be added to an IPv4 multicast routing table.

Use the **no** variant of this command to return the IPv4 route limit to the default.

**Syntax** `ip multicast route-limit <limit> [<threshold>]`  
`no ip multicast route-limit`

| Parameter                      | Description                                                                                                                                           |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;limit&gt;</code>     | <code>&lt;1-2147483647&gt;</code> Number of routes.                                                                                                   |
| <code>&lt;threshold&gt;</code> | <code>&lt;1-2147483647&gt;</code> Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit. |

**Default** The default limit and threshold value is 2147483647.

**Mode** Global Configuration

**Usage** This command limits the number of multicast IPv4 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

**Examples**

```
awplus# configure terminal
awplus(config)# ip multicast route-limit 34 24
awplus# configure terminal
awplus(config)# no ip multicast route-limit
```

# ip multicast wrong-vif-suppression

**Overview** Use this command to prevent unwanted multicast packets received on an unexpected VLAN being trapped to the CPU.

Use the no variant of this command to disable wrong VIF suppression.

**Syntax** `ip ip multicast wrong-vif-suppression`  
`no ip multicast wrong-vif-suppression`

**Default** By default, this feature is disabled.

**Mode** Global Configuration

**Usage** Use this command if there is excessive CPU load and multicast traffic is enabled. To confirm that VIF messages are being sent to the CPU use the `debug nsm mcast6` command.

**Examples** To enable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast wrong-vif-suppression
```

To disable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast wrong-vif-suppression
```

# ip multicast-routing

**Overview** Use this command to turn on/off IPv4 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv4 multicast routing after enabling it. Note the default stated below.

**Syntax** `ip multicast-routing`  
`no ip multicast-routing`

**Default** By default, IPv4 multicast routing is off.

**Mode** Global Configuration

**Usage** When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), stops IGMP operation, and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

**Example** `awplus# configure terminal`  
`awplus(config)# ip multicast-routing`

**Validation  
Commands** `show running-config`

# ipv6 mroute

**Overview** Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv6 multicast source.

Use the **no** variant of this command to delete a route to an IPv6 multicast source.

JC - 25/6/12 - added missing IPI IPv6 multicast commands that have been in since 5.4.1 as undocumented and unregistered CLI commands but have been available in 5.4.1/5.4.2 sw - this is out for 542-25 but should be added back in for 543 - check in with Team Zeta on it

**Syntax** `ipv6 mroute <ipv6-source-address/mask-length> [rip|static] <rpf-address> [<admin-distance>]`

`no ipv6 mroute <ipv6-source-address/mask-length> [rip|static]`

| Parameter                                            | Description                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-source-address/mask-length&gt;</code> | A multicast source IPv6 address and mask length, in hexadecimal notation in the format X.X::X.X/M.                                                                                                                                                                                                                                                  |
| <code>rip</code>                                     | RIPng IPv6 unicast routing protocol.                                                                                                                                                                                                                                                                                                                |
| <code>static</code>                                  | Specifies a static route.                                                                                                                                                                                                                                                                                                                           |
| <code>&lt;rpf-address&gt;</code>                     | X.X::X:X<br>The closest known address on the IPv6 multicast route back to the specified source. This host IPv6 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the nexthop address on the path to this host. |
| <code>&lt;admin-distance&gt;</code>                  | The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is 0 and the range available is 0-255.                    |

**Mode** Global Configuration

**Usage** Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to a multicast source, it uses the unicast IPv6 route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the switch with "multicast routes" back to given sources. When performing the RPF check on a stream from a

given IPv6 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest administrative distance - whether a static "multicast route" or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term "multicast route" does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

**Examples** The following example creates a static multicast route back to the sources in the 2001::1/64 subnet. The multicast route is via the host 2002::2, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ipv6 mroute 2001::1/64 static 2 2002::2
```

The following example creates a static multicast route back to the sources in the 2002::2/64 subnet. The multicast route is via the host 2001::1. The administrative distance on this route has the default value of 0:

```
awplus# configure terminal
awplus(config)# ipv6 mroute 2002::2/64 2001::1
```

**Validation Commands** `show ipv6 mroute`

# ipv6 multicast route

**Overview** Use this command to add an IPv6 static multicast route for a specific multicast source and group IPv6 address to the multicast Routing Information Base (RIB). This IPv6 multicast route is used to forward IPv6 multicast traffic from a specific source and group ingressing on an upstream VLAN to a single or range of downstream VLANs.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to either remove an IPv6 static multicast route set with this command or to remove a specific downstream VLAN interface from an IPv6 static multicast route for a specific IPv6 multicast source and group address.

**Syntax** `ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr> <upstream-vlan-id> [<downstream-vlan-id>]`  
`no ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr> [<upstream-vlan-id> <downstream-vlan-id>]`

| Parameter                               | Description                                                                                    |
|-----------------------------------------|------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-group-addr&gt;</code>    | Source IPv6 address, in dotted decimal notation in the format X.X::X.X.                        |
| <code>&lt;ipv6-group-addr&gt;</code>    | Group IP address, in dotted decimal notation in the format X.X::X.X.                           |
| <code>&lt;upstream-vlan-id&gt;</code>   | Upstream VLAN interface on which the multicast packets ingress.                                |
| <code>&lt;downstream-vlan-id&gt;</code> | Downstream VLAN interface or range of VLAN interfaces to which the multicast packets are sent. |

**Default** By default, no static routes exist.

**Mode** Global Configuration

**Usage** Only one multicast route entry per IPv6 address and multicast group can be specified. Therefore, if one entry for an IPv6 static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists, you cannot create a static multicast route with the same source IPv6 address and group IPv6 address. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to time out or clear the dynamic multicast route with the [clear ipv6 mroute](#) command.

To update an existing IPv6 static multicast route entry with new or additional downstream VLANs, you must firstly remove the existing static multicast route and then add the new static multicast route with all downstream VLANs specified. If

you attempt to update an existing static multicast route entry with an additional VLAN or VLANs an error message is displayed and logged.

To remove a specific downstream VLAN from an existing static multicast route entry, specify the VLAN you want to remove with the `<downstream-vlan-id>` parameter when entering the **no** variant of this command.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

See [ipv6 mld snooping mrouter](#) for a command description and command examples.

**Examples** To create an IPv6 static multicast route for the multicast source IPv6 address `2001::1` and group IPv6 address `ff08::1`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN interface as `vlan20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20
```

To create a blackhole route for the IPv6 multicast source IP address `2001::1` and group IP address `ff08::1`, specifying the upstream VLAN interface as `vlan10`, use the following commands:

To create an IPv6 static multicast route for the multicast source IPv6 address `2001::1` and group IPv6 address `ff08::1`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN range as `vlan20-25`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20-25
```

To remove the downstream VLAN 23 from the IPv6 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1 vlan10
vlan23
```

To delete an IPv6 static multicast route for the multicast source IPv6 address `2001::1` and group IPv6 address `ff08::1`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1
```

**Related Commands**

- [clear ipv6 mroute](#)
- [ipv6 mld snooping mrouter](#)
- [show ipv6 mroute](#)

# ipv6 multicast route-limit

**Overview** Use this command to limit the number of multicast routes that can be added to an IPv6 multicast routing table.

Use the no variant of this command to return the IPv6 route limit to the default.

**Syntax** `ipv6 multicast route-limit <limit> [<threshold>]`  
`no ipv6 multicast route-limit`

| Parameter                      | Description                                                                                                                                           |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;limit&gt;</code>     | <code>&lt;1-2147483647&gt;</code> Number of routes.                                                                                                   |
| <code>&lt;threshold&gt;</code> | <code>&lt;1-2147483647&gt;</code> Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit. |

**Default** The default limit and threshold value is 2147483647.

**Mode** Global Configuration

**Usage** This command limits the number of multicast IPv6 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 multicast route-limit 34 24
awplus# configure terminal
awplus(config)# no ipv6 multicast route-limit
```

# ipv6 multicast-routing

**Overview** Use this command to turn on/off IPv6 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv6 multicast routing after enabling it. Note the default stated below.

**Syntax** `ipv6 multicast-routing`  
`no ipv6 multicast-routing`

**Default** By default, IPv6 multicast routing is off.

**Mode** Global Configuration

**Usage** When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

**Examples** `awplus# configure terminal`  
`awplus(config)# ipv6 multicast-routing`  
`awplus# configure terminal`  
`awplus(config)# no ipv6 multicast-routing`

**Validation Commands** `show running-config`

# multicast

**Overview** Use this command to enable a device port to route multicast packets that ingress the port.

Use the **no** variant of this command to stop the device port from routing multicast packets that ingress the port. Note that this does not affect Layer 2 forwarding of multicast packets. If you enter **no multicast** on a port, multicast packets received on that port will not be forwarded to other VLANs, but ports in the same VLANs as the receiving port will still receive the multicast packets.

**CAUTION:** *We do not recommend disabling multicast routing in a live network. Some non-multicast protocols use multicast packets and will not function correctly if you disable it.*

**Syntax** multicast  
no multicast

**Default** By default, all device ports route multicast packets.

**Mode** Interface Configuration

**Examples** To disable routing of multicast packets on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no multicast
```

To re-enable routing of multicast packets on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# multicast
```

**Validation Commands** `show running-config`

# show ip mroute

**Overview** Use this command to display the contents of the IPv4 multicast routing (mroute) table.

**Syntax** `show ip mroute [<ipv4-group-addr>] [<ipv4-source-addr>] [{dense|sparse}] [{count|summary}]`

| Parameter          | Description                                                                               |
|--------------------|-------------------------------------------------------------------------------------------|
| <ipv4-group-addr>  | Group IPv4 address, in dotted decimal notation in the format A.B.C.D.                     |
| <ipv4-source-addr> | Source IPv4 address, in dotted decimal notation in the format A.B.C.D.                    |
| dense              | Display dense IPv4 multicast routes.                                                      |
| sparse             | Display sparse IPv4 multicast routes.                                                     |
| count              | Display the route and packet count from the IPv4 multicast routing (mroute) table.        |
| summary            | Display the contents of the IPv4 multicast routing (mroute) table in an abbreviated form. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip mroute 10.10.3.34 224.1.1.4.3
awplus# show ip mroute 10.10.5.24 225.2.2.2 count
awplus# show ip mroute 10.10.1.34 summary
```

**Output** The following is a sample output of this command displaying the IPv4 multicast routing table, with and without specifying the group and source IPv4 address:

Figure 37-1: Example output from the **show ip mroute** command

```
awplus# show ip mroute

# show ip mvif

**Overview** Use this command to display the contents of the IPv4 Multicast Routing Information Base (MRIB) VIF table.

**Syntax** `show ip mvif <interface>`

| Parameter   | Description                                 |
|-------------|---------------------------------------------|
| <interface> | The interface to display information about. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip mvif vlan2`

**Output** Figure 37-5: Example output from the **show ip mvif** command

| Interface | Vif Idx | Owner Module | TTL | Local Address | Remote Address | Uptime   |
|-----------|---------|--------------|-----|---------------|----------------|----------|
| vlan2     | 0       | PIM-SM       | 1   | 192.168.1.53  | 0.0.0.0        | 00:04:26 |
| Register  | 1       |              | 1   | 192.168.1.53  | 0.0.0.0        | 00:04:26 |
| vlan3     | 2       | PIM-SM       | 1   | 192.168.10.53 | 0.0.0.0        | 00:04:25 |

Figure 37-6: Example output from the **show ip mvif** command with the interface parameter **vlan2** specified

| Interface | Vif Idx | Owner Module | TTL | Local Address | Remote Address | Uptime   |
|-----------|---------|--------------|-----|---------------|----------------|----------|
| vlan2     | 0       | PIM-SM       | 1   | 192.168.1.53  | 0.0.0.0        | 00:05:17 |

# show ip rpf

**Overview** Use this command to display Reverse Path Forwarding (RPF) information for the specified IPv4 source address.

**Syntax** `show ip rpf <source-addr>`

| Parameter                        | Description                                                            |
|----------------------------------|------------------------------------------------------------------------|
| <code>&lt;source-addr&gt;</code> | Source IPv4 address, in dotted decimal notation in the format A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip rpf 10.10.10.50`

# show ipv6 mroute

**Overview** Use this command to display the contents of the IPv6 multicast routing (mroute) table.

**Syntax** `show ipv6 mroute [<ipv6-group-addr>] [<ipv6-source-addr>] [{count|summary}]`

| Parameter                             | Description                                                                               |
|---------------------------------------|-------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-group-addr&gt;</code>  | Group IPv6 address, in hexadecimal notation in the format X.X::X.X.                       |
| <code>&lt;ipv6-source-addr&gt;</code> | Source IPv6 address, in hexadecimal notation in the format X.X::X.X.                      |
| <code>count</code>                    | Display the route and packet count from the IPv6 multicast routing (mroute) table.        |
| <code>summary</code>                  | Display the contents of the IPv6 multicast routing (mroute) table in an abbreviated form. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ipv6 mroute
awplus# show ipv6 mroute count
awplus# show ipv6 mroute summary
awplus# show ipv6 mroute 2001::2 ff08::1 count
awplus# show ipv6 mroute 2001::2 ff08::1
awplus# show ipv6 mroute 2001::2 summary
```

**Output** The following is a sample output of this command displaying the IPv6 multicast routing table for a single static IPv6 Multicast route:

Figure 37-7: Example output from the **show ipv6 mroute** command

```
awplus#show ipv6 mroute
IPv6 Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface
(2001::2, ff08::1), uptime 03:18:38
Owner IMI, Flags: F
 Incoming interface: vlan2
 Outgoing interface list:
 vlan3
```

The following is a sample output of this command displaying the IPv6 multicast routing count table for a single static IPv6 Multicast route:

Figure 37-8: Example output from the **show ipv6 mroute count** command

```
awplus#show ipv6 mroute count

IPv6 Multicast Statistics
Total 1 routes using 152 bytes memory
Route limit/Route threshold: 1024/1024
Total NOCACHE/WRONGmif/WHOLEPKT rcv from fwd: 6/0/0
Total NOCACHE/WRONGmif/WHOLEPKT sent to clients: 6/0/0
Immediate/Timed stat updates sent to clients: 0/0
Reg ACK rcv/Reg NACK rcv/Reg pkt sent: 0/0/0
Next stats poll: 00:01:14

Forwarding Counts: Pkt count/Byte count, Other Counts: Wrong If
pkts
Fwd msg counts: WRONGmif/WHOLEPKT rcv
Client msg counts: WRONGmif/WHOLEPKT/Imm Stat/Timed Stat sent
Reg pkt counts: Reg ACK rcv/Reg NACK rcv/Reg pkt sent

(2001::2, ff08::1), Forwarding: 0/0, Other: 0
 Fwd msg: 0/0, Client msg: 0/0/0/0, Reg: 0/0/0
```

The following is a sample output of this command displaying the IPv6 multicast routing summary table for a single static IPv6 Multicast route:

Figure 37-9: Example output from the **show ipv6 mroute summary** command

```
awplus#show ipv6 mroute summary

IPv6 Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface

(2001::2, ff08::1), 03:20:28/-, IMI, Flags: F
```

# show ipv6 multicast forwarding

**Overview** Use this command to view the status of multicast forwarding slow-path-packet setting.

**Syntax** `show ipv6 multicast forwarding`

**Mode** User Exec

**Example** To show the status of the multicast forwarding, slow-path-packet setting, use the following command:

```
awplus# show ipv6 multicast forwarding
```

**Output** Figure 37-10: Example output from the **show ipv6 multicast forwarding** command:

```
ipv6 multicast forwarding is disabled
```

**Related Commands** [ipv6 multicast forward-slow-path-packet](#)

# show ipv6 mif

**Overview** Use this command to display the contents of the IPv6 Multicast Routing Information Base (MRIB) MIF table.

**Syntax** `show ipv6 mif [<interface>]`

| Parameter   | Description                                 |
|-------------|---------------------------------------------|
| <interface> | The interface to display information about. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 mif`  
`awplus# show ipv6 mif vlan2`

**Output** Figure 37-11: Example output from the **show ipv6 mif** command

```
awplus#show ipv6 mif
Interface Mif Owner Uptime
 Idx Module
vlan3 0 MLD/MLD Proxy-Service 03:28:48
vlan2 1 MLD/MLD Proxy-Service 03:28:48
vlan1 2 MLD/MLD Proxy-Service 03:28:48
```

Figure 37-12: Example output from the **show ipv6 mif** command with the interface parameter **vlan2** specified

| Interface | Mif Idx | Owner Module | TTL | Remote Address | Uptime   |
|-----------|---------|--------------|-----|----------------|----------|
| vlan2     | 0       | PIM-SMv6     | 1   | 0.0.0.0        | 00:05:17 |

# PIM-SM Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of PIM-SM commands. For commands common to PIM-SM and PIM-DM, see the [Multicast Commands](#) chapter.

- Command List**
- “clear ip pim sparse-mode bsr rp-set \*” on page 1690
  - “clear ip pim sparse-mode packet statistics” on page 1691
  - “clear ip mroute pim sparse-mode” on page 1692
  - “debug pim sparse-mode” on page 1693
  - “debug pim sparse-mode timer” on page 1694
  - “ip pim anycast-rp” on page 1696
  - “ip pim bsr-border” on page 1697
  - “ip pim bsr-candidate” on page 1698
  - “ip pim cisco-register-checksum” on page 1699
  - “ip pim crp-cisco-prefix” on page 1700
  - “ip pim dr-priority” on page 1701
  - “ip pim exclude-genid” on page 1702
  - “ip pim ext-srcs-directly-connected” on page 1703
  - “ip pim hello-holdtime (PIM-SM)” on page 1704
  - “ip pim hello-interval (PIM-SM)” on page 1705
  - “ip pim ignore-rp-set-priority” on page 1706
  - “ip pim jp-timer” on page 1707
  - “ip pim register-rate-limit” on page 1708
  - “ip pim register-rp-reachability” on page 1709

- [“ip pim register-source”](#) on page 1710
- [“ip pim register-suppression”](#) on page 1711
- [“ip pim rp-address”](#) on page 1712
- [“ip pim rp-candidate”](#) on page 1713
- [“ip pim rp-register-kat”](#) on page 1714
- [“ip pim sparse-mode”](#) on page 1715
- [“ip pim sparse-mode passive”](#) on page 1716
- [“ip pim spt-threshold”](#) on page 1717
- [“ip pim ssm”](#) on page 1718
- [“show debugging pim sparse-mode”](#) on page 1719
- [“show ip pim sparse-mode bsr-router”](#) on page 1720
- [“show ip pim sparse-mode interface”](#) on page 1721
- [“show ip pim sparse-mode interface detail”](#) on page 1723
- [“show ip pim sparse-mode local-members”](#) on page 1724
- [“show ip pim sparse-mode mroute”](#) on page 1725
- [“show ip pim sparse-mode mroute detail”](#) on page 1727
- [“show ip pim sparse-mode neighbor”](#) on page 1729
- [“show ip pim sparse-mode nexthop”](#) on page 1730
- [“show ip pim sparse-mode packet statistics”](#) on page 1731
- [“show ip pim sparse-mode rp-hash”](#) on page 1732
- [“show ip pim sparse-mode rp mapping”](#) on page 1733
- [“undebbug all pim sparse-mode”](#) on page 1734

# clear ip pim sparse-mode bsr rp-set \*

**Overview** Use this command to clear all Rendezvous Point (RP) sets learned through the PIMv2 Bootstrap Router (BSR).

**Syntax** `clear ip pim sparse-mode bsr rp-set *`

| Parameter | Description         |
|-----------|---------------------|
| *         | Clears all RP sets. |

**Mode** Privileged Exec

**Usage** For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

**Example** `awplus# clear ip pim sparse-mode bsr rp-set *`

# clear ip pim sparse-mode packet statistics

**Overview** Use this command to clear the PIM sparse mode packet statistics counter.

**Syntax** `clear ip pim sparse-mode packet statistics`

**Mode** Privileged Exec

**Example** The following command clears the current packet receive counts for PIM sparse-mode:

```
awplus# configure terminal
awplus(config)# clear ip pim sparse-mode statistics
```

**Output** Figure 38-1: Example output from **clear ip pim sparse-mode statistics**

```
awplus(config)#clear ip pim sparse-mode statistics
PIM-SM Receive Packet Statistics :
All PIM-SM : Total : 0 Valid : 0
Hello : Total : 0 Valid : 0
Register : Total : 0 Valid : 0
Register Stop : Total : 0 Valid : 0
Join/Prune : Total : 0 Valid : 0
Bootstrap : Total : 0 Valid : 0
Assert : Total : 0 Valid : 0
Candidate-RP : Total : 0 Valid : 0
```

**Related Commands** [show ip pim sparse-mode packet statistics](#)

# clear ip mroute pim sparse-mode

**Overview** Use this command to clear all multicast route table entries learned through PIM-SM for a specified multicast group address, and optionally a specified multicast source address.

**Syntax** `clear ip mroute <Group-IP-address> pim sparse-mode`  
`clear ip mroute <Group-IP-address> <Source-IP-address> pim sparse-mode`

| Parameter                              | Description                                                          |
|----------------------------------------|----------------------------------------------------------------------|
| <code>&lt;Group-IP-address&gt;</code>  | Specify a multicast group IPv6 address, entered in the form A.B.C.D. |
| <code>&lt;Source-IP-address&gt;</code> | Specify a source group IP address, entered in the form A.B.C.D.      |

**Mode** Privileged Exec

**Example** `awplus# clear ip mroute pim sparse-mode 224.0.0.0`  
`awplus# clear ip mroute 192.168.7.1 pim sparse-mode 224.0.0.0`

# debug pim sparse-mode

**Overview** Use this command to turn on some or all PIM-SM debugging.

Use the **no** variant of this command to turn off some or all PIM-SM debugging.

**Syntax** `debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`

`no debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`

| Parameter | Description                                                                                |
|-----------|--------------------------------------------------------------------------------------------|
| all       | Activates/deactivates all PIM-SM debugging.                                                |
| events    | Activates debug printing of events.                                                        |
| mfc       | Activates debug printing of MFC (Multicast Forwarding Cache in kernel) add/delete/updates. |
| mib       | Activates debug printing of PIM-SM MIBs.                                                   |
| nexthop   | Activates debug printing of PIM-SM next hop communications.                                |
| nsm       | Activates debugging of PIM-SM Network Services Module communications.                      |
| packet    | Activates debug printing of incoming and/or outgoing packets.                              |
| state     | Activates debug printing of state transition on all PIM-SM FSMs.                           |
| mtrace    | Activates debug printing of multicast traceroute.                                          |

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim sparse-mode all`

**Related Commands** [show debugging pim sparse-mode](#)

# debug pim sparse-mode timer

**Overview** Use this command to enable debugging for the specified PIM-SM timers. Use the **no** variants of this command to disable debugging for the specified PIM-SM timers.

**Syntax**

```
debug pim sparse-mode timer assert [at]
no debug pim sparse-mode timer assert [at]
debug pim sparse-mode timer bsr [bst|crp]
no debug pim sparse-mode timer bsr [bst|crp]
debug pim sparse-mode timer hello [ht|nlt|tht]
no debug pim sparse-mode timer hello [ht|nlt|tht]
debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
debug pim sparse-mode timer register [rst]
no debug pim sparse-mode timer register [rst]
```

| Parameter | Description                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------|
| assert    | Enable or disable debugging for the Assert timers.                                                    |
| at        | Enable or disable debugging for the Assert Timer.                                                     |
| bsr       | Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers. |
| bst       | Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.                                |
| crp       | Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.                             |
| hello     | Enable or disable debugging for the specified Hello timer, or all Hello timers.                       |
| ht        | Enable or disable debugging for the Hello timer: Hello Timer.                                         |
| nlt       | Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.                             |
| tht       | Enable or disable debugging for the Hello timer: Triggered Hello Timer.                               |
| joinprune | Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.               |
| jt        | Enable or disable debugging for the JoinPrune timer: upstream Join Timer.                             |
| et        | Enable or disable debugging for the JoinPrune timer: Expiry Timer.                                    |
| ppt       | Enable or disable debugging for the JoinPrune timer: PrunePending Timer.                              |

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| kat       | Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.         |
| ot        | Enable or disable debugging for the JoinPrune timer: Upstream Override Timer. |
| register  | Enable or disable debugging for the Register timers.                          |
| rst       | Enable or disable debugging for the Register timer: Register Stop Timer.      |

**Default** By default, all debugging is disabled.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging for the PIM-SM Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SM Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SM Joinprune expiry timer, use the command:

```
awplus# debug pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SM Register timer, use the command:

```
awplus# no debug pim sparse-mode timer register
```

**Related Commands** [show debugging pim sparse-mode](#)

# ip pim anycast-rp

**Overview** Use this command to configure Anycast RP (Rendezvous Point) in a RP set.  
Use the **no** variant of this command to remove the configuration.

**Syntax** `ip pim anycast-rp <anycast-rp-address> <member-rp-address>`  
`no ip pim anycast-rp <anycast-rp-address> [<member-rp-address>]`

| Parameter                               | Description                                                                                        |
|-----------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>&lt;anycast-rp-address&gt;</code> | <A.B.C.D> Specify an anycast IP address to configure an Anycast RP (Rendezvous Point) in a RP set. |
| <code>&lt;member-rp-address&gt;</code>  | <A.B.C.D> Specify an Anycast RP (Rendezvous Point) address to configure an Anycast RP in a RP set. |

**Mode** Global Configuration

**Usage** Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IP address range from many sources, resulting in packets address to destination addresses in this range being routed to the nearest source announcing the given destination IP address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

**Examples** The following example shows how to configure the Anycast RP address with **ip pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ip pim anycast-rp 1.1.1.1 10.10.10.10
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ip pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ip pim anycast-rp 1.1.1.1
```

# ip pim bsr-border

**Overview** Use the **ip pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through a VLAN interface. The BSR border is the border of the PIM domain.

Use the **no** variant of this command to disable the configuration set with **ip pim bsr-border**.

**Syntax** `ip pim bsr-border`  
`no ip pim bsr-border`

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** When this command is configured on a VLAN interface, no PIM version 2 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM domain with this command to avoid BSR messages from being exchanged between the two PIM domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM protocol from working as intended.

**Examples** The following example configures the VLAN interface `vlan2` to be the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim bsr-border
```

The following example removes the VLAN interface `vlan2` from the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim bsr-border
```

The following example configures the PPP interface `ppp0` to be the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim bsr-border
```

The following example removes the PPP interface `ppp0` from the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim bsr-border
```

# ip pim bsr-candidate

**Overview** Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IP address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

**Syntax** `ip pim bsr-candidate <interface> [<hash>] [<priority>]`  
`no ip pim bsr-candidate [<interface>]`

| Parameter   | Description                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface> | The interface. For instance, <code>vlan2</code> .                                                                                                                                                           |
| <hash>      | <0-32> configure hash mask length for RP selection. The default hash value if you do not configure this parameter is 10.                                                                                    |
| <priority>  | <0-255> configure priority for a BSR candidate. Note that you must also specify the <hash> (mask length) when specifying the <priority>. The default priority if you do not configure this parameter is 64. |

**Mode** Global Configuration

**Default** The default hash parameter value is 10 and the default priority parameter value is 64.

**Examples** To set the BSR candidate to the VLAN interface `vlan2`, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan2 20 30
```

To withdraw the address of `vlan2` from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ip pim bsr-candidate vlan2
```

To set the BSR candidate to the PPP interface `ppp0`, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate ppp0 20 30
```

To withdraw the address of `ppp0` from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ip pim bsr-candidate ppp0
```

# ip pim cisco-register-checksum

**Overview** Use this command to configure the option to calculate the Register checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

**Syntax** ip pim cisco-register-checksum  
no ip pim cisco-register-checksum

**Default** This command is disabled by default. By default, Register Checksum is calculated only over the header.

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# ip pim cisco-register-checksum

# ip pim crp-cisco-prefix

**Overview** Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0. RP advertisements for the default IPv4 multicast group range 224/4 are sent with a prefix of 1.

Use the **no** variant of this command to revert to the default settings.

**Syntax** `ip pim crp-cisco-prefix`  
`no ip pim crp-cisco-prefix`

**Mode** Global Configuration

**Usage** Cisco's BSR code does not conform to the latest BSR draft. It does not accept candidate RPs with a group prefix number of zero. To make the candidate RP work with a Cisco BSR, use the **ip pim crp-cisco-prefix** command when interoperating with older versions of Cisco IOS.

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim crp-cisco-prefix`  
`awplus# configure terminal`  
`awplus(config)# no ip pim crp-cisco-prefix`

**Related Commands** [ip pim rp-candidate](#)

# ip pim dr-priority

**Overview** Use this command to set the Designated Router priority value.  
Use the **no** variant of this command to disable this function.

**Syntax** `ip pim dr-priority <priority>`  
`no ip pim dr-priority [<priority>]`

| Parameter  | Description                                                                                        |
|------------|----------------------------------------------------------------------------------------------------|
| <priority> | <0-4294967294><br>The Designated Router priority value.<br>A higher value has a higher preference. |

**Default** The default is 1. The negated form of this command restores the value to the default.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples** To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim dr-priority
```

To set the Designated Router priority value to 11234 for the PPP interface ppp0, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim dr-priority 11234
```

To disable the Designated Router priority value for the PPP interface ppp0, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim dr-priority
```

**Related Commands** [ip pim ignore-rp-set-priority](#)

# ip pim exclude-genid

**Overview** Use this command to exclude the GenID option from Hello packets sent out by the PIM module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

**Syntax** ip pim exclude-genid  
no ip pim exclude-genid

**Default** By default, this command is disabled; the GenID option is included.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Example**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim exclude-genid
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim exclude-genid
```

# ip pim ext-srcs-directly-connected

**Overview** Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

**Syntax** `ip pim ext-srcs-directly-connected`  
`no ip pim ext-srcs-directly-connected`

**Default** The **no** variant of this command is the default behavior.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Example** To configure PIM to treat all sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

To configure PIM to treat all sources as directly connected for PPP interface `ppp0`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for PPP interface `ppp0`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

## ip pim hello-holdtime (PIM-SM)

**Overview** This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 \* the current hello-interval.

**Syntax** ip pim hello-holdtime <holdtime>  
no ip pim hello-holdtime

| Parameter  | Description                                                                      |
|------------|----------------------------------------------------------------------------------|
| <holdtime> | <1-65535><br>The holdtime value in seconds (no fractional seconds are accepted). |

**Default** The default hello-holdtime value is 3.5 \* the current hello-interval. The default hello-holdtime is restored using the negated form of this command.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** Each time the hello interval is updated, the hello holdtime is also updated, according to the following rules:

If the hello holdtime is not configured; or if the hello holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 \* hello interval). Otherwise, it retains the configured value.

**Example**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-holdtime 123
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim hello-holdtime 123
```

# ip pim hello-interval (PIM-SM)

**Overview** This command configures a hello-interval value.  
Use the **no** variant of this command to reset the hello-interval to the default.

**Syntax** `ip pim hello-interval <interval>`  
`no ip pim hello-interval`

| Parameter  | Description                                                      |
|------------|------------------------------------------------------------------|
| <interval> | <1-65535> The value in seconds (no fractional seconds accepted). |

**Default** The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** When the hello interval is configured, and the hello holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 \* hello interval). Otherwise, the hello-holdtime value is the configured value.

**Example**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim hello-interval 123
```

# ip pim ignore-rp-set-priority

**Overview** Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this setting.

**Syntax** `ip pim ignore-rp-set-priority`  
`no ip pim ignore-rp-set-priority`

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim ignore-rp-set-priority`

# ip pim jp-timer

**Overview** Use this command to set the PIM-SM join/prune timer. Note that the value the device puts into the holdtime field of the join/prune packets it sends to its neighbors is 3.5 times the join/prune timer value set using this command.

Use the **no** variant of this command to return the PIM-SM join/prune timer to its default value of 60 seconds, which corresponds to a join/prune packet holdtime of 210 seconds.

**Syntax** `ip pim jp-timer <1-65535>`  
`no ip pim jp-timer [<1-65535>]`

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| <1-65535> | Specifies the join/prune timer value. The default value is 60 seconds. |

**Default** The default join/prune timer value is 60 seconds.

**Mode** Global Configuration

**Example** To set the join/prune timer value to 300 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim jp-timer 300
```

To return the join/prune timer to its default value of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim jp-timer
```

# ip pim register-rate-limit

**Overview** Use this command to configure the rate of register packets sent by this DR, in units of packets per second.

Use the **no** variant of this command to remove the limit.

**Syntax** `ip pim register-rate-limit <1-65535>`  
`no ip pim register-rate-limit`

| Parameter                    | Description                                                          |
|------------------------------|----------------------------------------------------------------------|
| <code>&lt;1-65535&gt;</code> | Specifies the maximum number of packets that can be sent per second. |

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-rate-limit 3444`

# ip pim register-rp-reachability

**Overview** Use this command to enable the RP reachability check for PIM Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

**Syntax** `ip pim register-rp-reachability`  
`no ip pim register-rp-reachability`

**Default** This command is disabled; by default, there is no checking for RP-reachability.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-rp-reachability`

# ip pim register-source

**Overview** Use this command to configure the source address of register packets sent by this DR, overriding the default source address, which is the address of the RPF interface toward the source host.

Use the **no** variant of this command to un-configure the source address of Register packets sent by this DR, reverting back to use the default source address that is the address of the RPF interface toward the source host.

**Syntax** `ip pim register-source [<source_address>|<interface>]`  
`no ip pim register-source`

| Parameter                           | Description                                                                                    |
|-------------------------------------|------------------------------------------------------------------------------------------------|
| <code>&lt;source_address&gt;</code> | The IP address, entered in the form A.B.C.D, to be used as the source of the register packets. |
| <code>&lt;interface&gt;</code>      | The name of the interface to be used as the source of the register packets.                    |

**Usage** The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback interface address, but can also be a physical address. This address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM enabled.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-source 10.10.1.3`

# ip pim register-suppression

**Overview** Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds. Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the [ip pim rp-register-kat](#) command is not used.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

**Syntax** `ip pim register-suppression <1-65535>`  
`no ip pim register-suppression`

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-suppression 192`

# ip pim rp-address

**Overview** Use this command to statically configure RP (Rendezvous Point) address for multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for multicast groups.

**Syntax** `ip pim rp-address <ip-address> [override]`  
`no ip pim rp-address <ip-address> [override]`

| Parameter    | Description                                                         |
|--------------|---------------------------------------------------------------------|
| <ip-address> | IP address of Rendezvous Point, entered in the form A . B . C . D.  |
| override     | Enables statically defined RPs to override dynamically learned RPs. |

**Mode** Global Configuration

**Usage** The AlliedWare Plus PIM-SM implementation supports multiple static RPs. It also supports usage of static-RP and BSR mechanism simultaneously. The **ip pim rp-address** command is used to statically configure the RP address for multicast groups.

You need to understand the following information before using this command.

If the RP-address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP-address configured through BSR is chosen over the statically configured RP-address.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by the [ip pim rp-address](#) command. Commands with the `override` keyword take precedence over dynamically learned mappings.

**Example**

```
awplus# configure terminal
awplus(config)# ip pim rp-address 192.168.3.4 4
```

**Related Commands** [ip pim rp-candidate](#)  
[ip pim rp-register-kat](#)

# ip pim rp-candidate

**Overview** Use this command to make the router an RP (Rendezvous Point) candidate, using the IP address of the specified interface.

Use the **no** variant of this command to remove the RP status set using the **ip pim rp-candidate** command.

**Syntax** `ip pim rp-candidate <interface> [priority <priority> | interval <interval> ]`

`no ip pim rp-candidate [<interface>]`

| Parameter   | Description                                                           |
|-------------|-----------------------------------------------------------------------|
| <interface> | Interface name                                                        |
| <priority>  | <0-255> configure priority for an RP candidate.                       |
| <interval>  | advertisement interval specified in the range <1-16383> (in seconds). |

**Default** The priority value for a candidate RP is 0 by default until specified using the **priority** parameter.

**Mode** Global Configuration

**Usage** Note that issuing the command **ip pim rp-candidate <interface>** without optional **priority**, **interval**, or **group** parameters will configure the candidate RP with a priority value of 0.

**Examples** To specify a priority of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 priority 3
```

To stop the device from being an RP candidate on vlan2 , use the following commands:

```
awplus# configure terminal
awplus(config)# no ip pim rp-candidate vlan2
```

**Related Commands**

- [ip pim rp-address](#)
- [ip pim rp-register-kat](#)
- [ip pim crp-cisco-prefix](#)

# ip pim rp-register-kat

**Overview** Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SM Register packets.

Use the **no** variant of this command to return the PIM-SM KAT timer to its default value of 210 seconds.

**Syntax** `ip pim rp-register-kat <1-65535>`  
`no ip pim rp-register-kat`

| Parameter | Description                                                         |
|-----------|---------------------------------------------------------------------|
| <1-65535> | Specify the KAT timer in seconds. The default value is 210 seconds. |

**Mode** Global Configuration

**Default** The default PIM-SM KAT timer value is 210 seconds.

**Examples**

```
awplus# configure terminal
awplus(config)# ip pim rp-register-kat 3454
awplus# configure terminal
awplus(config)# no ip pim rp-register-kat
```

**Related Commands** [ip pim rp-address](#)  
[ip pim rp-candidate](#)

# ip pim sparse-mode

**Overview** Use this command to enable PIM-SM on the VLAN interface.  
Use the **no** variant of this command to disable PIM-SM on the VLAN interface.

**Syntax** ip pim sparse-mode  
no ip pim sparse-mode

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim sparse-mode
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim sparse-mode
```

# ip pim sparse-mode passive

**Overview** Use this command to enable and disable passive mode operation for local members on the VLAN interface.

Use the **no** variant of this command to disable passive mode operation for local members on the VLAN interface.

**Syntax** ip pim sparse-mode passive  
no ip pim sparse-mode passive

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** Passive mode essentially stops PIM transactions on the interface, allowing only IGMP mechanism to be active. To turn off passive mode, use the **no ip pim sparse-mode passive** or the **ip pim sparse-mode** command. To turn off PIM activities on the VLAN interface, use the **no ip pim sparse-mode** command.

**Examples**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim sparse-mode passive
```

# ip pim spt-threshold

**Overview** This command turns on the ability for the last-hop PIM router to switch to SPT (shortest-path tree).

The **no** variant of this command turns off the ability for the last-hop PIM router to switch to SPT.

**NOTE:** *The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.*

**Syntax** ip pim spt-threshold  
no ip pim spt-threshold

**Mode** Global Configuration

**Examples** To enable the last-hop PIM-SM router to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# ip pim spt-threshold
```

To stop the last-hop PIM-SM router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip pim spt-threshold
```

## ip pim ssm

**Overview** Use this command to define the Source Specific Multicast (SSM) range of IP multicast addresses. The default keyword defines the SSM range as 232/8.

Use the **no** variant of this command to disable the SSM range.

**Syntax** `ip pim ssm default`  
`no ip pim ssm`

**Default** By default, the command is disabled.

**Mode** Global Configuration

**Usage** When an SSM range of IP multicast addresses is defined by the `ip pim ssm` command, the `no (*,G)` or `(S,G,rpt)` state will be initiated for groups in the SSM range.

The messages corresponding to these states will not be accepted or originated in the SSM range.

**Examples** The following commands show how to set PIM-SSM as default:

```
awplus# configure terminal
awplus(config)# ip pim ssm default
```

The following commands show how to disable PIM-SSM:

```
awplus# configure terminal
awplus(config)# no ip pim ssm
```

# show debugging pim sparse-mode

**Overview** This command displays the status of the debugging of the system.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging pim sparse-mode`

**Mode** User Exec and Privileged Exec

**Example** To display PIM-SM debugging settings, use the command:

```
awplus# show debugging pim sparse-mode
```

Figure 38-2: Output from **show debugging pim sparse-mode**

```
Debugging status:
PIM event debugging is on
PIM Hello THT timer debugging is on
PIM event debugging is on
PIM MFC debugging is on
PIM state debugging is on
PIM packet debugging is on
PIM incoming packet debugging is on
PIM outgoing packet debugging is on
```

**Related Commands** [debug pim sparse-mode](#)

# show ip pim sparse-mode bsr-router

**Overview** Use this command to show the Bootstrap Router (BSR) (v2) address.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode bsr-router`

**Mode** User Exec and Privileged Exec

**Output** Figure 38-3: Output from the **show ip pim sparse-mode bsr-router** command

```
PIMv2 Bootstrap information
BSR address: 10.10.11.35 (?)
Uptime: 00:00:38, BSR Priority: 0, Hash mask length: 10
Expires: 00:01:32
Role: Non-candidate BSR
State: Accept Preferred
```

**Related Commands** [show ip pim sparse-mode rp mapping](#)  
[show ip pim sparse-mode neighbor](#)

# show ip pim sparse-mode interface

**Overview** Use this command to show PIM-SM interface information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)

**Syntax** `show ip pim sparse-mode interface`

**Mode** User Exec and Privileged Exec

**Example** To display information about PIM-SM interfaces, use the command:

```
awplus# show ip pim sparse-mode interface
```

**Output** Figure 38-4: Example output from **show ip pim sparse-mode interface**

```
Total configured interfaces: 16 Maximum allowed: 31
Total active interfaces: 12

Address Interface VIFindex Ver/ Nbr DR DR
 Mode Count Prior
192.168.1.53 vlan2 0 v2/S 2 2 192.168.1.53
192.168.10.53 vlan3 2 v2/S 0 2 192.168.10.53

... Note that this screen has been edited to remove any additional interfaces.
```

**Table 1:** Parameters in the output from the **show ip pim sparse-mode interface** command

| Parameters                  | Description                                                              |
|-----------------------------|--------------------------------------------------------------------------|
| Total configured interfaces | The number of configured PIM Sparse Mode interfaces.                     |
| Maximum allowed             | The maximum number of PIM Sparse Mode interfaces that can be configured. |
| Total active interfaces     | The number of active PIM Sparse Mode interfaces.                         |
| Address                     | Primary PIM-SM address.                                                  |
| Interface                   | Name of the PIM-SM interface.                                            |
| VIF Index                   | The Virtual Interface index of the VLAN.                                 |
| Ver/Mode                    | PIM version/Sparse mode.                                                 |
| Nbr Count                   | Neighbor count of the PIM-SM interface.                                  |

**Table 1:** Parameters in the output from the **show ip pim sparse-mode interface** command (cont.)

| Parameters  | Description                              |
|-------------|------------------------------------------|
| DR Priority | Designated Router priority.              |
| DR          | The IP address of the Designated Router. |

# show ip pim sparse-mode interface detail

**Overview** Use this command to show detailed information on a PIM-SM interface.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode interface detail`

**Mode** User Exec and Privileged Exec

**Output** Figure 38-5: Example output from the **show ip pim sparse-mode interface detail** command

```
vlan3 (vif 3):
 Address 192.168.1.149, DR 192.168.1.149
 Hello period 30 seconds, Next Hello in 15 seconds
 Triggered Hello period 5 seconds
 Neighbors:
 192.168.1.22

vlan2 (vif 0):
 Address 10.10.11.149, DR 10.10.11.149
 Hello period 30 seconds, Next Hello in 18 seconds
 Triggered Hello period 5 seconds
 Neighbors:
 10.10.11.4
```

# show ip pim sparse-mode local-members

**Overview** Use this command to show detailed local member information on a VLAN interface configured for PIM-SM. If you do not specify a VLAN interface then detailed local member information is shown for all VLAN interfaces configured for PIM-SM.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode local-members [<interface>]`

| Parameter   | Description                                                                        |
|-------------|------------------------------------------------------------------------------------|
| <interface> | Optional. Specify the interface. For instance, VLAN interface <code>vlan2</code> . |

**Mode** User Exec and Privileged Exec

**Example** To show detailed PIM-SM information for all PIM-SM configured VLAN interfaces, use the command:

```
awplus# show ip pim sparse-mode local-members
```

**Output** Figure 38-6: Example output from the **show ip pim sparse-mode local-members** command

```
awplus#show ip pim sparse-mode local-members
PIM Local membership information

vlan1:
 (*, 224.0.0.4) : Include

vlan203:
 (*, 223.0.0.3) : Include
```

**Example** To show detailed PIM-SMv6 information for the PIM-SM configured interface `vlan1`, use the command:

```
awplus# show ip pim sparse-mode local-members vlan1
```

**Output** Figure 38-7: Example output from the **show ip pim sparse-mode local-members vlan1** command

```
awplus#show ip pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:
 (*, 224.0.0.4) : Include
```

# show ip pim sparse-mode mroute

**Overview** Use this command to display the IP multicast routing table or the IP multicast routing table based on a specific address or addresses.

**Syntax** `show ip pim sparse-mode mroute [<group-address>]`  
`show ip pim sparse-mode mroute [<source-address>]`  
`show ip pim sparse-mode mroute [<source-address>  
<group-address>]`

| Parameter                           | Description                                                                                               |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <code>&lt;group-address&gt;</code>  | Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.   |
| <code>&lt;source-address&gt;</code> | Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source. |

**Mode** Privileged Exec

**Usage** Note that when a feature license is enabled, the output for the **show ip pim sparse-mode mroute** command will only show 32 interfaces because of the terminal display width limit. Use the **show ip pim sparse-mode mroute detail** command to display detailed entries of the IP multicast routing table.

**Example** To display the IP multicast routing table for the address 40.40.40.11, enter the command:

```
awplus# show ip pim sparse-mode mroute 40.40.40.11
```

**Output** Figure 38-8: Example output from **show ip pim sparse-mode mroute**

```
awplus#show ip pim sparse-mode mroute
IP Multicast Routing Table

**Related Commands** [show ip pim sparse-mode mroute detail](#)

# show ip pim sparse-mode mroute detail

**Overview** This command displays detailed entries of the IP multicast routing table, or detailed entries of the IP multicast routing table based on the specified address or addresses.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax**

```
show ip pim sparse-mode mroute [<group-address>] detail
show ip pim sparse-mode mroute [<source-address>] detail
show ip pim sparse-mode mroute [<group-address>
<source-address>] detail
show ip pim sparse-mode mroute [<source-address>
<group-address>] detail
```

| Parameter        | Description                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------------------|
| <group-address>  | Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.   |
| <source-address> | Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source. |
| detail           | Show detailed information.                                                                                |

**Usage** Based on the group and source address, the output is the selected route if present in the multicast route tree.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip pim sparse-mode mroute detail
awplus# show ip pim sparse-mode mroute 40.40.40.11 detail
awplus# show ip pim sparse-mode mroute 224.1.1.1 detail
awplus# show ip pim sparse-mode mroute 224.1.1.1 40.40.40.11
detail
```

# show ip pim sparse-mode neighbor

**Overview** Use this command to show the PIM-SM neighbor information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode neighbor [<interface>] [<ip-address>]  
[detail]`

| Parameter    | Description                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------|
| <interface>  | Interface name (e.g. vlan2). Show neighbors on an interface.                                          |
| <ip-address> | Show neighbors with a particular address on an interface. The IP address entered in the form A.B.C.D. |
| detail       | Show detailed information.                                                                            |

**Mode** Privileged Exec

**Examples** `awplus# show ip pim sparse-mode neighbor`  
`awplus# show ip pim sparse-mode neighbor vlan5 detail`

Figure 38-10: Example output from the **show ip pim sparse-mode neighbor** command

| Neighbor Address | Interface | Uptime/Expires    | Ver | DR Priority/ |
|------------------|-----------|-------------------|-----|--------------|
| 10.10.0.9        | vlan2     | 00:55:33/00:01:44 | v2  | 1 /          |
| 10.10.0.136      | vlan2     | 00:55:20/00:01:25 | v2  | 1 /          |
| 10.10.0.172      | vlan2     | 00:55:33/00:01:32 | v2  | 1 / DR       |
| 192.168.0.100    | vlan3     | 00:55:30/00:01:20 | v2  | N / DR       |

```

# show ip pim sparse-mode nexthop

**Overview** Use this command to see the next hop information as used by PIM-SM.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)

**Syntax** `show ip pim sparse-mode nexthop`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim sparse-mode nexthop`

Figure 38-12: Example output from the **show ip pim sparse-mode nexthop** command

```
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination Type Nexthop Nexthop Nexthop Nexthop Metric Pref Refcnt
 Num Addr Ifindex Name

10.10.0.9 .RS. 1 0.0.0.0 4 0 0 1
```

**Table 2:** Parameters in output of the **show ip pim sparse-mode nexthop** command

| Parameter       | Description                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------|
| Destination     | The destination address for which PIM-SM requires next hop information.                                      |
| Type            | The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable. |
| Nexthop Num     | The number of next hops to the destination. PIM-SM always uses only 1 next hop.                              |
| Nexthop Addr    | The address of the primary next hop gateway.                                                                 |
| Nexthop IfIndex | The interface on which the next hop gateway can be reached.                                                  |
| Nexthop Name    | The name of next hop interface.                                                                              |
| Metric          | The metric of the route towards the destination.                                                             |
| Preference      | The preference of the route towards destination.                                                             |
| Refcnt          | Only used for debugging.                                                                                     |

# show ip pim sparse-mode packet statistics

**Overview** Use this command to display the current packet receive counts for PIM sparse-mode.

**Syntax** `show ip pim sparse-mode packet statistics`

**Mode** Privileged Exec

**Example** The following command displays the current packet receive counts for PIM sparse-mode:

```
awplus# configure terminal
awplus(config)# show ip pim sparse-mode statistics
```

**Output** Figure 38-13: Example output from **show ip pim sparse-mode statistics**

```
awplus(config)#show ip pim sparse-mode statistics
PIM-SM Receive Packet Statistics :
All PIM-SM : Total : 25 Valid : 25
Hello : Total : 14 Valid : 14
Register : Total : 5 Valid : 5
Register Stop : Total : 0 Valid : 0
Join/Prune : Total : 0 Valid : 0
Bootstrap : Total : 6 Valid : 6
Assert : Total : 0 Valid : 0
Candidate-RP : Total : 0 Valid : 0
```

**Related Commands** [clear ip pim sparse-mode packet statistics](#)

# show ip pim sparse-mode rp-hash

**Overview** Use this command to display the Rendezvous Point (RP) to be chosen based on the group selected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode rp-hash <group-addr>`

| Parameter                       | Description                                                              |
|---------------------------------|--------------------------------------------------------------------------|
| <code>&lt;group-addr&gt;</code> | The group address for which to find the RP, entered in the form A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim sparse-mode rp-hash 224.0.1.3`

Figure 38-14: Output from the **show ip pim sparse-mode rp-hash** command

```
RP: 10.10.11.35
Info source: 10.10.11.35, via bootstrap
```

**Related Commands** [show ip pim sparse-mode rp mapping](#)

# show ip pim sparse-mode rp mapping

**Overview** Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode rp mapping`

**Mode** Privileged Exec

**Example** `awplus# show ip pim sparse-mode rp mapping`

Figure 38-15: Output from the **show ip pim sparse-mode rp mapping** command

```
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4
RP: 10.10.0.9
 Info source: 10.10.0.9, via bootstrap, priority 192
 Uptime: 16:52:39, expires: 00:02:50
```

**Related Commands** [show ip pim sparse-mode rp-hash](#)

# undebbug all pim sparse-mode

**Overview** Use this command to disable all PIM-SM debugging.

**Syntax** `undebbug all pim sparse-mode`

**Mode** Privileged Exec

**Example** `awplus# undebbug all pim sparse-mode`

**Related  
Commands** [debug pim sparse-mode](#)

## Introduction

**Overview** This chapter provides an alphabetical reference of PIM-SMv6 commands. For IPv6 Multicast commands, see [Multicast Commands](#). For an overview of PIM-SMv6, see the [PIM-SMv6 Feature Overview and Configuration Guide](#).

IPv6 must be enabled on an interface with the `ipv6 enable` command, IPv6 forwarding must be enabled globally for routing IPv6 with the `ipv6 forwarding` command, and IPv6 multicasting must be enabled globally with the `ipv6 multicast-routing` command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the `clear ipv6 mroute` command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous IPv6 static multicast routes.

**NOTE:** The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPv6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

# clear ipv6 mroute pim

**Overview** Use this command to clear all Multicast Forwarding Cache (MFC) entries in PIM-SMv6.

**NOTE:** *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the `clear ipv6 mroute` command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

**Syntax** `clear ipv6 mroute [*] pim sparse-mode`

| Parameter | Description                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------|
| *         | Clears all PIM-SMv6 multicast routes. Using this command without this optional operator only deletes the multicast router table entries. |

**Mode** Privileged Exec

**Example**  
`awplus# clear ipv6 mroute pim sparse-mode`  
`awplus# clear ipv6 mroute * pim sparse-mode`

# clear ipv6 mroute pim sparse-mode

**Overview** Use this command to clear all multicast route table entries learned through PIM-SMv6 for a specified multicast group address, and optionally a specified multicast source address.

**NOTE:** *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the `clear ipv6 mroute` command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

**Syntax** `clear ipv6 mroute <Group-IPv6-add> pim sparse-mode`  
`clear ipv6 mroute <Group-IPv6-add> <Source-IPv6-add> pim sparse-mode`

| Parameter                            | Description                                                           |
|--------------------------------------|-----------------------------------------------------------------------|
| <code>&lt;Group-IPv6-add&gt;</code>  | Specify a multicast group IPv6 address, entered in the form X:X::X:X. |
| <code>&lt;Source-IPv6-add&gt;</code> | Specify a source group IPv6 address, entered in the form X:X::X:X.    |

**Mode** Privileged Exec

**Example** `awplus# clear ipv6 mroute 2001:db8:: pim sparse-mode`  
`awplus# clear ipv6 mroute 2001:db8:: 2002:db8:: pim sparse-mode`

# clear ipv6 pim sparse-mode bsr rp-set \*

**Overview** Use this command to clear all Rendezvous Point (RP) sets learned through the PIM-SMv6 Bootstrap Router (BSR).

**NOTE:** *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the `clear ipv6 mroute` command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

**Syntax** `clear ipv6 pim sparse-mode bsr rp-set *`

| Parameter | Description         |
|-----------|---------------------|
| *         | Clears all RP sets. |

**Mode** Privileged Exec

**Usage** For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

**Example** `awplus# clear ipv6 pim sparse-mode bsr rp-set *`

# debug ipv6 pim sparse-mode

**Overview** Use this command to activate PIM-SMv6 debugging.

Use the no variant of this command to deactivate PIMv6 debugging. Note that the [undebug ipv6 pim sparse-mode](#) command is an alias of the no variant of this command.

**Syntax** debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [state] [timer]  
no debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [state] [timer]

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| all       | Activates/deactivates all PIM-SMv6 debugging.                                 |
| events    | Activates debug printing of PIM-SMv6 events.                                  |
| mfc       | Activates debug printing of MFC (Multicast Forwarding Cache).                 |
| mib       | Activates debug printing of PIM-SMv6 MIBs.                                    |
| nexthop   | Activates debug printing of PIM-SMv6 next hop communications.                 |
| nsm       | Activates debugging of PIM-SMv6 NSM (Network Services Module) communications. |
| state     | Activates debug printing of state transition on all PIM-SMv6 FSMs.            |
| timer     | Activates debug printing of PIM-SMv6 timers.                                  |

**Mode** Privileged Exec and Global Configuration

**Example** awplus# configure terminal  
awplus(config)# terminal monitor  
awplus(config)# debug ipv6 pim sparse-mode all  
awplus# configure terminal  
awplus(config)# terminal monitor  
awplus(config)# debug ipv6 pim sparse-mode events  
awplus# configure terminal  
awplus(config)# terminal monitor  
awplus(config)# debug ipv6 pim sparse-mode nexthop

**Validation output** Figure 39-1: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing **multiple debug ipv6 pim sparse-mode** commands

```
awplus#debug ipv6 pim sparse-mode state
awplus#debug ipv6 pim sparse-mode events
awplus#debug ipv6 pim sparse-mode packet
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:

**Related commands** [show debugging ipv6 pim sparse-mode](#)  
[undebug all ipv6 pim sparse-mode](#)  
[undebug ipv6 pim sparse-mode](#)

# debug ipv6 pim sparse-mode packet

**Overview** Use this command to activate PIM-SMv6 packet debugging.  
Use the no variant of this command to deactivate PIMv6 packet debugging.

**Syntax** debug ipv6 pim sparse-mode packet {in|out}  
no debug ipv6 pim sparse-mode packet {in|out}

| Parameter | Description                                                        |
|-----------|--------------------------------------------------------------------|
| packet    | Activates debug printing of incoming and/or outgoing IPv6 packets. |
| in        | Specify incoming packet debugging.                                 |
| out       | Specify outgoing packet debugging.                                 |

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet in
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet out
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet in
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet out
```

**Related commands** [show debugging ipv6 pim sparse-mode](#)  
[undebug all ipv6 pim sparse-mode](#)

# debug ipv6 pim sparse-mode timer

**Overview** Use this command to enable debugging for the specified PIM-SMv6 timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SMv6 timers.

**Syntax**

```
debug ipv6 pim sparse-mode timer assert [at]
no debug ipv6 pim sparse-mode timer assert [at]
debug pim ipv6 sparse-mode timer bsr [bst|crp]
no debug pim ipv6 sparse-mode timer bsr [bst|crp]
debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
no debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
debug pim ipv6 sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim ipv6 sparse-mode timer joinprune
[jt|et|ppt|kat|ot]
debug pim ipv6 sparse-mode timer register [rst]
no debug pim ipv6 sparse-mode timer register [rst]
```

| Parameter | Description                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------|
| assert    | Enable or disable debugging for the Assert timers.                                                    |
| at        | Enable or disable debugging for the Assert Timer.                                                     |
| bsr       | Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers. |
| bst       | Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.                                |
| crp       | Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.                             |
| hello     | Enable or disable debugging for the specified Hello timer, or all Hello timers.                       |
| ht        | Enable or disable debugging for the Hello timer: Hello Timer.                                         |
| nlt       | Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.                             |
| tht       | Enable or disable debugging for the Hello timer: Triggered Hello Timer.                               |
| joinprune | Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.               |
| jt        | Enable or disable debugging for the JoinPrune timer: upstream Join Timer.                             |
| et        | Enable or disable debugging for the JoinPrune timer: Expiry Timer.                                    |
| ppt       | Enable or disable debugging for the JoinPrune timer: PrunePending Timer.                              |

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| kat       | Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.         |
| ot        | Enable or disable debugging for the JoinPrune timer: Upstream Override Timer. |
| register  | Enable or disable debugging for the Register timers.                          |
| rst       | Enable or disable debugging for the Register timer: Register Stop Timer.      |

**Default** By default, all debugging is disabled.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging for the PIM-SMv6 Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug ipv6 pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SMv6 Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug ipv6 pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SMv6 Joinprune expiry timer, use the command:

```
awplus# debug ipv6 pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SMv6 Register timer, use the command:

```
awplus# no debug ipv6 pim sparse-mode timer register
```

**Related commands** [show debugging ipv6 pim sparse-mode](#)

# ipv6 pim anycast-rp

**Overview** Use this command to configure Anycast RP (Rendezvous Point) in an RP set.

Use the **no** variant of this command to remove the configuration.

**Syntax** `ipv6 pim anycast-rp <anycast-rp-address> <member-rp-address>`  
`no ipv6 pim anycast-rp <anycast-rp-address>`  
`[<member-rp-address>]`

| Parameter                               | Description                                                                                                                |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;anycast-rp-address&gt;</code> | <code>&lt;X:X::X:X&gt;</code> Specify an Anycast IPv6 address to configure an Anycast RP (Rendezvous Point) in a RP set.   |
| <code>&lt;member-rp-address&gt;</code>  | <code>&lt;A:B::C:D&gt;</code> Specify an Anycast RP (Rendezvous Point)IPv6 address to configure an Anycast RP in a RP set. |

**Mode** Global Configuration

**Usage** Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IPv6 address range from many sources, resulting in packets addressed to destination addresses in this range being routed to the nearest source announcing the given destination IPv6 address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

**Examples** The following example shows how to configure the Anycast RP address with **ipv6 pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ipv6 pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

# ipv6 pim bsr-border

**Overview** Use the **ipv6 pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through a VLAN interface. The BSR border is the border of the PIM-SMv6 domain.

Use the **no** variant of this command to disable the configuration set with **ipv6 pim bsr-border**.

**Syntax** `ipv6 pim bsr-border`  
`no ipv6 pim bsr-border`

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** When this command is configured on a VLAN interface, no PIM-SMv6 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM-SMv6 domain with this command to avoid BSR messages from being exchanged between the two PIM-SMv6 domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM-SMv6 protocol from working as intended.

**Examples** The following example configures the VLAN interface vln2 to be the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vln2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim bsr-border
```

The following example removes the VLAN interface vln2 from the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# interface vln2
awplus(config-if)# no ipv6 pim bsr-border
```

The following example configures the PPP interface ppp0 to be the PIM -SMv6 domain border:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim bsr-border
```

The following example removes the PPP interface ppp0 from the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim bsr-border
```

# ipv6 pim bsr-candidate

**Overview** Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IPv6 address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

**Syntax** `ipv6 pim bsr-candidate <interface> [<hash>] [<priority>]`  
`no ipv6 pim bsr-candidate [<interface>]`

| Parameter   | Description                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface> | Specify the interface. For instance, VLAN interface <code>vlan2</code> .                                                                                                                                    |
| <hash>      | <0-128> configure the hash mask length used for RP selection. The default hash value if you do not configure this parameter is 126.                                                                         |
| <priority>  | <0-255> configure priority for a BSR candidate. Note that you must also specify the <hash> (mask length) when specifying the <priority>. The default priority if you do not configure this parameter is 64. |

**Mode** Global Configuration

**Default** The default hash parameter value is 126 and the default priority parameter value is 64.

**Examples** To set the BSR candidate to the VLAN interface `vlan2`, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan2 20 30
```

To withdraw the address of `vlan2` from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 pim bsr-candidate vlan2
```

To set the BSR candidate to the PPP interface `ppp0`, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate ppp0 20 30
```

To withdraw the address of ppp0 from being offered as a BSR candidate, enter:

```
awplus# configure terminal
```

```
awplus(config)# no ipv6 pim bsr-candidate ppp0
```

# ipv6 pim cisco-register-checksum

**Overview** Use this command to configure the option to calculate the Register Checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

**Syntax** `ipv6 pim cisco-register-checksum`  
`no ipv6 pim cisco-register-checksum`

**Default** This command is disabled by default. By default, Register Checksum is calculated only over the header.

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum
awplus# configure terminal
awplus(config)# no ipv6 pim cisco-register-checksum
```

# ipv6 pim crp-cisco-prefix

**Overview** Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0.

Use the **no** variant of this command to revert to the default settings.

**Syntax** `ipv6 pim crp-cisco-prefix`  
`no ipv6 pim crp-cisco-prefix`

**Mode** Global Configuration

**Usage** Cisco's BSR code does not conform to the latest BSR draft, it does not accept candidate RPs with a group prefix number of zero. To make the candidate RP work with a Cisco BSR, use the **ipv6 pim crp-cisco-prefix** command when interoperating with older versions of Cisco IOS.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim crp-cisco-prefix
awplus# configure terminal
awplus(config)# no ipv6 pim crp-cisco-prefix
```

**Related commands** [ipv6 pim rp-candidate](#)

# ipv6 pim dr-priority

**Overview** Use this command to set the Designated Router priority value.  
Use the **no** variant of this command to disable this function.

**Syntax** `ipv6 pim dr-priority <priority>`  
`no ipv6 pim dr-priority [<priority>]`

| Parameter  | Description                                                                                                                       |
|------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <priority> | <0-4294967294> Specify the Designated Router priority value. Note that a higher value has a higher preference or higher priority. |

**Default** The default value is 1. The negated form of this command restores the value to the default.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples** To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim dr-priority
```

To set the Designated Router priority value to 11234 for the PPP interface ppp0, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim dr-priority 11234
```

To disable the Designated Router priority value for the PPP interface ppp0, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim dr-priority
```

**Related commands** [ipv6 pim ignore-rp-set-priority](#)

# ipv6 pim exclude-genid

**Overview** Use this command to exclude the GenID option from Hello packets sent out by the PIM-SMv6 module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

**Syntax** `ipv6 pim exclude-genid`  
`no ipv6 pim exclude-genid`

**Default** By default, this command is disabled; the GenID option is included.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim exclude-genid
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim exclude-genid
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim exclude-genid
```

# ipv6 pim ext-srcs-directly-connected

**Overview** Use this command to configure PIM-SMv6 to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM-SMv6 to treat only directly connected sources as directly connected.

**Syntax** `ipv6 pim ext-srcs-directly-connected`  
`no ipv6 pim ext-srcs-directly-connected`

**Default** The **no** variant of this command is the default behavior.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Example** To configure PIM-SMv6 to treat all sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim ext-srcs-directly-connected
```

To configure PIM-SMv6 to treat only directly connected sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim ext-srcs-directly-connected
```

To configure PIM to treat all sources as directly connected for PPP interface `ppp0`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for PPP interface `ppp0`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim ext-srcs-directly-connected
```

# ipv6 pim hello-holdtime

**Overview** This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 \* the current hello-interval.

**Syntax** `ipv6 pim hello-holdtime <holdtime>`  
`no ipv6 pim hello-holdtime`

| Parameter                     | Description                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------------------|
| <code>&lt;holdtime&gt;</code> | <code>&lt;1-65535&gt;</code><br>The holdtime value in seconds (no fractional seconds are accepted). |

**Default** The default hello-holdtime value is 3.5 \* the current hello-interval. The default hello- holdtime is restored using the negated form of this command.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** Each time the hello interval is updated, the hello holdtime is also updated, according to the following rules:

If the hello holdtime is not configured; or if the hello holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 \* hello interval). Otherwise, it retains the configured value.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-holdtime 123
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-holdtime 123
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-holdtime
```

# ipv6 pim hello-interval

**Overview** This command configures a hello-interval value for PIM-SMv6. Use the **no** variant of this command to reset the hello-interval for PIM-SMv6 to the default.

**Syntax** `ipv6 pim hello-interval <interval>`  
`no ipv6 pim hello-interval`

| Parameter  | Description                                                      |
|------------|------------------------------------------------------------------|
| <interval> | <1-65535> The value in seconds (no fractional seconds accepted). |

**Default** The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** When the hello interval is configured, and the hello holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 \* hello interval). Otherwise, the hello-holdtime value is the configured value.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-interval 123
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-interval 123
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-interval
```

# ipv6 pim ignore-rp-set-priority

**Overview** Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

Use the **no** variant of this command to disable this setting.

**Syntax** `ipv6 pim ignore-rp-set-priority`  
`no ipv6 pim ignore-rp-set-priority`

**Mode** Global Configuration

**Usage** This command is used to inter-operate with older Cisco IOS versions.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim ignore-rp-set-priority
awplus# configure terminal
awplus(config)# no ipv6 pim ignore-rp-set-priority
```

# ipv6 pim jp-timer

**Overview** Use this command to set the PIM-SMv6 join/prune timer. Note that the value set by the join/prune timer is the value that the device puts into the holdtime field of the join/prune packets it sends to its neighbors.

Use the **no** variant of this command to return the PIM-SMv6 join/prune timer to its default value of 210 seconds.

**Syntax** `ipv6 pim jp-timer <1-65535>`  
`no ipv6 pim jp-timer [<1-65535>]`

| Parameter                    | Description                                                             |
|------------------------------|-------------------------------------------------------------------------|
| <code>&lt;1-65535&gt;</code> | Specifies the Join/Prune timer value. The default value is 210 seconds. |

**Default** The default PIM-SMv6 join/prune timer value is 210 seconds.

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim jp-timer 300
awplus# configure terminal
awplus(config)# no ipv6 pim jp-timer
```

# ipv6 pim neighbor-filter

**Overview** The AR3050S and AR4050S devices don't support access control list in 5.4.5-0.1 release.

This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SMv6 will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering IPv6 access list.

Use the **no** variant of this command to disable this function.

**Syntax** `ipv6 pim neighbor-filter <IPv6-accesslist>`  
`no ipv6 pim neighbor-filter <IPv6-accesslist>`

| Parameter                            | Description                                                                                        |
|--------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>&lt;IPv6-accesslist&gt;</code> | Specify a Standard or an Extended software IPv6 access list name for the PIM-SMv6 neighbor filter. |

**Default** By default, there is no neighbor filtering applied to an interface.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim neighbor-filter filter1
```

# ipv6 pim register-rate-limit

**Overview** Use this command to configure the rate of register packets sent by this DR, in units of packets per second. The configured rate is per (S, G) state, and is not a system wide rate.

Use the **no** variant of this command to remove the limit and reset to the default rate limit.

**Syntax** `ipv6 pim register-rate-limit <1-65535>`  
`no ipv6 pim register-rate-limit`

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <1-65535> | Specifies the maximum number of packets that can be sent per second. |

**Mode** Global Configuration

**Default** The default is 0, as reset with the **no** variant, which also specifies an unlimited rate limit.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rate-limit 3444
awplus# configure terminal
awplus(config)# no ipv6 pim register-rate-limit 3444
```

# ipv6 pim register-rp-reachability

**Overview** Use this command to enable the RP reachability check for PIMv6 Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

**Syntax** `ipv6 pim register-rp-reachability`  
`no ipv6 pim register-rp-reachability`

**Default** This command is disabled; by default, there is no checking for RP-reachability.

**Mode** Global Configuration

**Examples** `awplus# configure terminal`  
`awplus(config)# ipv6 forwarding`  
`awplus(config)# ipv6 multicast-routing`  
`awplus(config)# ipv6 pim register-rp-reachability`  
`awplus# configure terminal`  
`awplus(config)# no ipv6 pim register-rp-reachability`

# ipv6 pim register-source

**Overview** Use this command to configure the source IPv6 address of register packets sent by this DR, overriding the default source IPv6 address, which is the IPv6 address of the RPF interface toward the source host.

Use the **no** variant of this command to remove the IPv6 source address of Register packets sent by this DR, reverting back to use the default IPv6 source address that is the address of the RPF interface toward the source host.

**Syntax** `ipv6 pim register-source [<source-IPv6-address>|<interface>]`  
`no ipv6 pim register-source`

| Parameter                                | Description                                                                                       |
|------------------------------------------|---------------------------------------------------------------------------------------------------|
| <code>&lt;source-IPv6-address&gt;</code> | The IPv6 address, entered in the form X:X::X:X, to be used as the source of the register packets. |
| <code>&lt;interface&gt;</code>           | The name of the VLAN interface to be used as the source of the register packets.                  |

**Usage** The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback IPv6 interface address, but can also be a physical IPv6 address. This IPv6 address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM-SMv6 enabled.

**Mode** Global Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source 3ffe::24:2
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source vlan2
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# no ipv6 pim register-source
```

# ipv6 pim register-suppression

**Overview** Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

**Syntax** `ipv6 pim register-suppression <1-65535>`  
`no ipv6 pim register-suppression`

| Parameter | Description                              |
|-----------|------------------------------------------|
| <1-65535> | Register suppression on time in seconds. |

**Mode** Global Configuration

**Default** The default PIM-SMv6 register suppression time is 60 seconds, and is restored with the no variant of this command.

**Usage** Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the [ipv6 pim rp-register-kat](#) command is not used.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-suppression 192
awplus# configure terminal
awplus(config)# no ipv6 pim register-suppression
```

# ipv6 pim rp-address

**Overview** The AR3050S and AR4050 devices don't support access control list in 5.4.5-0.1 release.

Use this command to statically configure RP (Rendezvous Point) address for IPv6 multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for IPv6 multicast groups.

**Syntax** `ipv6 pimv6 rp-address <IPv6-address>`  
`no ipv6 pim rp-address <IPv6-address>`

| Parameter      | Description                                                                     |
|----------------|---------------------------------------------------------------------------------|
| <IPv6-address> | Specify the IPv6 address of the Rendezvous Point, entered in the form X:X::X:X. |

**Mode** Global Configuration

**Usage** The AlliedWare Plus™ PIM-SMv6 implementation supports multiple static RPs. It also supports usage of static-RP and BSR mechanism simultaneously. The **ipv6 pim rp-address** command is used to statically configure the RP address for IPv6 multicast groups.

You need to understand the following information before using this command.

If the RP-address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP-address configured through BSR is chosen over the statically configured RP-address.

If multiple static-RPs are available for a group range, then one with the highest IPv6 address is chosen.

After configuration, the RP-address is inserted into a static-RP group tree based on the configured group ranges. For each group range, multiple static-RPs are maintained in a list. This list is sorted in a descending order of IPv6 addresses. When selecting static-RPs for a group range, the first element (which is the static-RP with highest IPv6 address) is chosen.

RP-address deletion is handled by removing the static-RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by the `ipv6 pim rp-address` command. Commands with the `override` keyword take precedence over dynamically learned mappings.

**Examples** `awplus# configure terminal`  
`awplus(config)# no ipv6 pim rp-address 3ffe:30:30:5::153 G2`

**Related  
commands** [ipv6 pim rp-candidate](#)  
[ipv6 pim rp-register-kat](#)

# ipv6 pim rp-candidate

**Overview** Use this command to make the device an RP (Rendezvous Point) candidate, using the IPv6 address of the specified VLAN interface.

Use the **no** variant of this command to stop the device from being an RP candidate.

**Syntax** `ipv6 pim rp-candidate <interface> [priority <priority>|interval <interval>|grouplist <accesslist>]`  
`no ipv6 pim rp-candidate [<interface>]`

| Parameter    | Description                                                                      |
|--------------|----------------------------------------------------------------------------------|
| <interface>  | Specify a VLAN interface name.                                                   |
| <priority>   | Specify the priority for the RP candidate in the range 0 to 255.                 |
| <interval>   | Specify a candidate RP advertisement interval in the range 1 to 16383 (seconds). |
| <accesslist> | Specify a Standard or an Extended software IPv6 access list name.                |

**Default** The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

**Mode** Global Configuration

**Usage** Note that issuing the command **ipv6 pim rp-candidate <interface>** without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

**Examples** To specify a priority of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-candidate vlan2 priority 3
```

To stop the device from being an RP candidate on vlan2 , use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-candidate vlan2
```

**Related commands** [ipv6 pim rp-address](#)  
[ipv6 pim rp-register-kat](#)

# ipv6 pim rp embedded

**Overview** Use this command to configure and enable embedded RP (Rendezvous Point) in PIM-SMv6.

This command only applies to the embedded RP group range **ff7x::/12** and **fffx::/12**.

Use the **no** variant of this command to disable embedded RP support. Since embedded RP support is enabled by default, use the **no** variant of this command to disable the default.

**Syntax** `ipv6 pim rp embedded`  
`no ipv6 pim rp embedded`

**Mode** Global Configuration

**Default** Embedded RP is enabled by default in the AlliedWare Plus implementation of PIM-SMv6.

**Examples** The following example re-enables embedded RP support, the default state in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp embedded
```

The following example disables embedded RP support, which is enabled by default in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp embedded
```

# ipv6 pim rp-register-kat

**Overview** Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SMv6 Register packets.

Use the **no** variant of this command to return the PIM-SMv6 KAT timer to its default value of 210 seconds.

**Syntax** `ipv6 pim rp-register-kat <1-65535>`  
`no ipv6 pim rp-register-kat`

| Parameter | Description                                                         |
|-----------|---------------------------------------------------------------------|
| <1-65536> | Specify the KAT timer in seconds. The default value is 210 seconds. |

**Mode** Global Configuration

**Default** The default PIM-SMv6 KAT timer value is 210 seconds.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-register-kat 3454
awplus# configure terminal
awplus(config)# no ipv6 pim rp-register-kat
```

**Related commands** [ipv6 pim rp-address](#)  
[ipv6 pim rp-candidate](#)

# ipv6 pim sparse-mode

**Overview** Use this command to enable PIM-SMv6 on a VLAN interface or a PPP interface. Use the **no** variant of this command to disable PIM-SMv6 on a VLAN interface or a PPP interface.

**Syntax** `ipv6 pim sparse-mode`  
`no ipv6 pim sparse-mode`

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim sparse-mode
```

# ipv6 pim sparse-mode passive

**Overview** Use this command to enable and disable PIM-SMv6 passive mode operation for local members on a VLAN interface or a PPP interface.

Use the **no** variant of this command to disable PIM-SMv6 passive mode operation for local members on a VLAN interface or a PPP interface.

**Syntax** `ipv6 pim sparse-mode passive`  
`no ipv6 pim sparse-mode passive`

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** Passive mode essentially stops PIM-SMv6 transactions on the interface, allowing only the MLD mechanism to be active.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode passive
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim sparse-mode passive
```

# ipv6 pim spt-threshold

**Overview** This command turns on the ability for the last-hop PIM-SMv6 router to switch to SPT (shortest-path tree).

The **no** variant of this command turns off the ability for the last-hop PIM-SMv6 router to switch to SPT.

**NOTE:** *The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.*

**Syntax** `ipv6 pim spt-threshold`  
`no ipv6 pim spt-threshold`

**Mode** Global Configuration

**Examples** To enable the last-hop PIM-SMv6 router to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold
```

To stop the last-hop PIM-SMv6 router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold
```

# ipv6 pim ssm

**Overview** Use this command to define the Source Specific Multicast (SSM) range of IPv6 multicast addresses. PIM-SMv6 routers will only install (S,G) entries for multicast groups (addresses) residing in the SSM range.

Use the **no** variant of this command to disable the SSM range.

**Syntax** `ipv6 pim ssm [default]`  
`no ipv6 pim ssm`

| Parameter | Description                                                    |
|-----------|----------------------------------------------------------------|
| default   | Named Standard Access List. Use FF3x::/32 group range for SSM. |

**Default** By default, the command is disabled.

**Mode** Global Configuration

**Usage** Any (\*,G) or (S,G,rpt) joins received for multicast groups (addresses) within the range, are not installed in PIM-SMv6 mroute table.

**Examples** The following commands show how to set PIM-SSM as default:

```
awplus# configure terminal
awplus(config)# ipv6 pim ssm default
```

The following commands show how to disable PIM-SSM:

```
awplus# configure terminal
awplus(config)# no ipv6 pim ssm
```

# ipv6 pim unicast-bsm

**Overview** Use this command to enable support for the sending and receiving of unicast Boot Strap Messages (BSM) on a VLAN interface.

Use the **no** variant of this command to disable the sending and receiving of unicast BSM on a VLAN interface.

**Syntax** `ipv6 pim unicast-bsm`  
`no ipv6 pim unicast-bsm`

**Mode** Interface Configuration for a VLAN interface.

**Default** Unicast BSM is disabled by default on an interface.

**Usage** This command provides backward compatibility with older versions of the Boot Strap Router (BSR) specification, which directs unicast BSM to refresh the state of new or restarting neighbors. The current BSR specification defines a No Forward BSM to achieve the same result.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim unicast-bsm
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim unicast-bsm
```

# show debugging ipv6 pim sparse-mode

**Overview** This command displays the status of the PIM-SMv6 debugging on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging ipv6 pim sparse-mode`

**Mode** User Exec and Privileged Exec

**Example** To display PIM-SMv6 debugging settings, use the command:

```
awplus# show debugging ipv6 pim sparse-mode
```

Figure 39-2: Example output from the **show debugging ipv6 pim sparse-mode** command

```
awplus#show debugging ipv6 pim sparse-mode
Debugging status:

 PIM Bootstrap BST timer debugging is on
 PIM Bootstrap CRP timer debugging is on
```

**Related commands** [debug ipv6 pim sparse-mode](#)  
[undebug ipv6 pim sparse-mode](#)

# show ipv6 pim sparse-mode bsr-router

**Overview** Use this command to show the PIM-SMv6 Bootstrap Router (BSR) IPv6 address.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 pim sparse-mode bsr-router`

**Mode** User Exec and Privileged Exec

**Example** To display the BSR IPv6 address, use the command:

```
awplus# show ipv6 pim sparse-mode bsr-router
```

**Output** Figure 39-3: Example output from the **show ipv6 pim sparse-mode bsr-router** command

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
 BSR address: 2001:203::213 (?)
 Uptime: 00:36:25, BSR Priority: 64, Hash mask length: 126
 Expires: 00:01:46
 Role: Candidate BSR
 State: Candidate BSR

Candidate RP: 2001:5::211(vlan5)
 Advertisement interval 60 seconds
 Next C-RP advertisement in 00:00:43
```

**Related commands** [show ipv6 pim sparse-mode rp mapping](#)  
[show ipv6 pim sparse-mode neighbor](#)

# show ipv6 pim sparse-mode interface

**Overview** Use this command to show PIM-SMv6 interface information. Note that you can specify an individual VLAN interface with the optional parameter. Alternatively, you can display PIM-SMv6 interface information for all interfaces if you omit the optional interface parameter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 pim sparse-mode interface`

**Mode** User Exec and Privileged Exec

**Examples** To display information about all PIM-SMv6 interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode interface
```

```
awplus#show ipv6 pim sparse-mode interface

 Address : fe80::207:e9ff:fe02:21a2
 Global Address: 3ffe:192:168:10::53
 DR : this system
```

**Table 1:** Parameters in the output from the **show ipv6 pim sparse-mode interface** command

| Parameters  | Description                                |
|-------------|--------------------------------------------|
| Address     | Primary PIM-SMv6 address.                  |
| Interface   | Name of the PIM-SMv6 interface.            |
| VIF Index   | The Virtual Interface index of the VLAN.   |
| Ver/Mode    | PIMv6 version/Sparse mode.                 |
| Nbr Count   | Neighbor count of the PIM-SMv6 interface.  |
| DR Priority | Designated Router priority.                |
| DR          | The IPv6 address of the Designated Router. |

# show ipv6 pim sparse-mode local-members

**Overview** Use this command to show detailed local member information on a VLAN interface configured for PIM-SMv6. If you do not specify a VLAN interface then detailed local member information is shown for all VLAN interfaces configured for PIM-SMv6.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 pim sparse-mode local-members [<interface>]`

| Parameter   | Description                                                                       |
|-------------|-----------------------------------------------------------------------------------|
| <interface> | Optional Specify the interface. For instance, VLAN interface <code>vlan2</code> . |

**Mode** User Exec and Privileged Exec

**Example** To show detailed PIM-SMv6 information for all PIM-SMv6 configured VLAN interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode local-members
```

**Output** Figure 39-5: Example output from the **show ipv6 pim sparse-mode local-members** command

```
awplus#show ipv6 pim sparse-mode local-members
PIM Local membership information

vlan1:

 (*, ff02::1:ff6b:4783) : Include

vlan203:

 (*, ff0e:1::4) : Include
```

**Example** To show detailed PIM-SMv6 information for the PIM-SMv6 configured interface `vlan1`, use the command:

```
awplus# show ipv6 pim sparse-mode local-members vlan1
```

**Output** Figure 39-6: Example output from the **show ipv6 pim sparse-mode local-members vlan1** command

```
awplus#show ipv6 pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:

(*, ff02::1:ff6b:4783) : Include
```

# show ipv6 pim sparse-mode mroute

**Overview** This command displays the IPv6 multicast routing table, or the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two source IPv6 addresses cannot be used simultaneously.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax**

```
show ipv6 pim sparse-mode mroute
[<group-IPv6-address>|<source-IPv6-address>]

show ipv6 pim sparse-mode mroute [<group-IPv6-address>
<source-IPv6-address>]

show ipv6 pim sparse-mode mroute [<source-IPv6-address>
<group-IPv6-address>]
```

| Parameter                          | Description                                                                                                                                                             |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;group-IPv6-address&gt;</i>  | Group IPv6 address, entered in the form X:X::X:X. Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.  |
| <i>&lt;source-IPv6-address&gt;</i> | Source IPv6 address, entered in the form X:X::X:X. Based on the source and group IPv6 address, the output is the selected route if present in the multicast route tree. |

**Mode** User Exec and Privileged Exec

**Usage** Note that when a feature license is enabled, the output for the `show ipv6 pim sparse-mode mroute` command will only show 100 interfaces because of the terminal display width limit. Use the `show ipv6 pim sparse-mode mroute detail` command to display detailed entries of the IPv6 multicast routing table.

**Examples**

```
awplus# show ipv6 pim sparse-mode mroute
awplus# show ipv6 pim sparse-mode mroute 2001:db8::
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8::
```

# show ipv6 pim sparse-mode mroute detail

**Overview** This command displays detailed entries of the IPv6 multicast routing table, or detailed entries of the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two IPv6 source addresses cannot be used simultaneously.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 pim sparse-mode mroute [<source-IPv6-address>] detail`

| Parameter                                | Description                                                                                                  |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <code>&lt;source-IPv6-address&gt;</code> | Source IPv6 address, entered in the form X:X::X:X. Output is all multicast entries belonging to that source. |
| <code>detail</code>                      | Show detailed information.                                                                                   |

**Usage** Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ipv6 pim sparse-mode mroute detail
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: detail
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8::
detail
```

# show ipv6 pim sparse-mode neighbor

**Overview** Use this command to show the PIM-SMv6 neighbor information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 pim sparse-mode neighbor [<interface>]  
[<IPv6-address>] [detail]`

| Parameter      | Description                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------|
| <interface>    | Interface name (e.g. vlan2). Show neighbors on an interface.                                             |
| <IPv6-address> | Show neighbors with a particular address on an interface. The IPv6 address entered in the form X:X::X:X. |
| detail         | Show detailed information.                                                                               |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ipv6 pim sparse-mode neighbor`  
`awplus# show ipv6 pim sparse-mode neighbor vlan5 detail`

Figure 39-9: Example output from the **show ipv6 pim sparse-mode neighbor** command

```
awplus#show ipv6 pim sparse-mode neighbor

```

# show ipv6 pim sparse-mode nexthop

**Overview** Use this command to see the next hop information as used by PIM-SMv6.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ipv6 pim sparse-mode nexthop

**Mode** User Exec and Privileged Exec

**Example** awplus# show ipv6 pim sparse-mode nexthop

Figure 39-11: Example output from the **show ipv6 pim sparse-mode nexthop** command

```
awplus#show ipv6 pim sparse-mode nexthop
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination Type Nexthop Nexthop Nexthop Nexthop Metric Pref Refcnt
 Num Addr Ifindex Name

3ffe:10:10:5::153 .RS. 1 fe80::20e:cff:fe01:facc 2 30 110 1
```

**Table 2:** Parameters in output of the **show ipv6 pim sparse-mode nexthop** command

| Parameter       | Description                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------|
| Destination     | The destination address for which PIM-SMv6 requires next hop information.                                    |
| Type            | The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable. |
| Nexthop Num     | The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.                            |
| Nexthop Addr    | The address of the primary next hop gateway.                                                                 |
| Nexthop IfIndex | The interface on which the next hop gateway can be reached.                                                  |
| Nexthop Name    | The name of next hop interface.                                                                              |
| Metric          | The metric of the route towards the destination.                                                             |
| Preference      | The preference of the route towards destination.                                                             |
| Refcnt          | Only used for debugging.                                                                                     |

# show ipv6 pim sparse-mode rp-hash

**Overview** Use this command to display the Rendezvous Point (RP) to be chosen based on the IPv6 group address selected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 pim sparse-mode rp-hash <IPv6-group-addr>`

| Parameter                            | Description                                                               |
|--------------------------------------|---------------------------------------------------------------------------|
| <code>&lt;IPv6-group-addr&gt;</code> | The IPv6 group address used to find the RP, entered in the form X:X::X:X. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode rp-hash ff04:10`

Figure 39-12: Output from the **show ipv6 pim sparse-mode rp-hash** command:

```
awplus#show ipv6 pim sparse-mode rp-hash ff04::10
RP: 3ffe:10:10:5::153
Info source: 3ffe:10:10:5::153, via bootstrap
```

**Related commands** [show ipv6 pim sparse-mode rp mapping](#)

# show ipv6 pim sparse-mode rp mapping

**Overview** Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 pim sparse-mode rp mapping`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode rp mapping`

Figure 39-13: Output from the **show ipv6 pim sparse-mode rp mapping** command

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff00::/8
 RP: 3ffe:10:10:5::153
 Info source: 3ffe:10:10:5::153, via bootstrap, priority 192
 Uptime: 05:36:40
```

**Related commands** [show ipv6 pim sparse-mode rp-hash](#)

# show ipv6 pim sparse-mode rp nexthop

**Overview** Use this command to display the RP (Rendezvous Point) next hop information used by PIM-SMv6.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 pim sparse-mode rp nexthop <RP-group-addr>`

| Parameter       | Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------|
| <RP-group-addr> | Specify the RP group address used to display next hop RP information, entered in the form X:X::X:X. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153`

Figure 39-14: Example output from the **show ipv6 pim sparse-mode rp nexthop** command

```
awplus#show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination Type Nexthop Nexthop Nexthop Nexthop Metric Pref Refcnt
 Num Addr Ifindex Name

3ffe:10:10:5::153 .RS. 1 fe80::20e:cff:fe01:facc 2 30 110 1
```

**Table 3:** Parameters in output of the **show ipv6 pim sparse-mode rp nexthop** command

| Parameter       | Description                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------|
| Destination     | The destination address for which PIM-SMv6 requires next hop information.                                    |
| Type            | The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable. |
| Nexthop Num     | The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.                            |
| Nexthop Addr    | The address of the primary next hop gateway.                                                                 |
| Nexthop IfIndex | The interface on which the next hop gateway can be reached.                                                  |
| Nexthop Name    | The name of next hop interface.                                                                              |

**Table 3:** Parameters in output of the **show ipv6 pim sparse-mode rp nexthop** command (cont.)

| Parameter  | Description                                      |
|------------|--------------------------------------------------|
| Metric     | The metric of the route towards the destination. |
| Preference | The preference of the route towards destination. |
| Refcnt     | Only used for debugging.                         |

# undebbug all ipv6 pim sparse-mode

**Overview** Use this command to disable all PIM-SMv6 debugging.

**Syntax** `undebbug all ipv6 pim sparse-mode`

**Mode** Privileged Exec

**Example** `awplus# undebbug all ipv6 pim sparse-mode`

**Related commands** [debug ipv6 pim sparse-mode](#)

# undebg ipv6 pim sparse-mode

**Overview** Use this command to deactivate PIM-SMv6 debugging. Note that this command is an alias of the no variant of the [debug ipv6 pim sparse-mode](#) command.

**Syntax** `undebg ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [state] [timer]`

| Parameter | Description                                                                     |
|-----------|---------------------------------------------------------------------------------|
| all       | Deactivates all PIM-SMv6 debugging.                                             |
| events    | Deactivates debug printing of PIM-SMv6 events.                                  |
| mfc       | Deactivates debug printing of MFC (Multicast Forwarding Cache).                 |
| mib       | Deactivates debug printing of PIM-SMv6 MIBs.                                    |
| nexthop   | Deactivates debug printing of PIM-SMv6 next hop communications.                 |
| nsm       | Deactivates debugging of PIM-SMv6 NSM (Network Services Module) communications. |
| state     | Deactivates debug printing of state transition on all PIM-SMv6 FSMs.            |
| timer     | Deactivates debug printing of PIM-SMv6 timers.                                  |

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode all
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode events
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode nexthop
```

**Validation Output** Figure 39-15: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing the **undebug ipv6 pim sparse-mode all** command

```
awplus#undebug ipv6 pim sparse-mode all
awplus#show debugging ipv6 pim sparse-mode

- [“sub-sub-class \(priority\)”](#) on page 1838
- [“sub-sub-class \(wrr\)”](#) on page 1840
- [“traffic-control enable”](#) on page 1842
- [“traffic-control”](#) on page 1843

# class (htb)

**Overview** Use this command to configure a hierarchy token bucket (HTB) class within a traffic control policy.

Use the **no** variant of this command to delete an existing class under a current policy.

**Syntax** `class <class-name> [cir <committed-rate>] [pir <peak-rate>]  
[bc <1-100000000>] [be <1-100000000>] [preference <0-7>]  
[queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve  
<red-curve-name>]`

`class <class-name> [cir <committed-rate>] [pir <peak-rate>]  
[bc <1-100000000>] [be <1-100000000>] [preference <0-7>]  
sub-class-policy htb`

`no class <class-name>`

| Parameter                                     | Description                                                                                                                                                                                                   |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;class-name&gt;</code>               | Name of the class.                                                                                                                                                                                            |
| <code>cir &lt;committed-rate&gt;</code>       | Set the Committed Information Rate (CIR) for the queue. This parameter is compulsory when creating a new class. When editing an existing class, this parameter is optional.                                   |
| <code>pir &lt;peak-rate&gt;</code>            | Set the Peak Information Rate (PIR) for the queue. This is the rate of the queue under peak conditions. Specified in kbit/mbit/gbit per second, in the range 1kbit-100gbit.                                   |
| <code>bc &lt;1-100000000&gt;</code>           | Set the Committed Burst size (BC). This is the burst allowed above the CIR sent at the PIR rate.                                                                                                              |
| <code>be &lt;1-100000000&gt;</code>           | Set the Excess Burst size (BE). This is the burst allowed above the PIR sent at the maximum rate.                                                                                                             |
| <code>preference &lt;0-7&gt;</code>           | Set the preference for a class to receive spare bandwidth. Preference for the class to receive spare bandwidth (highest is 7).                                                                                |
| <code>queue-length &lt;2-65536&gt;</code>     | Set the maximum queue length.                                                                                                                                                                                 |
| <code>set-dscp &lt;dscp-value&gt;</code>      | Set the DSCP value to apply to the packets.                                                                                                                                                                   |
| <code>red-curve &lt;red-curve-name&gt;</code> | Apply a random early discard template with the class (only available on leaf queues when specifying class policy). If the keyword <code>&lt;default&gt;</code> is used then the default RED curve is applied. |
| <code>sub-class-policy</code>                 | Specify that the class will contain sub-classes.                                                                                                                                                              |
| <code>htb</code>                              | Sub-classes will use the Hierarchy Token Bucket (HTB) queueing discipline.                                                                                                                                    |

**Default** BC and BE are assigned suitable values proportional to the CIR and PIR respectively, and are larger than the MTU. The PIR defaults to the CIR. The Preference defaults to 7 and the queue-length defaults to 1000 (if the class is a leaf). If the keyword `<default>` is used then the default RED curve is applied.

**Mode** Traffic-Control Policy for an HTB policy.

**Usage** If there is already a class in the same level that has the specified name, the command will replace the configuration of the existing class if it does not have any sub-classes.

If a sub-class policy is specified, this command uses the Traffic-Control Class mode to apply it.

**Examples** To configure a leaf class, use the commands:

```
awplus#configure terminal
awplus (config) #traffic-control
awplus (config-tc) #policy p01 htb
awplus (config-tc-policy) #class c01 cir 100mbit pir 150mbit
```

To configure a class with a sub-sub-class as the leaf class, use the commands:

```
awplus#configure terminal
awplus (config) #traffic-control
awplus (config-tc) #policy p01 htb
awplus (config-tc-policy) #class c01 cir 100mbit pir 150mbit
sub-class-policy htb

awplus (config-tc-class) #sub-class s01 cir 10mbit sub-sub-class
policy htb

awplus (config-tc-subclass) #sub-sub-class ss01 cir 5mbit
queue-length 200 red-curve ss01-red
```

To enter Traffic-Control Class mode for an existing class, use the commands:

```
awplus#configure terminal
awplus (config) #traffic-control
awplus (config-tc) #policy p01
awplus (config-tc-policy) #class c01
awplus (config-tc-class) #
```

To delete an existing class, use the commands:

```
awplus#configure terminal
awplus (config) #traffic-control
awplus (config-tc) #policy p01
awplus (config-tc-policy) #no class c01
```

**Related  
Commands** [policy \(traffic-control\)](#)  
[sub-class \(htb\)](#)  
[traffic-control](#)

# class (priority)

**Overview** Use this command to configure a priority queue class within a traffic control policy.

Use the **no** variant of this command to delete an existing priority class under a current policy.

**Syntax** `class <class-name> [priority-level <0-15>] [max <max-rate>]  
[queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve  
<red-curve-name>]`

`class <class-name> [priority-level <0-15>] sub-class-policy  
{priority|wrr|htb}`

`no class <class-name>`

| Parameter                                     | Description                                                                                                                                                                                                   |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;class-name&gt;</code>               | Name of the class.                                                                                                                                                                                            |
| <code>priority-level &lt;0-15&gt;</code>      | Set the priority level (15 is the highest). This parameter is compulsory when creating a new class. When editing an existing class, this parameter is optional.                                               |
| <code>max &lt;max-rate&gt;</code>             | Set the maximum traffic rate of the queue (in kbit/mbit/gbit per second, 1kbit-100gbit).                                                                                                                      |
| <code>queue-length &lt;2-65535&gt;</code>     | Set the maximum queue length in packets (only available on leaf queues when specifying sub-class policy).                                                                                                     |
| <code>set-dscp &lt;dscp-value&gt;</code>      | Set the DSCP value to apply to the packets (only available on leaf queues when specifying sub-class policy).                                                                                                  |
| <code>red-curve &lt;red-curve-name&gt;</code> | Apply a random early discard template with the class (only available on leaf queues when specifying class policy). If the keyword <code>&lt;default&gt;</code> is used then the default RED curve is applied. |
| <code>sub-class-policy</code>                 | Create a sub-class within the policy.                                                                                                                                                                         |
| <code>priority</code>                         | Sub-classes use the Priority Queue scheduling algorithm.                                                                                                                                                      |
| <code>wrr</code>                              | Sub-classes use the Weighted Round Robin scheduling algorithm.                                                                                                                                                |
| <code>htb</code>                              | Sub-classes use the Hierarchy Token Bucket scheduling algorithm.                                                                                                                                              |

**Default** No priority class is applied. If the keyword `<default>` is used then the default RED curve is applied.

**Mode** Traffic Control Policy for a priority policy.

**Usage** If there is already a class in the same level with the specified name, the command will replace the configuration of the existing class if it does not have any sub-classes.

If a sub-class policy is specified, this command uses the Traffic-Control Class mode to apply it.

**Examples** To configure a leaf class, use the commands:

```
awplus#configure terminal
awplus (config) #traffic-control
awplus (config-tc) #policy p01 priority
awplus (config-tc-policy) #class c01 priority-level 5
```

To configure a class with a sub-sub-class as the leaf class, use the commands:

```
awplus#configure terminal
awplus (config) #traffic-control
awplus (config-tc) #policy p01 priority
awplus (config-tc-policy) #class c01 priority-level 5
sub-class-policy priority
awplus (config-tc-class) #sub-class s01 priority-level 7
sub-sub-class-policy priority
awplus (config-tc-subclass) #sub-sub-class ss01 priority-level 3
max 5mbit queue-length 200 red-curve ss01-red
```

To enter Traffic-Control Class mode for an existing class, use the commands:

```
awplus#configure terminal
awplus (config) #traffic-control
awplus (config-tc) #policy p01
awplus (config-tc-policy) #class c01
awplus (config-tc-class) #
```

To delete an existing policy class, use the commands:

```
awplus#configure terminal
awplus (config) #traffic-control
awplus (config-tc) #policy p01
awplus (config-tc-policy) #no class c01
```

# class (wrr)

**Overview** Use this command to configure a Weighted Round-Robin (WRR) class within a traffic control policy.

Use the **no** variant of this command to delete an existing class under a current policy.

**Syntax** `class <class-name> [weight <1-100>] [queue-length <2-65536>]  
[set-dscp <dscp-value>] [red-curve <red-curve-name>]  
class <class-name> [weight <1-100>] sub-class-policy wrr  
no class <class-name>`

| Parameter                                     | Description                                                                                                                                                                                                                                                                   |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;class-name&gt;</code>               | Name of the class.                                                                                                                                                                                                                                                            |
| <code>weight &lt;1-100&gt;</code>             | Set the weight. The relative weight is the available bandwidth divided between sibling WRR classes according to the ratio of their configured weights.<br>This parameter is compulsory when creating a new class. When editing an existing class, this parameter is optional. |
| <code>queue-length &lt;2-65536&gt;</code>     | Set the maximum queue length in packets.                                                                                                                                                                                                                                      |
| <code>set-dscp &lt;dscp-value&gt;</code>      | Set the DSCP value to apply to packets.                                                                                                                                                                                                                                       |
| <code>red-curve &lt;red-curve-name&gt;</code> | Apply a random early discard template with the class (only available on leaf queues when specifying class policy). If the keyword <code>&lt;default&gt;</code> is used then the default RED curve is applied.                                                                 |
| <code>sub-class-policy</code>                 | Create a sub-class within the policy.                                                                                                                                                                                                                                         |
| <code>wrr</code>                              | Sub-classes use the Weighted Round Robin queueing algorithm.                                                                                                                                                                                                                  |

**Default** A weighted round-robin class has no DSCP value or sub-class policy. The queue length is 1000 by default. If the keyword `<default>` is used then the default RED curve is applied.

**Mode** Traffic-Control Policy for a WRR policy.

**Usage** If there is already a class in the same level with the specified name, the command will replace the configuration of the existing class if it does not have any sub-classes.

If a sub-class policy is specified, this command uses the Traffic-Control Class mode to apply it.

**Examples** To configure a leaf class, use the commands:

```
awplus#configure terminal
awplus (config) #traffic-control
awplus (config-tc) #policy p01 wrr
awplus (config-tc-policy) #class c01 weight 50
```

To configure a class with a sub-sub-class as the leaf class, use the commands:

```
awplus#configure terminal
awplus (config) #traffic-control
awplus (config-tc) #policy p01 wrr
awplus (config-tc-policy) #class c01 weight 50 sub-class-policy
wrr
awplus (config-tc-class) #sub-class s01 weight 30 sub-sub-class-
policy wrr
awplus (config-tc-subclass) #sub-sub-class ss01 weight 5
queue-length 200 red-curve ss01-red
```

To enter Traffic-Control Class mode for an existing class, use the commands:

```
awplus#configure terminal
awplus (config) #traffic-control
awplus (config-tc) #policy p01
awplus (config-tc-policy) #class c01
awplus (config-tc-class) #
```

To delete an existing class, use the commands:

```
awplus#configure terminal
awplus (config) #traffic-control
awplus (config-tc) #policy p01
awplus (config-tc-policy) #no class c01
```

# debug traffic-control

**Overview** Use this command to enable traffic-control debugging. This will cause additional detailed debugging information to be logged and available using the show debugging traffic-control.

Use the **no** variant of this command to disable traffic-control debugging.

**Syntax** debug traffic-control  
no debug traffic-control

**Default** Disabled

**Mode** Privileged Exec

**Examples** To enable traffic control debugging, use the commands:

```
awplus#debug traffic-control
```

To disable traffic control debugging, use the commands:

```
awplus#no debug traffic-control
```

**Related Commands** traffic-control  
show debugging traffic-control

# interface (traffic-control)

**Overview** Use this command to configure interface specific parameters for traffic control.

**Syntax** `interface <interface-name> {overhead  
[<overhead-bytes>|ethernet]|virtual-bandwidth  
<bandwidth>|system-bandwidth <system-percentage>}`

| Parameter           | Description                                                                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface-name>    | Name of interface to configure                                                                                                                                |
| overhead            | Set overhead to add to each packet when calculating the packet size                                                                                           |
| <overhead-bytes>    | Number of bytes to add to the packet for packet size calculations. The range is from 0 to 512 and the default is 0.                                           |
| ethernet            | Setting the overhead to 'ethernet' adds 24 bytes to the packet to account for preamble + CRC + inter-frame gap.                                               |
| virtual-bandwidth   | Specify the virtual-bandwidth of the interface. This is the maximum amount of traffic that traffic control will allow to be sent via the interface..          |
| <bandwidth>         | Value for the virtual bandwidth in kbit, mbit or gbits. For example 5mbit.                                                                                    |
| system-bandwidth    | Specify the percentage of the interface bandwidth to reserve for system traffic. The default when a traffic control policy is applied to the interface is 5%. |
| <system-percentage> | Percentage of the bandwidth to reserve for system traffic in the range from 1 to 99.                                                                          |

**Default** The default overhead is 0, the default bandwidth is the interface speed if it can be read. It is recommended to always set the virtual bandwidth when using traffic control. The system bandwidth default is 5%.

**Mode** Traffic-Control

**Usage** This command allows configuring traffic control parameters specific to the traffic egress interface.

**Examples** To rate limit eth1 to 10mbit while taking into account the ethernet framing overhead and reserving only 1% of the bandwidth for system traffic, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#interface eth1 overhead ethernet
virtual-bandwidth 10mbit system-bandwidth 1
```

# I3-filtering enable

**Overview** Use this command to enable traffic control for bridged traffic on a bridge interface.

Use the **no** variant of this command to disable traffic control for bridged traffic on a bridge interface.

**Syntax** l3-filtering enable  
no l3-filtering enable

**Default** Traffic control is disabled by default for bridged traffic.

**Mode** Interface mode for a bridge interface

**Usage** We do not recommend shaping bridged traffic on firewalls that are running Unified Threat Management (UTM) features, because both Traffic Control and UTM require significant CPU resources.

**Example** To enable traffic control for bridged traffic on br1, use the commands:

```
awplus# configure terminal
awplus(config)# interface br1
awplus(config-if)# l3-filtering enable
```

**Related  
Commands** [traffic-control](#)

**Command  
changes** Version 5.4.7-0.1: command added. Previously, traffic control was enabled by default on all bridge interfaces.

# move rule (traffic-control)

**Overview** Use this command to change the identification of an existing traffic control rule.

**Syntax** `move rule [<1-65535> to <1-65535>]`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| <1-65535> | Range of the rule ID to move from                   |
| <1-65535> | Range of the destination ID for the rule to move to |

**Default** None

**Mode** Traffic-Control

**Example** To change rule ID 10 to rule ID 25, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#move rule 10 to 25
```

# policy (traffic-control)

**Overview** Use this command to configure a traffic control policy, that can then be used with rules that have been created.

Use the **no** variant of this command to delete an existing policy.

**Syntax** `policy <policy-name> [priority|wrr|htb]`  
`no policy <policy-name>`

| Parameter                        | Description                      |
|----------------------------------|----------------------------------|
| <code>&lt;policy_name&gt;</code> | The name of the policy           |
| <code>priority</code>            | Use Priority Queueing (PQ)       |
| <code>wrr</code>                 | Use Weighted Round Robin (WRR)   |
| <code>htb</code>                 | Use Hierarchy Token Bucket (HTB) |

**Default** No policies are configured

**Mode** Traffic-Control

**Usage** A policy specifies a top-level queueing discipline which determines the type of classes that can be configured under the policy. This command uses the Traffic-Control Policy mode.

**Examples** To configure a policy, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#
```

To delete an existing policy, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#no policy p01 htb
```

# red-curve

**Overview** Use this command to allow configuration of a RED (Random Early Discard) curve template.

Use the **no** variant of this command to set the RED curve back to the default.

**Syntax** `red-curve <red-curve-name> [limit <4-127>] [avpkt <64-1518>]  
[min <3-126>] [max <4-127>] [probability <1-100>]  
[ecn [ecn-drop]]  
no red-curve [<red-curve-name>]`

| Parameter                              | Description                                                                                                                                                                                                                                          |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;red-curve-name&gt;</code>    | The RED curve name.                                                                                                                                                                                                                                  |
| <code>limit &lt;4-127&gt;</code>       | The hard queue length limit (in packets) for the RED curve. Once the queue length reaches the limit, all packets are dropped.                                                                                                                        |
| <code>avpkt &lt;64-1518&gt;</code>     | The average packet size to use for queue size calculations in bytes.                                                                                                                                                                                 |
| <code>min &lt;3-126&gt;</code>         | The minimum queue length for random early discard (in packets). Between <code>&lt;min&gt;</code> and <code>&lt;max&gt;</code> the drop probability will increase linearly.                                                                           |
| <code>max &lt;4-127&gt;</code>         | The maximum queue length where packets are probabilistically dropped. At <code>&lt;max&gt;</code> the drop probability equals <code>&lt;probability&gt;</code> . Beyond <code>&lt;max&gt;</code> the drop or marking probability is 100%.            |
| <code>probability &lt;1-100&gt;</code> | The probability of a packet being dropped when queue-length reaches <code>&lt;max&gt;</code> . The drop probability increases linearly from 0 to <code>&lt;probability&gt;</code> in between <code>&lt;min&gt;</code> and <code>&lt;max&gt;</code> . |
| <code>ecn</code>                       | Use explicit congestion notification marking instead of dropping the packet.                                                                                                                                                                         |
| <code>ecn-drop</code>                  | When average queue size exceeds <code>&lt;max&gt;</code> drop packets instead of marking.                                                                                                                                                            |

**Default** The default RED curve is **red-curve default limit 127 avpkt 576B min 10 max 32 prob 2**.

**Mode** Traffic-control

**Usage** The RED curve template can later be applied to a traffic control class, sub-class, or sub-sub-class.

**Example** To configure a RED curve with ECN dropping and the default curve shape, use the commands:

```
awplus# configure terminal
awplus(config)# traffic-control
awplus(config-tc)# red-curve red-ecn ecn
```

To configure an aggressive RED curve, use the commands:

```
awplus# configure terminal
awplus(config)# traffic-control
awplus(config-tc)# red-curve aggressive min 5 max 50
probability 70
```

# rule (traffic-control)

**Overview** Use this command to create a traffic-control rule.

Use the **no** variant of this command to remove a traffic-control rule

**Syntax** `rule [<1-65535>] match <application> from <source-entity> to <destination-entity> policy <policy>`  
`no rule [<1-65535>]`

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-65535>            | The rule ID is an integer in the range from 1 to 65535. If you do not designate a rule ID, one will be automatically generated and it will be greater than the current highest rule ID. Lower IDs have higher priority.                                                                                                                                        |
| match                | Application traffic to match                                                                                                                                                                                                                                                                                                                                   |
| <application>        | Application name                                                                                                                                                                                                                                                                                                                                               |
| from                 | Set the source of the entity                                                                                                                                                                                                                                                                                                                                   |
| <source_entity>      | Source entity name. Entities represent logical grouping of subnets, hosts or interfaces.                                                                                                                                                                                                                                                                       |
| to                   | Set the destination of the entity                                                                                                                                                                                                                                                                                                                              |
| <destination_entity> | Source entity name. Entities represent logical grouping of subnets, hosts or interfaces.                                                                                                                                                                                                                                                                       |
| policy               | Policy to apply to matched traffic                                                                                                                                                                                                                                                                                                                             |
| <policy>             | Traffic control policy. This consists of a top-level policy name followed by the name of a class within that policy, and sub-class (of the class) and a sub-sub-class if applicable. Examples are:<br>p01.c03<br>p01.c03.sc02<br>p01.c03.scc02.ssc01<br>P01 is the policy name, c03 is the class name, sc02 is the sub-class, and ssc01 is the sub-sub-class.. |

**Default** No rules

**Mode** Traffic-Control

**Usage** Rules are used to apply traffic-control policies to a type of traffic. When traffic control is enabled and no rules are added, a default traffic-control policy is installed on all supported interfaces.

If the application, source entity or destination entity specified in the rule is not configured correctly, the rule is not valid and is not installed.

You can change the rule order by using the `move rule (traffic-control)` command.

Rules are applied to destination interfaces in the order of their ID (lower IDs are applied first). If traffic matches a rule, then the rest are ignored. If traffic does not match any rule, then it is classified to the default class.

A rule can specify the system class as the policy. System traffic is high priority traffic that is allocated a fixed amount of bandwidth on an interface. Use the interface (traffic-control) command to configure system bandwidth on an interface.

**Examples** To configure a rule, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#rule 10 match ftp from wan to private policy
p01.c02.sc03
```

To delete a rule, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#no rule 10
```

## traffic-control

# show traffic-control counters

**Overview** Use this command to display counters related to traffic control. This command displays counters for the number of packets sent, queued or dropped by each traffic control class. The information is shown by each interface. There is an overall counter for the policy, and counters for each leaf class in the policy.

If no interface name is specified then information for all interfaces with traffic control policies applied is displayed.

**Syntax** `show traffic-control counters [<interface-name>]`

| Parameter                           | Description                                           |
|-------------------------------------|-------------------------------------------------------|
| <code>&lt;interface-name&gt;</code> | Name of Interface to display traffic control counters |

**Default** None

**Mode** Privileged Exec

**Examples** To show the traffic control counters for all interfaces, use the commands:

```
awplus#show traffic-control counters
```

Figure 40-3: Example output from **show traffic-control counters**

```
awplus#show traffic-control counters

**Related Commands** [show running-config traffic-control](#)

# show traffic-control interface

**Overview** Use this command to display information about interfaces known to traffic control, such as the applied policy, the virtual-bandwidth configured on the interface, the bandwidth reserved for system traffic and the overhead applied to the packet size calculations. If no interface name is specified, information is shown for all interfaces known to traffic control.

**Syntax** `show traffic-control interface [<interface-name>]`

| Parameter                           | Description                              |
|-------------------------------------|------------------------------------------|
| <code>&lt;interface-name&gt;</code> | Name of interface to display information |

**Default** None

**Mode** Privileged Exec

**Examples** To show traffic control information for all interfaces, use the command:

```
awplus#show traffic-control interface
```

**Output** Figure 40-4: Example output from **show traffic-control interface**

```
awplus#show traffic-control interface

[show running-config traffic-control](#)

# show traffic-control red-curve

**Overview** Use this command to show configured RED curve templates.

**Syntax** show traffic-control red-curve <red-curve-name>

| Parameter        | Description                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------|
| <red-curve-name> | The name of the RED curve. The default RED curve is <b>red-curve default limit 127 avpkt 576B min 10 max 32 prob 2.</b> |

**Default** None

**Mode** Privileged Exec

**Usage** If you have not configured some parameters, default values will display. If no RED curve name is given, all configured RED curves are shown.

**Example** To show all RED curves, use the command:

```
awplus# show traffic-control red-curve
```

To show a specified red curve called "TCP\_session\_1", use the command:

```
awplus# show traffic-control red-curve TCP_session_1
```

**Output** Figure 40-6: Example output from **show traffic-control red-curve**

```
awplus#show traffic-control red-curve
Traffic Control RED Curves:

RED curve default:
 Average packet size: 576 bytes
 Minimum: 10 packets
 Maximum: 32 packets
 Limit: 127 packets
 Drop probability: 2%

# show traffic-control rule config-check

**Overview** Use this command to show information about traffic control rule validity.

**Syntax** `show traffic-control rule config-check`

**Default** None

**Mode** Privileged Exec

**Usage** An asterisk is printed before each rule that is invalid. To help determine why the rule is invalid, the `show traffic-control rule config-check` command will print the reasons why the rule is invalid. Information is only shown for invalid rules. If all rules are valid, a message will be printed showing all rules are valid.

**Example** To check if configured rules are valid, use the commands:

```
awplus#show traffic-control rule config-check
```

**Output** Figure 40-8: Example output from **show traffic-control rule config-check**

```
awplus#show traffic-control rule config-check

Rule 30:
 "From" entity does not exist
 "To" entity does not exist
 Policy doesn't exist or is not leaf
```

**Related Commands**

# show traffic-control rule

**Overview** Use this command to show specific rules or a complete list of rules configured for traffic control.

**Syntax** `show traffic-control rule [<1-65535>]`

| Parameter | Description                                                                           |
|-----------|---------------------------------------------------------------------------------------|
| <1-65535> | The ID of the rule you want to display. If no ID is entered, all rules are displayed. |

**Default** None

**Mode** Privileged Exec

**Usage** An asterisk will be printed at the start of a row if the rule is invalid. The rules are shown in a table showing the rule ID, the application, source and destination that the rule matches on and the policy and class that the matching traffic will be sent to.

**Examples** To show a list of all traffic control rules configured, use the command:

```
awplus#show traffic-control rule
```

To show traffic control rule 10 configured, use the command:

```
awplus#show traffic-control rule 10
```

**Output** Figure 40-9: Example output from **show traffic-control rule**

```
awplus#show traffic-control rule

[* - Rule is not valid - see "show traffic-control rule config-check"]
 ID APP From To Policy

 10 udp-5001 ipv6.vlan3 ipv6.eth2 A.B5001

# sub-class (htb)

**Overview** Use this command to configure a hierarchy token bucket (HTB) sub-class within an existing class.

Use the **no** variant of this command to delete an existing sub-class under the current class.

**Syntax**

```
sub-class <class-name> [cir <committed-rate>] [pir <peak-rate>]
[bc <1-100000000>] [be <1-100000000>] [preference <0-7>]
[queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve
<red-curve-name>]

sub-class <class-name> [cir <committed-rate>] [pir <peak-rate>]
[bc <1-100000000>] [be <1-100000000>] [preference <0-7>]
sub-sub-class-policy htb

no sub-class <class-name>
```

| Parameter                  | Description                                                                                                                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <class-name>               | Name of the class.                                                                                                                                                                                                                         |
| cir <committed-rate>       | Set the Committed Information Rate (CIR) for the queue. Specified in kbit/mbit/gbit per second, 1kbit-100gbit. This parameter is compulsory when creating a new sub-class. When editing an existing sub-class, this parameter is optional. |
| pir <peak-rate>            | Set the Peak Information Rate (PIR) for the queue. This is the rate of the queue under peak conditions. Specified in kbit/mbit/gbit per second, in the range 1kbit-100gbit.                                                                |
| bc <1-100000000>           | Set the Committed Burst size (BC). This is the burst allowed above the CIR, sent at the PIR rate.                                                                                                                                          |
| be <1-100000000>           | Set the Excess Burst size (BE). This is the burst allowed above the PIR, sent at the maximum rate.                                                                                                                                         |
| preference <0-7>           | Set the preference for a class to receive spare bandwidth (highest is 7).                                                                                                                                                                  |
| queue-length <2-65536>     | Set the maximum queue length in packets.                                                                                                                                                                                                   |
| set-dscp <dscp-value>      | Set the DSCP value to apply to the packets.                                                                                                                                                                                                |
| red-curve <red-curve-name> | Apply a random early discard template with the sub-class and enter the name of the red curve template to apply.                                                                                                                            |
| sub-sub-class-policy       | Specify that the sub-class will contain sub-sub-classes.                                                                                                                                                                                   |
| htb                        | Sub-sub-classes will use the Hierarchy Token Bucket (HTB) queueing discipline.                                                                                                                                                             |

**Default** BC and BE are assigned suitable values proportional to the CIR and PIR respectively and are larger than the MTU. PIR defaults to the CIR. Preference defaults to 7 and the queue length default to 1000 if the class is a leaf.

**Mode** Traffic-Control Class for an HTB sub-class policy.

**Usage** If there is already a sub-class in the same level with the specified name, the command will replace the configuration of the existing sub class if it does not have any sub-sub-classes.

If you specify a sub-sub-class policy, this command puts you into sub-class mode so you can specify the sub-sub-class.

**Examples** To configure a leaf sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01 cir 100mbit pir 150mbit
sub-class-policy htb
wplus(config-tc-class)#sub-class s02 cir 20mbit queue-length
200 red-curve s02-red
```

To enter Traffic-Control Class mode for an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#
```

To delete an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#no sub-class s01
```

# sub-class (priority)

**Overview** Use this command to configure a priority queue sub-class within a class.

Use the **no** variant of this command to delete an existing sub-class under the current class.

**Syntax** `sub-class <class-name> [priority-level <0-15>] [max <max-rate>]  
[queue-length <2-65536>] [set-dscp <dscp_value>] [red-curve  
<red-curve-name>]`

`sub-class <class-name> [priority-level <0-15>]`

`sub-sub-class-policy {priority|wrr|htb}`

`no sub-class <class-name>`

| Parameter                                     | Description                                                                                                                                                             |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;class-name&gt;</code>               | Name of the class.                                                                                                                                                      |
| <code>priority-level &lt;0-15&gt;</code>      | Set the priority level (15 is the highest). This parameter is compulsory when creating a new sub-class. When editing an existing sub-class, this parameter is optional. |
| <code>max &lt;max-rate&gt;</code>             | Set the maximum traffic rate of the queue (in kbit/mbit/gbit per second, 1kbit-100gbit).                                                                                |
| <code>queue-length &lt;2-65536&gt;</code>     | Set the maximum queue length in packets.                                                                                                                                |
| <code>set-dscp&lt;dscp-value&gt;</code>       | Set the DSCP value to apply to the packets.                                                                                                                             |
| <code>red-curve &lt;red-curve-name&gt;</code> | Apply a random early discard template with the sub class and enter the name of the red curve template to apply.                                                         |
| <code>sub-sub-class-policy</code>             | Create a sub-sub-class for the policy.                                                                                                                                  |
| <code>priority</code>                         | Sub-sub-classes will use the Priority Queue queueing algorithm.                                                                                                         |
| <code>wrr</code>                              | Sub-sub-classes will use the Weighted Round Robin (WRR) queueing algorithm.                                                                                             |
| <code>htb</code>                              | Sub-classes will use the Hierarchy Token Bucket (HTB) queueing algorithm.                                                                                               |

**Default** A priority queue sub class has no max rate, DSCP value or sub-sub class policy. The queue length is 1000 by default if the class is a leaf.

**Mode** Traffic-Control Class for a priority sub-class policy.

**Usage** If there is already a sub-class in the same level with the specified name, the command will replace the configuration of the existing sub class if it does not have any sub-sub classes.

If a sub-sub class policy is specified, this command uses the Traffic-Control Class mode to apply it.

**Examples** To configure a sub-class as the leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01 priority-level 5
sub-class-policy priority
awplus(config-tc-class)#sub-class s02 priority-level 8 max
50mbit queue-length 200 red-curve ss01-red
```

To enter Traffic-Control Class mode for an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#
```

To delete an existing class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#no sub-class s01
```

# sub-class (wrr)

**Overview** Use this command to configure a Weighted Round-Robin (WRR) sub-class within a class.

Use the **no** variant of this command to delete an existing sub-class under the current class.

**Syntax** `sub-class <class-name> [weight <1-100>] [queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve <red-curve-name>]`  
`sub-class <class-name> [weight <1-100>] sub-sub-class-policy wrr`  
`no sub-class <class-name>`

| Parameter                                     | Description                                                                                                                                                                                                                                                                        |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;class-name&gt;</code>               | Name of the sub-class.                                                                                                                                                                                                                                                             |
| <code>weight&lt;1-100&gt;</code>              | Set the weight. The relative weight is the available bandwidth divided between sibling WRR classes according to the ratio of their configured weights. This parameter is compulsory when creating a new sub-class. When editing an existing sub-class, this parameter is optional. |
| <code>queue-length&lt;2-65536&gt;</code>      | Set the maximum queue length in packets.                                                                                                                                                                                                                                           |
| <code>set-dscp</code>                         | Set the DSCP value to apply to packets.                                                                                                                                                                                                                                            |
| <code>&lt;dscp-value&gt;</code>               | DSCP value as an integer or lower-case DSCP name.                                                                                                                                                                                                                                  |
| <code>red curve &lt;red-curve-name&gt;</code> | Apply a random early discard template with the sub-class and enter the name of the red curve template to apply.                                                                                                                                                                    |
| <code>sub-sub-class-policy</code>             | Create a sub-sub-class within the policy.                                                                                                                                                                                                                                          |
| <code>wrr</code>                              | Sub sub classes use the Weighted Round Robin queueing discipline.                                                                                                                                                                                                                  |

**Default** A weighted round-robin sub class has no DSCP value or sub-sub-class policy. The queue length is 1000 by default.

**Mode** Traffic-Control Class for a WRR sub-class policy.

**Usage** If there is already a class in the same level with the specified name, the command will replace the configuration of the existing class if it does not have any sub-classes.

If a sub class policy is specified, this command uses the Traffic-Control Class mode to apply it.

**Examples** To configure a sub-class as a leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 wrr
awplus(config-tc-policy)#class c02 weight 30 sub-class-policy
wrr
awplus(config-tc-class)#sub-class s02 weight 40 queue-length
200 red-curve s02-red
```

To enter Traffic-Control Class mode for an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#
```

To delete an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#no sub-class s01
```

## sub-sub-class (htb)

**Overview** Use this command to configure a Hierarchy Token Bucket (HTB) sub-sub-class for a sub-class.

Use the **no** variant of this command to delete an existing sub-sub-class from the current sub-class.

**Syntax** `sub-sub-class <class-name> [cir <committed-rate>] [pir <peak-rate>] [bc <1-100000000>] [be <1-100000000>] [preference <0-7>] [queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve <red-curve-name>]`  
`no sub-sub-class <class-name>`

| Parameter                                     | Description                                                                                                                                                                                                                                        |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;class-name&gt;</code>               | Name of the sub-sub-class.                                                                                                                                                                                                                         |
| <code>cir &lt;committed-rate&gt;</code>       | Set the Committed Information Rate (CIR) for the queue. Specified in kbit/mbit/gbit per second, 1kbit-100gbit. This parameter is compulsory when creating a new sub-sub-class. When editing an existing sub-sub-class, this parameter is optional. |
| <code>pir &lt;peak-rate&gt;</code>            | Set the Peak Information Rate (PIR) for the queue. This is the rate of the queue under peak conditions. Specified in kbit/mbit/gbit per second, in the range 1kbit-100gbit.                                                                        |
| <code>bc &lt;1-100000000&gt;</code>           | Set the Committed Burst size (BC). This is the burst allowed above the CIR, sent at the PIR rate.                                                                                                                                                  |
| <code>be &lt;1-100000000&gt;</code>           | Set the Excess Burst size (BE. This is the burst allowed above the PIR, sent at the maximum rate..                                                                                                                                                 |
| <code>preference &lt;0-7&gt;</code>           | Set the preference for a class to receive spare bandwidth (highest is 7).                                                                                                                                                                          |
| <code>queue-length &lt;2-65536&gt;</code>     | Set the maximum queue length.                                                                                                                                                                                                                      |
| <code>set-dscp &lt;dscp-value&gt;</code>      | Set the DSCP value to apply to the packets.                                                                                                                                                                                                        |
| <code>red-curve &lt;red-curve-name&gt;</code> | Apply a random early discard template with the sub-sub-class and enter the name of the red curve template to apply.                                                                                                                                |

**Default** BC and BE are assigned suitable values proportional to the CIR and PIR respectively and are larger than the MTU. PIR defaults to the CIR. Preference defaults to 7 and Queue length defaults to 1000.

**Mode** Traffic-Control Sub-class for an HTB sub-sub-class policy.

**Usage** If there is already a sub-sub-class in the same level with the specified name, this command will replace the configuration of the existing sub-sub-class.

**Examples** To configure a sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01 cir 100mbit pir 150mbit
sub-class-policy htb
awplus(config-tc-class)#sub-class s01 cir 10mbit
```

To configure a leaf sub-sub-class with a RED curve, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01 cir 100mbit pir 150mbit
sub-class-policy htb
awplus(config-tc-class)#sub-class s01 cir 10mbit
sub-sub-class-policy htb
awplus(config-tc-subclass)#sub-sub-class ss01 cir 5mbit
queue-length 200 red-curve ss01-red
```

To delete an existing sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#no sub-sub-class ss01
```

# sub-sub-class (priority)

**Overview** Use this command to configure a priority queue sub-sub-class for a sub-class.  
Use the **no** variant of this command to delete an existing sub-sub-class from the current sub-class.

**Syntax** `sub-sub-class <class-name> [priority-level <0-15>] [max <max-rate>] [queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve <red-curve-name>]`  
`no sub-sub-class <class-name>`

| Parameter                                     | Description                                                                                                                                                                     |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;class-name&gt;</code>               | Name of the class.                                                                                                                                                              |
| <code>priority-level &lt;0-15&gt;</code>      | Set the priority level (15 is the highest). This parameter is compulsory when creating a new sub-sub-class. When editing an existing sub-sub-class, this parameter is optional. |
| <code>max &lt;max-rate&gt;</code>             | Set the maximum traffic rate of the queue (in kbit/mbit/gbit per second, 1kbit-100gbit).                                                                                        |
| <code>queue-length &lt;2-65536&gt;</code>     | Set the maximum queue length in packets.                                                                                                                                        |
| <code>set-dscp &lt;dscp-value&gt;</code>      | Set the DSCP value to apply to the packets.                                                                                                                                     |
| <code>red-curve &lt;red-curve-name&gt;</code> | Apply a random early discard template with the sub-sub-class and enter the name of the red curve template to apply.                                                             |

**Default** A priority queue sub-sub-class has no max rate or DSCP value. The queue length is 1000.

**Mode** Traffic-Control Sub-class for a priority sub-sub-class policy.

**Usage** If there is already a sub-sub-class in the same level with the specified name, this command will replace the configuration of the existing sub-sub-class.

**Examples** To configure a sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01 priority-level 5
awplus(config-tc-class)#sub-class s01 priority-level 7
awplus(config-tc-subclass)#sub-sub-class ss01 priority-level 3
```

To configure a sub-sub-class with a RED curve, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01 priority-level 5
sub-class-policy priority
awplus(config-tc-class)#sub-class s01 priority-level 7
sub-sub-class-policy priority
awplus(config-tc-subclass)#sub-sub-class ss01 priority-level 3
max 5mbit queue-length 200 red-curve ss01-red
```

To delete an existing sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#no sub-sub-class ss01
```

**Related  
Commands**

# sub-sub-class (wrr)

**Overview** Use this command to configure a Weighted Round-Robin (WRR) sub-sub-class within a sub-class.

Use the **no** variant of this command to delete an existing sub-sub-class from the current sub-class.

**Syntax** `sub-sub-class <class-name> [weight <1-100>] [queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve <red-curve-name>]`  
`no sub-sub-class <class-name>`

| Parameter                                     | Description                                                                                                                                                                                                                                                                                |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;class-name&gt;</code>               | Name of the sub-class.                                                                                                                                                                                                                                                                     |
| <code>weight &lt;1-100&gt;</code>             | Set the weight. The relative weight is the available bandwidth divided between sibling WRR classes according to the ratio of their configured weights. This parameter is compulsory when creating a new sub-sub-class. When editing an existing sub-sub-class, this parameter is optional. |
| <code>queue-length &lt;2-65536&gt;</code>     | Set the maximum queue length in packets.                                                                                                                                                                                                                                                   |
| <code>set-dscp &lt;dscp-value&gt;</code>      | Set the DSCP value to apply to packets.                                                                                                                                                                                                                                                    |
| <code>red-curve &lt;red-curve-name&gt;</code> | Apply a random early discard template with the sub-sub-class and enter the name of the red curve template to apply.                                                                                                                                                                        |

**Default** A weighted round-robin sub-sub-class has no DSCP value. The queue length is 1000 by default.

**Mode** Traffic-Control Sub-class for a WRR sub-sub-class policy.

**Usage** If there is already a sub-sub-class in the same level with the specified name, this command will replace the configuration of the existing sub-sub-class.

**Examples** To configure a sub-sub-class as a leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 wrr
awplus(config-tc-policy)#class c01 weight 50 sub-class-policy
wrr
awplus(config-tc-class)#sub-class s01 weight 30 sub-sub-class
policy wrr
awplus(config-tc-subclass)#sub-sub-class ss01 weight 5
queue-length 200
```

To configure a sub-sub-class with a RED curve, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 wrr
awplus(config-tc-policy)#class c01 weight 50 sub-class-policy
wrr
awplus(config-tc-class)#sub-class s01 weight 30
sub-sub-class-policy wrr
awplus(config-tc-subclass)#sub-sub-class ss01 weight 5
queue-length 200 red-curve ss01-red
```

To delete an existing sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#no sub-sub-class ss01
```

[sub-class \(priority\)](#)  
[sub-class \(wrr\)](#)

# traffic-control enable

**Overview** Use this command to enable traffic control.  
Use the **no** variant of this command to disable traffic control without losing your existing traffic control configuration.

**Syntax** `traffic-control enable`  
`no traffic-control enable`

**Default** Disabled

**Mode** Traffic-Control

**Usage** When traffic control is enabled and no rules are added, a default queueing discipline is applied to all interfaces that support traffic control. You can use the `policy` command to configure traffic control policies and the `rule (traffic-control)` command to apply the configured policies to the traffic.

**Examples** To enable traffic control, use the commands:

```
awplus#configure terminal
awplus (config) #traffic-control
awplus (config-tc) #traffic-control enable
```

To disable traffic control, use the commands:

```
awplus#configure terminal
awplus (config) #traffic-control
awplus (config-tc) #no traffic-control enable
```

**Related  
Commands** [policy \(traffic-control\)](#)  
[rule \(traffic-control\)](#)  
[traffic-control](#)

# traffic-control

**Overview** Use this command to enter into Traffic-Control configuration mode.  
Use the **no** variant of this command to remove all traffic control configuration.

**Syntax** traffic-control  
no traffic-control

**Default** Disabled

**Mode** Global Configuration

**Usage** This command enters you into Traffic-Control configuration mode.  
In Traffic-Control Configuration mode you can:

- enable or disable traffic control
- create and delete traffic control policies
- create, move and delete rules for traffic control
- set and unset packet overhead, system bandwidth and virtual bandwidth of interfaces

**Examples** To configure traffic-control, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#
```

To remove all traffic control configuration, use the commands:

```
awplus#configure terminal
awplus(config)#no traffic-control
awplus(config)#
```

# 41

# Traffic Shaping Commands (deleted)

## Introduction

**Overview** Traffic Shaping has been replaced with Traffic Control, and Traffic Shaping commands have been deleted in version 5.4.7-0.1. If you are running Traffic Shaping and you want to upgrade to 5.4.7-0.x from 5.4.5-x.x or an earlier version, upgrade to a 5.4.6-x.x version first and then save your configuration. AlliedWare Plus will convert your configuration automatically to a Traffic Control configuration.

For more information about Traffic Control, see the [Traffic Control Feature Overview and Configuration Guide](#)

# 42

# Authentication Commands

## Introduction

# auth critical

**Overview** This command enables the critical port feature on the interface. When the critical port feature is enabled on an interface, and all the RADIUS servers are unavailable, then the interface becomes authorized.

The **no** variant of this command disables critical port feature on the interface.

**Syntax** `auth critical`  
`no auth critical`

**Default** The critical port of port authentication is disabled.

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

**Examples** To enable the critical port feature on interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth critical
```

To disable the critical port feature on interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth critical
```

To enable the critical port feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth critical
```

To disable the critical port feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth critical
```

**Related Commands** [auth profile \(Global Configuration\)](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth host-mode

**Overview** This command selects the host mode on the specified interface.

Use the **no** variant of this command to set host mode to the default setting (single host).

**Syntax** `auth host-mode {single-host|multi-host|multi-supPLICANT}`  
`no auth host-mode`

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>single-host</code>      | Single host mode. In this mode, only one host may be authorized with the port. If other hosts out the interface attempt to authenticate, the authenticator blocks the attempt.                                                                                                                                                                                                                                                                                            |
| <code>multi-host</code>       | Multi host mode. In this mode, multiple hosts may be authorized with the port; however only one host must be successfully authenticated at the Authentication Server for all hosts to be authorized with the port. Upon one host being successfully authenticated (state Authenticated), the other hosts will be automatically authorized at the port (state ForceAuthorized). If no host is successfully authenticated, then all hosts are not authorized with the port. |
| <code>multi-supPLICANT</code> | Multi supplicant (client device) mode. In this mode, multiple hosts may be authorized with the port, but each host must be individually authenticated with the Authentication Server to be authorized with the port. Supplicants which are not authenticated are not authorized with the port, while supplicants which are successfully authenticated are authorized with the port.                                                                                       |

**Default** The default host mode for port authentication is for a single host.

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

**Usage** Ports residing in the unauthorized state for host(s) or supplicant(s), change to an authorized state when the host or supplicant has successfully authenticated with the Authentication Server.

When multi-host mode is used or auth critical feature is used, all hosts do not need to be authenticated.

**Examples** To set the host mode to multi-supPLICANT on interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth host-mode multi-supPLICANT
```

To set the host mode to default (single host) on interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth host-mode
```

To set the host mode to multi-supPLICANT on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth host-mode multi-supPLICANT
```

To set the host mode to default (single host) on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth host-mode
```

**Related Commands** [auth profile \(Global Configuration\)](#)  
[show running-config](#)

# auth log

**Overview** Use this command to configure the types of authentication feature log messages that are output to the log file.

Use the **no** variant of this command to remove either specified types or all types of authentication feature log messages that are output to the log file.

**Syntax** `auth log auth-web {success|failure|logoff|all}`  
`no auth log auth-web {success|failure|logoff|all}`

| Parameter | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auth-web  | Specify only Web-Authentication log messages are output to the log file.                                                                                    |
| success   | Specify only successful authentication log messages are output to the log file.                                                                             |
| failure   | Specify only authentication failure log messages are output to the log file.                                                                                |
| logoff    | Specify only authentication log-off messages are output to the log file. Note that link down, age out and expired ping polling messages will be included.   |
| all       | Specify all types of authentication log messages are output to the log file. Note that this is the default behavior for the authentication logging feature. |

**Default** All types of authentication log messages are output to the log file by default.

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

**Examples** To configure the logging of web authentication failures to the log file for supplicants (client devices) connected to interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth log auth-web failure
```

To configure the logging of web authentication failures to the log file for supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth log auth-web failure
```

To disable the logging of all types of authentication log messages to the log file for supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth log all
```

**Related Commands** [auth profile \(Global Configuration\)](#)  
[show running-config](#)

# auth max-supPLICANT

**Overview** This command sets the maximum number of supplicants (client devices) that can be authenticated on the selected port. Once this value is exceeded, further supplicants will not be authenticated.

The **no** variant of this command resets the maximum supplicant number to the default.

**Syntax** `auth max-supPLICANT <2-1024>`  
`no auth max-supPLICANT`

| Parameter | Description   |
|-----------|---------------|
| <2-1024>  | Limit number. |

**Default** The max supplicant of port authentication is 1024.

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

**Examples** To set the maximum number of supplicants to 10 on interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth max-supPLICANT 10
```

To reset the maximum number of supplicant to default on interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth max-supPLICANT
```

To set the maximum number of supplicants to 10 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth max-supPLICANT 10
```

To reset the maximum number of supplicant to default on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth max-supPLICANT
```

**Related  
Commands** [auth profile \(Global Configuration\)](#)  
[show running-config](#)

# auth profile (Global Configuration)

**Overview** Use this command to enter port authentication profile mode and configure a port authentication profile.

If the specified profile does not exist a new authentication profile is created with the name provided.

Use the **no** variant of this command to delete the specified port authentication profile.

**Syntax** `auth profile <profile-name>`  
`no auth profile <profile-name>`

| Parameter                    | Description                                 |
|------------------------------|---------------------------------------------|
| <code>&lt;varname&gt;</code> | Name of the profile to create or configure. |

**Default** No port authentication profiles are created by default.

**Mode** Global Configuration

**Usage** A port authentication profile is a configuration object that aggregates multiple port authentication commands. These profiles are attached or detached from an interface using the [auth profile \(Interface Configuration\)](#) command.

**Example** To create a new authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)#
```

To delete an authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# no auth profile student
```

**Related Commands** [auth profile \(Interface Configuration\)](#)  
[description \(Authentication Profile\)](#)

# auth profile (Interface Configuration)

**Overview** Use this command to attach a port authentication profile to the current interface. Use the **no** variant of this command to detach a port authentication profile from the current interface.

**Syntax** `auth profile <profile-name>`  
`no auth profile <profile-name>`

| Parameter                         | Description                                                 |
|-----------------------------------|-------------------------------------------------------------|
| <code>&lt;profile-name&gt;</code> | The name of the profile to attach to the current interface. |

**Default** No profile is attached by default.

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

**Usage** This command attaches a authentication profile, created using the [auth profile \(Global Configuration\)](#) command, to an Ethernet port.

You can only attach one profile to an interface at a time, use the **no** variant of the command to detach a profile before attempting to attach another one.

**Example** To attach the authentication profile 'student' to eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth profile student
```

To detach the authentication profile 'student' from eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth profile student
```

**Related Commands** [auth profile \(Global Configuration\)](#)

# auth reauthentication

**Overview** This command enables re-authentication on the interface specified in the Interface mode.

Use the **no** variant of this command to disables reauthentication on the interface.

**Syntax** `auth reauthentication`  
`no auth reauthentication`

**Default** Reauthentication of port authentication is disabled by default.

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

**Examples** To enable reauthentication on interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth reauthentication
```

To disable reauthentication on interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth reauthentication
```

To enable reauthentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth reauthentication
```

To disable reauthentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth reauthentication
```

**Related Commands** [auth profile \(Global Configuration\)](#)  
[show running-config](#)

# auth supplicant-ip

**Overview** This command adds a supplicant (client device) IP address on a given interface and provides parameters for its configuration.

Use the **no** variant of this command to delete the supplicant IP address and reset other parameters to their default values. The IP address can be determined before authentication for only auth-web client.

**Syntax**

```
auth supplicant-ip <ip-addr> [max-reauth-req <1-10>]
[port-control {auto|force-authorized|force-unauthorized}]
[quiet-period <1-65535>] [reauth-period <1-4294967295>]
[supp-timeout <1-65535>] [server-timeout <1-65535>]
[reauthentication]

no auth supplicant-ip <ip-addr> [reauthentication]
```

| Parameter          | Description                                                                        |
|--------------------|------------------------------------------------------------------------------------|
| <ip-addr>          | IP address of the supplicant entry in A.B.C.D/P format.                            |
| max-reauth-req     | The number of reauthentication attempts before becoming unauthorized.              |
| <1-10>             | Count of reauthentication attempts (default 2).                                    |
| port-control       | Port control commands.                                                             |
| auto               | A port control parameter that allows port clients to negotiate authentication.     |
| force-authorized   | A port control parameter that forces the port state to authorized.                 |
| force-unauthorized | A port control parameter that forces the port state to unauthorized.               |
| quiet-period       | Quiet period during which the port remains in the HELD state (default 60 seconds). |
| <1-65535>          | Seconds for quiet period.                                                          |
| reauth-period      | Seconds between reauthorization attempts (default 3600 seconds).                   |
| <1-4294967295>     | Seconds for reauthorization attempts (reauth-period).                              |
| supp-timeout       | Supplicant response timeout.                                                       |
| <1-65535>          | Seconds for supplicant response timeout (default 30 seconds).                      |
| server-timeout     | The period, in seconds, before the authentication server response times out.       |
| <1-65535>          | The server-timeout period, in seconds, default 3600 seconds.                       |
| reauthentication   | Enable reauthentication on a port.                                                 |

**Default** No supplicant IP address for port authentication exists by default until first created with the **auth supplicant-ip** command. The defaults for parameters applied are as shown in the table above.

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile.

**Examples** To add the supplicant IP address 192.168.10.0/24 to force authorized port control for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth supplicant-ip 192.168.10.0/24
port-control force-authorized
```

To delete the supplicant IP address 192.168.10.0/24 for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
```

To disable reauthentication for the supplicant(s) IP address 192.168.10.0/24 for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
reauthentication
```

To add the supplicant IP address 192.168.10.0/24 to force authorized port control for auth profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-ip
192.168.10.0/24 port-control force-authorized
```

To disable reauthentication for the supplicant IP address 192.168.10.0/24, for auth profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
reauthentication
```

**Related  
Commands** [show running-config](#)

# auth supplicant-mac

**Overview** This command adds a supplicant (client device) MAC address or MAC mask on a given interface with the parameters as specified in the table below.

Use the **no** variant of this command to delete the supplicant MAC address and reset other parameters to their default values.

**Syntax**

```
auth supplicant-mac <mac-addr> [mask <mac-addr-mask>]
[max-reauth-req <1-10>] [port-control
{auto|force-authorized|force-unauthorized} [quiet-period
<1-65535>] [reauth-period <1-4294967295>] [supp-timeout
<1-65535>] [server-timeout <1-65535>] [reauthentication]
no auth supplicant-mac <mac-addr> [reauthentication]
```

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <mac-addr>         | MAC (hardware) address of the supplicant entry in HHHH.HHHH.HHHH MAC address hexadecimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| mask               | A mask applied to MAC addresses in order to select only those addresses containing a specific string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <mac-addr-mask>    | The mask comprises a string of three (period separated) bytes, where each byte comprises four hexadecimal characters that will generally be either 1 or 0. When the mask is applied to a specific MAC address, a match is only required for characters that correspond to a 1 in the mask. Characters that correspond to a 0 in the mask are effectively ignored.<br>In the examples section below, the mask ffff.ff00.0000 is applied for the MAC address 0000.5E00.0000. The applied mask will then match only those MAC addresses that begin with 0000.5E (in this case the OUI component). The remaining portion of the addresses (in this case the NIC component) will be ignored. |
| port-control       | Port control commands.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| auto               | Allow port client to negotiate authentication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| force-authorized   | Force port state to authorized.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| force-unauthorized | Force port state to unauthorized.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| quiet-period       | Quiet period in the HELD state (default 60 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <1-65535>          | Seconds for quiet period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| reauth-period      | Seconds between reauthorization attempts (default 3600 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <1-4294967295>     | Seconds for reauthorization attempts (reauth-period).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| supp-timeout       | Supplicant response timeout (default 30 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <1-65535>          | Seconds for supplicant response timeout.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Parameter        | Description                                                               |
|------------------|---------------------------------------------------------------------------|
| server-timeout   | Authentication server response timeout (default 30 seconds).              |
| <1-65535>        | Seconds for authentication server response timeout.                       |
| reauthentication | Enable reauthentication on a port.                                        |
| max-reauth-req   | No of reauthentication attempts before becoming unauthorized (default 2). |
| <1-10>           | Count of reauthentication attempts.                                       |

**Default** No supplicant MAC address for port authentication exists by default until first created with the **auth supplicant-mac** command. The defaults for parameters are shown in the table above.

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

**Examples** To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth supplicant-mac 0000.5E00.5343
port-control force-authorized
```

To apply the mask ffff.ff00.0000 in order to add any supplicant MAC addresses whose MAC address begins with 0000.5E, and then to force authorized port control for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth supplicant-mac 0000.5E00.0000 mask
ffff.ff00.0000 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
```

To disable reauthentication for the supplicant MAC address 0000.5E00.5343 for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
reauthentication
```

To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-mac
0000.5E00.5343 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth supplicant-mac
0000.5E00.5343
```

To disable reauthentication for the supplicant MAC address 0000.5E00.5343 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth supplicant-mac
0000.5E00.5343 reauthentication
```

# auth timeout connect-timeout

**Overview** This command sets the connect-timeout period for the interface.

Use the **no** variant of this command to reset the connect-timeout period to the default.

```
auth timeout connect-timeout <1-65535>
no auth timeout connect-timeout
```

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| <1-65535> | Specifies the connect-timeout period (in seconds). |

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

This command is used for Web-Authentication. If the connect-timeout has lapsed and the supplicant has the state **connecting**, then the supplicant is deleted. When [auth-web-server session-keep](#) is enabled, we recommend you configure a longer connect-timeout period.

To set the connect-timeout period to 3600 seconds for interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth timeout connect-timeout 3600
```

To reset the connect-timeout period to the default (30 seconds) for interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth timeout connect-timeout
```

To set the connect-timeout period to 3600 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout connect-timeout 3600
```

To reset the connect-timeout period to the default (30 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout connect-timeout
```

[auth profile \(Global Configuration\)](#)

# auth timeout quiet-period

**Overview** This command sets a time period for which another authentication request is not accepted on a given interface, after an authentication request has failed.

Use the **no** variant of this command to reset the quiet period to the default.

**Syntax** `auth timeout quiet-period <1-65535>`  
`no auth timeout quiet-period`

| Parameter | Description                              |
|-----------|------------------------------------------|
| <1-65535> | Specifies the quiet period (in seconds). |

**Default** The quiet period for port authentication is 60 seconds.

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

**Examples** To set the quiet period to 10 seconds for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth timeout quiet-period 10
```

To reset the quiet period to the default (60 seconds) for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth timeout quiet-period
```

To set the quiet period to 10 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout quiet-period 10
```

To reset the quiet period to the default (60 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout quiet-period
```

**Related Commands** [auth profile \(Global Configuration\)](#)

# auth timeout reauth-period

**Overview** This command sets the timer for reauthentication on a given interface. The re-authentication for the supplicant (client device) is executed at this timeout. The timeout is only applied if the **auth reauthentication** command is applied.

Use the **no** variant of this command to reset the **reauth-period** parameter to the default (3600 seconds).

**Syntax** `auth timeout reauth-period <1-4294967295>`  
`no auth timeout reauth-period`

| Parameter      | Description                                       |
|----------------|---------------------------------------------------|
| <1-4294967295> | The reauthentication timeout period (in seconds). |

**Default** The default reauthentication period for port authentication is 3600 seconds, when reauthentication is enabled on the port.

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

**Examples** To set the reauthentication period to 1 day for interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth timeout reauth-period
```

To set the reauthentication period to 1 day for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout reauth-period
```

**Related  
Commands**    [auth profile \(Global Configuration\)](#)  
                  [auth reauthentication](#)  
                  [show running-config](#)

# auth timeout server-timeout

**Overview** This command sets the timeout for the waiting response from the RADIUS server on a given interface.

The **no** variant of this command resets the server-timeout to the default (30 seconds).

**Syntax** `auth timeout server-timeout <1-65535>`  
`no auth timeout server-timeout`

| Parameter | Description                         |
|-----------|-------------------------------------|
| <1-65535> | Server timeout period (in seconds). |

**Default** The server timeout for port authentication is 30 seconds.

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

**Examples** To set the server timeout to 120 seconds for interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth timeout server-timeout
```

To set the server timeout to 120 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout server-timeout
```

**Related Commands** [auth profile \(Global Configuration\)](#)  
[show running-config](#)

# auth-web accounting

**Overview** This command overrides the **default** RADIUS accounting method for Web-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** `auth-web accounting {default|<list-name>}`  
`no auth-web accounting`

| Parameter   | Description                              |
|-------------|------------------------------------------|
| default     | Apply the default accounting method list |
| <list-name> | Apply a named accounting method list     |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Mode

**Example** To apply the named list 'example\_acct' on the eth1 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web accounting example_acct
```

To remove the named list from the eth1 interface and set the accounting method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web accounting
```

**Related Commands** [aaa accounting auth-web](#)

# auth-web authentication

**Overview** This command overrides the **default** Web-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** `auth-web authentication {default|<list-name>}`  
`no auth-web authentication`

| Parameter   | Description                                  |
|-------------|----------------------------------------------|
| default     | Apply the default authentication method list |
| <list-name> | Apply the user-defined named list            |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Mode

**Example** To apply the named list 'example\_auth' on the eth1 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web authentication example_auth
```

To remove the named list from the eth1 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web authentication
```

**Related Commands** [aaa authentication auth-web](#)

# auth-web enable

**Overview** This command enables Web-based authentication in Interface mode on the interface specified.

Use the **no** variant of this command to apply its default.

**Syntax** auth-web enable  
no auth-web enable

**Default** Web-Authentication is disabled by default.

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

**Usage** You need to configure an IPv4 address for the Ethernet interface on which Web Authentication is running.

When the **protect (firewall)** command and the **web-auth enable** command are both configured, you need to configure a firewall rule to allow Auth-web traffic to pass through the firewall. Web-auth uses TCP ports 8081, 8082, 8083 and 8084. You can create a firewall rule like the following example:

```
!
application auth-apl
protocol tcp
dport 8081 to 8084
!
!
firewall
 rule 65 permit auth-apl from private.supPLICANT to
private.supPLICANT.router
!
```

**Examples** To enable Web-Authentication on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web enable
```

To disable Web-Authentication on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web enable
```

To enable Web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web enable
```

To disable Web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web enable
```

- [show auth](#)
- [show auth interface](#)
- [show running-config](#)

# auth-web forward

**Overview** This command enables the Web-authentication packet forwarding feature on the interface specified. This command also enables ARP forwarding, and adds forwarded packets to the **tcp** or **udp** port number specified.

The **no** variant of this command disables the specified packet forwarding feature on the interface.

**Syntax** `auth-web forward [<ip-address>|<ip-address/prefix-length>]  
{dns|tcp <1-65535>|udp <1-65535>}`

Or

`auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

The **no** variant of this command are:

`no auth-web forward [<ip-address>|<ip-address/prefix-length>]  
{dns|tcp <1-65535>|udp <1-65535>}`

Or

`no auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

| Parameter                                                                             | Description                                                                |
|---------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code><br><code>&lt;ip-address/<br/>prefix-length&gt;</code> | The IP address or subnet on which the Web-authentication is to be enabled. |
| <code>arp</code>                                                                      | Enable forwarding of ARP.                                                  |
| <code>dhcp</code>                                                                     | Enable forwarding of DHCP (67/udp).                                        |
| <code>dns</code>                                                                      | Enable forwarding of DNS (53/udp).                                         |
| <code>tcp</code>                                                                      | Enable forwarding of TCP specified port number.                            |
| <code>&lt;1-65535&gt;</code>                                                          | TCP Port number.                                                           |
| <code>udp</code>                                                                      | Enable forwarding of UDP specified port number.                            |
| <code>&lt;1-65535&gt;</code>                                                          | UDP Port number.                                                           |

**Default** Packet forwarding for port authentication is enabled by default for "arp", "dhcp" and "dns".

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

**Usage** For more information about the `<ip-address>` parameter, and an example, see the "auth- web forward" section in the [AlliedWare Plus Technical Tips and Tricks](#).

**Examples** To enable the ARP forwarding feature on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web forward arp
```

To add the TCP forwarding port 137 on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web forward tcp 137
```

To disable the ARP forwarding feature on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web forward arp
```

To delete the TCP forwarding port 137 on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web forward tcp 137
```

To delete the all of TCP forwarding on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web forward tcp
```

To enable the arp forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward arp
```

To add the tcp forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward tcp 137
```

To disable the ARP forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward arp
```

To delete the tcp forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp 137
```

To delete all tcp forwarding on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp
```

- [show auth](#)
- [show auth interface](#)

# auth-web idle-timeout enable

**Overview** Use this command to enable the idle-timeout for client of web authentication on the interface.

The **no** variant of this command to disable the idle-timeout for client of web authentication on the interface.

**Syntax** `auth-web idle-timeout enable`  
`no auth-web idle-timeout enable`

**Default** The idle-timeout is disabled by default.

**Mode** Interface Mode and Auth Profile

**Example** To enable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config)# auth-web enable
awplus(config-if)# auth-web idle-timeout enable
```

To disable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout enable
```

**Related Commands** [auth-web enable](#)  
[auth-web idle-timeout timeout](#)

# auth-web idle-timeout timeout

**Overview** Use this command to set the timeout value for web authentication client in seconds. The client will be unauthorized when it does not have any activity for a period that exceeds the timeout value.

The **no** variant of this command sets the timeout value to the default setting, 3600 seconds.

**Syntax** `auth-web idle-timeout timeout <420-86400>`  
`no auth-web idle-timeout timeout`

| Parameter   | Description      |
|-------------|------------------|
| <420-86400> | Time in seconds. |

**Default** The timeout is 3600 seconds by default.

**Mode** Interface Mode and Auth Profile

**Example** To set 30 minutes as the idle-timeout, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web idle-timeout timeout 1800
```

To return the idle-timeout to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout timeout
```

**Related Commands** [auth-web enable](#)  
[auth-web idle-timeout enable](#)

# auth-web max-auth-fail

**Overview** This command sets the number of authentication failures allowed before rejecting further authentication requests. When the supplicant (client device) fails more than the specified number of times, then login requests are refused during the quiet period.

The **no** variant of this command resets the maximum number of authentication failures to the default.

**Syntax** `auth-web max-auth-fail <0-10>`  
`no auth-web max-auth-fail`

| Parameter | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| <0-10>    | The maximum number of authentication requests allowed before failing. |

**Default** The maximum number of authentication failures is set to 3.

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

**Examples** To set the lock count to 5 on interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web max-auth-fail 5
```

To set the lock count to the default on interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web max-auth-fail
```

To set the lock count to 5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web max-auth-fail 5
```

To set the lock count to the default on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web max-auth-fail
```

**Related  
Commands**    auth profile (Global Configuration)  
                  auth timeout quiet-period  
                  show auth  
                  show auth interface  
                  show running-config

# auth-web method

**Overview** This command sets the Web-authentication access method that is used with RADIUS on the interface specified.

The **no** variant of this command sets the authentication method to PAP for the interface specified when Web-Authentication is also used with the RADIUS authentication method.

**Syntax** `auth-web method {eap-md5|pap}`  
`no auth-web method`

| Parameter            | Description                                  |
|----------------------|----------------------------------------------|
| <code>eap-md5</code> | Enable EAP-MD5 as the authentication method. |
| <code>pap</code>     | Enable PAP as the authentication method.     |

**Default** The Web-Authentication method is set to PAP by default.

**Mode** Interface Configuration for an Ethernet port, or Authentication Profile mode.

**Example** To set the Web-Authentication method to `eap-md5` on interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web method eap-md5
```

To set the web authentication method to `eap-md5` for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web method eap-md5
```

To reset the web authentication method to the default (PAP) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web method
```

**Related Commands**

- [auth profile \(Global Configuration\)](#)
- [show auth](#)
- [show auth interface](#)
- [show running-config](#)

# auth-web-server dhcp ipaddress

**Overview** Use this command to assign an IP address and enable the DHCP service on the Web-Authentication server for supplicants (client devices).

Use the **no** variant of this command to remove an IP address and disable the DHCP service on the Web-Authentication server for supplicants.

**Syntax** `auth-web-server dhcp ipaddress <ip-address/prefix-length>`  
`no auth-web-server dhcp ipaddress`

| Parameter                                       | Description                                                                                                        |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-addr/<br/>prefix-length&gt;</code> | The IPv4 address and prefix length assigned for the DHCP service on the Web-Authentication server for supplicants. |

**Default** No IP address for the Web-Authentication server is set by default.

**Mode** Global Configuration

**Usage** See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

**Examples** To assign the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp ipaddress 10.0.0.1/8
```

To remove an IP address on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp ipaddress
```

**Validation Commands** `show running-config`

**Related Commands** `show auth-web-server`  
`auth-web-server dhcp lease`

# auth-web-server dhcp lease

**Overview** Use this command to set the DHCP lease time for supplicants (client devices) using the DHCP service on the Web-Authentication server.

Use the **no** variant of this command to reset to the default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server.

**Syntax** `auth-web-server dhcp lease <20-60>`  
`no auth-web-server dhcp lease`

| Parameter | Description                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------|
| <20-60>   | DHCP lease time for supplicants using the DHCP service on the Web-Authentication server in seconds. |

**Default** The default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server is set to 30 seconds.

**Mode** Global Configuration

**Usage** See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

**Examples** To set the DHCP lease time to 1 minute for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp lease 60
```

To reset the DHCP lease time to the default setting (30 seconds) for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp lease
```

**Validation Commands** `show running-config`

**Related Commands** `show auth-web-server`  
`auth-web-server dhcp ipaddress`

# auth-web-server dhcp-wpad-option

**Overview** This command sets the DHCP WPAD (Web Proxy Auto-Discovery) option for the Web-Authentication temporary DHCP service.

For more information and examples, see the “Web Auth Proxy” section in the [AlliedWare Plus Technical Tips and Tricks](#).

Use the **no** variant of this command to disable the DHCP WPAD function.

**Syntax** `auth-web-server dhcp wpad-option <url>`  
`no auth-web-server dhcp wpad-option`

| Parameter                | Description                               |
|--------------------------|-------------------------------------------|
| <code>&lt;url&gt;</code> | URL to the server which gets a .pac file. |

**Default** The Web-Authentication server DHCP WPAD option is not set.

**Mode** Global Configuration

**Usage** If the supplicant is configured to use WPAD, the supplicant’s web browser will use TCP port 80 as usual. Therefore, the packet can be intercepted by Web-Authentication as normal, and the Web-Authentication Login page can be sent. However, after authentication, the browser does not know where to get the WPAD file and so cannot access external web pages. The WPAD file is usually named proxy.pac file and tells the browser what web proxy to use.

Use this command to tell the supplicant where it can get this file from. The switch itself can be specified as the source for this file, and it can deliver it to the supplicant on request.

**Example** To specify that the proxy.pac file is found on the server at 192.168.1.100, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp wpad-option
http://192.168.1.100/proxy/proxy.pac
```

**Related Commands** [show auth-web-server](#)

# auth-web-server host-name

**Overview** This command assigns a hostname to the web authentication server.  
Use the **no** variant of this command to remove the hostname from the web authentication server.

**Syntax** `auth-web-server host-name <hostname>`  
`no auth-web-server host-name`

| Parameter                     | Description                |
|-------------------------------|----------------------------|
| <code>&lt;hostname&gt;</code> | URL string of the hostname |

**Default** The web authentication server has no hostname.

**Mode** Global Configuration

**Usage** When the web authentication server uses HTTPS protocol, the web browser will validate the certificate. If the certificate is invalid, the web page gives a warning message before displaying server content. However, the web page will not give warning message if the server has a hostname same as the one stored in the installed certificate.

**Examples** To set the `auth.example.com` as the hostname of the web authentication server, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server host-name auth.example.com
```

To remove hostname `auth.example.com` from the web authentication server, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server host-name
```

**Related Commands** [aaa authentication auth-web](#)  
[auth-web enable](#)

# auth-web-server intercept-port

**Overview** This command specifies any additional TCP port numbers that the Web-Authentication server is to intercept.

Use the **no** variant of this command to stop intercepting the TCP port numbers.

**Syntax** `auth-web-server intercept-port {<1-65535>|any}`  
`no auth-web-server intercept-port {<1-65535>|any}`

| Parameter | Description               |
|-----------|---------------------------|
| <1-65535> | TCP port number.          |
| any       | Intercept all TCP packets |

**Default** No additional TCP port numbers are intercepted by default.

**Mode** Global Configuration

**Usage** If this command is not specified, AlliedWare Plus Web-Authentication intercepts the supplicant's initial TCP port 80 connection to a web page and sends it the Web-Authentication Login page. However, if the supplicant is configured to use a web proxy, then it will usually be using TCP port 8080 (or another user configured port number). In this case Web-Authentication cannot intercept the connection.

To overcome this limitation you can use this command to tell the switch which additional port it should intercept, and then send the Web-Authentication Login page to the supplicant.

When the web authentication switch is in a guest network, the switch does not know the proxy server's port number in the supplicant's proxy setting. To overcome this limitation, you can use the **any** option in this command to intercept all TCP packets.

When you use this command in conjunction with a proxy server configured in the web browser, you must add the proxy server's network as a 'No Proxy' network. You can specify 'No Proxy' networks in the proxy settings in your web browser. For more information, see the "Web Auth Proxy" section in the [Alliedware Plus Technical Tips and Tricks](#).

**Example** To additionally intercept port number 3128, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server intercept-port 3128
```

**Related Commands** [show auth-web-server](#)

# auth-web-server ipaddress

**Overview** This command sets the IP address for the Web-Authentication server.

Use the **no** variant of this command to delete the IP address for the Web-Authentication server.

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

**Syntax** `auth-web-server ipaddress <ip-address>`  
`no auth-web-server ipaddress`

| Parameter                       | Description                                                            |
|---------------------------------|------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | Web-Authentication server dotted decimal IP address in A.B.C.D format. |

**Default** The Web-Authentication server address on the system is not set by default.

**Mode** Global Configuration

**Examples** To set the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 10.0.0.1
```

To delete the IP address from the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ipaddress
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server page language

**Overview** Use this command to set the presentation language of Web authentication pages. Titles and subtitles of Web authentication pages will be set accordingly. Note that presently only English or Japanese are offered.

Use the **no** variant of this command to set the presentation language of Web authentication pages to its default (English).

**Syntax** `auth-web-server page language {english|japanese}`  
`no auth-web-server page language`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| english   | Web authentication pages are presented in English.  |
| japanese  | Web authentication pages are presented in Japanese. |

**Default** Web authentication pages are presented in English by default.

**Mode** Global Configuration

**Examples** To set Japanese as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language japanese
```

To set English as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language english
```

To unset the presentation language of Web authentication pages and use English as the default presentation language, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page language
```

**Related Commands** [auth-web-server page title](#)  
[auth-web-server page sub-title](#)  
[show auth-web-server page](#)

# auth-web-server login-url

**Overview** This command sets the web-authentication login page URL. This lets you replace the login page with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for details.

Use the **no** variant of this command to delete the URL.

**Syntax** `auth-web-server login-url <URL>`  
`no auth-web-server login-url`

| Parameter | Description        |
|-----------|--------------------|
| <URL>     | Set login page URL |

**Default** The built-in login page is set by default.

**Mode** Global Configuration

**Examples** To set `http://example.com/login.html` as the login page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server login-url
http://example.com/login.html
```

To unset the login page URL, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server login-url
```

**Related Commands** [show running-config](#)

# auth-web-server page logo

**Overview** This command sets the type of logo that will be displayed on the web authentication page.

Use the **no** variant of this command to set the logo type to **auto**.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page logo {auto|default|hidden}`  
`no auth-web-server page logo`

| Parameter | Description                                                              |
|-----------|--------------------------------------------------------------------------|
| auto      | Display the custom logo if installed; otherwise display the default logo |
| default   | Display the default logo                                                 |
| hidden    | Hide the logo                                                            |

**Default** Logo type is **auto** by default.

**Mode** Global Configuration

**Examples** To display the default logo with ignoring installed custom logo, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page logo default
```

To set back to the default logo type **auto**, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page logo
```

**Validation Commands** `show auth-web-server page`

# auth-web-server page sub-title

**Overview** This command sets the custom sub-title on the web authentication page.

Use the **no** variant of this command to reset the sub-title to its default.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page sub-title {hidden|text <sub-title>}`  
`no auth-web-server page sub-title`

| Parameter   | Description                  |
|-------------|------------------------------|
| hidden      | Hide the sub-title           |
| <sub-title> | Text string of the sub-title |

**Default** “Allied-Telesis” is displayed by default.

**Mode** Global Configuration

**Examples** To set the custom sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title text Web
Authentication
```

To hide the sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title hidden
```

To change back to the default title, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page sub-title
```

**Validation Commands** `show auth-web-server page`

# auth-web-server page success-message

**Overview** This command sets the success message on the web-authentication page.

Use the **no** variant of this command to remove the success message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page success-message text <success-message>`  
`no auth-web-server page success-message`

| Parameter                            | Description                        |
|--------------------------------------|------------------------------------|
| <code>&lt;success-message&gt;</code> | Text string of the success message |

**Default** No success message is set by default.

**Mode** Global Configuration

**Examples** To set the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page success-message text Your
success message
```

To unset the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page success-message
```

**Validation Commands** [show auth-web-server page](#)

# auth-web-server page title

**Overview** This command sets the custom title on the web authentication page.

Use the **no** variant of this command to remove the custom title.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page title {hidden|text <title>}`  
`no auth-web-server page title`

| Parameter | Description              |
|-----------|--------------------------|
| hidden    | Hide the title           |
| <title>   | Text string of the title |

**Default** “Web Access Authentication Gateway” is displayed by default.

**Mode** Global Configuration

**Examples** To set the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title text Login
```

To hide the title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title hidden
```

To unset the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page title
```

**Validation Commands** `show auth-web-server page`

# auth-web-server page welcome-message

**Overview** This command sets the welcome message on the web-authentication login page.

Use the **no** variant of this command to remove the welcome message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page welcome-message text <welcome-message>`  
`no auth-web-server page welcome-message`

| Parameter                            | Description                        |
|--------------------------------------|------------------------------------|
| <code>&lt;welcome-message&gt;</code> | Text string of the welcome message |

**Default** No welcome message is set by default.

**Mode** Global Configuration

**Examples** To set the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page welcome-message text Your
welcome message
```

To remove the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page welcome-message
```

**Validation Commands** [show auth-web-server page](#)

# auth-web-server ping-poll enable

**Overview** This command enables the ping polling to the supplicant (client device) that is authenticated by Web-Authentication.

The **no** variant of this command disables the ping polling to the supplicant that is authenticated by Web-Authentication.

**Syntax** `auth-web-server ping-poll enable`  
`no auth-web-server ping-poll enable`

**Default** The ping polling feature for Web-Authentication is disabled by default.

**Mode** Global Configuration

**Examples** To enable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
```

To disable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll enable
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll failcount

**Overview** This command sets a fail count for the ping polling feature when used with Web-Authentication. The **failcount** parameter specifies the number of unanswered pings. A supplicant (client device) is logged off when the number of unanswered pings are greater than the failcount set with this command.

Use the **no** variant of this command to resets the fail count for the ping polling feature to the default (5 pings).

**Syntax** `auth-web-server ping-poll failcount <1-100>`  
`no auth-web-server ping-poll failcount`

| Parameter | Description |
|-----------|-------------|
| <1-100>   | Count.      |

**Default** The default failcount for ping polling is 5 pings.

**Mode** Global Configuration

**Examples** To set the failcount of ping polling to 10 pings, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll failcount 10
```

To set the failcount of ping polling to default, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll failcount
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll interval

**Overview** This command is used to change the ping poll interval. The interval specifies the time period between pings when the supplicant (client device) is reachable.

Use the **no** variant of this command to reset to the default period for ping polling (30 seconds).

**Syntax** `auth-web-server ping-poll interval <1-65535>`  
`no auth-web-server ping-poll interval`

| Parameter | Description |
|-----------|-------------|
| <1-65535> | Seconds.    |

**Default** The interval for ping polling is 30 seconds by default.

**Mode** Global Configuration

**Examples** To set the interval of ping polling to 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll interval 60
```

To set the interval of ping polling to the default (30 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll interval
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll reauth-timer-refresh

**Overview** This command modifies the **reauth-timer-refresh** parameter for the Web-Authentication feature. The **reauth-timer-refresh** parameter specifies whether a re-authentication timer is reset and when the response from a supplicant (a client device) is received.

Use the **no** variant of this command to reset the **reauth-timer-refresh** parameter to the default setting (disabled).

**Syntax** `auth-web-server ping-poll reauth-timer-refresh`  
`no auth-web-server ping-poll reauth-timer-refresh`

**Default** The `reauth-timer-refresh` parameter is disabled by default.

**Mode** Global Configuration

**Examples** To enable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll reauth-timer-refresh
```

To disable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll
reauth-timer-refresh
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll timeout

**Overview** This command modifies the ping poll **timeout** parameter for the Web-Authentication feature. The **timeout** parameter specifies the time in seconds to wait for a response to a ping packet.

Use the **no** variant of this command to reset the timeout of ping polling to the default (1 second).

**Syntax** `auth-web-server ping-poll timeout <1-30>`  
`no auth-web-server ping-poll timeout`

| Parameter | Description |
|-----------|-------------|
| <1-30>    | Seconds.    |

**Default** The default timeout for ping polling is 1 second.

**Mode** Global Configuration

**Examples** To set the timeout of ping polling to 2 seconds, use the command:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll timeout 2
```

To set the timeout of ping polling to the default (1 second), use the command:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll timeout
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server port

**Overview** This command sets the HTTP port number for the Web-Authentication server. Use the **no** variant of this command to reset the HTTP port number to the default (80).

**Syntax** `auth-web-server port <port-number>`  
`no auth-web-server port`

| Parameter                        | Description                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------|
| <code>&lt;port-number&gt;</code> | Set the local Web-Authentication server port within the TCP port number range 1 to 65535. |

**Default** The Web-Authentication server HTTP port number is set to 80 by default.

**Mode** Global Configuration

**Examples** To set the HTTP port number 8080 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server port 8080
```

To reset to the default HTTP port number 80 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server port
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server redirect-delay-time

**Overview** Use this command to set the delay time in seconds before redirecting the supplicant to a specified URL when the supplicant is authorized.

Use the variant **no** to reset the delay time set previously.

**Syntax** `auth-web-server redirect-delay-time <5-60>`  
`no auth-web-server redirect-delay-time`

| Parameter                        | Description                                                                              |
|----------------------------------|------------------------------------------------------------------------------------------|
| <code>redirect-delay-time</code> | Set the delay time before jumping to a specified URL after the supplicant is authorized. |
| <code>&lt;5-60&gt;</code>        | The time in seconds.                                                                     |

**Default** The default redirect delay time is 5 seconds.

**Mode** Global Configuration

**Examples** To set the delay time to 60 seconds for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-delay-time 60
```

To reset the delay time, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-delay-time
```

**Related Commands** [auth-web-server redirect-url](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth-web-server redirect-url

**Overview** This command sets a URL for supplicant (client device) authentication. When a supplicant is authorized it will be automatically redirected to the specified URL. Note that if the http redirect feature is used then this command is ignored.

Use the **no** variant of this command to delete the URL string set previously.

**Syntax** `auth-web-server redirect-url <url>`  
`no auth-web-server redirect-url`

| Parameter                | Description                           |
|--------------------------|---------------------------------------|
| <code>&lt;url&gt;</code> | URL (hostname or dotted IP notation). |

**Default** The redirect URL for the Web-Authentication server feature is not set by default (null).

**Mode** Global Configuration

**Examples** To enable and set redirect a URL string `www.alliedtelesis.com` for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-url
http://www.alliedtelesis.com
```

To delete a redirect URL string, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-url
```

**Related Commands** [auth-web-server redirect-delay-time](#)  
[show auth](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth-web-server session-keep

**Overview** This command enables the session-keep feature to jump to the original URL after being authorized by Web-Authentication.

Use the **no** variant of this command to disable the session keep feature.

**Syntax** `auth-web-server session-keep`  
`no auth-web-server session-keep`

**Default** The session-keep feature is disabled by default.

**Mode** Global Configuration

**Usage** This function doesn't ensure to keep session information in all cases. Authenticated supplicant may be redirected to unexpected page when session-keep is enabled. This issue occurred by supplicant sending HTTP packets automatically after authentication page is displayed and the URL is written.

**Examples** To enable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server session-keep
```

To disable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server session-keep
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ssl

**Overview** This command enables HTTPS functionality for the Web-Authentication server feature.

Use the **no** variant of this command to disable HTTPS functionality for the Web-Authentication server.

**Syntax** `auth-web-server ssl`  
`no auth-web-server ssl`

**Default** HTTPS functionality for the Web-Authentication server feature is disabled by default.

**Mode** Global Configuration

**Examples** To enable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl
```

To disable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ssl intercept-port

**Overview** Use this command to register HTTPS intercept port numbers when the HTTPS server uses custom port number (not TCP port number 443).

Note that you need to use the **auth-web-server intercept-port** command to register HTTP intercept port numbers.

Use the **no** variant of this command to delete registered port number.

**Syntax** `auth-web-server ssl intercept-port <1-65535>`  
`no auth-web-server ssl intercept-port <1-65535>`

| Parameter                    | Description                                       |
|------------------------------|---------------------------------------------------|
| <code>&lt;1-65535&gt;</code> | TCP port number in the range from 1 through 65535 |

**Default** 443/TCP is registered by default.

**Mode** Global Configuration

**Examples** To register HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl intercept-port 3128
```

To delete HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl intercept-port 3128
```

**Validation Commands** `show auth-web-server`

**Related Commands** `auth-web-server intercept-port`

# copy proxy-autoconfig-file

**Overview** Use this command to download the proxy auto configuration (PAC) file to your switch. The Web-Authentication supplicant can get the downloaded file from the system web server.

**Syntax** `copy <filename> proxy-autoconfig-file`

| Parameter                     | Description              |
|-------------------------------|--------------------------|
| <code>&lt;filename&gt;</code> | The URL of the PAC file. |

**Mode** Privileged Exec

**Example** To download the PAC file to this device, use the command:

```
awplus# copy tftp://server/proxy.pac proxy-autoconfig-file
```

**Related Commands** [show proxy-autoconfig-file](#)  
[erase proxy-autoconfig-file](#)

# copy web-auth-https-file

**Overview** Use this command to download the SSL server certificate for web-based authentication. The file must be in PEM (Privacy Enhanced Mail) format, and contain the private key and the server certificate.

**Syntax** `copy <filename> web-auth-https-file`

| Parameter                     | Description                             |
|-------------------------------|-----------------------------------------|
| <code>&lt;filename&gt;</code> | The URL of the server certificate file. |

**Mode** Privileged Exec

**Example** To download the server certificate file `verisign_cert.pem` from the TFTP server directory `server`, use the command:

```
awplus# copy tftp://server/verisign_cert.pem
web-auth-https-file
```

# description (Authentication Profile)

**Overview** Use this command to add a description to an authentication profile in Authentication Profile mode.  
Use the **no** variant of this command to remove the current description.

**Syntax** `description <description>`

| Parameter                        | Description                                          |
|----------------------------------|------------------------------------------------------|
| <code>&lt;description&gt;</code> | Text describing the selected authentication profile. |

**Default** No description configured by default.

**Mode** Authentication Profile

**Example** To add a description to the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# description student room setting
```

To remove a description from the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no description
```

**Related Commands** [auth profile \(Global Configuration\)](#)

# erase proxy-autoconfig-file

**Overview** Use this command to remove the proxy auto configuration file.

**Syntax** `erase proxy-autoconfig-file`

**Mode** Privileged Exec

**Example** To remove the proxy auto configuration file, use the command:

```
awplus# erase proxy-autoconfig-file
```

**Related  
Commands** [show proxy-autoconfig-file](#)  
[copy proxy-autoconfig-file](#)

# erase web-auth-https-file

**Overview** Use this command to remove the SSL server certificate for web-based authentication.

**Syntax** `erase web-auth-https-file`

**Mode** Privileged Exec

**Example** To remove the SSL server certificate file for web-based authentication use the command:

```
awplus# erase web-auth-https-file
```

**Related Commands**

- [auth-web-server ssl](#)
- [copy web-auth-https-file](#)

# show auth

**Overview** This command shows the configuration state of authentication.

**Syntax** show auth [all]

| Parameter | Description                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all       | Display all authentication information for each authenticated interface. This can be a static channel (or static aggregator), or a dynamic (or LACP) channel group, or a switch port. |

**Mode** Privileged Exec

**Example** To display all authentication information, enter the command:

```
awplus# show auth all
```

**Output** Figure 42-1: Example output from the **show auth** command

```
awplus# show auth all
802.1X Port-Based Authentication Enabled

# show auth diagnostics

**Overview** This command shows authentication diagnostics, optionally for the specified interface, which may be an Ethernet port.

If no interface is specified then authentication diagnostics are shown for all interfaces.

**Syntax** `show auth diagnostics [interface <interface-list>]`

| Parameter        | Description                                                                                                                                                                                                                                                                                             |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface        | Specify ports to show.                                                                                                                                                                                                                                                                                  |
| <interface-list> | The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"><li>• an interface (e.g. eth1)</li><li>• a continuous range of interfaces, e.g. eth1-2</li><li>• a comma-separated list of the above; e.g. eth1, eth2.</li></ul> The specified interfaces must exist. |

**Mode** Privileged Exec

**Example** To display authentication diagnostics for eth1, enter the command:

```
awplus# show auth diagnostics interface eth1
```

**Output** Figure 42-2: Example output from the **show auth diagnostics** command

```

# show auth interface

**Overview** This command shows the status of port authentication on the specified interface.

Use the optional **diagnostics** parameter to show authentication diagnostics for the specified interface. Use the optional **sessionstatistics** parameter to show authentication session statistics for the specified interface. Use the optional **statistics** parameter to show authentication diagnostics for the specified interface. Use the optional **supplicant** (client device) parameter to show the supplicant state for the specified interface.

**Syntax** `show auth interface <interface-list>  
[diagnostics|sessionstatistics|statistics|supplicant [brief]]`

| Parameter                           | Description                                                                                                                                                                                                                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface-list&gt;</code> | The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"><li>• an interface (e.g. eth1)</li><li>• a continuous range of interfaces, e.g. eth1-2</li><li>• a comma-separated list of the above; e.g. eth1, eth2</li></ul> The specified interfaces must exist. |
| <code>diagnostics</code>            | Diagnostics.                                                                                                                                                                                                                                                                                           |
| <code>sessionstatistics</code>      | Session statistics.                                                                                                                                                                                                                                                                                    |
| <code>statistics</code>             | Statistics.                                                                                                                                                                                                                                                                                            |
| <code>supplicant</code>             | Supplicant (client device).                                                                                                                                                                                                                                                                            |
| <code>brief</code>                  | Brief summary of supplicant state.                                                                                                                                                                                                                                                                     |

**Mode** Privileged Exec

**Example** To display the Port based authentication status for eth1, enter the command:

```
awplus# show auth interface eth1
```

If port-based authentication is not configured, the output will be

```
% Port-Control not configured on eth1
```

To display the Port based authentication status for eth1, enter the command:

```
awplus# show auth interface eth1
```

```
awplus# show auth interface eth1

# show auth supplicant interface

**Overview** This command shows the supplicant (client device) state for the authentication mode set for the interface. Use the optional **brief** parameter to show a summary of the supplicant state.

**Syntax** `show auth-web supplicant interface <interface-list> [brief]`

| Parameter                           | Description                                                                                                                                                                                                                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface-list&gt;</code> | The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"><li>• an interface (e.g. eth1)</li><li>• a continuous range of interfaces, e.g. eth1-2</li><li>• a comma-separated list of the above; e.g. eth1, eth2</li></ul> The specified interfaces must exist. |
| <code>brief</code>                  | Brief summary of the supplicant state.                                                                                                                                                                                                                                                                 |

**Mode** Privileged Exec

**Examples** To display the authenticated supplicant on the interface eth1, enter the command:

```
awplus# show auth supplicant interface eth1
```

To display brief summary output for the authenticated supplicant, enter the command:

```
awplus# show auth supplicant brief
```

# show auth-web-server

**Overview** This command shows the Web-Authentication server configuration and status on the switch.

**Syntax** `show auth-web-server`

**Mode** Privileged Exec

**Example** To display Web-Authentication server configuration and status, enter the command:

```
awplus# show auth-web-server
```

**Output** Figure 42-7: Example output from the **show auth-web-server** command

```
Web authentication server
 Server status: enabled
 Server mode: none
 Server address: 192.168.1.1/24
 DHCP server enabled
 DHCP lease time: 20
 DHCP WPAD Option URL: http://192.168.1.1/proxy.pac
 HTTP Port No: 80
 Security: disabled
 Certification: default
 SSL Port No: 443
 Redirect URL: --
 Redirect Delay Time: 5
 HTTP Redirect: enabled
 Session keep: disabled
 PingPolling: disabled
 PingInterval: 30
 Timeout: 1
 FailCount: 5
 ReauthTimerReFresh: disabled
```

# aaa accounting auth-web

**Overview** This command configures an accounting method list for Web-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with Web-based authentication enabled, or a named method list, which can be applied to an interface with the [auth-web accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for Web-based authentication. Once all method lists are disabled, AAA accounting for Web-based authentication is disabled globally.

**Syntax**

```
aaa accounting auth-web {default|<list-name>}
{start-stop|stop-only|none} group {<group-name>|radius}
no aaa accounting auth-web {default|<list-name>}
```

| Parameter    | Description                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------|
| default      | Configure the default accounting method list                                                                              |
| <list-name>  | Configure a named accounting method list                                                                                  |
| start-stop   | Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session. |
| stop-only    | Only sends a stop accounting message at the end of the session.                                                           |
| none         | No accounting record sent.                                                                                                |
| group        | Use a server group                                                                                                        |
| <group-name> | Server group name.                                                                                                        |
| radius       | Use all RADIUS servers.                                                                                                   |

**Default** RADIUS accounting for Web-based authentication is disabled by default.

**Mode** Global Configuration

**Usage** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web accounting](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command

- **group** <group-name>: use the specified RADIUS server group configured with the `aaa group server` command

Configure the accounting event to be sent to the RADIUS server with the following options:

- **start-stop**: sends a start accounting message at the beginning of a session and a stop accounting message at the end of the session.
- **stop-only**: sends a stop accounting message at the end of a session.
- **none**: disables accounting.

**Examples** To enable the default RADIUS accounting method for Web-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web default start-stop
group radius
```

To disable the default RADIUS accounting method for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web default
```

To enable a named RADIUS accounting method list 'example\_acct' for Web-based authentication, with the RADIUS server group 'rad\_group\_example', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web example_acct start-stop
group rad_group_example
```

To disable a named RADIUS accounting method list 'example\_acct' for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web example_acct
```

**Related Commands**

# aaa accounting commands

**Overview** This command configures and enables TACACS+ accounting on commands entered at a specified privilege level. Once enabled for a privilege level, accounting messages for commands entered at that privilege level will be sent to a TACACS+ server.

In order to account for all commands entered on a device, configure command accounting for each privilege level separately.

The command accounting message includes, the command as entered, the date and time the command finished executing, and the user-name of the user who executed the command.

Use the **no** variant of this command to disable command accounting for a specified privilege level.

**Syntax** `aaa accounting commands <1-15> default stop-only group tacacs+`  
`no aaa accounting commands <1-15> default`

| Parameter | Description                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| <1-15>    | The privilege level being configured, in the range 1 to 15.                                                        |
| default   | Use the default method list, this means the command is applied globally to all user exec sessions.                 |
| stop-only | Send accounting message when the commands have stopped executing.                                                  |
| group     | Specify the server group where accounting messages are sent. Only the tacacs+ group is available for this command. |
| tacacs+   | Use all TACACS+ servers configured by the <code>tacacs-server host</code> command.                                 |

**Default** TACACS+ command accounting is disabled by default.

**Mode** Global Configuration

**Usage** This command only supports a **default** method list, this means that it is applied to every console and VTY line.

The **stop-only** parameter indicates that the command accounting messages are sent to the TACACS+ server when the commands have stopped executing.

The **group tacacs+** parameters signifies that the command accounting messages are sent to the TACACS+ servers configured by the `tacacs-server host` command.

Note that up to four TACACS+ servers can be configured for accounting. The servers are checked for reachability in the order they are configured with only the first reachable server being used. If no server is found, the accounting message is dropped.

Command accounting cannot coexist with triggers. An error message is displayed if you attempt to enable command accounting while a trigger is configured. Likewise, an error message is displayed if you attempt to configure a trigger while command accounting is configured.

**Examples** To configure command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting commands 1 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 7 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 15 default stop-only
group tacacs+
```

To disable command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting commands 1 default
awplus(config)# no aaa accounting commands 7 default
awplus(config)# no aaa accounting commands 15 default
```

**Related  
Commands**

- [aaa authentication login](#)
- [aaa accounting login](#)
- [accounting login](#)
- [tacacs-server host](#)

# aaa accounting login

**Overview** This command configures RADIUS and TACACS+ accounting for login shell sessions. The specified method list name can be used by the **accounting login** command in the Line Configuration mode. If the **default** parameter is specified, then this creates a default method list that is applied to every console and VTY line, unless another accounting method list is applied on that line.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

Use the **no** variant of this command to remove an accounting method list for login shell sessions configured by an **aaa accounting login** command. If the method list being deleted is already applied to a console or VTY line, accounting on that line will be disabled. If the default method list name is removed by this command, it will disable accounting on every line that has the default accounting configuration.

**Syntax**

```
aaa accounting login
{default|<list-name>} {start-stop|stop-only|none} {group
{radius|tacacs+|<group-name>}}

no aaa accounting login {default|<list-name>}
```

| Parameter    | Description                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------|
| default      | Default accounting method list.                                                                       |
| <list-name>  | Named accounting method list.                                                                         |
| start-stop   | Start and stop records to be sent.                                                                    |
| stop-only    | Stop records to be sent.                                                                              |
| none         | No accounting record to be sent.                                                                      |
| group        | Specify the servers or server group where accounting packets are sent.                                |
| radius       | Use all RADIUS servers configured by the <a href="#">radius-server host</a> command.                  |
| tacacs+      | Use all TACACS+ servers configured by the <a href="#">tacacs-server host</a> command.                 |
| <group-name> | Use the specified RADIUS server group, as configured by the <a href="#">aaa group server</a> command. |

**Default** Accounting for login shell sessions is disabled by default.

**Mode** Global Configuration

**Usage** This command enables you to define a named accounting method list. The items that you define in the accounting options are:

- the types of accounting packets that will be sent
- the set of servers to which the accounting packets will be sent

You can define a default method list with the name **default** and any number of other named method lists. The name of any method list that you define can then be used as the *<list-name>* parameter in the [accounting login](#) command.

If the method list name already exists, the command will replace the existing configuration with the new one.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>** : use the specified RADIUS server group configured with the [aaa group server](#) command

There is one way to define servers where TACACS+ accounting messages are sent:

- **group tacacs+** : use all TACACS+ servers configured by [tacacs-server host](#) command

The accounting event to send to the RADIUS or TACACS+ server is configured with the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

**Examples** To configure RADIUS accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
radius
```

To configure TACACS+ accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
tacacs+
```

To reset the configuration of the default accounting list, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting login default
```

**Related  
Commands**

- [tacacs-server host](#)

# aaa authentication auth-web

**Overview** This command enables Web-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running Web-based authentication, or a user named authentication method list, which is applied to an interface with the [auth-web authentication](#) command.

Use the **no** variant of this command to disable either the default or a named method list for Web-based authentication. Once all method lists are disabled Web-based authentication is disabled globally.

**Syntax**

```
aaa authentication auth-web {default|<list-name>} group
{<group-name>|radius}

no aaa authentication auth-web {default|<list-name>}
```

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| default      | Configure the default authentication method list |
| <list-name>  | Configure a named authentication method list     |
| group        | Use a server group                               |
| <group-name> | Server group name.                               |
| radius       | Use all RADIUS servers.                          |

**Default** Web-based authentication is disabled by default.

**Mode** Global Configuration

**Usage** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web authentication](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command

Note that you need to configure an IPv4 address for the VLAN interface on which Web authentication is running.

**Examples** To enable Web-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web default group
radius
```

To disable Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-web default
```

To enable Web-based authentication for named list 'example\_auth', with RADIUS server group 'rad\_group\_example, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web example_auth group
rad_group_example
```

To disable Web-based authentication for named list 'example\_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication example_auth
```

**Related  
Commands**

- [aaa accounting auth-web](#)
- [aaa group server](#)
- [auth-web authentication](#)
- [radius-server host](#)

# aaa authentication enable default group tacacs+

**Overview** This command enables AAA authentication to determine the privilege level a user can access for passwords authenticated against the TACACS+ server.

Use the **no** variant of this command to disable privilege level authentication.

**Syntax** `aaa authentication enable default group tacacs+ [local] [none]`  
`no aaa authentication enable default`

| Parameter | Description                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------|
| local     | Use the locally configured enable password ( <b>enable password</b> command) for authentication. |
| none      | No authentication.                                                                               |

**Default** Local privilege level authentication is enabled by default ([aaa authentication enable default local](#) command).

**Mode** Global Configuration

**Usage** A user is configured on a TACACS+ server with a maximum privilege level. When they enter the [enable \(Privileged Exec mode\)](#) command they are prompted for an enable password which is authenticated against the TACACS+ server. If the password is correct and the specified privilege level is equal to or less than the users maximum privilege level, then they are granted access to that level. If the user attempts to access a privilege level that is higher than their maximum configured privilege level, then the authentication session will fail and they will remain at their current privilege level.

**NOTE:** If both **local** and **none** are specified, you must always specify **local** first.

If the TACACS+ server goes offline, or is not reachable during enable password authentication, and command level authentication is configured as:

- **aaa authentication enable default group tacacs+**  
then the user is never granted access to Privileged Exec mode.
- **aaa authentication enable default group tacacs+ local**  
then the user is authenticated using the locally configured enable password, which if entered correctly grants the user access to Privileged Exec mode. If no enable password is locally configured (**enable password** command), then the enable authentication will fail until the TACACS+ server becomes available again.

- **aaa authentication enable default group tacacs+ none**  
then the user is granted access to Privileged Exec mode with no authentication. This is true even if a locally configured enable password is configured.
- **aaa authentication enable default group tacacs+ local none**  
then the user is authenticated using the locally configured enable password. If no enable password is locally configured, then the enable authentication will grant access to Privileged Exec mode with no authentication.

If the password for the user is not successfully authenticated by the server, then the user is again prompted for an enable password when they enter **enable** via the CLI.

**Examples** To enable a privilege level authentication method that will not allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
```

To enable a privilege level authentication method that will allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, and a locally configured enable password is configured, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
local
```

To disable privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

**Related Commands**

# aaa authentication enable default local

**Overview** This command enables AAA authentication to determine the privilege level a user can access for passwords authenticated locally.

**Syntax** `aaa authentication enable default local`

**Default** Local privilege level authentication is enabled by default.

**Mode** Global Configuration

**Usage** The privilege level configured for a particular user in the local user database is the privilege threshold above which the user is prompted for an [enable \(Privileged Exec mode\)](#) command.

**Examples** To enable local privilege level authentication command, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default local
```

To disable privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

**Related Commands**

- [aaa authentication enable default group tacacs+](#)
- [aaa authentication login](#)
- [enable \(Privileged Exec mode\)](#)
- [enable password](#)
- [enable secret](#)
- [tacacs-server host](#)

# aaa authentication login

**Overview** Use this command to create an ordered list of methods to use to authenticate user login, or to replace an existing method list with the same name. Specify one or more of the options **local** or **group**, in the order you want them to be applied. If the **default** method list name is specified, it is applied to every console and VTY line immediately unless another method list is applied to that line by the [login authentication](#) command. To apply a non-default method list, you must also use the [login authentication](#) command.

Use the **no** variant of this command to remove an authentication method list for user login. The specified method list name is deleted from the configuration. If the method list name has been applied to any console or VTY line, user login authentication on that line will fail.

Note that the **no aaa authentication login default** command does not remove the default method list. This will return the default method list to its default state (**local** is the default).

**Syntax**

```
aaa authentication login {default|<list-name>} {[local] [group
{radius|tacacs+|<group-name>}]}
no aaa authentication login {default|<list-name>}
```

| Parameter    | Description                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------|
| default      | Set the default authentication server for user login.                                                 |
| <list-name>  | Name of authentication server.                                                                        |
| local        | Use the local username database.                                                                      |
| group        | Use server group.                                                                                     |
| radius       | Use all RADIUS servers configured by the <a href="#">radius-server host</a> command.                  |
| tacacs+      | Use all TACACS+ servers configured by the <a href="#">tacacs-server host</a> command.                 |
| <group-name> | Use the specified RADIUS server group, as configured by the <a href="#">aaa group server</a> command. |

**Default** If the default server is not configured using this command, user login authentication uses the local user database only.

If the **default** method list name is specified, it is applied to every console and VTY line immediately unless a named method list server is applied to that line by the **login authentication** command.

**local** is the default state for the default method list unless a named method list is applied to that line by the **login authentication** command. Reset to the default method list using the **no aaa authentication login default** command.

**Mode** Global Configuration

**Usage** When a user attempts to log in, the switch sends an authentication request to the first authentication server in the method list. If the first server in the list is reachable and it contains a username and password matching the authentication request, the user is authenticated and the login succeeds. If the authentication server denies the authentication request because of an incorrect username or password, the user login fails. If the first server in the method list is unreachable, the switch sends the request to the next server in the list, and so on.

For example, if the method list specifies **group tacacs+ local**, and a user attempts to log in with a password that does not match a user entry in the first TACACS+ server, if this TACACS+ server denies the authentication request, then the switch does not try any other TACACS+ servers not the local user database; the user login fails.

**Examples** To configure the default authentication method list for user login to first use all available RADIUS servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group radius
local
```

To configure a user login authentication method list called **USERS** to first use the RADIUS server group `RAD_GROUP1` for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group RAD_GROUP1
local
```

To configure a user login authentication method list called **USERS** to first use the TACACS+ servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group tacacs+
local
```

To return to the default method list (**local** is the default server), use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login default
```

To delete an existing authentication method list **USERS** created for user login authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login USERS
```

**Related Commands** [aaa accounting commands](#)  
[aaa authentication enable default group tacacs+ login authentication](#)

# aaa authentication openvpn

**Overview** This command enables RADIUS authentication of OpenVPN tunnels globally. It is automatically applied to every OpenVPN tunnel interface.

Use the **no** variant of this command to globally disable RADIUS authentication of OpenVPN tunnels.

**Syntax** `aaa authentication openvpn default group {<group-name>|radius}`  
`no aaa authentication openvpn default`

| Parameter    | Description             |
|--------------|-------------------------|
| radius       | Use all RADIUS servers. |
| <group-name> | Server group name.      |

**Default** RADIUS authentication of OpenVPN tunnels is disabled by default.

**Mode** Global Configuration

**Usage** Use the **no** variant of this command to reset the default authentication method for OpenVPN tunnels, to its default, that is, to use the group **radius**, containing all RADIUS servers configured by the **radius-server host** command.

Note that if the default authentication method is used, all OpenVPN tunnels will use the group **radius**, containing all RADIUS servers.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>** : use the specified RADIUS server group configured with the [aaa group server](#) command

**Examples** To enable RADIUS authentication of OpenVPN tunnels globally and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication openvpn default group radius
```

To disable RADIUS authentication of OpenVPN tunnels, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication openvpn default
```

**Related Commands** [aaa group server](#)  
[radius-server host](#)

# aaa authorization commands

**Overview** This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

**Syntax**

```
aaa authorization commands <privilege-level>
{default|<list-name>} group tacacs+ [none]

no aaa authorization commands <privilege-level>
{default|<list-name>}
```

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <privilege-level> | The privilege level of the set of commands the method list will be applied to. AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| group             | Specify the server group where authorization messages are sent. Only the <code>tacacs+</code> group is available for this command.                                                                                                                                                                                                                                                                                                                                                           |
| tacacs+           | Use all TACACS+ servers configured by the <code>tacacs-server host</code> command.                                                                                                                                                                                                                                                                                                                                                                                                           |
| default           | Configure the default authorization commands method list.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <list-name>       | Configure a named authorization commands method list                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| none              | If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.                                                                                                                                                                                                                                                                     |

**Mode** Global Configuration

**Usage** TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.

- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

**Example** To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 15 TAC15 group
tacacs+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 7 default group
tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization commands 15 TAC15
```

**Command changes** Version 5.4.6-2.1: command added

# aaa authorization config-commands

**Overview** Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

**Syntax** `aaa authorization config-commands`  
`no aaa authorization config-commands`

**Default** By default, command authorization is disabled on configuration mode commands.

**Mode** Global Configuration

**Usage** If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

**NOTE:** *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

**Example** To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

**Related Commands** [aaa authorization commands](#)  
[authorization commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# aaa group server

**Overview** This command configures a RADIUS server group. A server group can be used to specify a subset of RADIUS servers in **aaa** commands. The group name **radius** is predefined, which includes all RADIUS servers configured by the **radius-server host** command.

RADIUS servers are added to a server group using the **server** command. Each RADIUS server should be configured using the **radius-server host** command.

Use the **no** variant of this command to remove an existing RADIUS server group.

**Syntax** `aaa group server radius <group-name>`  
`no aaa group server radius <group-name>`

| Parameter                       | Description        |
|---------------------------------|--------------------|
| <code>&lt;group-name&gt;</code> | Server group name. |

**Mode** Global Configuration

**Usage** Use this command to create an AAA group of RADIUS servers, and to enter Server Group Configuration mode, in which you can add servers to the group. Use a server group to specify a subset of RADIUS servers in AAA commands. Each RADIUS server must be configured by the **radius-server host** command. To add RADIUS servers to a server group, use the **server** command.

**Examples** To create a RADIUS server group named `GROUP1` with hosts `192.168.1.1`, `192.168.2.1` and `192.168.3.1`, use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1 auth-port 1812 acct-port 1813
awplus(config-sg)# server 192.168.2.1 auth-port 1812 acct-port 1813
awplus(config-sg)# server 192.168.3.1 auth-port 1812 acct-port 1813
```

To remove a RADIUS server group named `GROUP1` from the configuration, use the command:

```
awplus(config)# no aaa group server radius GROUP1
```

# aaa local authentication attempts lockout-time

**Overview** This command configures the duration of the user lockout period.

Use the **no** variant of this command to restore the duration of the user lockout period to its default of 300 seconds (5 minutes).

**Syntax** `aaa local authentication attempts lockout-time <lockout-time>`  
`no aaa local authentication attempts lockout-time`

| Parameter                         | Description                                                         |
|-----------------------------------|---------------------------------------------------------------------|
| <code>&lt;lockout-time&gt;</code> | <code>&lt;0-10000&gt;</code> . Time in seconds to lockout the user. |

**Mode** Global Configuration

**Default** The default for the lockout-time is 300 seconds (5 minutes).

**Usage** While locked out all attempts to login with the locked account will fail. The lockout can be manually cleared by another privileged account using the [clear aaa local user lockout](#) command.

**Examples** To configure the lockout period to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts lockout-time
600
```

To restore the default lockout period of 5 minutes (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts
lockout-time
```

**Related Commands** [aaa local authentication attempts max-fail](#)

# aaa local authentication attempts max-fail

**Overview** This command configures the maximum number of failed login attempts before a user account is locked out. Every time a login attempt fails the failed login counter is incremented.

Use the **no** variant of this command to restore the maximum number of failed login attempts to the default setting (five failed login attempts).

**Syntax** `aaa local authentication attempts max-fail <failed-logins>`  
`no aaa local authentication attempts max-fail`

| Parameter                          | Description                                                                             |
|------------------------------------|-----------------------------------------------------------------------------------------|
| <code>&lt;failed-logins&gt;</code> | <code>&lt;1-32&gt;</code> . Number of login failures allowed before locking out a user. |

**Mode** Global Configuration

**Default** The default for the maximum number of failed login attempts is five failed login attempts.

**Usage** When the failed login counter reaches the limit configured by this command that user account is locked out for a specified duration configured by the [aaa local authentication attempts lockout-time](#) command.

When a successful login occurs the failed login counter is reset to 0. When a user account is locked out all attempts to login using that user account will fail.

**Examples** To configure the number of login failures that will lock out a user account to two login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail 2
```

To restore the number of login failures that will lock out a user account to the default number of login attempts (five login attempts), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
```

**Related Commands** [aaa local authentication attempts lockout-time](#)  
[clear aaa local user lockout](#)

# aaa login fail-delay

**Overview** Use this command to configure the minimum time period between failed login attempts. This setting applies to login attempts via the console, SSH and Telnet. Use the **no** variant of this command to reset the minimum time period to its default value.

**Syntax** `aaa login fail-delay [<1-10>]`  
`no aaa login fail-delay [<1-10>]`

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <1-10>    | The minimum number of seconds required between login attempts |

**Default** 1 second

**Mode** Global configuration

**Example** To apply a delay of at least 5 seconds between login attempts, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa login fail-delay 5
```

**Related Commands** [aaa authentication login](#)

# accounting login

**Overview** This command applies a login accounting method list to console or VTY lines for user login. When login accounting is enabled using this command, logging events generate an accounting record to the accounting server.

The accounting method list must be configured first using this command. If an accounting method list is specified that has not been created by this command then accounting will be disabled on the specified lines.

The **no** variant of this command resets AAA Accounting applied to console or VTY lines for local or remote login. **default** login accounting is applied after issuing the **no accounting login** command. Accounting is disabled with **default**.

**Syntax** `accounting login {default|<list-name>}`  
`no accounting login`

| Parameter   | Description                     |
|-------------|---------------------------------|
| default     | Default accounting method list. |
| <list-name> | Named accounting method list.   |

**Default** By default login accounting is disabled in the **default** accounting server. No accounting will be performed until accounting is enabled using this command.

**Mode** Line Configuration

**Examples** To apply the accounting server `USERS` to all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# accounting login USERS
```

To reset accounting for login sessions on the console, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no accounting login
```

**Related Commands** [aaa accounting commands](#)

# authorization commands

**Overview** This command applies a command authorization method list, defined using the [aaa authorization commands](#) command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

**Syntax** `authorization commands <privilege-level> {default|<list-name>}`  
`no authorization commands <privilege-level>`

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;privilege-level&gt;</code> | The privilege level of the set of commands the method list will be applied to.<br>AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| <code>default</code>                 | Configure the default authorization commands method list.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>&lt;list-name&gt;</code>       | Configure a named authorization commands method list                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Default** The **default** method list is applied to each console and VTY line by default.

**Mode** Line Configuration

**Usage** If the specified method list does not exist users will not be able to execute any commands in the specified method list on the specified VTY lines.

**Example** To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

**Related Commands** [aaa authorization commands](#)

tacacs-server host

**Command changes** Version 5.4.6-2.1: command added

# clear aaa local user lockout

**Overview** Use this command to clear the lockout on a specific user account or all user accounts.

**Syntax** `clear aaa local user lockout {username <username>|all}`

| Parameter  | Description                           |
|------------|---------------------------------------|
| username   | Clear lockout for the specified user. |
| <username> | Specifies the user account.           |
| all        | Clear lockout for all user accounts.  |

**Mode** Privileged Exec

**Examples** To unlock the user account 'bob' use the following command:

```
awplus# clear aaa local user lockout username bob
```

To unlock all user accounts use the following command:

```
awplus# clear aaa local user lockout all
```

**Related Commands** [aaa local authentication attempts lockout-time](#)

# debug aaa

**Overview** This command enables AAA debugging.  
Use the **no** variant of this command to disable AAA debugging.

**Syntax** debug aaa [accounting|all|authentication|authorization]  
no debug aaa [accounting|all|authentication|authorization]

| Parameter      | Description                        |
|----------------|------------------------------------|
| accounting     | Accounting debugging.              |
| all            | All debugging options are enabled. |
| authentication | Authentication debugging.          |
| authorization  | Authorization debugging.           |

**Default** AAA debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable authentication debugging for AAA, use the command:

```
awplus# debug aaa authentication
```

To disable authentication debugging for AAA, use the command:

```
awplus# no debug aaa authentication
```

**Related Commands** [show debugging aaa](#)  
[undebug aaa](#)

# login authentication

**Overview** Use this command to apply an AAA server for authenticating user login attempts from a console or remote logins on these console or VTY lines. The authentication method list must be specified by the **aaa authentication login** command. If the method list has not been configured by the **aaa authentication login** command, login authentication will fail on these lines.

Use the **no** variant of this command to reset AAA Authentication configuration to use the default method list for login authentication on these console or VTY lines.

**Command Syntax**

```
login authentication {default|<list-name>}
no login authentication
```

| Parameter   | Description                                                                                                                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default     | The default authentication method list. If the default method list has not been configured by the <a href="#">aaa authentication login</a> command, the local user database is used for user login authentication. |
| <list-name> | Named authentication server.                                                                                                                                                                                       |

**Default** The default login authentication method list, as specified by the [aaa authentication login](#) command, is used to authenticate user login. If this has not been specified, the default is to use the local user database.

**Mode** Line Configuration

**Examples** To apply the authentication method list called `CONSOLE` to the console port terminal line (asyn 0), use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# login authentication CONSOLE
```

To reset user authentication configuration on all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# no login authentication
```

**Related Commands** [aaa authentication login](#)  
[line](#)

# proxy-port

**Overview** Use this command to change the local UDP port used for communication between local RADIUS client applications and the RadSecProxy AAA application. Any unused UDP port may be selected. The default port is 1645.

Use the **no** variant of this command to change the UDP port back to the default of 1645.

**Syntax** `proxy-port <port>`  
`no proxy-port`

| Parameter                 | Description               |
|---------------------------|---------------------------|
| <code>&lt;port&gt;</code> | UDP Port Number, 1-65536. |

**Default** The default port is 1645.

**Mode** RadSecProxy AAA Configuration Mode

**Usage** It is not necessary to change the value from the default unless UDP port 1645 is required for another purpose. RADIUS requests received on this port from external devices will be ignored. The port is only used for local (intra-device) communication.

**Example** To configure change the UDP port to 7001, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# proxy-port 7001
```

**Related Commands** [radius-secure-proxy aaa](#)  
[server \(radsecproxy-aaa\)](#)  
[server name-check](#)  
[server trustpoint](#)

# radius-secure-proxy aaa

**Overview** Use this command to enter the RadSecProxy AAA (authentication, authorization, and accounting) application configuration mode. This application allows local RADIUS-based clients on system to communicate with remote RadSec servers via a secure (TLS) proxy.

**Syntax** `radius-secure-proxy aaa`

**Mode** Global Configuration Mode

**Example** To change mode from User Exec mode to the RadSecProxy AAA configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)#
```

**Related Commands**

- [proxy-port](#)
- [server \(radsecproxy-aaa\)](#)
- [server name-check](#)
- [server trustpoint](#)

# server (radsecproxy-aaa)

**Overview** Use this command to add a server to the RadSecProxy AAA application. Local RADIUS client applications will attempt, via the proxy, to communicate with any RadSec servers that are operational (in addition to any non-TLS RADIUS servers that are configured).

Use the **no** variant of this command to delete a previously-configured server from the RadSecProxy AAA application.

**Syntax** `server {<hostname>|<ip-addr>} [timeout <1-1000>] [name-check {on|off}]`

`no server {<hostname>|<ip-addr>}`

| Parameter                     | Description                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;hostname&gt;</code> | Hostname of RadSec server                                                                                                                                                       |
| <code>&lt;ip-addr&gt;</code>  | Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).                                                                                                          |
| <code>timeout</code>          | Specify the amount of time that the RadSecProxy AAA application should wait before receiving replies from this server. RADIUS server timeout (which defaults to 5 seconds).     |
| <code>&lt;1-1000&gt;</code>   | Time in seconds to wait for a server reply.                                                                                                                                     |
| <code>name-check</code>       | Specify whether or not to enforce certificate name checking for this client. If the parameter is not specified then the global behavior, which defaults to <b>on</b> , is used. |
| <code>on</code>               | Enable name checking for this client.                                                                                                                                           |
| <code>off</code>              | Disable name checking for this client.                                                                                                                                          |

**Mode** RadSecProxy AAA Configuration Mode

**Usage** The server may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each server may be configured with a timeout; if not specified, the global timeout value for RADIUS servers will be used. The global timeout may be changed using the **radius-server timeout** command. The default global timeout is 5 seconds.

Each server may be configured to use certificate name-checking; if not specified, the global behavior defined by **server name-check** or **no server name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the server's X.509 certificate must match the domain name or IP address specified in this command.

**Example** To add a server which waits 3 seconds before receiving replies, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# client mynas.local name-check
off
```

**Related  
Commands**

- proxy-port
- radius-secure-proxy aaa
- server name-check
- server trustpoint

# server mutual-authentication

**Overview** This command enables or disables mutual certificate authentication for all RadSecProxy servers. When enabled, the RadSecProxy AAA application will send a local X.509 certificate to the server when establishing a TLS connection.

Use the **no** variant of this command to disable mutual certificate validation causing the RadSecProxy AAA application to not transmit a certificate to the server.

**NOTE:** *If mutual authentication is disabled on the client (AAA) application but enabled on the server, a connection will not be established.*

**Syntax** `server mutual-authentication`  
`no server mutual-authentication`

**Default** Mutual authentication is enabled by default.

**Mode** RadSecProxy AAA Configuration Mode

**Example** Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server
mutual-authentication
```

**Related  
Commands** [radius-secure-proxy aaa](#)  
[server name-check](#)  
[server \(radsecproxy-aaa\)](#)

**Command  
changes** Version 5.4.6-2.1: command added

# server name-check

**Overview** This command sets the global behavior for certificate name-checking for the RadSecProxy AAA application to **on**. This behavior will be used for all servers associated with the application that do not specify a behavior on a per-server basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **server (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

**Syntax** `server name-check`  
`no server name-check`

**Default** Certificate name checking is on by default.

**Mode** RadSecProxy AAA Configuration Mode

**Example** Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server name-check
```

**Related Commands** [proxy-port](#)  
[radius-secure-proxy aaa](#)  
[server \(radsecproxy-aaa\)](#)  
[server trustpoint](#)

# server trustpoint

**Overview** This command adds one or more trustpoints to be used with the RadSecProxy AAA application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** `server trustpoint [<trustpoint-list>]`  
`no server trustpoint [<trustpoint-list>]`

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| <trustpoint-list> | Specify one or more trustpoints to be added or deleted. |

**Default** By default, no trustpoints are associated with the application.

**Mode** RadSecProxy AAA Configuration Mode

**Usage** The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no server trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints to the RadSecProxy AAA application by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server trustpoint example_1
awplus(config-radsecproxy-aaa)# server trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-aaa)# server trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy AAA application using the command:

```
awplus(config-radsecproxy-aaa)# no server trustpoint
```

**Related Commands** [proxy-port](#)

# show aaa local user locked

**Overview** This command displays the current number of failed attempts, last failure time and location against each user account attempting to log into the device.

Note that once the lockout count has been manually cleared by another privileged account using the [clear aaa local user lockout](#) command or a locked account successfully logs into the system after waiting for the lockout time, this command will display nothing for that particular account.

**Syntax** `show aaa local user locked`

**Mode** User Exec and Privileged Exec

**Example** To display the current failed attempts for local users, use the command:

```
awplus# show aaa local user locked
```

**Output** Figure 43-1: Example output from the **show aaa local user locked** command

```
awplus# show aaa local user locked
Login Failures Latest failure From
bob 3 05/23/14 16:21:37 ttyS0
manager 5 05/23/14 16:31:44 192.168.1.200
```

# show aaa server group

**Overview** Use this command to list AAA users and any method lists applied to them.

**Syntax** show aaa server group

**Mode** Privileged Exec

**Example** To show the AAA configuration on a device, use the command:

```
awplus# aaa server group
```

**Output** Figure 43-2: Example output from **aaa server group**

```
awplus#show aaa server group
```

| User     | List Name       | Method          | Acct-Event       |

# show debugging aaa

**Overview** This command displays the current debugging status for AAA (Authentication, Authorization, Accounting).

**Syntax** `show debugging aaa`

**Mode** User Exec and Privileged Exec

**Example** To display the current debugging status of AAA, use the command:

```
awplus# show debug aaa
```

**Output** Figure 43-3: Example output from the **show debug aaa** command

```
AAA debugging status:
Authentication debugging is on
Accounting debugging is off
```

# show radius server group

**Overview** Use this command to show the RADIUS server group configuration.

**Syntax** show radius server group [<group-name>]

| Parameter    | Description               |
|--------------|---------------------------|
| <group-name> | RADIUS server group name. |

**Default** Command name is set to something by default.

**Mode** Privileged Exec

**Usage** Use this command with the <group-name> parameter to display information for a specific RADIUS server group, or without the parameter to display information for all RADIUS server groups.

**Example** To display information for all RADIUS server groups, use the command:

```
awplus# show radius server group
```

To display a information for a RADIUS server group named 'rad\_group\_list1', use the command:

```
awplus# show radius server group rad_group_list1
```

**Output** Figure 43-4: Example output from **show radius server group**

```
awplus#show radius server group

# deadtime (RADIUS server group)

**Overview** Use this command to configure the **deadtime** parameter for the RADIUS server group. This command overrides the global dead-time configured by the [radius-server deadtime](#) command. The configured deadtime is the time period in minutes to skip a RADIUS server for authentication or accounting requests if the server is “dead”. Note that a RADIUS server is considered “dead” if there is no response from the server within a defined time period.

Use the **no** variant of this command to reset the deadtime configured for the RADIUS server group. If the global deadtime for RADIUS server is configured the value will be used for the servers in the group. The global deadtime for the RADIUS server is set to 0 minutes by default.

**Syntax** `deadtime <0-1440>`  
`no deadtime`

| Parameter                   | Description                |
|-----------------------------|----------------------------|
| <code>&lt;0-1440&gt;</code> | Amount of time in minutes. |

**Default** The deadtime is set to 0 minutes by default.

**Mode** Server Group Configuration

**Usage** If the RADIUS server does not respond to a request packet, the packet is retransmitted the number of times configured for the **retransmit** parameter (after waiting for a **timeout** period to expire). The server is then marked “dead”, and the time is recorded. The **deadtime** parameter configures the amount of time to skip a dead server; if a server is dead, no request message is sent to the server for the **deadtime** period.

**Examples** To configure the deadtime for 5 minutes for the RADIUS server group “GROUP1”, use the command:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1
awplus(config-sg)# deadtime 5
```

To remove the deadtime configured for the RADIUS server group “GROUP1”, use the command:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no deadtime
```

**Related Commands** [aaa group server](#)  
[radius-server deadtime](#)

# debug radius

**Overview** This command enables RADIUS debugging. If no option is specified, all debugging options are enabled.

Use the **no** variant of this command to disable RADIUS debugging. If no option is specified, all debugging options are disabled.

**Syntax** debug radius [packet|event|all]  
no debug radius [packet|event|all]

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| packet    | Debugging for RADIUS packets is enabled or disabled. |
| event     | Debugging for RADIUS events is enabled or disabled.  |
| all       | Enable or disable all debugging options.             |

**Default** RADIUS debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable debugging for RADIUS packets, use the command:

```
awplus# debug radius packet
```

To enable debugging for RADIUS events, use the command:

```
awplus# debug radius event
```

To disable debugging for RADIUS packets, use the command:

```
awplus# no debug radius packet
```

To disable debugging for RADIUS events, use the command:

```
awplus# no debug radius event
```

**Related Commands** [show debugging radius](#)  
[undebug radius](#)

# ip radius source-interface

**Overview** This command configures the source IP address of every outgoing RADIUS packet to use a specific IP address or the IP address of a specific interface. If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing RADIUS packets depends on the interface the packets leave.

Use the **no** variant of this command to remove the source interface configuration. The source IP address in outgoing RADIUS packets will be the IP address of the interface from which the packets are sent.

**Syntax** `ip radius source-interface {<interface>|<ip-address>}`  
`no ip radius source-interface`

| Parameter                       | Description                                      |
|---------------------------------|--------------------------------------------------|
| <code>&lt;interface&gt;</code>  | Interface name.                                  |
| <code>&lt;ip-address&gt;</code> | IP address in the dotted decimal format A.B.C.D. |

**Default** Source IP address of outgoing RADIUS packets depends on the interface the packets leave.

**Mode** Global Configuration

**Examples** To configure all outgoing RADIUS packets to use the IP address of the interface "vlan1" for the source IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface vlan1
```

To configure the source IP address of all outgoing RADIUS packets to use 192.168.1.10, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface 192.168.1.10
```

To reset the source interface configuration for all outgoing RADIUS packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip radius source-interface
```

**Related Commands** [radius-server host](#)

# radius-server deadtime

**Overview** Use this command to specify the global **deadtime** for all RADIUS servers. If a RADIUS server is considered dead, it is skipped for the specified deadtime. This command specifies for how many minutes a RADIUS server that is not responding to authentication requests is passed over by requests for RADIUS authentication.

Use the **no** variant of this command to reset the global deadtime to the default of 0 seconds, so that RADIUS servers are not skipped even if they are dead.

**Syntax** `radius-server deadtime <minutes>`  
`no radius-server deadtime`

| Parameter                    | Description                                                          |
|------------------------------|----------------------------------------------------------------------|
| <code>&lt;minutes&gt;</code> | RADIUS server deadtime in minutes in the range 0 to 1440 (24 hours). |

**Default** The default RADIUS deadtime configured on the system is 0 seconds.

**Mode** Global Configuration

**Usage** The RADIUS client considers a RADIUS server to be dead if it fails to respond to a request after it has been retransmitted as often as specified globally by the [radius-server retransmit](#) command or for the server by the [radius-server host](#) command. To improve RADIUS response times when some servers may be unavailable, set a **deadtime** to skip dead servers.

**Examples** To set the dead time of the RADIUS server to 60 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server deadtime 60
```

To disable the dead time of the RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server deadtime
```

**Related Commands** [deadtime \(RADIUS server group\)](#)  
[radius-server host](#)  
[radius-server retransmit](#)

# radius-server host

**Overview** Use this command to specify a remote RADIUS server host for authentication or accounting, and to set server-specific parameters. The parameters specified with this command override the corresponding global parameters for RADIUS servers. This command specifies the IP address or host name of the remote RADIUS server host and assigns authentication and accounting destination UDP port numbers.

This command adds the RADIUS server address and sets parameters to the RADIUS server. The RADIUS server is added to the running configuration after you issue this command. If parameters are not set using this command then common system settings are applied.

Use the **no** variant of this command to remove the specified server host as a RADIUS authentication and/or accounting server and set the destination port to the default RADIUS server port number (1812).

**Syntax**

```
radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key <key-string>] [retransmit <0-100>] [timeout <1-1000>]
```

```
no radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>]
```

| Parameter    | Description                                                                                                                                                                                                     |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <host-name>  | Server host name. The DNS name of the RADIUS server host.                                                                                                                                                       |
| <ip-address> | The IP address of the RADIUS server host.                                                                                                                                                                       |
| acct-port    | Accounting port. Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the server is not used for accounting. The default UDP port for accounting is 1813.                      |
| <0-65535>    | UDP port number<br>(Accounting port number is set to 1813 by default)<br>Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the host is not used for accounting.             |
| auth-port    | Authentication port. Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the server is not used for authentication. The default UDP port for authentication is 1812.      |
| <0-65535>    | UDP port number<br>(Authentication port number is set to 1812 by default)<br>Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the host is not used for authentication. |
| timeout      | Specifies the amount of time to wait for a response from the server. If this parameter is not specified the global value configured by the <b>radius-server timeout</b> command is used.                        |

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-1000>     | Time in seconds to wait for a server reply (timeout is set to 5 seconds by default)<br>The time interval (in seconds) to wait for the RADIUS server to reply before retransmitting a request or considering the server dead. This setting overrides the global value set by the <b>radius-server timeout</b> command.<br>If no timeout value is specified for this server, the global value is used.                                                                                                                                                                                                             |
| retransmit   | Specifies the number of retries before skip to the next server. If this parameter is not specified the global value configured by the <b>radius-server retransmit</b> command is used.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <0-100>      | Maximum number of retries (maximum number of retries is set to 3 by default)<br>The maximum number of times to resend a RADIUS request to the server, if it does not respond within the timeout interval, before considering it dead and skipping to the next RADIUS server. This setting overrides the global setting of the <b>radius-server retransmit</b> command.<br>If no retransmit value is specified, the global value is used.                                                                                                                                                                         |
| key          | Set shared secret key with RADIUS servers                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <key-string> | Shared key string applied<br>Specifies the shared secret authentication or encryption key for all RADIUS communications between this device and the RADIUS server. This key must match the encryption used on the RADIUS daemon. All leading spaces are ignored, but spaces within and at the end of the string are used. If spaces are used in the string, do not enclose the string in quotation marks unless the quotation marks themselves are part of the key. This setting overrides the global setting of the <b>radius-server key c</b> command. If no key value is specified, the global value is used. |

**Default** The RADIUS client address is not configured (null) by default. No RADIUS server is configured.

**Mode** Global Configuration

**Usage** Multiple **radius-server host** commands can be used to specify multiple hosts. The software searches for hosts in the order they are specified. If no host-specific timeout, retransmit, or key values are specified, the global values apply to that host. If there are multiple RADIUS servers for this client, use this command multiple times—once to specify each server.

If you specify a host without specifying the auth port or the acct port, it will by default be configured for both authentication and accounting, using the default UDP ports. To set a host to be a RADIUS server for authentication requests only, set the **acct-port** parameter to 0; to set the host to be a RADIUS server for accounting requests only, set the auth-port parameter to 0.

A RADIUS server is identified by IP address, authentication port and accounting port. A single host can be configured multiple times with different authentication or accounting ports. All the RADIUS servers configured with this command are

included in the predefined RADIUS server group radius, which may be used by AAA authentication, authorization and accounting commands. The client transmits (and retransmits, according to the **retransmit** and **timeout** parameters) RADIUS authentication or accounting requests to the servers in the order you specify them, until it gets a response.

**Examples** To add the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20
```

To set the secret key to **allied** on the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key allied
```

To delete the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host 10.0.0.20
```

To configure rad1.company.com for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad1.company.com acct-port 0
```

To remove the RADIUS server rad1.company.com configured for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host rad1.company.com
acct-port 0
```

To configure rad2.company.com for accounting only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad2.company.com auth-port 0
```

To configure 192.168.1.1 with authentication port 1000, accounting port 1001 and retransmit count 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 192.168.1.1 auth-port 1000
acct-port 1001 retransmit 5
```

**Related  
Commands**

- [aaa group server](#)
- [radius-server key](#)
- [radius-server retransmit](#)
- [radius-server timeout](#)

# radius-server key

**Overview** This command sets a global secret key for RADIUS authentication on the device. The shared secret text string is used for RADIUS authentication between the device and a RADIUS server.

Note that if no secret key is explicitly specified for a RADIUS server, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to reset the secret key to the default (null).

**Syntax** `radius-server key <key>`  
`no radius-server key`

| Parameter                | Description                                          |
|--------------------------|------------------------------------------------------|
| <code>&lt;key&gt;</code> | Shared secret among radius server and 802.1X client. |

**Default** The RADIUS server secret key on the system is not set by default (null).

**Mode** Global Configuration

**Usage** Use this command to set the global secret key shared between this client and its RADIUS servers. If no secret key is specified for a particular RADIUS server using the **radius-server host c** command, this global key is used.

After enabling AAA authentication with the **aaa authentication login** command, set the authentication and encryption key using the **radius-server key** command so the key entered matches the key used on the RADIUS server.

**Examples** To set the global secret key to **allied** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key allied
```

To set the global secret key to **secret** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key secret
```

To delete the global secret key for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server key
```

**Related Commands** [radius-server host](#)

# radius-server retransmit

**Overview** This command sets the retransmit counter to use RADIUS authentication on the device. This command specifies how many times the device transmits each RADIUS request to the RADIUS server before giving up.

This command configures the **retransmit** parameter for RADIUS servers globally. If the **retransmit** parameter is not specified for a RADIUS server by the **radius-server host** command then the global configuration set by this command is used for the server instead.

Use the **no** variant of this command to reset the re-transmit counter to the default (3).

**Syntax** `radius-server retransmit <retries>`  
`no radius-server retransmit`

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;retries&gt;</code> | RADIUS server retries in the range <0-100>. The number of times a request is resent to a RADIUS server that does not respond, before the server is considered dead and the next server is tried. If no retransmit value is specified for a particular RADIUS server using the <b>radius-server host</b> command, this global value is used. |

**Default** The default RADIUS retransmit count on the device is 3.

**Mode** Global Configuration

**Examples** To set the RADIUS **retransmit** count to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 1
```

To set the RADIUS **retransmit** count to the default (3), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server retransmit
```

To configure the RADIUS **retransmit** count globally with 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 5
```

To disable retransmission of requests to a RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 0
```

**Related  
Commands** [radius-server deadtime](#)  
[radius-server host](#)

# radius-server timeout

**Overview** Use this command to specify the RADIUS global timeout value. This is how long the device waits for a reply to a RADIUS request before retransmitting the request, or considering the server to be dead. If no timeout is specified for the particular RADIUS server by the **radius-server host** command, it uses this global timeout value.

Note that this command configures the **timeout** parameter for RADIUS servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

**Syntax** `radius-server timeout <seconds>`  
`no radius-server timeout`

| Parameter                    | Description                                                                                                                                                                                                                                                               |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;seconds&gt;</code> | RADIUS server timeout in seconds in the range 1 to 1000. The global time in seconds to wait for a RADIUS server to reply to a request before retransmitting the request, or considering the server to be dead (depending on the <b>radius-server retransmit</b> command). |

**Default** The default RADIUS transmit timeout on the system is 5 seconds.

**Mode** Global Configuration

**Examples** To globally set the device to wait 20 seconds before retransmitting a RADIUS request to unresponsive RADIUS servers, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 20
```

To set the RADIUS **timeout** parameter to 1 second, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 1
```

To set the RADIUS **timeout** parameter to the default (5 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

To configure the RADIUS server **timeout** period globally with 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 3
```

To reset the global **timeout** period for RADIUS servers to the default, use the following command:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

# server (Server Group)

**Overview** This command adds a RADIUS server to a server group in Server-Group Configuration mode. The RADIUS server should be configured by the [radius-server host](#) command.

The server is appended to the server list of the group and the order of configuration determines the precedence of servers. If the server exists in the server group already, it will be removed before added as a new server.

The server is identified by IP address and authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports. The **auth-port** specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set `auth-port` to 0. If the authentication port is missing, the default port number is 1812. The **acct-port** specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set `acct-port` to 0. If the accounting port is missing, the default port number is 1813.

Use the **no** variant of this command to remove a RADIUS server from the server group.

**Syntax**

```
server {<hostname>|<ip-address>} [auth-port <0-65535>] [acct-port <0-65535>]
no server {<hostname>|<ip-address>} [auth-port <0-65535>] [acct-port <0-65535>]
```

| Parameter                       | Description                                                                                                                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;hostname&gt;</code>   | Server host name                                                                                                                                                                                                                                                       |
| <code>&lt;ip-address&gt;</code> | Server IP address<br>The server is identified by IP address, authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports.                                        |
| <code>auth-port</code>          | Authentication port<br>The <b>auth-port</b> specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set <b>auth-port</b> to 0. If the authentication port is missing, the default port number is 1812. |
| <code>&lt;0-65535&gt;</code>    | UDP port number (default: 1812)                                                                                                                                                                                                                                        |
| <code>acct-port</code>          | Accounting port<br>The <b>acct-port</b> specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set <b>acct-port</b> to 0. If the accounting port is missing, the default port number is 1813.                 |
| <code>&lt;0-65535&gt;</code>    | UDP port number (default: 1813)                                                                                                                                                                                                                                        |

**Default** The default Authentication port number is 1812 and the default Accounting port number is 1813.

**Mode** Server Group Configuration

**Usage** The RADIUS server to be added must be configured by the **radius-server host** command. In order to add or remove a server, the **auth-port** and **acct-port** parameters in this command must be the same as the corresponding parameters in the **radius-server host** command.

**Examples** To create a RADIUS server group RAD\_AUTH1 for authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_AUTH1
awplus(config-sg)# server 192.168.1.1 acct-port 0
awplus(config-sg)# server 192.168.2.1 auth-port 1000 acct-port 0
```

To create a RADIUS server group RAD\_ACCT1 for accounting, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_ACCT1
awplus(config-sg)# server 192.168.2.1 auth-port 0 acct-port 1001
awplus(config-sg)# server 192.168.3.1 auth-port 0
```

To remove server 192.168.3.1 from the existing server group **GROUP1**, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no server 192.168.3.1
```

# show debugging radius

**Overview** This command displays the current debugging status for the RADIUS servers.

**Syntax** `show debugging radius`

**Mode** User Exec and Privileged Exec

**Example** To display the current debugging status of RADIUS servers, use the command:

```
awplus# show debugging radius
```

**Output** Figure 44-1: Example output from the **show debugging radius** command

```
RADIUS debugging status:
RADIUS event debugging is off
RADIUS packet debugging is off
```

# show radius

**Overview** This command displays the current RADIUS server configuration and status.

**Syntax** show radius

**Mode** User Exec and Privileged Exec

**Example** To display the current status of RADIUS servers, use the command:

```
awplus# show radius
```

**Output** Figure 44-2: Example output from the **show radius** command showing RADIUS servers

```
RADIUS Global Configuration

| Output Parameter    | Meaning                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------|
| Source Interface    | The interface name or IP address to be used for the source address of all outgoing RADIUS packets. |
| Secret Key          | A shared secret key to a radius server.                                                            |
| Timeout             | A time interval in seconds.                                                                        |
| Retransmit Count    | The number of retry count if a RADIUS server does not response.                                    |
| Deadtime            | A time interval in minutes to mark a RADIUS server as "dead".                                      |
| Interim-Update      | A time interval in minutes to send Interim-Update Accounting report.                               |
| Group Deadtime      | The deadtime configured for RADIUS servers within a server group.                                  |
| Server Host         | The RADIUS server hostname or IP address.                                                          |
| Authentication Port | The destination UDP port for RADIUS authentication requests.                                       |
| Accounting Port     | The destination UDP port for RADIUS accounting requests.                                           |

| Output Parameter | Meaning                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auth Status      | The status of the authentication port.<br>The status ("dead", "error", or "alive") of the RADIUS authentication server and, if dead, how long it has been dead for.                |
|                  | Alive      The server is alive.                                                                                                                                                    |
|                  | Error      The server is not responding.                                                                                                                                           |
|                  | Dead      The server is detected as dead and it will not be used for deadtime period. The time displayed in the output shows the server is in dead status for that amount of time. |
|                  | Unknown    The server is never used or the status is unknown.                                                                                                                      |
| Acct Status      | The status of the accounting port.<br>The status ("dead", "error", or "alive") of the RADIUS accounting server and, if dead, how long it has been dead for.                        |

# undebug radius

# attribute

**Overview** Use this command to define a RADIUS attribute for the local RADIUS server user group.

For a complete list of defined RADIUS attributes and values, see the [Local RADIUS Server Feature Overview and Configuration Guide](#).

When used with the **help** parameter the **attribute** command displays a list of standard and vendor specific valid RADIUS attributes that are supported by the local RADIUS server.

If an attribute name is specified with the **help** parameter, then the **attribute** command displays a list of predefined attribute names. Note that you can only use the defined RADIUS attribute names and not define your own.

When used with the **value** parameter the **attribute** command configures RADIUS attributes to the user group. If the specified attribute is already defined then it is replaced with the new value.

Use the **no** variant of this command to delete an attribute from the local RADIUS server user group.

**Syntax**

```
attribute [<attribute-name>|<attribute-id>] help
attribute {<attribute-name>|<attribute-id>} <value>
no attribute {<attribute-name>|<attribute-id>}
```

| Parameter        | Description                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <attribute-name> | RADIUS attribute name for standard attributes or Vendor-Specific attributes (see the <a href="#">Local RADIUS Server Feature Overview and Configuration Guide</a> for tables of attributes). |
| <attribute-id>   | RADIUS attribute numeric identifier for standard attributes.                                                                                                                                 |
| <value>          | RADIUS attribute value.                                                                                                                                                                      |
| help             | Display a list of available attribute types.                                                                                                                                                 |

**Default** By default, no attributes are configured.

**Mode** RADIUS Server Group Configuration

**Usage** For the Standard attributes, the attribute may be specified using either the attribute name, or its numeric identifier. For example, the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause
help
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 help
```

In the same way, where the specific attribute has a pre-defined value, the parameter *<value>* may be substituted with the Value Name or with its numeric value, for example the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause
user-request
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

or the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

**Examples** To check a list of all available defined RADIUS attribute names, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# attribute help
```

A list of Vendor-specific Attributes displays after the list of defined Standard Attributes.

To get help for valid RADIUS attribute values for the attribute *Service-Type*, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# attribute Service-Type help
```

This results in the following output:

```
Service-Type : integer (Integer number)

Pre-defined values :
 Administrative-User (6)
 Authenticate-Only (8)
 Authorize-Only (17)
 Callback-Administrative (11)
 Callback-Framed-User (4)
 Callback-Login-User (3)
 Callback-NAS-Prompt (9)
 Call-Check (10)
 Framed-User (2)
 Login-User (1)
 NAS-Prompt-User (7)
 Outbound-User (5)
```

To define the attribute name 'Service-Type' with Administrative User (6) to the RADIUS User Group 'Admin', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# attribute Service-Type 6
```

To delete the attribute 'Service-Type' from the RADIUS User Group 'Admin', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# no attribute Service-Type
```

**Related  
Commands** [egress-vlan-id](#)  
[egress-vlan-name](#)

# authentication

**Overview** Use this command to enable the specified authentication methods on the local RADIUS server.

Use the **no** variant of this command to disable specified authentication methods on the local RADIUS server.

**Syntax** authentication {mac|eapmd5|eaptls|peap}  
no authentication {mac|eapmd5|eaptls|peap}

| Parameter | Description                            |
|-----------|----------------------------------------|
| mac       | Enable MAC authentication method.      |
| eapmd5    | Enable EAP-MD5 authentication method.  |
| eaptls    | Enable EAP-TLS authentication method.  |
| peap      | Enable EAP-PEAP authentication method. |

**Default** All authentication methods are enabled by default.

**Mode** RADIUS Server Configuration

**Examples** The following commands enable EAP-MD5 authentication methods on the local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# authentication eapmd5
```

The following commands disable EAP-MD5 authentication methods on Local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no authentication eapmd5
```

**Related Commands** [server enable](#)  
[show radius local-server statistics](#)

# client (radsecproxy-srv)

**Overview** Use this command to add a RadSec client (for example, a NAS device) to the RadSecProxy local-server application. The application will accept RADIUS requests from all configured clients.

Use the **no** variant of this command to delete a previously-configured client from the RadSecProxy local-server application.

**Syntax** `client {<hostname>|<ip-addr>} [name-check {on|off}]`  
`no client {<hostname>|<ip-addr>}`

| Parameter  | Description                                                                                                                                                                     |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <hostname> | Hostname of client.                                                                                                                                                             |
| <ip-addr>  | Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).                                                                                                          |
| name-check | Specify whether or not to enforce certificate name checking for this client. If the parameter is not specified then the global behavior, which defaults to <b>on</b> , is used. |
| on         | Enable name checking for this client.                                                                                                                                           |
| off        | Disable name checking for this client.                                                                                                                                          |

**Mode** RadSecProxy Local Server Configuration

**Usage** The client may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each client may be configured to use certificate name-checking; if not specified, the global behavior defined by **client name-check** or **no client name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in this command.

**NOTE:** *If mutual authentication is disabled then this parameter has no effect, see the [client mutual-authentication](#) command.*

**Example** To add a client called 'mynas.local' with certificate name checking **off**, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client mynas.local name-check
off
```

**Related Commands** [client mutual-authentication](#)  
[client name-check](#)

client trustpoint  
radius-secure-proxy local-server

# client mutual-authentication

**Overview** This command enables or disables mutual certificate authentication for all RadSecProxy clients. When enabled, the RadSecProxy local-server application will request and validate an X.509 certificate from the client when establishing a connection.

The **no** variant of this command disables mutual certificate validation. The local-server application will still transmit the local server certificate to the client, but will not expect or validate a certificate from the client.

**Syntax** `client mutual-authentication`  
`no client mutual-authentication`

**Default** Mutual authentication is enabled by default.

**Mode** RadSecProxy Local Server Configuration

**Example** Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# no client
mutual-authentication
```

**Related Commands** [client \(radsecproxy-srv\)](#)  
[client name-check](#)  
[radius-secure-proxy local-server](#)

**Command changes** Version 5.4.6-2.1: command added

# client name-check

**Overview** This command sets the global behavior for certificate name-checking for the RadSecProxy localserver application to **on**. This behavior will be used for all clients associated with the application that do not specify a behavior on a per-client basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **client (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

**Syntax** `client name-check`  
`no client name-check`

**Default** Certificate name checking is on by default.

**Mode** RadSecProxy Local Server Configuration

**Example** Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# no client name-check
```

**Related Commands** [client \(radsecproxy-srv\)](#)  
[client trustpoint](#)  
[radius-secure-proxy local-server](#)

# client trustpoint

**Overview** This command adds one or more trustpoints to be used with the RadSecProxy local-server application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** `client trustpoint [<trustpoint-list>]`  
`no client trustpoint [<trustpoint-list>]`

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| <trustpoint-list> | Specify one or more trustpoints to be added or deleted. |

**Mode** RadSecProxy Local Server Configuration

**Usage** The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no client trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints to the RadSecProxy local-server by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client trustpoint example_1
awplus(config-radsecproxy-srv)# client trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-srv)# client trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy local-server application using the command:

```
awplus(config-radsecproxy-srv)# no client trustpoint
```

**Related Commands** [client \(radsecproxy-srv\)](#)  
[client name-check](#)  
[radius-secure-proxy local-server](#)

# clear radius local-server statistics

**Overview** Use this command to clear the statistics stored on the device for the local RADIUS server.

Use this command without any parameters to clear all types of local RADIUS server statistics.

**Syntax** `clear radius local-server statistics [nas|server|user]`

| Parameter | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| nas       | Clear the NAS (Network Access Server) statistics on the device. For example, clearing statistics stored for NAS server invalid passwords.    |
| server    | Clear the Local RADIUS Server statistics on the device. For example, clearing Local RADIUS Servers statistics for all failed login attempts. |
| user      | Clear the Local RADIUS Server user statistics. For example, clearing statistics stored for the number of successful user logins.             |

**Mode** Privileged Exec

**Usage** Refer to the sample output for the [show radius local-server statistics](#) for further information about the type of statistics each parameter option for this command clears. Both the **nas** and **server** parameters clear unknown username and invalid passwords statistics, while the **user** parameter clears the number of successful and failed logins for each local RADIUS server user.

**Examples** To clear the NAS (Network Access Server) statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics nas
```

To clear the local RADIUS server statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics server
```

To clear the local RADIUS server user statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics user
```

**Related Commands** [show radius local-server statistics](#)

# copy fdb-radius-users (to file)

**Overview** Use this command to create a set of local RADIUS server users from MAC addresses in the local FDB. A local RADIUS server user created using this command can be used for MAC authentication.

**Syntax** `copy fdb-radius-users  
{local-radius-user-db|nvs|flash|usb|debug|tftp|scp|  
fserver|<url>} [interface <port>] [vlan <vid>] [group <name>]  
[export-vlan [<radius-group-name>]]`

| Parameter            | Description                                                                                                          |
|----------------------|----------------------------------------------------------------------------------------------------------------------|
| local-radius-user-db | Copy the local RADIUS server users created to the local RADIUS server.                                               |
| nvs                  | Copy the local RADIUS server users created to NVS memory.                                                            |
| flash                | Copy the local RADIUS server users created to Flash memory.                                                          |
| card                 | Copy the local RADIUS server users created to SD card.                                                               |
| usb                  | Copy the local RADIUS server users created to USB storage device.                                                    |
| debug                | Copy the local RADIUS server users created to debug.                                                                 |
| tftp                 | Copy the local RADIUS server users created to the TFTP destination.                                                  |
| scp                  | Copy the local RADIUS server users created to the SCP destination.                                                   |
| fserver              | Copy the local RADIUS server users created to the remote file server.                                                |
| <url>                | Copy the local RADIUS server users created to the specified URL.                                                     |
| interface <port>     | Copy only MAC addresses learned on a specified device port. Wildcards may be used when specifying an interface name. |
| vlan <vid>           | Copy only MAC addresses learned on a specified VLAN.                                                                 |
| group <name>         | Assign a group name to the local RADIUS server users created.                                                        |
| export-vlan          | Export VLAN ID assigned to exported FDB entry.                                                                       |
| <radius-group-name>  | Prefix for Radius group name storing VLAN ID                                                                         |

**Mode** Privileged Exec

**Usage** The local RADIUS server users created are written to a specified destination file in local RADIUS user CSV (Comma Separated Values) format. The local RADIUS server users can then be imported to a local RADIUS server using the [copy local-radius-user-db \(from file\)](#) command.

The name and password of the local RADIUS server users created use a MAC address, which can be used for MAC authentication.

This command does not copy a MAC address learned by the CPU or the management port.

This command can filter FDB entries by the interface name and the VLAN ID. When the interface name and the VLAN ID are specified, this command generates local RADIUS server users from only the MAC address learned on the specified interface and on the specified VLAN.

**Examples** To register the local RADIUS server users from the local FDB directly to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db
```

To register the local RADIUS server users from the interface `port1.0.1` to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db interface port1.0.1
```

To copy output generated as local RADIUS server user data from MAC addresses learned on `vlan10` on interface `port1.0.1` to the file `radius-user.csv`, use the command:

```
awplus# copy fdb-radius-users radius-user.csv interface port1.0.1 vlan10
```

To copy output generated as local RADIUS server user data from MAC addresses learned on `vlan10` on interface `port1.0.1` to a file on the remote file server, use the command:

```
awplus# copy fdb-radius-users fserver interface port1.0.1 vlan10
```

**Related Commands** [copy local-radius-user-db \(to file\)](#)  
[copy local-radius-user-db \(from file\)](#)

# copy local-radius-user-db (from file)

**Overview** Use this command to copy the Local RADIUS server user data from a file. The file, including the RADIUS user data in the file, must be in the CSV (Comma Separated Values) format.

You can select **add** or **replace** as the copy method. The **add** parameter option copies the contents of specified file to the local RADIUS server user database. If the same user exists then the old user is removed before adding a new user. The **replace** parameter option deletes all contents of the local RADIUS server user database before copying the contents of specified file.

**Syntax** `copy <source-url> local-radius-user-db [add|replace]`

| Parameter                       | Description                                                           |
|---------------------------------|-----------------------------------------------------------------------|
| <code>&lt;source-url&gt;</code> | URL of the source file.                                               |
| <code>add</code>                | Add file contents to local RADIUS server user database.               |
| <code>replace</code>            | Replace current local RADIUS server user database with file contents. |

**Default** When no copy method is specified with this command the **replace** option is applied.

**Mode** Privileged Exec

**Examples** To replace the current local RADIUS server user data to the contents of `http://datahost/ user.csv`, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db
```

To add the contents of `http://datahost/user.csv` to the current local RADIUS server user database, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db add
```

**Related commands** [copy fdb-radius-users \(to file\)](#)  
[copy local-radius-user-db \(to file\)](#)

# copy local-radius-user-db (to file)

**Overview** Use this command to copy the local RADIUS server user data to a file. The output file produced is CSV (Comma Separated Values) format.

**Syntax** `copy local-radius-user-db  
{nvs|flash|card|usb|tftp|scp|<destination-url>}`

| Parameter         | Description                  |
|-------------------|------------------------------|
| nvs               | Copy to NVS memory.          |
| flash             | Copy to Flash memory.        |
| card              | Copy to SD card.             |
| usb               | Copy to USB storage device.  |
| tftp              | Copy to TFTP destination.    |
| scp               | Copy to SCP destination.     |
| <destination-url> | URL of the Destination file. |

**Mode** Privileged Exec

**Example** Copy the current local RADIUS server user data to `http://datahost/user.csv`.

```
awplus# copy local-radius-user-db http://datahost/user.csv
```

```

Note that "local" is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

# debug crypto pki (deleted)

**Overview** This command is no longer available.

# domain-style

**Overview** Use this command to enable a specified domain style on the local RADIUS server. The local RADIUS server decodes the domain portion of a username login string when this command is enabled.

Use the **no** variant of this command to disable the specified domain style on the local RADIUS server.

**Syntax** `domain-style {suffix-atsign|ntdomain}`  
`no domain-style {suffix-atsign|ntdomain}`

| Parameter                  | Description                                                    |
|----------------------------|----------------------------------------------------------------|
| <code>suffix-atsign</code> | Enable at sign "@" delimited suffix style, i.e. "user@domain". |
| <code>ntdomain</code>      | Enable NT domain style, i.e. "domain\user".                    |

**Default** This feature is disabled by default.

**Mode** RADIUS Server Configuration

**Usage** When both domain styles are enabled, the first domain style configured has the highest priority. A username login string is matched against the first domain style enabled. Then, if the username login string is not decoded, it is matched against the second domain style enabled.

**Examples** To enable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# domain-style ntdomain
```

To disable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no domain-style ntdomain
```

**Related Commands** [server enable](#)

# egress-vlan-id

**Overview** Use this command to configure the standard RADIUS attribute “Egress-VLANID (56)” for the local RADIUS Server user group.

Use the **no** variant of this command to remove the Egress-VLANID attribute from the local RADIUS server user group.

**Syntax** `egress-vlan-id <vid> [tagged|untagged]`  
`no egress-vlan-id`

| Parameter | Description                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------|
| <vid>     | The VLAN identifier to be used for the Egress VLANID attribute, in the range 1 to 4094.                                           |
| tagged    | Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.         |
| untagged  | Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged. |

**Default** By default, no Egress-VLANID attributes are configured.

**Mode** RADIUS Server Group Configuration

**Examples** To set the “Egress-VLANID” attribute for the *NormalUsers* local RADIUS server user group to VLAN identifier 200, with tagged frames, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-id 200 tagged
```

To remove the “Egress-VLANID” attribute for the *NormalUsers* local RADIUS server user group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-id
```

**Related Commands** [attribute](#)  
[egress-vlan-name](#)

# egress-vlan-name

**Overview** Use this command to configure the standard RADIUS attribute “Egress-VLAN-Name (58)” for the local RADIUS server user group.

Use the **no** variant of this command to remove the Egress-VLAN-Name attribute from the local RADIUS server user group.

**Syntax** `egress-vlan-name <vlan-name> [tagged|untagged]`  
`no egress-vlan-name`

| Parameter                      | Description                                                                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;vlan-name&gt;</code> | The VLAN name to be configured as the Egress-VLAN-Name attribute.                                                                 |
| <code>tagged</code>            | Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.         |
| <code>untagged</code>          | Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged. |

**Default** By default, no Egress-VLAN-Name attributes are configured.

**Mode** RADIUS Server Group Configuration

**Examples** To configure the “Egress-VLAN-Name” attribute for the RADIUS server user group *NormalUsers* with the VLAN name *vlan2* and all frames on this VLAN tagged, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-name vlan2 tagged
```

To delete the “Egress-VLAN-Name” attribute for the *NormalUsers* group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-name
```

**Related Commands** [attribute](#)  
[egress-vlan-id](#)

# group

**Overview** Use this command to create a local RADIUS server user group, and enter local RADIUS Server User Group Configuration mode.

Use the **no** variant of this command to delete the local RADIUS server user group.

**Syntax** `group <user-group-name>`  
`no group <user-group-name>`

| Parameter                            | Description             |
|--------------------------------------|-------------------------|
| <code>&lt;user-group-name&gt;</code> | User group name string. |

**Mode** RADIUS Server Configuration

**Examples** The following command creates the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
```

The following command deletes user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no group NormalUsers
```

[show radius local-server user](#)  
[vlan \(RADIUS server\)](#)

# nas

**Overview** This command adds a client device (the Network Access Server or the NAS) to the list of devices that are able to send authentication requests to the local RADIUS server. The NAS is identified by its IP address and a shared secret (also referred to as a shared key) must be defined that the NAS will use to establish its identity.

Use the **no** variant of this command to remove a NAS client from the list of devices that are allowed to send authentication requests to the local RADIUS server.

**Syntax** `nas <ip-address> key <nas-keystring>`  
`no nas <ip-address>`

| Parameter                          | Description            |
|------------------------------------|------------------------|
| <code>&lt;ip-address&gt;</code>    | RADIUS NAS IP address. |
| <code>&lt;nas-keystring&gt;</code> | NAS shared keystring.  |

**Mode** RADIUS Server Configuration

**Examples** The following commands add the NAS with an IP address of 192.168.1.2 to the list of clients that may send authentication requests to the local RADIUS server. Note the shared key that this NAS will use to establish its identify is NAS\_PASSWORD.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# nas 192.168.1.2 key NAS_PASSWORD
```

The following commands remove the NAS with an IP address of 192.168.1.2 from the list of clients that are allowed to send authentication requests to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no nas 192.168.1.2
```

**Related Commands** [show radius local-server nas](#)

# radius-secure-proxy local-server

**Overview** Use this command to enter the RadSecProxy local-server application configuration mode. This application allows remote RadSec clients to communicate with the local RADIUS server process via a secure (TLS) proxy.

**Syntax** `radius-secure-proxy local-server`

**Mode** Global Configuration Mode

**Example** To change mode from User Exec mode to the RadSecProxy local-server configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)#
```

**Related Commands**

- [client \(radsecproxy-srv\)](#)
- [client name-check](#)
- [client trustpoint](#)

# radius-server local

**Overview** Use this command to navigate to the Local RADIUS server configuration mode (`config-radsrv`) from the Global Configuration mode (`config`).

**Syntax** `radius-server local`

**Mode** Global Configuration

**Example** Local RADIUS Server commands are available from `config-radsrv` configuration mode. To change mode from User Exec mode to the Local RADIUS Server mode (`config-radsrv`), use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)#
```

## Output

```
awplus(config)#radius-server local
Creating Local CA repository.....OK
Enrolling Local System to local trustpoint..OK
awplus(config-radsrv)#
```

**Related Commands**

# server auth-port

**Overview** Use this command to change the UDP port number for local RADIUS server authentication.

Use the **no** variant of this command to reset the RADIUS server authentication port back to the default.

**Syntax** `server auth-port <1-65535>`  
`no server auth-port`

| Parameter | Description      |
|-----------|------------------|
| <1-65535> | UDP port number. |

**Default** The default local RADIUS server UDP authentication port number is 1812.

**Mode** RADIUS Server Configuration

**Examples** The following commands set the RADIUS server authentication port to 10000.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server auth-port 10000
```

The following commands reset the RADIUS server authentication port back to the default UDP port of 1812.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server auth-port
```

**Related Commands** [server enable](#)  
[show radius local-server statistics](#)

# server enable

**Overview** This command enables the local RADIUS server. The local RADIUS server feature is started immediately when this command is issued.

The **no** variant of this command disables local RADIUS server. When this command is issued, the local RADIUS server stops operating.

**Syntax** `server enable`  
`no server enable`

**Default** The local RADIUS server is disabled by default and must be enabled for use with this command.

**Mode** RADIUS Server Configuration

**Examples** To enable the local RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server enable
```

To disable the local RADIUS server, use the command:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server enable
```

**Related Commands** [server auth-port](#)

# show crypto pki certificates (deleted)

**Overview** This command is no longer available. Please use the following command instead:

```
show crypto pki certificates <trustpoint>
```

Note that "local" is a valid name for a trustpoint.

# show crypto pki certificates local-radius-all-users (deleted)

**Overview** This command is no longer available because user certificates are not stored on the system; they are generated for export and then removed.

# show crypto pki certificates user (deleted)

**Overview** This command is no longer available because user certificates are not stored on the system; they are generated for export and then removed.

# show crypto pki trustpoints (deleted)

**Overview** This command is no longer available. Please use the following command instead:

```
show crypto pki trustpoint [<trustpoint>]
```

Note that "local" is a valid name for a trustpoint.

# show radius local-server group

**Overview** Use this command to display information about the local RADIUS server user group.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show radius local-server group [<user-group-name>]`

| Parameter         | Description             |
|-------------------|-------------------------|
| <user-group-name> | User group name string. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays Local RADIUS server user group information.

```
awplus# show radius local-server group
```

## Output

**Table 1:** Example output from the **show radius local-server group** command

|                  |               |
|------------------|---------------|
| Group-Name       | Vlan          |
| -----            |               |
| NetworkOperators | ManagementNet |
| NormalUsers      | CommonNet     |

**Table 2:** Parameters in the output of the **show radius local-server group** command

| Parameter  | Description                      |
|------------|----------------------------------|
| Group-Name | Group name.                      |
| Vlan       | VLAN name assigned to the group. |

**Related Commands** [group](#)

# show radius local-server nas

**Overview** Use this command to display information about NAS (Network Access Servers) registered to the local RADIUS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show radius local-server nas [<ip-address>]`

| Parameter    | Description                             |
|--------------|-----------------------------------------|
| <ip-address> | Specify NAS IP address for show output. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays NAS information.

```
awplus# show radius local-server nas
```

## Output

**Table 3:** Example output from the **show radius local-server nas** command

| NAS-Address | Shared-Key                 |
|-------------|----------------------------|
| 127.0.0.1   | awplus-local-radius-server |

**Table 4:** Parameters in the output of the **show radius local-server nas** command

| Parameter   | Description                            |
|-------------|----------------------------------------|
| NAS-Address | IP address of NAS.                     |
| Shared-Key  | Shared key used for RADIUS connection. |

**Related Commands** [nas](#)

# show radius local-server statistics

**Overview** Use this command to display statistics about the local RADIUS server.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show radius local-server statistics`

**Mode** User Exec and Privileged Exec

**Usage** Both unknown usernames and invalid passwords will display as failed logins in the show output.

**Example** The following command displays Local RADIUS server statistics.

```
awplus# show radius local-server statistics
```

## Output

**Table 5:** Example output from the **show radius local-server statistics** command

```
Server status : Run (administrative status is enable)

# show radius local-server user

**Overview** Use this command to display information about the local RADIUS server user.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show radius local-server user [<user-name>]`  
`show radius local-server user <user-name> format csv`

| Parameter   | Description                                                                             |
|-------------|-----------------------------------------------------------------------------------------|
| <user-name> | RADIUS user name. If no user name is specified, information for all users is displayed. |
| format      | File format.                                                                            |
| csv         | Comma separated value format.                                                           |

**Mode** User Exec and Privileged Exec

**Examples** The following command displays Local RADIUS server user information for user Tom.

```
awplus# show radius local-server user Tom
```

**Table 6:** Example output from the **show radius local-server user** command

| User-Name | Password | Group            | Vlan          |
|-----------|----------|------------------|---------------|
| Tom       | abcd     | NetworkOperators | ManagementNet |

The following command displays all Local RADIUS server information for all users.

```
awplus# show radius local-server user
```

The following command displays Local RADIUS server user information for Tom in CSV format.

```
awplus# show radius local-server user Tom format csv
```

**Table 7:** Example output from the **show radius local-server user csv** command

|                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------|

|-----------------------------------------------------------------------------------------------------------------|

**Table 8:** Parameters in the output from the **show radius local-server user** command

| Parameter | Description                      |
|-----------|----------------------------------|
| User-Name | User name.                       |
| Password  | User password.                   |
| Group     | Group name assigned to the user. |
| Vlan      | VLAN name assigned to the user.  |

**Related Commands** [group](#)  
[user \(RADIUS server\)](#)

# user (RADIUS server)

**Overview** Use this command to register a user to the local RADIUS server.  
Use the **no** variant of this command to delete a user from the local RADIUS server.

**Syntax** `user <radius-user-name> [encrypted] password <user-password>  
[group <user-group>]`  
`no user <radius-user-name>`

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;radius-user-name&gt;</code> | RADIUS user name. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.                                                                                                                                                                                                                                                                                                                                                                           |
| <code>encrypted</code>                | Specifies that the password is being entered in its encrypted form, so that it is not further encrypted. When creating a new user, enter the password in plaintext, and do not use the <b>encrypted</b> parameter. Use the <b>encrypted</b> parameter only when referring to a user that has previously been created. For instance, when adding an existing user from another RADIUS server, use the <b>encrypted</b> parameter, and enter the encrypted version of the password that appears in the output of <b>show</b> commands for the user. |
| <code>&lt;user-password&gt;</code>    | User password. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.                                                                                                                                                                                                                                                                                                                                                                              |
| <code>group</code>                    | Specify the group for the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>&lt;user-group&gt;</code>       | User group name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Mode** RADIUS Server Configuration

**Usage** RADIUS user names cannot contain question mark (?), space ( ), or quote (" ") characters. RADIUS user names containing the below characters cannot use certificate authentication:

`/ \ '$ & () * ; < > ` |`

Certificates cannot be created and exported for RADIUS user names that contain the above characters. We advise you to avoid using these characters in RADIUS user names if you need to use certificate authentication, because you will not be able to create and export certificates.

You also can use the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) to specify a supplicant MAC address to configure the user name and user password parameters to use local RADIUS server for MAC Authentication. See the [AAA and Port\\_Authentication Feature Overview and Configuration\\_Guide](#) for a sample MAC configuration. See also the command **user**

**00-db-59-ab-70-37 password 00-db-59-ab-70-37** as shown in the command examples.

**Examples** The following commands add user "Tom" to the local RADIUS server and sets his password to "QwerSD".

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD
```

The following commands add user "Tom" to the local RADIUS server user group "NormalUsers" and sets his password "QwerSD".

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD group
NormalUsers
```

The following commands remove user "Tom" from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user Tom
```

The following commands add the supplicant MAC address 00-d0-59-ab-70-37 to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user 00-db-59-ab-70-37 password
00-db-59-ab-70-37
```

The following commands remove the supplicant MAC address 00-d0-59-ab-70-37 from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user 00-db-59-ab-70-37
```

**Related Commands** [group](#)  
[show radius local-server user](#)

# vlan (RADIUS server)

**Overview** Use this command to set the VLAN ID or name for the local RADIUS server user group. The VLAN information is used for authentication with the dynamic VLAN feature.

Use the **no** variant of this command to clear the VLAN ID or VLAN name for the local RADIUS server user group.

**Syntax** `vlan {<vid>|<vlan-name>}`  
`no vlan`

| Parameter                      | Description |
|--------------------------------|-------------|
| <code>&lt;vid&gt;</code>       | VLAN ID.    |
| <code>&lt;vlan-name&gt;</code> | VLAN name.  |

**Default** VLAN information is not set by default.

**Mode** RADIUS Server Group Configuration

**Examples** The following commands set VLAN ID 200 to the group named *NormalUsers*:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# vlan 200
```

The following commands remove VLAN ID 200 from the group named *NormalUsers*:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no vlan
```

# crypto key generate rsa

**Overview** Use this command to generate a cryptographic public/private key pair for the Rivest-Shamir-Adleman (RSA) encryption algorithm.

**Syntax** `crypto key generate rsa [label <keylabel>] [<1024-4096>]`

| Parameter                      | Description                                                                                                                                                                                                                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;keylabel&gt;</code>  | The name of the key to be created. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. If no label is specified the default value "server-default" is used. |
| <code>&lt;1024-4096&gt;</code> | The bit length for the key. If no bit length is specified the default of 2048 is used.                                                                                                                                                                                                      |

**Mode** Privileged Exec

**Usage** The generated key may be used for multiple server certificates in the system. A key is referenced by its label. A bit length between 1024 and 4096 bits may be specified. Larger bit lengths are more secure, but require more computation time. The specified key must not already exist.

**Example** To create a key with the label "example-server-key" and a bit length of 2048, use the commands:

```
awplus> enable
awplus# crypto key generate rsa label example-server-key 2048
```

**Related Commands** [crypto key zeroize](#)  
[rsakeypair \(trustpoint configuration mode\)](#)  
[show crypto key mypubkey rsa](#)

# crypto key zeroize

**Overview** Use this command to delete one or all cryptographic public/private key pairs.

**Syntax** `crypto key zeroize rsa <keylabel>`  
`crypto key zeroize all`

| Parameter                         | Description                                                                        |
|-----------------------------------|------------------------------------------------------------------------------------|
| <code>rsa &lt;keylabel&gt;</code> | Delete a single key pair for the Rivest-Shamir-Adleman (RSA) encryption algorithm. |
| <code>all</code>                  | Delete all keys.                                                                   |

**Mode** Privileged Exec

**Usage** Note that this command has the same effect as using the **delete** command (it deletes the file from Flash memory but does not overwrite it with zeros).

The specified key must exist but must not be in use for any existing server certificates.

A key may not be deleted if it is associated with the server certificate or server certificate signing request for an existing trustpoint. To remove a server certificate so that the key may be deleted, use the **no crypto pki enroll** command to de-enroll the server.

**Example** To delete an RSA key named "example-server-key", use the following command:

```
awplus# crypto key zeroize rsa example-server-key
```

**Related Commands** [crypto key generate rsa](#)  
[show crypto key mypubkey rsa](#)

# crypto pki authenticate

**Overview** Use this command to authenticate a trustpoint by generating or importing the root CA certificate. This must be done before the server can be enrolled to the trustpoint.

**Syntax** `crypto pki authenticate <trustpoint>`

| Parameter                       | Description                                     |
|---------------------------------|-------------------------------------------------|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint to be authenticated. |

**Mode** Privileged Exec

**Usage** If the trustpoint's **enrollment** setting is "selfsigned", then this command causes a private key to be generated for the root CA, and a self-signed certificate to be generated based on that key.

If the trustpoint's **enrollment** setting is "terminal", then this command prompts the user to paste a certificate Privacy Enhanced Mail (PEM) file at the CLI terminal. If the certificate is a valid selfsigned CA certificate, then it will be stored as the trustpoint's root CA certificate.

The specified trustpoint must already exist, and its enrollment mode must have been defined.

**Example** To show the **enrollment** setting of a trustpoint named "example" and then generate a certificate from it, use the commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# enrollment selfsigned
awplus(config)# exit
awplus# exit
awplus# crypto pki authenticate example
```

**Related Commands**

- [crypto pki import pem](#)
- [crypto pki trustpoint](#)
- [enrollment \(trustpoint configuration mode\)](#)

# crypto pki enroll

**Overview** Use this command to enroll the local server to the specified trustpoint.  
Use the **no** variant of this command to de-enroll the server by removing its certificate

**Syntax** `crypto pki enroll <trustpoint>`  
`no crypto pki enroll <trustpoint>`

| Parameter                       | Description                               |
|---------------------------------|-------------------------------------------|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint to be enrolled |

**Mode** Privileged Exec

**Usage** For the local server, “enrollment” is the process of creating of a certificate for the server that has been signed by a CA associated with the trustpoint. The public portion of the RSA key pair specified using the `rsa` parameter for the trustpoint will be included in the server certificate.

If the trustpoint represents a locally self-signed certificate authority, then this command results in the direct generation of the server certificate, signed by the root CA for the trustpoint.

If the trustpoint represents an external certificate authority, then this command results in the generation of a Certificate Signing Request (CSR) file, which is displayed at the terminal in Privacy-Enhanced Mail (PEM) format, suitable for copying and pasting into a file or message. The CSR must be sent to the external CA for processing. When the CA replies with the signed certificate, that certificate should be imported using the `crypto pki import pem` command, to complete the enrollment process.

The specified trustpoint must already exist, and it must already be authenticated.

**Example** To enroll the local server with the trustpoint “example”, use the following commands:

```
awplus> enable
awplus# crypto pki enroll example
```

**Related Commands**

- [crypto pki enroll user](#)
- [crypto pki import pem](#)
- [crypto pki trustpoint](#)
- [enrollment \(trustpoint configuration mode\)](#)

# crypto pki enroll user

**Overview** Use this command to enroll a single RADIUS user or all RADIUS users to the specified trustpoint.

Use the **no** variant of this command to remove the PKCS#12 file from the system. Note that the PKCS#12 files are generated in a temporary (volatile) file system, so a system restart also results in removal of all of the files.

**Syntax**

```
crypto pki enroll <trustpoint>
{user <username>|local-radius-all-users}

no crypto pki enroll <trustpoint>
{user <username>|local-radius-all-users}
```

| Parameter    | Description                                                   |
|--------------|---------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint to which users are to be enrolled. |
| <username>   | The name of the user to enroll to the trustpoint.             |

**Mode** Privileged Exec

**Usage** For RADIUS users, “enrollment” is the process of generating a private key and a corresponding client certificate for each user, with the certificate signed by the root CA for the trustpoint. The resulting certificates may be exported to client devices, for use with PEAP or EAP-TLS authentication with the local RADIUS server.

The specified trustpoint must represent a locally self-signed certificate authority.

The private key and certificate are packaged into a PKCS#12-formatted file, suitable for export using the **crypto pki export pkcs12** command. The private key is encrypted for security, with a passphrase that is entered at the command line. The passphrase is required when the PKCS#12 file is imported on the client system. The passphrase is not stored anywhere on the device, so users are responsible for remembering it until the export-import process is complete.

If **local-radius-all-users** is specified instead of an individual user, then keys and certificates for all RADIUS users will be generated at once. All the keys will be encrypted using the same passphrase.

The specified trustpoint must already exist, it must represent a locally self-signed CA, and it must already have been authenticated.

**Example** To enroll the user “example-user” with the trustpoint “example”, use the following commands:

```
awplus> enable
awplus# crypto pki enroll example user example-user
```

To enroll all local RADIUS users with the trustpoint "example", use the following commands:

```
awplus> enable
```

```
awplus# crypto pki enroll example local-radius-all-users
```

**Related  
Commands** [crypto pki export pkcs12](#)  
[crypto pki trustpoint](#)

# crypto pki export pem

**Overview** Use this command to export the root CA certificate for the given trustpoint to a file in Privacy-Enhanced Mail (PEM) format. The file may be transferred to the specified destination URL, or displayed at the terminal.

**Syntax** `crypto pki export <trustpoint> pem [terminal|<url>]`

| Parameter                       | Description                                                                     |
|---------------------------------|---------------------------------------------------------------------------------|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint for which the root CA certificate is to be exported. |
| <code>terminal</code>           | Display the PEM file to the terminal.                                           |
| <code>&lt;url&gt;</code>        | Transfer the PEM file to the specified URL.                                     |

**Default** The PEM will be displayed to the terminal by default.

**Mode** Privileged Exec

**Usage** The specified trustpoint must already exist, and it must already be authenticated.

**Example** To display the PEM file for the trustpoint "example" to the terminal, use the following commands:

```
awplus> enable
awplus# crypto pki export example pem terminal
```

To export the PEM file "example.pem" for the trustpoint "example" to the URL "tftp://server\_a/", use the following commands:

```
awplus> enable
awplus# crypto pki export example pem
tftp://server_a/example.pem
```

**Related Commands**

- [crypto pki authenticate](#)
- [crypto pki import pem](#)
- [crypto pki trustpoint](#)

# crypto pki export pkcs12

**Overview** Use this command to export a certificate and private key for an entity in a trustpoint to a file in PKCS#12 format at the specified URL. The private key is encrypted with a passphrase for security.

**Syntax** `crypto pki export <trustpoint> pkcs12 {ca|server|<username>} <url>`

| Parameter    | Description                                                                                                                                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint for which the certificate and key are to be exported.                                                                                                                                                                   |
| ca           | If this option is specified, the command exports the root CA certificate and corresponding key.                                                                                                                                                    |
| server       | If this option is specified, the command exports the server certificate and corresponding key.                                                                                                                                                     |
| <username>   | If a RADIUS username is specified, the command exports the PKCS#12 file that was previously generated using the <code>crypto pki enroll user</code> command. To avoid ambiguity with keywords, the username may be prefixed by the string "user:". |
| <url>        | The destination URL for the PKCS#12 file. The format of the URL is the same as any valid destination for a file copy command.                                                                                                                      |

**Mode** Privileged Exec

**Usage** If the **ca** option is specified, this command exports the root CA certificate and the corresponding private key, if the trustpoint has been authenticated as a locally selfsigned CA. (If the trustpoint represents an external CA, then there is no private key on the system corresponding to the root CA certificate. Use the **crypto pki export pem** file to export the certificate by itself.) The command prompts for a passphrase to encrypt the private key.

If the **server** option is specified, this command exports the server certificate and the corresponding private key, if the server has been enrolled to the trustpoint. The command prompts for a passphrase to encrypt the private key.

If a RADIUS username is specified, this command exports the PKCS#12 file that was generated using the **crypto pki enroll user** command. (The key within the file was already encrypted as part of the user enrollment process.)

In the event that there is a RADIUS user named "ca" or "server", enter "user:ca" or "user:server" as the username.

The key and certificate must already exist.

**Example** To export the PKCS#12 file "example.pk12" for the trustpoint "example" to the URL "tftp://backup/", use the following commands:

```
awplus> enable
awplus# crypto pki export example pkcs12 ca
tftp://backup/example.pk12
```

**Related  
Commands**

- crypto pki enroll user
- crypto pki export pem
- crypto pki import pkcs12

# crypto pki import pem

**Overview** This command imports a certificate for the given trustpoint from a file in Privacy-Enhanced Mail (PEM) format. The file may be transferred from the specified destination URL, or entered at the terminal.

**Syntax** `crypto pki import <trustpoint> pem [terminal|<url>]`

| Parameter                       | Description                                                                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint for which the root CA certificate is to be imported.                                                                                            |
| <code>terminal</code>           | Optional parameter, If specified, the command prompts the user to enter (or paste) the PEM file at the terminal. If parameter is specified terminal is assumed by default. |
| <code>&lt;url&gt;</code>        | Optional parameter, If specified, the PEM file is transferred from the specified URL                                                                                       |

**Default** The PEM will be imported from the terminal by default.

**Mode** Privileged Exec

**Usage** The command is generally used for trustpoints representing external certificate authorities. It accepts root CA certificates, intermediate CA certificates, and server certificates. The system automatically detects the certificate type upon import.

Using this command to import root CA certificates at the terminal is identical to the functionality provided by the `crypto pki authenticate` command, for external certificate authorities. The imported certificate is validated to ensure it is a proper CA certificate.

Intermediate CA certificates are validated to ensure they are proper CA certificates, and that the issuer chain ends in a root CA certificate already installed for the trustpoint. If there is no root CA certificate for the trustpoint (i.e., if the trustpoint is unauthenticated) then intermediate CA certificates may not be imported.

Server certificates are validated to ensure that the issuer chain ends in a root CA certificate already installed for the trustpoint. If there is no root CA certificate for the trustpoint (i.e., if the trustpoint is unauthenticated) then server certificates may not be imported.

The specified trustpoint must already exist. If the imported certificate is self-signed, then no certificates may exist for the trustpoint. Otherwise, the issuer's certificate must already be present for the trustpoint.

**Example** To import the PEM file for the trustpoint "example" from the terminal, use the following commands:

```
awplus> enable
awplus# crypto pki import example pem
```

To import the PEM file for the trustpoint "example" from the URL "tftp://server\_a/", use the following commands:

```
awplus> enable
awplus# crypto pki import example pem
tftp://server_a/example.pem
```

**Related  
Commands**

- crypto pki authenticate
- crypto pki export pem
- crypto pki trustpoint

# crypto pki import pkcs12

**Overview** This command imports a certificate and private key for an entity in a trustpoint from a file in PKCS#12 format at the specified URL. The command prompts for a passphrase to decrypt the private key within the file.

**Syntax** `crypto pki import <trustpoint> pkcs12 {ca|server} <url>`

| Parameter    | Description                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint for which the certificate and key are to be imported.                                         |
| ca           | If this option is specified, the command imports the root CA certificate and corresponding key.                          |
| server       | If this option is specified, the command imports the server certificate and corresponding key.                           |
| <url>        | The source URL for the PKCS#12 file. The format of the URL is the same as any valid destination for a file copy command. |

**Mode** Privileged Exec

**Usage** If the **ca** option is specified, this command imports the root CA certificate and the corresponding private key. This is only valid if the root CA certificate does not already exist for the trustpoint (i.e., if the trustpoint is unauthenticated).

If the **server** option is specified, this command imports the server certificate and the corresponding private key. The imported private key is given a new unique label of the form "localN", where N is a non-negative integer. This operation is only valid if the server certificate does not already exist for the trustpoint (i.e., if the server is not enrolled to the trustpoint).

PKCS#12 files for RADIUS users may not be imported with this command. (There is no value in doing so, as the files are not needed on the local system.)

The specified trustpoint must already exist. The key and certificate must not already exist.

**Example** To import the PKCS#12 file "example.pk12" for the trustpoint "example" to the URL "tftp://backup/", use the following commands:

```
awplus> enable
awplus# crypto pki import example pkcs12 ca
tftp://backup/example.pk12
```

**Related Commands** [crypto pki export pkcs12](#)  
[crypto pki import pem](#)

# crypto pki trustpoint

**Overview** Use this command to declare the named trustpoint and enter trustpoint configuration mode.

Use the **no** variant of this command to destroy the trustpoint.

**Syntax** `crypto pki trustpoint <trustpoint>`  
`no crypto pki trustpoint <trustpoint>`

| Parameter                       | Description                                                                                                                                                                                                     |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. |

**Mode** Global Configuration

**Usage** If the trustpoint did not previously exist, it is created as a new trustpoint. The trustpoint will be empty (unauthenticated) unless the name "local" is selected, in which case the system will automatically authenticate the trustpoint as a local self-signed certificate authority.

The **no** variant of this command destroys the trustpoint by removing all CA and server certificates associated with the trustpoint, as well as the private key associated with the root certificate (if the root certificate was locally self-signed). This is a destructive and irreversible operation, so this command should be used with caution.

**Example** To configure a trustpoint named "example", use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
```

**Related Commands** [show crypto pki certificates](#)  
[show crypto pki trustpoint](#)

# enrollment (trustpoint configuration mode)

**Overview** Use this command to declare how certificates will be added to the system for the current trustpoint.

**Syntax** `enrollment {selfsigned|terminal}`

| Parameter               | Description                                                        |
|-------------------------|--------------------------------------------------------------------|
| <code>selfsigned</code> | Sets the enrollment mode for the current trustpoint to selfsigned. |
| <code>terminal</code>   | Sets the enrollment mode for the current trustpoint to terminal.   |

**Mode** Trustpoint Configuration

**Usage** If the enrollment is set to **selfsigned**, then the system will generate a root CA certificate and its associated key when the **crypto pki authenticate** command is issued. It will generate a server certificate (signed by the root CA certificate) when the **crypto pki enroll** command is issued.

If the enrollment is set to **terminal**, then the system will prompt the user to paste the root CA certificate Privacy Enhanced Mail (PEM) file at the terminal, when the **crypto pki authenticate** command is issued. It will create a Certificate Signing Request (CSR) file for the local server when the **crypto pki enroll** command is issued. The server certificate received from the external CA should be imported using the **crypto pki import pem** command.

The trustpoint named "local" may only use the **selfsigned** enrollment setting.

If no enrollment mode is specified, the **crypto pki authenticate** command will fail for the trustpoint.

**Example** To configure the trustpoint named "example" and set its enrollment to **selfsigned**, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# enrollment selfsigned
```

**Related Commands** [crypto pki enroll](#)

# fingerprint (trustpoint configuration mode)

**Overview** Use this command to declare that certificates with the specified fingerprint should be automatically accepted, when importing certificates from an external certificate authority. This can affect the behavior of the **crypto pki authenticate** and **crypto pki import pem** commands.

Use the **no** variant of this command to remove the specified fingerprint from the pre-accepted list.

**Syntax** fingerprint <word>  
no fingerprint <word>

| Parameter | Description                                                                                                     |
|-----------|-----------------------------------------------------------------------------------------------------------------|
| <word>    | The fingerprint as a series of 40 hexadecimal characters, optionally separated into multiple character strings. |

**Default** By default, no fingerprints are pre-accepted for the trustpoint.

**Mode** Trustpoint Configuration

**Usage** Specifying a fingerprint adds it to a list of pre-accepted fingerprints for the trustpoint. When a certificate is imported, if it matches any of the pre-accepted values, then it will be saved in the system automatically. If the imported certificate's fingerprint does not match any pre-accepted value, then the user will be prompted to verify the certificate contents and fingerprint visually.

This command is useful when certificates from an external certificate authority are being transmitted over an insecure channel. If the certificate fingerprint is delivered via a separate messaging channel, then pre-entering the fingerprint value via cut-and-paste may be less errorprone than attempting to verify the fingerprint value visually.

The fingerprint is a series of 40 hexadecimal characters. It may be entered as a continuous string, or as a series of up to multiple strings separated by spaces. The input format is flexible because different certificate authorities may provide the fingerprint string in different formats.

**Example** To configure a fingerprint "5A81D34C 759CC4DA CFCA9F65 0303AD83 410B03AF" for the trustpoint named "example", use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# fingerprint 5A81D34C 759CC4DA CFCA9F65
0303AD83 410B03AF
```

**Related Commands** [crypto pki authenticate](#)

`crypto pki import pem`

# no crypto pki certificate

**Overview** Use this command to delete a certificate with the specified fingerprint from the specified trustpoint.

**Syntax** no crypto pki certificate *<trustpoint>* *<word>*

| Parameter                 | Description                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------|
| <i>&lt;trustpoint&gt;</i> | The name of the trustpoint.                                                                                     |
| <i>&lt;word&gt;</i>       | The fingerprint as a series of 40 hexadecimal characters, optionally separated into multiple character strings. |

**Default** By default, no fingerprints are pre-accepted for the trustpoint.

**Mode** Privileged Exec

**Usage** The fingerprint can be found in the output of the **show crypto pki certificates** command. If there are dependent certificates in the trustpoint (i.e., if other certificates were signed by the specified certificate), the command will be rejected. If the specified certificate is the root CA certificate and the trustpoint represents a locally selfsigned CA, then the corresponding private key is also deleted from the system. Deleting the root CA certificate effectively resets the trustpoint to an unauthenticated state.

**Example** To delete a certificate with the fingerprint "594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792" from the trustpoint "example", use the following commands:

```
awplus> enable
awplus# no crypto pki certificate example
594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792
```

**Related Commands** [no crypto pki trustpoint](#)  
[show crypto pki certificates](#)

# rsakeypair (trustpoint configuration mode)

**Overview** Use this command to declare which RSA key pair should be used to enroll the local server with the trustpoint. Note that this defines the key pair used with the server certificate, not the key pair used with the root CA certificate.

Use the **no** variant of this command to restore the default value, "server-default".

**Syntax** `rsakeypair <keylabel> [<1024-4096>]`  
`no rsakeypair`

| Parameter                      | Description                                                                                                                                                                                                                                             |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;keylabel&gt;</code>  | The key to be used with the server certificate for this trustpoint. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. |
| <code>&lt;1024-4096&gt;</code> | The bit length for the key, to be used if the key is implicitly generated during server enrollment.                                                                                                                                                     |

**Default** The default value for **keylabel** is "server-default".  
The default value for the key bit length is 2048.

**Mode** Trustpoint Configuration

**Usage** If the label specified does not refer to an existing key created by the **crypto key generate rsa** command, the key will be implicitly generated when the **crypto pki enroll** command is issued to generate the server certificate or the server certificate signing request. The optional numeric parameter defines the bit length for the key, and is only applicable for keys that are implicitly created during enrollment.

This command does not affect server certificates or server certificate signing requests that have already been generated. The trustpoint's server certificate is set to use whatever key pair was specified for the trustpoint at the time the **crypto pki enroll** command is issued.

The default key pair is "server-default". The default bit length is 2048 bits.

**Example** To configure trustpoint "example" to use the key pair "example-server-key" with a bit length of 2048, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# rsakeypair example-server-key 2048
```

**Related Commands** [crypto key generate rsa](#)

# show crypto key mypubkey rsa

**Overview** Use this command to display information about the specified Rivest-Shamir-Adleman encryption key.

**Syntax** `show crypto key mypubkey rsa [<keylabel>]`

| Parameter  | Description                                    |
|------------|------------------------------------------------|
| <keylabel> | The name of the key to be shown, if specified. |

**Default** By default, all keys will be shown.

**Mode** Privileged Exec

**Usage** If no key label is specified, information about all keys is shown. The command displays the bit length of the key, a key fingerprint (a hash of the key contents to help uniquely identify a key), and a list of trustpoints in which the server certificate is using the key.

The specified keys must exist.

**Example** To show all keys, use the following commands:

```
awplus> enable
awplus# show crypto key mypubkey rsa
```

**Output** Figure 46-1: Example output from **show crypto key mypubkey rsa**

```
awplus#show crypto key mypubkey rsa

RSA Key Pair "example-server-key":
 Key size : 2048 bits
 Fingerprint : 1A605D73 C2274CB7 853886B3 1C802FC6 7CDE45FB
 Trustpoints : example

RSA Key Pair "server-default":
 Key size : 2048 bits
 Fingerprint : 34AC4D2D 5249A168 29D426A3 434FFC59 C4A19901
 Trustpoints : local
```

**Related Commands** [crypto key generate rsa](#)

# show crypto pki certificates

**Overview** Use this command to display information about existing certificates for the specified trustpoint.

**Syntax** `show crypto pki certificates [<trustpoint>]`

| Parameter                       | Description                                                |
|---------------------------------|------------------------------------------------------------|
| <code>&lt;trustpoint&gt;</code> | The trustpoint for which the certificates are to be shown. |

**Default** By default, the certificates for all trustpoints are shown.

**Mode** Privileged Exec

**Usage** If no trustpoint is specified, certificates for all trustpoints are shown. The command displays the certificates organized into certificate chains. It starts with the server certificate and then displays its issuer, and continues up the issuer chain until the root CA certificate is reached.

For each certificate, the command displays the certificate type, the subject's distinguished name (the entity identified by the certificate), the issuer's distinguished name (the entity that signed the certificate), the validity dates for the certificate, and the fingerprint of the certificate. The fingerprint is a cryptographic hash of the certificate contents that uniquely identifies the certificate.

The specified trustpoints must already exist.

**Example** To show the certificates for the trustpoint "example", use the following command:

```
awplus> enable
awplus# show crypto pki certificates example
```

**Output** Figure 46-2: Example output from **show crypto pki certificates**

```
awplus>enable
awplus#show crypto pki certificates example

Trustpoint "example" Certificate Chain

Server certificate
 Subject : /O=local/CN=local.loc.lc
 Issuer : /C=NZ/CN=local_Signing_CA
 Valid From : Nov 11 15:35:21 2015 GMT
 Valid To : Aug 31 15:35:21 2018 GMT
 Fingerprint : 5A81D34C 759CC4DA CFCA9F65 0303AD83 410B03AF
Intermediate CA certificate
 Subject : /C=NZ/CN=example_Signing_CA
 Issuer : /C=NZ/CN=example_Root_CA
 Valid From : Sep 3 18:45:01 2015 GMT
 Valid To : Oct 10 18:45:01 2020 GMT
 Fingerprint : AE2D5850 9867D258 ABBEE95E 2E0E3D81 60714920
Imported root certificate
 Subject : /C=NZ/CN=example_Root_CA
 Issuer : /C=NZ/CN=example_Root_CA
 Valid From : Jul 23 18:12:10 2015 GMT
 Valid To : May 12 18:12:10 2025 GMT
 Fingerprint : 594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792
```

**Related Commands** [crypto pki trustpoint](#)

# show crypto pki enrollment user

**Overview** Use this command to display a list of trustpoints for which RADIUS user enrollments have been performed, using the **crypto pki enroll user** command. This indicates that PKCS#12 files for the user are available for export for the given trustpoints, using the **crypto pki export pkcs12** command.

**Syntax** `crypto pki enrollment user <username>`

| Parameter                     | Description                                     |
|-------------------------------|-------------------------------------------------|
| <code>&lt;username&gt;</code> | The user for which enrollments are to be shown. |

**Mode** Privileged Exec

**Example** To show the list of trustpoints to which user "exampleuser1" is enrolled, use the following commands:

```
awplus> enable
awplus(config)# show crypto pki enrollment user exampleuser1
```

**Output** Figure 46-3: Example output from **show crypto pki enrollment user**

```
awplus> enable
awplus# show crypto pki enrollment user exampleuser1
User "exampleuser1" is enrolled to the following trustpoints:
local,example
```

**Related Commands** [crypto pki enroll user](#)  
[crypto pki export pkcs12](#)

# show crypto pki trustpoint

**Overview** Use this command to display information about the specified trustpoint.

**Syntax** `show crypto pki trustpoint [<trustpoint>]`

| Parameter                       | Description                            |
|---------------------------------|----------------------------------------|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint to be shown |

**Default** By default, all trustpoints are shown.

**Mode** Privileged Exec

**Usage** If no trustpoint is specified, information about all trustpoints is shown. The command displays the authentication status of the trustpoint, the fingerprint of the root CA certificate (if it exists), the enrollment status of the local server with the trustpoint, a list of any applications that are configured to use the trustpoint, and the trustpoint parameters that were configured from trustpoint-configuration mode.

The specified trustpoints must already exist.

**Example** To show the details of the trustpoint "example", use the following commands:

```
awplus> enable
awplus# show crypto pki trustpoint example
```

**Output** Figure 46-4: Example output from **show crypto pki trustpoint**

```
awplus> enable
awplus# show crypto pki trustpoint example

Trustpoint "example"
 Type : Self-signed certificate authority
 Root Certificate: 50C1856B EEC7555A 0F3A61F6 690D9463 67DF74D1
 Local Server : The server is enrolled to this trustpoint.
 Server Key : example-server-key
 Applications : RADIUS

Authentication and Enrollment Parameters:
 Enrollment : selfsigned
 RSA Key Pair : example-server-key (2048 bits)

```

**Related Commands** [crypto pki trustpoint](#)  
[show crypto pki certificates](#)

# subject-name (trustpoint configuration)

**Overview** Use this command to specify the distinguished name string that should be used for the subject field in the server certificate, when enrolling the server (generating the server certificate or server certificate signing request).

**Syntax** `subject-name <word>`

| Parameter                 | Description                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;word&gt;</code> | Specify the subject name as a distinguished name string. Complex strings (e.g., strings containing spaces) should be surrounded with double-quote characters. |

**Default** If no subject name is specified for the trustpoint, then the system automatically builds a name of the form `/O=AlliedWare Plus/CN=xxxx.yyyy.zzz`, where `xxxx` is the hostname of the system and `yyyy.zzz` is the default search domain for the system.

**Mode** Trustpoint Configuration

**Usage** The subject name is specified as a variable number of fields, where each field begins with a forward-slash character (`/`). Each field is of the form `XX=value`, where `XX` is the abbreviation of the node type in the tree.

Common values include:

- `"C"` (country),
- `"ST"` (state),
- `"L"` (locality),
- `"O"` (organization),
- `"OU"` (organizational unit), and
- `"CN"` (common name).

Of these fields, `"CN"` is usually the most important.

**NOTE:** For a server certificate, many applications require that the network name of the server matches the common name in the server's certificate.

**Example** To configure the trustpoint named "example" and set its subject name, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# subject-name "/O=My
Company/CN=192.168.1.1
```

# authorization commands

**Overview** This command applies a command authorization method list, defined using the [aaa authorization commands](#) command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

**Syntax** `authorization commands <privilege-level> {default|<list-name>}`  
`no authorization commands <privilege-level>`

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;privilege-level&gt;</code> | The privilege level of the set of commands the method list will be applied to.<br>AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| <code>default</code>                 | Configure the default authorization commands method list.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>&lt;list-name&gt;</code>       | Configure a named authorization commands method list                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Default** The **default** method list is applied to each console and VTY line by default.

**Mode** Line Configuration

**Usage** If the specified method list does not exist users will not be able to execute any commands in the specified method list on the specified VTY lines.

**Example** To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

**Related Commands** [aaa authorization commands](#)

aaa authorization config-commands

tacacs-server host

**Command changes** Version 5.4.6-2.1: command added

# aaa authorization commands

**Overview** This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

**Syntax**

```
aaa authorization commands <privilege-level>
{default|<list-name>} group tacacs+ [none]

no aaa authorization commands <privilege-level>
{default|<list-name>}
```

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <privilege-level> | The privilege level of the set of commands the method list will be applied to. AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| group             | Specify the server group where authorization messages are sent. Only the <code>tacacs+</code> group is available for this command.                                                                                                                                                                                                                                                                                                                                                           |
| tacacs+           | Use all TACACS+ servers configured by the <code>tacacs-server host</code> command.                                                                                                                                                                                                                                                                                                                                                                                                           |
| default           | Configure the default authorization commands method list.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <list-name>       | Configure a named authorization commands method list                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| none              | If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.                                                                                                                                                                                                                                                                     |

**Mode** Global Configuration

**Usage** TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.

- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

**Example** To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 15 TAC15 group
tacacs+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 7 default group
tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization commands 15 TAC15
```

# aaa authorization config-commands

**Overview** Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

**Syntax** `aaa authorization config-commands`  
`no aaa authorization config-commands`

**Default** By default, command authorization is disabled on configuration mode commands.

**Mode** Global Configuration

**Usage** If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

**NOTE:** *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

**Example** To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

**Command changes** Version 5.4.6-2.1: command added

# ip tacacs source-interface

**Overview** This command sets the source interface, or IP address, to use for all TACACS+ packets sent from the device. By default, TACACS+ packets use the source IP address of the egress interface.

Use the **no** variant of this command to remove the source interface configuration and use the source IP address of the egress interface.

**Syntax** `ip tacacs source-interface {<interface>|<ip-address>}`  
`no ip tacacs source-interface`

| Parameter                       | Description                                      |
|---------------------------------|--------------------------------------------------|
| <code>&lt;interface&gt;</code>  | Interface name.                                  |
| <code>&lt;ip-address&gt;</code> | IP address in the dotted decimal format A.B.C.D. |

**Default** The source IP address of outgoing TACACS+ packets default to the IP address of the egress interface.

**Mode** Global Configuration

**Usage** Setting the source interface ensures that all TACACS+ packets sent from the device will have the same source IP address. Once configured this affects all TACACS+ packets, namely accounting, authentication, and authorization.

If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing TACACS+ packets will default to the IP address of the egress interface.

**Example** To configure all outgoing TACACS+ packets to use the IP address of the loop-back "lo" interface as the source IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ip tacacs source-interface lo
```

To reset the source interface configuration for all TACACS+ packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip tacacs source-interface
```

**Command changes** Version 5.4.6-2.1: command added

# show tacacs+

**Overview** This command displays the current TACACS+ server configuration and status.

**Syntax** show tacacs+

**Mode** User Exec and Privileged Exec

**Example** To display the current status of TACACS+ servers, use the command:

```
awplus# show tacacs+
```

**Output** Figure 47-1: Example output from the **show tacacs+** command

```
TACACS+ Global Configuration
 Source Interface : not configured
 Timeout : 5 sec

Server Host/ Server
IP Address Status

192.168.1.10 Alive
192.168.1.11 Unknown
```

**Table 1:** Parameters in the output of the **show tacacs+** command

| Output Parameter       | Meaning                                                                              |                                                                              |
|------------------------|--------------------------------------------------------------------------------------|------------------------------------------------------------------------------|
| Source Interface       | IP address of source interface if set with <code>ip tacacs source-interface</code> . |                                                                              |
| Timeout                | A time interval in seconds.                                                          |                                                                              |
| Server Host/IP Address | TACACS+ server hostname or IP address.                                               |                                                                              |
| Server Status          | The status of the authentication port.                                               |                                                                              |
|                        | Alive                                                                                | The server is alive.                                                         |
|                        | Dead                                                                                 | The server has timed out.                                                    |
|                        | Error                                                                                | The server is not responding or there is an error in the key string entered. |
|                        | Unknown                                                                              | The server is never used or the status is unknown.                           |
|                        | Unreachable                                                                          | The server is unreachable.                                                   |
| Unresolved             | The server name can not be resolved.                                                 |                                                                              |

**Command changes** Version 5.4.6-2.1: **Source Interface** parameter added

# tacacs-server host

**Overview** Use this command to specify a remote TACACS+ server host for authentication, authorization and accounting, and to set the shared secret key to use with the TACACS+ server. The parameters specified with this command override the corresponding global parameters for TACACS+ servers.

Use the **no** variant of this command to remove the specified server host as a TACACS+ authentication and authorization server.

**Syntax** `tacacs-server host {<host-name>|<ip-address>} [key [8]<key-string>]`  
`no tacacs-server host {<host-name>|<ip-address>}`

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;host-name&gt;</code>  | Server host name. The DNS name of the TACACS+ server host.                                                                                                                                                                                                                                                                                                                                                                  |
| <code>&lt;ip-address&gt;</code> | The IP address of the TACACS+ server host, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                                                                                                                              |
| <code>key</code>                | Set shared secret key with TACACS+ servers.                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>8</code>                  | Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password. The running config displays the new password as an encrypted string even if password encryption is turned off.                                                                                                                                                                            |
| <code>&lt;key-string&gt;</code> | Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and the TACACS+ server. This key must match the encryption used on the TACACS+ server. This setting overrides the global setting of the <code>tacacs-server key</code> command. If no key value is specified, the global value is used. |

**Default** No TACACS+ server is configured by default.

**Mode** Global Configuration

**Usage** A TACACS+ server host cannot be configured multiple times like a RADIUS server.

As many as four TACACS+ servers can be configured and consulted for login authentication, enable password authentication and accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, not if a login authentication attempt is rejected. The reasons a server would fail are:

- it is not network reachable
- it is not currently TACACS+ capable

- it cannot communicate with the switch properly due to the switch and the server having different secret keys

**Examples** To add the server `tacl.company.com` as the TACACS+ server host, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tacl.company.com
```

To set the secret key to `secret` on the TACACS+ server `192.168.1.1`, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host 192.168.1.1 key secret
```

To remove the TACACS+ server `tacl.company.com`, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host tacl.company.com
```

# tacacs-server key

**Overview** This command sets a global secret key for TACACS+ authentication, authorization and accounting. The shared secret text string is used for TACACS+ communications between the switch and all TACACS+ servers.

Note that if no secret key is explicitly specified for a TACACS+ server with the [tacacs-server host](#) command, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to remove the global secret key.

**Syntax** `tacacs-server key [8] <key-string>`  
`no tacacs-server key`

| Parameter    | Description                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8            | Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off.                                                                                         |
| <key-string> | Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and all TACACS+ servers. This key must match the encryption used on the TACACS+ server. |

**Mode** Global Configuration

**Usage** Use this command to set the global secret key shared between this client and its TACACS+ servers. If no secret key is specified for a particular TACACS+ server using the [tacacs-server host](#) command, this global key is used.

**Examples** To set the global secret key to `secret` for TACACS+ server, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server key secret
```

To delete the global secret key for TACACS+ server, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server key
```

**Related Commands** [tacacs-server host](#)  
[show tacacs+](#)

# tacacs-server timeout

**Overview** Use this command to specify the TACACS+ global timeout value. The timeout value is how long the device waits for a reply to a TACACS+ request before considering the server to be dead.

Note that this command configures the **timeout** parameter for TACACS+ servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

**Syntax** `tacacs-server timeout <seconds>`  
`no tacacs-server timeout`

| Parameter                    | Description                                                |
|------------------------------|------------------------------------------------------------|
| <code>&lt;seconds&gt;</code> | TACACS+ server timeout in seconds, in the range 1 to 1000. |

**Default** The default timeout value is 5 seconds.

**Mode** Global Configuration

**Examples** To set the timeout value to 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server timeout 3
```

To reset the timeout period for TACACS+ servers to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server timeout
```

**Related Commands** [tacacs-server host](#)

# Part 6: High Availability

# 48

# High Availability Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure high availability. For more information, see the [High Availability Feature Overview and Configuration\\_Guide](#).

**Command List** • [“ha associate”](#) on page 2073

# ha associate

**Overview** This command is used to change the mode of a VRRP session to High Availability (HA) mode, and to associate it with a HA bypass port.

Use the **no** variant of this command to take the VRRP session out of HA-Mode.

**Syntax** `ha associate [wan-bypass <1-2>]`  
`no ha associate [wan-bypass <1-2>]`

| Parameter                       | Description                               |
|---------------------------------|-------------------------------------------|
| <code>&lt;wan-bypass&gt;</code> | The control wan bypass port.              |
| <code>&lt;1-2&gt;</code>        | The identifier number of wan bypass port. |

**Default** The default state of bypass port 1 and port 2 is deactivated.

**Mode** Router Configuration

**Usage** One VRRP session can have the control of one or two bypass ports. After VRRP has the control of the wan-bypass ports, the state of the wan-bypass ports will be determined by the VRRP state. If the VRRP session is in master state, then the associated wan-bypass ports will be deactivated. If the VRRP session is in backup or initial state, then the associated wan-bypass ports will be activated.

If no wan-bypass ports are specified, then it puts the VRRP session in HA mode and the wan-bypass ports will always be deactivated.

If there are one or more VRRP sessions running in HA mode, then the wan-bypass ports should not be controlled by an other feature.

**Examples** To change a VRRP session into HA mode, use the following commands:

```
awplus#configure terminal
awplus(config)#router vrrp 1 vlan1
awplus(config-router)#ha associate
```

To change a VRRP session into HA mode and allow it to control wan-bypass port 1, use the following commands:

```
awplus#configure terminal
awplus(config)#vrrp 1 vlan1
awplus(config-router)#ha associate wan-bypass 1
```

To change a VRRP session to stop control of a wan-bypass port 1, use the following commands:

```
awplus#configure terminal
awplus(config)#router vrrp 1 vlan1
awplus(config-router)#no ha associate wan-bypass 1
```

To change a VRRP session out of HA-mode, use the following commands:

```
awplus#configure terminal
awplus(config)#router vrrp 1 vlan1
awplus(config-router)#no ha associate
```

# advertisement-interval

**Overview** Use this command to configure the advertisement interval of the virtual router. This is the length of time, in seconds, between each advertisement sent from the master to its backup(s).

IPv6 VRRP advertisements are sent to the multicast address assigned to the VRRP group (ff02:0:0:0:0) and a backup virtual router has to join all multicast groups within this range. VRRP advertisements are sent to a multicast address (ff02::12) every second by default.

Use the **no** variant of this command to remove an advertisement interval of the virtual router, which has been set using the **advertisement-interval** command, and revert to the default advertisement interval of 1 second.

**Syntax** advertisement-interval [**<1-255>**|csec **<1-4095>**]  
no advertisement-interval

| Parameter             | Description                                                         |
|-----------------------|---------------------------------------------------------------------|
| <b>&lt;1-255&gt;</b>  | Specifies the advertisement interval in seconds.                    |
| csec                  | Use centiseconds instead of seconds for the advertisement interval. |
| <b>&lt;1-4095&gt;</b> | Specifies the advertisement interval in centiseconds.               |

**Default** The default advertisement interval is 1 second.

**Mode** Router Configuration

**Usage** See the [VRRP Feature Overview and Configuration Guide](#) for more information about:

- setting the advertisement-interval when configuring VRRP
- using seconds for VRRPv2 host compatibility whenever you use [transition-mode](#) to upgrade or transition from VRRPv2 to VRRPv3
- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details

**Examples** The example below shows you how to configure the advertisement interval to 6 seconds for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

The example below shows you how to reset the advertisement interval to the default of 1 second for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no advertisement-interval
```

The example below shows you how to configure the advertisement interval to 6 seconds for the VRRPv3 IPv6 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

**Related  
Commands**    [router vrrp \(interface\)](#)  
                  [router ipv6 vrrp \(interface\)](#)

# alternate-checksum-mode

**Overview** Use this command to enable an alternate checksum mode for VRRPv3 to allow inter-operability with some other vendors' products. The IPv4 checksum for VRRPv3 advertisements will then use a pseudo header in the calculation.

This mode may be required if the other product indicates checksum errors on VRRP packets sent by AlliedWare Plus devices.

Use the **no** variant of this command to disable the alternate checksum mode.

**Syntax** `alternate-checksum-mode`  
`no alternate-checksum-mode`

**Default** Disabled

**Mode** Router Configuration

**Example** To turn on the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# alternate-checksum-mode
```

To turn off the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# no alternate-checksum-mode
```

**Related Commands** [show running-config](#)

**Command changes** Version 5.4.7-1.1: command added

# circuit-failover

**Overview** Use this command to enable the VRRP circuit failover feature.

Circuit failover enables the device to take action if the uplink interface goes down, so that the VRRP backup, whose uplink interface is still active, takes over as VRRP master. See the Usage section below and the [VRRP Feature Overview and Configuration Guide](#) for more information.

Use the **no** variant of this command to disable this feature.

**Syntax** `circuit-failover <interface> <1-253>`  
`no circuit-failover [<interface> <1-253>]`

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface&gt;</code> | The interface of the router that is monitored. The interface must exist on the router, and is usually an upstream interface. Should the interface go down, then another router that is configured as a backup router in the group takes over as the master. You should configure the circuit failover on an interface other than the active VRRP interface - generally the uplink interface. |
| <code>&lt;1-253&gt;</code>     | Delta value. The value by which virtual routers decrement their priority value during a circuit failover event. Configure this value to be greater than the difference of priorities on the master and backup routers. In the case of failover, this priority delta value is subtracted from the current VR Master Router priority value.                                                    |

**Mode** Router Configuration

**Usage** You can use Circuit Failover to monitor up to 32 interfaces per VRRP instance. If a VRRP instance is configured to monitor multiple interfaces, the VRRP priority will be cumulatively decremented by the configured delta for each interface as it goes down.

For example, if VRRP is configured to monitor VLAN2 and VLAN3 with the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip address 192.168.1.1/24
awplus(config-if)# exit
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# virtual-ip 192.168.1.10 backup
awplus(config-router)# priority 100
awplus(config-router)# circuit-failover vlan2 10
awplus(config-router)# circuit-failover vlan3 20
```

then the following examples explain the effect of each VLAN going down:

- If only VLAN2 fails, then the VRRP priority will be decremented by 10. VRRP priority would be adjusted to become 90, because  $100 - 10 = 90$ .
- If only VLAN3 fails, then the VRRP priority will be decremented by 20. VRRP priority would be adjusted to become 80, because  $100 - 20 = 80$ .
- If both VLAN2 and VLAN3 fail, then the VRRP priority will be decremented by the cumulative delta values of all monitored interfaces. VRRP priority would therefore be adjusted to become 70, because  $100 - 10 - 20 = 70$ .

As each monitored interface recovers, the VRRP priority is incremented by the same delta value.

When you configure the delta values of the monitored interfaces, make sure their sum is high enough to ensure that the VRRP priority stays above zero if all the interfaces go down.

**Examples** To configure circuit failover on an IPv4 VRRP instance, so that if interface VLAN3 goes down, then the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRP IPv4 session with VR ID 1 on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

To configure circuit failover on a VRRPv3 IPv6 session with VR ID 1, so that when interface VLAN3 goes down, the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRPv3 IPv6 session with VR ID 1 on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

**Related Commands** [router vrrp \(interface\)](#)  
[router ipv6 vrrp \(interface\)](#)

# debug vrrp

**Overview** Use this command to specify debugging options for VRRP. The **all** parameter turns on all the debugging options.

Use the **no** variant of this command to disable this function.

**Syntax** `debug vrrp [all]`  
`no debug vrrp [all]`

**Mode** Privileged Exec and Global Configuration

**Usage** See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp all
```

The example below shows you how to disable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp all
```

**Related Commands** [show debugging vrrp](#)  
[undebug vrrp](#)

# debug vrrp events

**Overview** Use this command to specify debugging options for VRRP event troubleshooting. Use the **no** variant of this command to disable this function.

**Syntax** `debug vrrp events`  
`no debug vrrp events`

**Mode** Privileged Exec and Global Configuration

**Usage** The **debug vrrp events** command enables the display of debug information related to VRRP internal events.  
See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp events
```

The example below shows you how to disable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp events
```

**Related Commands** [show debugging vrrp](#)  
[undebug vrrp events](#)

# debug vrrp packet

**Overview** Use this command to specify debugging options for VRRP packets.  
Use the **no** variant of this command to disable this function.

**Syntax** debug vrrp packet [send|recv]  
no debug vrrp packet [send|recv]

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| send      | Specifies the debug option set for sent packets.     |
| recv      | Specifies the debug option set for received packets. |

**Mode** Privileged Exec and Global Configuration

**Usage** The **debug vrrp packet** command enables the display of debug information related to the sending and receiving of packets.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable received and sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet
```

The example below shows you how to enable only received packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet recv
```

The example below shows you how to enable only sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet send
```

The example below shows you how to disable packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp packet
```

**Related Commands** [show debugging vrrp](#)  
[undebug vrrp packet](#)

# disable (VRRP)

**Overview** Use this command to disable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router to stop it participating in virtual routing. Note that when this command is configured then a backup router assumes the role of master router depending on its priority. See the [enable \(VRRP\)](#) command to enable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router.

**Syntax** `disable`

**Mode** Router Configuration

**Usage** See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** The example below shows you how to disable the VRRP session for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# disable
```

The example below shows you how to disable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# disable
```

**Related Commands**

- [enable \(VRRP\)](#)
- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)
- [show vrrp](#)

# enable (VRRP)

**Overview** Use this command to enable the VRRP session on the router to make it participate in virtual routing. To make changes to the VRRP configuration, first disable the router from participating in virtual routing using the [disable \(VRRP\)](#) command.

**Syntax** enable

**Mode** Router Configuration

**Usage** You must configure the virtual IP address and define the interface for the VRRP session (using the [virtual-ip](#) or [virtual-ipv6](#) and the [router vrrp \(interface\)](#) or [router ipv6 vrrp \(interface\)](#) commands) before using this command.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** To enable the VRRP session for VRRP VR ID 5 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# enable
```

To enable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# enable
```

**Related Commands**

- [disable \(VRRP\)](#)
- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)
- [show vrrp](#)
- [virtual-ip](#)
- [virtual-ipv6](#)

# preempt-mode

**Overview** Use this command to configure preempt mode. If preempt-mode is set to **true**, then the highest priority backup will always be the master when the default master is unavailable.

If preempt-mode is set to **false**, then a higher priority backup will not preempt a lower priority backup who is acting as master.

**Syntax** `preempt-mode {true|false}`

| Parameter          | Description             |
|--------------------|-------------------------|
| <code>true</code>  | Preemption is enabled.  |
| <code>false</code> | Preemption is disabled. |

**Default** The default is **true**.

**Mode** Router Configuration

**Usage** When the master router fails, the backup routers come online in priority order—highest to lowest. Preempt mode means that a higher priority back up router will take over the master role from a lower priority back up. Preempt mode on **true** allows a higher priority backup router to relieve a lower priority backup router.

By default, a preemptive scheme is enabled whereby a higher priority backup virtual router that becomes available take over for the backup virtual router that was elected to become the master virtual router.

This preemptive scheme can be disabled using the **preempt-mode false** command. If preemption is disabled, the backup virtual router that is currently elected as the master virtual router does not transition to backup virtual router again whenever the alternate backup router with a higher priority becomes available.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- preempt mode

**Examples** The example below shows you how to configure preempt-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure preempt-mode as true for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode false
```

**Related  
Commands**

[circuit-failover](#)

[priority](#)

[router vrrp \(interface\)](#)

[router ipv6 vrrp \(interface\)](#)

# priority

**Overview** Use this command to configure the VRRP router priority within the virtual router. The highest priority router is Master (unless [preempt-mode](#) is false).

Use the **no** variant of this command to remove the VRRP router priority within the virtual router, which has been set using the **priority** command.

**Syntax** `priority <1-255>`  
`no priority`

| Parameter | Description                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------|
| <1-255>   | The priority. For the master router, use 255 for this parameter; otherwise use any number from the range <1-254>. |

**Default** Defaults for priority are: **master router**= 255; **backup**= 100.

**Mode** Router Configuration

**Usage** Priority determines the role that each VRRP router plays and what happens if the master virtual router fails. If a VRRP router owns the IP address of the virtual router and the IP address of the interface, then this VRRP router functions as the master virtual router.

Priority also determines whether a VRRP router functions as a backup virtual router and the order of ascendancy to becoming a master virtual router if the master virtual router fails. Configure the priority of each backup virtual router with a value of 1 through 254.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** The example below shows you how to configure 101 as the priority for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# priority 101
```

The example below shows you how to remove the priority configured for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no priority
```

The example below shows you how to configure 101 as the priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# priority 101
```

The example below shows you how to remove the configured priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no priority
```

**Related  
Commands** [circuit-failover](#)  
[preempt-mode](#)

# router ipv6 vrrp (interface)

**Overview** Use this command to configure VRRPv3 for IPv6 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRPv3 for IPv6 configuration. Disable the VRRP session before using the **no** variant of this command.

**Syntax** `router ipv6 vrrp <vrid> <interface>`  
`no router ipv6 vrrp <vrid> <interface>`

| Parameter   | Description                                                                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vrid>      | <1-255> The ID of the virtual router VRRPv3 IPv6 session to create.                                                                                                                                    |
| <interface> | Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages. |

**Mode** Global Configuration

**Usage** Use the required <interface> placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

**NOTE:** *Tunnels and PPP interfaces are not supported.*

**NOTE:** *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Examples** The example below shows you how to enable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan2
awplus(config-router)# enable
awplus(config-router)#
```

The example below shows you how to disable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router ipv6 vrrp 3 vlan2
awplus(config)#
```

**Related  
Commands** advertisement-interval  
circuit-failover

# router vrrp (interface)

**Overview** Use this command to configure VRRP IPv4 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRP IPv4 configuration. Disable the VRRP session before using the **no** variant of this command.

**Syntax** `router vrrp <vrid> <interface>`  
`no router vrrp <vrid> <interface>`

| Parameter                      | Description                                                                                                                                                                                          |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;vrid&gt;</code>      | <code>&lt;1-255&gt;</code> The ID of the virtual router VRRP IPv4 session to create.                                                                                                                 |
| <code>&lt;interface&gt;</code> | Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRP IPv4 advertisement messages. |

**Mode** Global Configuration

**Usage** Use the required `<interface>` placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

**NOTE:** *Tunnels and PPP interfaces are not supported.*

**NOTE:** *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Examples** To enable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan1
awplus(config-router)# enable
```

To disable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router vrrp 5 vlan1
```

**Related  
Commands**

- advertisement-interval
- circuit-failover
- disable (VRRP)
- enable (VRRP)

# show debugging vrrp

**Overview** Use this command to display the set VRRP debugging option. Use the terminal monitor command to display output on the console otherwise debug output is in the log file.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Syntax** `show debugging vrrp`

**Mode** User Exec and Privileged Exec

**Example** The example below shows you how to display VRRP debugging:

```
awplus# show debugging vrrp
```

**Related Commands**

- [debug vrrp](#)
- [debug vrrp events](#)
- [debug vrrp packet](#)

# show running-config router ipv6 vrrp

**Overview** Use this command to show the running configuration for VRRPv3 IPv6.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Syntax** `show running-config router vrrp`

**Mode** Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

**Example** The example below shows you how to display the running configuration for VRRPv3 IPv6:

```
awplus# show running-config router ipv6 vrrp
```

**Output** Figure 49-1: Example output from the **show running-config router ipv6 vrrp** command

```
!
router ipv6 vrrp 3 vlan3
 virtual-ip fe80::202:b3ff:fed5:983e master
 circuit-failover vlan3 3
 advertisement-interval 6
 preempt-mode false
!
```

# show running-config router vrrp

**Overview** Use this command to show the running configuration for VRRP IPv4.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show running-config router vrrp`

**Mode** Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

**Example** The example below shows you how to display the running configuration for VRRP IPv4:

```
awplus# show running-config router vrrp
```

**Output** Figure 49-2: Example output from the **show running-config router vrrp** command

```
!
router vrrp 2 vlan2
 circuit-failover vlan2 2
 advertisement-interval 4
 preempt-mode true
!
```

# show vrrp

**Overview** Use this command to display information about all VRRP IPv4 sessions. This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** show vrrp [brief]

| Parameter | Description                     |
|-----------|---------------------------------|
| brief     | Brief summary of VRRP sessions. |

**Mode** User Exec and Privileged Exec

**Example** To display information about all VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp
```

To display brief summary output about VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp brief
```

**Output** Figure 49-3: Example output from the **show vrrp** command

```
awplus#show vrrp
VMAC enabled
Address family IPv4
VRRP Id: 1 on interface: vlan2
State: AdminUp - Master
Virtual IP address: 192.168.1.2 (Not-owner)
Priority is 100
Advertisement interval: 100 centiseconds
Preempt mode: TRUE
Multicast membership on IPv4 interface vlan2: JOINED
Transition mode: FALSE
Accept mode: FALSE
Master address: 192.168.1.3
High Availability: enabled
wan-bypass 1 (eth1) is on
```

Figure 49-4: Example output from the **show vrrp brief** command

```
awplus#show vrrp brief
Interface Grp Prio Own Pre State Master addr Group addr
vlan10 1 200 N P Master 192.168.10.4 192.168.10.253
vlan10 2 150 N P Backup 192.168.10.4 192.168.10.254
vlan11 3 200 N P Master 192.168.11.4 192.168.11.253
vlan11 4 150 N P Backup 192.168.11.4 192.168.11.254
```

**Related  
Commands**    enable (VRRP)  
                  disable (VRRP)

# show vrrp counters

**Overview** This command displays VRRP SNMP counters on the console, as described in the VRRP MIB and RFC2787, for debugging use while you configure VRRP with commands in this chapter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show vrrp counters

**Mode** User Exec and Privileged Exec

**Usage** The output has a section for global counters and a section of counters for each VRRP instance configured. See the descriptions of the counters below the sample output as per RFC2787.

**NOTE:** Note that the counters displayed with this commands are the same counters as described in RFC 2787 (Copyright (C) The Internet Society (2000). All Rights Reserved) except for the “Monitored Circuit Up” and “Monitored Circuit Down” counters, which are additions beyond the MIB.

**Example** To display information about VRRP SNMP counters on the console, enter the command:

```
awplus# show vrrp counters
```

Figure 49-5: Example output from the **show vrrp counters** command

```
awplus#show vrrp counters
VRRP Global Counters:
 Checksum Errors 230
 Version Errors 0
 VRID Errors 230

VRRP IPv4 counters for VR 10/vlan10:
 Master Transitions 0
 Received Advertisements ... 0
 Internal Errors 0
 TTL Errors 0
 Received Priority 0 Pkt ... 0
 Sent Priority 0 Pkt 0
 Received Invalid Type 0
 Address List Errors 0
 Packet Length Errors 0
 Monitored Circuit Up 0
 Monitored Circuit Down..... 0
```

```
VRRP IPv4 counters for VR 100/vlan100:
Master Transitions 1
Received Advertisements ... 1614
Internal Errors 0
TTL Errors 0
Received Priority 0 Pkt ... 0
Sent Priority 0 Pkt 0
Received Invalid Type 0
Address List Errors 0
Packet Length Errors 0
Monitored Circuit Up 0
Monitored Circuit Down.... 2
```

**Table 1:** Global counters with descriptions for the **show vrrp counters** command:

| Counter         | Description                                                                              |
|-----------------|------------------------------------------------------------------------------------------|
| Checksum Errors | The total number of VRRP packets received with an invalid VRRP checksum value.           |
| Version Errors  | The total number of VRRP packets received with an unknown or unsupported version number. |
| VRID Errors     | The total number of VRRP packets received with an invalid VRID for this virtual router.  |

**Table 2:** Per VR counters with descriptions for the **show vrrp counters** command:

| Counter                 | Description                                                                                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Master Transitions      | The total number of times that this virtual router's state has transitioned to MASTER.                                                                          |
| Received Advertisements | The total number of VRRP advertisements received by this virtual router.                                                                                        |
| Internal Errors         | The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router. |
| TTL Errors              | The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.                                                    |
| Received Priority 0 Pkt | The total number of VRRP packets received by the virtual router with a priority of '0'.                                                                         |
| Sent Priority 0 Pkt     | The total number of VRRP packets sent by the virtual router with a priority of '0'.                                                                             |
| Received Invalid Type   | The number of VRRP packets received by the virtual router with an invalid value in the 'type' field.                                                            |
| Address List Errors     | The total number of packets received for which the address list does not match the locally configured list for the virtual router.                              |

**Table 2:** Per VR counters with descriptions for the **show vrrp counters** command: (cont.)

| Counter                | Description                                                                                        |
|------------------------|----------------------------------------------------------------------------------------------------|
| Packet Length Errors   | The total number of packets received with a packet length less than the length of the VRRP header. |
| Monitored Circuit Up   | The total number of times the monitored circuit has generated the UP event.                        |
| Monitored Circuit Down | The total number of times the monitored circuit has generated the down event.                      |

# show vrrp ipv6

**Overview** Use this command to display information about all configured VRRPv3 IPv6 sessions for all interfaces, or all VRRPv3 IPv6 sessions for a given interface with the optional parameter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Syntax** `show vrrp ipv6 [<interface>]`

| Parameter   | Description                                                                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface> | Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages. |

**Mode** User Exec and Privileged Exec

**Example** To display information about all VRRPv3 IPv6 sessions, enter the command:

```
awplus# show vrrp ipv6
```

**Output** Figure 49-6: Example output from the **show vrrp ipv6 vlan2** command

```
awplus#show vrrp ipv6 vlan2
VrId <1>
 State is Master
 Virtual IP is fe80::202:b3ff:fed5:983e (Owner)
 Interface is vlan2
 Priority is 255
 Advertisement interval is 4 sec
 Preempt mode is FALSE
```

**Related Commands** [enable \(VRRP\)](#)  
[disable \(VRRP\)](#)

# show vrrp (session)

**Overview** Use this command to display information for a particular VRRP session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show vrrp <vrid> <interface>`

| Parameter                      | Description                                                                                                    |
|--------------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>&lt;vrid&gt;</code>      | <code>&lt;1-255&gt;</code> The virtual router ID for which to display information. Session must already exist. |
| <code>&lt;interface&gt;</code> | The interface to display information about, for instance, <code>vlan2</code> .                                 |

**Mode** User Exec and Privileged Exec

**Usage** See the below sample output from the **show vrrp** command displaying information about VRRP session 1 configured on **vlan2**. Output shows that a Virtual IP address has been set.

```
awplus# show vrrp 1 vlan2
```

```
awplus#show vrrp 1 vlan2
Address family IPv4
VrId <1>
 Interface is vlan2
 State is Initialize
 Virtual IP address is 10.10.11.250 (Not IP owner)
 Priority is 100
 Advertisement interval is 1 sec
 Preempt mode is TRUE
 Multicast membership on IPv4 interface vlan1: JOINED
 Transition mode: FALSE
 Accept mode: TRUE
 Master address: 192.168.24.5
 High Availability:
 enabled
 wan-bypass 1 (eth1) is on
```

See the below sample output from the **show vrrp** command displaying information about VRRP session 1 configured on **vlan3**. Output shows a Virtual IP address has not been set.

```
awplus# show vrrp 1 vlan3
```

```
awplus#show vrrp 1 vlan3
Address family IPv4
VrId <1>
 Interface is vlan3
 State is Initialize
 Virtual IP address is unset
 Priority is 100
 Advertisement interval is 1 sec
 Preempt mode is TRUE
Preempt mode is TRUE
Multicast membership on IPv4 interface vlan3: JOINED
Transition mode: FALSE
Accept mode: TRUE
Master address: 192.168.24.5
High Availability:
enabled
 wan-bypass 1 (eth1) is on
```

**Example** The following command shows information about VRRP session 5 for interface **vlan2**.

```
awplus# show vrrp 5 vlan2
```

# transition-mode

**Overview** Use this command to configure the IPv4 transition mode. Transition mode allows you to upgrade from VRRPv2 to VRRPv3 and gives interoperability between VRRPv2 and VRRPv3.

If transition-mode is set to **true**, then the IPv4 transition mode is enabled and VRRPv2 and VRRPv3 advertisements are sent allowing VRRPv2 and VRRPv3 interoperability. Received VRRPv2 advertisement packets are accepted and processed when transition-mode is true.

If transition-mode is set to **false**, then the IPv4 transition mode is disabled and only VRRPv3 advertisements are sent. Received VRRPv2 advertisement packets are dropped.

Note the [advertisement-interval](#) should not be configured to less than 1 second when using transition-mode. VRRPv2 can only use advertisements in whole second intervals.

**Syntax** `transition-mode {true|false}`

| Parameter | Description                                                                                                                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| true      | Transition mode is enabled. This results in VRRPv2 and VRRPv3 IPv4 advertisements being sent. Transition mode is only available on VRRPv3 for interoperability with VRRPv2 while upgrading to VRRPv3. |
| false     | Transition mode is disabled. This stops VRRPv2 IPv4 advertisements being sent. Only VRRPv3 advertisements are sent when disabled. Disable transition-mode after upgrading from VRRPv2 to VRRPv3.      |

**Default** The default is **false**.

**Mode** Router Configuration

**Usage** See the [VRRP Feature Overview and Configuration Guide](#) for more information:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- further information about configuring transition mode to upgrade from VRRPv2 to VRRPv3

**Examples** The example below shows you how to configure IPv4 transition-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode true
```

The example below shows you how to configure IPv4 transition-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode false
```

**Related  
Commands** [router vrrp \(interface\)](#)

# undebug vrrp

**Overview** Use this command to disable all VRRP debugging.

**Syntax** undebug vrrp all

**Mode** Privileged Exec

**Example** The example below shows you how to disable all VRRP debugging:

```
awplus# undebug vrrp all
```

**Related  
Commands** [debug vrrp](#)

# undebg vrrp events

**Overview** Use this command to disable debugging options for VRRP event troubleshooting.

**Syntax** undebg vrrp events

**Mode** Privileged Exec

**Example** The example below shows you how to disable VRRP event debugging:

```
awplus# undebg vrrp events
```

**Related  
Commands** [debug vrrp events](#)

# undebbug vrrp packet

**Overview** Use this command to disable debugging options for VRRP packets.

**Syntax** `undebbug vrrp packet [send|recv]`

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| send      | Disable the debug option set for sent packets.     |
| recv      | Disable the debug option set for received packets. |

**Mode** Privileged Exec

**Examples** The example below shows you how to disable VRRP sent packet debugging:

```
awplus# undebbug vrrp packet send
```

The example below shows you how to disable VRRP received packet debugging:

```
awplus# undebbug vrrp packet recv
```

The example below shows you how to disable all VRRP packet debugging:

```
awplus# undebbug vrrp packet
```

**Related  
Commands** [debug vrrp packet](#)

# virtual-ip

**Overview** Use this command to set the virtual IP address for the VRRP session. This is the IP address of the virtual router that end hosts set as their default gateway.

Use the **no** variant of this command to disable this feature.

**Syntax** `virtual-ip <ip-address> [master|backup|owner]`  
`no virtual-ip`

| Parameter                       | Description                                                                                                                                                                                                       |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | The virtual IPv4 address of the virtual router, entered in dotted decimal format A.B.C.D.                                                                                                                         |
| <code>master</code>             | Sets the default state of the VRRP router within the Virtual Router as <b>master</b> . For master, the router must own the Virtual IP address. Specify the <b>owner</b> option before using <b>master</b> option. |
| <code>backup</code>             | Sets the default state of the VRRP router within the Virtual Router as <b>backup</b> .                                                                                                                            |
| <code>owner</code>              | Sets the IPv6 address of the VRRP router within the Virtual Router as the <b>owner</b> . Specify this before using the <b>master</b> option.                                                                      |

**Mode** Router Configuration

**Usage** The VRRP master and owner of the virtual IPv4 address for the VRRP session only responds to the packets destined to the virtual IPv4 address. The VRRP master that is not an owner of the virtual IPv4 address for the VRRP session does not respond to the packets destined to the virtual IPv4 address, but forwards packets with a VMAC as the destination address. See the [vrrp vmac](#) command to enable and disable this feature.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Examples** The example below shows you how to set the virtual IP address for VRRP VR ID 5 and the router as the VRRP master:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 master
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as the VRRP backup:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 backup
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as owner of the virtual IPv4 address:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 owner
```

The example below shows you how to disable the virtual IPv4 address for VRRP VR ID 5

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no virtual-ip
```

**Related  
Commands**

- [router vrrp \(interface\)](#)
- [enable \(VRRP\)](#)
- [vrrp vmac](#)

# virtual-ipv6

**Overview** Use this command to set the virtual IPv6 address for the VRRPv3 session. This is the IPv6 address of the virtual router that end hosts set as their default gateway.

Note that the primary IPv6 address specified is an IPv6 link-local address. See the Usage note below for further information.

Use the **no** variant of this command to disable this feature.

**Syntax** `virtual-ipv6 <ipv6-address> [master|backup]  
[primary|secondary]`  
`no virtual-ipv6`

| Parameter                         | Description                                                                                                                                                                                                                                          |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-address&gt;</code> | The IPv6 address of the virtual router, entered in hexadecimal, in the format X:X::X.X.                                                                                                                                                              |
| <code>master</code>               | Sets <b>master</b> to be the default state of the VRRPv3 router within the Virtual Router. For <b>master</b> , we recommend using a Virtual IP address that is not owned by any of the VRRP routers in the same grouping (that share the same VRID). |
| <code>backup</code>               | Sets <b>backup</b> to be the default state of the VRRPv3 router within the Virtual Router.                                                                                                                                                           |
| <code>primary</code>              | Sets the specified address as the primary IPv6 address. The primary address must be a link-local IPv6 address.                                                                                                                                       |
| <code>secondary</code>            | Sets the specified address as the secondary IPv6 address. Normally this would be a globally-routable IPv6 address. This enables you to specify a globally-routable address as the default gateway address for all the hosts on a VLAN.               |

**Mode** Router Configuration

**Usage** The virtual router will reply to ping, telnet, and SSH requests to the virtual IP address. The virtual router will reply even if it does not own the virtual IP address.

The AlliedWare Plus VRRPv3 implementation supports one IPv6 virtual link local address per virtual router ID. Note that in the command examples fe80::1 is an IPv6 link-local address. An IPv6 link-local address is used because IPv6 link-local addresses are used by IPv6 ND (Neighbor Discovery). A host's default route to a router points to the IPv6 link-local address, not a specific global IPv6 address for the router. For the host's traffic to switch over to a backup router, the IPv6 link-local address of the router is used by VRRPv3.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Examples** The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 master:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 master
```

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 backup:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 backup
```

The example below shows you disable the virtual IPv6 address for VRRPv3 VR ID 3:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no virtual-ipv6
```

**Related  
Commands** [router ipv6 vrrp \(interface\)](#)  
[enable \(VRRP\)](#)  
[vrrp vmac](#)

## vrrp vmac

**Overview** Use this command to enable or disable the VRRP Virtual MAC feature. This feature is used by VRRP to make the hosts use the virtual MAC address as the physical hardware address of their gateway.

A VRRP router master will use the virtual MAC address for any ARP responses associated with the virtual IP address, or any gratuitous ARPs sent on behalf of the virtual IP address.

All VRRP advertisements are sent using this virtual MAC address as the source MAC address.

The virtual MAC address has the form 00:00:5e:00:01:<VRID>, where VRID is the ID of the Virtual Router.

**Syntax** `vrrp vmac {enable|disable}`

**Mode** Global Configuration

**Examples** To enable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac enable
```

To disable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac disable
```

# Part 7: Network Management

# 50

# Allied Telesis Management Framework™ (AMF) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for Allied Telesis Management Framework™ (AMF) commands.

**AMF master nodes** Every AMF network must have at least one master node, which acts as the core of the AMF network. Not all AlliedWare Plus devices are capable of acting as an AMF master. See the [AMF Feature Overview and Configuration Guide](#) for information about AMF master support.

**AMF edge** CentreCOM® FS980M, GS900MX, GS970M, and XS900MX Series switches can only be used as edge switches in an AMF network. The full management power and convenience of AMF is available on these switches, but they can only link to one other AMF node. They cannot form cross-links or virtual links.

**AMF naming convention** When AMF is enabled on a device, it will automatically be assigned a host name. If a host name has already been assigned, by using the command [hostname](#) on page 238, this will remain. If however, no host name has been assigned, then the name applied will be the prefix, **host\_** followed (without a space) by the MAC address of the device. For example, a device whose MAC address is **0016.76b1.7a5e** will have the name **host\_0016\_76b1\_7a5e** assigned to it.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network devices, and accordingly apply an appropriate hostname to each device in your AMF network.

**AMF and STP** On AR-Series firewalls, you cannot use STP at the same time as AMF.

# area-link

**Overview** Use this command to create an area-link between a Virtual AMF Appliance (VAA) host controller and an AMF container.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an area-link from a container.

**Syntax** `area-link <area-name>`  
`no area-link`

| Parameter                      | Description                            |
|--------------------------------|----------------------------------------|
| <code>&lt;area-name&gt;</code> | AMF area name of the container's area. |

**Mode** AMF Container Configuration

**Usage** The AMF area-link connects the AMF controller on a VAA host to the AMF container. Once a container has been created with the [atmf container](#) command and an area-link configured with the **area-link** command, it can be enabled using the [state](#) command.

You can only configure a single area-link on a container. You will see the following message if you try and configure a second one:

```
% AreaLink already configured for this container
```

Each container has two virtual interfaces:

- Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, configured using this area-link command.
- Interface eth1, used to connect to the outside world using a bridged L2 network link, configured using the [bridge-group](#) command.

See the [AMF Feature Overview and Configuration\\_Guide](#) for more information on these virtual interfaces and links.

**Example** To create the area-link to "wlg" on container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# area-link wlg
```

To remove an area-link from container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no area-link
```

**Related  
Commands**

[atmf container](#)

changes**

Version 5.4.7-0.1: command added

# atmf area

**Overview** This command creates an AMF area and gives it a name and ID number. Use the **no** variant of this command to remove the AMF area. This command is only valid on AMF controllers, master nodes and gateway nodes.

**Syntax** `atmf area <area-name> id <1-126> [local]`  
`no atmf area <area-name>`

| Parameter   | Description                                                                                                               |
|-------------|---------------------------------------------------------------------------------------------------------------------------|
| <area-name> | The AMF area name. The area name can be up to 15 characters long. Valid characters are:<br>a..z<br>A..Z<br>0..9<br>-<br>_ |
| <1-126>     | An ID number that uniquely identifies this area.                                                                          |
| local       | Set the area to be the local area. The local area contains the device you are configuring.                                |

**Mode** Global Configuration

**Usage** This command enables you to divide your AMF network into areas. Each area is managed by at least one AMF master node. Each area can have up to 120 nodes, depending on the license installed on that area's master node.

The whole AMF network is managed by up to 8 AMF controllers. Each AMF controller can communicate with multiple areas. The number of areas supported on a controller depends on the license installed on that controller.

You must give each area in an AMF network a unique name and ID number.

Only one local area can be configured on a device. You must specify a local area on each controller, remote AMF master, and gateway node.

**Example** To create the AMF area named *New-Zealand*, with an ID of 1, and specify that it is the local area, use the command:

```
controller-1(config)# atmf area New-Zealand id 1 local
```

To configure a remote area named *Auckland*, with an ID of 100, use the command:

```
controller-1(config)# atmf area Auckland id 100
```

**Related  
Commands**

- atmf area password
- show atmf area
- show atmf area summary
- show atmf area nodes
- switchport atmf-arealink remote-area

# atmf area password

**Overview** This command sets a password on an AMF area.

Use the **no** variant of this command to remove the password.

This command is only valid on AMF controllers, master nodes and gateway nodes. The area name must have been configured first.

**Syntax** `atmf area <area-name> password [8] <password>`  
`no atmf area <area-name> password`

| Parameter   | Description                                                                                                                                                                           |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-name> | The AMF area name.                                                                                                                                                                    |
| 8           | This parameter is displayed in <b>show running-config</b> output to indicate that it is displaying the password in encrypted form. You should not enter <b>8</b> on the CLI yourself. |
| <password>  | The password is between 8 and 32 characters long. It can include spaces.                                                                                                              |

**Mode** Global Configuration

**Usage** You must configure a password on each area that an AMF controller communicates with, except for the controller's local area. The areas must already have been created using the `atmf area` command.

Enter the password identically on both of:

- the area that locally contains the controller, and
- the remote AMF area masters

The command **show running-config atmf** will display the encrypted version of this password. The encryption keys will match between the controller and the remote AMF master.

If multiple controller and masters exist in an area, they must all have the same area configuration.

**Example** To give the AMF area named *Auckland* a password of "secure#1" use the following command on the controller:

```
controller-1(config)# atmf area Auckland password secure#1
```

and also use the following command on the master node for the Auckland area:

```
auck-master(config)# atmf area Auckland password secure#1
```

**Related  
Commands**

- atmf area
- show atmf area
- show atmf area summary
- show atmf area nodes
- switchport atmf-arealink remote-area

# atmf authorize

**Overview** On an AMF network, with secure mode enabled, use this command on an AMF master to authorize an AMF node to join the network. AMF nodes waiting to be authorized appear in the pending authorization queue, which can be examined using the [show atmf authorization](#) command with the **pending** parameter.

Use the **no** variant of this command to revoke authorization for an AMF node on an AMF master.

**Syntax** `atmf authorize {<node-name> [area <area-name>]|all-pending}`  
`no atmf authorize <node-name> [area <area-name>]`

| Parameter   | Description                                                              |
|-------------|--------------------------------------------------------------------------|
| <node-name> | The name of the node to be authorized or have its authorization revoked. |
| area        | Specify an AMF area.                                                     |
| <area-name> | This is the name of the area the node belongs to.                        |
| all-pending | Authorize all nodes in the pending queue.                                |

**Mode** Privileged Exec

**Usage** On an AMF controller, AMF remote-area masters must be authorized by the controller, and the AMF remote-area masters will also need to authorized access from the AMF controller.

**Example** To authorize all AMF nodes in the pending authorization queue on an AMF master, use the command:

```
awplus# atmf authorize all-pending
```

To authorize a node called "node2" in remote AMF area "area3", use the command:

```
awplus# atmf authorize node2 area "area3"
```

To authorize a node called "node4" on an AMF master, use the command:

```
awplus# atmf authorize node4
```

To revoke authorization for a node called "node4" on an AMF master, use the command:

```
awplus# no atmf authorize node4
```

**Command changes** Version 5.4.7-0.3: command added

# atmf authorize provision

**Overview** Use this command from an AMF controller or AMF master to pre-authorize a node on an AMF network running in secure mode. This allows a node to join the AMF network the moment the `atmf secure-mode` command is run on that node.

Use the **no** variant of this command to remove a provisional authorization from and AMF controller or AMF master.

**Syntax**

```
atmf authorize provision [timeout <minutes>] node <node-name>
interface <interface-name> [area <area-name>]

atmf authorize provision [timeout <minutes>] mac <mac-address>

atmf authorize provision [timeout <minutes>] all

no atmf authorize provision node <node-name> interface
<interface-name> [area <area-name>]

no atmf authorize provision mac <mac-address>

no atmf authorize provision all
```

| Parameter        | Description                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------|
| timeout          | Timeout for provisional authorization. Authorization for provisioned nodes expires after the timeout period specified. |
| <minutes>        | Timeout in minutes. A value between 1 and 6000 is permissible with the default being 60 minutes.                       |
| node             | Specify a node to provision by node name.                                                                              |
| <node-name>      | The name of the node to provisionally authorize.                                                                       |
| interface        | Specify the interface the node will connect on.                                                                        |
| <interface-name> | The name of the interface, this can be a switchport, link aggregator, LACP link, or virtual link.                      |
| area             | Specify the AMF area.                                                                                                  |
| <area-name>      | This is the name of the area the node belongs to.                                                                      |
| mac              | Specify a node to provision by MAC address.                                                                            |
| <mac-address>    | Enter a MAC address to provisionally authorize in the format HHHH.HHHH.HHHH.                                           |
| all              | Provision authorization for all secure mode capable nodes.                                                             |

**Default** The default timeout is 60 minutes.

**Mode** Privileged Exec

**Example** To provisionally authorize all non-secure AMF nodes, use the command:

```
awplus# atmf authorize provision all
```

To authorize a node with a MAC address of 0000.cd28.0880 for 2 hours, use the command:

```
awplus# authorize provision timeout 120 mac 0000.cd28.0880
```

To remove all provisional authorization, on an AMF master, use the command:

```
awplus# no atmf authorize provision all
```

**Related  
Commands**    [show atmf authorization](#)  
              [show atmf secure-mode](#)

**Command  
changes**    Version 5.4.7-0.3: command added

# atmf backup

**Overview** This command can only be applied to a master node. It manually schedules an AMF backup to start at a specified time and to execute a specified number of times per day.

Use the **no** variant of this command to disable the schedule.

**Syntax** `atmf backup {default|<hh:mm> frequency <1-24>}`

| Parameter        | Description                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------|
| default          | Restore the default backup schedule.                                                                                   |
| <hh:mm>          | Sets the time of day to apply the first backup, in hours and minutes. Note that this parameter uses the 24 hour clock. |
| backup           | Enables AMF backup to external media.                                                                                  |
| frequency <1-24> | Sets the number of times within a 24 hour period that backups will be taken.                                           |

**Default** Backups run daily at 03:00 AM, by default

**Mode** Global Configuration

**Usage** Running this command only configures the schedule. To enable the schedule, you should then apply the command [atmf backup enable](#).

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To schedule backup requests to begin at 11 am and execute twice per day (11 am and 11 pm), use the following command:

```
node_1# configure terminal
node_1(config)# atmf backup 11:00 frequency 2
```

**CAUTION:** File names that comprise identical text, but with differing case, such as *Test.txt* and *test.txt*, will not be recognized as being different on FAT32 based backup media such as a USB storage device. However, these filenames will be recognized as being different on your Linux based device. Therefore, for good practice, ensure that you apply a consistent case structure for your back-up file names.

**Related Commands**

- [atmf backup enable](#)
- [atmf backup stop](#)
- [show atmf backup](#)

# atmf backup area-masters delete

**Overview** Use this command to delete from external media, a backup of a specified node in a specified area.

Note that this command can only be run on an AMF controller.

**Syntax** `atmf backup area-masters delete area <area-name> node <node-name>`

| Parameter                      | Description                                                   |
|--------------------------------|---------------------------------------------------------------|
| <code>&lt;area-name&gt;</code> | The area that contains the node whose backup will be deleted. |
| <code>&lt;node-name&gt;</code> | The node whose backup will be deleted.                        |

**Mode** Privileged Exec

**Example** To delete the backup of the remote area-master named “well-gate” in the AMF area named Wellington, use the command:

```
controller-1# atmf backup area-masters delete area Wellington
node well-gate
```

**Related Commands** [show atmf backup area](#)

# atmf backup area-masters enable

**Overview** Use this command to enable backup of remote area-masters from the AMF controller. This command is only valid on AMF controllers.

Use the **no** form of the command to stop backups of remote area-masters.

**Syntax** `atmf backup area-masters enable`  
`no atmf backup area-masters enable`

**Mode** Global configuration

**Default** Remote area backups are disabled by default

**Usage** Use the following commands to configure the remote area-master backups:

- `atmf backup` to configure when the backups begin and how often they run
- `atmf backup server` to configure the backup server.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To enable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf backup area-masters enable
```

To disable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf backup area-masters enable
```

**Related  
Commands** `atmf backup server`  
`atmf backup`  
`show atmf backup area`

# atmf backup area-masters now

**Overview** Use this command to run an AMF backup of one or more remote area-masters from the AMF controller immediately.

This command is only valid on AMF controllers.

**Syntax** `atmf backup area-masters now [area <area-name>|area <area-name>  
node <node-name>]`

| Parameter   | Description                                    |
|-------------|------------------------------------------------|
| <area-name> | The area whose area-masters will be backed up. |
| <node-name> | The node that will be backed up.               |

**Mode** Privileged Exec

**Example** To back up all local master nodes in all areas controlled by controller-1, use the command

```
controller-1# atmf backup area-masters now
```

To back up all local masters in the AMF area named Wellington, use the command

```
controller-1# atmf backup area-masters now area Wellington
```

To back up the local master "well-master" in the Wellington area, use the command

```
controller-1# atmf backup area-masters now area Wellington node
well-master
```

**Related Commands** [atmf backup area-masters enable](#)  
[atmf backup area-masters synchronize](#)  
[show atmf backup area](#)

# atmf backup area-masters synchronize

**Overview** Use this command to synchronize backed-up area-master files between the active remote file server and the backup remote file server. Files are copied from the active server to the remote server.

Note that this command is only valid on AMF controllers.

**Syntax** `atmf backup area-masters synchronize`

**Mode** Privileged Exec

**Example** To synchronize backed-up files between the remote file servers for all area-masters, use the command:

```
controller-1# atmf backup area-masters synchronize
```

**Related Commands**

- [atmf backup area-masters enable](#)
- [atmf backup area-masters now](#)
- [show atmf backup area](#)

# atmf backup bandwidth

**Overview** This command sets the maximum bandwidth in kilobytes per second (kBps) available to the AMF backup process. This command enables you to restrict the bandwidth that is utilized for downloading file contents during a backup.

**NOTE:** *This command will only run on an AMF master. An error message will be generated if the command is attempted on node that is not a master.*

*Also note that setting the bandwidth value to zero will allow the transmission of as much bandwidth as is available, which can exceed the maximum configurable speed of 1000 kBps. In effect, zero means unlimited.*

Use the **no** variant of this command to reset (to its default value of zero) the maximum bandwidth in kilobytes per second (kBps) available when initiating an AMF backup. A value of zero tells the backup process to transfer files using unlimited bandwidth.

**Syntax** `atmf backup bandwidth <0-1000>`  
`no atmf backup bandwidth`

| Parameter                   | Description                                       |
|-----------------------------|---------------------------------------------------|
| <code>&lt;0-1000&gt;</code> | Sets the bandwidth in kilobytes per second (kBps) |

**Default** The default value is zero, allowing unlimited bandwidth when executing an AMF backup.

**Mode** Global Configuration

**Examples** To set an atmf backup bandwidth of 750 kBps, use the commands:

```
node2# configure terminal
node2(config)# atmf backup bandwidth 750
```

To set the AMF backup bandwidth to the default value for unlimited bandwidth, use the commands:

```
node2# configure terminal
node2(config)# no atmf backup bandwidth
```

**Related Commands** [show atmf backup](#)

# atmf backup delete

**Overview** This command removes the backup file from the external media of a specified AMF node.

Note that this command can only be run from an AMF master node.

**Syntax** `atmf backup delete <node-name>`

| Parameter                      | Description                                         |
|--------------------------------|-----------------------------------------------------|
| <code>&lt;node-name&gt;</code> | The AMF node name of the backup file to be deleted. |

**Mode** Privileged Exec

**Example** To delete the backup file from node2, use the following command:

```
Node_1# atmf backup delete node2
```

**Related Commands**

- `show atmf backup`
- `atmf backup now`
- `atmf backup stop`

# atmf backup enable

**Overview** This command enables automatic AMF backups on the AMF master node that you are connected to. By default, automatic backup starts at 3:00 AM. However, this schedule can be changed by the [atmf backup](#) command. Note that backups are initiated and stored only on the master nodes.

Use the **no** variant of this command to disable any AMF backups that have been scheduled and previously enabled.

**Syntax** `atmf backup enable`  
`no atmf backup enable`

**Default** Automatic AMF backup functionality is enabled on the AMF master when it is configured and external media, i.e. an SD card or a USB storage device or remote server, is detected.

**Mode** Global Configuration

**Usage** A warning message will appear if you run the [atmf backup enable](#) command with either insufficient or marginal memory availability on your external storage device.

You can use the command [show atmf backup](#) on page 2249 to check the amount of space available on your external storage device.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To turn on automatic AMF backup, use the following command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup enable
```

**Related Commands** [show atmf](#)  
[show atmf backup](#)  
[atmf backup](#)  
[atmf backup now](#)  
[atmf enable](#)

# atmf backup guests delete

**Overview** This command removes a guest node's backup files from external media such as a USB drive, SD card, or an external file server.

**Syntax** `atmf backup guests delete <node-name> <guest-port>`

| Parameter                       | Description                          |
|---------------------------------|--------------------------------------|
| <code>&lt;node-name&gt;</code>  | The name of the guest's parent node. |
| <code>&lt;guest-port&gt;</code> | The port number on the parent node.  |

**Mode** User Exec/Privileged Exec

**Example** On a parent node named "node1" (which, in this case, the user has a direct console connection to) use the following command to remove the backup files of the guest node that is directly connected to port1.0.3.

```
node1# atmf backup guests delete node1 port1.0.3
```

**Related Command** [atmf backup delete](#)  
[atmf backup area-masters delete](#)  
[show atmf backup guest](#)

# atmf backup guests enable

**Overview** Use this command to enable backups of remote guest nodes from an AMF master. Use the **no** variant of this command to disable the ability of the guest nodes to be backed up.

**Syntax** `atmf backup guests enable`  
`no atmf backup guests enable`

**Default** Guest node backups are enabled by default.

**Mode** Global Config

**Usage** We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** On the AMF master node, enable all scheduled guest node backups:

```
atmf-master# configure terminal
atmf-master(config)# atmf backup guests enable
```

**Related Commands** [atmf backup area-masters enable](#)  
[show atmf backup guest](#)  
[atmf backup guests synchronize](#)

# atmf backup guests now

**Overview** This command manually triggers an AMF backup of guest nodes on a AMF Master.

**Syntax** `atmf backup guests now [<node-name>] [<guest-port>]`

| Parameter                       | Description                                      |
|---------------------------------|--------------------------------------------------|
| <code>&lt;node-name&gt;</code>  | The name of the guest's parent node.             |
| <code>&lt;guest-port&gt;</code> | The port number that connects to the guest node. |

**Default** N/A

**Mode** Privileged Exec

**Example** Use the following command to manually trigger the backup of all guests in the AMF network

```
awplus# atmf backup guests now
```

**Example** To manually trigger the backup of a guest node connected to port 1.0.23 of node1, use the following command:

```
awplus# atmf backup guests now node1 port1.0.23
```

**Related Commands** [show atmf backup guest](#)

# atmf backup guests synchronize

**Overview** This command initiates a manual synchronization of all guest backup file-sets across remote file servers and various redundancy backup media, such as USB storage devices. This facility ensures that each device contains the same backup image files. Note that this backup synchronization process will occur as part of the regular backups scheduled by the [atmf backup](#) command.

**Syntax** `atmf backup guests synchronize`

**Default** N/A

**Mode** User Exec/Privileged Exec

**Example** To synchronize backups across remote file servers and storage devices, use the command:

```
Node1#atmf backup guests synchronize
```

**Related Commands** [atmf backup redundancy enable](#)  
[show atmf guests](#)  
[atmf backup guests enable](#)

# atmf backup now

**Overview** This command initiates an immediate AMF backup of either all AMF members, or a selected AMF member. Note that this backup information is stored in the external media on the master node of the device on which this command is run, even though the selected AMF member may not be a master node.

Note that this command can only be run on an AMF master node.

**Syntax** `atmf backup now [<nodename>]`

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <nodename><br>or<br><hostname> | The name of the AMF member to be backed up, as set by the command <code>hostname</code> on page 238. Where no name has been assigned to this device, then you must use the default name, which is the word "host", then an underscore, then (without a space) the MAC address of the device to be backed up. For example <code>host_0016_76b1_7a5e</code> . Note that the node-name appears as the command Prompt when in Privileged Exec mode. |

**Default** A backup is initiated for all nodes on the AMF (but stored on the master nodes).

**Mode** Privileged Exec

**Usage** Although this command will select the AMF node to be backed-up, it can only be run from any AMF master node.

**NOTE:** *The backup produced will be for the selected node but the backed-up config will reside on the external media of the AMF master node on which the command was run. However, this process will result in the information on one master being more up-to-date. To maintain concurrent backups on both masters, you can apply the backup now command to the master working-set. This is shown in Example 4 below.*

**Example 1** In this example, an AMF member has not been assigned a host name. The following command is run on the `AMF_Master_2` node to immediately backup the device that is identified by its MAC address of `0016.76b1.7a5e`:

```
AMF_Master_2# atmf backup now host_0016_76b1_7a5e
```

**NOTE:** *When a host name is derived from its MAC address, the syntax format entered changes from `XXXX.XXXX.XXXX` to `XXXX_XXXX_XXXX`.*

**Example 2** In this example, an AMF member has the host name, **office\_annex**. The following command will immediately backup this device:

```
AMF_Master_2# atmf backup now office_annex
```

This command is initiated on the device's master node named **AMF\_Master\_2** and initiates an immediate backup on the device named **office\_annex**.

**Example 3** To initiate from AMF\_master\_1 an immediate backup of all AMF member nodes, use the following command:

```
AMF_Master_1# amf backup now
```

**Example 4** To initiate an immediate backup of the node with the host-name “office\_annex” and store the configuration on both masters, use the following process:

From the AMF\_master\_1, set the working-set to comprise only of the automatic group, master nodes.

```
AMF_Master_1# atmf working-set group master
```

This command returns the following display:

```
=====
AMF_Master_1, AMF_Master_2
=====

Working set join
```

Backup the AMF member with the host name, **office\_annex** on both the master nodes as defined by the working set.

```
AMF_Master[2]# atmf backup now office_annex
```

Note that the [2] shown in the command prompt indicates a 2 node working-set.

  - [atmf backup stop](#)
  - [hostname](#)
  - [show atmf backup](#)

# atmf backup redundancy enable

**Overview** This command is used to enable or disable AMF backup redundancy.

**Syntax** `atmf backup redundancy enable`  
`no atmf backup redundancy enable`

**Default** Disabled

**Mode** Global Configuration

**Usage** If the AMF Master or Controller supports any removable media (SD card/USB), it uses the removable media as the redundant backup for the AMF data backup.

This feature is valid only if remote file servers are configured on the AMF Master or Controller.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To enable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# atmf backup redundancy enable
```

To disable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf backup redundancy enable
```

**Related Commands** [atmf backup synchronize](#)  
[show atmf backup](#)  
[show atmf backup area](#)

# atmf backup server

**Overview** This command configures remote file servers as the destination for AMF backups.

Use the **no** variant of this command to remove the destination server(s). When all servers are removed the system will revert to backup from external media.

**Syntax** `atmf backup server id {1|2} <hostlocation> username <username>`  
`[path <path>|port <1-65535>]`  
`no atmf backup server id {1|2}`

| Parameter      | Description                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | Remote server backup server identifier.                                                                                                                                                          |
| {1 2}          | The backup server identifier number (1 or 2). Note that there can be up to two backup servers, numbered 1 and 2 respectively, and you would need to run this command separately for each server. |
| <hostlocation> | Either the name or the IP address (IPv4 or IPv6) of the selected backup server (1 or 2).                                                                                                         |
| username       | Configure the username to log in with on the selected remote file server.                                                                                                                        |
| <username>     | The selected remote file server's username.                                                                                                                                                      |
| path           | The location of the backup files on the selected remote file server. By default this will be the home directory of the username used to log in with.                                             |
| <path>         | The directory path utilized to store the backup files on the selected remote file server. No spaces are allowed in the path.                                                                     |
| port           | The connection to the selected remote backup file server using SSH. By default SSH connects to a device on TCP port 22 but this can be changed with this command.                                |
| <1-65535>      | A TCP port within the specified range.                                                                                                                                                           |

**Defaults** Remote backup servers are not configured. The default SSH TCP port is 22. The path utilized on the remote file server is the home directory of the username.

**Mode** Global Exec

**Usage** The hostname and username parameters must both be configured.

**Examples** To configure server 1 with an IPv4 address and a username of *backup1*, use the commands:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 192.168.1.1
username backup1
```

To configure server 1 with an IPv6 address and a username of *backup1*, use the command:

```
AMF_backup1_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 FFEE::01 username
backup1
```

To configure server 2 with a hostname and username, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com
username backup2
```

To configure server 2 with a hostname and username in addition to the optional path and port parameters, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com
username backup2 path tokyo port 1024
```

To unconfigure the AMF remote backup file server 1, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# no atmf backup server id 1
```

**Related  
Commands**    [show atmf backup](#)

# atmf backup stop

**Overview** Running this command stops a backup that is currently running on the master node you are logged onto. Note that if you have two masters and want to stop both, then you can either run this command separately on each master node, or add both masters to a working set, and issue this command to the working set.

Note that this command can only be run on a master node.

**Syntax** `atmf backup stop`

**Mode** Privileged Exec

**Usage** This command is used to halt an AMF backup that is in progress. In this situation the backup process will finish on its current node and then stop.

**Example** To stop a backup that is currently executing on master node node-1, use the following command:

```
AMF_Master_1# amf backup stop
```

**Related Commands**

- [atmf backup](#)
- [atmf backup enable](#)
- [atmf backup now](#)
- [show atmf backup](#)

# atmf backup synchronize

**Overview** For the master node you are connected to, this command initiates a system backup of files from the node's active remote file server to its backup remote file server. Note that this process happens automatically each time the network is backed up.

Note that this command can only be run from a master node.

**Syntax** `atmf backup synchronize`

**Mode** Privileged Exec

**Example** When connected to the master node `AMF_Master_1`, the following command will initiate a backup of all system related files from its active remote file server to its backup remote file server.

```
AMF_Master_1# atmf backup synchronize
```

**Related Commands**

- [atmf backup enable](#)
- [atmf backup redundancy enable](#)
- [show atmf](#)
- [show atmf backup](#)

# atmf cleanup

**Overview** This command erases all data from NVS and all data from Flash **excluding** the following:

- the current release file
- the backup release file
- license files

It then reboots to put the device in a clean state ready to be used as a replacement node on a provisioned port.

**Syntax** `atmf cleanup`

**Mode** Privileged Exec

**Usage** This command is an alias to the [erase factory-default](#) command.

**Example** To erase data, use the command:

```
Node_1# atmf cleanup
```

```
This command will erase all NVS, all flash contents except for
the boot release, and any license files, and then reboot the
switch. Continue? (y/n):y
```

**Related  
Commands** [erase factory-default](#)

# atmf container

**Overview** Use this command to create or update an AMF container on a Virtual AMF Appliance (VAA) virtual machine.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an AMF container.

**Syntax** `atmf container <container-name>`  
`no atmf container <container-name>`

| Parameter                           | Description                                                 |
|-------------------------------------|-------------------------------------------------------------|
| <code>&lt;container-name&gt;</code> | The name of the AMF container to create, update, or remove. |

**Mode** AMF Container Configuration

**Usage** You cannot delete a container while it is still running. First use the **state disable** command to stop the container.

**Examples** To create or update the AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)#
```

To remove the AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# no atmf container vac-wlg-1
```

**Related Commands**

- [state](#)

**Command changes** Version 5.4.7-0.1: command added

# atmf container login

**Overview** Use this command to login to an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `atmf container login <container-name>`

| Parameter                           | Description                                           |
|-------------------------------------|-------------------------------------------------------|
| <code>&lt;container-name&gt;</code> | The name of the AMF container you wish to login into. |

**Mode** Privileged Exec

**Usage** If you try to login to a AMF container that has not been created, or is not running, you will see the following message:

```
% Container does not exist or is not running.
```

To exit from a container and return to the host VAA press `<Ctrl+a q>`.

**Example** To login to container “vac-wlg-1”, use the command:

```
awplus# atmf container login vac-wlg-1
```

You will then be presented with a login screen for that container:

```
Connected to tty 1
Type <Ctrl+a q> to exit the console, <Ctrl+a Ctrl+a> to enter Ctrl+a itself

vac-wlg-1 login: manager
Password: friend

AlliedWare Plus (TM) 5.4.7 02/03/17 08:46:12

vac-wlg-1>
```

**Related Commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# atmf controller

**Overview** Use this command to configure the device as an AMF controller. This enables you to split a large AMF network into multiple areas.

AMF controller is a licensed feature. The number of areas supported on a controller depends on the license installed on that controller.

Use the **no** variant of this command to remove the AMF controller functionality.

**Syntax** `atmf controller`  
`no atmf controller`

**Mode** Global configuration

**Usage** If a valid AMF controller license is not available on the device, the device will accept this command but will not act as a controller until you install a valid license. The following message will warn you of this:

“An AMF Controller license must be installed before this feature will become active”

**NOTE:** *If the AMF controller functionality is removed from a device using the **no atmf controller** command then the device must be rebooted if it is to function properly as an AMF master.*

**Example** To configure the node named *controller-1* as an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf controller
```

To stop the node named *controller-1* from being an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf controller
```

**Related  
Commands** [atmf area](#)  
[show atmf](#)

# atmf distribute firmware

**Overview** This command can be used to upgrade software one AMF node at a time. A URL can be selected from any media location. The latest compatible release for a node will be selected from this location.

Several procedures are performed to ensure the upgrade will succeed. This includes checking the current node release boots from flash. If there is enough space on flash the software release is copied to flash on the new location.

The new release name is updated using the [boot system](#) command. The old release will become the backup release file. If a release file exists in a remote device (such as TFTP or HTTP, for example) then the URL should specify the exact release filename without using a wild card character.

The command will continue to upgrade software until all nodes are upgraded. At the end of the upgrade cycle the command should be used on the working-set.

**Syntax** `atmf distribute firmware <filename>`

| Parameter                     | Description                                                                                                                           |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;filename&gt;</code> | The filename and path of the file. See the <a href="#">File Management Feature Overview and Configuration Guide</a> for valid syntax. |

**Mode** Privileged Exec

**Examples** To upgrade nodes in a AMF network with a predefined AMF group called "teams", use the following commands:

```
Team1# atmf working-set group teams
```

```
=====
Team1, Team2, Team3:
=====
Working set join
```

```
ATMF_NETWORK[3]# atmf distribute firmware card:*.rel
```

```
Retrieving data from Team1
Retrieving data from Team2
Retrieving data from Team3

ATMF Firmware Upgrade:

Node Name New Release File Status

Team1 x510-5.4.7-1.1.rel Release ready
Team2 x930-5.4.7-1.1.rel Release ready
Team3 x930-5.4.7-1.1.rel Release ready
Continue the rolling reboot ? (y/n):y
=====
Copying Release : x510-5.4.7-1.1.rel to Team1
Updating Release : x510-5.4.7-1.1.rel information on Team1
=====
Copying Release : x930-5.4.7-1.1.rel to Team2
Updating Release : x930-5.4.7-1.1.rel information on Team2
=====
Copying Release : x930-5.4.7-1.1.rel to Team3
Updating Release : x930-5.4.7-1.1.rel information on Team3
=====
New firmware will not take effect until nodes are rebooted.
=====

ATMF_NETWORK[3]#
```

**Related** [atmf working-set](#)  
**Commands**

# atmf domain vlan

**Overview** The AMF domain VLAN is created when the AMF network is first initiated and is assigned a default VID of 4091. This command enables you to change the VID from this default value on this device.

The AMF domain VLAN is one of AMF's internal VLANs (the management VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

An important point conceptually is that although the domain VLAN exists globally across the AMF network, it is assigned separately to each domain. The AMF network therefore can be thought of as comprising a series of domain VLANs each having the same VID and each being applied to a horizontal slice (domain) of the AMF. It follows therefore that the domain VLANs are only applied to ports that form cross-links and not to ports that form uplinks/downlinks.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to reset the VLAN ID to its default value of 4091.

**Syntax** `atmf domain vlan <2-4090>`  
`no atmf domain vlan`

| Parameter                   | Description                             |
|-----------------------------|-----------------------------------------|
| <code>&lt;2-4090&gt;</code> | The VLAN number in the range 2 to 4090. |

**Default** VLAN 4091

**Mode** Global Configuration

**Usage** We recommend you only change the domain VLAN when first creating the AMF network, and only if VLAN 4091 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
test(config)[10]# atmf domain vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

- 4) Create the working set again, using the commands:

```
master(config)# exit
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

**NOTE:** The domain VLAN will automatically be assigned an IP subnet address based on the value configured by the command *atmf management subnet*.

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

**Examples** To change the AMF domain VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf domain vlan 4090
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF domain VLAN to its default of 4091 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf domain vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands** [atmf management subnet](#)  
[atmf management vlan](#)

# atmf enable

**Overview** This command manually enables (turns on) the AMF feature for the device being configured.

Use the **no** variant of this command to disable (turn off) the AMF feature on the member node.

**Syntax** atmf enable  
no atmf enable

**Default** Once AMF is configured, the AMF feature starts automatically when the device starts up.

**Mode** Global Configuration

**Usage** The device does not auto negotiate AMF domain specific settings such as the Network Name. You should therefore, configure your device with any domain specific (non default) settings before enabling AMF.

**Examples** To turn off AMF, use the command:

```
MyNode# config terminal
MyNode(config)# no atmf enable
```

To turn on AMF, use the command:

```
MyNode(config)# atmf enable
```

This command returns the following display:

```
% Warning: The ATMF network config has been set to enable
% Save the config and restart the system for this change to take
effect.
```

# atmf group (membership)

**Overview** This command configures a device to be a member of one or more AMF groups. Groups exist in three forms: Implicit Groups, Automatic Groups, and User-defined Groups.

- Implicit Groups
  - all: All nodes in the AMF
  - current: The current working-set
  - local: The originating node.

Note that the Implicit Groups do not appear in show group output.

- Automatic Groups - These are defined by hardware architecture, e.g. x510, x230, x8100, AR3050S, AR4050S.
- User-defined Groups - These enable you to define arbitrary groups of AMF members based on your own criteria.

Each node in the AMF is automatically assigned membership to the implicit groups, and the automatic groups that are appropriate to its node type, e.g. x230, PoE. Similarly, nodes that are configured as masters are automatically assigned to the master group.

Use the **no** variant of this command to remove the membership.

**Syntax** `atmf group <group-list>`  
`no atmf group <group-list>`

| Parameter                       | Description                                                                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;group-list&gt;</code> | A list of group names. These should be entered as a comma delimited list without spaces. Names can contain alphanumeric characters, hyphens and underscores. |

**Mode** Global Configuration

**Usage** You can use this command to define your own arbitrary groups of AMF members based on your own network's configuration requirements. Applying a node to a non existing group will result in the group automatically being created.

Note that the master nodes are automatically assigned to be members of the pre-existing master group.

The following example configures the device to be members of three groups; two are company departments, and one comprises all devices located in building\_2. To avoid having to run this command separately on each device that is to be added to these groups, you can remotely assign all of these devices to a working-set, then use the capabilities of the working-set to apply the [atmf group \(membership\)](#) command to all members of the working set.

**Example 1** To specify the device to become a member of AMF groups named *marketing*, *sales*, and *building\_2*, use the following commands:

```
node-1# configure terminal
node-1(config)# atmf group marketing,sales,building_2
```

**Example 2** To add the nodes *member\_node\_1* and *member\_node\_2* to groups *building1* and *sales*, first add the nodes to the working-set:

```
master_node# atmf working-set member_node_1,member_node_2
```

This command returns the following output confirming that the nodes *member\_node\_1* and *member\_node\_2* are now part of the working-set:

```
=====
member_node_1, member_node_2
=====

Working set join
```

Then add the members of the working set to the groups:

```
atmf-net[2]# configure terminal
atmf-net[2](config)# atmf group building1,sales
atmf-net[2](config)# exit
atmf-net[2]# show atmf group
```

This command returns the following output displaying the groups that are members of the working-set.

```
=====
member_node_1
=====

AMF group information

building1, sales
```

**Related Commands** [show atmf group](#)  
[show atmf group members](#)

# atmf guest-class

**Overview** This modal command creates a guest-class. Guest-classes are modal templates that can be applied to selected guest types. Once you have created a guest-class, you can select it by entering its mode. From here, you can then configure a further set of operational settings specifically for the new guest-class. These settings can then all be applied to a guest link by running the [switchport atmf-guestlink](#) command. The following settings can be configured from each guest class mode:

- discovery method
- model type
- http-enable setting
- guest port, user name, and password

The **no** variant of this command removes the guest-class. Note that you cannot remove a guest-class that is assigned to a port.

**Syntax** `atmf guest-class <guest-class-name>`  
`no atmf guest-class`

| Parameter                             | Description                                                                                                    |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>&lt;guest-class-name&gt;</code> | The name assigned to the guest-class type. This can be chosen from an arbitrary string of up to 15 characters. |

**Mode** Interface

**Example 1** To create a guest-class named **camera** use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class camera
node1(config-atmf-guest)# end
```

**Example 2** To remove the guest-class named **phone** use the following commands:

```
node1# configure terminal
node1(config)# no atmf guest-class phone
node1(config-atmf-guest)# end
```

show atmf guests

# atmf log-verbose

**Overview** This command limits the number of log messages displayed on the console or permanently logged.

Use the **no** variant of this command to reset to the default.

**Syntax** atmf log-verbose <1-3>  
no atmf log-verbose

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| <1-3>     | The verbose limitation (3 = noisiest, 1 = quietest) |

**Default** The default log display is 3.

**Usage** This command is intended for use in large networks where verbose output can make the console unusable for periods of time while nodes are joining and leaving.

**Mode** Global Configuration

**Example** To set the log-verbose to noise level 2, use the command:

```
node-1# configure terminal
node-1(config)# atmf log-verbose 2
```

**Validation Command** `show atmf`

# atmf management subnet

**Overview** This command is used to assign a subnet that will be allocated to the AMF management and domain management VLANs. From the address space defined by this command, two subnets are created, a management subnet component and a domain component, as explained in the Usage section below.

AMF uses these internal IPv4 subnets to communicate network status information between nodes. These subnet addresses must be reserved for AMF and not used for other purposes.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to remove the assigned subnet.

**Syntax** atmf management subnet <a.b.0.0>  
no atmf management subnet

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a.b.0.0> | The IP address selected for the management subnet. Because a mask of 255.255.0.0 (i.e. /16) will be applied automatically, an IP address in the format a.b.0.0 must be selected. Usually this subnet address is selected from an appropriate range from within the private address space of 172.16.0.0 to 172.31.255.255, or 192.168.0.0, as defined in RFC1918. |

**Default** 172.31.0.0. A subnet mask of 255.255.0.0 will automatically be applied.

**Mode** Global Configuration

**Usage** Running this command will result in the creation of a further two subnets (within the class B address space assigned) and the mask will extend from /16 to /17.

For example, if the management subnet is assigned the address 172.31.0.0/16, this will result in the automatic creation of the following two subnets:

- 172.31.0.0/17 assigned to the [atmf management vlan](#)
- 172.31.128.0/17 assigned to the [atmf domain vlan](#).

We recommend you only change the management subnet when first creating the AMF network, and only if 172.31.0.0 is already being used in your network.

However, if you do need to change the subnet on an existing AMF network, use the following steps:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN, management VLAN, or management subnet. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new subnet address, using the commands:

```
test[10]# configure terminal
```

```
test(config)[10]# atmf management subnet <a.b.0.0>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new subnet.

- 4) Create the working set again, using the commands:

```
master(config)# exit
```

```
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the subnet on missing devices by logging into their consoles directly.

**Examples** To change the AMF management subnet address to 172.25.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
```

```
test[10]# configure terminal
```

```
test(config)[10]# atmf management subnet 172.25.0.0
```

```
master(config)# exit
```

```
master# atmf working-set group all
```

```
test[10]# write
```

To reset the AMF management subnet address to its default of 172.31.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management subnet
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands**

- [atmf domain vlan](#)
- [atmf management vlan](#)

# atmf management vlan

**Overview** The AMF management VLAN is created when the AMF network is first initiated and is assigned a default VID of 4092. This command enables you to change the VID from this default value on this device.

The AMF management VLAN is one of AMF's internal VLANs (the domain VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to restore the VID to the default of 4092.

**Syntax** `atmf management vlan <2-4090>`  
`no atmf management vlan`

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| <2-4090>  | The VID assigned to the AMF management VLAN. |

**Default** VLAN 4092

**Mode** Global Configuration

**Usage** We recommend you only change the management VLAN when first creating the AMF network, and only if VLAN 4092 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps to ensure you change it on all nodes simultaneously:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the management VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
test(config)[10]# atmf management vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

- 4) Create the working set again, using the commands:

```
master(config)# exit
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

**NOTE:** The management VLAN will automatically be assigned an IP subnet address based on the value configured by the command *atmf management subnet*.

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

**Examples** To change the AMF management VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf management vlan 4090
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF management VLAN to its default of 4092 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands** [atmf domain vlan](#)  
[atmf management subnet](#)

# atmf master

**Overview** This command configures the device to be an AMF master node and automatically creates an AMF master group. The master node is considered to be the core of the AMF network, and must be present for the AMF to form. The AMF master has its node depth set to 0. Note that the node depth vertical distance is determined by the number of uplinks/downlinks that exist between the node and its master.

An AMF master node must be present for an AMF network to form. Up to two AMF master nodes may exist in a network, and they **must** be connected by an AMF crosslink.

**NOTE:** Master nodes are an essential component of an AMF network. In order to run AMF, an AMF License is required for each master node.

If the crosslink between two AMF masters fails, then one of the masters will become isolated from the rest of the AMF network.

Use the **no** variant of this command to remove the device as an AMF master node. The node will retain its node depth of 0 until the network is rebooted.

**NOTE:** Node depth is the vertical distance (or level) from the master node (whose depth value is 0).

**Syntax** `atmf master`  
`no atmf master`

**Default** The device is not configured to be an AMF master node.

**Mode** Global Configuration

**Example** To specify that this node is an AMF master, use the following command:

```
node-1# configure terminal
node-1(config)# atmf master
```

**Related Commands** [show atmf](#)  
[show atmf group](#)

# atmf mtu

**Overview** This command configures the AMF network Maximum Transmission Unit (MTU). The MTU value will be applied to the AMF Management VLAN, the AMF Domain VLAN and AMF Area links.

Use the **no** variant of this command to restore the default MTU.

**Syntax** `atmf mtu <1300-1442>`  
`no atmf mtu`

| Parameter   | Description                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <1300-1442> | The value of the maximum transmission unit for the AMF network, which sets the maximum size of all AMF packets generated from the device. |

**Default** 1300

**Mode** Global Configuration

**Usage** The default value of 1300 will work for all AMF networks (including those that involve virtual links over IPsec tunnels). If there are virtual links over IPsec tunnels anywhere in the AMF network, we recommend not changing this default. If there are no virtual links over IPsec tunnels, then this AMF MTU value may be increased for network efficiency.

**Example** To change the ATMF network MTU to 1442, use the command:

```
awplus(config)# atmf mtu 1442
```

**Related Commands** [show atmf detail](#)

# atmf network-name

**Overview** This command applies an AMF network name to a (prospective) AMF node. In order for an AMF network to be valid, its network-name must be configured on at least two nodes, one of which must be configured as a master and have an AMF License applied. These nodes may be connected using either AMF downlinks or crosslinks.

For more information on configuring an AMF master node, see the command [atmf master](#).

Use the **no** variant of this command to remove the AMF network name.

**Syntax** `atmf network-name <name>`  
`no atmf network-name`

| Parameter                 | Description                                                                              |
|---------------------------|------------------------------------------------------------------------------------------|
| <code>&lt;name&gt;</code> | The AMF network name. Up to 15 printable characters can be entered for the network-name. |

**Mode** Global Configuration

**Usage** This is one of the essential commands when configuring AMF and must be entered on each node that is to be part of the AMF.

A switching node (master or member) may be a member of only one AMF network.

**CAUTION:** *Ensure that you enter the correct network name. Entering an incorrect name will cause the AMF network to fragment (at the next reboot).*

**Example** To set the AMF network name to `amf_net` use the command:

```
Node_1(config)# atmf network-name amf_net
```

# atmf provision

**Overview** This command configures a specified port on an AMF node to accept a provisioned node, via an AMF link, some time in the future.

Use the **no** variant of this command to remove the provisioning on the node.

**Syntax** `atmf provision [<nodename>]`  
`no atmf provision`

| Parameter  | Description                                                                         |
|------------|-------------------------------------------------------------------------------------|
| <nodename> | The name of the provisioned node that will appear on the AMF network in the future. |

**Default** No AMF provisioning.

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage** The port should be configured as an AMF link or cross link and should be “down” to add or remove a provisioned node.

**Example** To provision an AMF node named node1 for port1.0.1, use the command:

```
host1(config)# interface port1.0.1
host1(config-if)# atmf provision node1
```

**Related Commands** [switchport atmf-link](#)  
[switchport atmf-crosslink](#)  
[show atmf links](#)

# atmf provision node clone

**Overview** This command sets up a space on the backup media for use with a provisioned node and copies into it almost all files and directories from a chosen backup or provisioned node.

Alternatively, you can set up a new, unique provisioned node by using the command [atmf provision node create](#).

**Syntax** `atmf provision node <nodename> clone <source-nodename>`

| Parameter                            | Description                                                                        |
|--------------------------------------|------------------------------------------------------------------------------------|
| <code>&lt;nodename&gt;</code>        | The name that will be assigned to the clone when connected.                        |
| <code>&lt;source-nodename&gt;</code> | The name of the node whose configuration is to be copied for loading to the clone. |

**Mode** Privileged Exec

**Usage** This command is only available on master nodes in the AMF network.

You must run either this command or [atmf provision node create](#) command, before you can use other **atmf provision node** commands using the specified node name. If a backup or provisioned node already exists for the specified node then you must delete it before using the **atmf provision node clone** command.

When using this command it is important to be aware of the following:

- A copy of `<media>:atmf/<atmf_name>/nodes/<source_node>/flash` will be made for the provisioned node and stored in the backup media.
- The directory `<node_backup_dir>/flash/.config/ssh` is excluded from the copy.
- All contents of `<root_backup_dir>/nodes/<nodename>` will be deleted or overwritten.
- Settings for the expected location of other provisioned nodes are excluded from the copy.

The active and backup configuration files are automatically modified in the following ways:

- The **hostname** command is modified to match the name of the provisioned node.
- The **stack virtual-chassis-id** command is removed, if present.

**Example** To copy from the backup of device2 to create backup files for the new provisioned node device3 use the following command:

```
device1# atmf provision node device3 clone device2
```

Figure 50-1: Sample output from the **atmf provision node clone** command

```
device1#atmf provision node device3 clone device2
Copying...
Successful operation
```

To confirm that a new provisioned node has been cloned, use the command:

```
device1# show atmf backup
```

The output from this command is shown in the following figure, and shows the details of the new provisioned node device3.

Figure 50-2: Sample output from the **show atmf backup** command

```
device1#show atmf backup

# atmf provision node configure boot config

**Overview** This command sets the configuration file to use during the next boot cycle. This command can also set a backup configuration file to use if the main configuration file cannot be accessed for an AMF provisioned node. To unset the boot configuration or the backup boot configuration use the **no boot** command.

Use the **no** variant of this command to set back to the default.

**Syntax** `atmf provision node <nodename> configure boot config [backup] [<file-path|URL>]`  
`atmf provision node [<nodename>] configure no boot config [backup]`

| Parameter       | Description                                         |
|-----------------|-----------------------------------------------------|
| <nodename>      | The name of the provisioned node.                   |
| <file-path URL> | The path or URL and name of the configuration file. |

**Default** No boot configuration files or backup configuration files are specified for the provisioned node.

**Mode** Privileged Exec

**Usage** When using this command to set a backup configuration file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

**Examples** To set the configuration file `branch.cfg` on the AMF provisioned node `node1`, use the command:

```
MasterNodeName# atmf provision node node1 configure boot config
branch.cfg
```

To set the configuration file `backup.cfg` as the backup to the main configuration file on the AMF provisioned node `node1`, use the command:

```
MasterNodeName# atmf provision node node1 configure boot config
backup usb:/atmf/amf_net/nodes/node1/config/backup.cfg
```

To unset the boot configuration, use the command:

```
MasterNodeName# atmf provision node node1 configure no boot
config
```

To unset the backup boot configuration, use the command:

```
MasterNodeName# atmf provision node node1 configure no boot
config backup
```

**Related Commands** [atmf provision node configure boot system](#)  
[show atmf provision nodes](#)

# atmf provision node configure boot system

**Overview** This command sets the release file that will load onto a specified provisioned node during the next boot cycle. This command can also set the backup release file to be loaded for an AMF provisioned node. To unset the boot system release file or the backup boot release file use the **no boot** command.

Use the **no** variant of this command to return to the default.

This command can only be run on AMF master nodes.

**Syntax** `atmf provision node <nodename> configure boot system [backup] [<file-path|URL>]`  
`atmf provision node <nodename> configure no boot system [backup]`

| Parameter       | Description                                   |
|-----------------|-----------------------------------------------|
| <nodename>      | The name of the provisioned node.             |
| <file-path URL> | The path or URL and name of the release file. |

**Default** No boot release file or backup release files are specified for the provisioned node.

**Mode** Privileged Exec

**Usage** When using this command to set a backup release file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

**Examples** To set the release file x930-5.4.7-1.1.rel on the AMF provisioned node "node1", use the command:

```
MasterNodeName# atmf provision node node1 configure boot system x930-5.4.7-1.1.rel
```

To set the backup release file x930-5.4.7-0.4.rel as the backup to the main release file on the AMF provisioned node "node1", use the command:

```
MasterNodeName# atmf provision node node1 configure boot system backup card:/atmf/amf_net/nodes/node1/flash/x930-5.4.7-0.4.rel
```

To unset the boot release, use the command:

```
MasterNodeName# atmf provision node node1 configure no boot system
```

To unset the backup boot release, use the command:

```
MasterNodeName# atmf provision node node1 configure no boot system backup
```

**Related Commands** [atmf provision node configure boot config](#)  
[show atmf provision nodes](#)

# atmf provision node create

**Overview** This command sets up an empty directory on the backup media for use with a provisioned node. This directory can have configuration and release files copied to it from existing devices. Alternatively, the configuration files can be created by the user.

An alternative way to create a new provisioned node is with the command [atmf provision node clone](#).

This command can only run on AMF master nodes.

**Syntax** `atmf provision node <nodename> create`

| Parameter  | Description                                     |
|------------|-------------------------------------------------|
| <nodename> | The name of the node that is being provisioned. |

**Mode** Privileged Exec

**Usage** This command is only available on master nodes in the AMF network.

The [atmf provision node create](#) command (or [atmf provision node clone](#)) must be executed before you can use other **atmf provision node** commands with the specified node name. If a backup or provisioned node already exists for the specified node name then you must delete it before using this command.

A date and time is assigned to the new provisioning directory reflecting when this command was executed. If there is a backup or provisioned node with the same name on another AMF master then the most recent one will be used.

**Example** To create a new provisioned node named "device2" use the command:

```
device1# atmf provision node device2 create
```

Running this command will create the following directories:

- `<media>:atmf/<atmf_name>/nodes/<node>`
- `<media>:atmf/<atmf_name>/nodes/<node>/flash`

To confirm the new node's settings, use the command:

```
device1# show atmf backup
```

The output for the **show atmf backup** command is shown in the following figure, and shows details for the new provisioned node device2.

Figure 50-3: Sample output from the **show atmf backup** command

```
device1#show atmf backup

For instructions on how to configure on a provisioned node, see the [AMF Feature Overview and Configuration Guide](#).

**Related commands** [atmf provision node clone](#)

# atmf provision node delete

**Overview** This command deletes files that have been created for loading onto a provisioned node. It can only be run on master nodes.

**Syntax** `atmf provision node <nodename> delete`

| Parameter  | Description                                     |
|------------|-------------------------------------------------|
| <nodename> | The name of the provisioned node to be deleted. |

**Mode** Privileged Exec

**Usage** This command is only available on master nodes in the AMF network. The command will only work if the provisioned node specified in the command has already been set up (although the device itself is still yet to be installed). Otherwise, an error message is shown when the command is run.

You may want to use the **atmf provision node delete** command to delete a provisioned node that was created in error or that is no longer needed.

This command cannot be used to delete backups created by the AMF backup procedure. In this case, use the command [atmf backup delete](#) to delete the files.

**NOTE:** *This command allows provisioned entries to be deleted even if they have been referenced by the [atmf provision](#) command, so take care to only delete unwanted entries.*

**Example** To delete backup files for a provisioned node named device3 use the command:

```
device1# atmf provision node device3 delete
```

To confirm that the backup files for provisioned node device3 have been deleted use the command:

```
device1# show atmf backup
```

The output should show that the provisioned node device3 no longer exists in the backup file, as shown in the figure below:

Figure 50-4: Sample output showing the **show atmf backup** command

```
device1#show atmf backup

Scheduled Backup Enabled
 Schedule 1 per day starting at 03:00

device2 30 Sep 2016 00:05:44 Yes Yes Good
```

**Related commands** [atmf provision node create](#)

# atmf provision node license-cert

**Overview** This command is used to set up the license certificate for a provisioned node.

The certificate file usually has all the license details for the network, and can be stored anywhere in the network. This command makes a hidden copy of the certificate file and stores it in the space set up for the provisioned node on AMF backup media.

For node provisioning, the new device has not yet been part of the AMF network, so the user is unlikely to know its product ID or its MAC address. When such a device joins the network, assuming that this command has been applied successfully, the copy of the certificate file will be applied automatically to the provisioned node.

Once the new device has been resurrected on the network and the certificate file has been downloaded to the provisioned node, the hidden copy of the certificate file is deleted from AMF backup media.

Use the **no** variant of this command to set it back to the default.

This command can only be run on AMF master nodes.

**Syntax** `atmf provision node <nodename> license-cert <file-path|URL>`  
`no atmf provision node <nodename> license-cert`

| Parameter                          | Description                                                                   |
|------------------------------------|-------------------------------------------------------------------------------|
| <code>&lt;nodename&gt;</code>      | The name of the provisioned node.                                             |
| <code>&lt;file-path URL&gt;</code> | The name of the certificate file. This can include the file-path of the file. |

**Default** No license certificate file is specified for the provisioned node.

**Mode** Privileged Exec

**Usage** This command is only available on master nodes in the AMF network. It will only operate if the provisioned node specified in the command has already been set up, and if the license certification is present in the backup file. Otherwise, an error message is shown when the command is run.

**Example 1** To apply the license certificate "cert1.txt" stored on a TFTP server for AMF provisioned node "device2", use the command:

```
device1# atmf provision node device2 license-cert
tftp://192.168.1.1/cert1.txt
```

**Example 2** To apply the license certificate "cert2.txt" stored in the AMF master's flash directory for AMF provisioned node "host2", use the command:

```
device1# atmf provision node host2 license-cert /cert2.txt
```

To confirm that the license certificate has been applied to the provisioned node, use the command [show atmf provision nodes](#). The output from this command is shown below, and displays license certification details in the last line.

Figure 50-5: Sample output from the **show atmf provision nodes** command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media: SD (Total 3827.0MB, Free 3481.1MB)

Node Name : device2
Date & Time : 06-Oct-2016 & 23:25:44
Provision Path : card:/atmf/nodes

Boot configuration :
Current boot image : x510-5.4.6-1.4.rel (file exists)
Backup boot image : x510-5.4.6-1.3.rel (file exists)
Default boot config : flash:/default.cfg (file exists)
Current boot config : flash:/abc.cfg (file exists)
Backup boot config : flash:/xyz.cfg (file exists)

Software Licenses :
Repository file : ../configs/.sw_v2.lic
 : ../configs/.swfeature.lic
Certificate file : card:/atmf/lok/nodes/awplus1/flash/.atmf-lic-cert
```

**Related commands** [show atmf provision nodes](#)

# atmf provision node locate

**Overview** This command changes the present working directory to the directory of a provisioned node. This makes it easier to edit files and create a unique provisioned node in the backup.

This command can only be run on AMF master nodes.

**Syntax** `atmf provision node <nodename> locate`

| Parameter                     | Description                       |
|-------------------------------|-----------------------------------|
| <code>&lt;nodename&gt;</code> | The name of the provisioned node. |

**Mode** Privileged Exec

**Usage** This command is only available on master nodes in the AMF network. The command will only work if the provisioned node specified in the command has already been set up. Otherwise, an error message is shown when the command is run.

**NOTE:** We advise that after running this command, you return to a known working directory, typically flash.

**Example** To change the working directory that happens to be on device1 to the directory of provisioned node device2, use the following command:

```
device1# atmf provision node device2 locate
```

The directory of the node device2 should now be the working directory. You can use the command `pwd` to check this, as shown in the following figure.

Figure 50-6: Sample output from the `pwd` command

```
device2#pwd
card:/atmf/building_2/nodes/device2/flash
```

The output above shows that the working directory is now the flash of device2.

**Related commands**

- [atmf provision node create](#)
- [atmf provision node clone](#)
- [pwd](#)

# atmf reboot-rolling

**Overview** This command enables you to reboot the nodes in an AMF working-set, one at a time, as a rolling sequence in order to minimize downtime. Once a rebooted node has finished running its configuration and its ports are up, it re-joins the AMF network and the next node is rebooted.

By adding the *url* parameter, you can also upgrade your devices' software one AMF node at a time.

The **force** parameter forces the rolling reboot to continue even if a previous node does not rejoin the AMF network. Without the **force** parameter, the unsuitable node will time-out and the rolling reboot process will stop. However, with the **force** parameter applied, the process will ignore the timeout and move on to reboot the next node in the sequence.

This command can take a significant amount of time to complete.

**Syntax** `atmf reboot-rolling [force] [<url>]`

| Parameter                | Description                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>force</code>       | Ignore a failed node and move on to the next node. Where a node fails to reboot a timeout is applied based on the time taken during the last reboot. |
| <code>&lt;url&gt;</code> | The path to the software upgrade file.                                                                                                               |

**Mode** Privileged Exec

**Usage** You can load the software from a variety of locations. The latest compatible release for a node will be selected from your selected location, based on the parameters and URL you have entered.

For example `card:/5.4.6/x*-5.4.6-*.rel` will select from the folder `card:/5.4.6` the latest file that matches the selection `x` (wildcard) `-5.4.6-` (wildcard).`rel`. Because `x*` is applied, each device type will be detected and its appropriate release file will be installed.

Other allowable entries are:

| Entry                                 | Used when loading software                              |
|---------------------------------------|---------------------------------------------------------|
| <code>card:*.rel:</code>              | from an SD card                                         |
| <code>tftp:&lt;ip-address&gt;:</code> | from a TFTP server                                      |
| <code>usb:</code>                     | from a USB flash drive                                  |
| <code>flash:</code>                   | from flash memory, e.g. from one x930 switch to another |
| <code>scp:</code>                     | using secure copy                                       |
| <code>http:</code>                    | from an HTTP file server                                |

Several checks are performed to ensure the upgrade will succeed. These include checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash to a new location on each node as it is processed. The new release name will be updated using the **boot system**<release-name> command, and the old release will become the backup release file.

**NOTE:** *If you are using TFTP or HTTP, for example, to access a file on a remote device then the URL should specify the exact release filename without using wild card characters.*

On bootup the software release is verified. Should an upgrade fail, the upgrading unit will revert back to its previous software version. At the completion of this command, a report is run showing the release upgrade status of each node.

**NOTE:** *Take care when removing external media or rebooting your devices. Removing an external media while files are being written entails a significant risk of causing a file corruption.*

**Example 1** To reboot all x510 nodes in an AMF network, use the following command:

```
Bld2_Floor_1# atmf working-set group x510
```

This command returns the following type of screen output:

```
=====
node1, node2, node3:
=====

Working set join

AMF_NETWORK[3]#
```

```
ATMF_NETWORK[3]# atmf reboot-rolling
```

When the reboot has completed, a number of status screens appear. The selection of these screens will depend on the parameters set.

```
Bld2_Floor_1#atmf working-set group x510

=====
SW_Team1, SW_Team2, SW_Team3:
=====

Working set join

ATMF_NETWORK[3]#atmf reboot-rolling
ATMF Rolling Reboot Nodes:

Continue upgrading releases ? (y/n):

# atmf recover

**Overview** This command is used to manually initiate the recovery (or replication) of an AMF node, usually when a node is being replaced.

**Syntax** `atmf recover [<node-name> master <node-name>]`  
`atmf recover [<node-name> controller <node-name>]`

| Parameter                           | Description                                                                                                                                                                                                                              |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;node-name&gt;</i>            | The name of the device whose configuration is to be recovered or replicated.                                                                                                                                                             |
| master<br><i>&lt;node-name&gt;</i>  | The name of the master device that holds the required configuration information.<br>Note that although you can omit both the node name and the master name; you cannot specify a master name unless you also specify the node name.      |
| controller <i>&lt;node-name&gt;</i> | The name of the controller that holds the required configuration information.<br>Note that although you can omit both the node name and the controller name; you cannot specify a controller name unless you also specify the node name. |

**Mode** Privileged Exec

**Usage** The recovery/replication process involves loading the configuration file for a node that is either about to be replaced or has experienced some problem. You can specify the configuration file of the device being replaced by using the *<node-name>* parameter, and you can specify the name of the master node or controller holding the configuration file.

If the *<node-name>* parameter is not entered then the node will attempt to use one that has been previously configured. If the replacement node has no previous configuration (and has no previously used node-name), then the recovery will fail.

If the master or controller name is not specified then the device will poll all known AMF masters and controllers and execute an election process (based on the last successful backup and its timestamp) to determine which to use. If no valid backup master or controller is found, then this command will fail.

No error checking occurs when this command is run. Regardless of the last backup status, the recovering node will attempt to load its configuration from the specified master node or controller.

If the node has previously been configured, we recommend that you suspend any AMF backup before running this command. This is to prevent corruption of the backup files on the AMF master as it attempts to both backup and recover the node at the same time.

**Example** To recover the AMF node named Node\_10 from the AMF master node named Master\_2, use the following command:

```
Master_2# atmf recover Node_10 master Master_2
```

**Related  
Commands**

- atmf backup stop
- show atmf backup
- show atmf

# atmf recover guest

**Overview** Use this command to initiate a guest node recovery or replacement by reloading its backup file-set that is located within the AMF backup system. Note that this command must be run on the edge node device that connects to the guest node.

**Syntax** `atmf recover guest [<guest-port>]`

| Parameter                       | Description                                      |
|---------------------------------|--------------------------------------------------|
| <code>&lt;guest-port&gt;</code> | The port number that connects to the guest node. |

**Mode** User Exec/Privileged Exec

**Example** To recover a guest on node1 port1.0.1, use the following command

```
node1# atmf recover guest port1.0.1
```

**Related Commands** [show atmf backup guest](#)

# atmf recover led-off

**Overview** This command turns off the recovery failure flashing port LEDs. It reverts the LED's function to their normal operational mode, and in doing so assists with resolving the recovery problem. You can repeat this process until the recovery failure has been resolved. For more information, see the [AMF Feature Overview and Configuration Guide](#).

**Syntax** `atmf recover led-off`

**Default** Normal operational mode

**Mode** Privileged Exec

**Example** To revert the LEDs on Node1 from recovery mode display to their normal operational mode, use the command:

```
Node1# atmf recover led-off
```

**Related Commands** [atmf recover](#)

# atmf remote-login

**Overview** Use this command to remotely login to other AMF nodes in order to run commands as if you were a local user of that node.

**Syntax** `atmf remote-login [user <name>] <nodename>`

| Parameter  | Description                                            |
|------------|--------------------------------------------------------|
| <name>     | The name of a user on the remote node.                 |
| <nodename> | The name of the remote AMF node you are connecting to. |

**Mode** Privileged Exec (This command will only run at privilege level 15)

**Usage** You do not need a valid login on the local device in order to run this command. The session will take you to the enable prompt on the new device. If the remote login session exits for any reason (e.g. device reboot) you will be returned to the originating node.

You can create additional user accounts on nodes. AMF's goal is to provide a uniform management plane across the whole network, so we recommend you use the same user accounts on all the nodes in the network.

In reality, though, it is not essential to have the same accounts on all the nodes. Users can remote login from one node to a second node even if they are logged into the first node with a user account that does not exist on the second node (provided that `atmf restricted-login` is disabled and the user account on the first node has privilege level 15).

Moreover, it is possible to use a RADIUS or TACACS+ server to manage user authentication, so users can log into AMF nodes using user accounts that are present on the RADIUS or TACACS+ server, and not present in the local user databases of the AMF nodes.

The software will not allow you to run multiple remote login sessions. You must exit an existing session before starting a new one.

If you disconnect from the VTY session without first exiting from the AMF remote session, the device will keep the AMF remote session open until the `exec-timeout` time expires (10 minutes by default). If the `exec-timeout` time is set to infinity (`exec-timeout 0 0`), then the device is unable to ever close the remote session. To avoid this, we recommend you use the `exit` command to close AMF remote sessions, instead of closing the associated VTY sessions. We also recommend you avoid setting the `exec-timeout` to infinity.

**Example** To remotely login from node Node10 to Node20, use the following command:

```
Node10# atmf remote-login node20
Node20>
```

To close the session on Node20 and return to Node10's command line, use the following command:

```
Node20# exit
Node10#
```

In this example, user User1 is a valid user of node5. They can remotely login from node5 to node3 by using the following commands:

```
node5# atmf remote-login user User1 node3
node3> enable
```

**Related  
Commands** [atmf restricted-login](#)

**Command  
changes** Version 5.4.6-2.1: changes to AMF user account requirements

# atmf restricted-login

**Overview** By default, users who are logged into any node on an AMF network are able to manage any other node by using either working-sets or an AMF remote login. If the access provided by this feature is too wide, or contravenes network security restrictions, it can be limited by running this command, which changes the access so that:

- users who are logged into non-master nodes cannot execute any commands that involve working-sets, and
- from non-master nodes, users can use remote-login, but only to login to a user account that is valid on the remote device (via a statically configured account or RADIUS/TACACS+). Users are also required to enter the password for that user account.

Once entered on any AMF master node, this command will propagate across the network.

Use the **no** variant of this command to disable restricted login on the AMF network. This allows access to the **atmf working-set** command from any node in the AMF network.

**Syntax** `atmf restricted-login`  
`no atmf restricted-login`

**Mode** Privileged Exec

**Default** Master nodes operate with **atmf restricted-login** disabled.  
Member nodes operate with **atmf restricted-login** enabled.

**NOTE:** *The default conditions of this command vary from those applied by its “no” variant. This is because the restricted-login action is only applied by **master** nodes, and in the absence of a master node, the default is to apply the restricted action to all **member** nodes with AMF configured.*

**Usage** In the presence of a **master** node, its default of **atmf restricted-login disabled** will propagate to all its member nodes. Similarly, any change in this command’s status that is made on a master node, will also propagate to all its member nodes

Note that once you have run this command, certain other commands that utilize the AMF working-set command, such as the **include**, **atmf reboot-rolling** and **show atmf group members** commands, will operate only on master nodes.

Restricted-login must be enabled on AMF areas with more than 120 nodes.

**Example** To enable restricted login, use the command

```
Node_20(config)# atmf restricted-login node20
```

**Related Commands** [atmf remote-login](#)  
[show atmf](#)

**Command changes** Version 5.4.6-2.1: changes to AMF user account requirements

# atmf secure-mode

**Overview** Use this command to enable AMF secure mode on an AMF node. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before and AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once the secure mode command is run on all nodes on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

Use the **no** variant of this command to disable AMF secure mode on an AMF node.

**Syntax** `atmf secure-mode`  
`no atmf secure-mode`

**Default** Secure mode is disabled by default.

**Mode** Global Configuration

**Usage** When an AMF network is running in AMF secure mode the [atmf restricted-login](#) feature is automatically enabled. This restricts the [atmf working-set](#) command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

**Example** To enable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode
```

To disable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode
```

**Related Commands** [atmf authorize](#)  
[atmf secure-mode certificate expiry](#)

clear atmf secure-mode certificates  
clear atmf secure-mode statistics  
show atmf  
show atmf authorization  
show atmf secure-mode  
show atmf secure-mode certificates  
show atmf secure-mode sa  
show atmf secure-mode statistics

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate expire

**Overview** Use this command on an AMF master to expire a secure mode certificate. Running this command will force the removal of the AMF node from the network.

**Syntax** `atmf secure-mode certificate expire <node-name> [area <area-name>]`

| Parameter                      | Description                                                            |
|--------------------------------|------------------------------------------------------------------------|
| <code>&lt;node-name&gt;</code> | Name of the AMF node you want to expire the certificate for.           |
| <code>area</code>              | Specify an AMF area.                                                   |
| <code>&lt;area-name&gt;</code> | Name of the AMF area you want to expire the AMF nodes certificate for. |

**Mode** Privileged Exec

**Example** To remove an AMF node named "node3" from an AMF network, use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node3
```

To remove an AMF node named "node2" in an area named "area2", use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node2 area area2
```

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate expiry

**Overview** Use this command to set the expiry time of AMF secure mode certificates. Once an AMF node's certificate expires it must re-authorize and obtain a new certificate from the AMF master.

Use the **no** variant of this command to reset the expiry time to 180 days.

**Syntax** `atmf secure-mode certificate expiry {<days>|infinite}`  
`no atmf secure-mode certificate expiry`

| Parameter                 | Description                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------|
| <code>&lt;days&gt;</code> | Length of time, in days, that an AMF secure mode certificate remains valid. A value between 1 and 365. |
| <code>infinite</code>     | The authorization certificate does not expire, in other words AMF nodes stay authorized indefinitely.  |

**Default** The default expiry time is 180 days.

**Mode** Global Configuration

**Example** To set AMF secure mode certificate expiry to 7 days, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode certificate expiry 7
```

To set AMF secure mode certificates to never expire, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode certificate expiry infinite
```

To reset the certificate expiry to 180 days, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode certificate expiry
```

[show atmf secure-mode certificates](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate renew

**Overview** Use this command to force all local certificates to expire and be renewed on an AMF secure mode network.

Secure mode certificates renew automatically but this command could be used to renew a certificate in a situation where the automatic renewal may happen while the device is not attached to the AMF network.

**Syntax** `atmf secure-mode certificate renew`

**Mode** Privileged Exec

**Example** To renew a local certificate on a AMF member or AMF master, use the command:

```
awplus# atmf secure-mode certificate renew
```

**Related Commands** [show atmf secure-mode certificates](#)  
[show atmf secure-mode statistics](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode enable-all

**Overview** Use this command to enable AMF secure mode on an entire network. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before an AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once this command is run on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

This command can only be run on an AMF master.

Use the **no** variant of this command to disable AMF secure mode on an entire network.

**Syntax** `atmf secure-mode enable-all`  
`no atmf secure-mode enable-all`

**Default** Secure mode is disabled by default.

**Mode** Privileged Exec

**Usage** When an AMF network is running in AMF secure mode the [atmf restricted-login](#) feature is automatically enabled. This restricts the [atmf working-set](#) command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

Running **atmf secure-mode enable-all**:

- Groups all AMF members in a working set.
- Executes [clear atmf secure-mode certificates](#) on the working set of members, which removes existing secure mode certificates from all the nodes.
- Groups all the AMF masters in a working set.
- Executes [atmf authorize provision all](#) on the working set of masters, so all masters provision all nodes.
- Groups all AMF nodes in a working set.

- Runs a script which executes `atmf secure-mode` and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

Running **no atmf secure-mode enable-all**:

- Groups all AMF nodes in a working set.
- Runs a script which executes **no atmf secure-mode** and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

**NOTE:** Enabling or disabling secure mode on the network saves the running-config on every device.

**Example** To enable AMF secure mode on the entire network, use the command:

```
awplus# atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
Total number of nodes 21
21 nodes support secure-mode

Enable secure-mode across the AMF network ? (y/n): y
```

To disable AMF secure mode on the entire network, use the command:

```
awplus# no atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
% Warning: All security certificates will be deleted.
Disable secure-mode across the AMF network ? (y/n): y
```

**Command changes** Version 5.4.7-0.3: command added

# atmf select-area

**Overview** Use this command to access devices in an area outside the core area on the controller network. This command will connect you to the remote area-master of the specified area.

This command is only valid on AMF controllers.

The **no** variant of this command disconnects you from the remote area-master.

**Syntax** `atmf select-area {<area-name>|local}`  
`no atmf select-area`

| Parameter                      | Description                                                   |
|--------------------------------|---------------------------------------------------------------|
| <code>&lt;area-name&gt;</code> | Connect to the remote area-master of the area with this name. |
| <code>local</code>             | Return to managing the local controller area.                 |

**Mode** Privileged Exec

**Usage** After running this command, use the [atmf working-set](#) command to select the set of nodes you want to access in the remote area.

**Example** To access nodes in the area Canterbury, use the command

```
controller-1# atmf select-area Canterbury
```

This displays the following output:

```
Test_network[3]#atmf select-area Canterbury
=====
Connected to area Canterbury via host Avensis:
=====
```

To return to the local area for controller-1, use the command

```
controller-1# atmf select-area local
```

Alternatively, to return to the local area for controller-1, use the command

```
controller-1# no atmf select-area
```

**Related Commands** [atmf working-set](#)

# atmf topology-gui enable

**Overview** Use this command to enable the operation of Vista Manager EX on the Master device.

Vista Manager EX delivers state-of-the-art monitoring and management for your Autonomous Management Framework™ (AMF) network, by automatically creating a complete topology map of switches, firewalls and wireless access points (APs). An expanded view includes third-party devices such as security cameras.

Use the **no** variant of this command to disable operation of Vista Manager EX.

**Syntax** atmf topology-gui enable  
no atmf topology-gui enable

**Default** Disabled by default on AMF Master and member nodes. Enabled by default on Controllers.

**Mode** Global Configuration mode

**Usage** To use Vista Manager EX, you must also enable the HTTP service on all AMF nodes, including all AMF masters and controllers. The HTTP service is enabled by default on AlliedWare Plus switches and disabled by default on AR-Series firewalls. To enable it, use the commands:

```
Node1# configure terminal
Node1(config)# service http
```

On one master in each AMF area in your network, you also need to configure the master to send event notifications to Vista Manager EX. To do this, use the commands:

```
Node1# configure terminal
Node1(config)# log event-host <ip-address> atmf-topology-event
```

**Example** To enable Vista Manager EX on Node1, use the following commands:

```
Node1# configure terminal
Node1(config)# atmf topology-gui enable
```

To disable Vista Manager EX on Node1, use the following commands:

```
Node1# configure terminal
Node1(config)# no atmf topology-gui enable
```

**Related  
Commands** [atmf enable](#)  
[log event-host](#)  
[service http](#)

# atmf virtual-crosslink

**Overview** Use this command to create a virtual crosslink. A virtual crosslink connects an AMF master or controller on a physical device to a Virtual AMF Appliance (VAA) master or controller.

All AMF master nodes must reside in the same AMF domain and are required to be directly connected using AMF crosslinks. In order to be able to meet this requirement for AMF masters running on VAAs, a virtual crosslink connects the AMF master or controller on the physical device to the master or controller on the VAA.

Use the **no** variant of this command to remove a virtual crosslink.

**Syntax**

```
atmf virtual-crosslink id <local-id> ip <local-ip> remote-id <remote-id> remote-ip <remote-ip>
no atmf virtual-crosslink id <local-id>
```

| Parameter   | Description                                               |
|-------------|-----------------------------------------------------------|
| <local-id>  | ID of the local tunnel port, a value between 1 and 4094.  |
| <local-ip>  | IPv4 address of the local tunnel port in a.b.c.d format.  |
| <remote-id> | ID of the remote tunnel port, a value between 1 and 4094. |
| <remote-ip> | IPv4 address of the remote tunnel port in a.b.c.d format. |

**Default** No AMF virtual crosslinks are created by default.

**Mode** Global Configuration

**Usage** This command allows a virtual tunnel to be created between two remote sites over a layer 3 link. The tunnel encapsulates AMF packets and allows them to be sent transparently across a Wide Area Network (WAN) such as the Internet.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address. Each side of the tunnel must be configured with the same, but mirrored parameters.

**NOTE:** *Virtual crosslinks are not supported on AMF container masters, therefore if multiple tenants on a single VAA host are configured for secure mode, only a single AMF master is supported per area.*

**Example** To setup a virtual link from a local site, "siteA", to a remote site, "siteB", (assuming there is already IP connectivity between the sites), run the following commands at the local site:

```
siteA# configure terminal
siteA(config)# atmf virtual-crosslink id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1
```

At the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# atmf virtual-crosslink id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1
```

To remove this virtual crosslink, run the following commands on the local site:

```
siteA# configure terminal
siteA(config)# no atmf virtual-crosslink id 5
```

On the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# no atmf virtual-crosslink id 10
```

**Command  
changes**

Version 5.4.7-0.3: command added

# atmf virtual-link

**Overview** This command creates one or more Layer 2 tunnels that enable AMF nodes to transparently communicate across a wide area network using Layer 2 connectivity protocols.

Once connected through the tunnel, the remote member will have the same AMF capabilities as a directly connected AMF member.

Use the **no** variant of this command to remove the specified virtual link.

**Syntax** `atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>  
remote-ip <a.b.c.d> [remote-area <area-name>]  
no atmf virtual-link id <1-4094>`

| Parameter   | Description                                                                                                                                                                                                                                                       |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip          | The Internet Protocol (IP).                                                                                                                                                                                                                                       |
| <a.b.c.d>   | The IP address, of the local amf node (at its interface to the tunnel) entered in a.b.c.d format.                                                                                                                                                                 |
| remote-id   | The ID of the (same) tunnel that will be applied by the remote node. Note that this must match the local-id that is defined on the remote node. This means that (for the same tunnel) the local and remote tunnel IDs are reversed on the local and remote nodes. |
| <1-4094>    | The ID range 1-4094.                                                                                                                                                                                                                                              |
| remote-ip   | The IP address of the remote node                                                                                                                                                                                                                                 |
| <a.b.c.d>   | The IP address, of the remote node (at its interface to the tunnel) entered in a.b.c.d format.                                                                                                                                                                    |
| remote-area | The remote area connected to this area virtual link                                                                                                                                                                                                               |
| <area-name> | The name of the remote area connected to this virtual link.                                                                                                                                                                                                       |

**Mode** Global Configuration

**Usage** The Layer 2 tunnel that this command creates enables a local AMF session to appear to pass transparently across a Wide Area Network (WAN) such as the Internet. The addresses configured as the local and remote tunnel IP addresses must have IP connectivity to each other. If the tunnel is configured to connect a head office and branch office over the Internet, typically this would involve using some type of managed WAN service such as a site-to-site VPN. Tunnels are only supported using IPv4.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address. A reciprocal configuration is also required on the corresponding remote device. The local tunnel ID must be unique to the device on which it is configured.

The tunneled link may operate via external (non AlliedWare Plus) routers in order to provide wide area network connectivity. However in this configuration, the routers perform a conventional router to router connection. The protocol tunneling function is accomplished by the AMF nodes.

**NOTE:** AMF cannot achieve zero touch replacement of the remote device that terminates the tunnel connection, because you must pre-configure the local IP address and tunnel ID on that remote device.

**Example 1** Use the following commands to create the tunnel shown in the figure below.

Figure 50-7: AMF virtual link example

```
Node_10(config)# atmf virtual-link id 1 ip 192.168.1.1
remote-id 2 remote-ip 192.168.2.1

Node_20(config)# atmf virtual-link id 2 ip 192.168.2.1
remote-id 1 remote-ip 192.168.1.1
```

**Example 2** To set up an area virtual link to a remote site (assuming IP connectivity between the sites already), one site must run the following commands:

```
SiteA# configure terminal

SiteA(config)# atmf virtual-link id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1 remote-area SiteB-AREA
```

The second site must run the following commands:

```
SiteB# configure terminal

SiteB(config)# atmf virtual-link id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1 remote-area SiteA-AREA
```

Before you can apply the above **atmf virtual-link** command, you must configure the area names *SiteB-AREA* and *SiteA-AREA*.

**Validation Command** `show atmf`  
`show atmf links`

# atmf working-set

**Overview** Use this command to execute commands across an individually listed set of AMF nodes or across a named group of nodes.

Note that this command can only be run on a master node.

Use the **no** variant of this command to remove members or groups from the current working-set.

**Syntax** `atmf working-set { [<node-list> ] | [group <group-list> | all | local | current] }`  
`no atmf working-set { [<node-list> ] | [group <group-list> ] }`

| Parameter                       | Description                                                                                                                                                                                                                      |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;node-list&gt;</code>  | A comma delimited list (without spaces) of nodes to be included in the working-set.                                                                                                                                              |
| <code>group</code>              | The AMF group.                                                                                                                                                                                                                   |
| <code>&lt;group-list&gt;</code> | A comma delimited list (without spaces) of groups to be included in the working-set. Note that this can include either defined groups, or any of the Automatic, or Implicit Groups shown earlier in the bulleted list of groups. |
| <code>all</code>                | All nodes in the AMF.                                                                                                                                                                                                            |
| <code>local</code>              | Local node<br>Running this command with the parameters <b>group local</b> will return you to the local prompt and local node connectivity.                                                                                       |
| <code>current</code>            | Nodes in current list.                                                                                                                                                                                                           |

**Mode** Privileged Exec

**Usage** You can put AMF nodes into groups by using the [atmf group \(membership\)](#) command.

This command opens a session on multiple network devices. When you change the working set to anything other than the local device, the prompt will change to the AMF network name, followed by the size of the working set, shown in square brackets. This command has to be run at privilege level 15.

In addition to the user defined groups, the following system assigned groups are automatically created:

- Implicit Groups
  - local: The originating node.
  - current: All nodes that comprise the current working-set.
  - all: All nodes in the AMF.

- Automatic Groups - These can be defined by hardware architecture, e.g. x510, x610, x8100, AR3050S or AR4050S, or by certain AMF nodal designations such as master.

Note that the Implicit Groups do not appear in `show atmf group` command output. If a node is an AMF master it will be automatically added to the master group.

**Example 1** To add all nodes in the AMF to the working-set, use the command:

```
node1# atmf working-set group all
```

**NOTE:** This command adds the implicit group "all" to the working set, where "all" comprises all nodes in the AMF.

This command displays an output screen similar to the one shown below:

```
=====
node1, node2, node3, node4, node5, node6:
=====

Working set join

ATMF_NETWORK_Name[6]#
```

**Example 2** To return to the local prompt, and connect to only the local node, use the command:

```
ATMF_Network_Name[6]# atmf working-set group local
node1#
```

The following table describes the meaning of the prompts in this example.

| Parameter         | Description                                                                        |
|-------------------|------------------------------------------------------------------------------------|
| ATMF_Network_Name | The name of the AMF network, as set by the <code>atmf network-name</code> command. |
| [6]               | The number of nodes in the working-set.                                            |
| node1             | The name of the local node, as set by the <code>hostname</code> command.           |

# bridge-group

**Overview** Use this command to connect an AMF container to a bridge created on a Virtual AMF Appliance (VAA) virtual machine. This allows the AMF container to connect to a physical network.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove a bridge-group from an AMF container.

**Syntax** `bridge-group <bridge-id>`  
`no bridge-group`

| Parameter                      | Description                                                    |
|--------------------------------|----------------------------------------------------------------|
| <code>&lt;bridge-id&gt;</code> | The ID of the bridge group to join, a number between 1 and 64. |

**Mode** AMF Container Configuration

**Usage** Each container has two virtual interfaces:

- 1) Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, and configured using this [area-link](#) command.
- 2) Interface eth1, used to connect to the outside world using a bridged L2 network link, and configured using the **bridge-group** command.

Before using this command, a bridge must be created with the same bridge-id on the VAA host using the **bridge <bridge-id>** command.

See the [AMF Feature Overview and Configuration Guide](#) for more information on configuring the bridge.

**Example** To create a bridge group for AMF container "vac-wlg-1" and , use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# bridge-group 1
```

**Related Commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# clear atmf links statistics

**Overview** This command resets the values of all AMF link, port, and global statistics to zero.

**Syntax** `clear atmf links statistics`

**Mode** Privilege Exec

**Example** To reset the AMF link statistics values, use the command:

```
node_1# clear atmf links statistics
```

**Related  
Commands** [show atmf links statistics](#)

# clear atmf secure-mode certificates

**Overview** Use this command to remove all certificates from an AMF member or master. AMF nodes will need to be re-authorized once this command has been run.

**Syntax** `clear atmf secure-mode certificates`

**Mode** Privileged Exec

**Example** To clear all certificates from an AMF node, use the command:

```
awplus# clear atmf secure-mode certificates
```

If this is the only master on the network you will see the following warning:

```
% Warning: This node is the only master in the network!
All the nodes will become isolated and refuse to join any ATMF
network. The certificates on all the isolated nodes must be
cleared before rejoining an ATMF network will be possible.

To clear certificates a reboot of the device is required.
Clear certificates and Reboot ? (y/n):
```

On an AMF member you will see the following message:

```
To clear certificates a reboot of the device is required.
Clear certificates and Reboot ? (y/n):
```

changes** Version 5.4.7-0.3: command added

# debug atmf

**Overview** This command enables the AMF debugging facilities, and displays information that is relevant (only) to the current node. The detail of the debugging displayed depends on the parameters specified.

If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

The **no** variant of this command disables either all AMF debugging information, or only the particular information as selected by the command's parameters.

**Syntax**

```
debug atmf
[link|crosslink|arealink|database|neighbor|error|all]

no debug atmf
[link|crosslink|arealink|database|neighbor|error|all]
```

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| link      | Output displays debugging information relating to uplink or downlink information. |
| crosslink | Output displays all crosslink events.                                             |
| arealink  | Output displays all arealink events.                                              |
| database  | Output displays only notable database events.                                     |
| neighbor  | Output displays only notable AMF neighbor events.                                 |
| error     | Output displays AMF error events.                                                 |
| all       | Output displays all AMF events.                                                   |

**Default** All debugging facilities are disabled.

**Mode** User Exec and Global Configuration

**Usage** If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

**NOTE:** An alias to the **no** variant of this command is [undebg atmf](#) on page 2328.

**Examples** To enable all AMF debugging, use the command:

```
node_1# debug atmf
```

To enable AMF uplink and downlink debugging, use the command:

```
node_1# debug atmf link
```

To enable AMF error debugging, use the command:

```
node_1# debug atmf error
```

**Related  
Commands** [no debug all](#)

# debug atmf packet

**Overview** This command configures AMF Packet debugging parameters. The debug only displays information relevant to the current node. The command has following parameters:

**Syntax** debug atmf packet [direction {rx|tx|both}] [level {1|2|3}]  
[timeout <seconds>] [num-pkts <quantity>]  
[filter {node <name>|interface <ifname>}  
[pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]]]

## Simplified Syntax

|                          |                                                            |
|--------------------------|------------------------------------------------------------|
| debug atmf packet        | [direction {rx tx both}]                                   |
|                          | [level {[1][2 3]}]                                         |
|                          | [timeout <seconds>]                                        |
|                          | [num-pkts <quantity>]                                      |
| debug atmf packet filter | [node <name>]                                              |
|                          | [interface <ifname>]                                       |
|                          | [pkt-type<br>[1][2][3][4][5][6][7][8][9][10][11][12][13]]] |

**NOTE:** You can combine the syntax components shown, but when doing so, you must retain their original order.

**Default** Level 1, both Tx and Rx, a timeout of 60 seconds with no filters applied.

**NOTE:** An alias to the **no** variant of this command - *undebug atmf* - can be found elsewhere in this chapter.

**Mode** User Exec and Global Configuration

**Usage** If no additional parameters are specified, then the command output will apply a default selection of parameters shown below:

| Parameter | Description                                                                                  |
|-----------|----------------------------------------------------------------------------------------------|
| direction | Sets debug to packet received, transmitted, or both                                          |
| rx        | packets received by this node                                                                |
| tx        | Packets sent from this node                                                                  |
| 1         | AMF Packet Control header Information, Packet Sequence Number. Enter 1 to select this level. |
| 2         | AMF Detailed Packet Information. Enter 2 to select this level.                               |
| 3         | AMF Packet HEX dump. Enter 3 to select this level.                                           |
| timeout   | Sets the execution timeout for packet logging                                                |

| Parameter  | Description                                                                                       |
|------------|---------------------------------------------------------------------------------------------------|
| <seconds>  | Seconds                                                                                           |
| num-pkts   | Sets the number of packets to be dumped                                                           |
| <quantity> | The actual number of packets                                                                      |
| filter     | Sets debug to filter packets                                                                      |
| node       | Sets the filter on packets for a particular Node                                                  |
| <name>     | The name of the remote node                                                                       |
| interface  | Sets the filter to dump packets from an interface (portx.x.x) on the local node                   |
| <ifname>   | Interface port or virtual-link                                                                    |
| pkt-type   | Sets the filter on packets with a particular AMF packet type                                      |
| 1          | Crosslink Hello BPDU packet with crosslink links information. Enter 1 to select this packet type. |
| 2          | Crosslink Hello BPDU packet with downlink domain information. Enter 2 to select this packet type. |
| 3          | Crosslink Hello BPDU packet with uplink information. Enter 3 to select this packet type.          |
| 4          | Downlink and uplink hello BPDU packets. Enter 4 to select this packet type.                       |
| 5          | Non broadcast hello unicast packets. Enter 5 to select this packet type.                          |
| 6          | Stack hello unicast packets. Enter 6 to select this packet type.                                  |
| 7          | Database description. Enter 7 to select this packet type.                                         |
| 8          | DBE request. Enter 8 to select this packet type.                                                  |
| 9          | DBE update. Enter 9 to select this packet type.                                                   |
| 10         | DBE bitmap update. Enter 10 to select this packet type.                                           |
| 11         | DBE acknowledgment. Enter 11 to select this packet type.                                          |
| 12         | Area Hello Packets. Enter 12 to select this packet type.                                          |
| 13         | Gateway Hello Packets. Enter 13 to select this packet type.                                       |

**Examples** To set a packet debug on node 1 with level 1 and no timeout, use the command:

```
node_1# debug atmf packet direction tx timeout 0
```

To set a packet debug with level 3 and filter packets received from AMF node 1:

```
node_1# debug atmf packet direction tx level 3 filter node_1
```

To enable send and receive 500 packets only on vlink1 for packet types 1, 7, and 11, use the command:

```
node_1# debug atmf packet num-pkts 500 filter interface vlink1
pkt-type 1 7 11
```

This example applies the **debug atmf packet** command and combines many of its options:

```
node_1# debug atmf packet direction rx level 1 num-pkts 60
filter node x930 interface port1.0.1 pkt-type 4 7 10
```

# discovery

**Overview** AMF nodes gather information about guest nodes by using one of two internally defined discovery methods: static or dynamic. This is one of several modal commands that are configured from within its specific guest-class (mode).

Dynamic discovery (the default method) involves learning IP address and MAC addresses of guest nodes from protocols outside of AMF such as LLDP or DHCP snooping. Dynamic learning is only supported when using IPv4. For IPv6 the static discovery method must be used.

The static method involves entering the guest class name and IP address using the `switchport atmf-guestlink` command to separately assign an individual switch port to each of the guest nodes. The MAC addresses of each of the guests of that class can then be learned from ARP or Neighbor discovery tables. If you are using the static discovery method, you must ensure that you have configured the appropriate class type for each of your statically discovered guest nodes.

The **no** variant of this command returns the discovery method to **dynamic**.

**Syntax** `discovery [static|dynamic]`  
`no discovery`

| Parameter            | Description                  |
|----------------------|------------------------------|
| <code>static</code>  | Statically assigned          |
| <code>dynamic</code> | Learned from DCHCPSN or LLDP |

**Default** Dynamic

**Mode** ATMF Guest Configuration Mode

**Usage** This command is one of several modal commands that are configured and applied for a specific guest-class (mode) and whose settings are automatically applied to a guest-node link by the `switchport atmf-guestlink` command.

**Example 1** To configure the discovery of the guest-class camera to operate statically, use the following commands:

```
Node1#conf t
Node1(config)#atmf guest-class camera
Node1(config-guest)#discovery static
Node1(config-guest)#end
```

**Example 2** To return the discovery method for the guest class TQ4600-1 to its default of **dynamic**, use the following commands:

```
Node1#conf t
Node1(config)#atmf guest-class TQ4600-1
Node1(config-guest)#no discovery
Node1(config-guest)#end
```

**Related  
Commands**

- atmf guest-class
- switchport atmf-guestlink
- show atmf links guest
- show atmf nodes

# description (amf container)

**Overview** Use this command to set the description on an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove the description from an AMF container.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                                                      |
|----------------------------------|------------------------------------------------------------------|
| <code>&lt;description&gt;</code> | Enter up to 128 characters of text describing the AMF container. |

**Mode** AMF Container Configuration

**Example** To set the description for AMF container “vac-wlg-1” to “Wellington area”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# description Wellington area
```

To remove the description for AMF container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no description
```

**Related Commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# erase factory-default

**Overview** This command erases all data from NVS and all data from Flash **excluding** the following:

- the current release file
- the backup release file
- license files

The device is then rebooted and returned to its factory default condition. The device can then be used for AMF automatic node recovery.

**Syntax** `erase factory-default`

**Mode** Privileged Exec.

**Usage** This command is an alias to the [atmf cleanup](#) command.

**Example** To erase data, use the command:

```
Node_1# erase factory-default
```

```
This command will erase all NVS, all flash contents except for
the boot release, and any license files, and then reboot the
switch. Continue? (y/n):y
```

**Related  
Commands** [atmf cleanup](#)

# http-enable

**Overview** This command is used to enable GUI access to a guest node. When http-enable is configured the port number is set to its default of 80. If the guest node is using a different port for HTTP, you can configure this using the port <PORTNO> attribute.

This command is used to inform the GUI that this device has an HTTP interface at the specified port number so that a suitable URL can be provided to the user.

Use the **no** variant of this command to disable HTTP.

**Syntax** http-enable [port <port-number>]  
no http-enable

| Parameter     | Description                       |
|---------------|-----------------------------------|
| port          | TCP port number.                  |
| <port-number> | The port number to be configured. |

**Default** http-enable is off.  
If http-enable is selected without a port parameter the port number will default to 80.

**Mode** ATMF Guest Configuration Mode

**Example 1** To enable HTTP access to a guest node on port 80 (the default), use the following commands:

```
node1# conf t
node1(config)#atmf guest-class Camera
node1(config-atmf-guest)#http-enable
node1(config-atmf-guest)#
```

**Example 2** To enable HTTP access to a guest node on port 400, use the following commands:

```
node1# conf t
node1(config)#atmf guest-class Camera
node1(config-atmf-guest)#http-enable port 400
node1(config-atmf-guest)#
```

**Example 3** To disable HTTP access to a guest node, use the following commands:

```
node1# conf t
node1(config)#atmf guest-class Camera
node1(config-atmf-guest)#no http-enable
node1(config-atmf-guest)#
```

**Related  
Commands**    `atmf guest-class`  
                  `switchport atmf-guestlink`  
                  `show atmf links guest`  
                  `show atmf nodes`

# log event-host

**Overview** Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

**Syntax** `log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`  
`no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`

| Parameter                      | Description                    |
|--------------------------------|--------------------------------|
| <code>&lt;ipv4-addr&gt;</code> | ipv4 address of the event host |
| <code>&lt;ipv6-addr&gt;</code> | ipv6 address of the event host |

**Default** Log events are disabled by default.

**Mode** Global Configuration

**Usage** Event hosts are set so syslog sends the messages out as they come.

**NOTE:** *There is a difference between log event and log host messages:*

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

**Example** To enable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

# modeltype

**Overview** This command sets the expected model type of the guest node. Guest nodes can be one of various types: alliedware, aw+, tq or other. The model type will default to **other** if nothing is set.

Use the **no** variant of this command to reset the model type to **other**.

**Syntax** `modeltype [alliedware|aw+|tq|other]`

| Parameter  | Description                                                 |
|------------|-------------------------------------------------------------|
| alliedware | A legacy Allied Telesis operating system.                   |
| aw+        | The Allied Telesis AlliedWare Plus operating system.        |
| tq         | An Allied Telesis TQ Series wireless access point.          |
| other      | Used where the model type is outside the above definitions. |

**Default** Will default to **other**

**Mode** ATMF Guest Configuration Mode

**Example 1** To assign the model type **tq** to the guest-class called **tq\_device**, use the following commands:

```
node1# conf t
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# modeltype tq
node1(config-atmf-guest)# end
```

**Example 2** To remove the model type **tq** from the guest-class called **tq\_device**, and reset it to the default of **other**, use the following commands:

```
node1# conf t
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# no modeltype
node1(config-atmf-guest)# end
```

- [switchport atmf-guestlink](#)
- [show atmf links guest](#)

# show atmf

**Overview** Displays information about the current AMF node.

**Syntax** `show atmf [summary|tech|nodes|session]`

| Parameter | Description                                               |
|-----------|-----------------------------------------------------------|
| summary   | Displays summary information about the current AMF node.  |
| tech      | Displays global AMF information.                          |
| nodes     | Displays a list of AMF nodes together with brief details. |
| session   | Displays information on an AMF session.                   |

**Default** Only summary information is displayed.

**Mode** User Exec and Privileged Exec

**Usage** AMF uses internal VLANs to communicate between nodes about the state of the AMF network. Two VLANs have been selected specifically for this purpose. Once these have been assigned, they are reserved for AMF and cannot be used for other purposes

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Example 1** To show summary information on AMF node\_1 use the following command:

```
node_1# show atmf summary
```

**Table 1:** Output from the **show atmf summary** command

```
node_1#show atmf summary
ATMF Summary Information:

ATMF Status : Enabled
Network Name : Test_network
Node Name : node_1
Role : Master
Restricted login : Disabled
Current ATMF Nodes : 3
```

**Example 2** To show information specific to AMF nodes use the following command:

```
node_1# show atmf nodes
```

**Example 3** The **show amf session** command displays all CLI (Command Line Interface) sessions for users that are currently logged in and running a CLI session.

To display AMF active sessions, use the following command:

```
node_1# show atmf session
```

For example, in the output below, node\_1 and node\_5 have active users logged in.

**Table 2:** Output from the **show atmf session** command

```
node_1#show atmf session

CLI Session Neighbors

Session ID : 73518

```

**Example 4** The AMF tech command collects all the AMF commands, and displays them. You can use this command when you want to see an overview of the AMF network.

To display AMF technical information, use the following command:

```
node_1# show atmf tech
```

**Table 3:** Output from the **show atmf tech** command

```
node_1#show atmf tech

**Table 4:** Parameter definitions from the **show atmf tech** command

| Parameter    | Definition                                         |
|--------------|----------------------------------------------------|
| ATMF Status  | The Node's AMF status, either Enabled or Disabled. |
| Network Name | The AMF network that a particular node belongs to. |

**Table 4:** Parameter definitions from the **show atmf tech** command (cont.)

| Parameter          | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Name          | The name assigned to a particular node.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Role               | The role configured for this AMF device, either Master or Member.                                                                                                                                                                                                                                                                                                                                                                                                |
| Current ATMF Nodes | The count of AMF nodes in an AMF Network.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Node Address       | An address used to access a remotely located node (.atmf).                                                                                                                                                                                                                                                                                                                                                                                                       |
| Node ID            | A unique identifier assigned to a Node on an AMF network.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Node Depth         | The number of nodes in path from this node to level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.                                                                                                                                                                                                                                                           |
| Domain State       | The state of Node in a Domain in AMF network as Controller/Backup.                                                                                                                                                                                                                                                                                                                                                                                               |
| Recovery State     | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.                                                                                                                                                                                                                                                                                                                                           |
| Management VLAN    | The VLAN created for traffic between Nodes of different domain (up/down links). <ul style="list-style-type: none"> <li>• VLAN ID - In this example VLAN 4092 is configured as the Management VLAN.</li> <li>• Management Subnet - Network prefix for the subnet.</li> <li>• Management IP Address - The IP address allocated for this traffic.</li> <li>• Management Mask - The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul> |
| Domain VLAN        | The VLAN assigned for traffic between Nodes of same domain (crosslink). <ul style="list-style-type: none"> <li>• VLAN ID - In this example VLAN 4091 is configured as the domain VLAN.</li> <li>• Domain Subnet. The subnet address used for this traffic.</li> <li>• Domain IP Address. The IP address allocated for this traffic.</li> <li>• Domain Mask. The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>                 |
| Device Type        | The Product Series name.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ATMF Master        | Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).                                                                                                                                                                                                                                                                                                                                                                         |
| SC                 | The device configuration, one of C - Chassis (SBx8100 Series), S - Stackable (VCS) or N - Standalone.                                                                                                                                                                                                                                                                                                                                                            |
| Parent             | The node to which the current node has an active uplink.                                                                                                                                                                                                                                                                                                                                                                                                         |
| Node Depth         | The number of nodes in the path from this node to the master node.                                                                                                                                                                                                                                                                                                                                                                                               |

**Related Commands** [show atmf detail](#)

# show atmf area

**Overview** Use this command to display information about an AMF area. On AMF controllers, this command displays all areas that the controller is aware of. On remote AMF masters, this command displays the controller area and the remote local area. On gateways, this command displays the controller area and remote master area.

**Syntax** `show atmf area [detail] [<area-name>]`

| Parameter   | Description                                                                     |
|-------------|---------------------------------------------------------------------------------|
| detail      | Displays detailed information                                                   |
| <area-name> | Displays information about master and gateway nodes in the specified area only. |

**Mode** Privileged Exec

**Example 1** To show information about all areas, use the command:

```
controller-1# show atmf area
```

The following figure shows example output from running this command on a controller.

**Table 5:** Example output from the **show atmf area** command on a Controller.

```
controller-1#show atmf area

ATMF Area Information:

* = Local area

Area Area Local Remote Remote Node
Name ID Gateway Gateway Master Count

* NZ 1 Reachable N/A N/A 3
Wellington 2 Reachable Reachable Auth OK 120
Canterbury 3 Reachable Reachable Auth Error -
SiteA-AREA 14 Unreachable Unreachable Unreachable -
Auckland 100 Reachable Reachable Auth Start -
Southland 120 Reachable Reachable Auth OK 54

Area count: 6 Area node count: 177
```

The following figure shows example output from running this command on a remote master.

**Table 6:** Example output from the **show atmf area** command on a remote master.

```

Canterbury#show atmf area

 ATMF Area Information:

 * = Local area

 Area Area Local Remote Remote Node
 Name ID Gateway Gateway Master Count

 NZ 1 Reachable N/A N/A -
 * Canterbury 3 Reachable N/A N/A 40

 Area count: 2 Local area node count: 40

```

**Table 7:** Parameter definitions from the **show atmf area** command

| Parameter       | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| *               | Indicates the area of the device on which the command is being run.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Area Name       | The name of each area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Area ID         | The ID of the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Local Gateway   | Whether the local gateway node is reachable or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Remote Gateway  | Whether the remote gateway node is reachable or not. This is one of the following: <ul style="list-style-type: none"> <li>Reachable, if the link has been established.</li> <li>Unreachable, if a link to the remote area has not been established. This could mean that a port or vlan is down, or that inconsistent VLANs have been configured using the <a href="#">switchport atmf-arealink remote-area</a> command.</li> <li>N/A for the area of the controller or remote master on which the command is being run, because the gateway node on that device is local.</li> <li>Auth Start, which may indicate that the area names match on the controller and remote master, but the IDs do not match.</li> <li>Auth Error, which indicates that the areas tried to authenticate but there is a problem. For example, the passwords configured on the controller and remote master may not match, or a password may be missing on the remote master.?</li> <li>Auth OK, which indicates that area authentication was successful and you can now use the <a href="#">atmf select-area</a> command.</li> </ul> |
| Remote Master   | Whether the remote master node is reachable or not. This is N/A for the area of the controller or remote master on which the command is being run, because the master node on that device is local.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Node Count      | The number of nodes in the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Area Count      | The number of areas controlled by the controller.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Area Node Count | The total number of nodes in the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Example 2** To show detailed information about the areas, use the command:

```
controller-1# show atmf area detail
```

The following figure shows example output from running this command.

**Table 8:** Output from the **show atmf area detail** command

```
controller-1#show atmf area detail

ATMF Area Detail Information:

Controller distance : 0

Controller Id : 21
Backup Available : FALSE

Area Id : 2
Gateway Node Name : controller-1
Gateway Node Id : 342
Gateway Ifindex : 6013
Masters Count : 1
Master Node Name : well-master (329)
Node Count : 2

Area Id : 3
Gateway Node Name : controller-1
Gateway Node Id : 342
Gateway Ifindex : 4511
Masters Count : 2
Master Node Name : cant1-master (15)
Master Node Name : cant2-master (454)
Node Count : 2
```

# show atmf area guests

**Overview** This command will display details of all guests that the controller is aware of.

**Syntax** `show atmf area guests [<area-name> [<node-name>]]`

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| <area-name> | The area name for guest information               |
| <node-name> | The name of the node that connects to the guests. |

**Default** N/A

**Mode** User Exec/Privileged Exec

**Example 1** To display atmf area guest nodes on a controller, use the command,

```
GuestNode[1]#show atmf area guests
```

**Output** Figure 50-8: Example output from the **show atmf area guests** command

```
main-building Area Guest Node Information:
Device MAC IP/IPv6
Type Address Parent Port Address

- 0008.5d10.7635 x230 1.0.3 192.168.5.4

GuestNode[1]#
```

**Table 9:** Parameters in the output from **show atmf area guests** command

| Parameter   | Description                                                         |
|-------------|---------------------------------------------------------------------|
| Device Type | The device type as read from the guest node.                        |
| MAC Address | The MAC address of the guest-node                                   |
| Parent      | The device that directly connects to the guest-node                 |
| Port        | The port number on the parent node that connects to the guest node. |
| IP/IPv6     | The IP or IPv6 address of the guest node.                           |

**Related  
Commands** [show atmf area](#)  
[show atmf area nodes](#)  
[show atmf backup guest](#)  
[show atmf area guests-detail](#)

# show atmf area guests-detail

**Overview** This command displays the local and remote guest information from an AMF controller.

**Syntax** `show atmf area guests-detail [<area-name> [<node-name>]]`

| Parameter   | Description                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------|
| <area-name> | The name assigned to the AMF area. An area is an AMF network that is under the control of an AMF Controller. |
| <node-name> | The name assigned to the network node.                                                                       |

**Default** N/A.

**Mode** Privileged Exec

**Example** To display detailed information for all guest nodes attached to “node1”, which is located within the area named “northern”, use the following command:

```
AMF_controller#show atmf area guests-detail northern node1
```

**Output** Figure 50-9: Example output from the **show atmf guest detail** command.

```
#show atmf guest detail

**Table 10:** Parameters shown in the output of the **show atmf guest detail** command

| Parameter         | Description                                                                                                                                                                            |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Name         | The name of the guest's parent node.                                                                                                                                                   |
| Port Name         | The port on the parent node that connects to the guest.                                                                                                                                |
| IFindex           | An internal index number that maps to the port number on the parent node.                                                                                                              |
| Guest Description | A brief description of the guest node as manually entered into the <code>description (interface)</code> command for the guest node port on the parent node.                            |
| Device Type       | The device type as supplied by the guest node itself.                                                                                                                                  |
| Backup Supported  | Indicates whether AMF supports backup of this guest node.                                                                                                                              |
| MAC Address       | The MAC address of the guest node.                                                                                                                                                     |
| IP Address        | The IP address of the guest node.                                                                                                                                                      |
| IPv6 Address      | The IPv6 address of the guest node.                                                                                                                                                    |
| HTTP Port         | The HTTP port enables you to specify a port when enabling http to allow a URL for the http user interface of a Guest Node. This is determined by the <code>http-enable</code> command. |
| Firmware Version  | The firmware version that the guest node is currently running.                                                                                                                         |

**Related Commands** [show atmf area nodes-detail](#)  
[show atmf area guests](#)

# show atmf area nodes

**Overview** Use this command to display summarized information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

**Syntax** `show atmf area nodes [<area-name> [<node-name>]]`

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| <area-name> | Displays information about nodes in the specified area. |
| <node-name> | Displays information about the specified node.          |

**Mode** Privileged Exec

**Usage** If you do not limit the output to a single area or node, this command lists all remote nodes that the controller is aware of. This can be a very large number of nodes.

**Example** To show summarized information about all the nodes the controller is aware of, use the command:

```
controller-1# show atmf area nodes
```

The following figure shows partial example output from running this command.

**Table 11:** Output from the **show atmf area nodes** command

```
controller-1#show atmf area nodes

Wellington Area Node Information:

Node Device ATMF Node
Name Type Master SC Parent Depth

well-gate x230-18GP N N well-master 1
well-master AT-x930-28GPX Y N none 0

Wellington node count 2

...
```

**Table 12:** Parameter definitions from the **show atmf area nodes** command

| Parameter   | Definition                              |
|-------------|-----------------------------------------|
| Node Name   | The name assigned to a particular node. |
| Device Type | The Product series name.                |

**Table 12:** Parameter definitions from the **show atmf area nodes** command (cont.)

| Parameter   | Definition                                                                                            |
|-------------|-------------------------------------------------------------------------------------------------------|
| ATMF Master | Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).              |
| SC          | The device configuration, one of C - Chassis (SBx8100 series), S - Stackable (VCS) or N - Standalone. |
| Parent      | The node to which the current node has an active uplink.                                              |
| Node Depth  | The number of nodes in the path from this node to the master node.                                    |

**Related Commands** [show atmf area](#)  
[show atmf area nodes-detail](#)

# show atmf area nodes-detail

**Overview** Use this command to display detailed information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

**Syntax** `show atmf area nodes-detail [<area-name> [<node-name>]]`

| Parameter                      | Description                                                      |
|--------------------------------|------------------------------------------------------------------|
| <code>&lt;area-name&gt;</code> | Displays detailed information about nodes in the specified area. |
| <code>&lt;node-name&gt;</code> | Displays detailed information about the specified node.          |

**Mode** Privileged Exec

**Usage** If you do not limit the output to a single area or node, this command displays information about all remote nodes that the controller is aware of. This can be a very large number of nodes.

**Example** To show information about all the nodes the controller is aware of, use the command:

```
controller-1# show atmf area nodes-detail
```

The following figure shows partial example output from running this command.

**Table 13:** Output from the **show atmf area nodes-detail** command

```
controller-1#show atmf area nodes-detail

Wellington Area Node Information:
Node name well-gate
Parent node name : well-master
Domain id : well-gate's domain
Board type : 368
Distance to core : 1
Flags : 50
Extra flags : 0x00000006
MAC Address : 001a.eb56.9020

Node name well-master
Parent node name : none
Domain id : well-master's domain
Board type : 333
Distance to core : 0
Flags : 51
Extra flags : 0x0000000c
MAC Address : eccd.6d3f.fef7

...
```

**Table 14:** Parameter definitions from the **show atmf area nodes-detail** command

| Parameter        | Definition                                                                            |
|------------------|---------------------------------------------------------------------------------------|
| Node name        | The name assigned to a particular node.                                               |
| Parent node name | The node to which the current node has an active uplink.                              |
| Domain id        |                                                                                       |
| Board type       | The Allied Telesis code number for the device.                                        |
| Distance to core | The number of nodes in the path from the current node to the master node in its area. |
| Flags            | Internal AMF information                                                              |
| Extra flags      | Internal AMF information                                                              |
| MAC Address      | The MAC address of the current node                                                   |

**Related Commands** [show atmf area](#)  
[show atmf area nodes](#)

# show atmf area summary

**Overview** Use this command to display a summary of IPv6 addresses used by AMF, for one or all of the areas controlled by an AMF controller.

**Syntax** `show atmf area summary [<area-name>]`

| Parameter                      | Description                                       |
|--------------------------------|---------------------------------------------------|
| <code>&lt;area-name&gt;</code> | Displays information for the specified area only. |

**Mode** Privileged Exec

**Example 1** To show a summary of IPv6 addresses used by AMF, for all of the areas controlled by controller-1, use the command:

```
controller-1# show atmf area summary
```

The following figure shows example output from running this command.

**Table 15:** Output from the **show atmf area summary** command

```
controller-1#show atmf area summary

ATMF Area Summary Information:

Management Information
Local IPv6 Address : fd00:4154:4d46:1::15

Area Information
Area Name : NZ (Local)

# show atmf authorization

**Overview** Use this command on an AMF master to display the authorization status of other AMF members and masters on the network.

On an AMF controller this command will show the authorization status of remote area AMF masters.

**Syntax** `show atmf authorization {current|pending|provisional}`

| Parameter   | Description                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| current     | Show the status of all authorized nodes.                                                                                                                                                                    |
| pending     | Show the status of unauthorized nodes in the pending queue. These are nodes that enabled secure mode with <code>atmf secure-mode</code> but have not yet been authorized with <code>atmf authorize</code> . |
| provisional | Show the status of provisionally authorized nodes. These are nodes that have been provisioned with <code>atmf authorize provision</code> .                                                                  |

**Mode** Privileged Exec

**Example** To display all authorized AMF nodes on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization current
```

To display AMF nodes which are requesting authorization on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization pending
```

To display AMF nodes which have provisional authorization, use the command:

```
awplus# show atmf authorization provisional
```

**Output** Figure 50-10: Example output from **show atmf authorization current**

| NZ Authorized Nodes: |          |            |
|----------------------|----------|------------|
| Node Name            | Signer   | Expires    |
| -----                | -----    | -----      |
| master_1             | master_1 | 4 Mar 2017 |
| area_1_node_1        | master_1 | 4 Mar 2017 |
| area_1_node_2        | master_1 | 4 Mar 2017 |

Table 50-1: Parameters in the output from **show atmf authorization current**

| Parameter | Description                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------|
| Node Name | AMF node name of the authorized node.                                                                                       |
| Signer    | Name of the AMF master that authorized the node.                                                                            |
| Expires   | Expiry date of the authorization. Authorization expiry time is set using <code>atmf secure-mode certificate expiry</code> . |

**Output** Figure 50-11: Example output from **show atmf authorization pending**

```

Pending Authorizations:

NZ Requests:
Node Name Product Parent Node Interface

area_1_node_3 x230-18GP master_1 port1.2.9
area_1_node_4 x510-52GTX master_1 sa1

```

Table 50-2: Parameters in the output from **show atmf authorization pending**

| Parameter   | Description                                          |
|-------------|------------------------------------------------------|
| Node Name   | Name of the node that is requesting authorization.   |
| Product     | Product name.                                        |
| Parent Node | Authorization authority of the requesting node.      |
| Interface   | Interface that the authorization request came in on. |

**Output** Figure 50-12: Example output from **show atmf authorization provisional**

```

ATMF Provisional Authorization:

Area - Node Name Start Timeout
or MAC Address Interface Time Minutes

3333.4444.5555 5 Sep 2016 02:35:54 3
1111.2222.3333 5 Sep 2016 02:35:24 60
NZ - blue port1.0.3 5 Sep 2016 02:35:06 60

```

Table 50-3: Parameters in the output from **show atmf authorization provisional**

| Parameter                          | Description                                                                  |
|------------------------------------|------------------------------------------------------------------------------|
| Area - Node Name<br>or MAC Address | MAC address or node name of the node that has been provisionally authorized. |
| Interface                          | Interface that the node has been provisioned on.                             |
| Start Time                         | Time the node was provisioned.                                               |
| Timeout Minutes                    | Length of time from Start Time until the provisional authorization expires.  |

Version 5.4.7-0.3: command added

# show atmf backup

**Overview** This command displays information about AMF backup status for all the nodes in an AMF network. It can only be run on AMF master and controller nodes.

**Syntax** `show atmf backup [logs|server-status|synchronize [logs]]`

| Parameter     | Description                                                                           |
|---------------|---------------------------------------------------------------------------------------|
| logs          | Displays detailed log information.                                                    |
| server-status | Displays connectivity diagnostics information for each configured remote file server. |
| synchronize   | Display the file server synchronization status                                        |
| logs          | For each remote file server, display the logs for the last synchronization            |

**Mode** Privileged Exec

**Example 1** To display the AMF backup information, use the command:

```
node_1# show atmf backup
```

To display log messages to do with backups, use the command:

```
node_1# show atmf backup logs
```

Table 50-4: Output from **show atmf backup**

```
Node_1# show atmf backup
ScheduledBackupEnabled
 Schedule.....1 per day starting at 03:00

 2016/09/30 22:25:54 [8039] sent 46 bytes received 39 bytes total size 40
```

**Example 3** To display the AMF backup information with the optional parameter **server-status**, use the command:

```
Node_1# show atmf backup server-status
```

```
Node1#sh atmf backup server-status

Id Last Check State

1 186 s File server ready
2 1 s SSH no route to host
```

**Table 51:** Parameter definitions from the **show atmf backup** command

| Parameter         | Definition                                                                                                                                                                                                                                  |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scheduled Backup  | Indicates whether AMF backup scheduling is enabled or disabled.                                                                                                                                                                             |
| Schedule          | Displays the configured backup schedule.                                                                                                                                                                                                    |
| Next Backup Time  | Displays the date and time of the next scheduled.                                                                                                                                                                                           |
| Backup Media      | The current backup medium in use. This will be SD or NONE. SD card only (and not USB) is supported for AMF backup. Utilized and available memory (MB) will be indicated if backup media memory is present.                                  |
| Current Action    | The task that the AMF backup mechanism is currently performing. This will be a combination of either (Idle, Starting, Doing, Stopping), or (manual, scheduled).                                                                             |
| Started           | The date and time that the currently executing task was initiated in the format DD MMM YYYY HH:MM                                                                                                                                           |
| Current Node      | The name of the node that is currently being backed up.                                                                                                                                                                                     |
| Backup Redundancy | Whether backup redundancy is enabled or disabled.                                                                                                                                                                                           |
| Local media       | The local media to be used for backup redundancy; SD or USB or NONE, and total and free memory available on the media.                                                                                                                      |
| State             | Whether SD or USB media is installed and available for backup redundancy. May be Active (if backup redundancy is functional—requires both the local redundant backup media and a remote server to be configured and available) or Inactive. |
| Node Name         | The name of the node that is storing backup data - on its backup media.                                                                                                                                                                     |
| Date              | The data of the last backup in the format DD MMM YYYY.                                                                                                                                                                                      |
| Time              | The time of the last backup in the format HH:MM:SS.                                                                                                                                                                                         |
| In ATMF           | Whether the node shown is active in the AMF network, (Yes or No).                                                                                                                                                                           |
| On Media          | Whether the node shown has a backup on the backup media (Yes or No).                                                                                                                                                                        |

**Table 51:** Parameter definitions from the **show atmf backup** command (cont.)

| Parameter         | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status            | The output can contain one of four values: <ul style="list-style-type: none"><li>• “-” meaning that the status file cannot be found or cannot be read.</li><li>• “Errors” meaning that there are issues - note that the backup may still be deemed successful depending on the errors.</li><li>• “Stopped” meaning that the backup attempt was manually aborted.</li><li>• “Good” meaning that the backup was completed successfully.</li><li>• “In Progress” meaning that the backup is currently running on that node.</li></ul> |
| Log File Location | All backup attempts will generate a result log file in the identified directory based on the node name. In the above example this would be:<br>card:/amf/office/logs/rsync_amf_testbox1.log.                                                                                                                                                                                                                                                                                                                                       |
| Log Details       | The contents of the backup log file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| server-status     | Displays connectivity diagnostics information for each configured remove file server.                                                                                                                                                                                                                                                                                                                                                                                                                                              |

# show atmf backup area

**Overview** Use this command to display backup status information for the master nodes in one or more areas.

Note that this command is only available on AMF controllers.

**Syntax** `show atmf backup area [<area-name> [<node-name>]] [logs]`

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| logs        | Displays the logs for the last backup of each node.     |
| <area-name> | Displays information about nodes in the specified area. |
| <node-name> | Displays information about the specified node.          |

**Mode** Privileged Exec

**Example** To show information about backups for an area, use the command:

```
controller-1# show atmf backup area
```

**Table 52:** Output from the **show atmf backup area** command

```

controller-1#show atmf backup area

# show atmf backup guest

**Overview** This command displays backup status information of guest nodes in an AMF network. This command can only be run on a device configured as an AMF Master and has an AMF guest license.

**Syntax** show atmf backup guest [*<node-name>*] [*<guest-port>*] [logs]

| Parameter                 | Description                        |
|---------------------------|------------------------------------|
| <i>&lt;node-name&gt;</i>  | The name of parent guest node      |
| <i>&lt;guest-port&gt;</i> | The port number on the parent node |

**Mode** User Exec/Privileged Exec

**Example** On the switch named x930-master, to display information about the AMF backup guest status, use the command:

```
x930-master# show atmf backup guest
```

**Output** Figure 50-13: Example output from **show atmf backup guest**

```
x930-master#sh atmf backup guest

Table 50-1: Parameters in the output from **show atmf backup guest**

| Parameter        | Description                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Guest Backup     | The status of the guest node backup process                                                                                                                                |
| Scheduled Backup | The timing configured for guest backups.                                                                                                                                   |
| Schedule         | Displays the configured backup schedule.                                                                                                                                   |
| Next Backup Time | The time the next backup process will be initiated.                                                                                                                        |
| Backup Bandwidth | The bandwidth limit applied to the backup data flow measured in kilo Bytes /second. Note that unlimited means there is no limit set specifically for the backup data flow. |
| Backup Media     | Detail of the memory media used to store the backup files and the current memory capacity available.                                                                       |

# show atmf container

**Overview** Use this command to display information about the AMF containers created on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `show atmf container [detail] [<container-name>]`

| Parameter        | Description                                                        |
|------------------|--------------------------------------------------------------------|
| detail           | Show detailed information.                                         |
| <container-name> | The name of the AMF container you wish to display information for. |

**Mode** Privileged Exec

**Output** Figure 50-14: Example output from **show atmf container**

```
awplus#show atmf container
ATMF Container Information:
 Container Area Bridge State Memory CPU%

 vac-wlg-1 wlg br1 running 70.3 MB 1.2
 vac-akl-1 ak1 br2 stopped 0 bytes 0.0
 vac-nsn-1 nsn br3 running 53.2 MB 0.7
Current ATMF Container count: 3
```

Figure 50-15: Example output from **show atmf container vac-wlg-1**

```
awplus#show atmf container vac-wlg-1
ATMF Container Information:
 Container Area Bridge State Memory CPU%

 vac-wlg-1 wlg br1 running 70.3 MB 1.2
Current ATMF Container count: 1
```

Table 50-2: Parameters in the output from **show atmf container**

| Parameter | Description                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------|
| Container | Name of the AMF container.                                                                                       |
| Area      | Name of the area the container is in.                                                                            |
| Bridge    | Name of the bridge connecting the container to the physical network.                                             |
| State     | Container state, <code>running</code> or <code>stopped</code> . This is set with the <code>state</code> command. |
| Memory    | The amount of memory the container is using on the VAA host.                                                     |
| CPU%      | The percentage of CPU time the container is using on the VAA, at the time the show command is run.               |

Figure 50-16: Example output from **show atmf container detail vac-wlg-1**

```
awplus#show atmf container detail vac-wlg-1

ATMF Container Information:

Name: vac-wlg-1
State: RUNNING

TX bytes: 166.01 KiB
RX bytes: 141.44 KiB
Total bytes: 307.45 KiB
Link: vethYCT7BB
TX bytes: 674.27 KiB
RX bytes: 698.27 KiB
Total bytes: 1.34 MiB
```

Table 50-3: Parameters in the output from **show atmf container detail**

| Parameter | Description                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------|
| Name      | Name of the AMF container.                                                                                       |
| State     | Container state, <code>RUNNING</code> or <code>STOPPED</code> . This is set with the <code>state</code> command. |

Table 50-3: Parameters in the output from **show atmf container detail** (cont.)

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PID         | Internal container id.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IP          | This lists the IP addresses used by the container. These include the eth1 IP address and the AMF management IP address.                                                                                                                                                                                                                                                                                                                                                |
| CPU use     | The CPU usage of the container since it was enabled.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Memory use  | Container memory usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Link        | Each container has two links:<br><ol style="list-style-type: none"><li>1 An AMF area-link, this connects the container to the AMF controller and uses virtual interface eth0 on the AMF container.</li><li>2 A bridged L2 network link, this connects the container to the outside world and uses the virtual interface eth1 on the AMF container.</li></ol> See the <a href="#">AMF Feature Overview and Configuration_Guide</a> for more information on these links. |
| TX/RX bytes | Bytes sent and received on a link.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Total bytes | Total bytes transferred on a link.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Command  
changes**

Version 5.4.7-0.1: command added

# show atmf detail

**Overview** This command displays details about an AMF node. It can only be run on AMF master and controller nodes.

**Syntax** show atmf detail

| Parameter | Description                       |
|-----------|-----------------------------------|
| detail    | Displays output in greater depth. |

**Mode** Privileged Exec

**Example 1** To display the AMF node1 information in detail, use the command:

```
controller-1# show atmf detail
```

A typical output screen from this command is shown below:

```
atmf-1#show atmf detail
ATMF Detail Information:

Network Name : Test_network
Network Mtu : 1300
Node Name : controller-1
Node Address : controller-1.atmf
Node ID : 342
Node Depth : 0
Domain State : BackupDomainController
Recovery State : None
Log Verbose Setting : Verbose

Management VLAN
VLAN ID : 4000
Management Subnet : 172.31.0.0
Management IP Address : 172.31.1.86
Management Mask : 255.255.128.0
Management IPv6 Address : fd00:4154:4d46:1::156
Management IPv6 Prefix Length : 64

Domain VLAN
VLAN ID : 4091
Domain Subnet : 172.31.128.0
Domain IP Address : 172.31.129.86
Domain Mask : 255.255.128.0
```

**Table 51:** Parameter definitions from the **show atmf detail** command

| Parameter       | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network MTU     | The network MTU for the ATMF network.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Network Name    | The AMF network that a particular node belongs to.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Node Name       | The name assigned to a particular node.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Node Address    | An Address used to access a remotely located node. This is simply the Node Name plus the dotted suffix atmf (.atmf).                                                                                                                                                                                                                                                                                                                                             |
| Node ID         | A Unique identifier assigned to a Node on an AMF network.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Node Depth      | The number of nodes in path from this node to level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.                                                                                                                                                                                                                                                           |
| Domain State    | The state of Node in a Domain in AMF network as Controller/Backup.                                                                                                                                                                                                                                                                                                                                                                                               |
| Recovery State  | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.                                                                                                                                                                                                                                                                                                                                           |
| Management VLAN | The VLAN created for traffic between Nodes of different domain (up/down links). <ul style="list-style-type: none"> <li>• VLAN ID - In this example VLAN 4092 is configured as the Management VLAN.</li> <li>• Management Subnet - Network prefix for the subnet.</li> <li>• Management IP Address - The IP address allocated for this traffic.</li> <li>• Management Mask - The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul> |
| Domain VLAN     | The VLAN assigned for traffic between Nodes of same domain (crosslink). <ul style="list-style-type: none"> <li>• VLAN ID - In this example VLAN 4091 is configured as the domain VLAN.</li> <li>• Domain Subnet. The subnet address used for this traffic.</li> <li>• Domain IP Address. The IP address allocated for this traffic.</li> <li>• Domain Mask. The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>                 |
| Node Depth      | The number of nodes in the path from this node to the Core domain.                                                                                                                                                                                                                                                                                                                                                                                               |

# show atmf group

**Overview** This command can be used to display the group membership within to a particular AMF node. It can also be used with the working-set command to display group membership within a working set.

Each node in the AMF is automatically added to the group that is appropriate to its hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group.

You can create arbitrary groups of AMF members based on your own selection criteria. You can then assign commands collectively to any of these groups.

**Syntax** `show atmf group [user-defined|automatic]`

| Parameter                 | Description                             |
|---------------------------|-----------------------------------------|
| <code>user-defined</code> | User-defined-group information display. |
| <code>automatic</code>    | Automatic group information display.    |

**Default** All groups are displayed

**Mode** Privileged Exec

**Example 1** To display group membership of node2, use the following command:

```
node2# show atmf group
```

A typical output screen from this command is shown below:

```
ATMF group information

master, x510

node2#
```

This screen shows that node2 contains the groups **master** and **x510**. Note that although the node also contains the implicit groups, these do not appear in the show output.

**Example 2** The following commands (entered on *node2*) will display all the automatic groups within the working set containing *node1* and all nodes that have been pre-defined to contain the *sysadmin* group:

First define the working-set:

```
node1# #atmf working-set node1 group sysadmin
```

A typical output screen from this command is shown below:

```

ATMF group information

master, poe, x8100

=====
node1, node2, node3, node4, node5, node6:
=====

ATMF group information

sysadmin, x8100

AMF_NETWORK[6]#

```

This confirms that the six nodes (*node1* to *node6*) are now members of the working-set and that these nodes reside within the *AMF-NETWORK*.

Note that to run this command, you must have previously entered the command [atmf working-set](#) on page 2211. This can be seen from the network level prompt, which in this case is *AMF\_NETWORK[6]#*.

**Table 52:** Sample output from the **show atmf group** command for a working set.

```

AMF_NETWORK[6]#show atmf group
=====
node3, node4, node5, node6:
=====

ATMF group information

edge_switches, x510

```

**Table 53:** Parameter definitions from the **show atmf group** command for a working set

| Parameter              | Definition                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATMF group information | Displays a list of nodes and the groups that they belong to, for example: <ul style="list-style-type: none"> <li>• master - Shows a common group name for Nodes configured as AMF masters.</li> <li>• Hardware Arch - Shows a group for all Nodes sharing a common Hardware architecture, e.g. x8100, x230, for example.</li> <li>• User-defined - Arbitrary groups created by the user for AMF nodes.</li> </ul> |

# show atmf group members

**Overview** This command will display all group memberships within an AMF working-set. Each node in the AMF working set is automatically added to automatic groups which are defined by hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group. Users can define arbitrary groupings of AMF members based on their own criteria, which can be used to select groups of nodes.

**Syntax** `show atmf group members [user-defined|automatic]`

| Parameter    | Description                            |
|--------------|----------------------------------------|
| user-defined | User defined group membership display. |
| automatic    | Automatic group membership display.    |

**Mode** Privileged Exec

**Example** To display group membership of all nodes in a working-set, use the command:

```
ATMF_NETWORK[9]# show atmf group members
```

**Table 54:** Sample output from the **show atmf group members** command

```
ATMF Group membership
Automatic Total
Groups Members Members

master 1 Building_1
poe 1 HW_Team1
x510 3 SW_Team1 SW_Team2 SW_Team3
x930 1 HW_Team1
x8100 2 Building_1 Building_2

ATMF Group membership
User-defined Total
Groups Members Members

marketing 1 Bld1_Floor_1
software 3 SW_Team1 SW_Team2 SW_Team3
```

**Table 55:** Parameter definitions from the **show atmf group members** command

| Parameter           | Definition                                                                                                                                                       |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Automatic Groups    | Lists the Automatic Groups and their nodal composition. The sample output shows AMF nodes based on the same Hardware type or belonging to the same Master group. |
| User-defined Groups | Shows the grouping of AMF nodes in user defined groups.                                                                                                          |
| Total Members       | Shows the total number of members in each group.                                                                                                                 |
| Members             | Shows the list of AMF nodes in each group.                                                                                                                       |

**Related Commands**

- [show atmf group](#)
- [show atmf](#)
- [atmf group \(membership\)](#)

# show atmf guests

**Overview** This command is available on any AMF master or controller in the network. It displays a summary of the AMF guest nodes that exist in the AMF network, including device type, parent node, and IP address.

**Syntax** show atmf guests

**Mode** User Exec/Privileged Exec

**Usage** Use this command to display all guest nodes in a network. If you want to see only the guests attached to a single node, use the [show atmf links guest](#) command, which shows information about the guest nodes and also about their link to their parent node.

**Example** To display the AMF guest output, use the command:

```
awplus# show atmf guests
```

**Output** Figure 50-17: Example output from the **show atmf guests** command

```
master#show atmf guests

Guest Information:

Device Device Parent Guest IP/IPv6
Name Type Node Port Address

node1-2.0.1 x600-24Ts node1 2.0.1 192.168.2.10
wireless-zone1 AT-TQ4600 node2 1.0.1 192.168.1.10
wireless-zone2 AT-TQ4600 node2 1.0.2 192.168.1.12

Current ATMF guest node count 3
```

**Table 56:** Parameters shown in the output of the **show atmf guests** command

| Parameter   | Description                                                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Name | The name that is discovered from the device, or failing that, a name that is auto-assigned by AMF. The auto-assigned name consists of: <parent node name>-<attached port number> You can change this by configuring a description on the port.     |
| Device Type | The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command. |

**Table 56:** Parameters shown in the output of the **show atmf guests** command

| Parameter       | Description                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------|
| Parent Node     | The name of the AMF node that directly connects to the guest node.                                 |
| Guest Port      | The port on the parent node that directly connects to the guest node.                              |
| IP/IPv6 Address | The address discovered from the node, or statically configured on the parent node's attached port. |

**Related  
Commands**

[atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf backup guest](#)  
[show atmf links guest](#)

# show atmf guests detail

**Overview** This command is available on any AMF master in the network. It displays details about the AMF guest nodes that exist in the AMF network, such as device type, IP address, MAC address etc.

**Syntax** `show atmf guests detail [<node-name>] [<guest-port>]`

| Parameter                       | Description                          |
|---------------------------------|--------------------------------------|
| <code>&lt;node-name&gt;</code>  | The name of the guest node's parent. |
| <code>&lt;guest-port&gt;</code> | The port name on the parent node.    |

**Mode** User Exec/Privileged Exec

**Usage** If you want to see only the guests attached to a single node, you can use either:

- this command and specify the node name, or
- [show atmf links guest detail](#), which shows information about the guest nodes and also about their link to their parent node.

Note that the parameters that are displayed depend on the guest node's model.

**Example** To display the AMF guest output, use the command:

```
awplus# show atmf guests detail
```

**Output** Figure 50-18: Example output from **show atmf guests detail**

```
master#show atmf guests detail

ATMF Guest Node Information:

**Table 57:** Parameters in the output from **show atmf guests detail**.

| Parameter         | Description                                                                                                                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Name         | The name of the parent node, which is the AMF node that directly connects to the guest node.                                                                                                                                                       |
| Port Name         | The port on the parent node that connects to the guest.                                                                                                                                                                                            |
| IfIndex           | An internal index number that maps to the port number on the parent node.                                                                                                                                                                          |
| Guest Description | A description that is discovered from the device, or failing that, auto-assigned by AMF. The auto-assigned name consists of:<br><parent node name>-<attached port number>.<br>You can change this by configuring a description on the port.        |
| Device Type       | The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command. |
| Username          | The user name configured on the guest node.                                                                                                                                                                                                        |
| Backup Supported  | Whether the guest node supports AMF backup functionality.                                                                                                                                                                                          |
| MAC Address       | The MAC address of the guest node.                                                                                                                                                                                                                 |
| IP Address        | The IP address of the guest node.                                                                                                                                                                                                                  |
| IPv6 Address      | The IPv6 address of the guest node.                                                                                                                                                                                                                |
| Firmware Version  | The version of the firmware operating on the guest node.                                                                                                                                                                                           |
| HTTP port         | The HTTP port as specified with the <a href="#">http-enable</a> command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).                      |

**Related  
Commands**    `atmf guest-class`  
                  `switchport atmf-guestlink`  
                  `show atmf backup guest`

# show atmf links

**Overview** This command displays information about AMF links on a switch. The display output contains link status state information.

**Syntax** `show atmf links [brief]`

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| brief     | A brief summary of AMF links, their configuration and status. |

**Mode** User Exec and Privileged Exec

**Usage** The **show atmf links** and **show atmf links brief** commands both produce a table of summarized link information. For a more detailed view use the [show atmf links detail](#) command.

**Example** To display a brief summary of the AMF links, use the following command:

```
node-1# show atmf links brief
```

Figure 50-19: Example output from **show atmf links brief**

```
Example-core# show atmf links
ATMF Link Brief Information:
Local Link Link ATMF Adjacent Adjacent Link
Port Type Status State Node Ifindex State

1.0.10 Crosslink Down Init *crosslink1 - Blocking
1.0.14 Crosslink Down Init *crosslink2 - Blocking
1.0.1 Downlink Down Init - - Blocking
1.0.2 Downlink Up Full Node2 5001 Forwarding
1.0.8 Downlink Up Full downlink1 5001 Forwarding

* = Provisioned.
```

Table 50-1: Parameter in the output from **show atmf links brief**

| Parameter   | Definition                                                                                     |
|-------------|------------------------------------------------------------------------------------------------|
| Local Port  | Shows the local port on the selected node.                                                     |
| Link Type   | Shows link type as Uplink or Downlink (parent and child) or Cross-link (nodes in same domain). |
| Link Status | Shows the link status of the local port on the node as either Up or Down.                      |

Table 50-1: Parameter in the output from **show atmf links brief** (cont.)

| Parameter         | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATMF State        | Shows AMF state of the local port: <ul style="list-style-type: none"> <li>• Init - Link is down.</li> <li>• Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable.</li> <li>• Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations.</li> <li>• OneWay - Link is up and has waited the hold down period and now attempting to link to another unit in another domain.</li> <li>• OneWaySim - Device is running in secure mode and link is up but waiting for authorization from an AMF master.</li> <li>• Full - Link hello packets are sent and received from its neighbor with its own node id.</li> <li>• Shutdown - Link has been shut down by user configuration.</li> </ul> |
| Adjacent Node     | Shows the Adjacent AMF Node to the one being configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Adjacent IF Index | Shows the IF index for the Adjacent AMF Node connected to the node being configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Link State        | Shows the state of the AMF link. Valid states are either Forwarding or Blocking.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

# show atmf links detail

**Overview** This command displays detailed information on all the links configured in the AMF network. It can only be run on AMF master and controller nodes.

**Syntax** show atmf links detail

| Parameter | Description                     |
|-----------|---------------------------------|
| detail    | Detailed AMF links information. |

**Mode** User Exec

**Example** To display the AMF link details use this command:

```
device1# show atmf links detail
```

The output from this command will display all the internal data held for AMF links. The following example gives details of the links that are summarized in the example in [show atmf links](#).

**Table 51:** Sample output from the **show atmf links detail** command

```
device1# show atmf links detail

Crosslink Ports Information

Port : sa1
Ifindex : 4501
Port Status : Down
Port State : Init
Last event :
Port BPDU Receive Count : 0
Port : po10
Ifindex : 4610
Port Status : Up
Port State : Full
Last event : AdjNodeLSEPresent
Port BPDU Receive Count : 140
Adjacent Node Name : Building-B
Adjacent Ifindex : 4610
Adjacent MAC : eccd.6dd1.64d0
Port Last Message Response : 0
```

**Table 51:** Sample output from the **show atmf links detail** command (cont.)

**Related  
Commands**    no debug all  
                  clear atmf links statistics  
                  show atmf

# show atmf links guest

**Overview** This command displays information about guest nodes visible to an AMF device.

**Syntax** `show atmf links guest [interface <interface-range>]`

| Parameter                      | Description                                                                |
|--------------------------------|----------------------------------------------------------------------------|
| interface<br><interface-range> | Select a specific range of ports to display information about guest nodes. |

**Default** With no parameters specified this command will display its standard output for all ports with guest nodes connected.

**Mode** User Exec/Privileged Exec

**Usage** Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use [show atmf guests](#).

**Example 1** To display information about AMF guests that are connectible from node1, use the command:

```
node1# show atmf links guest
```

**Output** Figure 50-20: Example output from **show atmf links guest**

```
node1#sh atmf links guest

Guest Link Information:

```

Table 50-1: Parameters in the output from **show atmf links guest**

| Parameter   | Description                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------|
| Local Port  | The port on the parent node that connects to the guest.                                                                    |
| Guest Class | The name of the ATMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command. |

Table 50-1: Parameters in the output from **show atmf links guest** (cont.)

| Parameter         | Description                                                                                                                                                                                                              |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Model Type        | The model type of the guest node, as entered by the <code>modeltype</code> command. Can be one of the following: <ul style="list-style-type: none"><li>• alliedware</li><li>• aw+</li><li>• tq</li><li>• other</li></ul> |
| DC                | The discovery method as applied by the <code>discovery</code> command. This can be either dynamic (D) or static (S).                                                                                                     |
| MAC Address       | The MAC address of the guest node.                                                                                                                                                                                       |
| IP / IPv6 Address | The IP address of the guest node.                                                                                                                                                                                        |

# show atmf links guest detail

**Overview** This command displays detailed information about guest nodes visible to an AMF device.

**Syntax** `show atmf links guest detail [interface <interface-range>]`

| Parameter                                                      | Description                                                                |
|----------------------------------------------------------------|----------------------------------------------------------------------------|
| <code>interface</code><br><code>&lt;interface-range&gt;</code> | Select a specific range of ports to display information about guest nodes. |

**Default** Display details for all ports with guest nodes connected.

**Mode** User Exec/Privileged Exec

**Usage** Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use [show atmf guests detail](#).

Note that the parameters that are displayed depend on the guest node's model and state.

**Example** To display detailed information about AMF guests, use the command:

```
node1# show atmf links guest detail
```

**Output** Figure 50-21: Example output from **show atmf links guest detail**

```

node1#show atmf links guest detail

Detailed Guest Link Information:

Interface : port1.0.13
Link State : Down
Class Name : test
Model Type : Other
Discovery Method : Static
IP Address : 192.168.1.13
Node State : Down

Interface : port1.0.17
Link State : Full
Class Name : access
Model Type : TQ
Discovery Method : Dynamic
IP Address : 192.168.5.8
Username : manager
Node State : Full
Backup Supported : Yes
MAC address : 001a.ebad.ce60
Device Type : AT-TQ3400
Description : node1-1.0.17
Firmware Version : 3.2.1 A02

```

Table 50-2: Parameters in the output from **show atmf links guest detail**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface  | The port on the parent node that connects to the guest.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Link State | The state of the link to the guest node; one of: <ul style="list-style-type: none"> <li>Down: The physical link is down.</li> <li>Up: The physical link has come up, but it is still during a timeout period that is enforced to allow other links to come up.</li> <li>Learn: The timeout period described above has elapsed, and the link is now learning information from the AMF guest node. You can see what information it is learning from the "Node State" field below.</li> <li>Full: The node connected by this link has joined the AMF network.</li> <li>Fail: The port is physically up but something has prevented the guest node from joining the AMF network.</li> </ul> |
| Class Name | The name of the ATMF guest-class that has been assigned to the guest node by the <code>atmf guest-class</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 50-2: Parameters in the output from **show atmf links guest detail** (cont.)

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Model Type       | The model type of the guest node, as entered by the <code>modeltype</code> command. Can be one of the following: <ul style="list-style-type: none"> <li>• alliedware</li> <li>• aw+</li> <li>• tq</li> <li>• other</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Discovery Method | The discovery method as applied by the <code>discovery</code> command. This can be either dynamic or static.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| IP Address       | The IP address of the guest node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Username         | The user name configured on the guest node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Node state       | The state of the guest node; one of: <ul style="list-style-type: none"> <li>• Down: The initial state when a link to a guest node is first configured. This is also the state if the physical link goes down.</li> <li>• Getting IP: The AMF device is in the process of retrieving the IP address of the guest node.</li> <li>• Getting Mac: The AMF device is in the process of retrieving the MAC address of the guest node.</li> <li>• Getting Info: The AMF device is in the process of retrieving any other available information from the guest (firmware version etc). The information available depends on what device the guest node is.</li> <li>• Full: The AMF device has retrieved all necessary information and the guest node has joined the AMF network. Once this state is reached, the Link State also changes to "Full".</li> <li>• Failure: The physical link is up but the AMF member has failed to retrieve enough information to allow the guest node to join the AMF network.</li> </ul> |
| Backup Supported | Whether the guest node supports AMF backup functionality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| MAC Address      | The MAC address of the guest node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Device Type      | Model information for the guest node. This field shows the model information that AMF retrieved from the guest node. In contrast, the Model Type shows what a user entered as the type of device they intended this guest node to be.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Description      | By default, this is a concatenation of the guest node's parent node and the port to which it is attached. You can change it by configuring a description on the port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 50-2: Parameters in the output from **show atmf links guest detail** (cont.)

| Parameter        | Description                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Serial Number    | The serial number of the guest node.                                                                                                                                                                                          |
| Firmware Name    | The name of the firmware operating on the guest node.                                                                                                                                                                         |
| Firmware Version | The version of the firmware operating on the guest node.                                                                                                                                                                      |
| HTTP port        | The HTTP port as specified with the <a href="#">http-enable</a> command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80). |

# show atmf links statistics

**Overview** This command displays details of the AMF links configured on the device and also displays statistics about the AMF packet exchanges between the devices.

It is also possible to display the AMF link configuration and packet exchange statistics for a specified interface.

This command can only be run on AMF master and controller nodes

**Syntax** `show atmf links statistics [interface [<port_number>]]`

| Parameter     | Description                                                                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface     | Specifies that the command applies to a specific interface (port) or range of ports. Where both the interface and port number are unspecified, full statistics (not just those relating to ports) will be displayed.     |
| <port_number> | Enter the port number for which statistics are required. A port range, a static channel or LACP link can also be specified. Where no port number is specified, statistics will be displayed for all ports on the device. |

**Mode** User Exec

**Example 1** To display AMF link statistics for the whole device, use the command:

```
device1# show atmf links statistics
```

**Table 51:** Sample output from the **show atmf links statistics** command

| ATMF Statistics:       |         |          |
|------------------------|---------|----------|
|                        | Receive | Transmit |

# show atmf nodes

**Overview** This command displays nodes currently configured within the AMF network.

Note that the output also tells you whether or not node map exchange is active. Node map exchange improves the tracking of nodes joining and leaving an AMF network. This improves the efficiency of AMF networks. Node map exchange is only available if every node in your AMF network is running version 5.4.6-2.1 or later. We recommend running the latest version on all nodes in your network, so you receive the advantages of node map exchange and other improvements.

**Syntax** `show atmf nodes [guest|all]`

| Parameter | Description                                                  |
|-----------|--------------------------------------------------------------|
| guest     | Display only guest nodes in the AMF network.                 |
| all       | Display all nodes in the AMF network, including guest nodes. |

**Mode** Privileged Exec

**Usage** You can use this command to display one of three sets of nodes:

- all nodes except guest nodes, by specifying **show atmf nodes**
- all nodes including guest nodes, by specifying **show atmf nodes all**
- only guest nodes, by specifying **show atmf nodes guest**

**Examples** To display AMF information for all nodes except guest nodes, use the command:

```
node1# show atmf nodes
```

Table 50-1: Sample output from **show atmf nodes**

```
node1#show atmf nodes guest

Node Information:

* = Local device

SC = Switch Configuration:
C = Chassis S = Stackable N = Standalone

Node Device ATMF Parent Node
Name Type Master SC Domain Depth

* M1 x510-28GTX Y S none 0
N3 x230-18GP N N M1 1
N1 AR4050S N N M1 1

Node map exchange is active
Current ATMF node count 3
```

To display AMF information for all nodes, including guest nodes, use the command:

```
node1# show atmf nodes all
```

**Table 51:** Sample output from **show atmf nodes all**. In this example, not all nodes support node map exchange, as shown by the message at the end

```
node1#show atmf nodes all

Node and Guest Information:

* = Local device

SC = Switch Configuration:
C = Chassis S = Stackable N = Standalone G = Guest
```

| Node/Guest Name | Device Type | ATMF Master | SC | Parent Domain | Node Depth |
|-----------------|-------------|-------------|----|---------------|------------|
| * M1            | x510-28GTX  | Y           | S  | none          | 0          |
| N3              | x230-18GP   | N           | N  | M1            | 1          |
| N1              | AR4050S     | N           | N  | M1            | 1          |
| N3-1.0.24       | AT-TQ4600   | N           | G  | N3            | -          |

```

Node map exchange is inactive
Firmware on some nodes does not support node map exchange, eg AR4050S
Current ATMF node count 4 (guests 1)

```

To display AMF information for guest nodes only, use the command:

```
node1# show atmf nodes guest
```

**Table 50-1:** Sample output from **show atmf nodes guest**

```
node1#show atmf nodes guest

Guest Information:
```

| Device Name | MAC Address    | Parent | Port  | IP/IPv6 Address |
|-------------|----------------|--------|-------|-----------------|
| aastra-...  | 0008.5d10.7635 | Node-1 | 1.0.2 | 192.168.4.7     |
| poe-1.0.1   | 0013.1a1e.4589 | Node-1 | 1.0.1 | 192.168.4.6     |
| ip-camera   | 0800.239e.f1fe | Node-1 | 1.0.4 | 192.168.4.8     |
| tq4600      | eccd.6df2.da60 | Node-1 | 1.0.5 | 192.168.4.50    |

# show atmf provision nodes

**Overview** This command displays information about each provisioned node with details about date and time of creation, boot and configuration files available in the backup, and license files present in the provisioned backup. This includes nodes that have joined the network but are yet to run their first backup.

This command can only be run on AMF master and controller nodes.

**Syntax** `show atmf provision nodes`

**Mode** Privileged Exec

**Usage** This command will only work if provisioned nodes have already been set up. Otherwise, an error message is shown when the command is run.

**Example** To show the details of all the provisioned nodes in the backup use the command:

```
NodeName# show atmf provision nodes
```

Figure 50-24: Sample output from the **show atmf provision nodes** command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media: SD (Total 3827.0MB, Free 3481.1MB)

Node Name : device2
Date& Time : 06-Oct-2016 & 23:25:44
Provision Path : card:/atmf/provision_nodes

Boot configuration :
Current boot image : x510-5.4.6-1.4.rel (file exists)
Backup boot image : x510-5.4.6-1.3.rel (file exists)
Default boot config : flash:/default.cfg (file exists)
Current boot config : flash:/abc.cfg (file exists)
Backup boot config : flash:/xyz.cfg (file exists)

Software Licenses :
Repository file : ../configs/.sw_v2.lic
 : ../configs/.swfeature.lic
Certificate file : card:/atmf/nodes/awplus1/flash/.atmf-lic-cert
```

# show atmf secure-mode

**Overview** Use this command to display an overview of the secure mode status of an AMF network.

**Syntax** show atmf secure-mode

**Mode** Privileged Exec

**Example** To display an overview of AMF secure mode on an AMF master or member node, use the command:

```
awplus# show atmf secure-mode
```

**Output** Figure 50-25: Example output from **show atmf secure-mode** on an AMF master

```
ATMF Secure Mode:

Secure Mode Status : Enabled
Certificate Expiry : 180 Days
Certificates Total : 8
Certificates Revoked : 0
Certificates Rejected : 0
Certificates Active : 8

Provisional Authorization : 0
Pending Requests : 0

Trusted Master : master_1
Trusted Master : master_2

```

Table 50-4: Parameters in the output from **show atmf secure-mode audit link**

| Parameter      | Description                         |
|----------------|-------------------------------------|
| Port           | Port name on local device.          |
| Link Type      | Link type.                          |
| Discovered     | Date discovered                     |
| Node/Area Name | Node or area name of remote device. |

**Related Commands** [show atmf](#)  
[show atmf secure-mode](#)

**Command changes** Version 5.4.7-0.3: command added

# show atmf secure-mode certificates

**Overview** Use this command to display the certificate status details when secure mode is enabled on an AMF network.

**Syntax** `show atmf secure-mode certificates [detail] [area <area-name>]  
[node <node-name>]`

| Parameter   | Description                                                   |
|-------------|---------------------------------------------------------------|
| detail      | Display detailed certificate information.                     |
| area        | Specify an AMF area.                                          |
| <area-name> | The AMF area you want to see the certificate information for. |
| node        | Specify an AMF node.                                          |
| <node-name> | The AMF node you want to see information for.                 |

**Mode** Privileged Exec

**Example** To display AMF secure mode certificates on a master or member node, use the command:

```
awplus# show atmf secure-mode certificates
```

To display detailed information about AMF secure mode certificates for a node named "area\_2\_node\_1" in an area named "area-2", use the command:

```
awplus# show atmf secure-mode certificates detail area area-2
node area_2_node_1
```

**Output** Figure 50-29: Example output from **show atmf secure-mode certificates**

```
Area-1 Certificates:
Node Name Signer Expires Status

area_1_node_1 master_1 11 Mar 2017
 master_2 4 Mar 2017 Active
area_1_node_2 master_1 11 Mar 2017
 master_2 4 Mar 2017 Revoked

Area-2 Certificates:
Node Name Signer Expires Status

area_2_node_1 master_1 18 Mar 2017 Active
area_2_node_2 master_1 18 Mar 2017 Rejected
```

Table 50-5: Parameters in the output from **show atmf secure-mode certificates**

| Parameter | Description                                                                                                                                                                                     |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Name | Name of AMF node the certificate was issued to.                                                                                                                                                 |
| Signer    | Name of AMF master that issued the certificate.                                                                                                                                                 |
| Expires   | Certificate expiry date.                                                                                                                                                                        |
| Status    | The status column will display <i>Active</i> before a member node is trusted, and can be accessed using AMF commands. Valid statuses are <i>Active</i> , <i>Revoked</i> , and <i>Rejected</i> . |

**Output** Figure 50-30: Example output from **show atmf secure-mode certificates detail area area-2 node area\_2\_node\_1**

```

Certificates Detail:

area_2_node_1 (area:area-2)

**Command  
changes** Version 5.4.7-0.3: command added

# show atmf secure-mode sa

**Overview** Use this command to display the security associations on the network. This is the list of links and neighbors that are trusted.

**Syntax** `show atmf secure-mode sa [detail] [link|neighbor|broadcast]`

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| detail    | Display detailed security association information. |
| link      | Display security associations for type links.      |
| neighbor  | Display security associations for type neighbors.  |
| broadcast | Display security associations for type broadcast.  |

**Mode** Privileged Exec

**Example** To display an overview of AMF secure mode security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa
```

To display a detailed overview of AMF secure mode neighbor security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa detail neighbor
```

**Output** Figure 50-31: Example output from **show atmf secure-mode sa**

**Command changes**

Version 5.4.7-0.3: command added

# show atmf secure-mode statistics

**Overview** Use this command to display AMF secure mode statistics. These statistics are from when AMF secure mode was first enabled or the statistics were cleared with the `clear atmf secure-mode statistics` command.

**Syntax** `show atmf secure-mode statistics`

**Mode** Privileged Exec

**Example** To display AMF secure mode statistics on a master or member node, use the command:

```
awplus# show atmf secure-mode statistics
```

**Output** Figure 50-33: Example output from `show atmf secure-mode statistics` on an AMF master.

```
ATMF Secure Mode Statistics:

Certificates:
New 7 Expired 0
Updated 7 Deleted 0
Revoked 1 Renewed 2
Rejected 1 Re-authorized 1
Authorized 0

Local Certificates:
Valid 4 Invalid 0
Certificates Validation:
Request Valid 2
Request Invalid 0
Common Valid 13
Common Invalid 0
Issuer Valid 14
Issuer Invalid 0
Signature Verified 29
Signature Invalid 0
Signature Purpose Invalid 0

Signatures Signed 12
Master Certificates:
Re-issued 3
Downgraded to member 0

Public key change 2
Invalid SA public key 0
```

**Output** Figure 50-34: Example output from **show atmf secure-mode statistics** on an AMF node.

```
ATMF Secure Mode Statistics:

Local Certificates:
Valid 3 Invalid 0

Certificates Validation:
Request Valid 0
Request Invalid 0
Common Valid 0

**Command changes** Version 5.4.7-0.3: command added

# show atmf tech

**Overview** This command collects and displays all the AMF command output. The command can thus be used to display a complete picture of an AMF network.

**Syntax** show atmf tech

**Mode** Privileged Exec

**Example** To display output for all AMF commands, use the command:

```
NodeName# show atmf tech
```

**Table 51:** Sample output from the **show atmf tech** command.

```
node1#show atmf tech
ATMF Summary Information:

ATMF Status : Enabled
Network Name : ATMF_NET
Node Name : node1
Role : Master
Current ATMF Nodes : 8

ATMF Technical information:

Network Name : ATMF_NET
Domain : node1's domain
Node Depth : 0
Domain Flags : 0
Authentication Type : 0
MAC Address : 0014.2299.137d
Board ID : 287
Domain State : DomainController
Domain Controller : node1
Backup Domain Controller : node2
Domain controller MAC : 0014.2299.137d
Parent Domain : -
Parent Domain Controller : -
Parent Domain Controller MAC : 0000.0000.0000
Number of Domain Events : 0
Crosslink Ports Blocking : 0
Uplink Ports Waiting on Sync : 0
```

**Table 52:** Parameter definitions from the **show atmf tech** command

| Parameter          | Definition                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATMF Status        | Shows status of AMF feature on the Node as Enabled/Disabled.                                                                                                                                                                                                                                                                                                                                         |
| Network Name       | The name of the AMF network to which this node belongs.                                                                                                                                                                                                                                                                                                                                              |
| Node Name          | The name assigned to the node within the AMF network.                                                                                                                                                                                                                                                                                                                                                |
| Role               | The role configured on the device within the AMF - either master or member.                                                                                                                                                                                                                                                                                                                          |
| Current ATMF Nodes | A count of the AMF nodes in the AMF network.                                                                                                                                                                                                                                                                                                                                                         |
| Node Address       | The identity of a node (in the format name.atmf) that enables its access it from a remote location.                                                                                                                                                                                                                                                                                                  |
| Node ID            | A unique identifier assigned to an AMF node.                                                                                                                                                                                                                                                                                                                                                         |
| Node Depth         | The number of nodes in the path from this node to the core domain.                                                                                                                                                                                                                                                                                                                                   |
| Domain State       | A node's state within an AMF Domain - either controller or backup.                                                                                                                                                                                                                                                                                                                                   |
| Recovery State     | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - either Auto, Manual, or None.                                                                                                                                                                                                                                                                        |
| Management VLAN    | The VLAN created for traffic between nodes of different domains (up/down links).<br>VLAN ID - In this example VLAN 4092 is configured as the Management VLAN.<br>Management Subnet - the Network prefix for the subnet.<br>Management IP Address - the IP address allocated for this traffic.<br>Management Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17) |

**Table 52:** Parameter definitions from the **show atmf tech** command (cont.)

| Parameter   | Definition                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Domain VLAN | The VLAN assigned for traffic between Nodes of same domain (crosslink).<br>VLAN ID - In this example VLAN 4091 is configured as the domain VLAN.<br>Domain Subnet - the Subnet address used for this traffic.<br>Domain IP Address - the IP address allocated for this traffic.<br>Domain Mask - the Netmask used to create a subnet for this traffic 255.255.128.0<br>(= prefix /17) |
| Device Type | Shows the Product Series Name.                                                                                                                                                                                                                                                                                                                                                        |
| ATMF Master | Indicates the node's membership of the core domain (membership is indicated by Y)                                                                                                                                                                                                                                                                                                     |
| SC          | Shows switch configuration: <ul style="list-style-type: none"><li>• C - Chassis (such as SBx8100 series)</li><li>• S - Stackable (VCS)</li><li>• N - Standalone</li></ul>                                                                                                                                                                                                             |
| Parent      | A node that is connected to the present node's uplink, i.e. one layer higher in the hierarchy.                                                                                                                                                                                                                                                                                        |
| Node Depth  | Shows the number of nodes in path from the current node to the Core domain.                                                                                                                                                                                                                                                                                                           |

**NOTE:** The **show atmf tech** command can produce very large output. For this reason only the most significant terms are defined in this table.

# show atmf virtual-links

**Overview** This command displays a summary of all virtual links (L2TP tunnels) currently in the running configuration.

**Syntax** `show atmf virtual-links [macaddr]`

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| macaddr   | Display the virtual AMF links' MAC addresses. |

**Mode** Privileged Exec

**Example 1** To display AMF virtual links, use the command:

```
node_1# show atmf virtual-links
```

Table 50-1: Example output from **show atmf virtual-links**

```
ATMF Link Remote Information:
```

| Local Port | Local Ip   | Local Id | Remote Ip   | Remote Id | Retries | State |
|------------|------------|----------|-------------|-----------|---------|-------|
| vlink1     | 192.0.2.33 | 1        | 192.168.1.1 | 2         | 0       | Down  |
| vlink2     | 192.0.2.65 | 2        | 192.168.2.0 | 3         | 0       | Up    |

In the above example, a centrally located switch has the IP address space 192.0.2.x/24. It has two VLANs assigned the subnets 192.0.2.33 and 192.0.2.65 using the prefix /27. Each subnet connects to a virtual link. The first link has the IP address 192.168.1.1 and has a Local ID of 1. The second has the IP address 192.168.2.1 and has the Local ID of 2.

**Example 2** To display AMF virtual links' MAC address information, use the command:

```
node_1# show atmf virtual-links macaddr
```

Table 50-2: Example output from **show atmf virtual-links macaddr**

```
ATMF Link Remote Information:
```

```
ATMF Management Bridge Information:
```

```
Bridge: br-atmfmgmt
```

| port no | mac addr          | is local? | ageing timer |
|---------|-------------------|-----------|--------------|
| 1       | 00:00:cd:27:c2:07 | yes       | 0.00         |
| 2       | 8e:c7:ae:81:7e:68 | yes       | 0.00         |
| 2       | 00:00:cd:28:bf:e7 | no        | 0.01         |

Table 50-3: Parameters in the output from **show atmf virtual-links**

| Parameter    | Definition                                                                                                                                 |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| vlink1       | The tunnel named vlink1, equivalent to an L2TP tunnel.                                                                                     |
| Local ID     | The local ID of the virtual link. This matches the vlink<number>                                                                           |
| State        | The operational state of the vlink (either Up or Down). This state is always displayed once a vlink has been created.                      |
| mac addr     | AMF virtual links terminate on an internal soft bridge. The “show atmf virtual-links macaddress” command displays MAC Address information. |
| is local?    | Indicates whether the MAC displayed is for a local or a remote device.                                                                     |
| ageing timer | Indicates the current aging state for each MAC address.                                                                                    |

**Related Commands** [atmf virtual-link](#)

# show atmf working-set

**Overview** This command displays the nodes that form the current AMF working-set.

**Syntax** `show atmf working-set`

**Mode** Privileged Exec

**Example** To show current members of the working-set, use the command:

```
ATMF_NETWORK[6]# show atmf working-set
```

**Table 51:** Sample output from the **show atmf working-set** command.

```
ATMF Working Set Nodes:
node1, node2, node3, node4, node5, node6
Working set contains 6 nodes
```

# show debugging atmf

**Overview** This command shows the debugging modes status for AMF.

**Syntax** `show debugging atmf`

**Mode** User Exec and Global Configuration

**Example** To display the AMF debugging status, use the command:

```
node_1# show debugging atmf
```

Figure 50-35: Sample output from the **show debugging atmf** command.

Table 50-1:

```
node1# show debugging atmf
ATMF debugging status:
ATMF arealink debugging is on
ATMF link debugging is on
ATMF crosslink debugging is on
ATMF database debugging is on
ATMF neighbor debugging is on
ATMF packet debugging is on
ATMF error debugging is on
```

**Related Commands** [debug atmf packet](#)

# show debugging atmf packet

**Overview** This command shows details of AMF Packet debug command settings.

**Syntax** show debugging atmf packet

**Mode** User Exec and Global Configuration

**Example** To display the AMF packet debugging status, use the command:

```
node_1# show debug atmf packet
```

Figure 50-36: Sample output from the **show debugging atmf packet** command.

Table 50-2:

```
ATMF packet debugging is on
=== ATMF Packet Debugging Parameters===
Node Name: x908
Port name: port1.1.1
Limit: 500 packets
Direction: TX
Info Level: Level 2
Packet Type Bitmap:
2. Crosslink Hello BPDU pkt with downlink domain info
3. Crosslink Hello BPDU pkt with uplink info
4. Down and up link Hello BPDU pkts
6. Stack hello unicast pkts
8. DBE request
9. DBE update
10. DBE bitmap update
```

**Related Commands** [debug atmf](#)  
[debug atmf packet](#)

# show running-config atmf

**Overview** This command displays the running system information that is specific to AMF.

**Syntax** `show running-config atmf`

**Mode** User Exec and Global Configuration

**Example** To display the current configuration of AMF, use the following commands:

```
node_1# show running-config atmf
```

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Related Commands** `show running-config`  
`no debug all`

# state

**Overview** This command sets the running state of an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `state {enable|disable}`

| Parameter | Description                                                        |
|-----------|--------------------------------------------------------------------|
| disable   | Stop the AMF container. The container's state changes to stopped.  |
| enable    | Start the AMF container. The container's state changes to running. |

**Default** By default, **state** is disabled.

**Mode** AMF Container Configuration

**Usage** The first time the **state enable** command is executed on a container it assigns the container to an area and configures it as an AMF master. This is achieved by automatically adding the following configuration to the AMF container:

```
atmf network-name <AMF network-name>
atmf master
atmf area <container area-name> <container area-id> local
atmf area <container area-name> password <container area-password>
atmf area <host area-name> <host area-id>

interface eth0
 atmf-arealink remote-area <host area-name> vlan 4094
```

For this reason the **state enable** command should be run after the container has been created with the [atmf container](#) command and an area-link configured with the [area-link](#) command.

Once the start-up configuration has been saved from within the AMF container, all further configuration changes need to be made manually.

**Example** To start the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state enable
```

To stop the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state disable
```

**Related  
Commands** [atmf container](#)  
[show atmf container](#)

**Command  
changes** Version 5.4.7-0.1: command added

# switchport atmf-agentlink

**Overview** Use this command to configure a link between this device and an x600 Series switch, in order to integrate the x600 Series switch into your AMF network. The x600 Series switch is called an “AMF agent”, and the link between the x600 and this device is called an “agent link”.

The x600 Series switch must be running version 5.4.2-3.16 or later.

Use the **no** variant of this command to remove the agent link. If the x600 Series switch is still connected to the switch port, it will no longer be part of the AMF network.

**Syntax** `switchport atmf-agentlink`  
`no switchport atmf-agentlink`

**Default** By default, no agent links exist and x600 Series switches are not visible to AMF networks.

**Mode** Interface mode for a switch port. Note that the link between the x600 and the AMF network must be a single link, not an aggregated link.

**Usage** The x600 Series switch provides the following information to the AMF node that it is connected to:

- The MAC address
- The IPv4 address
- The IPv6 address
- The name/type of the device (Allied Telesis x600)
- The name of the current firmware
- The version of the current firmware
- The configuration name

AMF guestnode also makes most of this information available from x600 Series switches, but requires configuration with DHCP and/or LLDP. AMF agent is simpler; as soon the x600 is connected to an appropriately configured port of an AMF node, it is immediately integrated into the AMF network.

To see information about the x600 Series switch, use the **show atmf links guest detail** command.

**Example** To configure port 1.0.1 as an agent link, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport atmf-agentlink
```

**Related Commands** [show atmf links guest](#)

# switchport atmf-arealink remote-area

**Overview** This command enables you to configure a port or aggregator to be an AMF arealink. AMF arealinks are designed to operate between two nodes in different areas in an AMF network.

Use the **no** variant of this command to remove any AMF-arealink that may exist for the selected port or aggregated link.

This command is only available on AMF controllers and master nodes.

**Syntax** `switchport atmf-arealink remote-area <area-name> vlan <2-4094>`  
`no switchport atmf-arealink`

| Parameter   | Description                                                                                                                          |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <area-name> | The name of the remote area that the port is connecting to.                                                                          |
| <2-4094>    | The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link. |

**Default** By default, no arealinks are configured

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage** Run this command on the port or aggregator at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will automatically place the port or static aggregator into trunk mode (i.e. switchport mode trunk) and will synchronize the area information stored on the two nodes.

You can configure multiple arealinks between two area nodes, but only one arealink at any time will be in use. All other arealinks will block information, to prevent network storms.

**Example** To make a switchport 1.2.1 an arealink to the *Auckland* area on VLAN 6, use the following commands

```
controller-1# configure terminal
controller-1(config)# interface port1.2.1
controller-1(config-if)# switchport atmf-arealink remote-area
Auckland vlan 6
```

**Related  
Commands**    [atmf area](#)  
                  [atmf area password](#)  
                  [atmf virtual-link](#)  
                  [show atmf links](#)

# switchport atmf-crosslink

**Overview** This command configures the selected port, statically aggregated link or dynamic channel group (LACP) to be an AMF crosslink. Running this command will automatically place the port or aggregator into trunk mode (i.e. **switchport mode trunk**).

The connection between two AMF masters must utilize a crosslink. Crosslinks are used to carry the AMF control information between master nodes. Multiple crosslinks can be configured between two master nodes, but only one crosslink can be active at any particular time. All other crosslinks between masters will be placed in the blocking state, in order to prevent broadcast storms.

Use the **no** variant of this command to remove any crosslink that may exist for the selected port or aggregated link.

**Syntax** `switchport atmf-crosslink`  
`no switchport atmf-crosslink`

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage** Crosslinks can be used anywhere within an AMF network. They have the effect of separating the AMF network into separate domains.

Where this command is used, it is also good practice to use the [switchport trunk native vlan](#) command with the parameter **none** selected. This is to prevent a network storm on a topology of ring connected devices.

**Example 1** To make a switchport 1.0.1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-crosslink
```

**Example 2** This example is shown twice. Example 2A is the most basic command sequence. Example 2B is a good practice equivalent that avoids problems such as broadcast storms that can otherwise occur.

**Example 2A** To make static aggregator sa1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
```

**Example 2B** To make static aggregator sa1 an AMF crosslink, use the following commands for good practice:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
Node_1(config-if)# switchport trunk allowed vlan add 2
Node_1(config-if)# switchport trunk native vlan none
```

In this example VLAN 2 is assigned to the static aggregator, and the native VLAN (VLAN 1) is explicitly excluded from the aggregated ports and the crosslink assigned to it.

**NOTE:** *The AMF management and domain VLANs are automatically added to the aggregator and the crosslink.*

**Related Commands** [show atmf links statistics](#)

# switchport atmf-guestlink

**Overview** Guest links are used to provide basic AMF functionality to non AMF capable devices. Guest links can be configured for either a selected switch port or a range of switch ports and use generic protocols to collect status and configuration information that the guest devices make available.

Use the **no** variant of this command to remove the guest node functionality from the selected port or ports.

**Syntax** `switchport atmf-guestlink [class <GUEST-CLASS>] [ip <A.B.C.D> | ipv6 <X:X::X:X>]`

`no switchport atmf-guestlink`

| Parameter     | Description                                                   |
|---------------|---------------------------------------------------------------|
| class         | Set a Guest-class                                             |
| <GUEST-CLASS> | The name of the guest class.                                  |
| ip            | Specifies that the address following will have an IPv4 format |
| <A.B.C.D>     | The Guest-node's IP address in IPv4 format.                   |
| ipv6          | Specifies that the address following will have an IPv6 format |
| <X:X::X:X>    | The Guest-node's IP address in IPv6 format.                   |

**Default** No guest links are configured.

**Mode** Interface

**Example 1** To configure switch port 1.0.44 to be a guest link, that will connect to a guest node having a guest-class of **camera** and an IPv4 address of **192.168.3.3**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.44
node1(config-if)# switchport atmf-guestlink class camera ip
192.168.3.3
node1(config-if)# end
```

**Example 2** To configure switchport 1.0.41 to be a guest link, that will connect to a guest node having a guest-class of **phone** and an IPv6 address of **2001:db8:21e:10d::5**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.41
node1(config-if)# switchport atmf-guestlink class phone ipv6
2000:db8:21e:10d::5
node1(config-if)# end
```

**Example 3** To configure switch port 1.0.41 to be a guest link, using the default model type and learning method address, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.41
node1(config-if)# switchport atmf-guestlink
node1(config-if)# end
```

**Example 4** To configure switch ports 1.0.52 to 1.0.54 to be guest links, for the guest class **camera**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.41-port1.0.44
node1(config-if)# switchport atmf-guestlink class camera
node1(config-if)# end
```

**Example 5** To remove the guest-link functionality from switchport 1.0.41, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.41
node1(config-if)# no switchport atmf-guestlink
node1(config-if)# end
```

# switchport atmf-link

**Overview** This command enables you to configure a port or aggregator to be an AMF up/down link. Running this command will automatically place the port or aggregator into trunk mode.

Use the **no** variant of this command to remove any AMF-link that may exist for the selected port or aggregated link.

**Syntax** `switchport atmf-link`  
`no switchport atmf-link`

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage** Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore, you must configure your links so that no rings are formed only from up/down links and/or virtual links.

Within each domain, cross-links between AMF nodes define those nodes as siblings within the same domain. You can form rings by combining cross-links with up/down links and/or virtual links, as long as each AMF domain links upwards to only a single parent domain. Each domain may link downwards to multiple child domains.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

**Example** To make a switchport 1.0.1 an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-link
```

# type atmf node

**Overview** This command configures a trigger to be activated at an AMF node join event or leave event.

**Syntax** `type atmf node {join|leave}`

| Parameter | Description           |
|-----------|-----------------------|
| join      | AMF node join event.  |
| leave     | AMF node leave event. |

**Mode** Trigger Configuration

**CAUTION:** Only configure this trigger on one device because it is a network wide event.

**Example 1** To configure trigger 5 to activate at an AMF node leave event, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger) type atmf node leave
```

**Example 2** The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

### Display the trigger configurations

AMF-Net[3]# show trigger

This command returns the following display:

```
=====
node1:
=====

TR# Type & Details Description Ac Te Tr Repeat #Scr Days/Date

001 Periodic (2 min) Periodic Status Chk Y N Y Continuous 1 smtwtfS
005 ATMF node (leave) E-mail on ATMF Exit Y N Y Continuous 1 smtwtfS

=====
Node2, Node3,
=====

TR# Type & Details Description Ac Te Tr Repeat #Scr Days/Date

005 ATMF node (leave) E-mail on ATMF Exit Y N Y Continuous 1 smtwtfS

```

### Display the triggers configured on each of the nodes in the AMF Network.

AMF-Net[3]# show running-config trigger

This command returns the following display:

```
=====
Node1:
=====

trigger 1
 type periodic 2
 script 1 atmf.scp
trigger 5
 type atmf node leave
 description "E-mail on ATMF Exit"
 script 1 email_me.scp
!

=====
Node2, Node3:
=====

trigger 5
 type atmf node leave
 description "E-mail on ATMF Exit"
 script 1 email_me.scp
!
```

**Related  
Commands** [show trigger](#)

# undebbug atmf

**Overview** This command is an alias for the **no** variant of the [debug atmf](#) command.

# username

**Overview** This command enables you to assign a **username** to a guest class. Guests may require a username and possibly also a password. In its non-encrypted form the password must be between 1 and 32 characters and will allow spaces. In its encrypted form the password must be between 1 to 64 characters and will allow any character

**Syntax** `username <NAME> password [8] <USERPASS>`  
`no username`

| Parameter  | Description                                                                                                                                                                                          |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username   | Indicates that a user name is to follow                                                                                                                                                              |
| <NAME>     | User name of the guest node                                                                                                                                                                          |
| password   | Indicates that a password (or specifier) is to follow.                                                                                                                                               |
| 8          | Specifier indicating that the following password is encrypted. It's primary purpose is to differentiate between the configuration input and the CLI input. You should not specify this for CLI input |
| <USERPASS> | The password to be entered for the guest node.                                                                                                                                                       |

**Default** No usernames configured

**Mode** AMF Guest Configuration Mode

**Example 1** To assign the user name **reception** and the password of **secret** to an AMF guest node that has the guest class of **phone1** use the following commands:

```
node1# conf t
node1(config)# amf guest-class phone1
node1(config-atmf-guest)# username reception password secret
node1(config-atmf-guest)# end
```

**Example 2** To remove a guest node username and password for the user guest class **phone1**, use the following commands:

```
node1# conf t
node1(config)# atmf guest-class phone1
node1(config-atmf-guest)# no username
node1(config-atmf-guest)# end
```

# Dynamic Host Configuration Protocol (DHCP) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure DHCP.

Note that the DHCP client does not support tunnel interfaces.

For more information, see the [DHCP Feature Overview and Configuration Guide](#), which is available at the above link on alliedtelesis.com.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#). This guide is available at the above link on alliedtelesis.com.

# bootfile

**Overview** This command sets the boot filename for a DHCP server pool. This is the name of the boot file that the client should use in its bootstrap process. It may need to include a path.

The **no** variant of this command removes the boot filename from a DHCP server pool.

**Syntax** bootfile <filename>  
no bootfile

| Parameter  | Description         |
|------------|---------------------|
| <filename> | The boot file name. |

**Mode** DHCP Configuration

**Example** To configure the boot filename for a pool P2, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# bootfile boot/main_boot.bt
```

# clear ip dhcp binding

**Overview** This command clears either a specific lease binding or the lease bindings specified by the command or DHCP server. The command will only take effect on dynamically allocated bindings, not statically configured bindings.

**Syntax** `clear ip dhcp binding {ip <ip-address>|mac <mac-address>|all|pool <pool-name>|range <low-ip-address> <high-ip-address>}`

| Parameter                                                        | Description                                                                                                                                                                        |
|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ip &lt;ip-address&gt;</code>                               | IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D.                                                                                                 |
| <code>mac &lt;mac-address&gt;</code>                             | MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH.                                                                                              |
| <code>all</code>                                                 | All DHCP bindings.                                                                                                                                                                 |
| <code>pool &lt;pool-name&gt;</code>                              | Description used to identify DHCP server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks". |
| <code>range&lt;low-ip-address&gt; &lt;high-ip-address&gt;</code> | IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end of the range.             |

**Mode** User Exec and Privileged Exec

**Usage** A specific binding may be deleted by **ip** address or **mac** address, or several bindings may be deleted at once using **all**, **pool** or **range**.

Note that if you specify to clear the **ip** or **mac** address of what is actually a static DHCP binding, an error message is displayed. If **all**, **pool** or **range** are specified and one or more static DHCP bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

**Examples** To clear the specific IP address binding 192.168.1.1, use the command:

```
awplus# clear ip dhcp binding ip 192.168.1.1
```

To clear all dynamic DHCP entries, use the command:

```
awplus# clear ip dhcp binding all
```

**Related Commands** [show ip dhcp binding](#)

# default-router

**Overview** This command adds a default router to the DHCP address pool you are configuring. You can use this command multiple times to create a list of default routers on the client's subnet. This sets the router details using the pre-defined option 3. Note that if you add a user-defined option 3 using the **option** command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified default router, or all default routers from the DHCP pool.

**Syntax** `default-router <ip-address>`  
`no default-router [<ip-address>]`

| Parameter                       | Description                                                     |
|---------------------------------|-----------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | IPv4 address of the default router, in dotted decimal notation. |

**Mode** DHCP Configuration

**Examples** To add a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# default-router 192.168.1.2
```

To remove a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router 192.168.1.2
```

To remove all routers from the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router
```

# dns-server

**Overview** This command adds a Domain Name System (DNS) server to the DHCP address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6.

Note that if you add a user-defined option 6 using the [option](#) command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified DNS server, or all DNS servers from the DHCP pool.

**Syntax** `dns-server <ip-address>`  
`no dns-server [<ip-address>]`

| Parameter                       | Description                                                 |
|---------------------------------|-------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | IPv4 address of the DNS server, in dotted decimal notation. |

**Mode** DHCP Configuration

**Examples** To add the DNS server with the assigned IP address 192.168.1.1 to the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# dns-server 192.168.1.1
```

To remove the DNS server with the assigned IP address 192.168.1.1 from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server 192.168.1.1
```

To remove all DNS servers from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server
```

**Related Commands**

- [option](#)
- [service dhcp-server](#)
- [show ip dhcp pool](#)
- [subnet-mask](#)

# domain-name

**Overview** This command adds a domain name to the DHCP address pool you are configuring. Use this command to specify the domain name that a client should use when resolving host names using the Domain Name System. This sets the domain name details using the pre-defined option 15.

Note that if you add a user-defined option 15 using the [option](#) command, then you will override any settings created with this command.

The **no** variant of this command removes the domain name from the address pool.

**Syntax** `domain-name <domain-name>`  
`no domain-name`

| Parameter                        | Description                                                                                                                                                                |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;domain-name&gt;</code> | The domain name you wish to assign the DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** DHCP Configuration

**Examples** To add the domain name `Nerv_Office` to DHCP pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# domain-name Nerv_Office
```

To remove the domain name `Nerv_Office` from DHCP pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no domain-name Nerv_Office
```

**Related Commands**

- [default-router](#)
- [dns-server](#)
- [option](#)
- [service dhcp-server](#)
- [show ip dhcp pool](#)
- [subnet-mask](#)

# host (DHCP)

**Overview** This command adds a static host address to the DHCP address pool you are configuring. The client with the matching MAC address is permanently assigned this IP address. No other clients can request it.

The **no** variant of this command removes the specified host address from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

**Syntax** `host <ip-address> <mac-address>`  
`no host <ip-address>`  
`no host all`

| Parameter                        | Description                                                                          |
|----------------------------------|--------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code>  | IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D    |
| <code>&lt;mac-address&gt;</code> | MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH |

**Mode** DHCP Configuration

**Usage** Note that a network/mask must be configured using a **network** command before issuing a **host** command. Also note that a host address must match a network to add a static host address.

**Examples** To add the host at 192.168.1.5 with the MAC address 000a.451d.6e34 to DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# network 192.168.1.0/24
awplus(dhcp-config)# host 192.168.1.5 000a.451d.6e34
```

To remove the host at 192.168.1.5 with the MAC address 000a.451d.6e34 from DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# no host 192.168.1.5 000a.451d.6e34
```

**Related Commands** [lease](#)  
[range](#)  
[show ip dhcp pool](#)

# ip address dhcp

**Overview** This command activates the DHCP client on the interface you are configuring. This allows the interface to use the DHCP client to obtain its IP configuration details from a DHCP server on its connected network.

The **client-id** and **hostname** parameters are identifiers that you may want to set in order to interoperate with your existing DHCP infrastructure. If neither option is needed, then the DHCP server uses the MAC address field of the request to identify the host.

The DHCP client supports the following IP configuration options:

- Option 1 - the subnet mask for your device.
- Option 3 - a list of default routers.
- Option 6 - a list of DNS servers. This list appends the DNS servers set on your device with the [ip name-server](#) command.
- Option 15 - a domain name used to resolve host names. This option replaces the domain name set with the [ip domain-name](#) command. Your device ignores this domain name if it has a domain list set using the [ip domain-list](#) command.
- Option 51 - lease expiration time.

The **no** variant of this command stops the interface from obtaining IP configuration details from a DHCP server.

**Syntax** `ip address dhcp [client-id <interface>] [hostname <hostname>]`  
`no ip address dhcp`

| Parameter   | Description                                                                                                                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface> | The name of the interface you are activating the DHCP client on. If you specify this, then the MAC address associated with the specified interface is sent to the DHCP server in the optional identifier field.<br>Default: no default |
| <hostname>  | The hostname for the DHCP client on this interface. Typically this name is provided by the ISP.<br>Default: no default                                                                                                                 |

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples** To set the interface `vlan10` to use DHCP to obtain an IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# ip address dhcp
```

To stop the interface vlan10 from using DHCP to obtain its IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip address dhcp
```

# ip dhcp bootp ignore

**Overview** This command configures the DHCP server to ignore any BOOTP requests it receives. The DHCP server accepts BOOTP requests by default.

The **no** variant of this command configures the DHCP server to accept BOOTP requests. This is the default setting.

**Syntax** `ip dhcp bootp ignore`  
`no ip dhcp bootp ignore`

**Mode** Global Configuration

**Examples** To configure the DHCP server to ignore BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp bootp ignore
```

To configure the DHCP server to respond to BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp bootp ignore
```

# ip dhcp leasequery enable

**Overview** Use this command to enable the DHCP server to respond to DHCPLEASEQUERY packets. Enabling the DHCP leasequery feature allows a DHCP Relay Agent to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

Use the **no** variant of this command to disable the support of DHCPLEASEQUERY packets.

For more information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** ip dhcp leasequery enable  
no ip dhcp leasequery enable

**Default** DHCP leasequery support is disabled by default.

**Mode** Global Configuration

**Examples** To enable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp leasequery enable
```

To disable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp leasequery enable
```

# ip dhcp option

**Overview** This command creates a user-defined DHCP option. Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

You can use this option when configuring a DHCP pool, by using the [option](#) command.

The **no** variant of this command removes either the specified user-defined option, or removes all user-defined options. This also automatically removes the user-defined options from the associated DHCP address pools.

**Syntax** `ip dhcp option <1-254> [name <option-name>] [<option-type>]`  
`no ip dhcp option [<1-254>|<option-name>]`

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |                      |     |                                                                                                                                                                                             |    |                                                                                                                                                                                               |         |                                |      |                                                                                                                                                                                           |

| <1-254>       | The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |       |                      |     |                                                                                                                                                                                             |    |                                                                                                                                                                                               |         |                                |      |                                                                                                                                                                                           |
| <option-name> | Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".<br>Default: no default                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |       |                      |     |                                                                                                                                                                                             |    |                                                                                                                                                                                               |         |                                |      |                                                                                                                                                                                           |
| <option-type> | The option value. You must specify a value that is appropriate to the option type: <table border="1"><tbody><tr><td>ascii</td><td>An ASCII text string</td></tr><tr><td>hex</td><td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td></tr><tr><td>ip</td><td>An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.</td></tr><tr><td>integer</td><td>A number from 0 to 4294967295.</td></tr><tr><td>flag</td><td>A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b>, <b>on</b>, or <b>enabled</b> will set the flag. <b>false</b>, <b>off</b> or <b>disabled</b> will unset the flag.</td></tr></tbody></table> | ascii | An ASCII text string | hex | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long. | ip | An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times. | integer | A number from 0 to 4294967295. | flag | A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag. |
| ascii         | An ASCII text string                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |       |                      |     |                                                                                                                                                                                             |    |                                                                                                                                                                                               |         |                                |      |                                                                                                                                                                                           |
| hex           | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |                      |     |                                                                                                                                                                                             |    |                                                                                                                                                                                               |         |                                |      |                                                                                                                                                                                           |
| ip            | An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |       |                      |     |                                                                                                                                                                                             |    |                                                                                                                                                                                               |         |                                |      |                                                                                                                                                                                           |
| integer       | A number from 0 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |                      |     |                                                                                                                                                                                             |    |                                                                                                                                                                                               |         |                                |      |                                                                                                                                                                                           |
| flag          | A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |       |                      |     |                                                                                                                                                                                             |    |                                                                                                                                                                                               |         |                                |      |                                                                                                                                                                                           |

**Mode** Global Configuration

**Examples** To define a user-defined ASCII string option as option 66, without a name, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name "tcpip-node-type", use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name special-address, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option 12
```

To remove the specific user-defined option with the option name perform-router-discovery, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option perform-router-discovery
```

To remove all user-defined option definitions, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option
```

# ip dhcp pool

**Overview** This command will enter the configuration mode for the pool name specified. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCP configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCP pools on devices with multiple interfaces. This allows the device to act as a DHCP server on multiple interfaces to distribute different information to clients on the different networks.

The **no** variant of this command deletes the specific DHCP pool.

**Syntax** `ip dhcp pool <pool-name>`  
`no ip dhcp pool <pool-name>`

| Parameter                      | Description                                                                                                                                                           |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;pool-name&gt;</code> | Description used to identify this DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** Global Configuration

**Example** To create the DHCP pool named P2 and enter DHCP Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)#
```

To delete the DHCP pool named P2, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp pool P2
```

**Related Commands** [service dhcp-server](#)

# ip dhcp-client default-route distance

**Overview** Use this command to specify an alternative Administrative Distance (AD) for the current default route (from DHCP) for an interface.

Use the **no** variant of this command to set the AD back to the default of 1.

**Syntax** `ip dhcp-client default-route distance [<1-255>]`  
`no ip dhcp-client default-route distance`

| Parameter | Description                                               |
|-----------|-----------------------------------------------------------|
| <1-255>   | Administrative Distance (AD) from the range 1 though 255. |

**Default** 1

**Mode** Interface Configuration

**Usage** DHCP client interfaces can automatically add a default route with an AD of 1 into the IP Routing Information Base (RIB).

Any pre-existing default route(s) via alternative interfaces (configured with a higher AD) will no longer be selected as the preferred forwarding path for traffic when the DHCP based default route is added to the IP routing table.

This can be problematic if the DHCP client is operating via an interface that is only intended to be used for back-up interface redundancy purposes, such as a VLAN containing a single switchport, or a 4G cellular interface on an AR-Series Firewall.

Use this command to set the AD of the default route (via a specific DHCP client interface) to a non-default (higher cost) value, ensuring any pre-existing default route(s) via any other interface(s) continue to be selected as the preferred forwarding path for network traffic.

When the command is used, the static default route is deleted from the RIB, the distance value of the route is modified to the configured distance value, then it is reinstalled into the RIB.

**Examples** To set the AD for the default route added by DHCP via cellular interface wwan0 to 150, use the commands:

```
awplus# configure terminal
awplus(config)# interface wwan0
awplus(config-if)# ip dhcp-client default-route distance 150
```

To set the AD for the default route back to the default value of 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface wwan0
awplus(config-if)# no ip dhcp-client default-route distance
```

**Related  
Commands** [show ip route](#)  
[show ip route database](#)

**Command  
changes** Version 5.4.7-0.2 Command added.

# ip dhcp-relay agent-option

**Overview** This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.*

**Syntax**

```
ip dhcp-relay agent-option
no ip dhcp-relay agent-option
```

**Default** DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the [ip dhcp-relay max-message-length](#) command.

**Examples** To make the DHCP Relay Agent listening on `vlan15` append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on `vlan15`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# no ip dhcp-relay agent-option
```

To make the relay agent listening on PPP interface `ppp0` append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the relay agent from appending the DHCP Relay Agent Option 82 field on PPP interface `ppp0`, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip dhcp-relay agent-option
```

**Related Commands**

- [ip dhcp-relay agent-option remote-id](#)
- [ip dhcp-relay information policy](#)
- [ip dhcp-relay max-message-length](#)
- [service dhcp-relay](#)

# ip dhcp-relay agent-option checking

**Overview** This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that [ip dhcp-relay agent-option](#) must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option checking`  
`no ip dhcp-relay agent-option checking`

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples** To make the DHCP Relay Agent listening on vlan10 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan10 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay agent-option checking
```

To make the relay agent listening on PPP interface ppp0 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the relay agent from checking the DHCP Relay Agent Information Option (Option 82) field on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip dhcp-relay agent-option checking
```

**Related  
Commands** `ip dhcp-relay agent-option`  
`ip dhcp-relay agent-option remote-id`  
`ip dhcp-relay information policy`  
`service dhcp-relay`

# ip dhcp-relay agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option remote-id <remote-id>`  
`no ip dhcp-relay agent-option remote-id`

| Parameter                      | Description                                                                                                                                                      |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;remote-id&gt;</code> | An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed. |

**Default** The Remote ID is set to the device's MAC address by default.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

**Examples** To set the Remote ID to `myid` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

To set the Remote ID to `myid` for client DHCP packets received on PPP interface `ppp0`, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0 timeslots all
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for PPP interface `ppp0`, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0 timeslots all
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

**Related Commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [show ip dhcp-relay](#)

# ip dhcp-relay information policy

**Overview** This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.

**Syntax**

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

| Parameter | Description                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| append    | The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.                               |
| drop      | The DHCP Relay Agent discards the packet.                                                                                                                      |
| keep      | The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.                                                                |
| replace   | The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet. |

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples** To make the DHCP Relay Agent listening on `vlan15` drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface `vlan15`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# no ip dhcp-relay information policy
```

**Related Commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [service dhcp-server](#)

# ip dhcp-relay maxhops

**Overview** This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay maxhops <1-255>`  
`no ip dhcp-relay maxhops`

| Parameter | Description                  |
|-----------|------------------------------|
| <1-255>   | The maximum hop count value. |

**Default** The default hop count threshold is 10 hops.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Example** To set the maximum number of hops to 5 for packets received on interface `vlan15`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# ip dhcp-relay maxhops 5
```

**Related Commands** [service dhcp-relay](#)

# ip dhcp-relay max-message-length

**Overview** This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay max-message-length <548-1472>`  
`no ip dhcp-relay max-message-length`

| Parameter  | Description                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------------------|
| <548-1472> | The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes). |

**Default** The default is 1400 bytes.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

**NOTE:** Before setting this command, you must first run the `ip dhcp-relay agent-option` command. This will allow the DHCP Relay Agent Option 82 fields to be appended.

**Example** To set the maximum DHCP message length to 1200 bytes for packets arriving in interface `vlan7`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface `vlan7`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# no ip dhcp-relay max-message-length
```

**Related  
Commands** [service dhcp-relay](#)

# ip dhcp-relay server-address

**Overview** This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax**

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay
```

| Parameter          | Description                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv4-address>     | Specify the IPv4 address of the DHCP server for DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D. |
| <ipv6-address>     | Specify the IPv6 address of the DHCPv6 server for DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.                                          |
| <server-interface> | Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.                                                            |

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the [service dhcp-relay](#) command to enable the DHCP Relay Agent on your device. The [ip dhcp-relay server-address](#) command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

**Examples** To enable the DHCP Relay Agent to relay DHCP packets on interface `vlan2` to the DHCP server with the IPv4 address `192.0.2.200`, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address `192.0.2.200` from the list of servers available to the DHCP Relay Agent on interface `vlan2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

To enable the DHCP Relay Agent on your device to relay DHCP packets on interface `vlan10` to the DHCP server with the IPv6 address `2001:0db8:010d::1` on interface `vlan20`, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address `2001:0db8:010d::1` on interface `vlan20` from the list of servers available to the DHCP Relay Agent on interface `vlan10`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To disable DHCP relay on `vlan10`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay
```

**Related  
Commands** [service dhcp-relay](#)

# lease

**Overview** This command sets the expiration time for a leased address for the DHCP address pool you are configuring. The time set by the days, hours, minutes and seconds is cumulative. The minimum total lease time that can be configured is 20 seconds. The maximum total lease time that can be configured is 120 days.

Note that if you add a user-defined option 51 using the `option` command, then you will override any settings created with this command. Option 51 specifies a lease time of 1 day.

Use the **infinite** parameter to set the lease expiry time to infinite (leases never expire).

Use the **no** variant of this command to return the lease expiration time back to the default of one day.

**Syntax** `lease <days> <hours> <minutes> [<seconds>]`  
`lease infinite`  
`no lease`

| Parameter                    | Description                                                                                    |
|------------------------------|------------------------------------------------------------------------------------------------|
| <code>&lt;days&gt;</code>    | The number of days, from 0 to 120, that the lease expiry time is configured for.<br>Default: 1 |
| <code>&lt;hours&gt;</code>   | The number of hours, from 0 to 24, that the lease expiry time is configured for.<br>Default: 0 |
| <code>&lt;minutes&gt;</code> | The number of minutes, from 0 to 60, the lease expiry time is configured for.<br>Default: 0    |
| <code>&lt;seconds&gt;</code> | The number of seconds, from 0 to 60, the lease expiry time is configured for.                  |
| <code>infinite</code>        | The lease never expires.                                                                       |

**Default** The default lease time is 1 day.

**Mode** DHCP Configuration

**Examples** To set the lease expiration time for address pool P2 to 35 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# lease 0 0 35
```

To set the lease expiration time for the address pool `Nerv_Office` to 1 day, 5 hours, and 30 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# lease 1 5 30
```

To set the lease expiration time for the address pool `P3` to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P3
awplus(dhcp-config)# lease 0 0 0 20
```

To set the lease expiration time for the pool to never expire, use the command:

```
awplus(dhcp-config)# lease infinite
```

To return the lease expiration time to the default of one day, use the command:

```
awplus(dhcp-config)# no lease
```

**Related  
Commands** [option](#)  
[service dhcp-server](#)

# network (DHCP)

**Overview** This command sets the network (subnet) that the DHCP address pool applies to. The **no** variant of this command removes the network (subnet) from the DHCP address pool.

**Syntax** network  
{<ip-subnet-address/prefix-length>|<ip-subnet-address/mask>}  
no network

| Parameter                         | Description                                                                                                |
|-----------------------------------|------------------------------------------------------------------------------------------------------------|
| <ip-subnet-address/prefix-length> | The IPv4 subnet address in dotted decimal notation followed by the prefix length in slash notation.        |
| <ip-subnet-address/mask>          | The IPv4 subnet address in dotted decimal notation followed by the subnet mask in dotted decimal notation. |

**Mode** DHCP Configuration

**Usage** This command will fail if it would make existing ranges invalid. For example, if they do not lie within the new network you are configuring. The **no** variant of this command will fail if ranges still exist in the pool. You must remove all ranges in the pool before issuing a **no network** command to remove a network from the pool.

**Examples** To configure a network for the address pool P2, where the subnet is 192.0.2.5 and the mask is 255.255.255.0, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5/24
```

or you can use dotted decimal notation instead of slash notation for the subnet-mask:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5 255.255.255.0
```

**Related Commands** [service dhcp-server](#)  
[subnet-mask](#)

## next-server

**Overview** This command sets the next server address for a DHCP server pool. It is the address of the next server that the client should use in its bootstrap process.

The **no** variant of this command removes the next server address from the DHCP address pool.

**Syntax** `next-server <ip-address>`  
`no next-server`

| Parameter                       | Description                                                |
|---------------------------------|------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | The server IP address, entered in dotted decimal notation. |

**Mode** DHCP Configuration

**Example** To set the next-server address for the address pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# next-server 192.0.2.2
```

# option

**Overview** This command adds a user-defined option to the DHCP address pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value. Options with an **ip** type can hold a list of IP addresses or masks (i.e. entries that have the A.B.C.D address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IP addresses.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

The **no** variant of this command removes the specified user-defined option from the DHCP pool, or all user-defined options from the DHCP pool.

**Syntax** `option [<1-254>|<option-name>] <option-value>`  
`no option [<1-254>|<option-value>]`

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |     |                                                                                                                                                                                             |    |                                                                                                                                                                                            |         |                                |      |                                                                                                      |

| ip             | An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |     |                                                                                                                                                                                             |    |                                                                                                                                                                                            |         |                                |      |                                                                                                      |
| integer        | A number from 0 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |     |                                                                                                                                                                                             |    |                                                                                                                                                                                            |         |                                |      |                                                                                                      |
| flag           | A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |     |                                                                                                                                                                                             |    |                                                                                                                                                                                            |         |                                |      |                                                                                                      |

**Mode** DHCP Configuration

**Examples** To add the ASCII-type option named `tftp-server-name` to the pool P2 and give the option the value `server1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool P2 and give the option the value `08af`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option 175, use the command:

```
awplus(dhcp-config)# option 175 192.0.2.6
awplus(dhcp-config)# option 175 192.0.2.12
awplus(dhcp-config)# option 175 192.0.2.33
```

To add the option 179 to a pool, and give the option the value `123456`, use the command:

```
awplus(dhcp-config)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the command:

```
awplus(dhcp-config)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the command:

```
awplus(dhcp-config)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the command:

```
awplus(dhcp-config)# no option tftp-server-name
```

[ip dhcp option](#)  
[lease](#)  
[service dhcp-server](#)  
[show ip dhcp pool](#)

# probe enable

**Overview** Use this command to enable lease probing for a DHCP pool. Probing is used by the DHCP server to check if an IP address it wants to lease to a client is already being used by another host.

The **no** variant of this command disables probing for a DHCP pool.

**Syntax** probe enable  
no probe enable

**Default** Probing is enabled by default.

**Mode** DHCP Pool Configuration

**Examples** To enable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe enable
```

To disable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe enable
```

- [probe timeout](#)
- [probe type](#)
- [show ip dhcp pool](#)

# probe packets

**Overview** Use this command to specify the number of packets sent for each lease probe. Lease probing is configured on a per-DHCP pool basis. When set to 0 probing is effectively disabled.

The **no** variant of this command sets the number of probe packets sent to the default of 5.

**Syntax** `probe packets <0-10>`  
`no probe packets`

| Parameter | Description                       |
|-----------|-----------------------------------|
| <0-10>    | The number of probe packets sent. |

**Default** The default is 5.

**Mode** DHCP Pool Configuration

**Examples** To set the number of probe packets to 2 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe packets 2
```

To set the number of probe packets to the default 5 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe packets
```

**Related Commands** [probe enable](#)  
[probe timeout](#)  
[probe type](#)  
[show ip dhcp pool](#)

# probe timeout

**Overview** Use this command to set the timeout value in milliseconds that the server waits for a response after each probe packet is sent. Lease probing is configured on a per-DHCP pool basis.

The **no** variant of this command sets the probe timeout value to the default setting, 200 milliseconds.

**Syntax** `probe timeout <50-5000>`  
`no probe timeout`

| Parameter                    | Description                       |
|------------------------------|-----------------------------------|
| <code>&lt;50-5000&gt;</code> | Timeout interval in milliseconds. |

**Default** The default timeout interval is 200 milliseconds.

**Mode** DHCP Pool Configuration

**Examples** To set the probe timeout value to 500 milliseconds for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe timeout 500
```

To set the probe timeout value for pool P2 to the default, 200 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe timeout
```

**Related Commands** [probe enable](#)  
[probe packets](#)  
[probe type](#)  
[show ip dhcp pool](#)

# probe type

**Overview** Use this command to set the probe type for a DHCP pool. The probe type specifies how the DHCP server checks whether an IP address is being used by other hosts, referred to as lease probing. If **arp** is specified, the server sends an ARP request to determine if an address is in use. If **ping** is specified, the server will send an ICMP Echo Request (ping).

The **no** variant of this command sets the probe type to the default setting, ping.

**Syntax** `probe type {arp|ping}`  
`no probe type`

| Parameter | Description       |
|-----------|-------------------|
| arp       | Probe using ARP.  |
| ping      | Probe using ping. |

**Default** The default probe type is ping.

**Mode** DHCP Pool Configuration

**Examples** To set the probe type to `arp` for the pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe type arp
```

To set the probe type for the pool `P2` to the default, `ping`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe type
```

# range

**Overview** This command adds an address range to the DHCP address pool you are configuring. The DHCP server responds to client requests received from the pool's network. It assigns an IP addresses within the specified range. The IP address range must lie within the network. You can add multiple address ranges and individual IP addresses for a DHCP pool by using this command multiple times.

The **no** variant of this command removes an address range from the DHCP pool. Use the **no range all** command to remove all address ranges from the DHCP pool.

**Syntax**

```
range <ip-address> [<ip-address>]
no range <ip-address> [<ip-address>]
no range all
```

| Parameter    | Description                                                                                                                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address> | IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end. Specify only one IP address to add an individual IP address to the address pool. |

**Mode** DHCP Configuration

**Examples** To add an address range of 192.0.2.5 to 192.0.2.16 to the pool Nerv\_Office, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# range 192.0.2.5 192.0.2.16
```

To add the individual IP address 192.0.2.2 to a pool, use the command:

```
awplus(dhcp-config)# range 192.0.2.2
```

To remove all address ranges from a pool, use the command:

```
awplus(dhcp-config)# no range all
```

- [service dhcp-server](#)
- [show ip dhcp pool](#)

# route

**Overview** This command allows the DHCP server to provide static routes to clients.

**Syntax** `route A.B.C.D/M A.B.C.D {both|opt249|rfc3442}`

| Parameter | Description                            |
|-----------|----------------------------------------|
| A.B.C.D/M | Subnet for the route                   |
| A.B.C.D   | Next hop for the route                 |
| both      | opt249 and rft3442                     |
| opt249    | Classless static route option for DHCP |
| rfc3442   | Classless static route option for DHCP |

**Mode** DHCP Configuration

**Examples** To distribute static routes for route 0.0.0.0/0 whose next hop is 192.16.1.1 to clients using both opt249 and rfc3442, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool public
awplus(dhcp-config)# route 0.0.0.0/0 192.16.1.1 both
```

**Related Commands** [ip dhcp pool](#)

# service dhcp-relay

**Overview** This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

**Syntax** `service dhcp-relay`  
`no service dhcp-relay`

**Mode** Global Configuration

**Usage** A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

**Default** The DHCP-relay service is enabled by default.

**Examples** To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

# service dhcp-server

**Overview** This command enables the DHCP server on your device. The server then listens for DHCP requests on all IP interfaces. It will not run if there are no IP interfaces configured.

The **no** variant of this command disables the DHCP server.

**Syntax** `service dhcp-server`  
`no service dhcp-server`

**Mode** Global Configuration

**Example** To enable the DHCP server, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-server
```

**Related Commands** [ip dhcp pool](#)

[subnet-mask](#)

# show counter dhcp-client

**Overview** This command shows counters for the DHCP client on your device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter dhcp-client`

**Mode** User Exec and Privileged Exec

**Example** To display the message counters for the DHCP client on your device, use the command:

```
awplus# show counter dhcp-client
```

**Output** Figure 51-1: Example output from the **show counter dhcp-client** command

```
show counter dhcp-client
DHCPDISCOVER out 10
DHCPREQUEST out 34
DHCPCDECLINE out 4
DHCPRELEASE out 0
DHCPPOFFER in 22
DHCPACK in 18
DHCPNAK in 0
```

**Table 1:** Parameters in the output of the **show counter dhcp-client** command

| Parameter        | Description                                                                  |
|------------------|------------------------------------------------------------------------------|
| DHCPDISCOVER out | The number of DHCP Discover messages sent by the client.                     |
| DHCPREQUEST out  | The number of DHCP Request messages sent by the client.                      |
| DHCPCDECLINE out | The number of DHCP Decline messages sent by the client.                      |
| DHCPRELEASE out  | The number of DHCP Release messages sent by the client.                      |
| DHCPPOFFER in    | The number of DHCP Offer messages received by the client.                    |
| DHCPACK in       | The number of DHCP Acknowledgement messages received by the client.          |
| DHCPNAK in       | The number of DHCP Negative Acknowledgement messages received by the client. |

**Related Commands** [ip address dhcp](#)

# show counter dhcp-relay

**Overview** This command shows counters for the DHCP Relay Agent on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show counter dhcp-relay

**Syntax (VRF-lite)** show counter dhcp-relay [vrf <vrf-name>|global]

| Parameter  | Description                                    |
|------------|------------------------------------------------|
| vrf        | Display the output for a VRF instance          |
| <vrf-name> | The name of the specific VRF instance.         |
| global     | Display the output for the Global VRF instance |

**Mode** User Exec and Privileged Exec

**Examples** To display counters for the DHCP Relay Agent on your device, use the following command:

```
awplus# show counter dhcp-relay
```

**Output** Figure 51-2: Example output from the **show counter dhcp-relay** command

```
awplus#show counter dhcp-relay

| Requests In          | The number of DHCP Request messages received from clients.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Replies In           | The number of DHCP Reply messages received from servers.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Relayed To Server    | The number of DHCP Request messages relayed to servers.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Relayed To Client    | The number of DHCP Reply messages relayed to clients.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Out To Server Failed | The number of failures when attempting to send request messages to servers. This is an internal debugging counter.                                                                                                                                                                                                                                                                                                                                                                 |
| Out To Client Failed | The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.                                                                                                                                                                                                                                                                                                                                                                   |
| Invalid hlen         | The number of incoming messages dropped due to an invalid hlen field.                                                                                                                                                                                                                                                                                                                                                                                                              |
| Bogus giaddr         | The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.                                                                                                                                                                                                                                                                                                                                                                                                  |
| Corrupt Agent Option | The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command. |

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Missing Agent Option | The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command. |
| Bad Circuit ID       | The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.                               |
| Missing Circuit ID   | The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.                           |
| Bad Remote ID        | The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.                                |
| Missing Remote ID    | The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.                            |

| Parameter                                                                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Option Insert Failed                                                                                      | <p>The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when:</p> <ul style="list-style-type: none"> <li>the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the <code>ip dhcp-relay information policy</code> command.</li> <li>there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.</li> </ul> |
| <p>Note that the following parameters are only used on the Global VRF instance when DHCPv6 is running</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DHCPv6 Requests In                                                                                        | The number of incoming DHCPv6 Request messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DHCPv6 Replies In                                                                                         | The number of incoming DHCPv6 Reply messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DHCPv6 Relayed to Server                                                                                  | The number of DHCPv6 messages relayed to the server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| DHCPv6 Relayed to Client                                                                                  | The number of DHCPv6 messages relayed to the client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# show counter dhcp-server

**Overview** This command shows counters for the DHCP server on your device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter dhcp-server`

**Mode** User Exec and Privileged Exec

**Example** To display counters for the DHCP server on your device, use the command:

```
awplus# show counter dhcp-server
```

**Output** Figure 51-4: Example output from the **show counter dhcp-server** command

|                      |       |    |
|----------------------|-------|----|
| DHCP server counters |       |    |
| DHCPDISCOVER in      | ..... | 20 |
| DHCPREQUEST in       | ..... | 12 |
| DHCPDECLINE in       | ..... | 1  |
| DHCPRELEASE in       | ..... | 0  |
| DHCPINFORM in        | ..... | 0  |
| DHCPOFFER out        | ..... | 8  |
| DHCPACK out          | ..... | 4  |
| DHCPNAK out          | ..... | 0  |
| BOOTREQUEST in       | ..... | 0  |
| BOOTREPLY out        | ..... | 0  |

**Table 2:** Parameters in the output of the **show counter dhcp-server** command

| Parameter       | Description                                                     |
|-----------------|-----------------------------------------------------------------|
| DHCPDISCOVER in | The number of Discover messages received by the DHCP server.    |
| DHCPREQUEST in  | The number of Request messages received by the DHCP server.     |
| DHCPDECLINE in  | The number of Decline messages received by the DHCP server.     |
| DHCPRELEASE in  | The number of Release messages received by the DHCP server.     |
| DHCPINFORM in   | The number of Inform messages received by the DHCP server.      |
| DHCPOFFER out   | The number of Offer messages sent by the DHCP server.           |
| DHCPACK out     | The number of Acknowledgement messages sent by the DHCP server. |

**Table 2:** Parameters in the output of the **show counter dhcp-server** command

| Parameter      | Description                                                                                                                                                                                                                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DHCNPAK out    | The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool. |
| BOOTREQUEST in | The number of bootp messages received by the DHCP server from bootp clients.                                                                                                                                                                                                                                                    |
| BOOTREPLY out  | The number of bootp messages sent by the DHCP server to bootp clients.                                                                                                                                                                                                                                                          |

# show dhcp lease

**Overview** This command shows details about the leases that the DHCP client has acquired from a DHCP server for interfaces on the device.

For information on filtering and saving command output, see “Controlling “show” Command Output” in the “Getting Started with AlliedWare\_Plus” Feature Overview and Configuration Guide.

**Syntax** `show dhcp lease [<interface>]`

| Parameter                      | Description                                       |
|--------------------------------|---------------------------------------------------|
| <code>&lt;interface&gt;</code> | Interface name to display DHCP lease details for. |

**Mode** User Exec and Privileged Exec

**Example** To show the current lease expiry times for all interfaces, use the command:

```
awplus# show dhcp lease
```

To show the current lease for vlan1, use the command:

```
awplus# show dhcp lease vlan1
```

**Output** Figure 51-5: Example output from the **show dhcp lease** command

```
Interface vlan1

IP Address: 192.168.22.4
Expires: 13 Mar 2017 20:10:19
Renew: 13 Mar 2017 18:37:06
Rebind: 13 Mar 2017 19:49:29
Server:
Options:
 subnet-mask 255.255.255.0

 routers 10.58.1.51
 dhcp-lease-time 1000
 dhcp-message-type 5
 dhcp-server-identifier 100.8.16.1
```

**Related Commands** [ip address dhcp](#)

# show ip dhcp binding

**Overview** This command shows the lease bindings that the DHCP server has allocated clients.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp binding [<ip-address>|<address-pool>]`

| Parameter                         | Description                                                                                                                        |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code>   | IPv4 address of a leased IP address, in dotted decimal notation. This displays the lease information for the specified IP address. |
| <code>&lt;address-pool&gt;</code> | Name of an address pool. This displays the lease information for all clients within the address pool.                              |

**Mode** User Exec and Privileged Exec

**Examples** To display all leases for every client in all address pools, use the command:

```
awplus# show ip dhcp binding
```

To display the details for the leased IP address 172.16.2.16, use the command:

```
awplus# show ip dhcp binding 172.16.2.16
```

To display the leases from the address pool MyPool, use the command:

```
awplus# show ip dhcp binding MyPool
```

**Output** Figure 51-6: Example output from the **show ip dhcp binding** command

```
Pool 30_2_network Network 172.16.2.0/24

# show ip dhcp pool

**Overview** This command displays the configuration details and system usage of the DHCP address pools configured on the device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp pool [<address-pool>]`

| Parameter      | Description                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------|
| <address-pool> | Name of a specific address pool. This displays the configuration of the specified address pool only. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip dhcp pool`

**Output** Figure 51-7: Example output from the **show ip dhcp pool** command

```
Pool p1 :
 network: 192.168.1.0/24
 address ranges:
 addr: 192.168.1.10 to 192.168.1.18
 static host addresses:
 addr: 192.168.1.12 MAC addr: 1111.2222.3333
 lease <days:hours:minutes:seconds> <1:0:0:0>
 subnet mask: 255.255.255.0 (pool's network mask)
 Probe: Default Values
 Status: Enabled [Enabled]
 Type: ARP [Ping]
 Packets: 2 [5]
 Timeout: 200 msec [200]
 Dynamic addresses:
 Total: 8
 Leased: 2
 Utilization: 25.0 %
 Static host addresses:
 Total: 1
 Leased: 1
```

**Output** Figure 51-8: Example output from the **show ip dhcp pool** command with IP address 192.168.1.12 assigned to a VLAN interface on the device:

```
Pool p1 :
network: 192.168.1.0/24
address ranges:
 addr: 192.168.1.10 to 192.168.1.18
 (interface addr 192.168.1.12 excluded)
 (static host addr 192.168.1.12 excluded)
static host addresses:
 addr: 192.168.1.12 MAC addr: 1111.2222.3333
 (= interface addr, so excluded)
lease <days:hours:minutes:seconds> <1:0:0:0>
subnet mask: 255.255.255.0 (pool's network mask)
Probe: Default Values
Status: Enabled [Enabled]
Type: ARP [Ping]
Packets: 2 [5]
Timeout: 200 msec [200]
Dynamic addresses:
Total: 8
Leased: 2
Utilization: 25.0 %
Static host addresses:
Total: 1
Leased: 1
```

**Table 3:** Parameters in the output of the **show ip dhcp pool** command

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pool                  | Name of the pool.                                                                                                                                                                                                                                                                                                                                                                                     |
| network               | Subnet and mask length of the pool.                                                                                                                                                                                                                                                                                                                                                                   |
| address ranges        | Individual IP addresses and address ranges configured for the pool. The DHCP server can offer clients an IP address from within the specified ranges only.<br>Any of these addresses that match an interface address on the device, or a static host address configured in the pool, will be automatically excluded from the range, and a message to this effect will appear beneath the range entry. |
| static host addresses | The static host addresses configured on the pool. Each IP address is permanently assigned to the client with the matching MAC address.<br>Any of these addresses that match an interface address on the device will be automatically excluded, and a message to this effect will appear beneath the static host entry.                                                                                |

**Table 3:** Parameters in the output of the **show ip dhcp pool** command (cont.)

| Parameter                          | Description                                                                                                                          |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| lease<br><days:hours:minutes>      | The lease duration for address allocated by this pool.                                                                               |
| domain                             | The domain name sent by the pool to clients. This is the domain name that the client should use when resolving host names using DNS. |
| subnet mask                        | The subnet mask sent by the pool to clients.                                                                                         |
| Probe - Status                     | Whether lease probing is enabled or disabled.                                                                                        |
| Probe - Type                       | The lease probe type configured. Either ping or ARP.                                                                                 |
| Probe - Packets                    | The number of packets sent for each lease probe in the range 0 to 10.                                                                |
| Probe - Timeout                    | The timeout value in milliseconds to wait for a response after each probe packet is sent. In the range 50 to 5000.                   |
| dns servers                        | The DNS server addresses sent to by the pool to clients.                                                                             |
| default-router(s)                  | The default router addresses sent by the pool to clients.                                                                            |
| user-defined options               | The list of user-defined options sent by the pool to clients.                                                                        |
| Dynamic addresses-<br>Total        | The total number of IP addresses that have been configured in the pool for dynamic allocation to DHCP clients.                       |
| Dynamic addresses-<br>Leased       | The number of IP addresses in the pool that have been dynamically allocated (leased) to DHCP clients.                                |
| Dynamic addresses -<br>Utilization | The percentage of IP addresses in the pool that are currently dynamically allocated to clients.                                      |
| Static host addresses-<br>Total    | The number of static IP addresses configured in the pool for specific DHCP client hosts.                                             |
| Static host addresses<br>- Leased  | The number of static IP addresses assigned to specific DHCP client hosts.                                                            |

# show ip dhcp-relay

**Overview** This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp-relay [interface <interface-name>]`

**Syntax (VRF-lite)** `show ip dhcp-relay [vrf <name>|global] [interface <interface-name>]`

| Parameter        | Description                                                                                          |
|------------------|------------------------------------------------------------------------------------------------------|
| <interface-name> | Name of a specific interface. This displays the DHCP configuration for the specified interface only. |
| vrf              | Apply this command to a VRF instance.                                                                |
| <vrf-name>       | The name of the VRF instance.                                                                        |
| global           | The Global VRF instance.                                                                             |

**Mode** User Exec and Privileged Exec

**Example** To display the DHCP Relay Agent’s configuration on the interface `vlan100`, use the command:

```
awplus# show ip dhcp-relay interface vlan100
```

**Output** Figure 51-9: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan100 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers : 192.168.1.200
```

**Output (VRF-lite)** Figure 51-10: Example output from the **show ip dhcp-relay** command applied for VRF instance red

```
DHCP Relay Service is enabled

[VRF: red]
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is enabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay Information policy is to replace existing relay agent
information
List of servers : 192.168.1.3
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip dhcp server statistics

**Overview** This command shows statistics related to the DHCP server.

You can display the server counters using the [show counter dhcp-server](#) command as well as with this command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip dhcp server statistics

**Mode** User Exec and Privileged Exec

**Example** To display the server statistics, use the command:

```
awplus# show ip dhcp server statistics
```

**Output** Figure 51-11: Example output from the **show ip dhcp server statistics** command

```
DHCP server counters
DHCPDISCOVER in 20
DHCPREQUEST in 12
DHCPDECLINE in 1
DHCPRELEASE in 0
DHCPINFORM in 0
DHCPOFFER out 8
DHCPACK out 4
DHCPNAK out 0
BOOTREQUEST in 0
BOOTREPLY out 0
DHCPLEASEQUERY in 0
DHCPLEASEUNKNOWN out 0
DHCPLEASEACTIVE out 0
DHCPLEASEUNASSIGNED out 0
```

**Table 4:** Parameters in the output of the **show ip dhcp server statistics** command

| Parameter       | Description                                                  |
|-----------------|--------------------------------------------------------------|
| DHCPDISCOVER in | The number of Discover messages received by the DHCP server. |
| DHCPREQUEST in  | The number of Request messages received by the DHCP server.  |
| DHCPDECLINE in  | The number of Decline messages received by the DHCP server.  |

**Table 4:** Parameters in the output of the **show ip dhcp server statistics** command (cont.)

| Parameter               | Description                                                                                                                                                                                                                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DHCPRELEASE in          | The number of Release messages received by the DHCP server.                                                                                                                                                                                                                                                                     |
| DHCPINFORM in           | The number of Inform messages received by the DHCP server.                                                                                                                                                                                                                                                                      |
| DHCPOFFER out           | The number of Offer messages sent by the DHCP server.                                                                                                                                                                                                                                                                           |
| DHCPACK out             | The number of Acknowledgement messages sent by the DHCP server.                                                                                                                                                                                                                                                                 |
| DHCPNAK out             | The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool. |
| BOOTREQUEST in          | The number of bootp messages received by the DHCP server from bootp clients.                                                                                                                                                                                                                                                    |
| BOOTREPLY out           | The number of bootp messages sent by the DHCP server to bootp clients.                                                                                                                                                                                                                                                          |
| DHCPLEASEQUERY in       | The number of Lease Query messages received by the DHCP server from DHCP Relay Agents.                                                                                                                                                                                                                                          |
| DHCPLEASEUNKNOWN out    | The number of Lease Unknown messages sent by the DHCP server to DHCP Relay Agents.                                                                                                                                                                                                                                              |
| DHCPLEASEACTIVE out     | The number of Lease Active messages sent by the DHCP server to DHCP Relay Agents.                                                                                                                                                                                                                                               |
| DHCPLEASEUNASSIGNED out | The number of Lease Unassigned messages sent by the DHCP server to DHCP Relay Agents.                                                                                                                                                                                                                                           |

**Related Commands**

# show ip dhcp server summary

**Overview** This command shows the current configuration of the DHCP server. This includes:

- whether the DHCP server is enabled
- whether the DHCP server is configured to ignore BOOTP requests
- whether the DHCP server is configured to support DHCP lease queries
- the details of any user-defined options
- a list of the names of all DHCP address pools currently configured

This show command does not include any configuration details of the address pools. You can display these using the [show ip dhcp pool](#) command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp server summary`

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of the DHCP server, use the command:

```
awplus# show ip dhcp server summary
```

**Output** Figure 51-12: Example output from the **show ip dhcp server summary** command

```
DHCP Server service is disabled
BOOTP ignore is disabled
DHCP leasequery support is disabled
Pool list: p2
```

- [service dhcp-server](#)

# subnet-mask

**Overview** This command sets the subnet mask option for a DHCP address pool you are configuring. Use this command to specify the client's subnet mask as defined in RFC 950. This sets the subnet details using the pre-defined option 1. Note that if you create a user-defined option 1 using the [option](#) command, then you will override any settings created with this command. If you do not specify a subnet mask using this command, then the pool's network mask (specified using the [next-server](#) command) is applied.

The **no** variant of this command removes a subnet mask option from a DHCP pool. The pool reverts to using the pool's network mask.

**Syntax** `subnet-mask <mask>`  
`no subnet-mask`

| Parameter                 | Description                                         |
|---------------------------|-----------------------------------------------------|
| <code>&lt;mask&gt;</code> | Valid IPv4 subnet mask, in dotted decimal notation. |

**Mode** DHCP Configuration

**Examples** To set the subnet mask option to 255.255.255.0 for DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# subnet-mask 255.255.255.0
```

To remove the subnet mask option from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no subnet-mask
```

# DHCP for IPv6 (DHCPv6) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure DHCPv6. For more information, see the [DHCPv6 Feature Overview and Configuration Guide](#).

DHCPv6 is a network protocol used to configure IPv6 hosts with IPv6 addresses and IPv6 prefixes for an IPv6 network. DHCPv6 is used instead of SLAAC (Stateless Address Autoconfiguration) at sites where centralized management of IPv6 hosts is needed. IPv6 routers require automatic configuration of IPv6 addresses and IPv6 prefixes.

DHCPv6 Prefix Delegation provides automatic configuration of IPv6 addresses and IPv6 prefixes.

Note that DHCPv6 client does not support tunnel interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**NOTE:** The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

# address prefix

**Overview** Use this command in DHCPv6 Configuration mode to specify an address prefix for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove the address prefix from the DHCPv6 server pool.

**Syntax** address prefix <ipv6-prefix/prefix-length> [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]  
no address prefix <ipv6-prefix/prefix-length>

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv6-prefix/prefix-length> | Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.                                                                                                                                                                         |
| lifetime                    | Specify a time period for the hosts to remember router advertisements (RAs). If you specify the optional lifetime parameter with this command then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry. |
| <valid-time>                | Specify a valid lifetime in seconds in the range <5-315360000>. The default valid lifetime is 2592000 seconds.                                                                                                                                                                                                                                                                                              |
| infinite                    | Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.                                                                                                                                                                                                                                                                                                     |
| <preferred-time>            | Specify a preferred lifetime in seconds in the range <5-315360000>. The default preferred lifetime is 604800 seconds.                                                                                                                                                                                                                                                                                       |

**Mode** DHCPv6 Configuration

**Default** The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

**Usage** This command creates a pool of prefixes from which addresses are assigned to clients on request, and allocates a network prefix from which the DHCPv6 Server leases addresses. This command is an alternative to using a range set using the [address range](#) command.

The DHCPv6 Server selects an IPv6 address from the range available allocated by the IPv6 prefix, randomly generating the suffix of the IPv6 address, with the specified preferred and valid lifetime leases. Leased IPv6 address are found in the

DHCPv6 Server REPLY packet, which is located within the IANA (Identity Association for Non-temporary Addresses) IA address field in the **REPLY** message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** To add IPv6 address prefix 2001:0db8:1::/48 for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address prefix 2001:0db8:1::/48
```

To remove a configured IPv6 address prefix for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address prefix 2001:0db8:1::/48
```

# address range

**Overview** Use this command in DHCPv6 Configuration mode to specify an address range for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove an address range from the DHCPv6 server pool.

**Syntax** `address range <first-ipv6-address>  
<last-ipv6-address>[lifetime {<valid-time>|infinite}  
{<preferred-time>|infinite}]`  
`no address range <first-ipv6-address> <last-ipv6-address>`

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;first-ipv6-address&gt;</code> | Specify the first IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X:X:X.                                                                                                                                                                                                                                                                                 |
| <code>&lt;last-ipv6-address&gt;</code>  | Specify the last IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X:X:X.                                                                                                                                                                                                                                                                                  |
| <code>lifetime</code>                   | Optional. Specify a time period for the hosts to remember router advertisements (RAs).<br>If you specify this parameter then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value.<br>See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry. |
| <code>&lt;valid-time&gt;</code>         | Specify a valid lifetime in seconds in the range <5-31536000>.<br>The default valid lifetime is 2592000 seconds.                                                                                                                                                                                                                                                                         |
| <code>infinite</code>                   | Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.                                                                                                                                                                                                                                                                                  |
| <code>&lt;preferred-time&gt;</code>     | Specify a preferred lifetime in seconds in the range <5-31536000>.<br>The default preferred lifetime is 604800 seconds.                                                                                                                                                                                                                                                                  |

**Default** The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

**Mode** DHCPv6 Configuration

**Usage** Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** To add the IPv6 address range 2001:0db8:1::1 to 2001:0db8:1fff::1 for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address range 2001:0db8:1::1
2001:0db8:1fff::1
```

To remove a configured IPv6 address range for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address range
```

# clear counter ipv6 dhcp-client

**Overview** Use this command in Privileged Exec mode to clear DHCPv6 client counters.

**Syntax** `clear counter ipv6 dhcp-client`

**Mode** Privileged Exec

**Example** To clear DHCPv6 client counters, use the following command:

```
awplus# clear counter ipv6 dhcp-client
```

**Related  
Commands** [show counter ipv6 dhcp-client](#)

# clear counter ipv6 dhcp-server

**Overview** Use this command in Privileged Exec mode to clear DHCPv6 server counters.

**Syntax** `clear counter ipv6 dhcp-server`

**Mode** Privileged Exec

**Example** To clear DHCPv6 server counters, use the following command:

```
awplus# clear counter ipv6 dhcp-server
```

**Related  
Commands** [show counter ipv6 dhcp-server](#)

# clear ipv6 dhcp binding

**Overview** Use this command in Privileged Exec mode to clear either a specific lease binding or the lease bindings as specified by the command parameters. The command will only take effect on dynamically allocated bindings, not statically configured bindings. This command clears binding entries on the DHCPv6 server binding table.

**Syntax** `clear ipv6 dhcp binding {ipv6 <prefix>|duid <DUID>|all|pool <name>}`

| Parameter                        | Description                                                                                                                                                                          |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ipv6 &lt;prefix&gt;</code> | Optional. Specify the IPv6 prefix of the DHCPv6 client, in hexadecimal notation in the format X:X::X:X.                                                                              |
| <code>duid &lt;DUID&gt;</code>   | Specify the DUID (DHCPv6 unique ID) of the DHCPv6 client.                                                                                                                            |
| <code>all</code>                 | All DHCPv6 bindings.                                                                                                                                                                 |
| <code>pool &lt;name&gt;</code>   | Description used to identify DHCPv6 server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks". |

**Mode** Privileged Exec

**Usage** A specific binding may be deleted by **ipv6** address or **duid** address, or several bindings may be deleted at once using **all** or **pool**.

Note that if you specify to clear the **ipv6** or **duid** address of what is actually a static DHCPv6 binding, an error message is displayed. If **all** or **pool** are specified and one or more static DHCPv6 bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

The `clear ipv6 dhcp binding` command is used as a server function. A binding table entry on the DHCPv6 server is automatically:

- Created whenever a prefix is delegated to a client from the configuration pool.
- Updated when the client renews, rebinds, or confirms the prefix delegation.
- Deleted when the client releases all the prefixes in the binding, all prefix lifetimes have expired, or when a user runs the `clear ipv6 dhcp binding` command.

If the **clear ipv6 dhcp binding** command is used with the optional IPv6 address parameter, only the binding for the specified client is deleted. If the **clear ipv6 dhcp binding** command is used without the optional IPv6 address parameter, then all automatic client bindings are deleted from the DHCPv6 bindings table.

**Example** To clear all dynamic DHCPv6 server binding entries, use the command:

```
awplus# clear ipv6 dhcp binding all
```

**Output** Figure 52-1: Example output from the **clear ipv6 dhcp binding all** command

```
awplus#clear ipv6 dhcp binding all
% Deleted 1 entries
```

**Related  
Commands** [show ipv6 dhcp binding](#)

# clear ipv6 dhcp client

**Overview** Use this command in Privileged Exec mode to restart a DHCPv6 client on an interface.

**Syntax** `clear ipv6 dhcp client <interface>`

| Parameter                      | Description                                               |
|--------------------------------|-----------------------------------------------------------|
| <code>&lt;interface&gt;</code> | Specify the interface name to restart a DHCPv6 client on. |

**Mode** Privileged Exec

**Example** To restart a DHCPv6 client on interface vlan1, use the following command:

```
awplus# clear ipv6 dhcp client vlan1
```

**Related Commands** [show ipv6 dhcp binding](#)

# dns-server (DHCPv6)

**Overview** Use this command to add a Domain Name System (DNS) server to the DHCPv6 address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6. Note that if you add a user-defined option 6 using the [option \(DHCPv6\)](#) command, then you will override any settings created with this command.

Use the **no** variant of this command to remove either the specified DNS server or all DNS servers from the DHCPv6 pool.

**Syntax** `dns-server <ipv6-address>`  
`no dns-server [<ipv6-address>]`

| Parameter                         | Description                                                                                                                                                                                                                                                                                                           |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-address&gt;</code> | Specify an IPv6 address of the DNS server, in hexadecimal notation in the format <code>X:X::X:X</code> . This parameter is required when adding a DNS server to the DHCPv6 address pool. All DNS servers are removed from the DHCPv6 pool if you enter the <code>no dns-server</code> command without this parameter. |

**Mode** DHCPv6 Configuration

**Examples** To add the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` to the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# dns-server 2001:0db8:3000:3000::32
```

To remove the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` from the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server 2001:0db8:3000:3000::32
```

To remove all DNS servers from the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server
```

**Related  
Commands**    `ipv6 dhcp pool`  
                  `option (DHCPv6)`  
                  `show ipv6 dhcp pool`

# domain-name (DHCPv6)

**Overview** Use this command in DHCPv6 Configuration mode to add a domain name to the DHCPv6 server address pool you are configuring.

Use the **no** variant of this command to remove a domain name from the address pool.

**Syntax** `domain-name <domain-name>`  
`no domain-name`

| Parameter                        | Description                                                                                                                                                                                      |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;domain-name&gt;</code> | Specify the domain name you wish to assign the DHCPv6 server address pool. Valid characters are printable characters. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** DHCPv6 Configuration

**Usage** This command specifies the domain name that a client should use when resolving host names using the Domain Name System, and sets the domain name details using the pre- defined option 15. Note that if you add a user-defined option 15 using the [option \(DHCPv6\)](#) command, then you will override any settings created with this command.

**Examples** To add the domain name `Engineering` to DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# domain-name Engineering
```

To remove the domain name `Engineering` from DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no domain-name Engineering
```

**Related Commands** [dns-server \(DHCPv6\)](#)  
[option \(DHCPv6\)](#)  
[show ipv6 dhcp pool](#)

# ipv6 address (DHCPv6 PD)

**Overview** Use this command in Interface Configuration mode for a VLAN interface to append an IPv6 address suffix to the IPv6 prefix provided by a DHCPv6 Prefix Delegation (PD) server.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

**Syntax** `ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]`  
`no ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]`

| Parameter                                    | Description                                                                                                                                                                                     |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-prefix-name&gt;</code>        | The IPv6 prefix name advertised on the router advertisement message sent from the device. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.     |
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specifies the IPv6 address to be set, for example <code>::1/64</code> . The IPv6 address uses the format <code>X::X:X/Prefix-Length</code> . The prefix-length is usually set between 0 and 64. |
| <code>[eui64]</code>                         | EUI-64 is a method of automatically deriving the lower 64 bits of an IPv6 address, based on the switch's MAC address.                                                                           |

**Mode** Interface Configuration for a VLAN interface or Interface Configuration for a PPP interface.

**Usage** When specifying the **eui64** parameter, the interface identifier of the IPv6 address is derived from the MAC address of the device.

For more information about EUI64, see the [IPv6 Feature Overview and Configuration Guide](#).

**Examples** To configure a PD prefix named `prefix1` on interface `vlan1` and then add an IPv6 address, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1::1/64
```

In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix will be `::1` for the last 64 bits.

To configure a PD prefix named `prefix1` on interface `vlan1` and then add an IPv6 address using EUI-64 identifiers, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1/64 eui64
```

In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix is created from the EUI-64 identifier of the interface for the last 64 bits.

To assign the IPv6 address `2001:0db8::a2/48` to the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/48
```

To remove the IPv6 address `2001:0db8::a2/48` from the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/48
```

To assign the IPv6 address to the PPP interface `ppp0`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-fr-subif)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address `2001:0db8::a2/64` from the PPP interface `ppp0`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

To assign the **eui64** derived address in the prefix `2001:db8::/64` to VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::/64 eui64
```

To remove the **eui64** derived address in the prefix `2001:db8::/32` from VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::/64 eui64
```

**Validation  
Commands**

```
show running-config
show ipv6 dhcp binding
show ipv6 interface brief
show ipv6 route
```

**Related  
Commands**

```
ipv6 dhcp client pd
ipv6 dhcp pool
ipv6 local pool
ipv6 nd prefix (DHCPv6)
prefix-delegation pool
```

# ipv6 address dhcp

**Overview** Use this command to activate the DHCPv6 client on the interface that you are configuring. This allows the interface to use the DHCPv6 client to obtain its IPv6 configuration details from a DHCPv6 server on its connected network.

The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

Use the **no** variant of this command to stop the interface from obtaining IPv6 configuration details from a DHCPv6 server.

The DHCPv6 client supports the following IP configuration options:

- Option 1 - the subnet mask for your device.
- Option 3 - a list of default routers.
- Option 6 - a list of DNS servers. This list appends the DNS servers set on your device with the [dns-server \(DHCPv6\)](#) command.
- Option 15 - a domain name used to resolve host names. This option replaces any domain name that you have set with the [domain-name \(DHCPv6\)](#) command.
- Option 51 - lease expiration time.

**Syntax** `ipv6 address dhcp [default-route-to-server]`  
`no ipv6 address dhcp`

**Mode** Interface Configuration for a VLAN interface, a local loopback interface, or a PPP interface.

**Usage** Use the **default-route-to-server** option to allow the automatic configuration of a default route to the DHCPv6 server. Note that this option is not enabled by default when you enable the DHCP client on an interface.

**Examples** To set the interface `vlan10` to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 address dhcp
```

To stop the interface `vlan10` from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ipv6 address dhcp
```

To set the PPP interface ppp0 to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 address dhcp
```

To stop the PPP interface ppp0 from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 address dhcp
```

**Related  
Commands**

[ipv6 address](#)  
[ipv6 address \(DHCPv6 PD\)](#)  
[show ipv6 dhcp interface](#)  
[show running-config](#)

# ipv6 dhcp client pd

**Overview** Use this command in Interface Configuration mode to enable the DHCPv6 client process and enable requests for prefix delegation through the interface that you are configuring.

Use the **no** variant of this command to disable requests for prefix delegation. This is the default setting.

For further information about DHCPv6 Prefix Delegation, which is used to automate the process of assigning prefixes, see the [DHCPv6 Feature Overview and Configuration Guide](#).

**Syntax** `ipv6 dhcp client pd <prefix-name> <default-route-to-server>`  
`no ipv6 dhcp client pd`

| Parameter                                    | Description                                                                                                                                                   |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;prefix-name&gt;</code>             | Specify an IPv6 general prefix name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |
| <code>&lt;default-route-to-server&gt;</code> | Specify the default route to the DHCP server                                                                                                                  |

**Mode** Interface Configuration

**Default** Prefix delegation is disabled by default on an interface.

**Usage** Entering the **ipv6 dhcp client pd** command starts the DHCPv6 client process if not already running, and enables requests for prefix delegation through the interface on which the command is configured.

When prefix delegation is enabled and a prefix is acquired, the prefix is stored in the IPv6 prefix pool with an internal name defined by the required `<prefix-name>` placeholder parameter. The [ipv6 address](#) command can then refer to the prefixes stored in the IPv6 prefix pool.

**Examples** To enable prefix delegation with the prefix name `prefix-name` on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd my-prefix-name
```

To disable prefix delegation on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp client pd
```

**Related  
Commands**

- ipv6 enable
- clear ipv6 dhcp client
- ipv6 address (DHCPv6 PD)
- ipv6 nd prefix (DHCPv6)
- show ipv6 dhcp binding
- show ipv6 dhcp interface

# ipv6 dhcp option

**Overview** Use this command in Global Configuration mode to create a user-defined DHCPv6 option. You can then use this option when configuring a DHCPv6 server address pool, by using the [option \(DHCPv6\)](#) command.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Use the **no** variant of this command to remove either the specified user-defined option. This also removes user-defined options from the associated DHCPv6 server address pools.

**Syntax** `ipv6 dhcp option <1-254> [name <option-name>] [<option-type>]`  
`no ipv6 dhcp option <1-254>|<option-name>`

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |

| <1-254>       | The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |
| <option-name> | Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".<br>Default: no default                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |
| <option-type> | The option value. You must specify a value that is appropriate to the option type: <table border="1"><tbody><tr><td>ascii</td><td>An ASCII text string</td></tr><tr><td>hex</td><td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td></tr><tr><td>ipv6</td><td>An IPv6 address or prefix that has hexadecimal notation in the format <code>HHHH : HHHH : : HHHH : HHHH</code>. To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.</td></tr><tr><td>integer</td><td>A number from 0 to 4294967295.</td></tr><tr><td>flag</td><td>A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b>, <b>on</b>, or <b>enabled</b> will set the flag. <b>false</b>, <b>off</b> or <b>disabled</b> will unset the flag.</td></tr></tbody></table> | ascii | An ASCII text string | hex | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long. | ipv6 | An IPv6 address or prefix that has hexadecimal notation in the format <code>HHHH : HHHH : : HHHH : HHHH</code> . To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times. | integer | A number from 0 to 4294967295. | flag | A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag. |
| ascii         | An ASCII text string                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |
| hex           | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |
| ipv6          | An IPv6 address or prefix that has hexadecimal notation in the format <code>HHHH : HHHH : : HHHH : HHHH</code> . To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |
| integer       | A number from 0 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |
| flag          | A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |

**Mode** Global Configuration

**Examples** To define a user-defined ASCII string option as option 66, without a name, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name "tcpip-node-type", use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name special-address, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option 12
```

To remove the specific user-defined option with the option name perform-router-discovery, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option perform-router-discovery
```

# ipv6 dhcp pool

**Overview** Use this command in Global Configuration mode to enter the DHCPv6 Configuration mode for the DHCPv6 server pool name as specified in the required command parameter. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCPv6 configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCPv6 server pools on devices with multiple interfaces. This allows the device to act as a DHCPv6 server on multiple interfaces to distribute different information to clients on the different networks.

Use the **no** variant of this command to delete the specific DHCPv6 pool.

**Syntax** `ipv6 dhcp pool <DHCPv6-poolname>`  
`no ipv6 dhcp pool <DHCPv6-poolname>`

| Parameter                            | Description                                                                                                                                                                    |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;DHCPv6-poolname&gt;</code> | Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** Global Configuration

**Usage** All DHCPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

**Examples** To create the DHCPv6 pool named P2 and enter DHCPv6 configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)#
```

To delete the DHCPv6 pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp pool P2
```

- show ipv6 dhcp binding
- show ipv6 dhcp pool

# ipv6 dhcp server

**Overview** Use this command in Interface Configuration mode to enable DHCPv6 server for the current IPv6 configured interface to use the specified DHCPv6 server pool name.

The DHCPv6 server service listens for DHCPv6 requests on the IPv6 configured interface. The DHCPv6 server service does not run on interfaces without IPv6 configured on them.

Use the **no** variant of this command to disable the DHCPv6 server.

**Syntax** `ipv6 dhcp-server [<DHCPv6-poolname>]`  
`no ipv6 dhcp-server`

| Parameter         | Description                                                                                                                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <DHCPv6-poolname> | Specify a named DHCPv6 server pool as defined with the <a href="#">ipv6 dhcp pool</a> command. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** Interface Configuration

**Usage** The **ipv6 dhcp server** command enables the DHCPv6 service on a specified interface using the pool for prefix delegation and configuration through the specified interface.

Note that DHCPv6 client, DHCPv6 server and DHCPv6 relay are mutually exclusive on an interface. When one of the DHCPv6 functions is enabled on an interface then another DHCPv6 function cannot be enabled on the same interface.

**Examples** To enable the DHCPv6 server service and use the DHCPv6 pool named P2 on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 dhcp server P2
```

To disable the DHCPv6 server on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp server
```

[show ipv6 dhcp binding](#)  
[show ipv6 dhcp pool](#)

# ipv6 local pool

**Overview** Use this command in Global Configuration mode to configure a local DHCPv6 server prefix delegation pool specifying a poolname and a prefix/prefix length. You can optionally exclude the locally assigned prefix from the pool with the **exclude-local-prefix** keyword.

Use the **no** variant of this command to remove a local DHCPv6 server prefix delegation pool specifying the poolname.

**Syntax** `ipv6 local pool <DHCPv6-poolname> <delegated-prefix-name>  
<ipv6-prefix/prefix-length> <assigned-length>  
[exclude-local-prefix]`  
`no ipv6 local pool`

| Parameter                                      | Description                                                                                                                                                                                                                                                                                          |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;DHCPv6-poolname&gt;</code>           | Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".                                                                                                                       |
| <code>&lt;delegated-prefix-name&gt;</code>     | Description used to identify the delegated prefix name from the parent PD (Prefix Delegation) server. If the name contains spaces then you must enclose it in "quotation marks".                                                                                                                     |
| <code>&lt;ipv6-prefix/prefix-length&gt;</code> | Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool.<br>The IPv6 address uses the format X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.                                                               |
| <code>&lt;assigned-length&gt;</code>           | Specify an IPv6 prefix length assigned to the user from the pool in the range <1-128>. Note that the value of the <i>assigned-length</i> parameter entered cannot be less than or equal to the <i>prefix-length</i> parameter value entered. An assigned length must be longer than a prefix length. |
| <code>exclude-local-prefix</code>              | Specify this keyword to exclude the locally assigned prefix from the pool.                                                                                                                                                                                                                           |

**Default** No DHCPv6 server prefix delegation pool is configured by default.

**Mode** Global Configuration

**Usage** All IPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

**Examples** To create a local DHCPv6 local pool named P2 with the IPv6 prefix and prefix length 2001:0db8::/32 with an assigned length of 64, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 local pool P2 2001:0db8::/32 64
```

To remove a configured DHCPv6 local pool, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 local pool
```

**Related Commands** [ipv6 dhcp pool](#)  
[show ipv6 dhcp pool](#)

# ipv6 nd prefix (DHCPv6)

**Overview** Use this command to specify IPv6 RA (Router Advertisement) prefix information generated from the DHCPv6 server for DHCPv6 prefix-delegation for a VLAN.

Use the **no** variant of this command to remove IPv6 RA prefix information from the DHCPv6 Server for DHCPv6 Prefix-Delegation for the interface. Use the **all** parameter with the **no** variant of this command to remove all prefix names and all prefixes for an interface.

**Syntax**

```
ipv6 nd prefix <ipv6-prefix-name>
<ipv6-prefix/length>{<valid-lifetime>|infinite}
{<preferred-lifetime>|infinite} {off-link|no-autoconfig}
no ipv6 nd prefix {<ipv6-prefix-name>|<ipv6-prefix/length>|all}
```

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ipv6-prefix-name&gt;</i>   | The IPv6 prefix name advertised on the router advertisement message sent from the device.<br>The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.                                                                                                                                                                                                                                         |
| <i>&lt;ipv6-prefix/length&gt;</i> | The IPv6 prefix and prefix length advertised on the router advertisement message sent from the device.<br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                                                                                                                                                                                                              |
| <i>&lt;valid-lifetime&gt;</i>     | The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 5 and 315360000 seconds. Note that this period should be set to a value greater than that set for the prefix preferred-lifetime. See the Usage notes after this parameter table for a description of valid lifetime and how it determines invalid IPv6 addresses upon expiry.                                               |
| infinite                          | Specifying this keyword instead of entering a value for the <i>&lt;valid-lifetime&gt;</i> parameter applies an infinite valid lifetime.                                                                                                                                                                                                                                                                                                |
| <i>&lt;preferred-lifetime&gt;</i> | Specifies the IPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered current. Set this to a value between 0 and 315360000 seconds. Note that this period should be set to a value less than that set for the prefix valid-lifetime. See the Usage notes after this parameter table for a description of preferred lifetime and how it determines deprecated IPv6 addresses upon expiry. |
| infinite                          | Specifying this keyword instead of entering a value for the <i>&lt;preferred-lifetime&gt;</i> parameter applies an infinite valid lifetime.                                                                                                                                                                                                                                                                                            |
| off-link                          | Specify the IPv6 prefix off-link flag.                                                                                                                                                                                                                                                                                                                                                                                                 |
| no-autoconfig                     | Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration.                                                                                                                                                                                                                                                                                                |
| all                               | Specify all prefix names and all prefixes are removed when used with the no variant of this command.                                                                                                                                                                                                                                                                                                                                   |

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** The following example configures the device to issue RAs (Router Advertisements) on the VLAN interface `vlan4`, and advertises the DHCPv6 prefix name `prefix1` and the IPv6 address prefix of `2001:0db8::/32`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 nd prefix prefix1 2001:0db8::/32
```

The following example resets router advertisements on the VLAN interface `vlan4`, so the address prefix of `2001:0db8::/32` is not advertised from the device.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/32
```

The following example removes all prefix names and prefixes from VLAN interface `vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd prefix all
```

# link-address

**Overview** Use this command in DHCPv6 Configuration mode to specify a link-address prefix within a DHCPv6 Server pool.

Note that you can only configure one link address per DHCPv6 pool. Configuring another link address in the same DHCPv6 pool overwrites the previously configured link address.

Use the **no** variant of this command to remove the link-address prefix from the DHCPv6 Server pool.

**Syntax** `link-address <ipv6-prefix/prefix-length>`  
`no link-address`

| Parameter                                      | Description                                                                                                                                                                                                                         |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-prefix/prefix-length&gt;</code> | Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X/Prefix-Length. The prefix-length is usually set between 0 and 64. |

**Default** No DHCPv6 Server pool configuration link address prefix is configured by default.

**Mode** DHCPv6 Configuration

**Usage** Link addresses are configured in DHCPv6 Server address pools when there are remote clients that communicate via intermediate relay(s).

RELAY-FORW and RELAY-REPL relay packets contain the requesting link address source.

This command is used to match incoming requests from PD (Prefix Delegation) clients (received via an intermediate relay) to a configured delegation pool.

When an address on the incoming interface of the DHCPv6 server or a link address set in the incoming delegation request packet from the prefix delegation client matches the link-address prefix configured in the delegation pool, the DHCPv6 server is able to match and use the appropriate delegation pool for relayed delegation request messages.

If there is no match between incoming delegation request packets from the prefix delegation client and the link-address prefix configured in the delegation pool, the DHCPv6 Server does not delegate an IPv6 prefix to the requesting device.

The link address should be set to the network prefix where the prefix delegation client resides. The prefix delegation server will also need a forwarding path (IPv6 route) back to the network prefix where the prefix delegation client resides.

For more information, see the [DHCPv6 Feature Overview and Configuration Guide](#).

**Examples** To configure the IPv6 prefix and prefix length 2001:0db8:1::/48 as the link address for pool P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# address prefix 2001:0db8:2::/48
awplus(config-dhcp6)# link-address 2001:0db8:1::/48
```

To remove the link address, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no link-address
```

# option (DHCPv6)

**Overview** Use this command in DHCPv6 Configuration mode to add a user-defined option to the DHCPv6 prefix pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value.

Use the **no** variant of this command to remove the specified user-defined option from the DHCPv6 server pool, or to remove all user-defined options from the DHCPv6 server pool.

**Syntax** `option [<1-254>|<option-name>] <option-value>`  
`no option [<1-254>|<option-value>]`

| Parameter      | Description                                                                                                                            |                                                                                                                                                                                             |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-254>        | The option number of the option. Options with the same number as one of the standard options overrides the standard option definition. |                                                                                                                                                                                             |
| <option-name>  | Option name associated with the option.                                                                                                |                                                                                                                                                                                             |
| <option-value> | The option value. You must specify a value that is appropriate to the option type:                                                     |                                                                                                                                                                                             |
|                | hex                                                                                                                                    | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long. |
|                | ipv6                                                                                                                                   | An IPv6 prefix that has the hexadecimal X:X::X:X notation. To create a list of IPv6 prefixes, you must add each IPv6 prefix individually using this command multiple times.                 |
|                | integer                                                                                                                                | A number from 0 to 4294967295.                                                                                                                                                              |
|                | flag                                                                                                                                   | A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.                                                                                        |

**Mode** DHCPv6 Configuration

**Usage** You must define a DHCPv6 option using the `ipv6 dhcp option` command before using the `option (DHCPv6)` command.

Note that options with an **ipv6** type can hold a list of IPv6 prefix (i.e. entries that have the X:X::X:X address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IPv6 prefixes. Also note options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

**Examples** To add the IPv6 type option named `sntp-server-addr` to the pool P2 and give the option the value `ipv6`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 22 name sntp_server_addr ipv6
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option sntp_server_addr ipv6
```

To add the ASCII-type option named `tftp-server-name` to the pool P2 and give the option the value `server1`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool P2 and give the option the value `08af`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option 175, use the following commands:

```
awplus(config-dhcp6)# option 175 2001:0db8:3001::/64
awplus(config-dhcp6)# option 175 2001:0db8:3002::/64
awplus(config-dhcp6)# option 175 2001:0db8:3003::/64
```

To add the option 179 to a pool, and give the option the value `123456`, use the following command:

```
awplus(config-dhcp6)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the following command:

```
awplus(config-dhcp6)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the following command:

```
awplus(config-dhcp6)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the following command:

```
awplus(config-dhcp6)# no option tftp-server-name
```

# prefix-delegation pool

**Overview** Use this command in DHCPv6 Configuration mode to add a DHCPv6 server prefix-delegation pool entry to the current DHCPv6 pool configuration. You must define a DHCPv6 server prefix-delegation pool using the `ipv6 dhcp pool` command before using this command.

Use the **no** variant of this command to remove a DHCPv6 server prefix-delegation pool from the current DHCPv6 pool configuration.

**Syntax** `prefix-delegation pool <DHCPv6-poolname> [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]`  
`no prefix-delegation pool <DHCPv6-poolname>`

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;DHCPv6-poolname&gt;</code> | Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".                                                                                                                                                                                                        |
| <code>lifetime</code>                | Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value.<br>See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry. |
| <code>&lt;valid-time&gt;</code>      | Specify a valid lifetime in seconds in the range <code>&lt;5-315360000&gt;</code> .                                                                                                                                                                                                                                                                                                   |
| <code>infinite</code>                | Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.                                                                                                                                                                                                                                                                               |
| <code>&lt;preferred-time&gt;</code>  | Specify a valid lifetime in seconds in the range <code>&lt;5-315360000&gt;</code> .                                                                                                                                                                                                                                                                                                   |

**Default** No IPv6 local prefix pool is specified by default.

**Mode** DHCPv6 Configuration

**Usage** The DHCPv6 server assigns prefixes dynamically from an IPv6 local prefix pool, which is configured using the `ipv6 local pool` command and is associated with a DHCPv6 configuration pool using this command. When the server receives a prefix request from a client, it attempts to obtain unassigned prefixes from the pool. After the client releases the previously assigned prefixes, the server returns the prefixes to the pool for reassignment.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source

address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Example** This example adds DHCPv6 Prefix Delegation pool pd\_pool1 to DHCPv6 pool pool1:

```
awplus# configure terminal
awplus(config)# ipv6 local pool pd_pool1 2001:0db8::/48 56
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# prefix-delegation pool pd_pool1
```

**Related  
Commands**

- ipv6 dhcp pool
- ipv6 local pool
- show ipv6 dhcp pool

# show counter ipv6 dhcp-client

**Overview** Use this command in User Exec or Privilege Exec mode to show DHCPv6 client counter information. See [show counter ipv6 dhcp-server](#) for DHCPv6 server information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter ipv6 dhcp-client`

**Mode** User Exec and Privileged Exec

**Example** To display the DHCPv6 client counter information, use the command:

```
awplus# show counter ipv6 dhcp-client
```

**Output** Figure 52-2: Example output from the **show counter ipv6 dhcp-client** command

```
awplus#show counter ipv6 dhcp-client
SOLICIT out 20
ADVERTISE in 12
REQUEST out 1
CONFIRM out 0
RENEW out 0
REBIND out 0
REPLY in 0
RELEASE out 0
DECLINE out 0
INFORMATION-REQUEST out 0
```

**Table 1:** Parameters in the output of the **show counter ipv6 dhcp-client** command

| Parameter    | Description                                                             |
|--------------|-------------------------------------------------------------------------|
| SOLICIT out  | Displays the count of SOLICIT messages sent by the DHCPv6 client.       |
| ADVERTISE in | Displays the count of ADVERTISE messages received by the DHCPv6 client. |
| REQUEST out  | Displays the count of REQUEST messages sent by the DHCPv6 client.       |
| CONFIRM out  | Displays the count of CONFIRM messages sent by the DHCPv6 client.       |
| RENEW out    | Displays the count of RENEW messages sent by the DHCPv6 client.         |

**Table 1:** Parameters in the output of the **show counter ipv6 dhcp-client** command (cont.)

| Parameter               | Description                                                                   |
|-------------------------|-------------------------------------------------------------------------------|
| REBIND out              | Displays the count of REBIND messages sent by the DHCPv6 client.              |
| REPLY in                | Displays the count of REPLY messages received by the DHCPv6 client.           |
| RELEASE out             | Displays the count of RELEASE messages sent by the DHCPv6 client.             |
| DECLINE out             | Displays the count of DECLINE messages sent by the DHCPv6 client.             |
| INFORMATION-REQUEST out | Displays the count of INFORMATION-REQUEST messages sent by the DHCPv6 client. |

# show counter ipv6 dhcp-server

**Overview** Use this command in User Exec or Privileged Exec mode to show DHCPv6 server counter information. See [show counter ipv6 dhcp-client](#) for DHCPv6 client information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter ipv6 dhcp-server`

**Mode** User Exec and Privileged Exec

**Example** To display the DHCPv6 server counter information, use the command:

```
awplus# show counter ipv6 dhcp-server
```

**Output** Figure 52-3: Example output from the **show counter ipv6 dhcp-server** command

```
awplus#show counter ipv6 dhcp-server
SOLICIT in 20
ADVERTISE out 12
REQUEST in 1
CONFIRM in 0
RENEW in 0
REBIND in 0
REPLY out 0
RELEASE in 0
DECLINE in 0
INFORMATION-REQUEST in 0
```

**Table 2:** Parameters in the output of the **show counter ipv6 dhcp-server** command

| Parameter     | Description                                                           |
|---------------|-----------------------------------------------------------------------|
| SOLICIT in    | Displays the count of SOLICIT messages received by the DHCPv6 server. |
| ADVERTISE out | Displays the count of ADVERTISE messages sent by the DHCPv6 server.   |
| REQUEST in    | Displays the count of REQUEST messages received by the DHCPv6 server. |
| CONFIRM in    | Displays the count of CONFIRM messages received by the DHCPv6 server. |
| RENEW in      | Displays the count of RENEW messages received by the DHCPv6 server.   |

**Table 2:** Parameters in the output of the **show counter ipv6 dhcp-server** command (cont.)

| Parameter              | Description                                                                      |
|------------------------|----------------------------------------------------------------------------------|
| REBIND in              | Displays the count of REBIND messages received by the DHCPv6 server.             |
| REPLY out              | Displays the count of REPLY messages sent by the DHCPv6 server.                  |
| RELEASE in             | Displays the count of RELEASE messages received by the DHCPv6 server.            |
| DECLINE in             | Displays the count of DECLINE messages received by the DHCPv6 server.            |
| INFORMATION-REQUEST in | Displays the count of INFORMATION-REQUEST messages received by the DHCPv6 server |

**Related Commands** [show counter ipv6 dhcp-client](#)

# show ipv6 dhcp

**Overview** Use this command in User Exec or Privileged Exec mode to show the DHCPv6 unique identifier (DUID) configured on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp`

**Mode** User Exec and Privileged Exec

**Usage** The DUID is based on the link-layer address for both DHCPv6 client and DHCPv6 server identifiers. The device uses the MAC address from the lowest interface number for the DUID.

The DUID is used by a DHCPv6 client to obtain an IPv6 address from a DHCPv6 server. A DHCPv6 server compares the DUID with its database of DUIDs and sends configuration data for an IPv6 address plus the preferred and valid lease time values to a DHCPv6 client.

**Example** To display the DUID configured on your device, use the command:

```
awplus# show ipv6 dhcp
```

**Output** Figure 52-4: Example output from the **show ipv6 dhcp** command

```
awplus#show ipv6 dhcp
DHCPv6 Server DUID: 0001000117ab6876001577f7ba23
```

**Related Commands** [ipv6 address dhcp](#)

# show ipv6 dhcp binding

**Overview** Use this command in User Exec or Privileged Exec mode to show the IPv6 address entries that the DHCPv6 server leases to DHCPv6 clients. Note that applying this command with the optional *summary* keyword parameter displays the number of addresses per pool, but not the address or prefix entries per pool.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp binding [summary]`

| Parameter            | Description                                                                                                                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>summary</code> | Optional. Specify the <b>summary</b> keyword to display summarized information for DHCPv6 server leases to client nodes, displaying the number of address entries per pool, not the addresses or prefixes. |

**Mode** User Exec and Privileged Exec

**Example 1** To display the total DHCPv6 leasing address entries for all pools, use the command:

```
awplus# show ipv6 dhcp binding summary
```

**Output** Figure 52-5: Example output from the **show ipv6 dhcp binding summary** command

```
awplus# show ipv6 dhcp binding summary
Pool Name Number of Leased Addresses

ia-na1 3
ia-pd1 5
Total in all Pools: 8
```

**Table 3:** Parameters in the output of the **show ipv6 dhcp binding summary** command

| Parameter                  | Description                                                        |
|----------------------------|--------------------------------------------------------------------|
| Pool Name                  | Displays a list of all the pool names.                             |
| Number of Leased Addresses | Displays the number of leased address entries for the pool.        |
| Total in all Pools         | Displays the total number of leased address entries for all pools. |

**Example 2** To display addresses, prefixes, and lifetimes for all DHCPv6 leasing entries by pool, enter:

```
awplus# show ipv6 dhcp binding
```

**Output** Figure 52-6: Example output from the **show ipv6 dhcp binding** command

```
awplus#show ipv6 dhcp binding
Pool ia-na1
 Address 2002:0:3c0::1
 client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23

 preferred lifetime 604800, valid lifetime 2592000
 starts at 20 Aug 2012 18:38:29
 expires at 19 Sep 2012 18:38:29
```

**Table 4:** Parameters in the output of the **showipv6 dhcp binding** command

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address            | Address delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.                                                                                                                                                                                                                                                                                                                                                                          |
| Prefix             | Prefix delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.                                                                                                                                                                                                                                                                                                                                                                           |
| DUID               | DHCPv6 unique identifier (DUID) (see RFC 3315). Each DHCPv6 client has as DUID. DHCPv6 servers use DUIDs to identify clients for the association of IAs (Identity Associations) with DHCPv6 clients. DHCPv6 clients use DUIDs to identify a DHCPv6 server.                                                                                                                                                                                                                                   |
| IAID               | Identify Association Identifier (IAID) (see RFC 3315). IAIDs are identifiers for IAs (Identity Associations), where an IA is a collection of IPv6 addresses assigned to a DHCPv6 client. Each IA has an associated IAD. Each DHCPv6 client may have more than one IA assigned to it. Each IA holds one type of address.                                                                                                                                                                      |
| preferred lifetime | The preferred lifetime setting in seconds for the specified IAID and DUID. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected. |
| valid lifetime     | The valid lifetime setting in seconds for the specified IAID and DUID. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.                                                                                                                                                                                                      |

**Table 4:** Parameters in the output of the **showipv6 dhcp binding** command

| Parameter  | Description                                            |
|------------|--------------------------------------------------------|
| starts at  | The date and time at which the valid lifetime expires. |
| expires at | The date and time at which the valid lifetime expires. |

**Related  
Commands**

[clear ipv6 dhcp binding](#)  
[ipv6 dhcp pool](#)  
[show ipv6 dhcp pool](#)

# show ipv6 dhcp interface

**Overview** Use this command in User Exec or Privileged Exec mode to display DHCPv6 information for a specified interface, or all interfaces when entered without the interface parameter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp interface [<interface-name>]`

| Parameter                           | Description                                                                                                                                                                          |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface-name&gt;</code> | Optional. Specify the name of the interface to show DHCPv6 information about. Omit this optional parameter to display DHCPv6 information for all interfaces DHCPv6 is configured on. |

**Mode** User Exec and Privileged Exec

**Example** To display DHCPv6 information for all interfaces DHCPv6 is configured on, use the command:

```
awplus# show ipv6 dhcp interface
```

**Output** Figure 52-7: Example output from the **show ipv6 dhcp interface** command

```
awplus# show ipv6 dhcp interface
vlan1 is in client mode
Address 1001::3c0:1
 preferred lifetime 9000, valid lifetime 5000
 starts at 20 Jan 2012 09:21:35
 expires at 20 Jan 2012 10:25:32
```

**Example 2** To display DHCPv6 information for interface vlan2, use the command:

```
awplus# show ipv6 dhcp interface vlan2
```

**Output** Figure 52-8: Example output from the **show ipv6 dhcp interface vlan2** command

```
awplus# show ipv6 dhcp interface vlan2
vlan2 is in client (Prefix-Delegation) mode
Prefix name pd1
 prefix 2002:0:3c0::/42
 preferred lifetime 604800, valid lifetime 2592000
 starts at 20 Aug 2012 09:21:33
 expires at 19 Sep 2012 09:21:33
```

**Table 5:** Parameters in the output of the **show counter dhcp-client** command

| Parameter                                                 | Description                                                                                                                    |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <interface> is in server/client/ (Prefix-Delegation) mode | Displays whether the specified interface is in server or client mode and whether prefix-delegation is applied to an interface. |
| Address                                                   | Displays the address of the DHCPv6 server on the interface.                                                                    |
| Prefix name                                               | Displays the IPv6 general prefix pool name, where prefixes are stored for the interface.                                       |
| Using pool                                                | Displays the name of the pool used by the interface.                                                                           |
| Preference                                                | Displays the preference value for the DHCPv6 server.                                                                           |

**Related Commands** [ipv6 dhcp client pd](#)

# show ipv6 dhcp pool

**Overview** Use this command in User Exec or Privileged Exec mode to display the configuration details and system usage of the DHCPv6 address pools configured on the device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp pool [<DHCPv6-address-pool-name>]`

| Parameter                  | Description                                                                                                        |
|----------------------------|--------------------------------------------------------------------------------------------------------------------|
| <DHCPv6-address-pool-name> | Name of a specific DHCPv6 address pool. This displays the configuration of the specified DHCPv6 address pool only. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 dhcp pool`

**Output** Figure 52-9: Example output from the **show ipv6 dhcp pool** command

```
awplus# show ipv6 dhcp pool
DHCPv6 Pool: ia-na
Address Prefix : 1001::/64
 Lifetime: 2592000(valid), 604800(preferred)
DNS Server: 2001::1
DNS Server: 2001::2
Domain Name: example.com
Domain Name: example.co.jp
SNTP Server: 2001::5
SNTP Server: 2001::6
Option Code : 150
 Value: [ASCII] test-test
DHCPv6 Pool: ia-pd
PD Pool Name: pd1
Prefix : 2002::/38-42
Lifetime : 2592000(valid), 604800(preferred)
```

**Table 6:** Parameters in the output of the **show ipv6dhcp pool** command

| Parameter      | Description                        |
|----------------|------------------------------------|
| DHCPv6 Pool    | Name of the DHCPv6 pool.           |
| Address Prefix | Address prefix to the DHCPv6 pool. |

**Table 6:** Parameters in the output of the **show ipv6dhcp pool** command (cont.)

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address<br>Lifetime | Valid and preferred lifetimes to the DHCPv6 pool. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet. |
| DNS Server          | IPv6 address of the DNS Server                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Domain name         | URL for the domain name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SNTP Server         | IPv6 address of the SNTP (Simple Network Time Protocol) Server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Option Code         | DHCP Option code (see RFC 2132).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Option Value        | DHCP Option value type (see RFC 2132).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Related  
Commands** [ipv6 dhcp pool](#)

# sntp-address

**Overview** Use this command in DHCPv6 Configuration mode to add an SNTP Server IPv6 address to a DHCPv6 Server pool.

Use the **no** variant of this command to remove an SNTP Server IPv6 address from a DHCPv6 Server pool.

**Syntax** `sntp-address <ipv6-address>`  
`no sntp-address <ipv6-address>`

| Parameter                         | Description                                                                                        |
|-----------------------------------|----------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-address&gt;</code> | Specify an SNTP Server IPv6 address, in hexadecimal notation in the format <code>X:X::X:X</code> . |

**Mode** DHCPv6 Configuration

**Examples** The following example adds an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# sntp-address 2001:0db8::/32
```

The following example removes an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no sntp-address 2001:0db8::/32
```

# NTP Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the Network Time Protocol (NTP). For more information, see the [NTP Feature Overview and Configuration Guide](#).

The device can act as an NTP client to receive time from one or more NTP servers, and as an NTP server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

- Command List**
- [“ntp authenticate”](#) on page 2446
  - [“ntp authentication-key”](#) on page 2447
  - [“ntp broadcastdelay”](#) on page 2448
  - [“ntp discard”](#) on page 2449
  - [“ntp master”](#) on page 2450

  - [“show ntp status”](#) on page 2467

# ntp authenticate

**Overview** This command enables NTP authentication. This allows NTP to authenticate the associations with other systems for security purposes.

The **no** variant of this command disables NTP authentication.

**Syntax** ntp authenticate  
no ntp authenticate

**Mode** Global Configuration

**Examples** To enable NTP authentication, use the commands:

```
awplus# configure terminal
awplus(config)# ntp authenticate
```

To disable NTP authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp authenticate
```

# ntp authentication-key

**Overview** This command defines each of the authentication keys. Each key has a key number, a type (MD5 or SHA1), and a value.

The **no** variant of this disables the authentication key.

**Syntax** `ntp authentication-key <keynumber> {md5|sha1} <key> [trusted]`  
`no ntp authentication-key <keynumber>`

| Parameter   | Description                                                                                                                          |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <keynumber> | <1-4294967295> An identification number for the key.                                                                                 |
| md5         | Define an MD5 key.                                                                                                                   |
| sha1        | Define an SHA1 key.                                                                                                                  |
| <key>       | The authentication key. For SHA1, this is a 20 hexadecimal character string. For MD5, this is a string of up to 31 ASCII characters. |
| trusted     | Add this key to the list of authentication keys that this server trusts.                                                             |

**Mode** Global Configuration

**Examples** To define an MD5 authentication key number 134343 and a key value "mystring", use the commands:

```
awplus# configure terminal
awplus(config)# ntp authentication-key 134343 md5 mystring
```

To disable the authentication key number 134343 with the key value "mystring", use the commands:

```
awplus# configure terminal
awplus(config)# no ntp authentication-key 134343 md5 mystring
```

# ntp broadcastdelay

**Overview** Use this command to set the estimated round-trip delay for broadcast packets. Use the **no** variant of this command to reset the round-trip delay for broadcast packets to the default offset of 0 microseconds.

**Syntax** `ntp broadcastdelay <delay>`  
`no ntp broadcastdelay`

| Parameter                  | Description                                                        |
|----------------------------|--------------------------------------------------------------------|
| <code>&lt;delay&gt;</code> | <code>&lt;1-999999&gt;</code> The broadcast delay in microseconds. |

**Default** 0 microsecond offset, which can only be applied with the **no** variant of this command.

**Mode** Global Configuration

**Examples** To set the estimated round-trip delay to 23464 microseconds for broadcast packets, use these commands:

```
awplus# configure terminal
awplus(config)# ntp broadcastdelay 23464
```

To reset the estimated round-trip delay for broadcast packets to the default setting (0 microseconds), use these commands:

```
awplus# configure terminal
awplus(config)# no ntp broadcastdelay
```

# ntp discard

**Overview** Use this command to limit the time between NTP packets on the host or hosts specified by the command [ntp restrict](#). Packets that arrive at greater frequency than the limits are dropped or sent a kiss-of-death response.

Use the **no** variant of this command to return the limits to their default values.

**Syntax**

```
ntp discard minimum <1-60>
ntp discard average <1-16>
no ntp discard minimum
no ntp discard average
```

| Parameter      | Description                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| minimum <1-60> | The minimum time between NTP packets, in seconds.                                                                                                                                                     |
| average <1-16> | A value that determines the minimum average time between NTP packets. The number of seconds is 2 to the power of the specified value (e.g. if you specify 4, the minimum average time is 16 seconds). |

**Default** Minimum: 2  
Average: 3 (8 seconds)

**Mode** Global Configuration

**Example** To drop NTP packets from the 192.168.1.0/16 subnet if they arrive more frequently than every 5 seconds, and also send kiss-of-death messages, use the commands:

```
awplus# configure terminal
awplus(config)# ntp discard minimum 5
awplus(config)# ntp restrict 192.168.1.0/16 limited kod
```

To silently drop all NTP packets if they arrive more frequently than once every 4 seconds on average (2 to the power of 2), use the commands:

```
awplus# configure terminal
awplus(config)# ntp discard average 2
awplus(config)# ntp restrict default-v4 limited
awplus(config)# ntp restrict default-v6 limited
```

**Related Commands** [ntp restrict](#)

# ntp master

**Overview** Use this command to make the device to be an authoritative NTP server, even if the system is not synchronized to an outside time source.

Use the **no** variant of this command to stop the device being the designated NTP server.

**Syntax** `ntp master [<stratum>]`  
`no ntp master`

| Parameter | Description                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <stratum> | <1-15> The stratum number defines the configured level that is set for this master within the NTP hierarchy. The default stratum number is 12. |

**Mode** Global Configuration

**Usage** The stratum levels define the distance from the reference clock and exist to prevent cycles in the hierarchy. Stratum 1 is used to indicate time servers, which are more accurate than Stratum 2 servers. For more information on the Network Time Protocol go to: [www.ntp.org](http://www.ntp.org)

**Examples** To stop the device from being the designated NTP server, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp master
```

To make the device the designated NTP server with stratum number 2, use the commands:

```
awplus# configure terminal
awplus(config)# ntp master 2
```

# ntp peer

**Overview** Use this command to configure an NTP peer association. An NTP association is a peer association if this system is willing to either synchronize to the other system, or allow the other system to synchronize to it.

Use the **no** variant of this command to remove the configured NTP peer association.

**Syntax**

```
ntp peer {<peeraddress>|<peername>}
ntp peer {<peeraddress>|<peername>} [prefer] [key <key>]
[version <version>]
no ntp peer {<peeraddress>|<peername>}
```

| Parameter         | Description                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <peeraddress>     | Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address. |
| <peername>        | Specify the peer hostname. The peer hostname can resolve to an IPv4 and an IPv6 address.                                          |
| prefer            | Prefer this peer when possible.                                                                                                   |
| key <key>         | <1-4294967295><br>Configure the peer authentication key.                                                                          |
| version <version> | <1-4><br>Configure for this NTP version.                                                                                          |

**Mode** Global Configuration

**Examples** See the following commands for options to configure NTP peer association, key and NTP version for the peer with an IPv4 address of 192.0.2.23:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23
awplus(config)# ntp peer 192.0.2.23 prefer
awplus(config)# ntp peer 192.0.2.23 prefer version 4
awplus(config)# ntp peer 192.0.2.23 prefer version 4 key 1234
awplus(config)# ntp peer 192.0.2.23 version 4 key 1234
awplus(config)# ntp peer 192.0.2.23 version 4
awplus(config)# ntp peer 192.0.2.23 key 1234
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 192.0.2.23
```

See the following commands for options to configure NTP peer association, key and NTP version for the peer with an IPv6 address of 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# ntp peer 2001:0db8:010d::1
awplus(config)# ntp peer 2001:0db8:010d::1 prefer
awplus(config)# ntp peer 2001:0db8:010d::1 prefer version 4
awplus(config)# ntp peer 2001:0db8:010d::1 prefer version 4 key
1234
awplus(config)# ntp peer 2001:0db8:010d::1 version 4 key 1234
awplus(config)# ntp peer 2001:0db8:010d::1 version 4
awplus(config)# ntp peer 2001:0db8:010d::1 key 1234
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 2001:0db8:010d::1
```

**Related  
Commands**   [ntp server](#)  
                  [ntp source](#)

# ntp restrict

**Overview** Use this command to restrict NTP functionality for one or more hosts.

You can drop NTP packets from specified hosts, apply frequency limits to NTP packets from specified hosts, or restrict the level of functionality for specified hosts. For more details, see [The NTP Public\\_Services\\_Project\\_website](#).

Use the **no** variant of this command to remove a restriction from one or more hosts.

**Syntax**

```
ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} ignore

ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
[limited [kod]] {nomodify|noquery|nopeer|noserve|notrust}

no ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
```

| Parameter      | Description                                                                                                                                                                                                                                                  |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default-v4     | Apply this restriction to all IPv4 hosts.                                                                                                                                                                                                                    |
| default-v6     | Apply this restriction to all IPv6 hosts.                                                                                                                                                                                                                    |
| <host-address> | Apply this restriction to the specified IPv4 or IPv6 host.<br>Enter an IPv4 address in the format A.B.C.D.<br>Enter an IPv6 address in the format X::X:X.                                                                                                    |
| <host-subnet>  | Apply this restriction to the specified IPv4 subnet or IPv6 prefix.<br>Enter an IPv4 subnet in the format A.B.C.D/M.<br>Enter an IPv6 prefix in the format X::X:X/X.                                                                                         |
| ignore         | Block all NTP connections, including time polls, from matching hosts.                                                                                                                                                                                        |
| limited        | Apply frequency limits to matching hosts. To specify the frequency limits, use the command <a href="#">ntp discard</a> .                                                                                                                                     |
| kod            | Send kiss-of-death packets when the rate limit is exceeded. If you do not specify this, NTP packets are dropped without further processing when the rate limit is exceeded.                                                                                  |
| nomodify       | Prevent matching hosts from modifying the NTP configuration, even if they have a trusted key.                                                                                                                                                                |
| noquery        | Prevent matching hosts from querying this device's NTP status. This option does not block time queries. We recommend using this option on publicly-accessible systems, because it blocks ntpq and ntpdc queries, which can be used in amplification attacks. |
| nopeer         | Prevent matching hosts from becoming NTP peers of this device.                                                                                                                                                                                               |

| Parameter | Description                                                                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| noserve   | Do not serve the time to matching hosts.                                                                                                                           |
| notrust   | Require that matching hosts authenticate NTP sessions with this device. If you use this option, the device will drop all unsigned NTP packets from matching hosts. |

**Default** None. By default, there are no restrictions configured.

**Mode** Global Configuration

**Example** To prevent all hosts from using NTP except for the host 192.0.2.1 and the subnet 192.168.1.0/16, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict default-v4 ignore
awplus(config)# ntp restrict default-v6 ignore
awplus(config)# ntp restrict 192.0.2.1
awplus(config)# ntp restrict 192.168.1.0/16
```

To force the host 192.0.2.1 and the subnet 192.168.1.0/16 to authenticate NTP sessions with this device, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 192.0.2.1 notrust
awplus(config)# ntp restrict 192.168.1.0/16 notrust
```

To drop NTP packets from the 192.168.1.0/16 subnet if they arrive more frequently than every 5 seconds, and also send kiss-of-death messages, use the commands:

```
awplus# configure terminal
awplus(config)# ntp discard minimum 5
awplus(config)# ntp restrict 192.168.1.0/16 limited kod
```

**Related  
Commands** [ntp discard](#)

# ntp server

**Overview** Use this command to configure an NTP server. This means that this system will synchronize to the other system, and not vice versa.

Use the **no** variant of this command to remove the configured NTP server.

**Syntax**

```
ntp server {<serveraddress>|<servername>}
ntp server {<serveraddress>|<servername>} [prefer] [key <key>]
[version <version>]
no ntp server {<serveraddress>|<servername>}
```

| Parameter         | Description                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <serveraddress>   | Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address. |
| <servername>      | Specify the server hostname. The server hostname can resolve to an IPv4 and an IPv6 address.                                      |
| prefer            | Prefer this server when possible.                                                                                                 |
| key <key>         | <1-4294967295><br>Configure the server authentication key.                                                                        |
| version <version> | <1-4><br>Configure for this NTP version.                                                                                          |

**Mode** Global Configuration

**Examples** See the following commands for options to configure an NTP server association, key and NTP version for the server with an IPv4 address of 192.0.1.23:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.1.23
awplus(config)# ntp server 192.0.1.23 prefer
awplus(config)# ntp server 192.0.1.23 prefer version 4
awplus(config)# ntp server 192.0.1.23 prefer version 4 key 1234
awplus(config)# ntp server 192.0.1.23 version 4 key 1234
awplus(config)# ntp server 192.0.1.23 version 4
awplus(config)# ntp server 192.0.1.23 key 1234
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.1.23, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp server 192.0.1.23
```

See the following commands for options to configure an NTP server association, key and NTP version for the server with an IPv6 address of 2001:0db8:010e::2:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2
awplus(config)# ntp server 2001:0db8:010e::2 prefer
awplus(config)# ntp server 2001:0db8:010e::2 prefer version 4
awplus(config)# ntp server 2001:0db8:010e::2 prefer version 4
key 1234
awplus(config)# ntp server 2001:0db8:010e::2 version 4 key 1234
awplus(config)# ntp server 2001:0db8:010e::2 version 4
awplus(config)# ntp server 2001:0db8:010e::2 key 1234
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp server 2001:0db8:010e::2
```

**Related  
Commands**    [ntp peer](#)  
                  [ntp source](#)

# ntp source

**Overview** Use this command to configure an IPv4 or an IPv6 address for the NTP source interface. This command defines the socket used for NTP messages, and only applies to NTP client behavior.

Note that you cannot use this command when using AMF (Allied Telesis Management Framework) or VCStack.

Use the **no** variant of this command to remove the configured IPv4 or IPv6 address from the NTP source interface.

**Syntax** `ntp source <source-address>`  
`no ntp source`

| Parameter                           | Description                                                                                                                                       |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;source-address&gt;</code> | Specify the IP address of the NTP source interface, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address. |

**Default** An IP address is selected based on the most appropriate egress interface used to reach the NTP peer if a configured NTP client source IP address is unavailable or invalid.

**Mode** Global Configuration

**Usage** Adding an IPv4 or an IPv6 address allows you to select which source interface NTP uses for peering. The IPv4 or IPv6 address configured using this command is matched to the interface.

When selecting a source IP address to use for NTP messages to the peer, if the configured NTP client source IP address is unavailable then default behavior will apply, and an alternative source IP address is automatically selected. This IP address is based on the most appropriate egress interface used to reach the NTP peer. The configured NTP client source IP may be unavailable if the interface is down, or an invalid IP address is configured that does not reside on the device.

Note that this command only applies to NTP client behavior. The egress interface that the NTP messages use to reach the NTP server is determined by the `ntp peer` and `ntp server` commands.

Note that you cannot use this command when using AMF (Allied Telesis Management Framework).

**Examples** To configure the NTP source interface with the IPv4 address 192.0.2.23, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 192.0.2.23
```

To configure the NTP source interface with the IPv6 address 2001:0db8:010e::2, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 2001:0db8:010e::2
```

To remove a configured address for the NTP source interface, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp source
```

**Related  
Commands**    [ntp peer](#)  
                  [ntp server](#)

# ntp trusted-key (deprecated)

**Overview** This command has been deprecated in Software Version 5.4.6-1.1. Please use the **trusted** parameter of the command [ntp authentication-key](#) instead.

# show counter ntp (deprecated)

**Overview** From version 5.4.6-1.x onwards, this command has been replaced by the command [show ntp counters](#).

# show ntp associations

**Overview** Use this command to display the status of NTP associations.

**Syntax** show ntp associations

**Mode** User Exec and Privileged Exec

**Example** See the sample output of the **show ntp associations** command displaying the status of NTP associations.

**Table 1:** Example output from the **show ntp associations** command

```
awplus#show ntp associations
 remote refid st t when poll reach delay offset jitter

```

**Table 2:** Parameters in the output from the **show ntp associations** command

| Parameter      | Description                                                                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| * system peer  | The peer that NTP uses to calculate variables like the offset and root dispersion of this AlliedWare Plus device. NTP passes these variables to the clients using this AlliedWare Plus device. |
| # backup       | Peers that are usable, but are not among the first six peers sorted by synchronization distance. These peers may not be used.                                                                  |
| + candidate    | Peers that the NTP algorithm has determined can be used, along with the system peer, to discipline the clock (i.e. to set the time on the AlliedWare Plus device).                             |
| - outlier      | Peers that are not used because their time is significantly different from the other peers.                                                                                                    |
| x false ticker | Peers that are not used because they are not consider trustworthy.                                                                                                                             |
| space          | Peers that are not used because they are, for example, unreachable.                                                                                                                            |
| remote         | The peer IP address                                                                                                                                                                            |

**Table 2:** Parameters in the output from the **show ntp associations** command

| Parameter | Description                                                                                                                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| refid     | The IP address of the reference clock, or an abbreviation indicating the type of clock (e.g. GPS indicates that the server uses GPS for the reference clock). INIT indicates that the reference clock is initialising, so it is not operational.                                       |
| st        | The stratum, which is the number of hops between the server and the accurate time source such as an atomic clock.                                                                                                                                                                      |
| t         | Type, one of:<br>u: unicast or manycast client<br>b: broadcast or multicast client<br>l: local reference clock<br>s: symmetric peer<br>A: manycast server<br>B: broadcast server<br>M: multicast server                                                                                |
| when      | When last polled (seconds ago, h hours ago, or d days ago).                                                                                                                                                                                                                            |
| poll      | Time between NTP requests from the device to the server.                                                                                                                                                                                                                               |
| reach     | An indication of whether or not the NTP server is responding to requests. 0 indicates there has never been a successful poll; 1 indicates that the last poll was successful; 3 indicates that the last two polls were successful; 377 indicates that the last 8 polls were successful. |
| delay     | The round trip communication delay to the remote peer or server, in milliseconds.                                                                                                                                                                                                      |
| offset    | The mean offset (phase) in the times reported between this local host and the remote peer or server (root mean square, milliseconds).                                                                                                                                                  |
| jitter    | The mean deviation in the time reported for that remote peer or server (the root mean square of difference of multiple time samples, in milliseconds).                                                                                                                                 |

# show ntp counters

**Overview** This command displays packet counters for NTP.

**Syntax** show ntp counters

**Mode** User Exec and Privileged Exec

**Example** To display counters for NTP use the command:

```
awplus# show ntp counters
```

Figure 53-1: Example output from **show ntp counters**

|                        |      |
|------------------------|------|
| uptime:                | 7212 |
| sysstats reset:        | 7212 |
| packets received:      | 307  |
| current version:       | 237  |
| older version:         | 69   |
| bad length or format:  | 0    |
| authentication failed: | 0    |
| declined:              | 0    |

| rate limited:          | 0    |
| KoD responses:         | 0    |
| processed for time:    | 306  |

Table 53-1: Parameters in the output from **show ntp counters**

| Parameter            | Description                                                                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uptime               | How long NTP has been running since it was last restarted, in seconds.                                                                                           |
| sysstats reset       | How long since <a href="#">show ntp status</a> information was last reset, in seconds.                                                                           |
| packets received     | Total number of NTP client and server packets received by the device.                                                                                            |
| current version      | The number of version 4 NTP packets received.                                                                                                                    |
| older version        | The number of NTP packets received that are from an older version, down to version 1, of NTP. NTP is compatible with these versions and processes these packets. |
| bad length or format | The number of NTP packets received that do not conform to the standard packet length. NTP drops these packets.                                                   |

Table 53-1: Parameters in the output from **show ntp counters** (cont.)

| Parameter             | Description                                                                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| authentication failed | The number of NTP packets received that failed authentication. NTP drops these packets. Packets can only fail authentication if NTP authentication is enabled with the <b>ntp authenticate</b> command.    |
| declined              | The number of packets that were declined for any reason.                                                                                                                                                   |
| restricted            | The number of NTP packets received that do not match any restrict statements in the NTP restrictions. NTP drops these packets. See the command <a href="#">ntp restrict</a> for more information.          |
| rate limited          | The number of packets dropped because the packet rate exceeded its limits. See the command <a href="#">ntp discard</a> for more information.                                                               |
| KoD responses         | The number of kiss-of-death packets NTP has sent. See the command <a href="#">ntp restrict</a> for more information.                                                                                       |
| processed for time    | The number of packets processed by NTP. NTP processes a packet once it has determined that the packet is valid by checking factors such as the packet's authentication, format, access rights and version. |

# show ntp counters associations

**Overview** Use this command to display NTP packet counters for individual servers and peers.

**Syntax** show ntp counters associations

**Mode** User Exec/Privileged Exec

**Examples** To display packet counters for each NTP server and peer that is associated with this device, use the command:

```
awplus# show ntp counters associations
```

**Output** Figure 53-2: Example output from **show ntp counters associations**

```
awplus#show ntp counters associations
Peer time-server.example.com
sent: 123
received: 122
auth-failed: 0
bogus-origin: 0
duplicate: 0
bad-header: 0
kod-received: 0
```

Table 53-2: Parameters in the output from **show ntp counters associations**

| Parameter    | Description                                                                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Peer         | An NTP peer or server that the device is associated with.                                                                                                                                              |
| sent         | The number of NTP packets that this device sent to the peer.                                                                                                                                           |
| received     | The number of NTP packets that this device received from the peer.                                                                                                                                     |
| auth-failed  | The number of NTP packets received that failed authentication. NTP drops these packets. Packets can only fail authentication if NTP authentication is enabled with the <b>ntp authenticate</b> command |
| bogus-origin | The number of packets received that have unexpected timestamps. Such packets are not part of the current request/reply round and may be faked.                                                         |
| duplicate    | The number of duplicate packets received. Such packets are at best old duplicates and at worst a replay by a hacker. Duplicates can happen in symmetric modes if the poll intervals are uneven.        |

Table 53-2: Parameters in the output from **show ntp counters associations**

| Parameter    | Description                                                                                                                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bad-header   | The number of packets where one or more header fields are invalid.                                                                                                                                                                         |
| kod-received | The number of Kiss of Death packets received from the peer. KoD packets indicate that this device is sending NTP packets more often than the peer will accept them. If you receive KoD packets, you should stop using this server or peer. |

Commands** [ntp discard](#)  
[ntp restrict](#)

# show ntp status

**Overview** Use this command to display the status of the Network Time Protocol (NTP).

**Syntax** show ntp status

**Mode** User Exec and Privileged Exec

**Example** To see information about NTP status, use the command:

```
awplus# show ntp status
```

For information about the output displayed by this command, see [ntp.org](http://ntp.org).

Figure 53-3: Example output from the **show ntp status** command

```
awplus#show ntp status
associd=0 status=061b leap_none, sync_ntp, 1 event, leap_event,
system peer: 10.37.211.97:123
system peer mode: client
leap indicator: 00
stratum: 4

# debug snmp

**Overview** This command enables SNMP debugging.

The **no** variant of this command disables SNMP debugging.

**Syntax**

```
debug snmp
[all|detail|error-string|process|receive|send|xdump]

no debug snmp
[all|detail|error-string|process|receive|send|xdump]
```

| Parameter    | Description                                                                               |
|--------------|-------------------------------------------------------------------------------------------|
| all          | Enable or disable the display of all SNMP debugging information.                          |
| detail       | Enable or disable the display of detailed SNMP debugging information.                     |
| error-string | Enable or disable the display of debugging information for SNMP error strings.            |
| process      | Enable or disable the display of debugging information for processed SNMP packets.        |
| receive      | Enable or disable the display of debugging information for received SNMP packets.         |
| send         | Enable or disable the display of debugging information for sent SNMP packets.             |
| xdump        | Enable or disable the display of hexadecimal dump debugging information for SNMP packets. |

**Mode** Privileged Exec and Global Configuration

**Example** To start SNMP debugging, use the command:

```
awplus# debug snmp
```

To start SNMP debugging, showing detailed SNMP debugging information, use the command:

```
awplus# debug snmp detail
```

To start SNMP debugging, showing all SNMP debugging information, use the command:

```
awplus# debug snmp all
```

# show counter snmp-server

**Overview** This command displays counters for SNMP messages received by the SNMP agent.

**Syntax** show counter snmp-server

**Mode** User Exec and Privileged Exec

**Example** To display the counters for the SNMP agent, use the command:

```
awplus# show counter snmp-server
```

**Output** Figure 54-1: Example output from the **show counter snmp-server** command

```

**Table 1:** Parameters in the output of the **show counter snmp-server** command

| Parameter           | Meaning                                                                                                                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inPkts              | The total number of SNMP messages received by the SNMP agent.                                                                                                                                                                                                                                     |
| inBadVersions       | The number of messages received by the SNMP agent for an unsupported SNMP version. It drops these messages. The SNMP agent on your device supports versions 1, 2C, and 3.                                                                                                                         |
| inBadCommunityNames | The number of messages received by the SNMP agent with an unrecognized SNMP community name. It drops these messages.                                                                                                                                                                              |
| inBadCommunityUses  | The number of messages received by the SNMP agent where the requested SNMP operation is not permitted from SNMP managers using the SNMP community named in the message.                                                                                                                           |
| inASNParseErrs      | The number of ASN.1 or BER errors that the SNMP agent has encountered when decoding received SNMP Messages.                                                                                                                                                                                       |
| inTooBig            | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'tooBig'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.                                                                        |
| inNoSuchNames       | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'noSuchName'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.                                                                    |
| inBadValues         | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'badValue'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.                                                                      |
| inReadOnly          | The number of valid SNMP PDUs received by the SNMP agent where the value of the error-status field is 'readOnly'. The SNMP manager should not generate a PDU which contains the value 'readOnly' in the error-status field. This indicates that there is an incorrect implementation of the SNMP. |
| inGenErrs           | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'genErr'.                                                                                                                                                                                         |

**Table 1:** Parameters in the output of the **show counter snmp-server** command

| Parameter      | Meaning                                                                                                                                                                                                                              |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inTotalReqVars | The number of MIB objects that the SNMP agent has successfully retrieved after receiving valid SNMP Get-Request and Get-Next PDUs.                                                                                                   |
| inTotalSetVars | The number of MIB objects that the SNMP agent has successfully altered after receiving valid SNMP Set-Request PDUs.                                                                                                                  |
| inGetRequests  | The number of SNMP Get-Request PDUs that the SNMP agent has accepted and processed.                                                                                                                                                  |
| inGetNexts     | The number of SNMP Get-Next PDUs that the SNMP agent has accepted and processed.                                                                                                                                                     |
| inSetRequests  | The number of SNMP Set-Request PDUs that the SNMP agent has accepted and processed.                                                                                                                                                  |
| inGetResponses | The number of SNMP Get-Response PDUs that the SNMP agent has accepted and processed.                                                                                                                                                 |
| inTraps        | The number of SNMP Trap PDUs that the SNMP agent has accepted and processed.                                                                                                                                                         |
| outPkts        | The number of SNMP Messages that the SNMP agent has sent.                                                                                                                                                                            |
| outTooBig      | The number of SNMP PDUs that the SNMP agent has generated with the value 'tooBig' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.     |
| outNoSuchNames | The number of SNMP PDUs that the SNMP agent has generated with the value 'noSuchName' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager. |
| outBadValues   | The number of SNMP PDUs that the SNMP agent has generated with the value 'badValue' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.   |
| outGenErrs     | The number of SNMP PDUs that the SNMP agent has generated with the value 'genErr' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.     |
| outGetRequests | The number of SNMP Get-Request PDUs that the SNMP agent has generated.                                                                                                                                                               |

**Table 1:** Parameters in the output of the **show counter snmp-server** command

| Parameter                 | Meaning                                                                                                                                           |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| outGetNexts               | The number of SNMP Get-Next PDUs that the SNMP agent has generated.                                                                               |
| outSetRequests            | The number of SNMP Set-Request PDUs that the SNMP agent has generated.                                                                            |
| outGetResponses           | The number of SNMP Get-Response PDUs that the SNMP agent has generated.                                                                           |
| outTraps                  | The number of SNMP Trap PDUs that the SNMP agent has generated.                                                                                   |
| UnsupportedSecurityLevels | The number of received packets that the SNMP agent has dropped because they requested a securityLevel unknown or not available to the SNMP agent. |
| NotInTimeWindows          | The number of received packets that the SNMP agent has dropped because they appeared outside of the authoritative SNMP agent's window.            |
| UnknownUserNames          | The number of received packets that the SNMP agent has dropped because they referenced an unknown user.                                           |
| UnknownEngineIDs          | The number of received packets that the SNMP agent has dropped because they referenced an unknown snmpEngineID.                                   |
| WrongDigest               | The number of received packets that the SNMP agent has dropped because they didn't contain the expected digest value.                             |
| DecryptionErrors          | The number of received packets that the SNMP agent has dropped because they could not be decrypted.                                               |
| UnknownSecModels          | The number of messages received that contain a security model that is not supported by the server. Valid for SNMPv3 messages only.                |
| InvalidMsgs               | The number of messages received where the security model is supported but the authentication fails. Valid for SNMPv3 messages only.               |
| UnknownPDUHandlers        | The number of times the SNMP handler has failed to process a PDU. This is a system debugging counter.                                             |

**Related Commands** [show snmp-server](#)

# show debugging snmp

**Overview** This command displays whether SNMP debugging is enabled or disabled.

**Syntax** `show debugging snmp`

**Mode** User Exec and Privileged Exec

**Example** To display the status of SNMP debugging, use the command:

```
awplus# show debugging snmp
```

**Output** Figure 54-2: Example output from the **show debugging snmp** command

```
Sntp (SMUX) debugging status:
Sntp debugging is on
```

**Related  
Commands** [debug snmp](#)

# show running-config snmp

**Overview** This command displays the current configuration of SNMP on your device.

**Syntax** `show running-config snmp`

**Mode** Privileged Exec

**Example** To display the current configuration of SNMP on your device, use the command:

```
awplus# show running-config snmp
```

**Output** Figure 54-3: Example output from the **show running-config snmp** command

```
snmp-server contact AlliedTelesis
snmp-server location Philippines
snmp-server group grou1 auth read view1 write view1 notify view1
snmp-server view view1 1 included
snmp-server community public
snmp-server user user1 group1 auth md5 password priv des
password
```

**Related  
Commands** [show snmp-server](#)

# show snmp-server

**Overview** This command displays the status and current configuration of the SNMP server.

**Syntax** `show snmp-server`

**Mode** Privileged Exec

**Example** To display the status of the SNMP server, use the command:

```
awplus# show snmp-server
```

**Output** Figure 54-4: Example output from the **show snmp-server** command

```
SNMP Server Enabled
IP Protocol IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) 0x80001f888021338e4747b8e607
```

[snmp-server view](#)

# snmp trap link-status

**Overview** Use this command to enable SNMP to send link status notifications (traps) for the interfaces when an interface goes up (linkUp) or down (linkDown).

Use the **no** variant of this command to disable the sending of link status notifications.

**Syntax** `snmp trap link-status [enterprise]`  
`no snmp trap link-status`

| Parameter  | Description                                          |
|------------|------------------------------------------------------|
| enterprise | Send an Allied Telesis enterprise type of link trap. |

**Default** By default, link status notifications are disabled.

**Mode** Interface Configuration

**Usage** The link status notifications can be enabled for the following interface types:

- switch port (e.g. port 1.0.1)
- VLAN (e.g. vlan2)
- Ethernet (e.g. eth1)
- static and dynamic link aggregation (e.g. sa2, po2)

To specify where notifications are sent, use the [snmp-server host](#) command. To configure the device globally to send other notifications, use the [snmp-server enable trap](#) command.

**Examples** To enable SNMP to send link status notifications for ports 1.0.2 to 1.0.6, use following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-1.0.6
awplus(config-if)# snmp trap link-status
```

To enable SNMP to send an Allied Telesis enterprise type of link status notification for port1.0.1, use following commands:

```
awplus# configure terminal
awplus(config)# interface 1.0.1
awplus(config-if)# snmp trap link-status enterprise
```

To disable the sending of link status notifications for port 1.0.2, use following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no snmp trap link-status
```

**Related  
Commands**

[show interface](#)  
[snmp trap link-status suppress](#)  
[snmp-server enable trap](#)  
[snmp-server host](#)

# snmp trap link-status suppress

**Overview** Use this command to enable the suppression of link status notifications (traps) for the interfaces beyond the specified threshold, in the specified interval.

Use the **no** variant of this command to disable the suppression of link status notifications for the ports.

**Syntax** `snmp trap link-status suppress {time {<1-60>|default}|threshold {<1-20>|default}}`

`no snmp trap link-status suppress`

| Parameter | Description                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| time      | Set the suppression timer for link status notifications.                                                                                                                                          |
| <1-60>    | The suppress time in seconds.                                                                                                                                                                     |
| default   | The default suppress time in seconds (60).                                                                                                                                                        |
| threshold | Set the suppression threshold for link status notifications. This is the number of link status notifications after which to suppress further notifications within the suppression timer interval. |
| <1-20>    | The number of link status notifications.                                                                                                                                                          |
| default   | The default number of link status notifications (20).                                                                                                                                             |

**Default** By default, if link status notifications are enabled (they are enabled by default), the suppression of link status notifications is enabled: notifications that exceed the notification threshold (default 20) within the notification timer interval (default 60 seconds) are not sent.

**Mode** Interface Configuration

**Usage** An unstable network can generate many link status notifications. When notification suppression is enabled, a suppression timer is started when the first link status notification of a particular type (linkUp or linkDown) is sent for an interface. If the threshold number of notifications of this type is sent before the timer reaches the suppress time, any further notifications of this type generated for the interface during the interval are not sent. At the end of the interval, the sending of link status notifications resumes, until the threshold is reached in the next interval.

**Examples** To enable the suppression of link status notifications for ports 1.0.2 to 1.0.6 after 10 notifications have been sent in 40 seconds, use following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-1.0.6
awplus(config-if)# snmp trap link-status suppress time 40
threshold 10
```

To disable the suppression link status notifications for port 1.0.2, use following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no snmp trap link-status suppress
```

**Related  
Commands**    [show interface](#)  
                  [snmp trap link-status](#)

# snmp-server

**Overview** Use this command to enable the SNMP agent (server) on the device. The SNMP agent receives and processes SNMP packets sent to the device, and generates notifications (traps) that have been enabled by the [snmp-server enable trap](#) command.

Use the **no** variant of this command to disable the SNMP agent on the device. When SNMP is disabled, SNMP packets received by the device are discarded, and no notifications are generated. This does not remove any existing SNMP configuration.

**Syntax** `snmp-server [ip|ipv6]`  
`no snmp-server [ip|ipv6]`

| Parameter | Description                                |
|-----------|--------------------------------------------|
| ip        | Enable or disable the SNMP agent for IPv4. |
| ipv6      | Enable or disable the SNMP agent for IPv6. |

**Default** By default, the SNMP agent is enabled for both IPv4 and IPv6. If neither the **ip** parameter nor the **ipv6** parameter is specified for this command, then SNMP is enabled or disabled for both IPv4 and IPv6.

**Mode** Global Configuration

**Examples** To enable SNMP on the device for both IPv4 and IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server
```

To enable the SNMP agent for IPv4 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server ip
```

To disable the SNMP agent for both IPv4 and IPv6 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server
```

To disable the SNMP agent for IPv4, use the commands:

```
awplus(config)# no snmp-server ipv4
```

**Related  
Commands**

snmp-server group  
snmp-server host  
snmp-server location  
snmp-server view

# snmp-server community

**Overview** This command creates an SNMP community, optionally setting the access mode for the community. The default access mode is read only. If view is not specified, the community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

The **no** variant of this command removes an SNMP community. The specified community must already exist on the device.

**Syntax** `snmp-server community <community-name> {view <view-name>|ro|rw}`  
`no snmp-server community <community-name> [{view <view-name>}]`

| Parameter        | Description                                                                                        |
|------------------|----------------------------------------------------------------------------------------------------|
| <community-name> | Community name. The community name is a case sensitive string of up to 20 characters.              |
| view             | Configure SNMP view. If view is not specified, the community allows access to all the MIB objects. |
| <view-name>      | View name. The view name is a string up to 20 characters long and is case sensitive.               |
| ro               | Read-only community.                                                                               |
| rw               | Read-write community.                                                                              |

**Mode** Global Configuration

**Example** The following command creates an SNMP community called “public” with read only access to all MIB variables from any management station.

```
awplus# configure terminal
awplus(config)# snmp-server community public ro
```

The following command removes an SNMP community called “public”

```
awplus# configure terminal
awplus(config)# no snmp-server community public
```

**Related Commands** [show snmp-server](#)  
[show snmp-server community](#)  
[snmp-server view](#)

# snmp-server contact

**Overview** This command sets the contact information for the system. The contact name is:

- displayed in the output of the [show system](#) command
- stored in the MIB object sysContact

The **no** variant of this command removes the contact information from the system.

**Syntax** `snmp-server contact <contact-info>`  
`no snmp-server contact`

| Parameter                         | Description                                                                                                                     |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;contact-info&gt;</code> | The contact information for the system, from 0 to 255 characters long. Valid characters are any printable character and spaces. |

**Mode** Global Configuration

**Example** To set the system contact information to "support@alliedtelesis.co.nz", use the command:

```
awplus# configure terminal
awplus(config)# snmp-server contact
support@alliedtelesis.co.nz
```

**Related Commands** [show system](#)  
[snmp-server location](#)  
[snmp-server group](#)

# snmp-server enable trap

**Overview** Use this command to enable the switch to transmit the specified notifications (traps).

Note that the Environmental Monitoring traps defined in the AT-ENVMONv2-MIB are enabled by default.

Use the **no** variant of this command to disable the transmission of the specified notifications.

**Syntax** `snmp-server enable trap <trap-list>`  
`no snmp-server enable trap <trap-list>`

The traps you can enable are shown in the parameter table below.

| Parameter    | Description                             |
|--------------|-----------------------------------------|
| atmf         | AMF traps.                              |
| atmflink     | AMF Link traps.                         |
| atmfnode     | AMF Node traps.                         |
| atmfrr       | AMF Reboot Rolling traps.               |
| auth         | Authentication failure.                 |
| bgp          | BGP traps.                              |
| mstp         | MSTP traps.                             |
| nsm          | NSM traps.                              |
| ospf         | OSPF traps.                             |
| pim          | PIM traps.                              |
| thrash-limit | MAC address Thrash Limiting traps.      |
| vrrp         | Virtual Router Redundancy (VRRP) traps. |

**Default** By default, no notifications are generated.

**Mode** Global Configuration

**Usage** This command cannot be used to enable link status notifications globally. To enable link status notifications for particular interfaces, use the [snmp trap link-status](#) command.

To specify where notifications are sent, use the [snmp-server host](#) command.

Note that more than one trap can be configured with one command entry, and also note this command applied to notifications send by SNMP version 3.

**Examples** To enable the device to send a notification if an AMF node changes its status, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap atmfnode
```

To enable the device to send MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap thrash-limit
```

To disable the device from sending MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap thrash-limit
```

To enable the device to send OSPF and VRRP-related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap ospf vrrp
```

To disable OSPF traps being sent out by the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap ospf
```

**Related  
Commands** [show snmp-server](#)  
[snmp trap link-status](#)  
[snmp-server host](#)

# snmp-server engineID local

**Overview** Use this command to configure the SNMPv3 engine ID. The SNMPv3 engine ID is used to uniquely identify the SNMPv3 agent on a device when communicating with SNMP management clients. Once an SNMPv3 engine ID is assigned, this engine ID is permanently associated with the device until you change it.

Use the **no** variant of this command to set the user defined SNMPv3 engine ID to a system generated pseudo-random value by resetting the SNMPv3 engine. The **no snmp-server engineID local** command has the same effect as the **snmp-server engineID local default** command.

Note that the [snmp-server engineID local reset](#) command is used to force the system to generate a new engine ID when the current engine ID is also system generated.

**Syntax** `snmp-server engineID local {<engine-id>|default}`  
`no snmp-server engineID local`

| Parameter                      | Description                                                                                                                                                                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;engine-id&gt;</code> | Specify SNMPv3 Engine ID value, a string of up to 27 characters.                                                                                                                                                                                                                                 |
| <code>default</code>           | Set SNMPv3 engine ID to a system generated value by resetting the SNMPv3 engine, provided the current engine ID is user defined. If the current engine ID is system generated, use the <a href="#">snmp-server engineID local reset</a> command to force the system to generate a new engine ID. |

**Mode** Global Configuration

**Usage** All devices must have a unique engine ID which is permanently set unless it is configured by the user.

**Example** To set the SNMPv3 engine ID to 800000cf030000cd123456, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local
800000cf030000cd123456
```

To set a user defined SNMPv3 engine ID back to a system generated value, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server engineID local
```

**Output** The following example shows the engine ID values after configuration:

```
awplus(config)#snmp-server engineid local asdgdh231234d
awplus(config)#exit
awplus#show snmp-server

SNMP Server Enabled
IP Protocol IPv4
SNMPv3 Engine ID (configured name) ... asdgdh231234d
SNMPv3 Engine ID (actual) 0x80001f888029af52e149198483

awplus(config)#no snmp-server engineid local
awplus(config)#exit
awplus#show snmp-server

SNMP Server Enabled
IP Protocol IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) 0x80001f888029af52e149198483
```

**Related Commands**

- [show snmp-server](#)
- [snmp-server engineID local reset](#)
- [snmp-server group](#)

# snmp-server engineID local reset

**Overview** Use this command to force the device to generate a new pseudo-random SNMPv3 engine ID by resetting the SNMPv3 engine. If the current engine ID is user defined, use the [snmp-server engineID local](#) command to set SNMPv3 engine ID to a system generated value.

**Syntax** `snmp-server engineID local reset`

**Mode** Global Configuration

**Example** To force the SNMPv3 engine ID to be reset to a system generated value, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local reset
```

**Related Commands** [snmp-server engineID local](#)  
[show snmp-server](#)

# snmp-server group

**Overview** This command is used with SNMP version 3 only, and adds an SNMP group, optionally setting the security level and view access modes for the group. The security and access views defined for the group represent the minimum required of its users in order to gain access.

The **no** variant of this command deletes an SNMP group, and is used with SNMPv3 only. The group with the specified authentication/encryption parameters must already exist.

**Syntax** `snmp-server group <groupname> {auth|noauth|priv} [read <readname>|write <writename>|notify <notifyname>]`  
`no snmp-server group <groupname> {auth|noauth|priv}`

| Parameter    | Description                                                                                 |
|--------------|---------------------------------------------------------------------------------------------|
| <groupname>  | Group name. The group name is a string up to 20 characters long and is case sensitive.      |
| auth         | Authentication.                                                                             |
| noauth       | No authentication and no encryption.                                                        |
| priv         | Authentication and encryption.                                                              |
| read         | Configure read view.                                                                        |
| <readname>   | Read view name.                                                                             |
| write        | Configure write view.                                                                       |
| <writename>  | Write view name. The view name is a string up to 20 characters long and is case sensitive.  |
| notify       | Configure notify view.                                                                      |
| <notifyname> | Notify view name. The view name is a string up to 20 characters long and is case sensitive. |

**Mode** Global Configuration

**Examples** To add SNMP group, for ordinary users, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server group usergroup noauth read
useraccess write useraccess
```

To delete SNMP group `usergroup`, use the following commands

```
awplus# configure terminal
awplus(config)# no snmp-server group usergroup noauth
```

**Related  
Commands**

- snmp-server
- show snmp-server
- show snmp-server group
- show snmp-server user

# snmp-server host

**Overview** This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6),
- inform or trap messages,
- community name (SNMPv1 or SNMP v2c) or the authentication/encryption parameters and user name (SNMP v3).

**Syntax**

```
snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>]

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>

no snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>
```

| Parameter      | Description                                                                            |
|----------------|----------------------------------------------------------------------------------------|
| <ipv4-address> | IPv4 trap host address in the format A . B . C . D, for example, 192.0.2.2.            |
| <ipv6-address> | IPv6 trap host address in the format x : x : : x : x for example, 2001:db8::8a2e:7334. |
| informs        | Send Inform messages to this host.                                                     |
| traps          | Send Trap messages to this host (default).                                             |
| version        | SNMP version to use for notification messages. Default: version 1.                     |
| 1              | Use SNMPv1 (default).                                                                  |
| 2c             | Use SNMPv2c.                                                                           |
| 3              | Use SNMPv3.                                                                            |

| Parameter        | Description                           |
|------------------|---------------------------------------|
| auth             | Authentication.                       |
| noauth           | No authentication.                    |
| priv             | Encryption.                           |
| <community-name> | The SNMPv1 or SNMPv2c community name. |
| <user-name>      | SNMPv3 user name.                     |

**Mode** Global Configuration

**Examples** To configure the device to send generated traps to the IPv4 host destination 192.0.2.5 with the SNMPv2c community name public, use the following command:

```
awplus# configure terminal
awplus(config)# snmp-server host version 2c public192.0.2.5
```

To configure the device to send generated traps to the IPv6 host destination 2001:db8::8a2e:7334 with the SNMPv2c community name private, use the following command:

```
awplus# configure terminal
awplus(config)# snmp-server host version 2c
private2001:db8::8a2e:7334
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name public, use the following command:

```
awplus# configure terminal
awplus(config)# no snmp-server host version 2c public192.0.2.5
```

**Related Commands**

- [snmp trap link-status](#)
- [snmp-server enable trap](#)
- [snmp-server view](#)

# snmp-server legacy-ifadminstatus

**Overview** Use this command to set the ifAdminStatus to reflect the operational state of the interface, rather than the administrative state.

The **no** variant of this command sets the ifAdminStatus to reflect the administrative state of the interface.

**Syntax** `snmp-server legacy-ifadminstatus`  
`no snmp-server legacy-ifadminstatus`

**Default** Legacy ifAdminStatus is turned off by default, so by default the SNMP ifAdminStatus reflects the administrative state of the interface.

**Mode** Global Configuration

**Usage** Note that if you enable Legacy ifAdminStatus, the ifAdminStatus will report a link's status as Down when the link has been blocked by a process such as loop protection.

**Example** To turn on Legacy ifAdminStatus, use the command:

```
awplus#snmp-server legacy-ifadminstatus
```

**Related Commands** [show interface](#)

# snmp-server location

**Overview** This command sets the location of the system. The location is:

- displayed in the output of the [show system](#) command
- stored in the MIB object sysLocation

The **no** variant of this command removes the configured location from the system.

**Syntax** `snmp-server location <location-name>`  
`no snmp-server location`

| Parameter                          | Description                                                                                                         |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <code>&lt;location-name&gt;</code> | The location of the system, from 0 to 255 characters long. Valid characters are any printable character and spaces. |

**Mode** Global Configuration

**Example** To set the location to “server room 523”, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server location server room 523
```

**Related Commands** [show snmp-server](#)  
[show system](#)  
[snmp-server contact](#)

# snmp-server source-interface

**Overview** Use this command to specify the originating interface for SNMP traps or informs. An interface specified by this command must already have an IP address assigned to it.

Use the **no** variant of this command to reset the interface to its default value (the originating egress interface).

**Syntax** `snmp-server source-interface {traps|informs} <interface-name>`  
`no snmp-server source-interface {traps|informs}`

| Parameter        | Description                                                |
|------------------|------------------------------------------------------------|
| traps            | SNMP traps.                                                |
| informs          | SNMP informs.                                              |
| <interface-name> | Interface name (must already have an IP address assigned). |

**Default** By default, the source interface is the originating egress interface of the traps and informs messages.

**Mode** Global Configuration

**Usage** An SNMP trap or inform message that is sent from an SNMP server carries the notification IP address of its originating interface. Use this command to assign this interface.

**Example** The following commands set VLAN20 to be the interface whose IP address is used as the originating address in SNMP informs packets.

```
awplus# configure terminal
awplus(config)# snmp-server source-interface informs vlan20
```

The following commands reset the originating source interface for SNMP trap messages to be the default interface (the originating egress interface):

```
awplus# configure terminal
awplus(config)# no snmp-server source-interface traps
```

**Validation Commands** `show running-config`

# snmp-server startup-trap-delay

**Overview** Use this command to set the time in seconds after following completion of the device startup sequence before the device sends any SNMP traps (or SNMP notifications).

Use the no variant of this command to restore the default startup delay of 30 seconds.

**Syntax** `snmp-server startup-trap-delay <delay-time>`  
`no snmp-server startup-trap-delay`

| Parameter                       | Description                                                                   |
|---------------------------------|-------------------------------------------------------------------------------|
| <code>&lt;delay-time&gt;</code> | Specify an SNMP trap delay time in seconds in the range of 30 to 600 seconds. |

**Default** The SNMP server trap delay time is 30 seconds. The no variant restores the default.

**Mode** Global Configuration

**Example** To delay the device sending SNMP traps until 60 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server startup-trap-delay 60
```

To restore the sending of SNMP traps to the default of 30 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server startup-trap-delay
```

**Validation Commands** `show snmp-server`

# snmp-server user

**Overview** Use this command to create or move users as members of specified groups. This command is used with SNMPv3 only.

The **no** variant of this command removes an SNMPv3 user. The specified user must already exist.

**Syntax** `snmp-server user <username> <groupname> [encrypted] [auth {md5|sha} <auth-password>] [priv {des|aes} <privacy-password>]`  
`no snmp-server user <username>`

| Parameter          | Description                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------|
| <username>         | User name. The user name is a string up to 20 characters long and is case sensitive.                |
| <groupname>        | Group name. The group name is a string up to 20 characters long and is case sensitive.              |
| encrypted          | Use the encrypted parameter when you want to enter encrypted passwords.                             |
| auth               | Authentication protocol.                                                                            |
| md5                | MD5 Message Digest Algorithms.                                                                      |
| sha                | SHA Secure Hash Algorithm.                                                                          |
| <auth-password>    | Authentication password. The password is a string of 8 to 20 characters long and is case sensitive. |
| priv               | Privacy protocol.                                                                                   |
| des                | DES Data Encryption Standard.                                                                       |
| aes                | AES Advanced Encryption Standards.                                                                  |
| <privacy-password> | Privacy password. The password is a string of 8 to 20 characters long and is case sensitive.        |

**Mode** Global Configuration

**Usage** Additionally this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

- Note that each SNMP user must be configured on both the manager and agent entities. Where passwords are used, these passwords must be the same for both entities.
- Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configs stored on the device. For example, you may need to move a user from one group to another group and keep the same passwords for the user instead of removing the user to apply new passwords.

- User passwords are entered using plaintext without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.
- User passwords are viewed as encrypted passwords in running and startup configs shown from **show running-config** and **show startup-config** commands respectively. Copy and paste encrypted passwords from running-configs or startup-configs to avoid entry errors.

**Examples** To add SNMP user `authuser` as a member of group `usergroup`, with authentication protocol `md5`, authentication password `Authpass`, privacy protocol `des` and privacy password `Privpass`, use the following commands

```
awplus# configure terminal
awplus(config)# snmp-server user authuser usergroup auth md5
Authpass priv des Privpass
```

Validate the user is assigned to the group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name Group name Auth Privacy
----- -
authuser usergroup md5 des
```

To enter existing SNMP user `authuser` with existing passwords as a member of group `newusergroup` with authentication protocol `md5` plus the encrypted authentication password `0x1c74b9c22118291b0ce0cd883f8dab6b74`, privacy protocol `des` plus the encrypted privacy password `0x0e0133db5453ebd03822b004eeacb6608f`, use the following commands

```
awplus# configure terminal
awplus(config)# snmp-server user authuser newusergroup
encrypted auth md5 0x1c74b9c22118291b0ce0cd883f8dab6b74 priv
des 0x0e0133db5453ebd03822b004eeacb6608f
```

**NOTE:** Copy and paste the encrypted passwords from the **running-config** or the **startup-config** displayed, using the **show running-config** and **show startup-config** commands respectively, into the command line to avoid key stroke errors issuing this command.

Validate the user has been moved from the first group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name Group name Auth Privacy
----- -
authuser newusergroup md5 des
```

To delete SNMP user `authuser`, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server user authuser
```

**Related  
Commands** [show snmp-server user](#)  
[snmp-server view](#)

# snmp-server view

**Overview** Use this command to create an SNMP view that specifies a sub-tree of the MIB. Further sub-trees can then be added by specifying a new OID to an existing view. Views can be used in SNMP communities or groups to control the remote manager's access.

**NOTE:** The object identifier must be specified in a sequence of integers separated by decimal points.

The **no** variant of this command removes the specified view on the device. The view must already exist.

**Syntax** `snmp-server view <view-name> <mib-name> {included|excluded}`  
`no snmp-server view <view-name>`

| Parameter   | Description                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------|
| <view-name> | SNMP server view name.<br>The view name is a string up to 20 characters long and is case sensitive. |
| <mib-name>  | Object identifier of the MIB.                                                                       |
| included    | Include this OID in the view.                                                                       |
| excluded    | Exclude this OID in the view.                                                                       |

**Mode** Global Configuration

**Examples** The following command creates a view called "loc" that includes the system location MIB sub-tree.

```
awplus(config)# snmp-server view loc 1.3.6.1.2.1.1.6.0 included
```

To remove the view "loc" use the following command

```
awplus(config)# no snmp-server view loc
```

# debug mail

**Overview** This command turns on debugging for sending emails.  
The **no** variant of this command turns off debugging for sending emails.

**Syntax** debug mail  
no debug mail

**Mode** Privileged Exec

**Examples** To turn on debugging for sending emails, use the command:

```
awplus# debug mail
```

To turn off debugging for sending emails, use the command:

```
awplus# no debug mail
```

**Related  
Commands** delete mail  
mail  
show mail  
show counter mail  
undebug mail

# delete mail

**Overview** This command deletes mail from the queue.

**Syntax** delete mail [mail-id <mail-id>|all]

| Parameter | Description                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| mail-id   | Deletes a single mail from the mail queue.                                                                         |
|           | <mail-id> An unique mail ID number. Use the <a href="#">show mail</a> command to display this for an item of mail. |
| all       | Delete all the mail in the queue.                                                                                  |

**Mode** Privileged Exec

**Examples** To delete a unique mail item 20060912142356.1234 from the queue, use the command:

```
awplus# delete mail 20060912142356.1234
```

To delete all mail from the queue, use the command:

```
awplus# delete mail all
```

**Related Commands** [debug mail](#)  
[mail](#)  
[show mail](#)

# mail

**Overview** This command sends an email using the SMTP protocol. If you specify a file the text inside the file is sent in the message body.

If you do not specify the **to**, **file**, or **subject** parameters, the CLI prompts you for the missing information.

**Syntax** `mail [{to <to>|subject <subject>|file <filename>}]`

| Parameter | Description                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------|
| to        | The email recipient.<br><hr/> <code>&lt;to&gt;</code> Email address.                                                                           |
| subject   | Description of the subject of this email. Use quote marks when the subject text contains spaces.<br><hr/> <code>&lt;subject&gt;</code> String. |
| file      | File to insert as text into the message body.<br><hr/> <code>&lt;filename&gt;</code> String.                                                   |

**Mode** Privileged Exec

**Example** To send an email to `rei@nerv.com` with the subject `dummy plug configuration`, and with the message body inserted from the file `plug.conf` use the command:

```
awplus# mail rei@nerv.com subject dummy plug configuration
filename plug.conf
```

# show counter mail

**Overview** This command displays the mail counters.

**Syntax** `show counter mail`

**Mode** User Exec and Privileged Exec

**Output** Figure 55-1: Example output from the **show counter mail** command

```
Mail Client (SMTP) counters
Mails Sent 0
Mails Sent Fails 1
```

**Table 1:** Parameters in the output of the **show counter mail** command

| Parameter        | Description                                                                   |
|------------------|-------------------------------------------------------------------------------|
| Mails Sent       | The number of emails sent successfully since the last device restart.         |
| Mails Sent Fails | The number of emails the device failed to send since the last device restart. |

**Example** To show the emails in the queue use the command:

```
awplus# show counter mail
```

# banner login (SSH)

**Overview** This command configures a login banner on the SSH server. This displays a message on the remote terminal of the SSH client before the login prompt. SSH client version 1 does not support this banner.

To add a banner, first enter the command **banner login**, and hit [Enter]. Write your message. You can use any character and spaces. Use Ctrl+D at the end of your message to save the text and re-enter the normal command line mode.

The banner message is preserved if the device restarts.

The **no** variant of this command deletes the login banner from the device.

**Syntax** banner login  
no banner login

**Default** No banner is defined by default.

**Mode** Global Configuration

**Examples** To set a login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# banner login
```

The screen will prompt you to enter the message:

Type CNTL/D to finish.

... banner message comes here ...

Enter the message. Use Ctrl+D to finish, like this:

```
^D
awplus(config)#
```

To remove the login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# no banner login
```

**Related Commands** [show banner login](#)

# clear ssh

**Overview** This command deletes Secure Shell sessions currently active on the device. This includes both incoming and outgoing sessions. The deleted sessions are closed. You can only delete an SSH session if you are a system manager or the user who initiated the session. If **all** is specified then all active SSH sessions are deleted.

**Syntax** `clear ssh {<1-65535>|all}`

| Parameters | Description                                                                |
|------------|----------------------------------------------------------------------------|
| <1-65535>  | Specify a session ID in the range 1 to 65535 to delete a specific session. |
| all        | Delete all SSH sessions.                                                   |

**Mode** Privileged Exec

**Examples** To stop the current SSH session 123, use the command:

```
awplus# clear ssh 123
```

To stop all SSH sessions active on the device, use the command:

```
awplus# clear ssh all
```

**Related  
Commands** [service ssh](#)  
[ssh](#)

# crypto key destroy hostkey

**Overview** This command deletes the existing public and private keys of the SSH server.

When you enable the SSH server, the server automatically generates an SSHv2 host key pair (public and private keys), using RSA with 1024-bit key generation. If you need a key with different parameters than this, you can use the [crypto key generate hostkey](#) command to generate that key before you enable the SSH server.

**Syntax** `crypto key destroy hostkey {dsa|ecdsa|rsa|rsa1}`

| Parameters | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| dsa        | Deletes the existing DSA public and private keys.                                          |
| ecdsa      | Deletes the existing ECDSA public and private keys.                                        |
| rsa        | Deletes the existing RSA public and private keys configured for SSH version 2 connections. |
| rsa1       | Deletes the existing RSA public and private keys configured for SSH version 1 connections. |

**Mode** Global Configuration

**Example** To destroy the RSA host key used for SSH version 2 connections, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy hostkey rsa
```

**Related Commands** [crypto key generate hostkey](#)  
[service ssh](#)

# crypto key destroy userkey

**Overview** This command destroys the existing public and private keys of an SSH user configured on the device.

**Syntax** `crypto key destroy userkey <username> {dsa|rsa|rsa1}`

| Parameters                    | Description                                                                                                                                                                            |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;username&gt;</code> | Name of the user whose userkey you are destroying. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| <code>dsa</code>              | Deletes the existing DSA userkey.                                                                                                                                                      |
| <code>rsa</code>              | Deletes the existing RSA userkey configured for SSH version 2 connections.                                                                                                             |
| <code>rsa1</code>             | Deletes the existing RSA userkey for SSH version 1 connections.                                                                                                                        |

**Mode** Global Configuration

**Example** To destroy the RSA user key for the SSH user `remoteuser`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy userkey remoteuser rsa
```

**Related Commands**

- [crypto key generate hostkey](#)
- [show ssh](#)
- [show crypto key hostkey](#)

# crypto key generate hostkey

**Overview** This command generates public and private keys for the SSH server.

When you enable the SSH server, the server automatically generates an SSHv2 host key pair (public and private keys), using RSA with 1024-bit key generation.

If you need a key with different parameters than this, you can use this command to generate that key before you enable the SSH server. If a host key exists with the same cryptography algorithm, this command replaces the old host key with the new key.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

**Syntax** `crypto key generate hostkey {dsa} [<768-1024>]`  
`crypto key generate hostkey {rsa|rsa1} [<768-32768>]`  
`crypto key generate hostkey {ecdsa} [<256|384>]`

| Parameters  | Description                                                                               |
|-------------|-------------------------------------------------------------------------------------------|
| dsa         | Creates a DSA hostkey. Both SSH version 1 and 2 connections can use the DSA hostkey.      |
| rsa         | Creates an RSA hostkey for SSH version 2 connections.                                     |
| rsa1        | Creates an RSA hostkey for SSH version 1 connections.                                     |
| ecdsa       | Creates an ECDSA hostkey. Both SSH version 1 and 2 connections can use the ECDSA hostkey. |
| <768-32768> | The length in bits of the generated key. The default is 1024 bits.                        |
| <256 384>   | The ECDSA key size in bits. The default is 256, but it can be set to 384.                 |

**Default** The default key length for RSA and DSA is 1024 bits.

The default key size for ECDSA is 256 bits.

**Mode** Global Configuration

**Examples** To generate an RSA host key for SSH version 2 connections that is 2048 bits in length, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey rsa 2048
```

To generate a DSA host key, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate dsa
```

To generate an ECDSA host key with an elliptic curve size of 384 bits, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate ecdsa 384
```

**Related  
Commands**

[crypto key destroy hostkey](#)  
[service ssh](#)  
[show crypto key hostkey](#)

# crypto key generate userkey

**Overview** This command generates public and private keys for an SSH user using either an RSA or DSA cryptography algorithm. To use public key authentication, copy the public key of the user onto the remote SSH server.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

**Syntax** `crypto key generate userkey <username> {dsa} [<768-1024>]`  
`crypto key generate userkey <username> {rsa|rsa1} [<768-32768>]`  
`crypto key generate userkey <username> {ecdsa} [<256|384>]`

| Parameters  | Description                                                                                                                                                                              |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <username>  | Name of the user that the user key is generated for. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| dsa         | Creates a DSA userkey. Both SSH version 1 and 2 connections can use a key created with this command.                                                                                     |
| rsa         | Creates an RSA userkey for SSH version 2 connections.                                                                                                                                    |
| rsa1        | Creates an RSA userkey for SSH version 1 connections.                                                                                                                                    |
| ecdsa       | Creates an ECDSA hostkey. Both SSH version 1 and 2 connections can use the ECDSA hostkey.                                                                                                |
| <768-32768> | The length in bits of the generated key. The default is 1024 bits.                                                                                                                       |
| <256 384>   | The ECDSA key size in bits. The default is 256, but it can be set to 384.                                                                                                                |

**Mode** Global Configuration

**Examples** To generate a 2048-bits RSA user key for SSH version 2 connections for the user "bob", use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey bob rsa 2048
```

To generate a DSA user key for the user "lapo", use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo dsa
```

**Related Commands** [crypto key pubkey-chain userkey](#)  
[show crypto key userkey](#)

# crypto key pubkey-chain knownhosts

**Overview** This command adds a public key of the specified SSH server to the known host database on your device. The SSH client on your device uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

**Syntax** `crypto key pubkey-chain knownhosts [ip|ipv6] <hostname> [rsa|dsa|rsa1]`  
`no crypto key pubkey-chain knownhosts <1-65535>`

**Syntax (VRF-lite)** `crypto key pubkey-chain knownhosts [vrf <vrf-name>] [ip|ipv6] <hostname> [rsa|dsa|rsa1]`  
`no crypto key pubkey-chain knownhosts [vrf <vrf-name>] <1-65535>`

| Parameter  | Description                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| vrf        | Apply this command to the specified VRF instance.                                                                                          |
| <vrf-name> | The VRF instance name                                                                                                                      |
| ip         | Keyword used prior to specifying an IPv4 address                                                                                           |
| ipv6       | Keyword used prior to specifying an IPv6 address                                                                                           |
| <hostname> | IPv4/IPv6 address or hostname of a remote server in the format a.b.c.d for an IPv4 address, or in the format x:x::x:x for an IPv6 address. |
| rsa        | Specify the RSA public key of the server to be added to the known host database.                                                           |
| dsa        | Specify the DSA public key of the server to be added to the known host database.                                                           |
| rsa1       | Specify the SSHv1 public key of the server to be added to the know host database.                                                          |
| <1-65535>  | Specify a key identifier when removing a key using the <b>no</b> parameter.                                                                |

**Default** If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

**Mode** Privilege Exec

**Usage** This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

**Examples** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

**Examples (VRF-lite)** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 in VRF red to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts vrf red 192.0.2.11
```

To delete the second entry in the known host database in VRF red, use the command:

```
awplus# no crypto key pubkey-chain knownhosts vrf red 2
```

**Validation Commands** [show crypto key pubkey-chain knownhosts](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# crypto key pubkey-chain userkey

**Overview** This command adds a public key for an SSH user on the SSH server. This allows the SSH server to support public key authentication for the SSH user. When configured, the SSH user can access the SSH server without providing a password from the remote host.

The **no** variant of this command removes a public key for the specified SSH user that has been added to the public key chain. When a SSH user's public key is removed, the SSH user can no longer login using public key authentication.

**Syntax** `crypto key pubkey-chain userkey <username> [<filename>]`  
`no crypto key pubkey-chain userkey <username> <1-65535>`

| Parameters | Description                                                                                                                                                                                                              |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <username> | Name of the user that the SSH server associates the key with. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.<br>Default: no default |
| <filename> | Filename of a key saved in flash. Valid characters are any printable character. You can add a key as a hexadecimal string directly into the terminal if you do not specify a filename.                                   |
| <1-65535>  | The key ID number of the user's key. Specify the key ID to delete a key.                                                                                                                                                 |

**Mode** Global Configuration

**Usage** You should import the public key file from the client node. The device can read the data from a file on the flash or user terminal.

Or you can add a key as text into the terminal. To add a key as text into the terminal, first enter the command **crypto key pubkey-chain userkey <username>**, and hit [Enter]. Enter the key as text. Note that the key you enter as text must be a valid SSH RSA key, not random ASCII text. Use [Ctrl]+D after entering it to save the text and re-enter the normal command line mode.

Note you can generate a valid SSH RSA key on the device first using the **crypto key generate host rsa** command. View the SSH RSA key generated on the device using the **show crypto hostkey rsa** command. Copy and paste the displayed SSH RSA key after entering the **crypto key pubkey-chain userkey <username>** command. Use [Ctrl]+D after entering it to save it.

**Examples** To generate a valid SSH RSA key on the device and add the key, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto key generate host rsa
awplus(config)# exit

awplus# show crypto key hostkey
rsaAAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWluhnUC768EoWhyPW6FZ2t5360O5M29EpKBmGq1kQaz5V0mU9IQe66+5YyD4UxOKSDtTI+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=

awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey joeType CNTRL/D
to
finish:AAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWluhnUC768EoWhyPW6FZ2t5360O5M29EpKBmGq1kQaz5V0mU9IQe66+5YyD4UxOKSDtTI+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=control-D

awplus(config)#
```

To add a public key for the user `graydon` from the file `key.pub`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey graydon key.pub
```

To add a public key for the user `tamara` from the terminal, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey tamara
```

and enter the key. Use Ctrl+D to finish.

To remove the first key entry from the public key chain of the user `john`, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto key pubkey-chain userkey john 1
```

**Related Commands** [show crypto key pubkey-chain userkey](#)

# debug ssh client

**Overview** This command enables the SSH client debugging facility. When enabled, any SSH, SCP and SFTP client sessions send diagnostic messages to the login terminal.

The **no** variant of this command disables the SSH client debugging facility. This stops the SSH client from generating diagnostic debugging message.

**Syntax** `debug ssh client [brief|full]`  
`no debug ssh client`

| Parameter | Description               |
|-----------|---------------------------|
| brief     | Enables brief debug mode. |
| full      | Enables full debug mode.  |

**Default** SSH client debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To start SSH client debugging, use the command:

```
awplus# debug ssh client
```

To start SSH client debugging with extended output, use the command:

```
awplus# debug ssh client full
```

To disable SSH client debugging, use the command:

```
awplus# no debug ssh client
```

**Related Commands** [debug ssh server](#)  
[show ssh client](#)  
[undebug ssh client](#)

# debug ssh server

**Overview** This command enables the SSH server debugging facility. When enabled, the SSH server sends diagnostic messages to the system log. To display the debugging messages on the terminal, use the **terminal monitor** command.

The **no** variant of this command disables the SSH server debugging facility. This stops the SSH server from generating diagnostic debugging messages.

**Syntax** `debug ssh server [brief|full]`  
`no debug ssh server`

| Parameter | Description               |
|-----------|---------------------------|
| brief     | Enables brief debug mode. |
| full      | Enables full debug mode.  |

**Default** SSH server debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To start SSH server debugging, use the command:

```
awplus# debug ssh server
```

To start SSH server debugging with extended output, use the command:

```
awplus# debug ssh server full
```

To disable SSH server debugging, use the command:

```
awplus# no debug ssh server
```

**Related Commands** [debug ssh client](#)  
[show ssh server](#)  
[undebug ssh server](#)

# service ssh

**Overview** This command enables the Secure Shell server on the device. Once enabled, connections coming from SSH clients are accepted.

When you enable the SSH server, the server automatically generates an SSHv2 host key pair (public and private keys), using RSA with 1024-bit key generation. If you need a key with different parameters than this, you can use the [crypto key generate hostkey](#) command to generate that key before you enable the SSH server.

The **no** variant of this command disables the Secure Shell server. When the Secure Shell server is disabled, connections from SSH, SCP, and SFTP clients are not accepted. This command does not affect existing SSH sessions. To terminate existing sessions, use the [clear ssh](#) command.

**Syntax** `service ssh [ip|ipv6]`  
`no service ssh [ip|ipv6]`

**Default** The Secure Shell server is disabled by default. Both IPv4 and IPv6 Secure Shell server are enabled when you issue **service ssh** without specifying the optional **ip** or **ipv6** parameters.

**Mode** Global Configuration

**Examples** To enable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh
```

To enable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ip
```

To enable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ipv6
```

To disable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh
```

To disable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ip
```

To disable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ipv6
```

**Related  
Commands**

- crypto key generate hostkey
- show running-config ssh
- show ssh server
- ssh server allow-users
- ssh server deny-users

# show banner login

**Overview** This command displays the banner message configured on the device. The banner message is displayed to the remote user before user authentication starts.

**Syntax** `show banner login`

**Mode** User Exec, Privileged Exec, Global Configuration, Interface Configuration, Line Configuration

**Example** To display the current login banner message, use the command:

```
awplus# show banner login
```

**Related Commands** [banner login \(SSH\)](#)

# show crypto key hostkey

**Overview** This command displays the public keys generated on the device for the SSH server.

When you enable the SSH server, the server automatically generates an SSHv2 host key pair (public and private keys), using RSA with 1024-bit key generation. If you need a key with different parameters than this, you can use the [crypto key generate hostkey](#) command to generate that key before you enable the SSH server.

The private key remains on the device secretly. The public key is copied to SSH clients to identify the server. This command displays the public key.

**Syntax** `show crypto key hostkey [dsa|ecdsa|rsa|rsa1]`

| Parameter | Description                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------|
| dsa       | Displays the DSA algorithm public key. Both SSH version 1 and 2 connections can use the DSA hostkey      |
| ecdsa     | Displays the ECDSA algorithm public key. Both SSH version 1 and 2 connections can use the ECDSA hostkey. |
| rsa       | Displays the RSA algorithm public key for SSH version 2 connections.                                     |
| rsa1      | Displays the RSA algorithm public key for SSH version 1 connections.                                     |

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To show the public keys generated on the device for SSH server, use the command:

```
awplus# show crypto key hostkey
```

To display the RSA public key of the SSH server, use the command:

```
awplus# show crypto key hostkey rsa
```

**Output** Figure 56-1: Example output from the **show crypto key hostkey** command

| Type | Bits | Fingerprint                                     |
|------|------|-------------------------------------------------|
| rsa  | 2058 | 4e:7d:1d:00:75:79:c5:cb:c8:58:2e:f9:29:9c:1f:48 |
| dsa  | 1024 | fa:72:3d:78:35:14:cb:9a:1d:ca:1c:83:2c:7d:08:43 |
| rsa1 | 1024 | e2:1c:c8:8b:d8:6e:19:c8:f4:ec:00:a2:71:4e:85:8b |

**Table 1:** Parameters in output of the **show crypto key hostkey** command

| Parameter   | Description                         |
|-------------|-------------------------------------|
| Type        | Algorithm used to generate the key. |
| Bits        | Length in bits of the key.          |
| Fingerprint | Checksum value for the public key.  |

**Related Commands** [crypto key destroy hostkey](#)  
[crypto key generate hostkey](#)

# show crypto key pubkey-chain knownhosts

**Overview** This command displays the list of public keys maintained in the known host database on the device.

**Syntax** `show crypto key pubkey-chain knownhosts [<1-65535>]`

**Syntax (VRF-lite)** `show crypto key pubkey-chain knownhosts [vrf <vrf-name>|global] [<1-65535>]`

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                           |
| <vrf-name> | The name of the VRF instance.                                                              |
| <1-65535>  | Key identifier for a specific key. Displays the public key of the entry if specified.      |

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

When VRF-lite is configured:

- If **vrf** is specified, this command displays the known host database from the specified VRF instance.
- If **global** is specified, this command displays the known host database from the global routing environment.
- If neither **vrf** nor **global** is specified, this command displays the known host database from the global routing environment and each configured VRF.

For more information about VRF, see the [VRF Lite Feature Overview and Configuration Guide](#).

**Examples** To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

**Output** Figure 56-2: Example output from the **show crypto key public-chain knownhosts** command

| No | Hostname                                 | Type | Fingerprint                                     |
|----|------------------------------------------|------|-------------------------------------------------|
| 1  | 172.16.23.1                              | rsa  | c8:33:b1:fe:6f:d3:8c:81:4e:f7:2a:aa:a5:be:df:18 |
| 2  | 172.16.23.10                             | rsa  | c4:79:86:65:ee:a0:1d:a5:6a:e8:fd:1d:d3:4e:37:bd |

**Table 2:** Parameters in the output of the **show crypto key public-chain knownhosts** command

| Parameter   | Description                             |
|-------------|-----------------------------------------|
| No          | Number ID of the key.                   |
| Hostname    | Host name of the known SSH server.      |
| Type        | The algorithm used to generate the key. |
| Fingerprint | Checksum value for the public key.      |

**Related Commands** [crypto key pubkey-chain knownhosts](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show crypto key pubkey-chain userkey

**Overview** This command displays the public keys registered with the SSH server for SSH users. These keys allow remote users to access the device using public key authentication. By using public key authentication, users can access the SSH server without providing password.

**Syntax** `show crypto key pubkey-chain userkey <username> [<1-65535>]`

| Parameter  | Description                                                                                                                                                                                          |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <username> | User name of the remote SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| <1-65535>  | Key identifier for a specific key.                                                                                                                                                                   |

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the public keys for the user `manager` that are registered with the SSH server, use the command:

```
awplus# show crypto key pubkey-chain userkey manager
```

**Output** Figure 56-3: Example output from the **show crypto key public-chain userkey** command

| No | Type | Bits | Fingerprint                                     |
|----|------|------|-------------------------------------------------|
| 1  | dsa  | 1024 | 2b:cc:df:a8:f8:2e:8f:a4:a5:4f:32:ea:67:29:78:fd |
| 2  | rsa  | 2048 | 6a:ba:22:84:c1:26:42:57:2c:d7:85:c8:06:32:49:0e |

**Table 3:** Parameters in the output of the **show crypto key userkey** command

| Parameter   | Description                             |
|-------------|-----------------------------------------|
| No          | Number ID of the key.                   |
| Type        | The algorithm used to generate the key. |
| Bits        | Length in bits of the key.              |
| Fingerprint | Checksum value for the key.             |

**Related Commands** [crypto key pubkey-chain userkey](#)

# show crypto key userkey

**Overview** This command displays the public keys created on this device for the specified SSH user.

**Syntax** `show crypto key userkey <username> [dsa|rsa|rsa1]`

| Parameter  | Description                                                                                                                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <username> | User name of the local SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| dsa        | Displays the DSA public key.                                                                                                                                                                        |
| rsa        | Displays the RSA public key used for SSH version 2 connections.                                                                                                                                     |
| rsa1       | Displays the RSA key used for SSH version 1 connections.                                                                                                                                            |

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To show the public key generated for the user, use the command:

```
awplus# show crypto key userkey manager
```

To store the RSA public key generated for the user manager to the file "user.pub", use the command:

```
awplus# show crypto key userkey manager rsa > manager-rsa.pub
```

**Output** Figure 56-4: Example output from the **show crypto key userkey** command

| Type | Bits | Fingerprint                                     |
|------|------|-------------------------------------------------|
| rsa  | 2048 | e8:d6:1b:c0:f4:b6:e6:7d:02:2e:a9:d4:a1:ca:3b:11 |
| rsa1 | 1024 | 12:25:60:95:64:08:8e:a1:8c:3c:45:1b:44:b9:33:9b |

**Table 4:** Parameters in the output of the **show crypto key userkey** command

| Parameter   | Description                             |
|-------------|-----------------------------------------|
| Type        | The algorithm used to generate the key. |
| Bits        | Length in bits of the key.              |
| Fingerprint | Checksum value for the key.             |

**Related Commands** [crypto key generate userkey](#)

# show running-config ssh

**Overview** This command displays the current running configuration of Secure Shell (SSH).

**Syntax** `show running-config ssh`

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of SSH, use the command:

```
awplus# show running-config ssh
```

**Output** Figure 56-5: Example output from the **show running-config ssh** command

```
!
ssh server session-timeout 600
ssh server login-timeout 30
ssh server allow-users manager 192.168.1.*
ssh server allow-users john
ssh server deny-user john*.a-company.com
ssh server
```

**Table 5:** Parameters in the output of the **show running-config ssh** command

| Parameter                                           | Description                                                                 |
|-----------------------------------------------------|-----------------------------------------------------------------------------|
| <code>ssh server</code>                             | SSH server is enabled.                                                      |
| <code>ssh server v2</code>                          | SSH server is enabled and only support SSHv2.                               |
| <code>ssh server&lt;port&gt;</code>                 | SSH server is enabled and listening on the specified TCP port.              |
| <code>no ssh server scp</code>                      | SCP service is disabled.                                                    |
| <code>no ssh server sftp</code>                     | SFTP service is disabled.                                                   |
| <code>ssh server session-timeout</code>             | Configure the server session timeout.                                       |
| <code>ssh server login-timeout</code>               | Configure the server login timeout.                                         |
| <code>ssh server max-startups</code>                | Configure the maximum number of concurrent sessions waiting authentication. |
| <code>no ssh server authentication password</code>  | Password authentication is disabled.                                        |
| <code>no ssh server authentication publickey</code> | Public key authentication is disabled.                                      |

**Table 5:** Parameters in the output of the **show running-config ssh** command

| Parameter              | Description                                    |
|------------------------|------------------------------------------------|
| ssh server allow-users | Add the user (and hostname) to the allow list. |
| ssh server deny-users  | Add the user (and hostname) to the deny list.  |

**Related  
Commands** [service ssh](#)  
[show ssh server](#)

# show ssh

**Overview** This command displays the active SSH sessions on the device, both incoming and outgoing.

**Syntax** `show ssh`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the current SSH sessions on the device, use the command:

```
awplus# show ssh
```

**Output** Figure 56-6: Example output from the **show ssh** command

```
Secure Shell Sessions:
ID Type Mode Peer Host Username State Filename

414 ssh server 172.16.23.1 root open
456 ssh client 172.16.23.10 manager user-auth
459 scp client 172.16.23.12 root download 550dev_.awd
463 ssh client 5ffe:33fe:5632:ffbb:bc35:ddee:0101:ac51
 manager user-auth
```

**Table 6:** Parameters in the output of the **show ssh** command

| Parameter | Description                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------|
| ID        | Unique identifier for each SSH session.                                                                  |
| Type      | Session type; either SSH, SCP, or SFTP.                                                                  |
| Mode      | Whether the device is acting as an SSH client (client) or SSH server (server) for the specified session. |
| Peer Host | The hostname or IP address of the remote server or client.                                               |
| Username  | Login user name of the server.                                                                           |

**Table 6:** Parameters in the output of the **show ssh** command (cont.)

| Parameter | Description                                                           |                                                 |
|-----------|-----------------------------------------------------------------------|-------------------------------------------------|
| State     | The current state of the SSH session. One of:                         |                                                 |
|           | connecting                                                            | The device is looking for a remote server.      |
|           | connected                                                             | The device is connected to the remote server.   |
|           | accepted                                                              | The device has accepted a new session.          |
|           | host-auth                                                             | host-to-host authentication is in progress.     |
|           | user-auth                                                             | User authentication is in progress.             |
|           | authenticated                                                         | User authentication is complete.                |
|           | open                                                                  | The session is in progress.                     |
|           | download                                                              | The user is downloading a file from the device. |
|           | upload                                                                | The user is uploading a file from the device.   |
|           | closing                                                               | The user is terminating the session.            |
|           | closed                                                                | The session is closed.                          |
| Filename  | Local filename of the file that the user is downloading or uploading. |                                                 |

**Related Commands** [clear ssh](#)

# show ssh client

**Overview** This command displays the current configuration of the Secure Shell client.

**Syntax** `show ssh client`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the current configuration for SSH clients on the login shell, use the command:

```
awplus# show ssh client
```

**Output** Figure 56-7: Example output from the **show ssh client** command

```
Secure Shell Client Configuration

Port : 22
Version : 2,1
Connect Timeout : 30 seconds
Session Timeout : 0 (off)
Debug : NONE
```

**Table 7:** Parameters in the output of the **show ssh client** command

| Parameter       | Description                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port            | SSH server TCP port where the SSH client connects to. The default is port 22.                                                                               |
| Version         | SSH server version; either "1", "2" or "2,1".                                                                                                               |
| Connect Timeout | Time in seconds that the SSH client waits for an SSH session to establish. If the value is 0, the connection is terminated when it reaches the TCP timeout. |
| Debug           | Whether debugging is active on the client.                                                                                                                  |

**Related Commands** [show ssh server](#)

# show ssh server

**Overview** This command displays the current configuration of the Secure Shell server.

Note that changes to the SSH configuration affects only new SSH sessions coming from remote hosts, and does not affect existing sessions.

**Syntax** `show ssh server`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the current configuration of the Secure Shell server, use the command:

```
awplus# show ssh server
```

**Output** Figure 56-8: Example output from the **show ssh server** command

```
Secure Shell Server Configuration

SSH Server : Enabled
Port : 22
Version : 2
Services : scp, sftp
User Authentication : publickey, password
Resolve Hosts : Disabled
Session Timeout : 0 (Off)
Login Timeout : 60 seconds
Maximum Authentication Tries : 6
Maximum Startups : 10
Debug : NONE
```

**Table 8:** Parameters in the output of the **show ssh server** command

| Parameter      | Description                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SSH Server     | Whether the Secure Shell server is enabled or disabled.                                                                                                        |
| Port           | TCP port where the Secure Shell server listens for connections. The default is port 22.                                                                        |
| Version        | SSH server version; either "1", "2" or "2,1".                                                                                                                  |
| Services       | List of the available Secure Shell service; one or more of SHELL, SCP or SFTP.                                                                                 |
| Authentication | List of available authentication methods.                                                                                                                      |
| Login Timeout  | Time (in seconds) that the SSH server will wait the SSH session to establish. If the value is 0, the client login will be terminated when TCP timeout reaches. |

**Table 8:** Parameters in the output of the **show ssh server** command (cont.)

| Parameter        | Description                                                                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Idle Timeout     | Time (in seconds) that the SSH server will wait to receive data from the SSH client. The server disconnects if this timer limit is reached. If set at 0, the idle timer remains off. |
| Maximum Startups | The maximum number of concurrent connections that are waiting authentication. The default is 10.                                                                                     |
| Debug            | Whether debugging is active on the server.                                                                                                                                           |

**Related  
Commands** [show ssh](#)  
[show ssh client](#)

# show ssh server allow-users

**Overview** This command displays the user entries in the allow list of the SSH server.

**Syntax** `show ssh server allow-users`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the user entries in the allow list of the SSH server, use the command:

```
awplus# show ssh server allow-users
```

**Output** Figure 56-9: Example output from the **show ssh server allow-users** command

| Username | Remote Hostname (pattern) |
|----------|---------------------------|
| awplus   | 192.168.*                 |
| john     |                           |
| manager  | *.alliedtelesis.com       |

**Table 9:** Parameters in the output of the **show ssh server allow-users** command

| Parameter                 | Description                                                                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username                  | User name that is allowed to access the SSH server.                                                                                                                                       |
| Remote Hostname (pattern) | IP address or hostname pattern of the remote client. The user is allowed requests from a host that matches this pattern. If no hostname is specified, the user is allowed from all hosts. |

**Related Commands** [ssh server allow-users](#)  
[ssh server deny-users](#)

# show ssh server deny-users

**Overview** This command displays the user entries in the deny list of the SSH server. The user in the deny list is rejected to access the SSH server. If a user is not included in the access list of the SSH server, the user is also rejected.

**Syntax** `show ssh server deny-users`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the user entries in the deny list of the SSH server, use the command:

```
awplus# show ssh server deny-users
```

**Output** Figure 56-10: Example output from the **show ssh server deny-users** command

| Username | Remote Hostname (pattern) |
|----------|---------------------------|
| john     | *.b-company.com           |
| manager  | 192.168.2.*               |

**Table 10:** Parameters in the output of the **show ssh server deny-user** command

| Parameter                 | Description                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username                  | The user that this rule applies to.                                                                                                                                                     |
| Remote Hostname (pattern) | IP address or hostname pattern of the remote client. The user is denied requests from a host that matches this pattern. If no hostname is specified, the user is denied from all hosts. |

**Related Commands** [ssh server allow-users](#)  
[ssh server deny-users](#)

# ssh

**Overview** This command initiates a Secure Shell connection to a remote SSH server.

If the server requests a password for the user login, the user needs to type in the correct password on "Password:" prompt.

SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

**NOTE:** Note that a hostname specified with SSH cannot begin with a hyphen (-) character.

**Syntax** `ssh [ip|ipv6][[user <username>]|[port <1-65535>]|[version {1|2}]] <hostname> [<line>]`

**Syntax (VRF-lite)** `ssh [vrf <vrf-name>] [ip|ipv6][[user <username>]|[port <1-65535>]|[version {1|2}]] <hostname> [<line>]`

| Parameter  | Description                                                                                                                                                                                                                                                                                                               |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vrf        | Apply the command to the specified VRF instance.                                                                                                                                                                                                                                                                          |
| <vrf-name> | The name of the VRF instance.                                                                                                                                                                                                                                                                                             |
| ip         | Specify IPv4 SSH.                                                                                                                                                                                                                                                                                                         |
| ipv6       | Specify IPv6 SSH.                                                                                                                                                                                                                                                                                                         |
| user       | Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.<br><br><username> User name to login on the remote server.                                                                                       |
| port       | SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Other- wise, the client port configured by "ssh client" command or the default TCP port (22) is used.<br><br><1-65535> TCP port.                                                                     |
| version    | SSH client version. If version is specified, the SSH client supports only the specified SSH version. By default, SSH client uses SSHv2 first. If the server does not support SSHv2, it will try SSHv1. The default version can be configured by "ssh client" command.<br><br>1 Use SSH version 1.<br>2 Use SSH version 2. |

| Parameter                     | Description                                                                                                                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;hostname&gt;</code> | IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character. |
| <code>&lt;line&gt;</code>     | A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.                                                     |

**Mode** User Exec and Privileged Exec

**Examples** To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user "manager", use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server with example\_host using IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

**Example (VRF-lite)** To login to the remote SSH server at 192.168.1.1 on VRF "red", use the command:

```
awplus# ssh vrf red 192.168.1.1
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# ssh client

**Overview** This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the `ssh client` command, and restores the defaults.

This command does not affect the existing SSH sessions.

**Syntax**

```
ssh client {port <1-65535>|version {1|2}|session-timeout <0-3600>|connect-timeout <1-600>}
no ssh client {port|version|session-timeout|connect-timeout}
```

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| port            | The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port.<br>Default: 22                                                                                                                                                                                                     |
|                 | <1-65535> TCP port number.                                                                                                                                                                                                                                                                                                                                      |
| version         | The SSH version used by the client for SSH sessions. The SSH client supports both version 2 and version 1<br>Default: version 2<br>Note: SSH version 2 is the default SSH version. SSH client supports SSH version 1 if SSH version 2 is not configured using a ssh version command.                                                                            |
|                 | 1 SSH clients on the device supports SSH version 1 only.                                                                                                                                                                                                                                                                                                        |
|                 | 2 SSH clients on the device supports SSH version 2 only                                                                                                                                                                                                                                                                                                         |
| session-timeout | The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout.<br>Default: 0 (session timer remains off) |
|                 | <0-3600> Timeout in seconds.                                                                                                                                                                                                                                                                                                                                    |

| Parameter       | Description                                                                                                                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| connect-timeout | The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established.<br>Default: 30 |
|                 | <1-600> Timeout in seconds.                                                                                                                                                                            |

**Mode** Privileged Exec

**Examples** To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

**Related Commands** [show ssh client](#)  
[ssh](#)

# ssh server

**Overview** This command modifies the configuration of the SSH server. Changing these parameters affects new SSH sessions connecting to the device.

The **no** variant of this command restores the configuration of a specified parameter to its default. The change affects the SSH server immediately if the server is running. Otherwise, the configuration is used when the server starts.

To enable the SSH server, use the [service ssh](#) command.

**Syntax**

```
ssh server {[v1v2|v2only]|<1-65535>}
ssh server {[session-timeout <0-3600>} [login-timeout <1-600>]
[max-startups <1-128>]}
no ssh server {[session-timeout] [login-timeout]
[max-startups]}
```

| Parameter       | Description                                                                                                                                                                                                                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v1v2            | Supports both SSHv2 and SSHv1 client connections.<br>Default: v1v2                                                                                                                                                                                                                                                             |
| v2only          | Supports SSHv2 client connections only.                                                                                                                                                                                                                                                                                        |
| <1-65535>       | The TCP port number that the server listens to for incoming SSH sessions.<br>Default: 22                                                                                                                                                                                                                                       |
| session-timeout | There is a maximum time period that the server waits before deciding that a session is inactive and should be terminated. The server considers the session inactive when it has not received any data from the client, and when the client does not respond to keep alive messages.<br>Default: 0 (session timer remains off). |
|                 | <0-3600> Timeout in seconds.                                                                                                                                                                                                                                                                                                   |
| login-timeout   | The maximum time period the server waits before disconnecting an unauthenticated client.<br>Default: 60                                                                                                                                                                                                                        |
|                 | <1-600> Timeout in seconds.                                                                                                                                                                                                                                                                                                    |
| max-startups    | The maximum number of concurrent unauthenticated connections the server accepts. When the number of SSH connections awaiting authentication reaches the limit, the server drops any additional connections until authentication succeeds or the login timer expires for a connection.<br>Default: 10                           |
|                 | <1-128> Number of sessions.                                                                                                                                                                                                                                                                                                    |

**Mode** Global Configuration

**Examples** To configure the session timer of SSH server to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 600
```

To configure the login timeout of SSH server to 30 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 30
```

To limit the number of SSH client connections waiting authentication from SSH server to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-startups
```

To set max-startups parameters of SSH server to the default configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server max-startups
```

To support the Secure Shell server with TCP port 2200, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server 2200
```

To force the Secure Shell server to support SSHv2 only, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server v2only
```

To support both SSHv2 and SSHv1, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server v1v2
```

**Related  
Commands** [show ssh server](#)  
[ssh client](#)

# ssh server allow-users

**Overview** This command adds a username pattern to the allow list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is accepted.

When there are no registered users in the server's database of allowed users, the SSH server does not accept SSH sessions even when enabled.

SSH server also maintains the deny list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

The **no** variant of this command deletes a username pattern from the allow list of the SSH server. To delete an entry from the allow list, the username and hostname pattern should match exactly with the existing entry.

**Syntax** `ssh server allow-users <username-pattern> [<hostname-pattern>]`  
`no ssh server allow-users <username-pattern>`  
 `[<hostname-pattern>]`

| Parameter                             | Description                                                                                                                                                                                                              |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;username-pattern&gt;</code> | The username pattern that users can match to. An asterisk acts as a wildcard character that matches any string of characters.                                                                                            |
| <code>&lt;hostname-pattern&gt;</code> | The host name pattern that hosts can match to. If specified, the server allows the user to connect only from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters. |

**Mode** Global Configuration

**Examples** To allow the user `john` to create an SSH session from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john
```

To allow the user `john` to create an SSH session from a range of IP address (from 192.168.1.1 to 192.168.1.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john 192.168.1.*
```

To allow the user `john` to create a SSH session from `a-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john *.a-company.com
```

To delete the existing user entry `john 192.168.1.*` in the allow list, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server allow-users john 192.168.1.*
```

**Related  
Commands**

[show running-config ssh](#)

[show ssh server allow-users](#)

[ssh server deny-users](#)

# ssh server authentication

**Overview** This command enables RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **ssh server authentication** command to enable password authentication for users. Apply the **publickey** keyword with the **ssh server authentication** command to enable RSA public-key authentication for users.

Use the **no** variant of this command to disable RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **no ssh authentication** command to disable password authentication for users. Apply the required **publickey** keyword with the **no ssh authentication** command to disable RSA public-key authentication for users.

**Syntax** `ssh server authentication {password|publickey}`  
`no ssh server authentication {password|publickey}`

| Parameter              | Description                                             |
|------------------------|---------------------------------------------------------|
| <code>password</code>  | Specifies user password authentication for SSH server.  |
| <code>publickey</code> | Specifies user publickey authentication for SSH server. |

**Default** Both RSA public-key authentication and password authentication are enabled by default.

**Mode** Global Configuration

**Usage** For password authentication to authenticate a user, password authentication for a user must be registered in the local user database or on an external RADIUS server, before using the **ssh server authentication password** command.

For RSA public-key authentication to authenticate a user, a public key must be added for the user, before using the **ssh server authentication publickey** command.

**Examples** To enable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication password
```

To enable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication publickey
```

To disable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication password
```

To disable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication publickey
```

**Related  
Commands**

[crypto key pubkey-chain userkey](#)  
[service ssh](#)  
[show ssh server](#)

# ssh server deny-users

**Overview** This command adds a username pattern to the deny list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is rejected.

SSH server also maintains the allow list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

If a hostname pattern is specified, the user is denied from the hosts matching the pattern.

The **no** variant of this command deletes a username pattern from the deny list of the SSH server. To delete an entry from the deny list, the username and hostname pattern should match exactly with the existing entry.

**Syntax** `ssh server deny-users <username-pattern> [<hostname-pattern>]`  
`no ssh server deny-users <username-pattern>`  
 `[<hostname-pattern>]`

| Parameter                             | Description                                                                                                                                                                                                                                                                 |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;username-pattern&gt;</code> | The username pattern that users can match to. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen, full stop and asterisk symbols. An asterisk acts as a wildcard character that matches any string of characters. |
| <code>&lt;hostname-pattern&gt;</code> | The host name pattern that hosts can match to. If specified, the server denies the user only when they connect from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.                                             |

**Mode** Global Configuration

**Examples** To deny the user john to access SSH login from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john
```

To deny the user john to access SSH login from a range of IP address (from 192.168.2.1 to 192.168.2.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john 192.168.2.*
```

To deny the user john to access SSH login from b-company.com domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john*.b-company.com
```

To delete the existing user entry `john 192.168.2.*` in the deny list, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server deny-users john 192.168.2.*
```

**Related  
Commands**

[show running-config ssh](#)

[show ssh server deny-users](#)

[ssh server allow-users](#)

# ssh server max-auth-tries

**Overview** Use this command to specify the maximum number of SSH authentication attempts that the device will allow.

Use the **no** variant of this command to return the maximum number of attempts to its default value of 6.

**Syntax** `ssh server max-auth-tries <1-32>`  
`no ssh server max-auth-tries`

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <1-32>    | Maximum number of SSH authentication attempts the device will allow. |

**Default** 6 attempts

**Mode** Global Configuration

**Usage** By default, users must wait one second after a failed login attempt before trying again. You can increase this gap by using the command [aaa login fail-delay](#).

**Example** To set the maximum number of SSH authentication attempts to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-auth-tries 3
```

**Related Commands** [show ssh server](#)

# ssh server resolve-host

**Overview** This command enables resolving an IP address from a host name using a DNS server for client host authentication.

The **no** variant of this command disables this feature.

**Syntax** `ssh server resolve-hosts`  
`no ssh server resolve-hosts`

**Default** This feature is disabled by default.

**Mode** Global Configuration

**Usage** Your device has a DNS Client that is enabled automatically when you add a DNS server to your device. Use the [ip name-server](#) command to add a DNS server to the list of servers that the device queries.

**Example** To resolve a host name using a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server resolve-hosts
```

**Related Commands**

- [ip name-server](#)
- [show ssh server](#)
- [ssh server allow-users](#)
- [ssh server deny-users](#)

# ssh server scp

**Overview** This command enables the Secure Copy (SCP) service on the SSH server. Once enabled, the server accepts SCP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SCP connections. The SCP service is enabled by default as soon as the SSH server is enabled.

The **no** variant of this command disables the SCP service on the SSH server. Once disabled, SCP requests from remote clients are rejected.

**Syntax** `ssh server scp`  
`no ssh server scp`

**Mode** Global Configuration

**Examples** To enable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server scp
```

To disable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server scp
```

**Related  
Commands** [show running-config ssh](#)  
[show ssh server](#)

# ssh server sftp

**Overview** This command enables the Secure FTP (SFTP) service on the SSH server. Once enabled, the server accepts SFTP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SFTP connections. The SFTP service is enabled by default as soon as the SSH server is enabled. If the SSH server is disabled, SFTP service is unavailable.

The **no** variant of this command disables SFTP service on the SSH server. Once disabled, SFTP requests from remote clients are rejected.

**Syntax** `ssh server sftp`  
`no ssh server sftp`

**Mode** Global Configuration

**Examples** To enable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server sftp
```

To disable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server sftp
```

# active (trigger)

**Overview** This command enables a trigger. This allows the trigger to activate when its trigger conditions are met.

The **no** variant of this command disables a trigger. While in this state the trigger cannot activate when its trigger conditions are met.

**Syntax** active  
no active

**Mode** Trigger Configuration

**Usage** Configure a trigger first before you use this command to activate it.  
For information about configuring a trigger, see the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To enable trigger 172, so that it can activate when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 172
awplus(config-trigger)# active
```

To disable trigger 182, preventing it from activating when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 182
awplus(config-trigger)# no active
```

**Related Commands** [show trigger](#)  
[trigger](#)

# day

**Overview** This command specifies the days or date that the trigger can activate on. You can specify one of:

- A specific date
- A specific day of the week
- A list of days of the week
- every day

By default, the trigger can activate on any day.

**Syntax** `day every-day`  
`day <1-31> <month> <2000-2035>`  
`day <weekday>`

| Parameter                      | Description                                                                                                                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>every-day</code>         | Sets the trigger so that it can activate on any day.                                                                                                                                                                        |
| <code>&lt;1-31&gt;</code>      | Day of the month the trigger is permitted to activate on.                                                                                                                                                                   |
| <code>&lt;month&gt;</code>     | Sets the month that the trigger is permitted to activate on. Valid keywords are: <b>january, february, march, april, may, june, july, august, september, october, november, and december.</b>                               |
| <code>&lt;2000-2035&gt;</code> | Sets the year that the trigger is permitted to activate in.                                                                                                                                                                 |
| <code>&lt;weekday&gt;</code>   | Sets the days of the week that the trigger can activate on. You can specify one or more week days in a space separated list. Valid keywords are: <b>monday, tuesday, wednesday, thursday, friday, saturday, and sunday.</b> |

**Default** **every-day**, so by default, the trigger can activate on any day.

**Mode** Trigger Configuration

**Usage** For example trigger configurations that use the **day** command, see “Restrict Internet Access” and “Turn off Power to Port LEDs” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To permit trigger 55 to activate on the 1 October 2016, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 55
awplus(config-trigger)# day 1 oct 2016
```

To permit trigger 12 to activate on a Mondays, Wednesdays and Fridays, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# day monday wednesday friday
```

**Related  
Commands** [show trigger](#)  
[trigger](#)

# debug trigger

**Overview** This command enables trigger debugging. This generates detailed messages about how your device is processing the trigger commands and activating the triggers.

The **no** variant of this command disables trigger debugging.

**Syntax** `debug trigger`  
`no debug trigger`

**Mode** Privilege Exec

**Examples** To start trigger debugging, use the command:

```
awplus# debug trigger
```

To stop trigger debugging, use the command:

```
awplus# no trigger
```

**Related Commands** [show debugging trigger](#)  
[show trigger](#)  
[test](#)  
[trigger](#)  
[undebug trigger](#)

# description (trigger)

**Overview** This command adds an optional description to help you identify the trigger. This description is displayed in show command outputs and log messages.

The **no** variant of this command removes a trigger's description. The show command outputs and log messages stop displaying a description for this trigger.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                                                                                                                                                       |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;description&gt;</code> | A word or phrase that uniquely identifies this trigger or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters. |

**Mode** Trigger Configuration

**Examples** To give trigger 240 the description `daily status report`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 240
awplus(config-trigger)# description daily status report
```

To remove the description from trigger 36, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 36
awplus(config-trigger)# no description
```

**Related Commands** [show trigger](#)  
[test](#)  
[trigger](#)

# repeat

**Overview** This command specifies the number of times that a trigger is permitted to activate. This allows you to specify whether you want the trigger to activate:

- only the first time that the trigger conditions are met
- a limited number of times that the trigger conditions are met
- an unlimited number of times

Once the trigger has reached the limit set with this command, the trigger remains in your configuration but cannot be activated. Use the **repeat** command again to reset the trigger so that it is activated when its trigger conditions are met.

By default, triggers can activate an unlimited number of times. To reset a trigger to this default, specify either **yes** or **forever**.

**Syntax** `repeat { forever | no | once | yes | <1-4294967294> }`

| Parameter                         | Description                                          |
|-----------------------------------|------------------------------------------------------|
| <code>yes   forever</code>        | The trigger repeats indefinitely, or until disabled. |
| <code>no   once</code>            | The trigger activates only once.                     |
| <code>&lt;1-4292967294&gt;</code> | The trigger repeats the specified number of times.   |

**Mode** Trigger Configuration

**Examples** To allow trigger 21 to activate only once, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 21
awplus(config-trigger)# repeat no
```

To allow trigger 22 to activate an unlimited number of times whenever its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 22
awplus(config-trigger)# repeat forever
```

To allow trigger 23 to activate only the first 10 times the conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 23
awplus(config-trigger)# repeat 10
```

**Related Commands** [show trigger](#)  
[trigger](#)

# script

**Overview** This command specifies one or more scripts that are to be run when the trigger activates. You can add up to five scripts to a single trigger.

The sequence in which the trigger runs the scripts is specified by the number you set before the name of the script file. One script is executed completely before the next script begins.

Scripts may be either ASH shell scripts, indicated by a **.sh** filename extension suffix, or AlliedWare Plus™ scripts, indicated by a **.scp** filename extension suffix. AlliedWare Plus™ scripts only need to be readable.

The **no** variant of this command removes one or more scripts from the trigger's script list. The scripts are identified by either their name, or by specifying their position in the script list. The **all** parameter removes all scripts from the trigger.

**Syntax**

```
script <1-5> {<filename>}
no script {<1-5>|<filename>|all}
```

| Parameter  | Description                                                                                          |
|------------|------------------------------------------------------------------------------------------------------|
| <1-5>      | The position of the script in execution sequence. The trigger runs the lowest numbered script first. |
| <filename> | The path to the script file.                                                                         |

**Mode** Trigger Configuration

**Examples** To configure trigger 71 to run the script `flash:/cpu_trig.sh` in position 3 when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# script 3 flash:/cpu_trig.sh
```

To configure trigger 99 to run the scripts **flash:reconfig.scp**, **flash:cpu\_trig.sh** and **flash:email.scp** in positions 2, 3 and 5 when the trigger activates, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 99
awplus(config-trigger)# script 2 flash:/reconfig.scp 3
flash:/cpu_trig.sh 5 flash:/email.scp
```

To remove the scripts 1, 3 and 4 from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script 1 3 4
```

To remove the script flash:/cpu\_trig.sh from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script flash:/cpu_trig.sh
```

To remove all the scripts from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script all
```

**Related  
Commands** [show trigger](#)  
[trigger](#)

# show debugging trigger

**Overview** This command displays the current status for trigger utility debugging. Use this command to show when trigger debugging has been turned on or off from the [debug trigger](#) command.

**Syntax** `show debugging trigger`

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of trigger debugging, use the command:

```
awplus# show debugging trigger
```

**Output** Figure 57-1: Example output from the **show debugging trigger** command

```
awplus#debug trigger
awplus#show debugging trigger
Trigger debugging status:
 Trigger debugging is on

awplus#no debug trigger
awplus#show debugging trigger
Trigger debugging status:
 Trigger debugging is off
```

**Related Commands** [debug trigger](#)

# show running-config trigger

**Overview** This command displays the current running configuration of the trigger utility.

**Syntax** `show running-config trigger`

**Mode** Privileged Exec

**Example** To display the current configuration of the trigger utility, use the command:

```
awplus# show running-config trigger
```

Figure 57-2: Example output from the **show running-config trigger** command

```
trigger 1
 type card in

type usb in
 trigger 2

type usb out
!
```

**Related  
Commands** [show trigger](#)

# show trigger

**Overview** This command displays configuration and diagnostic information about the triggers configured on the device. Specify the **show trigger** command without any options to display a summary of the configuration of all triggers.

**Syntax** `show trigger [<1-250>|counter|full]`

| Parameter | Description                                                                           |
|-----------|---------------------------------------------------------------------------------------|
| <1-250>   | Displays detailed information about a specific trigger, identified by its trigger ID. |
| counter   | Displays statistical information about all triggers.                                  |
| full      | Displays detailed information about all triggers.                                     |

**Mode** Privileged Exec

**Example** To get summary information about all triggers, use the following command:

```
awplus# show trigger
```

**Table 1:** Example output from the **show trigger** command

```
awplus#show trigger
TR# Type & Details Name Ac Te Tr Repeat #Scr Days/Date

**Table 2:** Parameters in the output of the **show trigger** command

| Parameter      | Description                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------|
| TR#            | Trigger identifier (ID).                                                                           |
| Type & Details | The trigger type, followed by the trigger details in brackets.                                     |
| Name           | Descriptive name of the trigger configured with the <a href="#">description (trigger)</a> command. |
| Ac             | Whether the trigger is active (Y), or inactive (N).                                                |

**Table 2:** Parameters in the output of the **show trigger** command (cont.)

| Parameter | Description                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Te        | Whether the trigger is in test mode (Y) or not (N).                                                                                                                                                                 |
| Tr        | Whether or not the trigger is enabled to send SNMP traps. See the <a href="#">trap</a> command.                                                                                                                     |
| Repeat    | Whether the trigger repeats continuously, and if not, the configured repeat count for the trigger. To see the number of times a trigger has activated, use the <code>show trigger &lt;1-250&gt;</code> command.     |
| #Scr      | Number of scripts associated with the trigger.                                                                                                                                                                      |
| Days/Date | Days or date when the trigger may be activated. For the days options, the days are shown as a seven character string representing Sunday to Saturday. A hyphen indicates days when the trigger cannot be activated. |

To display detailed information about trigger 3, use the command:

```
awplus# show trigger 3
```

| Parameter             | Description                                                                                                                                                                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type and details      | The trigger type and its activation conditions.                                                                                                                                                                                               |
| Days                  | The days on which the trigger is permitted to activate.                                                                                                                                                                                       |
| Date                  | The date on which the trigger is permitted to activate. Only displayed if configured, in which case it replaces "Days".                                                                                                                       |
| Active                | Whether or not the trigger is permitted to activate.                                                                                                                                                                                          |
| Test                  | Whether or not the trigger is operating in diagnostic mode.                                                                                                                                                                                   |
| Trap                  | Whether or not the trigger is enabled to send SNMP traps.                                                                                                                                                                                     |
| Repeat                | Whether the trigger repeats an unlimited number of times (Continuous) or for a set number of times. When the trigger can repeat only a set number of times, then the number of times the trigger has been activated is displayed in brackets. |
| Modified              | The date and time of the last time that the trigger was modified.                                                                                                                                                                             |
| Number of activations | Number of times the trigger has been activated since the last restart of the device.                                                                                                                                                          |
| Last activation       | The date and time of the last time that the trigger was activated.                                                                                                                                                                            |
| Number of scripts     | How many scripts are associated with the trigger, followed by the names of the script files in the order in which they run.                                                                                                                   |

To display counter information about all triggers use the command:

```
awplus# show trigger counter
```

**Figure 57-4:** Example output from the **show trigger counter** command

```
awplus#show trigger counter

| Parameter                          | Description                                                                |
|------------------------------------|----------------------------------------------------------------------------|
| Trigger activations                | Number of times a trigger has been activated.                              |
| Time triggers activated today      | Number of times a time trigger has been activated today.                   |
| Periodic triggers activated today  | Number of times a periodic trigger has been activated today.               |
| Interface triggers activated today | Number of times an interface trigger has been activated today.             |
| Resource triggers activated today  | Number of times a CPU or memory resource trigger has been activated today. |
| Ping-poll triggers activated today | Number of times a ping-poll trigger has been activated today.              |

**Related Commands** [trigger](#)

# test

**Overview** This command puts the trigger into a diagnostic mode. In this mode the trigger may activate but when it does it will not run any of the trigger's scripts. A log message will be generated to indicate when the trigger has been activated.

The **no** variant of this command takes the trigger out of diagnostic mode, restoring normal operation. When the trigger activates the scripts associated with the trigger will be run, as normal.

**Syntax** test  
no test

**Mode** Trigger Configuration

**Usage** Configure a trigger first before you use this command to diagnose it. For information about configuring a trigger, see the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To put trigger 5 into diagnostic mode, where no scripts will be run when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# test
```

To take trigger 205 out of diagnostic mode, restoring normal operation, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no test
```

**Related  
Commands** [show trigger](#)  
[trigger](#)

# time (trigger)

**Overview** This command specifies the time of day when the trigger is permitted to activate. The **after** parameter specifies the start of a time period that extends to midnight during which trigger may activate. By default the value of this parameter is 00:00:00 (am); that is, the trigger may activate at any time. The **before** parameter specifies the end of a time period beginning at midnight during which the trigger may activate. By default the value of this parameter is 23:59:59; that is, the trigger may activate at any time. If the value specified for **before** is later than the value specified for **after**, a time period from “after” to “before” is defined, during which the trigger may activate. This command is not applicable to time triggers (**type time**).

The following figure illustrates how the **before** and **after** parameters operate.

**Syntax** `time {[after <hh:mm:ss>] [before <hh:mm:ss>]}`

| Parameter                           | Description                                                 |
|-------------------------------------|-------------------------------------------------------------|
| <code>after&lt;hh:mm:ss&gt;</code>  | The earliest time of day when the trigger may be activated. |
| <code>before&lt;hh:mm:ss&gt;</code> | The latest time of day when the trigger may be activated.   |

**Mode** Trigger Configuration

**Usage** For example trigger configurations that use the **time (trigger)** command, see “Restrict Internet Access” and “Turn off Power to Port LEDs” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To allow trigger 63 to activate between midnight and 10:30am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 63
awplus(config-trigger)# time before 10:30:00
```

To allow trigger 64 to activate between 3:45pm and midnight, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 64
awplus(config-trigger)# time after 15:45:00
```

To allow trigger 65 to activate between 10:30am and 8:15pm, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 65
awplus(config-trigger)# time after 10:30:00 before 20:15:00
```

**Related  
Commands** [show trigger](#)  
[trigger](#)

# trap

**Overview** This command enables the specified trigger to send SNMP traps.  
Use the **no** variant of this command to disable the sending of SNMP traps from the specified trigger.

**Syntax** trap  
no trap

**Default** SNMP traps are enabled by default for all defined triggers.

**Mode** Trigger Configuration

**Usage** You must configure SNMP before using traps with triggers. For more information, see:

- [Support for Allied Telesis Enterprise\\_MIBs\\_in\\_AlliedWare Plus](#), for information about which MIB objects are supported.
- the [SNMP Feature Overview and Configuration\\_Guide](#).
- the [SNMP Commands](#) chapter.

Since SNMP traps are enabled by default for all defined triggers, a common usage will be for the **no** variant of this command to disable SNMP traps from a specified trap if the trap is only periodic. Refer in particular to AT-TRIGGER-MIB in the [Support for Allied Telesis Enterprise\\_MIBs\\_in AlliedWare Plus](#) for further information about the relevant SNMP MIB.

**Examples** To enable SNMP traps to be sent from trigger 5, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# trap
```

To disable SNMP traps being sent from trigger 205, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no trap
```

**Related  
Commands** [trigger](#)  
[show trigger](#)

# trigger

**Overview** This command is used to access the Trigger Configuration mode for the specified trigger. Once Trigger Configuration mode has been entered the trigger type information can be configured and the trigger scripts and other operational parameters can be specified. At a minimum the trigger type information must be specified before the trigger can become active.

The **no** variant of this command removes a specified trigger and all configuration associated with it.

**Syntax** trigger <1-250>  
no trigger <1-250>

| Parameter | Description   |
|-----------|---------------|
| <1-250>   | A trigger ID. |

**Mode** Global Configuration

**Examples** To enter trigger configuration mode for trigger 12 use the command:

```
awplus# trigger 12
```

To completely remove all configuration associated with trigger 12, use the command:

```
awplus# no trigger 12
```

**Related Commands** [show trigger](#)  
[trigger activate](#)

# trigger activate

**Overview** This command is used to manually activate a specified trigger from the Privileged Exec mode, which has been configured with the **trigger** command from the Global Configuration mode.

**Syntax** `trigger activate <1-250>`

| Parameter | Description   |
|-----------|---------------|
| <1-250>   | A trigger ID. |

**Mode** Privileged Exec

**Usage** This command manually activates a trigger without the normal trigger conditions being met.

The trigger is activated even if it is configured as inactive. The scripts associated with the trigger will be executed even if the trigger is in the diagnostic test mode.

Triggers activated manually do not have their repeat counts decremented or their 'last triggered' time updated, and do not result in updates to the '[type] triggers today' counters.

**Example** To manually activate trigger 12 use the command:

```
awplus# trigger activate 12
```

**Related Commands** [show trigger](#)  
[trigger](#)

# type atmf node

**Overview** This command configures a trigger to be activated at an AMF node join event or leave event.

**Syntax** type atmf node {join|leave}

| Parameter | Description           |
|-----------|-----------------------|
| join      | AMF node join event.  |
| leave     | AMF node leave event. |

**Mode** Trigger Configuration

**CAUTION: Only configure this trigger on one device because it is a network wide event.**

**Example 1** To configure trigger 5 to activate at an AMF node leave event, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger) type atmf node leave
```

**Example 2** The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3] (config-trigger)# script 1 email_me.scp
AMF-Net[3] (config-trigger)# end
```

Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=====
node1:
=====
```

| TR# | Type & Details    | Description         | Ac | Te | Tr | Repeat     | #Scr | Days/Date |
|-----|-------------------|---------------------|----|----|----|------------|------|-----------|
| 001 | Periodic (2 min)  | Periodic Status Chk | Y  | N  | Y  | Continuous | 1    | smtwtfs   |
| 005 | ATMF node (leave) | E-mail on ATMF Exit | Y  | N  | Y  | Continuous | 1    | smtwtfs   |

```

=====
Node2, Node3,
=====
```

| TR# | Type & Details    | Description         | Ac | Te | Tr | Repeat     | #Scr | Days/Date |
|-----|-------------------|---------------------|----|----|----|------------|------|-----------|
| 005 | ATMF node (leave) | E-mail on ATMF Exit | Y  | N  | Y  | Continuous | 1    | smtwtfs   |

```

```

Display the triggers configured on each of the nodes in the AMF Network.

```
AMF-Net[3]# show running-config trigger
```

This command returns the following display:

```
=====
Node1:
=====

trigger 1
 type periodic 2
 script 1 atmf.scp
trigger 5
 type atmf node leave
description "E-mail on ATMF Exit"
 script 1 email_me.scp
!

=====
Node2, Node3:
=====

trigger 5
 type atmf node leave
description "E-mail on ATMF Exit"
 script 1 email_me.scp
!
```

**Related  
Commands** [show trigger](#)

# type card

**Overview** Use this command to configure a trigger that activates on either the removal or the insertion of a Secure Digital (SD) or Secure Digital High Capacity (SDHC) card.

**Syntax** `type card {in|out}`

| Parameter | Description                               |
|-----------|-------------------------------------------|
| in        | Trigger activates on insertion of a card. |
| out       | Trigger activates on removal of a card.   |

**Mode** Trigger Configuration

**Usage** Card triggers cannot execute script files from a card.

For example trigger configurations that use the **type card** command, see “Capture Show Output and Save to an SD Card” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To configure `trigger 1` to activate on the insertion of a card, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type card in
```

**Related Commands** [trigger](#)  
[show running-config trigger](#)  
[show trigger](#)

# type cpu

**Overview** This command configures a trigger to activate based on CPU usage level. Selecting the **up** option causes the trigger to activate when the CPU usage exceeds the specified usage level. Selecting the **down** option causes the trigger to activate when CPU usage drops below the specified usage level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

**Syntax** `type cpu <1-100> [up|down|any]`

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| <1-100>   | The percentage of CPU usage at which to trigger.                       |
| up        | Activate when CPU usage exceeds the specified level.                   |
| down      | Activate when CPU usage drops below the specified level                |
| any       | Activate when CPU usage passes the specified level in either direction |

**Mode** Trigger Configuration

**Usage** For an example trigger configuration that uses the **type cpu** command, see “Capture Unusual CPU and RAM Activity” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To configure trigger 28 to be a CPU trigger that activates when CPU usage exceeds 80% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 28
awplus(config-trigger)# type cpu 80 up
```

To configure trigger 5 to be a CPU trigger that activates when CPU usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65

or

awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65 any
```

**Related Commands** [show trigger](#)  
[trigger](#)

# type interface

**Overview** This command configures a trigger to activate based on the link status of an interface. The trigger can be activated when the interface becomes operational by using the **up** option, or when the interface closes by using the **down** option. The trigger can also be configured to activate when either one of these events occurs by using the **any** option.

**Syntax** `type interface <interface> [up|down|any]`

| Parameter   | Description                                                                               |
|-------------|-------------------------------------------------------------------------------------------|
| <interface> | Interface name. This can be the name of a device port, an eth-management port, or a VLAN. |
| up          | Activate when interface becomes operational.                                              |
| down        | Activate when the interface closes.                                                       |
| any         | Activate when any interface link status event occurs.                                     |

**Mode** Trigger Configuration

**Example** To configure trigger 19 to be an interface trigger that activates when port1.0.2 becomes operational, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 19
awplus(config-trigger)# type interface port1.0.2 up
```

**Related  
Commands** [show trigger](#)  
[trigger](#)

# type memory

**Overview** This command configures a trigger to activate based on RAM usage level. Selecting the **up** option causes the trigger to activate when memory usage exceeds the specified level. Selecting the **down** option causes the trigger to activate when memory usage drops below the specified level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

**Syntax** `type memory <1-100> [up|down|any]`

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| <1-100>   | The percentage of memory usage at which to trigger.                        |
| up        | Activate when memory usage exceeds the specified level.                    |
| down      | Activate when memory usage drops below the specified level.                |
| any       | Activate when memory usage passes the specified level in either direction. |

**Mode** Trigger Configuration

**Examples** To configure trigger 12 to be a memory trigger that activates when memory usage exceeds 50% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# type memory 50 up
```

To configure trigger 40 to be a memory trigger that activates when memory usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65 any
```

**Related Commands** [show trigger](#)  
[trigger](#)

# type periodic

**Overview** This command configures a trigger to be activated at regular intervals. The time period between activations is specified in minutes.

**Syntax** `type periodic <1-1440>`

| Parameter                   | Description                                |
|-----------------------------|--------------------------------------------|
| <code>&lt;1-1440&gt;</code> | The number of minutes between activations. |

**Mode** Trigger Configuration

**Usage** A combined limit of 10 triggers of the type periodic and time can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or periodic
```

For an example trigger configuration that uses the **type periodic** command, see "See Daily Statistics" in the [Triggers Feature Overview and Configuration Guide](#).

**Example** To configure trigger 44 to activate periodically at 10 minute intervals use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 44
awplus(config-trigger)# type periodic 10
```

**Related Commands** [show trigger](#)  
[trigger](#)

# type ping-poll

**Overview** This command configures a trigger that activates when Ping Polling identifies that a target device's status has changed. This allows you to run a configuration script when a device becomes reachable or unreachable.

**Syntax** `type ping-poll <1-100> {up|down}`

| Parameter | Description                                                                     |
|-----------|---------------------------------------------------------------------------------|
| <1-100>   | The ping poll ID.                                                               |
| up        | The trigger activates when ping polling detects that the target is reachable.   |
| down      | The trigger activates when ping polling detects that the target is unreachable. |

**Mode** Trigger Configuration

**Example** To configure trigger 106 to activate when ping poll 12 detects that its target device is now unreachable, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 106
awplus(config-trigger)# type ping-poll 12 down
```

**Related Commands** [show trigger](#)  
[trigger](#)

# type reboot

**Overview** This command configures a trigger that activates when your device is rebooted.

**Syntax** type reboot

**Mode** Trigger Configuration

**Example** To configure trigger 32 to activate when your device reboots, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 32
awplus(config-trigger)# type reboot
```

**Related  
Commands** [show trigger](#)  
[trigger](#)

# type time

**Overview** This command configures a trigger that activates at a specified time of day.

**Syntax** `type time <hh:mm>`

| Parameter                  | Description                       |
|----------------------------|-----------------------------------|
| <code>&lt;hh:mm&gt;</code> | The time to activate the trigger. |

**Mode** Trigger Configuration

**Usage** A combined limit of 10 triggers of the type time and type periodic can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

**Example** To configure trigger 86 to activate at 15:53, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type time 15:53
```

**Related  
Commands** [show trigger](#)  
[trigger](#)

# type usb

**Overview** Use this command to configure a trigger that activates on either the removal or the insertion of a USB storage device.

**Syntax** `type usb {in|out}`

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| in        | Trigger activates on insertion of a USB storage device. |
| out       | Trigger activates on removal of a USB storage device.   |

**Mode** Trigger Configuration

**Usage** USB triggers cannot execute script files from a USB storage device.

**Examples** To configure trigger 1 to activate on the insertion of a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type usb in
```

# 58

# Ping-Polling Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Ping Polling. For more information, see the [Ping Polling Feature Overview and Configuration Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Table 58-1: The following table lists the default values when configuring a ping poll

| Default           | Value                                                                       |
|-------------------|-----------------------------------------------------------------------------|
| Critical-interval | 1 second                                                                    |
| Description       | No description                                                              |
| Fail-count        | 5                                                                           |
| Length            | 32 bytes                                                                    |
| Normal-interval   | 30 seconds                                                                  |
| Sample-size       | 5                                                                           |
| Source-ip         | The IP address of the interface from which the ping packets are transmitted |
| Time-out          | 1 second                                                                    |
| Up-count          | 30                                                                          |

# active (ping-polling)

**Overview** This command enables a ping-poll instance. The polling instance sends ICMP echo requests to the device with the IP address specified by the [ip \(ping-polling\)](#) command.

By default, polling instances are disabled. When a polling instance is enabled, it assumes that the device it is polling is unreachable.

The **no** variant of this command disables a ping-poll instance. The polling instance no longer sends ICMP echo requests to the polled device. This also resets all counters for this polling instance.

**Syntax** active  
no active

**Mode** Ping-Polling Configuration

**Examples** To activate the ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# active
```

To disable the ping-poll instance 43 and reset its counters, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no active
```

**Related Commands** [debug ping-poll](#)  
[ip \(ping-polling\)](#)  
[ping-poll](#)  
[show ping-poll](#)

# clear ping-poll

**Overview** This command resets the specified ping poll, or all ping poll instances. This clears the ping counters, and changes the status of polled devices to unreachable. The polling instance changes to the polling frequency specified with the [critical-interval](#) command. The device status changes to reachable once the device responses have reached the [up-count](#).

**Syntax** `clear ping-poll {<1-100>|all}`

| Parameter | Description                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-100>   | A ping poll ID number. The specified ping poll instance has its counters cleared, and the status of the device it polls is changed to unreachable. |
| all       | Clears the counters and changes the device status of all polling instances.                                                                        |

**Mode** Privileged Exec

**Examples** To reset the ping poll instance 12, use the command:

```
awplus# clear ping-poll 12
```

To reset all ping poll instances, use the command:

```
awplus# clear ping-poll all
```

**Related Commands** [active \(ping-polling\)](#)  
[ping-poll](#)  
[show ping-poll](#)

# critical-interval

**Overview** This command specifies the time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable.

This command enables the device to quickly observe changes in state, and should be set to a much lower value than the [normal-interval](#) command.

The **no** variant of this command sets the critical interval to the default of one second.

**Syntax** `critical-interval <1-65536>`  
`no critical-interval`

| Parameter                    | Description                                                                                        |
|------------------------------|----------------------------------------------------------------------------------------------------|
| <code>&lt;1-65536&gt;</code> | Time in seconds between pings, when the device has failed to a ping, or the device is unreachable. |

**Default** The default is 1 second.

**Mode** Ping-Polling Configuration

**Examples** To set the critical interval to 2 seconds for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# critical-interval 2
```

To reset the critical interval to the default of one second for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# no critical-interval
```

**Related  
Commands**

[fail-count](#)  
[normal-interval](#)  
[sample-size](#)  
[show ping-poll](#)  
[timeout \(ping polling\)](#)  
[up-count](#)

# debug ping-poll

**Overview** This command enables ping poll debugging for the specified ping-poll instance. This generates detailed messages about ping execution.

The **no** variant of this command disables ping-poll debugging for the specified ping-poll.

**Syntax** `debug ping-poll <1-100>`  
`no debug ping-poll {<1-100>|all}`

| Parameter | Description                       |
|-----------|-----------------------------------|
| <1-100>   | A unique ping poll ID number.     |
| all       | Turn off all ping-poll debugging. |

**Mode** Privileged Exec

**Examples** To enable debugging for ping-poll instance 88, use the command:

```
awplus# debug ping-poll 88
```

To disable all ping poll debugging, use the command:

```
awplus# no debug ping-poll all
```

To disable debugging for ping-poll instance 88, use the command:

```
awplus# no debug ping-poll 88
```

- [ping-poll](#)
- [show ping-poll](#)
- [undebug ping-poll](#)

## description (ping-polling)

**Overview** This command specifies a string to describe the ping-polling instance. This allows the ping-polling instance to be recognized easily in show commands. Setting this command is optional.

By default ping-poll instances do not have a description.

Use the **no** variant of this command to delete the description set.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                                                                                                                   |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;description&gt;</code> | The description of the target. Valid characters are any printable character and spaces. There is no maximum character length. |

**Mode** Ping-Polling Configuration

**Examples** To add the text "Primary Gateway" to describe the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# description Primary Gateway
```

To delete the description set for the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no description
```

**Related Commands** [ping-poll](#)  
[show ping-poll](#)

# fail-count

**Overview** This command specifies the number of pings that must be unanswered, within the total number of pings specified by the [sample-size](#) command, for the ping-polling instance to consider the device unreachable.

If the number set by the [sample-size](#) command and the **fail-count** commands are the same, then the unanswered pings must be consecutive. If the number set by the [sample-size](#) command is greater than the number set by the **fail-count** command, then a device that does not always reply to pings may be declared unreachable.

The **no** variant of this command resets the fail count to the default.

**Syntax** `fail-count <1-100>`  
`no fail-count`

| Parameter                  | Description                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;1-100&gt;</code> | The number of pings within the sample size that a reachable device must fail to respond to before it is classified as unreachable. |

**Default** The default is 5.

**Mode** Ping-Polling Configuration

**Examples** To specify the number of pings that must fail within the sample size to determine that a device is unreachable for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# fail-count 5
```

To reset the fail-count to its default of 5 for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no fail-count
```

# ip (ping-polling)

**Overview** This command specifies the IPv4 address of the device you are polling.

**Syntax** `ip {<ip-address>|<ipv6-address>}`

| Parameter                         | Description                                        |
|-----------------------------------|----------------------------------------------------|
| <code>&lt;ip-address&gt;</code>   | An IPv4 address in dotted decimal notation A.B.C.D |
| <code>&lt;ipv6-address&gt;</code> | An IPv6 address in hexadecimal notation X:X::X:X   |

**Mode** Ping-Polling Configuration

**Examples** To set ping-poll instance 5 to poll the device with the IP address 192.168.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 5
awplus(config-ping-poll)# ip 192.168.0.1
```

To set ping-poll instance 10 to poll the device with the IPv6 address 2001:db8::, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 10
awplus(config-ping-poll)# ip 2001:db8::
```

- [ping-poll](#)
- [source-ip](#)
- [show ping-poll](#)

# length (ping-poll data)

**Overview** This command specifies the number of data bytes to include in the data portion of the ping packet. This allows you to set the ping packets to a larger size if you find that larger packet types in your network are not reaching the polled device, while smaller packets are getting through. This encourages the polling instance to change the device's status to unreachable when the network is dropping packets of the size you are interested in.

The **no** variant of this command resets the data bytes to the default of 32 bytes.

**Syntax** length <4-1500>  
no length

| Parameter | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| <4-1500>  | The number of data bytes to include in the data portion of the ping packet. |

**Default** The default is 32.

**Mode** Ping-Polling Configuration

**Examples** To specify that ping-poll instance 12 sends ping packet with a data portion of 56 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length 56
```

To reset the number of data bytes in the ping packet to the default of 32 bytes for ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length
```

**Related Commands** ping-poll  
show ping-poll

# normal-interval

**Overview** This command specifies the time period between pings when the device is reachable.

The **no** variant of this command resets the time period to the default of 30 seconds.

**Syntax** `normal-interval <1-65536>`  
`no normal-interval`

| Parameter                    | Description                                                 |
|------------------------------|-------------------------------------------------------------|
| <code>&lt;1-65536&gt;</code> | Time in seconds between pings when the target is reachable. |

**Default** The default is 30 seconds.

**Mode** Ping-Polling Configuration

**Examples** To specify a time period of 60 seconds between pings when the device is reachable for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# normal-interval 60
```

To reset the interval to the default of 30 seconds for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no normal-interval
```

**Related Commands**

# ping-poll

**Overview** This command enters the ping-poll configuration mode. If a ping-poll exists with the specified number, then this command enters its configuration mode. If no ping-poll exists with the specified number, then this command creates a new ping poll with this ID number.

To configure a ping-poll, create a ping poll using this command, and use the [ip \(ping-polling\)](#) command to specify the device you want the polling instance to poll. It is not necessary to specify any further commands unless you want to change a command's default.

The **no** variant of this command deletes the specified ping poll.

**Syntax** `ping-poll <1-100>`  
`no ping-poll <1-100>`

| Parameter | Description                   |
|-----------|-------------------------------|
| <1-100>   | A unique ping poll ID number. |

**Mode** Global Configuration

**Examples** To create ping-poll instance 3 and enter ping-poll configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 3
awplus(config-ping-poll)#
```

To delete ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# no ping-poll 3
```

**Related Commands**

- [show ping-poll](#)
- [source-ip](#)

# sample-size

**Overview** This command sets the total number of pings that the polling instance inspects when determining whether a device is unreachable. If the number of pings specified by the **fail-count** command go unanswered within the inspected sample, then the device is declared unreachable.

If the numbers set in this command and **fail-count** command are the same, the unanswered pings must be consecutive. If the number set by this command is greater than that set with the **fail-count** command, a device that does not always reply to pings may be declared unreachable.

You cannot set this command's value lower than the **fail-count** value.

The polling instance uses the number of pings specified by the **up-count** command to determine when a device is reachable.

The **no** variant of this command resets this command to the default.

**Syntax** `sample-size <1-100>`  
`no sample size`

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| <1-100>   | Number of pings that determines critical and up counts. |

**Default** The default is 5.

**Mode** Ping-Polling Configuration

**Examples** To set the sample-size to 50 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# sample-size 50
```

To reset sample-size to the default of 5 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no sample-size
```

# show counter ping-poll

**Overview** This command displays the counters for ping polling.

**Syntax** show counter ping-poll [*<1-100>*]

| Parameter            | Description                                                                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;1-100&gt;</i> | A unique ping poll ID number. This displays the counters for the specified ping poll only. If you do not specify a ping poll, then this command displays counters for all ping polls. |

**Mode** User Exec and Privileged Exec

**Output** Figure 58-1: Example output from the **show counter ping-poll** command

```
Ping-polling counters
Ping-poll: 1
PingsSent 15
PingsFailedUpState 0
PingsFailedDownState 0
ErrorSendingPing 2
CurrentUpCount 13
CurrentFailCount 0
UpStateEntered 0
DownStateEntered 0

Ping-poll: 2
PingsSent 15
PingsFailedUpState 0
PingsFailedDownState 0
ErrorSendingPing 2
CurrentUpCount 13
CurrentFailCount 0
UpStateEntered 0
DownStateEntered 0

Ping-poll: 5
PingsSent 13
PingsFailedUpState 0
PingsFailedDownState 2
ErrorSendingPing 2
CurrentUpCount 9
CurrentFailCount 0
UpStateEntered 0
DownStateEntered 0
```

**Table 59:** Parameters in output of the **show counter ping-poll** command

| Parameter            | Description                                                                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ping-poll            | The ID number of the polling instance.                                                                                                                       |
| PingsSent            | The total number of pings generated by the polling instance.                                                                                                 |
| PingsFailedUpState   | The number of unanswered pings while the target device is in the Up state. This is a cumulative counter for multiple occurrences of the Up state.            |
| PingsFailedDownState | Number of unanswered pings while the target device is in the Down state. This is a cumulative counter for multiple occurrences of the Down state.            |
| ErrorSendingPing     | The number of pings that were not successfully sent to the target device.<br>This error can occur when your device does not have a route to the destination. |
| CurrentUpCount       | The current number of sequential ping replies.                                                                                                               |
| CurrentFailCount     | The number of ping requests that have not received a ping reply in the current sample-size window.                                                           |
| UpStateEntered       | Number of times the target device has entered the Up state.                                                                                                  |
| DownStateEntered     | Number of times the target device has entered the Down state.                                                                                                |

**Example** To display counters for the polling instances, use the command:

```
awplus# show counter ping-poll
```

**Related Commands**

- [debug ping-poll](#)
- [ping-poll](#)
- [show ping-poll](#)

# show ping-poll

**Overview** This command displays the settings and status of ping polls.

**Syntax** `show ping-poll [<1-100>|state {up|down}] [brief]`

| Parameter | Description                                                                                                    |                                                                   |
|-----------|----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| <1-100>   | Displays settings and status for the specified polling instance.                                               |                                                                   |
| state     | Displays polling instances based on whether the device they are polling is currently reachable or unreachable. |                                                                   |
|           | up                                                                                                             | Displays polling instance where the device state is reachable.    |
|           | down                                                                                                           | Displays polling instances where the device state is unreachable. |
| brief     | Displays a summary of the state of ping polls, and the devices they are polling.                               |                                                                   |

**Mode** User Exec and Privileged Exec

**Output** Figure 58-2: Example output from the **show ping-poll brief** command

```
Ping Poll Configuration

Id Enabled State Destination

1 Yes Down 192.168.0.1
2 Yes Up 192.168.0.100
```

**Table 60:** Parameters in output of the **show ping-poll brief** command

| Parameter | Meaning                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------|
| Id        | The ID number of the polling instance, set when creating the polling instance with the <a href="#">ping-poll</a> command. |
| Enabled   | Whether the polling instance is enabled or disabled.                                                                      |

**Table 60:** Parameters in output of the **show ping-poll brief** command (cont.)

| Parameter     | Meaning                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------|
| State         | The current status of the device being polled:                                                                                           |
| Up            | The device is reachable.                                                                                                                 |
| Down          | The device is unreachable.                                                                                                               |
| Critical Up   | The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.    |
| Critical Down | The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up. |
| Destination   | The IP address of the polled device, set with the <code>ip (ping-polling)</code> command.                                                |

**Figure 58-3:** Example output from the **show ping-poll** command

```

Ping Poll Configuration

Poll 1:
Description : Primary Gateway
Destination IP address : 192.168.0.1
Status : Down
Enabled : Yes
Source IP address : 192.168.0.10
Critical interval : 1
Normal interval : 30
Fail count : 10
Up count : 5
Sample size : 50
Length : 32
Timeout : 1
Debugging : Enabled

```

```

Poll 2:
Description : Secondary Gateway
Destination IP address : 192.168.0.100
Status : Up
Enabled : Yes
Source IP address : Default
Critical interval : 5
Normal interval : 60
Fail count : 20
Up count : 30
Sample size : 100
Length : 56
Timeout : 2
Debugging : Enabled

```

**Table 61:** Parameters in output of the **show ping-poll** command

| Parameter              | Description                                                                                                                                                                                                           |                                                                                                                                          |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Description            | Optional description set for the polling instance with the <a href="#">description (ping-polling)</a> command.                                                                                                        |                                                                                                                                          |
| Destination IP address | The IP address of the polled device, set with the <a href="#">ip (ping-polling)</a> command.                                                                                                                          |                                                                                                                                          |
| Status                 | The current status of the device being polled:                                                                                                                                                                        |                                                                                                                                          |
|                        | Up                                                                                                                                                                                                                    | The device is reachable.                                                                                                                 |
|                        | Down                                                                                                                                                                                                                  | The device is unreachable.                                                                                                               |
|                        | Critical Up                                                                                                                                                                                                           | The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.    |
|                        | Critical Down                                                                                                                                                                                                         | The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up. |
| Enabled                | Whether the polling instance is enabled or disabled. The <a href="#">active (ping-polling)</a> and <a href="#">active (ping-polling)</a> commands enable and disable a polling instance.                              |                                                                                                                                          |
| Source IP address      | The source IP address sent in the ping packets. This is set using the <a href="#">source-ip</a> command.                                                                                                              |                                                                                                                                          |
| Critical interval      | The time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable. This is set with the <a href="#">critical-interval</a> command. |                                                                                                                                          |
| Normal interval        | The time period between pings when the device is reachable. This is set with the <a href="#">normal-interval</a> command.                                                                                             |                                                                                                                                          |

**Table 61:** Parameters in output of the **show ping-poll** command (cont.)

| Parameter   | Description                                                                                                                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fail count  | The number of pings that must be unanswered, within the total number of pings specified by the <a href="#">sample-size</a> command, for the polling instance to consider the device unreachable. This is set using the <a href="#">fail-count</a> command. |
| Up count    | The number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again. This is set using the <a href="#">up-count</a> command.                                                                   |
| Sample size | The total number of pings that the polling instance inspects when determining whether a device is unreachable. This is set using the <a href="#">sample-size</a> command.                                                                                  |
| Length      | The number of data bytes to include in the data portion of the ping packet. This is set using the <a href="#">length (ping-poll data)</a> command.                                                                                                         |
| Timeout     | The time in seconds that the polling instance waits for a response to a ping packet. This is set using the <a href="#">timeout (ping polling)</a> command.                                                                                                 |
| Debugging   | Indicates whether ping polling debugging is <b>Enabled</b> or <b>Disabled</b> . This is set using the <a href="#">debug ping-poll</a> command.                                                                                                             |

**Examples** To display the ping poll settings and the status of all the polls, use the command:

```
awplus# show ping-poll
```

To display a summary of the ping poll settings, use the command:

```
awplus# show ping-poll brief
```

To display the settings for ping poll 6, use the command:

```
awplus# show ping-poll 6
```

To display a summary of the state of ping poll 6, use the command:

```
awplus# show ping-poll 6 brief
```

To display the settings of ping polls that have reachable devices, use the command:

```
awplus# show ping-poll state up
```

To display a summary of ping polls that have unreachable devices, use the command:

```
awplus# show ping-poll 6 state down brief
```

**Related Commands** [debug ping-poll](#)  
[ping-poll](#)

# source-ip

**Overview** This command specifies the source IP address to use in ping packets.

By default, the polling instance uses the address of the interface through which it transmits the ping packets. It uses the device's local interface IP address when it is set. Otherwise, the IP address of the interface through which it transmits the ping packets is used.

The **no** variant of this command resets the source IP in the packets to the device's local interface IP address.

**Syntax** `source-ip {<ip-address>|<ipv6-address>}`  
`no source-ip`

| Parameter                         | Description                                        |
|-----------------------------------|----------------------------------------------------|
| <code>&lt;ip-address&gt;</code>   | An IPv4 address in dotted decimal notation A.B.C.D |
| <code>&lt;ipv6-address&gt;</code> | An IPv6 address in hexadecimal notation X:X::X:X   |

**Mode** Ping-Polling Configuration

**Examples** To configure the ping-polling instance 43 to use the source IP address 192.168.0.1 in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 192.168.0.1
```

To configure the ping-polling instance 43 to use the source IPv6 address 2001:db8:: in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 2001:db8::
```

To reset the source IP address to the device's local interface IP address for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no source-ip
```

Commands** [description \(ping-polling\)](#)  
[ip \(ping-polling\)](#)  
[length \(ping-poll data\)](#)  
[ping-poll](#)  
[show ping-poll](#)

# timeout (ping polling)

**Overview** This command specifies the time in seconds that the polling instance waits for a response to a ping packet. You may find a higher time-out useful in networks where ping packets have a low priority.

The **no** variant of this command resets the set time out to the default of one second.

**Syntax** `timeout <1-30>`  
`no timeout`

| Parameter | Description                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------|
| <1-30>    | Length of time, in seconds, that the polling instance waits for a response from the polled device. |

**Default** The default is 1 second.

**Mode** Ping-Polling Configuration

**Examples** To specify the timeout as 5 seconds for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# timeout 5
```

To reset the timeout to its default of 1 second for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no timeout
```

- [normal-interval](#)
- [ping-poll](#)
- [sample-size](#)
- [show ping-poll](#)
- [up-count](#)

# up-count

**Overview** This command sets the number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again.

The **no** variant of this command resets the up count to the default of 30.

**Syntax** `up-count <1-100>`  
`no up-count`

| Parameter                  | Description                                                                      |
|----------------------------|----------------------------------------------------------------------------------|
| <code>&lt;1-100&gt;</code> | Number of replied pings before an unreachable device is classified as reachable. |

**Default** The default is 30.

**Mode** Ping-Polling Configuration

**Examples** To set the upcount to 5 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# up-count 5
```

To reset the upcount to the default value of 30 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no up-count
```

# 59

# Firewall Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure AlliedWare Plus Firewall. For more information see the [Firewall\\_and Network Address Translation \(NAT\) Feature Overview and Configuration\\_Guide](#).

The table below lists the firewall commands and their applicable modes.

Figure 59-1: Firewall commands and applicable modes

| Mode                   | Command                                      |
|------------------------|----------------------------------------------|
| Privileged Exec        | <code>clear firewall connections</code>      |
|                        | <code>debug firewall</code>                  |
|                        | <code>show debugging firewall</code>         |
|                        | <code>show firewall</code>                   |
|                        | <code>show firewall connections</code>       |
|                        | <code>show firewall rule</code>              |
|                        | <code>show firewall rule config-check</code> |
|                        | <code>show running-config firewall</code>    |
| Global Configuration   | <code>firewall</code>                        |
| Firewall Configuration | <code>protect (Firewall)</code>              |
|                        | <code>rule (Firewall)</code>                 |
|                        | <code>move rule (Firewall)</code>            |

# clear firewall connections

**Overview** Use this command to clear firewall connections.

**Syntax** `clear firewall connections`

**Mode** Privileged Exec

**Usage** Removing the Network Address Translation (NAT) rule by using the **no nat rule** command for an actively translated flow does not stop translating immediately. This means subsequent packets in the flow are continued to be translated.

The continued translation after associated NAT rule is removed will only stop when:

- You use the **clear firewall connections** command to manually stop translations immediately, when the associated rule has been deleted regardless whether the firewall feature is actually configured with NAT or not.
- The traffic flow ends naturally, for example, when it is stopped from the source. If the flow is re-initiated from a host, it will not be translated by the firewall, as the rule is deleted after the first flow stopped.

**Examples** To clear firewall connections, use the command:

```
awplus# clear firewall connections
```

**Validation commands** [show firewall connections](#)

**Related commands** [rule \(NAT\)](#)

# connection-limit (Firewall)

**Overview** Use this command to limit firewall connections for an entity.

Use the **no** variant of this command to remove the limit.

**Syntax** `connection-limit [<1-65535>] from <entity_name> with limit <0-100000>`  
`no connection-limit {<1-65535>|all}`

| Parameter     | Description                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-65535>     | Unique numeric identifier for the limit.                                                                                                                              |
| <entity_name> | An entity represents a logical grouping of subnets, hosts or interfaces. For more information about entity, see the <a href="#">Application and Entity Commands</a> . |
| <0-100000>    | The maximum number of permitted connections for the entity.                                                                                                           |
| all           | Delete all limits.                                                                                                                                                    |

**Default** The limiting is disabled by default and the number of connections will not be limited. However, the number is up to the maximum total number of allowed connections.

**Mode** Firewall Configuration

**Usage** This command allows you to limit the number of firewall sessions associated with a specific entity. The limit will be applied to each host on that entity. This means connection limits applied to an entity with multiple addresses will apply the limit to individual hosts, not the total connections for the entity. The limit applies to both IPv4 and IPv6.

If a connection limit rule is removed, any running connections are not stopped. Changes to limits only affect new connections. Adding a lower limit will not affect existing connections.

**Examples** To set a connection limit for entity DMZ, use the following command:

```
awplus(config-firewall)# connection-limit
1 from DMZ with limit 10000
```

To remove the connection limit, use the following command:

```
awplus(config-firewall)# no connection-limit
1
```

**Validation commands** [show firewall connections](#)  
[show firewall connections limits](#)

# connection-log events

**Overview** Use this command to enable extra logging for indicating the start and the end of connections passing through the firewall.

Use the **no** variant of this command to turn off the extra logging of connections passing through the firewall.

**Syntax** `connection-log events [new|end|all]`  
`no connection-log events [new|end|all]`

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| new       | New connection                                       |
| end       | Connections closed                                   |
| all       | All new connections and connections closed. Default. |

**Default** Connection logging is not enabled by default.

**Mode** Global Configuration.

**Usage** There are two types of messages you can log: new connections and connections that ended. You can control the amount of messages you log by choosing to log either type of message or all of the message types.

Messages contain the following information:

- time
- source and destination addresses (NATed and unNATed)
- protocol
- source and destination ports (NATed and unNATed)
- bytes and packets passed (found in the connection end message)

**Example** To log all of the new connections and all of the closed connections, use the commands:

```
awplus# configure terminal
awplus(config)# connection-log events all
```

**Related Commands** [show connection-log events](#)

**Command changes** Version 5.4.7-1.1: command added.

# firewall

**Overview** Use this command to configure the firewall.  
Use the **no** variant of this command to remove all firewall configuration.

**Syntax** `firewall`  
`no firewall`

**Mode** Global Configuration

**Usage** This command allows you to enter the Firewall Configuration mode. The command prompt for this mode is **awplus(config-firewall)#**

In the Firewall Configuration mode, you can:

- Enable or disable firewall protection, see the [protect \(Firewall\)](#) command.
- Create, move, or delete rules for the firewall, see the [rule \(Firewall\)](#) command and the [move rule \(Firewall\)](#) command.

**Examples** To configure the firewall, use the commands:

```
awplus# configure terminal
awplus(config)# firewall
awplus(config-firewall)#
```

To remove all firewall configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no firewall
```

**Validation commands** `show firewall`  
`show running-config firewall`

# debug firewall

**Overview** Use this command to enable firewall debugging and Network Address Translation (NAT) debugging. This will cause additional detailed debugging information to be logged at the “informational” and “debugging” levels.

Use the **no** variant of this command to disable firewall debugging and NAT debugging.

For more information about NAT, see the [Firewall\\_and Network Address Translation \(NAT\) Feature Overview and Configuration\\_Guide](#).

**Syntax** `debug firewall`  
`no debug firewall`

**Default** Firewall debugging and NAT debugging are disabled by default.

**Mode** Privileged Exec

**Examples** To enable firewall debugging and NAT debugging, use the command:

```
awplus# debug firewall
```

To disable firewall debugging and NAT debugging, use the command:

```
awplus# no debug firewall
```

**Validation commands** [show debugging firewall](#)

# ip tcp timeout established

**Overview** Use this command to set the idle timeout for all established TCP connections. Use the **no** variant of this command to set the idle timeout back to the default of 3600 seconds.

**Syntax** `ip tcp timeout established <1-31536000>`  
`no ip tcp timeout established`

| Parameter                       | Description                                                                |
|---------------------------------|----------------------------------------------------------------------------|
| <code>&lt;1-31536000&gt;</code> | Idle timeout for established TCP connections in seconds from 1 to 3153600. |

**Default** 3600 seconds (1 hour)

**Mode** Global Configuration

**Usage** By default, when a TCP session is successfully established through the firewall, when the session goes idle, it automatically times out of the firewall connection tracking table after 3600 seconds. In some situations it may be beneficial to time out unused established TCP sessions earlier.

For example, in a busy environment where there is an excessive number of sessions being established, the firewall connection tracking table could become oversubscribed, with new connections being blocked until older sessions are timed out.

**Example** To set a non-default TCP session timeout for established idle sessions of 1800 seconds (30 minutes), use the commands:

```
awplus# configure terminal
awplus(config)# ip tcp timeout established 1800
```

**Example** To set the TCP session timeout for established idle sessions back to the default setting of 3600 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip tcp timeout established
```

**Related Commands** [show running-config](#)

**Command changes** Version 5.4.6-1.1: command added

# move rule (Firewall)

**Overview** Use this command to change the order of firewall rules.

Firewall rules are applied in rule ID order. When rules match the same application, source entity and destination entity, only the rule with the lowest ID is applied.

Note that you can move an existing rule ID only to an ID that is not assigned to any rule; otherwise you will be given an error message. Also note that a change to the rule order may change the rule results.

**Syntax** `move rule <1-65535> to <1-65535>`

| Parameter                                  | Description                                                                                                                                                                                                                          |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>move rule<br/>&lt;1-65535&gt;</code> | Move the ID of a given rule. The rule ID of the given rule must exist.<br>Each rule has an ID which is either designated by the user or automatically generated when the rule is created. The rule ID is an integer from 1 to 65535. |
| <code>to &lt;1-65535&gt;</code>            | New rule ID to assign. The new rule ID must not be used by any existing rule.                                                                                                                                                        |

**Mode** Firewall Configuration

**Examples** To change the rule ID from 20 to 10, use the commands:

```
awplus# configure terminal
awplus(config)# firewall
awplus(config-firewall)# move rule 20 to 10
```

**Validation commands** [show firewall rule](#)  
[show running-config firewall](#)

**Related commands** [rule \(Firewall\)](#)

# protect (Firewall)

**Overview** Use this command to enable firewall protection.

Use the **no** variant of this command to disable firewall protection without losing the existing firewall configuration.

**Syntax** protect  
no protect

**Default** Firewall protection is disabled by default.

**Mode** Firewall Configuration

**Usage** Firewall protection is disabled by default and all traffic can pass through the firewall. When the firewall is enabled and no rules are added, all traffic will be blocked by default. You can use the [rule \(Firewall\)](#) command to configure rules to allow traffic to pass through the firewall.

**Examples** To enable firewall protection, use the commands:

```
awplus# configure terminal
awplus(config)# firewall
awplus(config-firewall)# protect
```

To disable firewall protection, use the commands:

```
awplus# configure terminal
awplus(config)# firewall
awplus(config-firewall)# no protect
```

**Validation commands** [show firewall](#)  
[show running-config firewall](#)

# rule (Firewall)

**Overview** Use this command to create a rule for the firewall. Firewall security policy is specified in the form of firewall rules. Each rule defines the appropriate processing of a type of traffic passing through the firewall.

Use the **no** variant of this command to remove a rule.

**Syntax**

```
rule [<1-65535>] {permit|deny|reject|log} <application-name>
from <source-entity> to <destination-entity>
[no-state-enforcement] [log]

no rule {<1-65535>|all}
```

| Parameter            | Description                                                                                                                                                                                                                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-65535>            | Rule ID is an integer in the range <1-65535>. If you don't designate a rule ID, a rule ID will be automatically generated and it will be greater than the current highest rule ID.                                                                                                              |
| permit               | Permit connections that match the application, source entity and destination entity specified with this command.                                                                                                                                                                                |
| deny                 | Drop connections that match the application, source entity and destination entity specified with this command. No error message is sent back to the source host.                                                                                                                                |
| reject               | Reject connections that match the application, source entity and destination entity specified with this command. An error message (for instance, a TCP reset for a rejected TCP connection, or a destination unreachable message for an ICMP connection, etc.) is sent back to the source host. |
| log                  | When 'log' is the action for the rule, log an event each time the rule is hit. The traffic will also be processed by subsequent firewall rules which may permit, deny or reject the connection.                                                                                                 |
| <application-name>   | Application name. You can either specify an application name or use the word <i>any</i> , which stands for all applications. For more information about applications, see Application and Entity Commands.                                                                                      |
| <source-entity>      | Source entity name. An entity represents a logical grouping of subnets, hosts or interfaces. For more information about entities, see Application and Entity Commands.                                                                                                                          |
| <destination-entity> | Destination entity name.                                                                                                                                                                                                                                                                        |

| Parameter            | Description                                                                                                                                                                                                                                                                                                   |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no-state-enforcement | Optionally disable state enforcement for this rule. Use this option with caution as it will allow reverse path connection initiation. It should be used only when the traffic forward and reverse paths must be different and there is no alternative approach available. This option is disabled by default. |
| log                  | When 'log' is appended to a rule, the action is applied and a log message is also generated each time the rule is hit.                                                                                                                                                                                        |
| all                  | Delete all rules.                                                                                                                                                                                                                                                                                             |

**Mode** Firewall Configuration

**Usage** When the firewall is enabled and no rules are added, all traffic is blocked by default, you can use this command to create rules for permitting packets between entities.

The rule is not valid and cannot be hit if either the application, source entity or destination entity the rule applies to is not properly configured, for example, the application does not exist or does not have a protocol configured or the entity does not exist. To configure applications and entities, see Application and Entity Commands. You can also use the [show firewall rule config-check](#) command to check rule configuration validity.

You can change the rule order by using the [move rule \(Firewall\)](#) command.

**Examples** To create a rule for permitting application ping between 'public' and 'private', use the command:

```
awplus(config-firewall)# rule 10 permit
ping from public to private
```

To create a rule for denying application http between 'public.wan' and 'private.lan', use the command:

```
awplus(config-firewall)# rule 20 deny
http from public.wan to private.lan
```

To create a firewall rule to permit application 'ping' between 'public' and 'dmz' entities and to log the results, use the commands:

```
awplus(config-firewall)# rule 30 permit
ping from public to dmz log
```

**Related commands**

- [move rule \(Firewall\)](#)
- [show firewall rule](#)
- [show firewall rule config-check](#)

**Command changes** Version 5.4.7-0.1: **no-state-enforcement** option added.

# show connection-log events

**Overview** This command displays the configuration state (enabled or disabled) for the logging of connections passing through the firewall, as configured by the [connection-log events](#) command.

**Syntax** `show connection-log events`

**Mode** User Exec

**Example** To show the logging configuration state for the connections passing through the firewall, use the command:

```
awplus# show connection-log events
```

**Output** Figure 59-2: Example output from **show connection-log events**

```
awplus#show connection-log events
Log new connection events: Disabled
Log connection end events: Enabled
```

**Related Commands** [connection-log events](#)

**Command changes** Version 5.4.7-1.1: command added.

# show firewall

**Overview** Use this command to show the protection state of the firewall and the number of active connections being handled by the firewall.

You can use the [protect \(Firewall\)](#) command to enable firewall protection.

**Syntax** `show firewall`

**Mode** Privileged Exec

**Examples** To show the state of the firewall, use the command:

```
awplus# show firewall
```

**Output** Figure 59-3: Example output from the **show firewall** command

```
awplus#show firewall
Firewall protection is enabled
Active connections: 9
```

**Related commands** [protect \(Firewall\)](#)

# show firewall connections

**Overview** Use this command to show the connections currently being tracked by the firewall.

**Syntax** show firewall connections

**Mode** Privileged Exec

**Examples** To show the connections currently being tracked by the firewall, use the command:

```
awplus# show firewall connections
```

**Output** Figure 59-4: Example output from the **show firewall connections** command

```
awplus#show firewall connections
tcp ESTABLISHED src=192.168.1.2 dst=172.16.1.2 sport=58616

**Related commands** [clear firewall connections](#)

# show firewall connections limits

**Overview** Use this command to show the configured firewall connection-limits for a given entity.

**Syntax** `show firewall connections limits`

**Mode** Privileged Exec

**Examples** To show the information about all the firewall connection limits, use the command:

```
awplus# show firewall connections limits
```

**Output** Figure 59-5: Example output from the **show firewall connections limits** command

```
awplus#show firewall connections limits
```

| ID | Entity | Limit | Hit Count |
|----|--------|-------|-----------|
| 10 | DMZ    | 100   | 42        |

**Related commands** [show firewall connections limits config-check](#)

# show firewall connections limits config-check

**Overview** Use this command to check configuration validity of firewall connection limits.

An invalid rule will not be active and cannot be hit. This command also shows the reasons why a limit configuration is not valid.

**Syntax** `show firewall connections limits config-check`

**Mode** Privileged Exec

**Usage** Firewall limits are applied to entities only. A limit is not valid if the source entity (zone) is not configured properly. This command checks if the entity exists at all, and if it does it also checks if the entity (zone) has a valid subnet.

**Examples** To check configuration validity of connection-limit rules, use the command:

```
awplus# show firewall connections limits
config-check
```

**Output** Figure 59-6: Example output from the **show firewall connections limits config-check** command on the console if rule configuration errors are detected. Connection-limit 10 uses an entity that exists; however no subnet has been specified. Connection-limit 20 uses an entity that doesn't exist.

```
awplus#show firewall connections limits config-check
Connection-limit 10:
 "From" entity has no subnet or host addresses
Connection-limit 20:
 "From" entity does not exist
```

**Output** Figure 59-7: Example output from the **show firewall connections limits config-check** command if all limit rules are valid

```
awplus#show firewall connection limits config-check
All rules are valid
```

**Related commands** [show firewall connections limits](#)

# show firewall rule

**Overview** Use this command to show information about firewall rules.

**Syntax** show firewall rule [<1-65535>]

| Parameter | Description |
|-----------|-------------|
| <1-65535> | Rule ID     |

**Mode** Privileged Exec

**Examples** To show information about all firewall rules, use the command:

```
awplus# show firewall rule
```

**Output** Figure 59-8: Example output from the **show firewall rule** command

```
awplus#show firewall rule

[* = Rule is not valid - see "show firewall rule config-check"]
 ID Action App From To
Hits

 10 permit ping public private
 0
 20 permit ping public dmz
 0
 40 permit ping private dmz
 0
 * 50 permit voice public private
 0
```

To show information about a specific firewall rule, use the command:

```
awplus# show firewall rule 10
```

**Output** Figure 59-9: Example output from the **show firewall rule** command

```
awplus#show firewall rule 10

[* = Rule is not valid - see "show firewall rule config-check"]
 ID Action App From To
Hits

 10 permit ping public private
 0
```

| Output Parameter | Description                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------|
| *                | Indicates the rule is not valid and cannot be hit, see the <a href="#">show firewall rule config-check</a> command. |
| Action           | The rule action set by the <a href="#">rule (Firewall)</a> command.                                                 |
| App              | Application name.                                                                                                   |
| From             | Source entity.                                                                                                      |
| To               | Destination entity.                                                                                                 |
| Hits             | The number of times the firewall rule has been hit.                                                                 |

**Related commands** [rule \(Firewall\)](#)

# show firewall rule config-check

**Overview** Use this command to check configuration validity of firewall rules.  
An invalid rule will not be active and cannot be hit. This command also shows the reasons why a rule is not valid.

**Syntax** `show firewall rule config-check`

**Mode** Privileged Exec

**Usage** Firewall rules are applied to applications and entities. A rule is not valid if either the application, source entity or destination entity the rule applies to is not configured properly.

To configure applications and entities, see Application and Entity Commands.

**Examples** To check configuration validity of firewall rules, use the command:

```
awplus# show firewall rule config-check
```

**Output** Figure 59-10: Example output from the **show firewall rule config-check** command if rule configuration errors are detected

```
awplus#show firewall rule config-check
Rule 10:
 Application does not have a protocol configured
 "From" entity does not exist
 "To" entity has no subnet or host addresses
```

**Output** Figure 59-11: Example output from the **show firewall rule config-check** command if all rules are valid

```
awplus#show firewall rule config-check
All rules are valid
```

**Related commands** [rule \(Firewall\)](#)  
[show firewall rule](#)

# show debugging firewall

**Overview** Use this command to show the firewall and Network Address Translation (NAT) debugging status.

You can use the [debug firewall](#) command to enable firewall and NAT debugging.

For more information about NAT, see the [Firewall\\_and Network Address Translation \(NAT\) Feature Overview and Configuration\\_Guide](#).

**Syntax** `show debugging firewall`

**Mode** Privileged Exec

**Examples** To show the firewall and NAT debugging status, use the command:

```
awplus# show debugging firewall
```

**Output** Figure 59-12: Example output from the **show debugging firewall** command

```
awplus#show debugging firewall
Firewall Debugging Status: on
```

**Related commands** [debug firewall](#)

# show running-config firewall

**Overview** Use this command to show the configuration commands that have been used to configure the firewall.

**Syntax** `show running-config firewall`

**Mode** Privileged Exec

**Examples** To show the configuration commands that have been used to configure the firewall, use the command:

```
awplus# show running-config firewall
```

**Output** Figure 59-13: Example output from the **show running-config firewall** command

```
awplus#show running-config firewall
firewall
 rule 10 permit ping from public to private
 protect

# Application and Entity Commands

## Introduction

This chapter provides an alphabetical reference of commands used to configure application and entity. For more information, see the [Firewall\\_and Network Address Translation \(NAT\) Feature Overview and Configuration\\_Guide](#).

The table below lists the application commands and their applicable modes.

Figure 60-1: Application commands and applicable modes

| Mode                 | Command                              |
|----------------------|--------------------------------------|
| Privileged Exec      | <code>show application</code>        |
|                      | <code>show application detail</code> |
| Global Configuration | <code>application</code>             |
| Application Mode     | <code>protocol</code>                |
|                      | <code>icmp-type</code>               |
|                      | <code>icmp-code</code>               |
|                      | <code>sport</code>                   |
|                      | <code>dport</code>                   |

The table below lists the entity commands and their applicable modes.

Figure 60-2: Entity commands

| Mode                 | Command                       |
|----------------------|-------------------------------|
| Privileged Exec      | <code>show entity</code>      |
| Global Configuration | <code>zone</code>             |
| Zone Mode            | <code>network (Entity)</code> |

---

| Mode         | Command                            |
|--------------|------------------------------------|
| Network Mode | <code>ip subnet</code>             |
|              | <code>ipv6 subnet</code>           |
|              | <code>host (Entity)</code>         |
| Host Mode    | <code>ip address (Entity)</code>   |
|              | <code>ipv6 address (Entity)</code> |

# application

**Overview** Use this command to create or modify a custom application.

Application is a high level abstraction of application packets being transported by network traffic. Traffic matching for applications can be achieved through the firewall by using several techniques, for example, matching packets to port numbers or searching for application signatures in flows of packets.

Use the **no** variant of this command to delete a custom application.

**Syntax** `application <application-name>`  
`no application <application-name>`

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;application-name&gt;</code> | Application name.<br>You can use all alphanumeric ASCII characters, and the dash (-) and underscore (_) characters. The name can be 1 to 64 characters long. The application name is case-sensitive. If you create two application names with the same spelling but one in upper case and the other one in lower case, the last overwrites the first entry. |

**Mode** Global Configuration

**Usage** This command allows you to enter the Application Mode with the prompt **awplus(config-application)#**. You can use this command to create a custom application or to configure an exiting application. You can configure source port, destination port, protocol, ICMP code and ICMP type for the application. Application is invalid if its protocol, source or destination are not properly configured, for example, application has no protocol configured, or, source and destination ports are applied to protocols that are not TCP, UDP or SCTP.

There are 40 predefined applications with protocols, source and destinations ports.

You can change the protocol, source and destination ports of the predefined applications. You can only delete the predefined application when you change either of its protocol, source or destination port.

Use the [show application](#) command to show all the custom and predefined applications.

**Examples** To create a custom application named `openVPN`, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)#
```

To delete custom application openVPN, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no application openVPN
```

**Validation commands** show application

**Related commands** dport  
icmp-code  
icmp-type  
protocol  
sport

# dport

**Overview** Use this command to specify a destination port or port range for an application.

A port number is part of the addressing information used to identify a specific process to which a network message is to be forwarded between a sender and a receiver. For the full list of port numbers and their assignment, you can visit the Internet Assigned Numbers Authority (IANA) Web site: [www.iana.org](http://www.iana.org).

Use the **no** variant of this command to delete a port or a port range from an application. Note that

**NOTE:**

The port or port range that you want to delete must match exactly the existing port or port range. You cannot remove a port range that is part of an existing port range.

**Syntax** `dport {<destination-port>|any|<start-range> to <end-range>}`  
`no dport {<destination-port>|any|<start-range> to <end-range>}`

| Parameter                             | Description                                                                                     |
|---------------------------------------|-------------------------------------------------------------------------------------------------|
| <code>&lt;destination-port&gt;</code> | The destination port number, either TCP or UDP, specified as an integer in the range <1-65535>. |
| <code>any</code>                      | Any port number in the range <1-65535>. This equals to a range of 1 to 65535.                   |
| <code>&lt;start-range&gt;</code>      | Starting port number in the range <1-65535>.                                                    |
| <code>to &lt;end-range&gt;</code>     | Ending port number in the range <1-65535> or max.                                               |

**Mode** Application Mode

**Usage** You can create more than one destination port number or port range for an application.

**Examples** To specify destination port 13 for application `openVPN`, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# dport 13
```

To specify destination port 15 and port ranges for application `openVPN`, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# dport 15
awplus(config-application)# dport 30 to 37
awplus(config-application)# dport 50 to max
```

To specify destination port any, that is a port number range of <1-65535>, for application openVPN, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# dport any
```

To remove destination port 15 from application openVPN, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# no dport 15
```

To remove port any from application openVPN, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# no dport 1 to 65535
```

**Validation commands** [show application](#)

**Related commands** [application](#)  
[sport](#)

# dscp

**Overview** Use this command to specify one or more DSCP values used by an application.

Use the **no** variant of this command to remove one or more DSCP values from an application.

**Syntax** `dscp <dscp-list>`

`dscp {af11|af12|af13|af21|af22|af23|af31|af32|af33|af41|af42|af43|ef|be}`

`dscp {cs0|cs1|cs2|cs3|cs4|cs5|cs6|cs7}`

`no dscp`

`no dscp <dscp-list>`

`no dscp {af11|af12|af13|af21|af22|af23|af31|af32|af33|af41|af42|af43|ef|be}`

`no dscp {cs0|cs1|cs2|cs3|cs4|cs5|cs6|cs7}`

| Parameter                      | Description                                                                                                                                                                                                                                                                      |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;dscp-list&gt;</code> | One or more DSCP values, in the range 0-63. Use spaces to separate values.                                                                                                                                                                                                       |
| <code>af11 ... be</code>       | One or more DSCP values specified according to the Assured Forwarding group, as defined in RFC 2597 and RFC 3260. See the table below for values. "ef" means expedited forwarding (DSCP 46) and "be" means best effort (DSCP 0). Voice traffic is typically given a value of ef. |
| <code>cs0 ... cs7</code>       | One or more DSCP values specified according to the Class Selector group. This is equivalent to TOS IP precedence values, so that CS0 is equivalent to an IP precedence value of 0, CS1 is equivalent to an IP precedence value of 1, and so on.                                  |

Table 60-1: Assured Forwarding (AF) behavior group

|                         | Class 1           | Class 2           | Class 3           | Class 4           |
|-------------------------|-------------------|-------------------|-------------------|-------------------|
| Low drop probability    | AF11<br>(DSCP 10) | AF21<br>(DSCP 18) | AF31<br>(DSCP 26) | AF41<br>(DSCP 34) |
| Medium drop probability | AF12<br>(DSCP 12) | AF22<br>(DSCP 20) | AF32<br>(DSCP 28) | AF42<br>(DSCP 36) |
| High drop probability   | AF13<br>(DSCP 14) | AF23<br>(DSCP 22) | AF33<br>(DSCP 30) | AF43<br>(DSCP 38) |

**Mode** Application Mode

**Usage** You can specify only one set of DSCP values for an application. The newly specified list will replace the existing one; it will not be added to the existing one.

**Example** To specify a DSCP of **ef** for the application named **voice**, use the commands:

```
awplus# configure terminal
awplus(config)# application voice
awplus(config-application)# dscp ef
```

To specify DSCPs of 12 and 13 for the application named **test**, use the commands:

```
awplus# configure terminal
awplus(config)# application test
awplus(config-application)# dscp 12 13
```

To remove DSCP12 from the application named **test**, use the commands:

```
awplus# configure terminal
awplus(config)# application test
awplus(config-application)# no dscp 12
```

To stop the application named **test** from using DSCP values, use the commands:

```
awplus# configure terminal
awplus(config)# application test
awplus(config-application)# no dscp
```

**Related  
Commands**

- [application](#)
- [show application](#)
- [show application detail](#)

# host (Entity)

**Overview** Use this command to add a host to a network entity or to configure an existing host.

Host is a high level abstraction of a single node in a network. This is commonly used if a particular device, for example a server, has a static IP address that needs to be specified in a firewall policy.

Use the **no** variant of this command to remove a host from a network entity.

**Syntax** `host <host-name>`  
`no host <host-name>`

| Parameter                      | Description                                                                                                                                              |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;host-name&gt;</code> | Host name.<br>You can use all alphanumeric ASCII characters, and the dash (-) and underscore (_) characters. The name can be 1 to 64 characters in long. |

**Mode** Network Mode

**Usage** You can create multiple hosts for a network. A host entity is identified by its parent network using the dot notation, for example, `ZoneName.NetworkName.HostName`.

This commands allows you to enter the Host Mode with the prompt **awplus(config-host)#**. The Host Mode enables you to configure IPv4 address and IPv6 address for the host. For more information about host IPv4 address and IPv6 address, see [ip address \(Entity\)](#) command and [ipv6 address \(Entity\)](#) command respectively.

**Example** To create a host entity named `ftp` under network entity `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# host ftp
awplus(config-host)#
```

To remove host entity `ftp` and its IP address configuration from network entity `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# no host ftp
```

**Validation  
commands** show entity

**Related  
commands** ip address (Entity)  
ipv6 address (Entity)  
network (Entity)

# icmp-code

**Overview** Use this command to configure an ICMP message code for an application.

ICMP has many messages that are identified by a “type” field and many of these ICMP types have a “code” field. Use the `icmp-type` command to specify the ICMP type. For the full list of the ICMP code assignments, you can visit the Internet Assigned Numbers Authority (IANA) Web site: [www.iana.org](http://www.iana.org).

Use the **no** variant of this command to restore the ICMP message code to its default, which is any.

**Syntax** `icmp-code {<code-number>|any}`  
`no icmp-code`

| Parameter                        | Description                                                   |
|----------------------------------|---------------------------------------------------------------|
| <code>&lt;code-number&gt;</code> | Specify an ICMP message code number in the range of 0 to 255. |
| <code>any</code>                 | Any ICMP message code in the range of 0 to 255.               |

**Default** The default ICMP code number is any.

**Mode** Application Mode

**Usage** You should configure the ICMP code only for applications that use protocol ICMP. To configure the application protocol, see the `protocol` command.

You can specify only one ICMP message code for an application. The newly specified code will replace the previous one.

**Examples** To specify ICMP code 5 (redirect) for application `openVPN`, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# icmp-code 5
```

To specify ICMP code as any code for application `openVPN`, use the commands: To restore the ICMP message code to its default for application `openVPN`, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# icmp-code any
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# no icmp-code
```

**Validation commands** `show application`

**Related  
commands** [application](#)  
[icmp-type](#)  
[protocol](#)

# icmp-type

**Overview** Use this command to configure an ICMP message type for an application.

The ICMP protocol has many messages that are identified by a “type” field. For the full list of the ICMP type assignments, you can visit the Internet Assigned Numbers Authority (IANA) Web site: [www.iana.org](http://www.iana.org).

Use the **no** variant of this command to restore the ICMP message type its default, which is deny.

**Syntax** `icmp-type {<type-number>|any}`  
`no icmp-type`

| Parameter                        | Description                                                   |
|----------------------------------|---------------------------------------------------------------|
| <code>&lt;type-number&gt;</code> | Specify an ICMP message type number in the range of 0 to 255. |
| <code>any</code>                 | Any ICMP message type in the range of 0 to 255.               |

**Default** The default ICMP type is any.

**Mode** Application Mode

**Usage** You should configure the ICMP type only for applications that use protocol ICMP. To configure the application protocol, see the [protocol](#) command.

You can specify only one ICMP message type for an application. The newly specified type will replace the previous one.

**Examples** To specify ICMP message type 8 (echo) for application `openVPN`, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# icmp-type 8
```

To specify ICMP message type as any type for application `openVPN`, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# icmp-type any
```

To restore the ICMP message type to its default for application `openVPN`, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# no icmp-type
```

# ip address (Entity)

**Overview** Use this command to assign an IPv4 address to a host entity.  
Use the **no** variant of this command to remove an IPv4 address from the host.

**Syntax**

```
ip address <ipv4-address>
ip address dynamic interface <interface_name>
no ip address <ipv4-address>
no ip address dynamic interface <interface_name>
```

| Parameter        | Description                                                   |
|------------------|---------------------------------------------------------------|
| <ipv4-address>   | The IPv4 address uses the format A.B.C.D.                     |
| dynamic          | Dynamic IP address, for example, obtained from a DHCP server. |
| <interface_name> | Interface to acquire IP addresses from.                       |

**Mode** Host Mode

**Usage** You can add multiple IP addresses to a host entity. If the IP address is not in the scope of any of its parent network's IPv4 subnets, a warning message will be given. Such an IP address is still acceptable because in the future the user may assign a network subnet that contains the host's IP address. Firewall policy rules will not apply to an IP address that is not in at least one of the network's subnets.

**Examples** To add an IP address to host ftp, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.1.0/24
awplus(config-network)# host ftp
awplus(config-host)# ip address 192.168.1.5
```

To add multiple IP addresses to host ftp, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.1.0/24
awplus(config-network)# host ftp
awplus(config-host)# ip address 192.168.1.8
awplus(config-host)# ip address 192.168.1.9
awplus(config-host)# ip address 192.168.1.10
```

To remove an IP address from host ftp, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# host ftp
awplus(config-host)# no ip address 192.168.1.5
```

# ip subnet

**Overview** Use this command to add an IPv4 subnet to a network entity.  
Use the **no** variant of this command to remove a subnet from a network entity.

**Syntax** `ip subnet <ip-network/m> [interface <interface-name>]`  
`no ip subnet <ip-network/m> [interface <interface-name>]`

| Parameter                           | Description                                                                                                                                                                                                      |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-network/m&gt;</code>   | IP address of the network, entered in the form A.B.C.D/M. Dotted decimal notation followed by a forward slash, and then the subnet mask length.                                                                  |
| <code>interface</code>              | Specify an interface name. An interface may be specified to add a further restriction on the subnet. No interface configured indicates that any matching address from any interface is a member of this network. |
| <code>&lt;interface-name&gt;</code> | Interface name. Any AlliedWare Plus interface type (eth, vlan, ppp, tunnel, lo and so on). A warning message is given if the interface does not match an existing interface on the device.                       |

**Mode** Network Mode

**Usage** You can create multiple subnets to a network entity.

**Examples** To add a subnet to network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.2.0/24
```

To add a subnet and an interface to network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.2.0/24 interface eth1
```

To add multiple subnets to network servers, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.2.0/24 interface eth1
awplus(config-network)# ip subnet 10.1.0.0/16 interface eth1
```

To remove a subnet from network servers, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# no ip subnet 192.168.2.0/24
```

# ipv6 address (Entity)

**Overview** Use this command to assign an IPv6 address to a host entity.  
Use the **no** variant of this command to remove an IPv6 address from an host entity.

**Syntax** `ipv6 address <ipv6-address>`  
`ipv6 address dynamic interface <interface_name>`  
`no ipv6 address <ipv6-address>`  
`no ipv6 address dynamic interface <interface_name>`

| Parameter                           | Description                                                     |
|-------------------------------------|-----------------------------------------------------------------|
| <code>&lt;ipv6-address&gt;</code>   | The IPv6 address in the format x:x::x:x.                        |
| <code>dynamic</code>                | Dynamic IPv6 address, for example, obtained from a DHCP server. |
| <code>&lt;interface_name&gt;</code> | Interface to acquire IP addresses from.                         |

**Mode** Host Mode

**Usage** You can add multiple IPv6 addresses to a host entity. If the IPv6 address is not in the scope of any of its parent network's IPv6 subnets, a warning message will be given. Such an IP address is still acceptable because in the future the user may assign a network subnet that contains the host's IPv6 address. Firewall policy rules will not apply to an IPv6 address that is not in at least one of the network's subnets.

**Examples** To add an IPv6 address to host `web-server`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ipv6 subnet 2001:db8:24:100::/64
awplus(config-network)# host web-server
awplus(config-host)# ipv6 address 2001:db8:24:100::1
```

To add multiple IP addresses to host `web-server`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ipv6 subnet 2001:db8:24:100::/64
awplus(config-network)# host web-server
awplus(config-host)# ipv6 address 2001:db8:24:100::2
awplus(config-host)# ipv6 address 2001:db8:24:100::3
awplus(config-host)# ipv6 address 2001:db8:24:100::4
```

To remove an IPv6 address from host `web-server`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# host web-server
awplus(config-host)# no ipv6 address 2001:db8:24:100::2
```

# ipv6 subnet

**Overview** Use this command to assign an IPv6 subnet to a network entity.  
Use the **no** variant of this command to remove a IPv6 subnet from a network entity.

**Syntax** `ipv6 subnet <ip-network/m> [interface <interface-name>]`  
`no ipv6 subnet <ip-network/m> [interface <interface-name>]`

| Parameter                           | Description                                                                                                                                                                                                              |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-network/m&gt;</code>   | IPv6 address of the network, entered in the form X:X::X/M, followed by the prefix length in slash notation.                                                                                                              |
| <code>interface</code>              | Specify an interface name. An interface may be specified to add a further restriction on the subnet. No interface configured indicates that any matching address from any interface is a member of this network.         |
| <code>&lt;interface-name&gt;</code> | Interface name. Any AlliedWare Plus interface type (eth, vlan, ppp, tunnel, lo and so on.) followed by any character.<br>A warning message is given if the interface does not match an existing interface on the device. |

**Mode** Network Mode

**Usage** You can create multiple subnets for a network entity.

**Examples** To add a subnet to network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ipv6 subnet 2001:db8::/32
```

To add a subnet and an interface to network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ipv6 subnet 2001:db8::/32 interface
eth1
```

To add multiple subnets to network servers, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ipv6 subnet 2001:db8::7/32 interface
eth1
awplus(config-network)# ipv6 subnet 2001:db8::8/32 interface
eth1
```

To remove a subnet from network servers, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# no ipv6 subnet 2001:db8::/32
```

**Validation commands** [show entity](#)

**Related commands** [network \(Entity\)](#)

# network (Entity)

**Overview** Use this command to add a network to a zone entity or configure an existing network.

A network is a high level abstraction of a logical network in a zone. This consists of the IP subnets and interfaces over which it is reachable. Subnets are grouped into networks to apply a common set of rules among the subnets.

Use the **no** variant of this command to destroy a network entity.

**Syntax** `network <network-name>`  
`no network <network-name>`

| Parameter                         | Description                                                                                                                                                 |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;network-name&gt;</code> | Network name.<br>You can use all alphanumeric ASCII characters, and the dash (-) and underscore (_) characters. The name can be 1 to 64 characters in long. |

**Mode** Zone Mode

**Usage** A network is a member of a zone. You can create multiple networks in a zone. A network entity is identified with its parent zone using the dot notation, for example, ZoneName.NetworkName.

This commands allows you to enter the Network Mode with the prompt **awplus(config-network)#**. In the Network Mode, you can:

- Configure subnets and interfaces for the network entity
- Create and delete host entities in the network

A network must have at least one valid network address for it to result in functioning rules using that network entity. For more information about how to add network address, see the [ip subnet](#) command and the [ipv6 subnet](#) command.

Note that if the network entity is destroyed, the subnets and hosts in the network entity will be destroyed as well.

**Example** To create a network entity named `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)#
```

To destroy a network entity named `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# no network servers
```

**Validation  
commands** `show entity`

**Related  
commands** `host (Entity)`  
`ip subnet`  
`ipv6 subnet`  
`zone`

# protocol

**Overview** Use this command to specify a protocol used by an application.

Protocol numbers are used to configure firewalls, routers, and proxy servers. The protocol number is in the protocol field of the IPv4 header and the next header field of IPv6 header. For the full list of the IP Protocol assignments, you can visit the Internet Assigned Numbers Authority (IANA) Web site: [www.iana.org](http://www.iana.org).

Use the **no** variant of this command to unset the protocol in an application.

**Syntax** `protocol {tcp|udp|icmp|ipv6-icmp|<protocol-number>}`  
`no protocol`

| Parameter         | Description                                                                                   |
|-------------------|-----------------------------------------------------------------------------------------------|
| tcp               | Transmission Control Protocol. The protocol number is 6.                                      |
| udp               | User Datagram Protocol. The protocol number is 17.                                            |
| icmp              | Internet Control Message Protocol for Internet Protocol version 4. The protocol number is 1.  |
| ipv6-icmp         | Internet Control Message Protocol for Internet Protocol version 6. The protocol number is 58. |
| <protocol-number> | Protocol number in the range of 0 to 255.                                                     |

**Mode** Application Mode

**Usage** You can specify only one protocol for an application. The newly specified protocol will replace the previous one.

**Examples** To specify protocol `tcp` for application `openVPN`, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# protocol tcp
```

To specify protocol `udp` for application `openVPN`, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# protocol udp
```

To specify protocol `icmp` for application `openVPN`, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# protocol icmp
```

To specify protocol 41 (IPv6) for application openVPN, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# protocol 41
```

To unset the protocol in application openVPN, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# no protocol
```

**Validation commands** [show application](#)

**Related commands** [application](#)

# show application

**Overview** Use this command to show the custom and predefined applications currently configured.

You can use the [show application detail](#) command to show detailed information of the applications.

**Syntax** `show application`

**Mode** Privileged Exec

**Examples** To show all applications currently configured, use the command:

```
awplus# show application
```

**Output** Figure 60-3: Example output from **show application**

```
awplus#show application
aim cvs dns ftp http https icq

To show the information about the application ping, use the command:

```
awplus# show application detail ping
```

**Output** Figure 60-5: Example output from **show application detail** for a particular application

```
awplus#show application detail ping
Name Protocol Detail

ping ICMP type=8 code=0
```

**Related Commands** [show application](#)

# show entity

**Overview** Use this command to show entity information.

Entity is a high level abstraction of a network device, a group of networks or subnets. It is the instance that firewall policy can be applied to. There are three types of entity:

- zone
- network
- host

**Syntax** `show entity [<entity>]`

| Parameter | Description                      |
|-----------|----------------------------------|
| <entity>  | Specific entity in dot notation. |

**Mode** Privileged Exec

**Examples** To show the information about all entities, use the command:

```
awplus# show entity
```

**Output** Figure 60-6: Example output from the **show entity** command

```
awplus#show entity
Zone: zone1
Network: zone1.network1
Subnet: 1:db8:24:100::/64
Subnet: 2001:db8:24:100::/64
Host: zone1.network1.host1
Address: 2001:db8:24:100::1

Zone: zone2
Network: zone2.network2
Host: zone2.network2.host1
```

To show information associated with the network entity `zone1.network1`, use the command:

```
awplus# show entity zone1.network1
```

**Output** Figure 60-7: Example output from the **show entity** command

```
awplus#show entity zone1.network1
Network: zone1.network1
Subnet: 1:db8:24:100::/64
Subnet: 2001:db8:24:100::/64
Host: zone1.network1.host1
Address: 2001:db8:24:100::1
```

To show information associated with the host entity `zone1.network1.host1`, use the command:

```
awplus# show entity zone1.network1.host1
```

**Output** Figure 60-8: Example output from the **show entity** command

```
awplus#show entity zone1.network1.host1
Host: zone1.network1.host1
Address: 192.168.1.5
```

# sport

**Overview** Use this command to specify a source port or a port range used for an application.

A port number is part of the addressing information used to identify a specific process to which a network message is to be forwarded between a sender and a receiver. For the full list of port numbers and their assignment, you can visit the Internet Assigned Numbers Authority (IANA) Web site: [www.iana.org](http://www.iana.org).

Use the **no** variant of this command to delete ports or port ranges from an application.

**NOTE:**

The port or port range that you want to delete must match exactly the existing port or port range. You cannot remove a port range that is part of an existing port range.

**Syntax** `sport {<source-port>|any|<start-range> to <end-range>}`  
`no sport {<source-port>|any|<start-range> to <end-range>}`

| Parameter                                         | Description                                                                                       |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------|
| <code>&lt;source-port&gt;</code>                  | The source port number, either TCP or UDP, specified as an integer between 1 and 65535.           |
| <code>any</code>                                  | Any port number in the range <code>&lt;1-65535&gt;</code> . This equals to a range of 1 to 65535. |
| <code>&lt;start-range&gt;</code>                  | Starting port number in the range <code>&lt;1-65535&gt;</code> .                                  |
| <code>to</code><br><code>&lt;end-range&gt;</code> | Ending port number in the range <code>&lt;1-65535&gt;</code> or max.                              |

**Mode** Application Mode

**Usage** You can create more than one source port number or port range for an application.

**Examples** To specify source port 13 for application `openVPN`, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# sport 13
```

To specify source port 15 and port ranges for application `openVPN`, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# sport 15
awplus(config-application)# sport 30 to 37
awplus(config-application)# sport 50 to 80
```

To specify source port any, that is a port number range of <1-65535>, for application openVPN, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# sport any
```

To remove source port 15 from application openVPN, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# no sport 15
```

To remove port any from application openVPN, use the commands:

```
awplus# configure terminal
awplus(config)# application openVPN
awplus(config-application)# no sport 1 to 65535
```

**Validation commands** [show application](#)

**Related commands** [application](#)  
[dport](#)

# zone

**Overview** Use this command to create a zone entity or configure an existing zone.

Zone is a high level abstraction for a logical grouping or segmentation of physical networks. This is the highest level of partitioning that firewall policy can be applied to. Zone establishes the security border of your networks. A zone defines a boundary where traffic is subjected to policy restrictions as it crosses to another region of your networks. The minimum zones normally implemented would be a trusted zone for the private network behind the firewall and a untrusted zone for the Internet. Other common zones are a Demilitarized Zone (DMZ) for publicly visible web servers and a Virtual Private Network (VPN) zone for remote access users or tunnels to other networks.

Use the **no** variant of this command to destroy a zone entity.

**Syntax** `zone <zone-name>`  
`no zone <zone-name>`

| Parameter                      | Description                                                                                                                                           |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;zone-name&gt;</code> | Zone name.<br>You can use all alphanumeric ASCII characters, and the dash (-) and underscore (_) characters. The name can be 1 to 64 characters long. |

**Mode** Global Configuration

**Usage** This command allows you to enter the Zone Mode with the prompt **awplus(config-category)#**. The Zone Mode enables you to create, configure and delete network entities. For more information about network entity, see the [network \(Entity\)](#) command.

A zone entity must have at least one network entity for it to result in functioning rules using that zone entity. For more information about how to add network entities, see the [network \(Entity\)](#) command.

Note that if the zone entity is destroyed, the networks and hosts of this zone will be destroyed as well.

**Examples** To create a zone named `private`, use the commands:

```
awplus# configure terminal
awplus(config)# zone private
awplus(config-zone)#
```

To destroy zone `private` and all its networks, subnets and hosts, use the commands:

```
awplus# configure terminal
awplus(config)# no zone private
```

**Validation** show entity

# 61

# NAT Commands

## Introduction

This chapter provides an alphabetical reference of commands used to configure Network Address Translation (NAT). For more information about NAT introduction and configuration example, see the [Firewall\\_and Network Address Translation \(NAT\) Feature Overview and Configuration\\_Guide](#).

The following figure lists the NAT commands and their applicable modes.

Figure 61-1: NAT commands and applicable modes

| Mode                 | Command                                 |
|----------------------|-----------------------------------------|
| Privileged Exec      | <code>show nat</code>                   |
|                      | <code>show nat rule</code>              |
|                      | <code>show nat rule config-check</code> |
|                      | <code>show running-config nat</code>    |
| Global Configuration | <code>nat</code>                        |
| NAT Configuration    | <code>enable (NAT)</code>               |
|                      | <code>move rule (NAT)</code>            |
|                      | <code>rule (NAT)</code>                 |

# enable (NAT)

**Overview** Use this command to enable NAT .

Use the **no** variant of this command to disable NAT without losing existing NAT configuration.

**Syntax** enable  
no enable

**Default** NAT is disabled by default.

**Mode** NAT Configuration

**Examples** To enable NAT, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# enable
```

To disable NAT, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# no enable
```

**Validation commands** show nat  
show running-config nat

# ip limited-local-proxy-arp

**Overview** Use this command to enable local proxy ARP, but only for a specified set of IP addresses. This makes the device respond to ARP requests for those IP addresses when the addresses are reachable via the interface you are configuring.

To specify the IP addresses, use the command [local-proxy-arp](#).

Use the **no** variant of this command to disable limited local proxy ARP. This stops your device from intercepting and responding to ARP requests for the specified hosts. This allows the hosts to use MAC address resolution to communicate directly with one another.

**Syntax** `ip limited-local-proxy-arp`  
`no ip limited-local-proxy-arp`

**Default** Limited local proxy ARP is disabled by default.

**Mode** Interface Configuration

**Usage** Limited local proxy ARP supports Static NAT configurations in which the NAT configuration's public address is different to the ethernet interface's address.

On such ethernet interfaces, the device needs to respond to ARP requests for the public address so that it will receive packets targeted at that address.

Limited local proxy ARP makes this possible. It is especially useful when you have a number of 1-1 NAT configurations and each public address falls within the public interface's subnet. If you enable limited local proxy ARP on the public interface and specify suitable addresses, the device will respond to ARP requests for those addresses, as long as the addresses are routed out the interface the ARP requests are received on. The device responds with its own MAC address.

**Example** The following configuration snippet shows how to use limited local proxy ARP, if you are using NAT for an HTTP server with an address of 172.22.0.3 connected via eth1, and eth1 has an address of 172.22.0.1:

```
! Create a private zone for the HTTP server with address 172.22.200.3:
zone private
network vlan1
ip subnet 172.22.200.0/24
host http_server
ip address 172.22.200.3
!
! Create a public zone for the HTTP server with address 172.22.0.3:
zone public
network eth1
ip subnet 0.0.0.0/0 interface eth1
host http_server
ip address 172.22.0.3
!
! Create a NAT rule to map from the public to the private zone:
nat
rule 10 portfwd http from public.eth1 to public.eth1.http_server with dst
private.vlan1.http_server
enable
!
! Configure eth1. It has a different public address than the HTTP server:
interface eth1
ip limited local-proxy-arp
ip address 172.22.0.1/24
!
! Configure vlan1:
interface vlan1
ip address 172.22.200.5/24
!
! Tell the device to respond to ARPs for the HTTP server public address:
local-proxy-arp 172.22.0.3/32
```

**Related** [ip local-proxy-arp](#)  
**Commands** [local-proxy-arp](#)

# local-proxy-arp

**Overview** Use this command to specify an IP subnet for use with limited local proxy ARP. When limited local proxy ARP is enabled with the command `ip limited-local-proxy-arp`, the device will respond to ARP requests for addresses in that subnet.

Use the **no** variant of this command to stop specifying a subnet for use with limited local proxy ARP.

**Syntax** `local-proxy-arp [<ip-add/mask>]`  
`no local-proxy-arp [<ip-add/mask>]`

| Parameter                        | Description                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-add/mask&gt;</code> | The IP subnet to use with limited local proxy ARP, in dotted decimal format (A.B.C.D/M). To specify a single IP address, use a 32-bit mask. |

**Default** No subnets are specified for use with limited local proxy ARP.

**Mode** Global Configuration

**Example** To specify limited local proxy ARP for the address 172.22.0.3, use the following commands:

```
awplus# configure terminal
awplus(config)# local-proxy-arp 172.22.0.3/32
```

This is part of a configuration snippet that shows how to use limited local proxy ARP with static NAT. See the command `ip limited-local-proxy-arp` for the whole example.

**Related Commands** [ip limited-local-proxy-arp](#)

# move rule (NAT)

**Overview** Use this command to change the order of a NAT rule.

You can move an existing rule ID only to an ID that is not assigned to any rule, otherwise you will receive an error message.

**Syntax** `move rule <1-65535> to <1-65535>`

| Parameter                                  | Description                                                                                                                                                                                                                             |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>move rule<br/>&lt;1-65535&gt;</code> | Move the order of a given rule. The rule ID of the given rule must exist.<br>Each rule has an ID which is either designated by the user or automatically generated when the rule is created. The rule ID is an integer from 1 to 65535. |
| <code>to &lt;1-65535&gt;</code>            | New rule ID to assign. The new rule ID must not be used by any existing rule.                                                                                                                                                           |

**Mode** NAT Configuration

**Examples** To change the ID of a rule from 10 to 30, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# move rule 10 to 30
```

**Validation commands** `show nat rule`  
`show running-config nat`

**Related commands** `rule (NAT)`

# nat

**Overview** Use this command to configure NAT.

Use the **no** variant of this command to remove all NAT configuration.

**Syntax** nat  
no nat

**Mode** Global Configuration

**Usage** This command allows you to enter the NAT Configuration mode. The command prompt for this mode is **awplus(config-nat)#**.

In the NAT Configuration mode, you can:

- Enable NAT, see the [enable \(NAT\)](#) command.
- Create NAT rules or change the order of NAT rules, see the [rule \(NAT\)](#) command and the [move rule \(NAT\)](#) command.

**Examples** To configure NAT, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)#
```

To remove all NAT configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no nat
```

**Validation commands** [show nat](#)

# rule (NAT)

**Overview** Use this command to create a NAT rule.

Use the **no** variant of this command to remove a specified rule or all rules.

**Syntax**

```
rule [<1-65535>] masq <application-name> from <source-entity>
to <destination-entity> [with src <source-host-entity>]

rule [<1-65535>] portfw <application-name> from <source-entity>
[to <destination-entity>] with dst <destination-host-entity>
[dport <1-65535>]

rule [<1-65535>] netmap <application-name> from
<source-subnet-entity> to <destination-subnet-entity> with
{src|dst} <translated-subnet-entity>

no rule {<1-65535>|all}
```

| Parameter          | Description                                                                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-65535>          | Rule ID is an integer in the range 1 to 65535. If you do not designate a rule ID, a rule ID will be automatically generated and it will be greater than the current highest rule ID.                                                                                      |
| masq               | The type of NAT rule. NAT with IP Masquerade is a case where all or a range of addresses are mapped to a single address with source port translation to identify the association. This single address masquerades as the public source address for the private addresses. |
| portfw             | The type of NAT rule. Port forwarding allows remote hosts to connect to a specific host or service within a private LAN. This will forward IPv4 packets on to another device, for example, forward HTTP traffic to an internal web server.                                |
| netmap             | The type of NAT rule. Use subnet-based NAT to translate the subnet portion of IP addresses while leaving the host portion unchanged.                                                                                                                                      |
| <application-name> | In all NAT rules, the application name, either one of the predefined applications or an application defined by using the <b>application</b> command.                                                                                                                      |

| Parameter                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;source-entity&gt;</code>             | Source entity name. An entity represents a logical grouping of subnets, hosts or interfaces, created by the <b>zone</b> , <b>network (Entity)</b> , or <b>host (Entity)</b> commands. In a <b>masq</b> rule, the source entity defines the private side of the router. You assign private IP addresses (RFC 1918) to hosts on the private side of the router. When those hosts send traffic, the router translates the private addresses to one or more publicly valid addresses before routing the traffic. When the router receives traffic that is destined for those hosts, it translates the public addresses back to the appropriate private addresses. In a <b>portfw</b> rule, the source entity may be an entity outside your private network. |
| <code>&lt;destination-entity&gt;</code>        | The destination entity name. The destination entity defines the pool of public-valid IP addresses. It can be a zone (created by the <b>zone</b> command), network ( <b>network (Entity)</b> command) or host ( <b>host (Entity)</b> command).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>&lt;source-host-entity&gt;</code>        | In a <b>masq</b> rule, the specific source host address that the traffic will masquerade as. The source -host-entity must be a host with one IP address, created by using the <b>host (Entity)</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>&lt;destination-host-entity&gt;</code>   | In a <b>portfw</b> rule, the target entity name of the specific destination host that the traffic will be port-forwarded to. The target entity must be a host with one IP address, created by using the <b>host (Entity)</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>dport &lt;1-65535&gt;</code>             | In a <b>portfw</b> rule, modify the destination port to the specified port. (Only for protocols that have ports.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>&lt;source-subnet-entity&gt;</code>      | The source entity that the netmap rule will apply to, for instance a network created by the <b>network (Entity)</b> command. When the <b>with src</b> parameter is used, this source-subnet-entity is translated to the <code>&lt;translated-subnet-entity&gt;</code> specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>&lt;destination-subnet-entity&gt;</code> | The destination entity that the <b>netmap</b> rule applies to, for instance a network created by the <b>network (Entity)</b> command. When the <b>with dst</b> parameter is used, this destination subnet is translated to the <code>&lt;translated-subnet-entity&gt;</code> specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Parameter                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <code>all</code>                              | Remove all rules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Mode** NAT Configuration

**Usage** You can change the rule order by using the [move rule \(NAT\)](#) command.

Firewall is used in conjunction with NAT. Port forwarding (**portfw**) and masquerade (**masq**) rules do not implicitly permit packets. **Portfw** rules (actions) are applied before any other firewall and **masq** rules (actions) are applied after any other firewall rules. When firewall protection is enabled, all traffic is blocked by default. Use the [rule \(Firewall\)](#) command to configure firewall rules which allow the same application, source and destination entities you configure for the NAT rules.

Netmap **dst** rules are applied to traffic before it reaches the firewall rules, and netmap **src** rules are applied after the firewall has permitted the traffic. Firewall rules must be written to permit the traffic after it has been translated by the netmap **dst** rules.

Entities should have valid interfaces on which inbound and outbound traffic can be properly translated. You can use the [ip subnet](#) command and the [ipv6 subnet](#) command to configure the interfaces.

Removing a NAT rule for an actively translated flow does not stop it translating immediately. This means subsequent packets in the flow continue to be translated.

The continued translation after the associated NAT rule is removed will only stop when:

- The [clear firewall connections](#) command is executed or the flow stops.
- One of the following actions occurs:
  - You can use the [clear firewall connections](#) command to manually stop translations immediately, when the associated rule has been deleted regardless whether the firewall feature is actually configured with NAT or not.
  - The NAT rule is cleared when the traffic flow ends naturally, for example, stopped from the source. If the flow is re-initiated from a host, it will not be translated by the firewall, as the rule is deleted after the first flow stopped.

**Examples** To perform network address translation and port forward application 'http' from entity 'public' to any with target destination dmz.servers.web\_server, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# rule 10 portfw
http from public with dst dmz.servers.web_server
```

To perform network address translation and masquerade application 'http' from entity 'private' to 'public', use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# rule 20 masq
http from private to public
```

To use subnet-based NAT to translate the source address of all traffic from 'private.lan' going to 'remote.lan' with the new subnet specified in 'private.global', use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# rule 30 netmap all from private.lan to
remote.lan with src private.global
```

To remove NAT rule 10, use the command:

```
awplus(config-nat)# no rule 10
```

**Command  
changes** Version 5.4.7-0.1: **netmap** option added.

# show nat

**Overview** Use this command to show the configuration state of NAT.

**Syntax** show nat

**Mode** Privileged Exec

**Examples** To show the configuration state of NAT, use the commands:

```
awplus# show nat
```

**Output** Figure 61-2: Example output from the **show nat** command

```
awplus#show nat
NAT is enabled
```

**Related commands** [enable \(NAT\)](#)

# show nat rule

**Overview** Use this command to show information about NAT rules.

**Syntax** show nat rule [<1-65535>]

| Parameter | Description |
|-----------|-------------|
| <1-65535> | Rule ID     |

**Mode** Privileged Exec

**Examples** To show information about all NAT rules, use the command:

```
awplus# show nat rule
```

**Output** Figure 61-3: Example output from the **show nat rule** command

```
awplus#show nat rule

[* = Rule is not valid - see "show nat rule config-check"]
 ID Action App From To With Hits

* 30 masq any private public - 0
 10 portfw http public - dmz.a.b 0
```

To show information about a specific NAT rule, use the command:

```
awplus# show nat rule 10
```

**Output** Figure 61-4: Example output from the **show nat rule** command

```
awplus#show nat rule 10

[* = Rule is not valid - see "show nat rule config-check"]
 ID Action App From To With Hits

 10 portfw http public - dmz.a.b 0
```

| Output Parameter | Description                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------|
| *                | Indicates the rule is not valid and cannot be hit, see the <a href="#">show nat rule config-check</a> command. |
| App              | Application name.                                                                                              |
| From             | Source entity.                                                                                                 |

| Output Parameter | Description                                    |
|------------------|------------------------------------------------|
| with             | Target entity name.                            |
| To               | Destination entity.                            |
| Hits             | The number of times the NAT rule has been hit. |

**Related commands** [rule \(NAT\)](#)  
[show nat rule config-check](#)

# show nat rule config-check

**Overview** Use this command to check configuration validity of NAT rules.

An invalid rule will not be active and cannot be hit.

This command also shows the reasons why a rule is not valid.

**Syntax** `show nat rule config-check`

**Mode** Privileged Exec

**Usage** NAT rules are applied to applications and entities. A rule is not valid if either the application, source entity or destination entity the rule applies to is not configured properly.

To configure applications and entities, see Application and Entity Commands.

**Examples** To check configuration validity of NAT rules, use the command:

```
awplus# show nat rule config-check
```

**Output** Figure 61-5: Example output from the **show nat rule config-check** command if rule configuration errors are detected

```
awplus#show nat rule config-check
Rule 10:
 Application does not have a protocol configured
 "From" entity does not exist
 "To" entity has no subnet or host addresses
```

**Output** Figure 61-6: Example output from the **show nat rule config-check** command if all rules are valid

```
awplus#show nat rule config-check
All rules are valid
```

# show running-config nat

**Overview** Use this command to show the configuration commands that have been used to configure NAT.

**Syntax** show running-config nat

**Mode** Privileged Exec

**Examples** To show the configuration commands that have been used to configure NAT, use the commands:

```
awplus# show running-config nat
```

**Output** Figure 61-7: Example output from the **show running-config nat** command

```
awplus#show running-config nat
nat
 rule 10 masq http from private to public
 rule 20 portfw http from public with dst dmz.servers.wb
 enable
!
```

# Part 9: Advanced Network Protection

# 62

# IPS Commands

## Introduction

This chapter provides an alphabetical reference of commands used to configure Intrusion Prevention System (IPS). For more information, see the [IPS Feature Overview and Configuration\\_Guide](#).

The table below lists the IPS commands and their applicable modes.

Figure 62-1: IPS Commands and Applicable Modes

| Mode                 | Command                              |
|----------------------|--------------------------------------|
| Privileged Exec      | <code>show ips</code>                |
|                      | <code>show ips categories</code>     |
|                      | <code>show running-config ips</code> |
| Global Configuration | <code>ips</code>                     |
| IPS Mode             | <code>category action (IPS)</code>   |
|                      | <code>protect (IPS)</code>           |

- Command List**
- [“category action \(IPS\)” on page 2705](#)
  - [“ips” on page 2706](#)
  - [“protect \(IPS\)” on page 2707](#)
  - [“show ips” on page 2708](#)
  - [“show ips categories” on page 2709](#)
  - [“show running-config ips” on page 2711](#)

# category action (IPS)

**Overview** Use this command to configure an action for a specified category.  
Use the **no** variant of this command to set the default action of alert for a specified category.

**Syntax** `category <category-name> action {alert|deny|disable}`  
`no category <category-name> action`

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;category-name&gt;</code> | Category name. A category is a label that helps to classify the nature of traffic, for example, whether it is spammer, spot or spyware and so on. Once IPS protection is enabled, traffic will be categorized according to the available IPS categories. You can use the <a href="#">show ips categories</a> command to view the categories and their actions. |
| <code>alert</code>                 | Generate a log message. This is the default action.                                                                                                                                                                                                                                                                                                            |
| <code>deny</code>                  | Drop the matching packets. No error message is sent back to the source host.                                                                                                                                                                                                                                                                                   |
| <code>disable</code>               | Ignore a specified category. Ignored categories will not be used to categorize traffic.                                                                                                                                                                                                                                                                        |

**Default** The default action is alert.

**Mode** IPS Mode

**Examples** To drop packet categorized as `checksum`, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)# category checksum action deny
```

To set the default action for category `checksum`, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)# no category checksum action
```

**Validation Commands** [show ips categories](#)  
[show running-config ips](#)

# ips

**Overview** Use this command to configure IPS.

Use the **no** variant of this command to remove all IPS configuration.

**Syntax** `ips`  
`no ips`

**Mode** Global Configuration

**Usage** This command allows you to enter the IPS mode. The command prompt for this mode is **awplus(config-ips)#**.

In the IPS mode, you can:

- Enable or disable IPS protection, see the [protect \(IPS\)](#) command.
- Configure an action for specified categories, see the [category action \(IPS\)](#) command.

**Examples** To configure IPS, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)#
```

To remove all IPS configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ips
```

# protect (IPS)

**Overview** Use this command to enable IPS protection .  
Use the **no** variant of this command to disable IPS protection.

**Syntax** protect  
no protect

**Usage** Once IPS protection is enabled, traffic will be categorized according to the available IPS categories. See the [show ips categories](#) command for the list of available IPS categories.

**Default** IPS is disabled by default.

**Mode** IPS Mode

**Examples** To enable IPS protection, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)# protect
```

To disable IPS protection, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)# no protect
```

**Validation Commands** [show ips](#)  
[show running-config ips](#)

# show ips

**Overview** Use this command to show the IPS configuration state and event count for the Intrusion Prevention System (IPS).

**Syntax** `show ips`

**Mode** Privileged Exec

**Examples** To display information about IPS, use the command:

```
awplus# show ips
```

**Output** Figure 62-2: Example output from the **show ips** command

```
awplus#show ips
Status: Enabled (Active)
Events: 4
```

**Command changes** Version 5.4.7-0.1: Event count added to the command output.

# show ips categories

**Overview** Use this command to show the IPS categories and their actions.

Note that if the IPS database provider is configured, this commands shows only the provider's categories.

**Syntax** `show ips categories`

**Mode** Privileged Exec

**Examples** To show the IPS categories and their actions, use the command:

```
awplus# show ips categories
```

**Output** Figure 62-3: Example output of built-in categories from the **show ips categories** command

```
awplus#show ips categories
Category (* = invalid) Action

checksum alert
ftp-bounce alert
gre-decoder-events alert
http-events alert
icmp-decoder-events alert
ip-decoder-events alert
ppp-decoder-events alert
smtp-events alert
stream-events alert
udp-decoder-events alert
```

| Parameter          | Description                                                                                                                                                                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| checksum           | Invalid checksums, e.g. IPv4, TCPv4, UDPv4, ICMPv4,TCPv6, UDPv6, ICMPv6.                                                                                                                                                                                                                                                             |
| ftp-bounce         | GPL FTP PORT bounce attempt.                                                                                                                                                                                                                                                                                                         |
| gre-decoder events | GRE anomalies, e.g. GRE packet too small, GRE wrong version, GRE v0 recursion control, GRE v0 flags, GRE v0 header too big, GRE v1 checksum present, GRE v1 routing present, GRE v1 strict source route, GRE v1 recursion control.                                                                                                   |
| http-events        | HTTP anomalies, e.g. HTTP unknown error, HTTP gzip decompression failed, HTTP request field missing colon, HTTP response field missing colon, HTTP invalid request chunk len, HTTP invalid response chunk len, HTTP status 100-Continue already seen, HTTP unable to match response to request, HTTP invalid server port in request. |

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| icmp-decoder-events | ICMP anomalies, e.g. IPv6 with ICMPv4 header, ICMPv4 packet too small, ICMPv4 unknown type, ICMPv6 truncated packet, ICMPv6 unknown version.                                                                                                                                                                                                                                                                                                                   |
| ip-decoder-events   | IPv4 & IPv6 anomalies, e.g. IPv4 packet too small, IPv4 header size too small, IPv4 wrong IP version, IPv6 packet too small, IPv6 duplicated Routing extension header, IPv6 duplicated Hop-By-Hop Options extension header, IPv6 DSTOPTS only padding, SLL packet too small, Ethernet packet too small, VLAN header too small, FRAG IPv4 Fragmentation overlap, FRAG IPv6 Packet size too large, IPv4-in-IPv6 invalid protocol, IPv6-in-IPv6 packet too short. |
| ppp-decoder-events  | PPP anomalies, e.g. PPP packet too small, PPP IPv6 too small, PPP wrong type, PPPoE wrong code, PPPoE malformed tags.                                                                                                                                                                                                                                                                                                                                          |
| smtp-events         | SMTP anomalies, e.g. SMTP invalid reply, SMTP max reply line len exceeded, SMTP tls rejected, SMTP data command rejected.                                                                                                                                                                                                                                                                                                                                      |
| stream-events       | TCP anomalies, e.g. 3way handshake with ack in wrong dir, 3way handshake async wrong sequence, 3way handshake right seq wrong ack evasion, 4way handshake SYNACK with wrong ACK, STREAM CLOSEWAIT FIN out of window, STREAM ESTABLISHED SYNACK resend, STREAM FIN invalid ack, STREAM FIN1 ack with wrong seq, STREAM TIMEWAIT ACK with wrong seq, stream-events TCP packet too small, stream-events TCP duplicated option)                                    |
| udp-decoder-events  | UDP anomalies, e.g. UDP packet too small, UDP header length too small, UDP invalid header length                                                                                                                                                                                                                                                                                                                                                               |

# show running-config ips

**Overview** Use this command to show the configuration commands that have been used to configure IPS.

**Syntax** `show running-config dpi`

**Mode** Privileged Exec

**Examples** To show the commands that have been used to configure IPS, use the command:

```
awplus# show running-config ips
```

**Output** Figure 62-4: Example output from the **show running-config ips** command

```
awplus#show running-config ips
ips
 protect

# Malware Protection Commands

## Introduction

This chapter provides an alphabetical reference of commands used to configure Malware Protection. For more information about Malware Protection and a configuration example, see the [Malware Protection Feature Overview and Configuration Guide](#).

The table below lists the Malware Protection commands and their applicable modes.

Figure 63-1: Malware Protection commands and applicable modes

| Mode                    | Command                                              |
|-------------------------|------------------------------------------------------|
| Privileged Exec         | <code>show malware-protection</code>                 |
|                         | <code>show running-config malware-protection</code>  |
| Global Configuration    | <code>malware-protection</code>                      |
| Malware Protection Mode | <code>protect (Malware Protection)</code>            |
|                         | <code>provider kaspersky (Malware Protection)</code> |
|                         | <code>update-interval (Malware Protection)</code>    |

- Command List**
- [“malware-protection”](#) on page 2713
  - [“protect \(Malware Protection\)”](#) on page 2714
  - [“provider kaspersky \(Malware Protection\)”](#) on page 2715
  - [“show malware-protection”](#) on page 2716
  - [“show running-config malware-protection”](#) on page 2717
  - [“update-interval \(Malware Protection\)”](#) on page 2718

# malware-protection

**Overview** Use this command to configure Malware Protection.

Use the **no** variant of this command to remove all Malware Protection configuration.

**Syntax** `malware-protection`  
`no malware-protection`

**Mode** Global Configuration

**Usage** This command allows you to enter the Malware Protection Mode. The command prompt for this mode is **awplus(config-malware)#**.

In the Malware Protection Mode, you can:

- Set the Malware Protection provider, see the [provider kaspersky \(Malware Protection\)](#) command.
- Enable or disable Malware Protection, see the [protect \(Malware Protection\)](#) command.

**Examples** To configure Malware Protection settings, use the commands:

```
awplus# configure terminal
awplus(config)# malware-protection
awplus(config-malware)#
```

To remove all Malware Protection configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no malware-protection
```

**Validation Commands** [show malware-protection](#)

# protect (Malware Protection)

**Overview** Use this command to enable Malware Protection.

Use the **no** variant of this command to disable Malware Protection without losing existing Malware Protection configuration.

Note that you need to use the [provider kaspersky \(Malware Protection\)](#) command to set Malware Protection provider before issuing this command to enable Malware Protection.

**Syntax** protect  
no protect

**Default** Malware Protection is disabled by default.

**Mode** Malware Protection Mode

**Examples** To enable Malware Protection, use the commands:

```
awplus# configure terminal
awplus(config)# malware-protection
awplus(config-malware)# provider kaspersky
awplus(config-malware)# protect
```

To disable Malware Protection, use the commands:

```
awplus# configure terminal
awplus(config)# malware-protection
awplus(config-malware)# no protect
```

**Validation Commands** [show malware-protection](#)  
[show running-config malware-protection](#)

**Related Commands** [provider kaspersky \(Malware Protection\)](#)

# provider kaspersky (Malware Protection)

**Overview** Use this command to set Malware Protection provider.

Malware Protection provider provides a signature database containing a list of known threat patterns. The database is kept up-to-date to ensure the effectiveness of the detection. You can use the [update-interval \(Malware Protection\)](#) command to configure the update check interval and update local database if needed.

Note that you need to set Malware Protection provider before issuing [protect \(Malware Protection\)](#) command to enable Malware Protection.

**Syntax** `provider kaspersky`

**Default** No Malware Protection provider is set.

**Mode** Malware Protection Mode

**Examples** To set Malware Protection provider, use the commands:

```
awplus# configure terminal
awplus(config)# malware-protection
awplus(config-malware)# provider kaspersky
```

**Validation Commands** [show malware-protection](#)  
[show running-config malware-protection](#)

**Related Commands** [protect \(Malware Protection\)](#)

# show malware-protection

**Overview** Use this command to show the information about the operation of Malware Protection.

**Syntax** `show malware-protection`

**Mode** Privileged Exec

**Examples** To show the operation of Malware Protection, use the command:

```
awplus# show malware-protection
```

**Output** Figure 63-2: Example output from **show malware-protection** if the subscription license for Malware Protection is active.

```
awplus#show malware-protection
Status: Enabled (Active)
Events: 0
Provider: Kaspersky
Resource version: 1.0
Resource update interval: 1 hour
```

**Command changes** Version 5.4.7-0.1: Event count added to the command output.

# show running-config malware-protection

**Overview** Use this command to show the configuration information about Malware Protection.

**Syntax** `show running-config malware-protection`

**Mode** Privileged Exec

**Examples** To show the running configuration of Malware Protection, use the command:

```
awplus# show running-config malware-protection
```

**Output** Figure 63-3: Example output from the **show running-config malware-protection** command on the console

```
awplus#show running-config malware-protection
malware-protection
 provider kaspersky
 protect
!
```

# update-interval (Malware Protection)

**Overview** Use this command to configure an update check interval for the Malware Protection resource files.

Use the **no** variant of this command to restore the default update check interval to 1 hour.

**Syntax** `update-interval {minutes <10-525600>|hours <1-8760>|days <1-365>|weeks <1-52>|never}`

`no update-interval`

| Parameter           | Description                                                                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| minutes <10-525600> | Update interval from 10 through 52600 minutes                                                                                                                                                                                                 |
| hours <1-8760>      | Update interval from 1 hour through 8760 hours                                                                                                                                                                                                |
| days <1-365>        | Update interval from 1 day through 365 days                                                                                                                                                                                                   |
| weeks <1-52>        | Update interval from 1 week through 52 weeks                                                                                                                                                                                                  |
| never               | Never update the resource. If Malware Protection becomes enabled, the Update Manager will do update check and update the resource files if needed. Use the <a href="#">protect (Malware Protection)</a> command to enable Malware Protection. |

**Default** The default update interval is 1 hour.

**Mode** Malware Protection Mode

**Usage** The Update Manager will perform an update check for a resource when triggered by an update check interval. It will request the current version number of the resource from the Update Server, then compare it with the current local version. If they are different, the Update Manager will initiate an update of the local resource.

The Update Manager will revert to last known good resource file if installation of an updated resource fails.

Note that when a feature is disabled, regular and manual update checks for its resources are disabled.

Also note that an update check for a resource will not proceed if an update of that resource is already in progress.

**Examples** To check and update the Malware Protection resource files once a week, use the command:

```
awplus(config-malware)# update-interval weeks 1
```

To disable updating of the resource, use the command:

```
awplus(config-malware)# update-interval never
```

To restore the default update interval, which is 1 hour, use the command:

```
awplus(config-malware)# no update-interval
```

# Antivirus Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Antivirus. For more information about Antivirus introduction and configuration example, see the [Antivirus Feature Overview and Configuration\\_Guide](#).

The following table lists the Antivirus commands and their applicable modes.

Figure 64-1: Antivirus commands and applicable modes

| Mode                 | Command                                     |
|----------------------|---------------------------------------------|
| Privileged Exec      | <code>show antivirus</code>                 |
|                      | <code>show antivirus statistics</code>      |
|                      | <code>show running-config antivirus</code>  |
|                      | <code>debug antivirus</code>                |
|                      | <code>show debugging antivirus</code>       |
| Global Configuration | <code>antivirus</code>                      |
| Antivirus Mode       | <code>action (Antivirus)</code>             |
|                      | <code>protect (Antivirus)</code>            |
|                      | <code>provider kaspersky (Antivirus)</code> |
|                      | <code>update-interval (Antivirus)</code>    |

# action (Antivirus)

**Overview** Use this command to set the action to take when a scan fails or when a scan limit is exceeded.

Use the **no** variant of this command to restore the default action, which is deny.

**Syntax** `action {scan-failed|limit-exceeded} {deny|permit}`  
`no action {scan-failed|limit-exceeded}`

| Parameter      | Description                                                                                                                                                                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| scan-failed    | Scan failed for a wide variety of possible reasons, for example, encrypted or corrupt file type, out of temporary memory, license expired.                                                                                                                                                    |
| limit-exceeded | Scan failed due to a nesting limit or memory limit being exceeded. Antivirus can extract and scan nested files up to 3 levels deep. The maximum size of a file object that can be sent for scanning is 10MB. The maximum total size of all objects that can be concurrently scanned is 100MB. |
| deny           | Block HTTP request.                                                                                                                                                                                                                                                                           |
| permit         | Allow HTTP request.                                                                                                                                                                                                                                                                           |

**Default** The default action is deny when a scan failed or a scan limit is exceeded.

**Mode** Antivirus Mode

**Examples** To allow HTTP traffic when a scan fails, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# action scan-failed permit
```

To block HTTP request when a scan fails, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# action scan-failed deny
```

To allow HTTP request when a scan limit is exceeded, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# action limit-exceeded permit
```

To block HTTP traffic when a scan limit is exceeded, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# action limit-exceeded deny
```

To restore the default action when a scan fails, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# no action scan-failed
```

To restore the default action when a scan limit is exceeded, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# no action limit-exceeded
```

**Validation** `show antivirus`  
**Commands**

# antivirus

**Overview** Use this command to configure Antivirus.

Use the **no** variant of this command to remove all Antivirus configuration.

**Syntax** `antivirus`  
`no antivirus`

**Mode** Global Configuration

**Usage** This command allows you to enter the Antivirus Mode. The command prompt for this mode is **awplus(config-antivirus)#**.

In the Antivirus Mode, you can:

- Set the action to take if a scan failed or a scan limit is exceeded, see the [action \(Antivirus\)](#) command.
- Enable or disable Antivirus protection, see the [protect \(Antivirus\)](#) command.

**Examples** To configure Antivirus settings, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)#
```

To remove all Antivirus configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no antivirus
```

**Validation  
Commands** `show antivirus`

# debug antivirus

**Overview** Use this command to enable Antivirus debugging. This will cause additional detailed debugging information to be logged at the “informational” and “debugging” levels.

Use the **no** variant of this command to disable Antivirus debugging.

**Syntax** debug antivirus  
no debug antivirus

**Default** Antivirus debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable Antivirus debugging, use the command:

```
awplus# debug antivirus
```

To disable Antivirus debugging, use the command:

```
awplus# no debug antivirus
```

**Validation  
Commands** show debugging antivirus  
show antivirus

# protect (Antivirus)

**Overview** Use this command to enable Antivirus protection.

Use the **no** variant of this command to disable Antivirus protection without losing existing Antivirus configuration.

Note that you need to use the [provider kaspersky \(Antivirus\)](#) command to set Antivirus provider before issuing this command to enable Antivirus protection.

**Syntax** protect  
no protect

**Default** Antivirus is disabled by default.

**Mode** Antivirus Mode

**Examples** To enable Antivirus protection, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# provider kaspersky
awplus(config-antivirus)# protect
```

To disable Antivirus protection, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# no protect
```

**Validation Commands** show antivirus  
show running-config antivirus

**Related Commands** provider kaspersky (Antivirus)

# provider kaspersky (Antivirus)

**Overview** Use this command to set Antivirus provider.

Antivirus provider provides a signature database containing a list of known threat patterns. The database is kept up-to-date to ensure the effectiveness of the detection. You can use the [update-interval \(Antivirus\)](#) command to configure the update check interval and update local database if needed.

Note that you need to set Antivirus provider before issuing [protect \(Antivirus\)](#) command to enable Antivirus protection.

**Syntax** `provider kaspersky`

**Default** No Antivirus provider is set.

**Mode** Antivirus Mode

**Examples** To set Antivirus provider, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# provider kaspersky
```

**Validation Commands** [show antivirus](#)  
[show running-config antivirus](#)

**Related Commands** [protect \(Antivirus\)](#)

# show antivirus

**Overview** Use this command to show the information about the operation of Antivirus.

**Syntax** show antivirus

**Mode** Privileged Exec

**Examples** To show the operation of Antivirus, use the command:

```
awplus# show antivirus
```

**Output** Figure 64-2: Example output from the **show antivirus** command on the console if the subscription license of Antivirus is active.

```
Status: Enabled (Active)
Provider: Kaspersky
Scan failed action: block
Limit exceeded action: block
Resource version: 1.0
Resource update interval: 1 hour
```

Figure 64-3: Example output from the **show antivirus** command on the console if the subscription license of Antivirus is inactive.

```
awplus#show antivirus
Status: Enabled (Inactive Unlicensed)
Provider: Kaspersky
Scan failed action: block
Limit exceeded action: block
Resource version: not set
Resource update interval: 1 hour
```

# show antivirus statistics

**Overview** Use this command to show Antivirus statistics.

**Syntax** show antivirus statistics

**Mode** Privileged Exec

**Examples** To show Antivirus statistics, use the command:

```
awplus# show antivirus statistics
```

**Output** Figure 64-4: Example output from the **show antivirus statistics** command

```
awplus#show antivirus statistics
Proxy Antivirus Statistics:
Files scanned: 1572
Files skipped: 0
Viruses found: 3 (0.2%)
Scan failures: 0 (0.0%)
Limit exceeded: 0 (0.0%)
```

| Output Parameter | Description                                                                                            |
|------------------|--------------------------------------------------------------------------------------------------------|
| Files scanned    | The number of files that have been scanned.                                                            |
| Files skipped    | The number of files that could not be scanned.                                                         |
| Viruses found    | The number of files that contain a virus. Also shown as a percentage of total number of scanned files. |
| Scan failures    | The number of times a scan failed. Also shown as a total number of scans.                              |
| Limit exceeded   | The number of times a scan limit is exceeded. Also shown as a total number of scans.                   |

# show debugging antivirus

**Overview** Use this command to show the Antivirus debugging setting.

**Syntax** show debugging antivirus

**Mode** Privileged Exec

**Examples** To show the Antivirus debugging setting, use the command:

```
awplus# show debugging antivirus
```

**Output** Figure 64-5: Example output from the **show debugging antivirus** command

```
awplus#show debugging antivirus
Antivirus Debugging Status: on
```

**Related Commands** [debug antivirus](#)

# show running-config antivirus

**Overview** Use this command to show the configuration information about Antivirus.

**Syntax** show running-config antivirus

**Mode** Privileged Exec

**Examples** To show the running configuration of Antivirus, use the command:

```
awplus# show running-config antivirus
```

**Output** Figure 64-6: Example output from the **show running-config antivirus** command

```
awplus#show running-config antivirus
antivirus
 provider kaspersky
 action scan-failed permit
 update-interval weeks 1
 protect
!
```

# update-interval (Antivirus)

**Overview** Use this command to configure an update check interval for the Antivirus resource files.

Use the **no** variant of this command to restore the default update check interval to 1 hour.

**Syntax** `update-interval {minutes <10-525600>|hours <1-8760>|days <1-365>|weeks <1-52>|never}`  
`no update-interval`

| Parameter           | Description                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| minutes <10-525600> | Update interval from 10 through 52600 minutes                                                                                                                                                                      |
| hours <1-8760>      | Update interval from 1 hour through 8760 hours                                                                                                                                                                     |
| days <1-365>        | Update interval from 1 day through 365 days                                                                                                                                                                        |
| weeks <1-52>        | Update interval from 1 week through 52 weeks                                                                                                                                                                       |
| never               | Never update the resource. If Antivirus becomes enabled, the Update Manager will do update check and update the resource files if needed. Use the <a href="#">protect (Antivirus)</a> command to enable Antivirus. |

**Default** The default update interval is 1 hour.

**Mode** Antivirus Mode

**Usage** The Update Manager will perform an update check for a resource when triggered by an update check interval. It will request the current version number of the resource from the Update Server, then compare it with the current local version. If they are different, the Update Manager will initiate an update of the local resource.

The Update Manager will revert to last known good resource file if installation of an updated resource fails.

Note that when a feature is disabled, regular and manual update checks for its resources are disabled.

Also note that an update check for a resource will not proceed if an update of that resource is already in progress.

**Examples** To check and update the Antivirus resource files once a week, use the command:

```
awplus(config-antivirus)# update-interval weeks 1
```

To disable updating of the resource, use the command:

```
awplus(config-antivirus)# update-interval never
```

To restore the default update interval, which is 1 hour, use the command:

```
awplus(config-antivirus)# no update-interval
```

# URL Filtering Commands

## Introduction

This chapter provides an alphabetical reference of commands used to configure URL filtering.

URL filtering blocks all HTTP and HTTPS access to a list of websites. You can either specify a short list of websites to block (up to 1000 blacklist and 1000 whitelist rules), or subscribe to the blacklist service offered by Kaspersky. If you subscribe to the Kaspersky service, you can create custom blacklists to block additional URLs not in the Kaspersky blacklist or custom whitelists to allow URLs that the Kaspersky service blocks.

For more information, see the [URL Filtering Feature Overview\\_and Configuration Guide](#).

The following table lists the URL filtering commands and their applicable modes.

Figure 65-1: URL filtering commands and applicable modes

| Mode                     | Command                                      |
|--------------------------|----------------------------------------------|
| Privileged Exec          | <code>show running-config url-filter</code>  |
|                          | <code>show url-filter</code>                 |
|                          | <code>url-filter reload custom-lists</code>  |
| Global Configuration     | <code>url-filter</code>                      |
| URL Filter Configuration | <code>blacklist</code>                       |

- [“url-filter”](#) on page 2745
- [“whitelist”](#) on page 2746

# blacklist

**Overview** Use this command to add a custom blacklist file to the URL filtering configuration. Use the **no** variant of this command to remove a blacklist from the URL filtering configuration.

**Syntax** `blacklist <url_of_blacklist_file>`  
`no blacklist <url_of_blacklist_file>`

| Parameter                                  | Description                                                                                    |
|--------------------------------------------|------------------------------------------------------------------------------------------------|
| <code>&lt;url_of_blacklist_file&gt;</code> | URL of the blacklist file. The blacklist file can be located in flash, SD card, or USB device. |

**Mode** URL Filter Configuration

**Usage** You can use custom blacklists to specify URLs to be blocked.

If you are using the Kaspersky service, custom blacklists are processed before the Kaspersky blacklist.

For information about blacklist rule format, see the [URL Filtering Feature Overview and Configuration Guide](#).

You can use the [whitelist](#) command to add a whitelist that will override any corresponding blacklist entries.

**Examples** To add a blacklist that uses a custom file (that is stored on USB, for example) and then enable URL filtering, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# blacklist usb:/my_blacklist.txt
awplus(config-url-filter)# protect
```

To remove the blacklist file from the URL filtering configuration, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# no blacklist usb:/my_blacklist.txt
```

**Related commands**

- [protect \(URL filtering\)](#)
- [show url-filter](#)
- [url-filter reload custom-lists](#)
- [whitelist](#)

# log url-requests

**Overview** If URL Filtering is enabled, then by default, black list hits and issues with match criteria and list files are logged.

Use this command to enable logging of all HTTP and HTTPS URL requests (both permitted and denied) passing through the firewall.

Use the **no** variant of this command to disable extra logging of HTTP and HTTPS URL requests passing through the firewall.

**Syntax** `log url-requests`  
`no log url-requests`

**Default** Disabled by default.

**Mode** URL Filter Configuration

**Usage** When enabled, additional log messages for HTTP and HTTPS URL requests passing through the firewall contain the:

- URL being accessed
- IP address of the user that requested the URL

**Example** To configure logging of all HTTP and HTTPS URL requests passing through the firewall (permitted as well as denied), use the following commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# log url-requests
```

**Related Commands** [url-filter](#)

**Command changes** Version 5.4.7-1.1: command added

# protect (URL filtering)

**Overview** Use this command to enable URL filter protection.  
Use the **no** variant of this command to disable URL filter protection without losing the existing URL filter configuration.

**Syntax** protect  
no protect

**Default** URL filter protection is disabled by default and all HTTP and HTTPS traffic is allowed.

**Mode** URL Filter Configuration

**Usage** If you are subscribed to the Kaspersky service, you must enter the [provider kaspersky](#) command before entering this command.

**Examples** To enable URL filter protection, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# provider kaspersky
awplus(config-url-filter)# protect
```

To disable URL filter protection, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# no protect
```

**Related commands** [provider kaspersky](#)  
[show url-filter](#)

**Command changes** Version 5.4.7-1.1: HTTPS support added.

# provider kaspersky

**Overview** Use this command to set Kaspersky as the URL filter blacklist provider, and register Kaspersky's blacklist file with the update manager. This feature requires a Kaspersky subscription. For more information on Kaspersky see their website <https://support.kaspersky.com>

**Syntax** `provider kaspersky`

**Mode** URL Filter Configuration

**Usage** Kaspersky provides constantly updated blacklists that can be used for URL filtering. An HTTP or HTTPS request that includes a URL that matches an entry in the blacklist will be dropped.

**NOTE:** *that if you are using the Kaspersky service, you must enter this command before enabling URL filtering with the **protect** command.*

**Examples** To configure Kaspersky as the URL filter blacklist provider and then enable URL filtering, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# provider kaspersky
awplus(config-url-filter)# protect
```

**Related commands** [protect \(URL filtering\)](#)  
[show url-filter](#)

**Command changes** Version 5.4.7-1.1: HTTPS support added.

# show running-config url-filter

**Overview** Use this command to show the running configuration information for URL filtering

**Syntax** `show running-config url-filter`

**Mode** Privileged Exec

**Examples** To show the running configuration of URL filtering, use the command:

```
awplus# show running-config url-filter
```

**Output** Figure 65-2: Example output from the **show running-config url-filter** command

```
awplus#show running-config url-filter
url-filter
 provider kaspersky
 protect
!
```

# show url-filter

**Overview** Use this command to show information about the configuration state of URL filtering.

**Syntax** `show url-filter`

**Mode** Privileged Exec

**Examples** To show information about the configuration state of URL filtering, use the command:

```
awplus# show url-filter
```

**Output** Figure 65-3: Example output from **show url-filter**

```
awplus#show url-filter
Status: Enabled (Active)
Events: 104
Custom blacklists Entries
blacklist-example.txt 365
Custom whitelists Entries
whitelist-example.txt 4
```

**Output** Figure 65-4: Example output from **show url-filter** if the Kaspersky URL blacklist subscription license is active.

```
awplus#show url-filter
Status: Enabled (Active)
Provider: Kaspersky
Status: Enabled (Active)
Events: 104
Resource version: 1.0
Update interval: 1 hour
Blacklist entries: 63457
Custom blacklists Entries
blacklist-example.txt 3
Custom whitelists Entries
whitelist-example.txt 1
```

**Command changes** Version 5.4.7-0.1: Event count added to the command output.

# update-interval (URL Filtering)

**Overview** Use this command to configure the update-interval for the URL filter provider blacklist resource file.

Use the **no** variant of this command to restore the default update check interval of 1 hour.

**Syntax** `update-interval {minutes <10-525600>|hours <1-8760>|days <1-365>|weeks <1-52>|never}`  
`no update-interval`

| Parameter           | Description                                                                                                                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| minutes <10-525600> | Update interval from 10 through 52600 minutes                                                                                                                                                                                                           |
| hours <1-8760>      | Update interval from 1 hour through 8760 hours                                                                                                                                                                                                          |
| days <1-365>        | Update interval from 1 day through 365 days                                                                                                                                                                                                             |
| weeks <1-52>        | Update interval from 1 week through 52 weeks                                                                                                                                                                                                            |
| never               | Never update the resource. When URL filtering protection is enabled, the update manager will do an update check and update the resource files if necessary. Use the <a href="#">protect (URL filtering)</a> command to enable URL filtering protection. |

**Default** The default update interval is 1 hour.

**Mode** URL Filter Configuration

**Usage** The update manager will perform an update check for a resource when triggered by an update check interval. It will request the current version number of the resource from the update server, then compare it with the current local version. If they are different, the update manager will initiate an update of the local resource.

The update manager will revert to the last known good resource file if installation of an updated resource fails.

Note that when a feature is disabled, regular and manual update checks for its resources are also disabled.

Also note that an update check for a resource will not proceed if an update of that resource is already in progress.

**Examples** To check and update the URL filter provider blacklist every 3 hours, use the command:

```
awplus(config-url-filter)# update-interval hours 3
```

To disable updating of the provider blacklist, use the command:

```
awplus(config-url-filter)# update-interval never
```

To configure resource update checking for URL filter to the default interval, which is 1 hour, use the command:

```
awplus(config-url-filter)# no update-interval
```

**Related  
Commands**    [protect \(URL filtering\)](#)  
                  [show resource](#)

# url-filter reload custom-lists

**Overview** Use this command to reload all custom blacklists and whitelists after editing one or more of them.

**Syntax** `url-filter reload custom-lists`

**Mode** Privileged Exec

**Examples** To reload all custom blacklists and whitelists, use the following command:

```
awplus# url-filter reload custom-lists
```

**Related commands** [blacklist](#)  
[whitelist](#)

# url-filter

**Overview** Use this command to enter URL Filter Configuration mode and configure URL filtering functionality.

Use the **no** variant of this command to remove all URL filtering configuration.

**Syntax** `url-filter`  
`no url-filter`

**Mode** Global Configuration

**Usage** This command allows you to enter the URL Filter Configuration mode and changes the command prompt to **awplus(config-url-filter)#**.

The URL Filter Configuration mode enables you to:

- Enable URL filtering protection; see the [protect \(URL filtering\)](#) command.
- Configure the provider blacklist; see the [provider kaspersky](#) command.
- Configure custom blacklists; see the [blacklist](#) command.
- Configure custom whitelists; see the [whitelist](#) command.

**Examples** To enter the URL Filter Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)#
```

To remove all URL filter configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no url-filter
```

**Related commands**

- [blacklist](#)
- [protect \(URL filtering\)](#)
- [provider kaspersky](#)
- [show running-config](#)
- [show url-filter](#)
- [whitelist](#)

# whitelist

**Overview** Use this command to add a custom whitelist file to the URL filtering configuration. Use the **no** variant of this command to remove a whitelist from the URL filter configuration.

**Syntax** `whitelist <url_of_whitelist_file>`  
`no whitelist <url_of_whitelist_file>`

| Parameter                                  | Description                                                                                    |
|--------------------------------------------|------------------------------------------------------------------------------------------------|
| <code>&lt;url_of_whitelist_file&gt;</code> | URL of the whitelist file. The whitelist file can be located in flash, SD card, or USB device. |

**Mode** URL Filter Configuration

**Usage** Whitelist matching precedes blacklist matching. You can use custom whitelists to override any corresponding blacklist entries. An HTTP or HTTPS request that includes a URL that matches an entry in a whitelist will be permitted.

For information about whitelist rule format, see the [URL Filtering Feature Overview and Configuration Guide](#).

**Examples** To add a whitelist that uses a custom file (that is stored on USB, for example) and then enable URL filtering, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# whitelist usb:/my_whitelist.txt
awplus(config-url-filter)# protect
```

To remove the whitelist file from the URL filtering configuration, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# no whitelist usb:/my_whitelist.txt
```

**Related commands** [blacklist](#)  
[protect \(URL filtering\)](#)  
[show url-filter](#)  
[url-filter reload custom-lists](#)

**Command changes** Version 5.4.7-1.1: HTTPS support added.

# 66

# Web Control Commands

## Introduction

This chapter provides an alphabetical reference of commands used to configure Web Control. For more information, see the [Web Control Feature Overview and Configuration\\_Guide](#).

The table lists the Web Control commands and their applicable modes.

Figure 66-1: Web Control commands and applicable modes

| Mode                                    | Command                                      |
|-----------------------------------------|----------------------------------------------|
| Privileged Exec                         | <code>debug web-control</code>               |
|                                         | <code>show web-control</code>                |
|                                         | <code>show web-control categories</code>     |
|                                         | <code>show debugging web-control</code>      |
|                                         | <code>show running-config web-control</code> |
|                                         | <code>show web-control rules</code>          |
| Global Configuration                    | <code>web-control</code>                     |
| Web Control Configuration               | <code>action (Web Control)</code>            |
|                                         | <code>category (Web Control)</code>          |
|                                         | <code>provider digitalarts</code>            |
|                                         | <code>protect (Web Control)</code>           |
|                                         | <code>rule (Web Control)</code>              |
|                                         | <code>move rule (Web Control)</code>         |
| Web Control Category Configuration mode | <code>match (Web-Control)</code>             |

**Command List** • [“action \(Web Control\)” on page 2749](#)

- [“category \(Web Control\)”](#) on page 2750
- [“debug web-control”](#) on page 2752
- [“match \(Web-Control\)”](#) on page 2753
- [“move rule \(Web Control\)”](#) on page 2755
- [“protect \(Web Control\)”](#) on page 2756
- [“provider digitalarts”](#) on page 2757
- [“rule \(Web Control\)”](#) on page 2758

- [“show running-config web-control”](#) on page 2762
- [“show web-control”](#) on page 2763
- [“show web-control categories”](#) on page 2765
- [“show web-control rules”](#) on page 2767
- [“web-control”](#) on page 2768

# action (Web Control)

**Overview** Use this command to set the action to take on uncategorized websites and categorized websites that don't hit any rule.

Use the **no** variant of this command to restore the default action which is deny.

**Syntax** `action {permit|deny}`  
`no action`

| Parameter | Description  |
|-----------|--------------|
| permit    | Allow access |
| deny      | Block access |

**Default** The default action is deny.

**Mode** Web Control Configuration

**Examples** To allow HTTP and HTTPS requests when no rules are hit, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# action permit
```

To restore the default action and block all HTTP and HTTPS requests when no rules are hit, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# no action
```

**Related commands** [show web-control](#)

**Command changes** Version 5.4.7-1.1: HTTPS support added.

# category (Web Control)

**Overview** Use this command to configure a category.

A category is a text string that represents a logical grouping of websites. For example "Blog" is the category given to URLs that link to websites that are classified as being associated with blogging. There are two types of category: provider categories and custom categories. Provider categories are pre-defined categories. Digital Arts provides and constantly updates about 100 provider categories. Custom categories are defined by the users.

Use the **no** variant of this command to delete a custom category and delete all its match criteria.

**NOTE:** You cannot delete a provider category, but you can use the **no** variant of this command to delete the custom match criteria from the provider category.

**Syntax** `category <category-name>`  
`no category <category-name>`

| Parameter                          | Description                                                                                                                                                                                                                            |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;category-name&gt;</code> | Category name.<br>Category names are case insensitive and can be up to 64 characters long composed of printable ASCII characters. Spaces are allowed in category names, but the category names must be enclosed in double quotes (""). |

**Mode** Web Control Configuration

**Usage** You can use the to display both provider categories and custom categories.

You cannot delete the provider categories or modify their names, but you can configure custom match criteria for provider categories. Custom match criteria precede and override provider categorization. This means if a website matches the match criteria from custom categories, the website will not be further categorized by Digital Arts.

This command allows you to enter the Web Control Category Configuration mode with the prompt **awplus(config-category)#**. You can create a set of match criteria for a category in this sub-mode. The match criteria are applied to website URLs as a simple string comparison. For more information about match criteria, see the [match \(Web-Control\)](#) command.

You can also create a set of rules for a category. Rules set the action to take for an HTTP or HTTPS request from a specific entity. For more information about rules, see the [rule \(Web Control\)](#) command. For more information about entities, see the [Application and Entity Commands](#) chapter.

**Examples** To create a custom category named `work` and create match criteria for this category, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# category work
awplus(config-category)# match alliedtelesis
awplus(config-category)# match example
awplus(config-category)# match www.ietf.org
```

To delete the custom category and its match criteria, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# no category work
```

**Related commands** [match \(Web-Control\)](#)  
[rule \(Web Control\)](#)  
[show web-control categories](#)

**Command changes** Version 5.4.7-1.1: HTTPS support added.

# debug web-control

**Overview** Use this command to enable Web Control debugging. This will cause additional detailed debugging information to be logged at the “informational” and “debugging” levels.

Use the **no** variant of this command to disable Web Control debugging.

**Syntax** `debug web-control`  
`no debug web-control`

**Default** Web Control debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable Web Control debugging, use the commands:

```
awplus# debug web-control
```

To disable Web Control debugging, use the commands:

```
awplus# no debug web-control
```

**Related commands** [show debugging web-control](#)

# match (Web-Control)

**Overview** Use this command to add a match criterion for a category.

A match criterion is a static string that is compared to a website URL (domain name or IP address) for a partial or complete match. A URL will be searched to see if it contains the given match criterion string. If the URL contains the string, then the match criterion is matched.

Note that the match criterion is not applied to the web page content.

Use the **no** variant of this command to delete a match criterion.

**NOTE:** *If a custom category's last match criterion is deleted, then the category is automatically deleted.*

**Syntax** `match <word>`  
`no match <word>`

| Parameter                 | Description                                                         |
|---------------------------|---------------------------------------------------------------------|
| <code>&lt;word&gt;</code> | A string that is used to compare with IP addresses or domain names. |

**Mode** Web Control Category Configuration

**Usage** Match criteria are case-insensitive and matched up to the first appearance of '?' (query string marker) or '#' (fragment identifier) in a website URL. For example, URL [www.alliedtelesis.com/search.aspx?keyword=routers](http://www.alliedtelesis.com/search.aspx?keyword=routers) does not match the match criterion `match router` but [www.alliedtelesis.com/routers](http://www.alliedtelesis.com/routers) does match that criterion.

When a URL matches a match criterion, the URL is categorized to the match criterion's category. A URL can be matched to more than one category. Custom match criteria override and precede provider categorization. If a URL or website matches custom criteria, then the URL will not be further sent for categorization by the provider criteria.

You can create up to 50 match criteria in total, so a category can have a maximum of 50 match criteria, or 50 categories can each have one match criterion, as long as the total number of the match criteria does not exceed 50.

For more information about categories, see the [category \(Web Control\)](#) command.

**Examples** To create a match criterion with a string `ietf` for category `work`, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# category work
awplus(config-category)# match ietf
```

To delete a match criterion, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# category work
awplus(config-category)# no match ietf
```

To create a set of match criteria for category `movie`, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# category movie
awplus(config-category)# match youtube
awplus(config-category)# match imdb
awplus(config-category)# match rottentomatoes
```

[show web-control categories](#)

# move rule (Web Control)

**Overview** Use this command to change the order of the Web Control rules. Note that a change to the rule order may change the Web Control results.

**Syntax** `move rule <1-65535> to <1-65535>`

| Parameter                                  | Description                                                                                                                                                                                                                          |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>move rule<br/>&lt;1-65535&gt;</code> | Move the ID of a given rule. The rule ID of the given rule must exist.<br>Each rule has an ID which is either designated by the user or automatically generated when the rule is created. The rule ID is an integer from 1 to 65535. |
| <code>to &lt;1-65535&gt;</code>            | New rule ID to assign. The new rule ID must not be used by any existing rule.                                                                                                                                                        |

**Mode** Web Control Configuration

**Usage** If a website is categorized into multiple categories because they have overlapping match criteria that have associated rules, only the rule with the lowest ID is applied. For example, a website is categorized into both category A associated with rule ID 1 and category B associated with ID 2. In this case, only category A's rule with ID 1 is applied to the website. To see the rule IDs, use the [show web-control rules](#) command.

You can move an existing rule ID only to an ID that is not assigned to any rule, otherwise you will be given an error message.

**Examples** To change the ID of a rule from 20 to 10, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# move rule 20 to 10
```

**Related commands** [rule \(Web Control\)](#)  
[show web-control rules](#)

# protect (Web Control)

**Overview** Use this command to enable Web Control protection.  
Use the **no** variant of this command to disable Web Control protection without losing existing Web Control configuration.

**Syntax** protect  
no protect

**Default** Web Control protection is disabled by default.

**Mode** Web Control Configuration

**Usage** Web Control protection is disabled and all HTTP and HTTPS traffic is allowed by default. You must issue the [provider digitalarts](#) command to configure the categorization provider before using this command.

**Examples** To enable Web Protection protection, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# provider digitalarts
awplus(config-web-control)# protect
```

To disable Web Control protection, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# no protect
```

**Related commands** [provider digitalarts](#)  
[show web-control](#)

**Command changes** Version 5.4.7-1.1: HTTPS support added.

# provider digitalarts

**Overview** Use this command to set Digital Arts as the website categorization provider.

**Syntax** `provider digitalarts`

**Mode** Web Control Configuration

**Usage** Digital Arts provides about 100 pre-defined categories. You can use the [show web-control categories](#) command to display the list of categories. For more information about categories, see the [category \(Web Control\)](#) command.

Note that Web Control protection cannot be enabled by using the [protect \(Web Control\)](#) command until the provider is configured.

**Examples** To configure Digital Arts as the website categorization provider, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# provider digitalarts
awplus(config-web-control)# protect
```

**Related commands** [protect \(Web Control\)](#)  
[show web-control](#)

# rule (Web Control)

**Overview** Use this command to create a Web Control rule for a category.

Use the **no** variant of this command to remove a rule.

**Syntax** `rule [<rule-ID>] {permit|deny} <category> from <entity>`  
`no rule <1-65535>`

| Parameter  | Description                                                                                                                                                                                                           |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <rule-ID>  | Rule ID in the range from 1 through 65535. If you don't designate a rule ID, a rule ID will be automatically generated and it will be greater than the current highest rule ID.                                       |
| permit     | Set the rule's action to permit the access.                                                                                                                                                                           |
| deny       | Set the rule's action to block the access.                                                                                                                                                                            |
| <category> | Website category the rule applies to.                                                                                                                                                                                 |
| <entity>   | Source entity the rule applies to. Entity is a high level abstraction of a network device, a group of networks or subnets. For more information about entities, see <a href="#">Application and Entity Commands</a> . |

**Mode** Web Control Configuration

**Usage** A rule sets the action to take if a website matches one or more of the match criteria of the rule's category and the request's source matches the entity the rule applies to. You may create multiple rules for a category. If the request does not hit the first rule, then the request is assessed against the next. If the request does not hit any rule, then the action set by the [action \(Web Control\)](#) command is taken. The default action Web Control performs for uncategorized websites and categorized websites that do not match a rule is to deny.

A rule's action can either deny or permit an HTTP or HTTPS request. If a request hits a rule with a permit action, then the HTTP or HTTPS traffic of that website is allowed to pass through the device. If a request hits a rule with a deny action, then the HTTP or HTTPS traffic of that website is blocked and the client gets a notification page.

Entities represent logical groupings of subnets, hosts or interfaces. For more information about entities, see [Application and Entity Commands](#).

Rules are applied in order. Each rule has an ID which is either designated by the user or automatically generated. If a website is categorized into multiple categories because they have overlapping match criteria that have associated rules, only the rule with the lowest ID is applied. For example, a website is categorized into two categories: category A and category B. The rules for category A is allow, and for B is deny. If the rule ID of category A is lower than category B's,

then the action allow is applied. To see the rule IDs, use the [show web-control rules](#) command.

You can change the rule order by using the [move rule \(Web Control\)](#) command. A change to the rule order may change the Web Control results.

A new reserved keyword **any** has been added to the parameter **<category>** from release 5.4.6-2 onwards. This new keyword allows you to apply Web Control on a per entity basis. See the [Web Control Feature Overview\\_and Configuration Guide](#) for configuration examples.

If a configuration with the reserved word **any** was configured by an old release, the following error message appears at boot time:

Figure 66-2: Example error message when the reserved keyword **any** was used prior to release 5.4.6-2.

```
*WARNING: Failed to execute the following commands:
43: category any - % Category "any" is a reserved keyword
44: match a - % Invalid command or arguments
45: match b - % Invalid command or arguments
46: match c - % Invalid command or arguments
done! *
```

**Examples** To create a rule that blocks `engineer` entity from accessing websites categorized as `movie`, use the commands:

```
awplus(config-web-control)# category movie
awplus(config-category)# match youtube
awplus(config-category)# match imdb
awplus(config-category)# exit
awplus(config-web-control)# rule 10 deny movie from engineer
```

To create a rule that allows entity `engineer` to access category `work`, use the commands:

```
awplus(config-web-control)# category work
awplus(config-category)# match alliedtelesis
awplus(config-category)# exit
awplus(config-web-control)# rule permit work from engineer
```

To delete a rule, use the commands:

```
awplus(config-web-control)#no rule 10
```

To create a rule using the reserved keyword `any`:

```
awplus(config-web-control)#rule deny badsites from private
awplus(config-web-control)# rule permit any from private
```

Rules are processed in order. In this example above the access to URLs associated with the named category "badsites" being accessed from the named firewall entity `private` will be blocked via the deny rule. Access to all other URLs originating from that specific firewall entity will be allowed via the subsequent permit any rule.

# web-control

**Overview** Use this command to enter the Web Control Configuration mode and configure Web Control functionality.

Use the **no** variant of this command to remove all configuration for Web Control. Custom categories, rules and other configuration associated with Web Control will be deleted.

**Syntax** `web-control`  
`no web-control`

**Mode** Global Configuration

**Usage** This command allows you to enter the Web Control Configuration mode. This mode also contains the sub- mode of Web Control Category Configuration. For more information about the sub-mode, see the [category \(Web Control\)](#) command.

The Web Control Configuration mode enables you to:

- Enable Web Control protection, see the [protect \(Web Control\)](#) command.
- Configure the website categorization provider, see the [provider digitalarts](#) command.
- Create categories and associated match criteria, see the [category \(Web Control\)](#) command.
- Create, delete and move rules for categories, see the [rule \(Web Control\)](#) command and the [move rule \(Web Control\)](#) command.
- Configure the default action for HTTP and HTTPS requests that do not hit any rule, see the [action \(Web Control\)](#) command.

If you want to disable Web Control protection without removing the configuration, you can use the **no** variant of the [protect \(Web Control\)](#) command to do so.

**Examples** To enter the Web Control Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)#
```

To destroy all Web Control configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no web-control
```

**Related commands** [show running-config](#)  
[show running-config web-control](#)  
[show web-control](#)

**Command changes** Version 5.4.7-1.1: HTTPS support added.

# Application Control Commands

## Introduction

This chapter provides an alphabetical reference of commands used to configure Application Control which uses Deep Packet Inspection (DPI). For more information about Application Control introduction and configuration example, see the [Application Control Feature Overview and Configuration\\_Guide](#).

The table below lists the Application Control commands and their applicable modes.

Figure 67-1: Application Control Commands and Applicable Modes

| Mode                 | Command                                            |
|----------------------|----------------------------------------------------|
| Privileged Exec      | <code>show dpi</code>                              |
|                      | <code>show dpi statistics</code>                   |
|                      | <code>show running-config dpi</code>               |
| Global Configuration | <code>dpi</code>                                   |
| DPI Mode             | <code>enable (DPI)</code>                          |
|                      | <code>provider procera</code>                      |
|                      | <code>update-interval (Application Control)</code> |

# dpi

**Overview** Use this command to configure DPI.

Use the **no** variant of this command to remove all DPI configuration.

**Syntax** dpi  
no dpi

**Mode** Global Configuration

**Usage** This command allows you to enter the DPI mode. The command prompt for this mode is **awplus(config-dpi)#**.

In the DPI mode, you can:

- Set the DPI provider, see the [provider procera](#) command.
- Enable DPI, see the [enable \(DPI\)](#) command.

**Examples** To configure DPI, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)#
```

To remove all DPI configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no dpi
```

# enable (DPI)

**Overview** Use this command to enable DPI .

Use the **no** variant of this command to disable DPI without losing existing DPI configuration.

**Syntax** enable  
no enable

**Default** DPI is disabled by default.

**Mode** DPI Mode

**Usage** You need to use the [provider procera](#) command to configure the DPI provider before enabling DPI.

When DPI is enabled, the DPI engine can classify network traffic and identify today's most common applications.

DPI itself does not control or apply rules to the traffic. You can use the [rule \(Firewall\)](#) command to enforce security policy and apply rules to the DPI applications. You can use the [show dpi statistics](#) command to show statistics for the applications being inspected by DPI.

DPI is disabled by default and all traffic is not classified.

**Examples** To enable DPI, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)# provider procera
awplus(config-dpi)# enable
```

To disable DPI, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)# no enable
```

**Related Commands** [provider procera](#)

**Validation Commands** [show dpi](#)  
[show running-config dpi](#)

# provider procera

**Overview** Use this command to set DPI provider.

Application Control using DPI identifies applications by matching packets to a database of up-to-date and predefined application signature provided by Procera Networks.

You can use the [show dpi](#) command to view the provider's current version.

**Syntax** `provider procera`

**Mode** DPI Mode

**Usage** If DPI is enabled, you can use the [show application](#) command and the [show application detail](#) command to view all DPI applications defined by Procera.

Note that custom applications override DPI applications, which override AlliedWare Plus predefined applications. For more information about applications, see the [application](#) command.

Note that you need to issue this command before using the [enable \(DPI\)](#) command to enable DPI.

**Examples** To set DPI provider, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)# provider procera
```

**Related Commands** [enable \(DPI\)](#)

**Validation Commands** [show application detail](#)  
[show dpi](#)  
[show running-config dpi](#)

# show dpi

**Overview** Use this command to show the DPI configuration state, including the provider's current version.

**Syntax** show dpi

**Mode** Privileged Exec

**Examples** To show the DPI configuration state and provider's current version, use the command:

```
awplus# show dpi
```

**Output** Figure 67-2: Example output from the **show dpi** command if the subscription license of Application Control is active.

```
awplus#show dpi
Status: running
Provider: procera
Resource version: 1.0
Resource update interval: 1 hour
```

Figure 67-3: Example output from the **show dpi** command if the subscription license of Application Control is inactive.

```
awplus#show dpi
awplus#show dpi
Status: unlicensed
Provider: procera
Resource version: not set
Resource update interval: 1 hour
```

# show dpi statistics

**Overview** Use this command to show statistics for each application being inspected by DPI. This command gives you counts of the total number of packets and bytes of the applications being inspected by DPI. You can use the [rule \(Firewall\)](#) command to enforce security policy and apply rules to the DPI applications.

**Syntax** `show dpi statistics`

**Mode** Privileged Exec

**Examples** To display the statistics for each application being inspected by DPI, use the command:

```
awplus# show dpi statistics
```

**Output** Figure 67-4: Example output from the **show dpi statistics** command on the console.

```
awplus#show dpi statistics
```

| Application | Packets | Bytes |
|-------------|---------|-------|
| http        | 30      | 2020  |
| icmp        | 348     | 29232 |
| telnet      | 45      | 2553  |

# show running-config dpi

**Overview** Use this command to show the configuration commands that have been used to configure DPI.

**Syntax** `show running-config dpi`

**Mode** Privileged Exec

**Examples** To show the configuration commands that have been used to configure DPI, use the command:

```
awplus# show running-config dpi
```

**Output** Figure 67-5: Example output from the **show running-config dpi** command

```
awplus#show running-config dpi
dpi
 provider procera
 enable
!
```

# update-interval (Application Control)

**Overview** Use this command to configure the update check interval for the DPI resource files. Use the **no** variant of this command to restore the default update check interval to 1 hour.

**Syntax** `update-interval {minutes <10-525600>|hours <1-8760>|days <1-365>|weeks <1-52>|never}`  
`no update-interval`

| Parameter           | Description                                                                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| minutes <10-525600> | Update interval from 10 through 52600 minutes                                                                                                                                                   |
| hours <1-8760>      | Update interval from 1 hour through 8760 hours                                                                                                                                                  |
| days <1-365>        | Update interval from 1 day through 365 days                                                                                                                                                     |
| weeks <1-52>        | Update interval from 1 week through 52 weeks                                                                                                                                                    |
| never               | Never update the resource. If DPI becomes enabled, the Update Manager will do update check and update the resource files if needed. Use the <a href="#">enable (DPI)</a> command to enable DPI. |

**Default** The default update interval is 1 hour.

**Mode** DPI Mode

**Usage** The Update Manager will perform an update check for a resource when triggered by an update check interval. It will request the current version number of the resource from the Update Server, then compare it with the current local version. If they are different, the Update Manager will initiate an update of the local resource.

Note that when a feature is disabled, regular and manual update checks for its resources are disabled.

Also note that an update check for a resource will not proceed if an update of that resource is already in progress.

**Examples** To check and update the DPI resource files once a week, use the following command:

```
awplus(config-dpi)# update-interval weeks 1
```

To disable updating of the resource, use the following command:

```
awplus(config-dpi)# update-interval never
```

To restore the default update interval, which is 1 hour, use the following command:

```
awplus(config-dpi)# no update-interval
```

**Validation** show resource  
**Command**

# IP Reputation Commands

## Introduction

This chapter provides an alphabetical reference of commands used to configure AlliedWare Plus IP Reputation. For more information about IP Reputation introduction and configuration example, see the [IP Reputation Feature Overview and Configuration\\_Guide](#).

The table below lists the IP Reputation commands and their applicable modes.

Figure 68-1: IP Reputation Commands and Applicable Modes

| Mode                 | Command                                          |
|----------------------|--------------------------------------------------|
| Privileged Exec      | <code>show ip-reputation</code>                  |
|                      | <code>show ip-reputation categories</code>       |
|                      | <code>show running-config ip-reputation</code>   |
| Global Configuration | <code>ip-reputation</code>                       |
| IP Reputation Mode   | <code>category action (IP Reputation)</code>     |
|                      | <code>protect (IP Reputation)</code>             |
|                      | <code>provider proofpoint (IP Reputation)</code> |
|                      | <code>update-interval (IP Reputation)</code>     |

# category action (IP Reputation)

**Overview** Use this command to configure an action for a specified category.  
Use the **no** variant of this command to set action for a specified category to default, which is alert.

**Syntax** `category <category-name> action {alert|deny|disable}`  
`no category <category-name> action`

| Parameter                          | Description                                                                                                                                                                                                                                                                                         |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;category-name&gt;</code> | Category name. A category contains a group of IP reputation criteria that are used to classify the nature of a host reputation. A host may have a reputation in multiple categories. You can use the <a href="#">show ip-reputation categories</a> command to view the categories and their status. |
| <code>alert</code>                 | Generate a log message. This is the default action.                                                                                                                                                                                                                                                 |
| <code>deny</code>                  | Drop matching packets. No error message is sent back to the source host.                                                                                                                                                                                                                            |
| <code>disable</code>               | Ignore a specified category. Ignored categories will not be used to categorize traffic.                                                                                                                                                                                                             |

**Default** The default action is alert.

**Mode** IP Reputation Mode

**Usage** You can only configure the categories from the IP Reputation database provider, which is Proofpoint. You can use the [show ip-reputation categories](#) command to see the list of IP Reputation categories.

**NOTE:** Note that you should use the [provider proofpoint \(IP Reputation\)](#) command to configure the provider before configuring the action.

**Examples** To drop packets categorized as P2P, use the commands:

```
awplus# configure terminal
awplus(config)# ip-reputation
awplus(config-ip-reputation)# provider proofpoint
awplus(config-ip-reputation)# category P2P action deny
```

To set the action for category P2P to default, use the commands:

```
awplus# configure terminal
awplus(config)# ip-reputation
awplus(config-ip-reputation)# no category P2P action
```

**Related  
Commands**    `show ip-reputation categories`  
                  `show running-config ip-reputation`

# ip-reputation

**Overview** Use this command to configure IP Reputation.  
Use the **no** variant of this command to remove all IP Reputation configuration.

**Syntax** ip-reputation  
no ip-reputation

**Mode** Global Configuration

**Usage** This command allows you to enter the IP Reputation mode. The command prompt for this mode is **awplus(config-ip-reputation)#**.

In the IP Reputation mode, you can:

- Set or remove the IP Reputation database provider, see the [provider proofpoint \(IP Reputation\)](#) command.
- Enable or disable IP Reputation protection, see the [protect \(IP Reputation\)](#) command.
- Configure the action for specified categories, see the [category action \(IP Reputation\)](#) command.

**Examples** To configure IP Reputation, use the commands:

```
awplus# configure terminal
awplus(config)# ip-reputation
awplus(config-ip-reputation)#
```

To remove all IP Reputation configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ip-reputation
```

**Related Commands** [show ip-reputation](#)  
[show running-config ip-reputation](#)

# protect (IP Reputation)

**Overview** Use this command to enable IP Reputation protection.

Use the **no** variant of this command to disable IP Reputation protection without losing existing configuration.

Once IP Reputation protection is enabled, traffic will be categorized according to the available IP Reputation categories. See the [show ip-reputation categories](#) command for the list of available IP Reputation categories.

Note that you should use the [provider proofpoint \(IP Reputation\)](#) command to set the IP Reputation database provider before issuing this command.

**Syntax** protect  
no protect

**Default** IP Reputation protection is disabled by default.

**Mode** IP Reputation Mode

**Examples** To enable IP Reputation protection, use the commands:

```
awplus# configure terminal
awplus(config)# ip-reputation
awplus(config-ip-reputation)# provider proofpoint
awplus(config-ip-reputation)# protect
```

To disable IP Reputation protection, use the commands:

```
awplus# configure terminal
awplus(config)# ip-reputation
awplus(config-ip-reputation)# no protect
```

**Related Commands** [show ip-reputation](#)  
[show running-config ip-reputation](#)

# provider proofpoint (IP Reputation)

**Overview** Use this command to set the IP Reputation database provider.

Proofpoint provides a database of IP reputation based on threat analysis. The database is regularly updated and can deliver the latest information of identified and potentially harmful IP addresses classified in categories.

If the provider is configured, you can use the [show ip-reputation categories](#) command to show the category details from the provider.

The default action for all categories is alert and you can use the [category action \(IP Reputation\)](#) command to set the action for a specified category.

**Syntax** `provider proofpoint`

**Mode** IP Reputation Mode

**Examples** To set the IP Reputation database provider, use the commands:

```
awplus# configure terminal
awplus(config)# ip-reputation
awplus(config-ip-reputation)# provider proofpoint
```

**Related Commands**

- [show ip-reputation](#)
- [show running-config ip-reputation](#)
- [show ip-reputation categories](#)

# show ip-reputation

**Overview** Use this command to show the IP Reputation configuration state, including the IP Reputation database provider.

**Syntax** `show ip-reputation`

**Mode** Privileged Exec

**Examples** To show the IP Reputation configuration state, use the command:

```
awplus# show ip-reputation
```

**Output** Figure 68-2: Example output from **show ip-reputation** if the IP Reputation subscription license is active.

```
awplus#show ip-reputation
Status: Enabled (Active)
Events: 23
Provider: Proofpoint
 Resource version: 1.0
 Entry count: 148357
 Status: Enabled
Resource update interval: 1 hour
```

**Related Commands** [ip-reputation](#)

**Command changes** Version 5.4.7-0.1: Event count added to the command output.

# show ip-reputation categories

**Overview** Use this command to show the IP Reputation category details.

Note that you need to use the [provider proofpoint \(IP Reputation\)](#) command to set the IP Reputation database provider before issuing this command.

**Syntax** `show ip-reputation categories`

**Mode** Privileged Exec

**Examples** To show the IP Reputation category details, use the command:

```
awplus# show ip-reputation categories
```

**Output** Figure 68-3: Example output from the **show ip-reputation categories** command

```
awplus#show ip-reputation categories

Category(* = invalid) Action Description

AbusedTLD alert Abused or free TLD Related
Bitcoin_Related alert Bitcoin Mining and related
Blackhole alert Blackhole or Sinkhole systems
Bot alert Known Infected Bot
Brute_Forcer alert SSH or other brute forcer
ChatServer alert POLICY Chat Server
CnC alert Malware Command and Control Server
Compromised alert Known compromised or Hostile
DDoSAttacker alert DDoS Source
DriveBySrc alert Driveby Source
Drop alert Drop site for logs or stolen credentials
DynDNS alert Domain or IP Related to a Dynamic DNS Entry
 or Request
EXE_Source alert Suspicious exe or dropper service
FakeAV alert Fake AV and AS Products
IPCheck alert IP Check Services
Mobile_CnC alert Known CnC for Mobile specific Family
Mobile_Spyware_CnC alert Spyware CnC specific to mobile devices
OnlineGaming alert Questionable Gaming Site
P2P alert P2P Node
P2PCnC alert Distributed CnC Nodes
Parking alert Domain or SEO Parked
RemoteAccessService alert GoToMyPC and similar remote access services
Scanner alert Host Performing Scanning
Skype_SuperNode alert Observed Skype Bootstrap or Supernode
Spam alert Known Spam Source
SpywareCNS alert Spyware Reporting Server
TorNode alert POLICY Tor Node
Undesirable alert Undesirable but not illegal
Utility alert Known Good Public Utility
VPN alert VPN Server
```

**Related  
Commands** [category action \(IP Reputation\)](#)

# show running-config ip-reputation

**Overview** Use this command to show the configuration commands that have been used to configure IP Reputation.

**Syntax** `show running-config ip-reputation`

**Mode** Privileged Exec

**Examples** To show the commands that have been used to configure IP Reputation, use the command:

```
awplus# show running-config ip-reputation
```

**Output** Figure 68-4: Example output from the **show running-config ip-reputation** command

```
awplus#show running-config ip-reputation
ip-reputation
 provider proofpoint
 protect
!
```

# update-interval (IP Reputation)

**Overview** Use this command to configure an update check interval for the IP Reputation resource files.

Use the **no** variant of this command to restore the default update check interval to 1 hour.

**Syntax** `update-interval {minutes <10-525600>|hours <1-8760>|days <1-365>|weeks <1-52>|never}`  
`no update-interval`

| Parameter           | Description                                                                                                                                                                                                                    |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| minutes <10-525600> | Update interval from 10 through 52600 minutes                                                                                                                                                                                  |
| hours <1-8760>      | Update interval from 1 hour through 8760 hours                                                                                                                                                                                 |
| days <1-365>        | Update interval from 1 day through 365 days                                                                                                                                                                                    |
| weeks <1-52>        | Update interval from 1 week through 52 weeks                                                                                                                                                                                   |
| never               | Never update the resource. If IP Reputation becomes enabled, the Update Manager will do update check and update the resource files if needed. Use the <a href="#">protect (IP Reputation)</a> command to enable IP Reputation. |

**Default** The default update interval is 1 hour.

**Mode** IP Reputation Mode

**Usage** The Update Manager will perform an update check for a resource when triggered by an update check interval. It will request the current version number of the resource from the Update Server, then compare it with the current local version. If they are different, the Update Manager will initiate an update of the local resource.

Note that when a feature is disabled, regular and manual update checks for its resources are disabled.

Also note that an update check for a resource will not proceed if an update of that resource is already in progress.

**Examples** To check and update the IP Reputation resource files once a week, use the following command:

```
awplus(config-ip-reputation)# update-interval weeks 1
```

To disable updating of the resource, use the following command:

```
awplus(config-ip-reputation)# update-interval never
```

To restore the default update interval, which is 1 hour, use the following command:

```
awplus(config-ip-reputation)# no update-interval
```

# clear isakmp sa

**Overview** Use this command to delete Internet Security Association Key Management Protocol (ISAKMP) Security Associations (SAs). SAs specify the Security Parameter Index (SPI), protocols, algorithms and keys for protecting a single flow of traffic between two IPsec peers. For more information about SA, see the [Internet Protocol Security \(IPSec\) Feature Overview and Configuration Guide](#).

**Syntax** `clear [crypto] isakmp sa [peer <ipv4-addr>|<ipv6-addr>|<hostname>] [force]`

| Parameter   | Description                                                          |
|-------------|----------------------------------------------------------------------|
| <ipv4-addr> | Destination IPv4 address. The IPv4 address uses the format A.B.C.D.  |
| <ipv6-addr> | Destination IPv6 address. The IPv4 address uses the format X:X::X:X. |
| <hostname>  | Destination host name.                                               |
| force       | Force to clear ISAKMP SAs without negotiating with the peer.         |

**Mode** Privileged Exec

**Examples** To delete the ISAKMP security associations at the peer for an IPv6 address, use the command:

```
awplus# clear isakmp sa peer 2001:0db8::1
```

To delete the ISAKMP security associations at the peer for an IPv4 address, use the command:

```
awplus# clear isakmp sa peer 192.168.2.1
```

To delete the ISAKMP security associations at the peer for a host name, use the command:

```
awplus# clear isakmp sa peer remote.example.com
```

**Related Commands** [crypto isakmp key](#)  
[show isakmp sa](#)

**Command Changes** Version 5.4.7-0.1: Parameter <hostname> added for DDNS feature.

# crypto ipsec profile

**Overview** Use this command to configure a custom IPsec profile.

An IPsec profile comprises one or more transforms that can be configured by using the [transform \(IPsec Profile\)](#) command.

Use the **no** variant to delete a previously created profile.

**Syntax** `crypto ipsec profile <profile_name>`  
`no crypto ipsec profile <profile_name>`

| Parameter                         | Description                                                                                                                                                                                                                                |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;profile_name&gt;</code> | Profile name. Profile names are case insensitive and can be up to 64 characters long composed of printable ASCII characters. Profile names can have only letters from a to z and A to Z, numbers from 0 to 9, - (dash), or _ (underscore). |

**Default** The default IPsec profile with transforms in order of preference is listed in the following table. Which IPsec profile will actually be used depends on how the negotiation between the peers is carried out when establishing the connection. Note that you cannot delete or edit the default profile. Expiry time of 8 hours applies to the default IPsec profile.

Table 69-1: IPsec default profile

| Attribute            | Transform 1 | Transform 2 | Transform 3 | Transform 4 | Transform 5 | Transform 6 |
|----------------------|-------------|-------------|-------------|-------------|-------------|-------------|
| Protocol             | ESP         | ESP         | ESP         | ESP         | ESP         | ESP         |
| Encryption (all CBC) | AES256      | AES256      | AES128      | AES128      | 3DES        | 3DES        |
| Integrity (all HMAC) | SHA256      | SHA1        | SHA256      | SHA1        | SHA256      | SHA1        |

**Mode** Global Configuration

**Examples** To configure a custom IPsec profile for establishing IPsec SAs with a remote peer, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto ipsec profile my_profile
awplus(config-ipsec-profile)# transform 2 protocol esp
integrity sha1 encryption 3des
```

To delete a custom profile, use the following commands:

```
awplus# configure terminal
awplus(config)# no crypto ipsec profile my_profile
```

**Related  
Commands**    lifetime (IPsec Profile)  
                  transform (IPsec Profile)

**Validation  
Commands**    show ipsec profile

# crypto isakmp key

**Overview** Use this command to configure a pre-shared authentication key.

Pre-shared key authentication uses optionally encrypted shared keys identified by hostname, IPv4 or IPv6 address. Pre-shared keys are not viewable and stored encrypted in the running-configuration.

You must configure this key whenever you specify pre-shared keys in an (Internet Key Exchange) IKE policy and at both peers.

To use the **no** variant to remove a previously created pre-shared key.

**Syntax** `crypto isakmp key [8] <key> {hostname <hostname>|address {<ipv4-addr>|<ipv6-addr>}}`  
`no crypto isakmp key [8] <key> {hostname <hostname>|address {<ipv4-addr>|<ipv6-addr>}}`

| Parameter   | Description                                                                                                           |
|-------------|-----------------------------------------------------------------------------------------------------------------------|
| crypto      | Security specific command.                                                                                            |
| isakmp      | Internet Security Association Key Management Protocol provides a common framework for key management implementations. |
| key         | Pre-shared key.                                                                                                       |
| <key>       | Specify the pre-shared key. Us any combination of alphanumeric characters up to 128 bytes.                            |
| 8           | Specifies that an encrypted key follows.                                                                              |
| <hostname>  | Destination hostname.                                                                                                 |
| <ipv4-addr> | Destination IPv4 address. The IPv4 address uses the format A.B.C.D.                                                   |
| <ipv6-addr> | Destination IPv6 address. The IPv6 address uses the format X:X::X:X.                                                  |

**Default** ISAKMP keys do not exist.

**Mode** Global Configuration

**Examples** To configure a pre-shared authentication key for a destination host, use the commands below:

```
awplus# configure terminal
awplus(config)# crypto isakmp key friend hostname
mypeer@my.domain.com
```

To configure a pre-shared authentication key at a peer with IPv4 address, use the commands below:

```
awplus# configure terminal
awplus(config)# crypto isakmp key friend address
192.168.1.1
```

To configure a pre-shared encrypted authentication key at a peer with IPv4 address, use the commands below:

```
awplus# configure terminal
awplus(config)# crypto isakmp
key 8 Nhe6ioQmzbysQaJr6Du+cA== address 192.168.1.2
```

To remove a pre-shared key at a peer, use the commands below:

```
awplus# configure terminal
awplus(config)# no crypto isakmp key friend hostname
mypeer@my.domain.com
```

**Related  
Commands** [show isakmp key \(IPsec\)](#)

# crypto isakmp peer

**Overview** Use this command to configure a peer to use a specific ISAKMP profile.

Use the **no** variant to set the peer back to using the default profile.

**Syntax** `crypto isakmp peer address {<ipv4-addr>|<ipv6-addr>} hostname <hostname> profile <profile-name>`

`crypto isakmp peer dynamic profile <profile-name>`

`no crypto isakmp peer address {<ipv4-addr>|<ipv6-addr>} hostname <hostname> profile`

`no crypto isakmp peer dynamic profile`

| Parameter      | Description                                                          |
|----------------|----------------------------------------------------------------------|
| <ipv4-addr>    | Destination IPv4 address. The IPv4 address uses the format A.B.C.D.  |
| <ipv6-addr>    | Destination IPv6 address. The IPv6 address uses the format X:X::X:X. |
| <hostname>     | Remote endpoint with a host name as the destination.                 |
| dynamic        | Remote endpoint with a dynamic IP address.                           |
| <profile-name> | Profile name.                                                        |

**Default** By default, all peers use the default profile.

**Mode** Global Configuration

**Examples** To configure a profile for a peer with a dynamic IP address, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# crypto isakmp peer dynamic profile peer_profile
```

To configure a profile for a peer with IPv4 address, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# crypto isakmp peer address 192.168.1.2 profile peer_profile
```

To set the profile for the peer back to default, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no crypto isakmp peer dynamic profile
```

```
awplus# configure terminal
```

To configure a profile for a peer with a host name, use the following commands:

```
awplus(config)# crypto isakmp peer hostname user.domain.com
profile peer_profile
awplus# configure terminal
```

To set the profile for the peer back to the default, use the following commands:

```
awplus(config)# no crypto isakmp peer hostname user.domain.com
profile peer_profile
```

**Related  
Commands** [show isakmp peer](#)

**Command  
Changes** Version 5.4.7-0.1: Parameter <hostname> added for DDNS feature.

# crypto isakmp profile

**Overview** Use this command to configure a custom ISAKMP profile.

An ISAKMP profile comprises one or more transforms that can be configured by using the [transform \(ISAKMP Profile\)](#) command.

Use the **no** variant to delete a previously created profile.

**Syntax** `crypto isakmp profile <profile_name>`  
`no crypto isakmp profile <profile_name>`

| Parameter                         | Description                                                                                                                                                                                                                                |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;profile_name&gt;</code> | Profile name. Profile names are case insensitive and can be up to 64 characters long composed of printable ASCII characters. Profile names can have only letters from a to z and A to Z, numbers from 0 to 9, - (dash), or _ (underscore). |

**Default** Which ISAKMP profile transform will actually be used depends on how the negotiation between the peers is carried out when establishing the connection. For more information about default ISAKMP profiles, see the following table. Note that you cannot delete or edit the default profile. Expiry time of 24 hours applies to the default profile.

Table 69-2: ISAKMP default profile

| Attribute    | Encryption | Integrity | Group | Authentication |
|--------------|------------|-----------|-------|----------------|
| Transform 1  | AES256     | SHA256    | 14    | Pre-shared     |
| Transform 2  | AES256     | SHA256    | 16    | Pre-shared     |
| Transform 3  | AES256     | SHA1      | 14    | Pre-shared     |
| Transform 4  | AES256     | SHA1      | 16    | Pre-shared     |
| Transform 5  | AES128     | SHA256    | 14    | Pre-shared     |
| Transform 6  | AES128     | SHA256    | 16    | Pre-shared     |
| Transform 7  | AES128     | SHA1      | 14    | Pre-shared     |
| Transform 8  | AES128     | SHA1      | 16    | Pre-shared     |
| Transform 9  | 3DES       | SHA256    | 14    | Pre-shared     |
| Transform 10 | 3DES       | SHA256    | 16    | Pre-shared     |
| Transform 11 | 3DES       | SHA1      | 14    | Pre-shared     |
| Transform 12 | 3DES       | SHA1      | 16    | Pre-shared     |

**Mode** Global Configuration

**Examples** To configure a custom ISAKMP profile for establishing ISAKMP SAs with a remote peer, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto isakmp profile my_profile
awplus(config-isakmp-profile)# transform 2 integrity sha1
encryption 3des group 5
```

To delete a custom profile, use the following commands:

```
awplus# configure terminal
awplus(config)# no crypto isakmp profile my_profile
```

# debug isakmp

**Overview** Use this command to enable debugging ISAKMP.

To disable debugging ISAKMP, see [no debug isakmp](#) or [undebug isakmp](#).

**Syntax** debug [crypto] isakmp [info|trace|all]

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| debug     | Debugging function.                                                                                                   |
| crypto    | Security specific command.                                                                                            |
| isakmp    | Internet Security Association Key Management Protocol provides a common framework for key management implementations. |
| info      | Informational debug messages such as protocol events.                                                                 |
| trace     | Verbose debug messages including protocol events and message traces.                                                  |
| all       | All debug enabled.                                                                                                    |

**Mode** Privileged Exec

**Examples** Figure 69-1: Example output from the **debug isakmp** command on the console.

# dpd-interval

**Overview** Use this command to specify the Dead Peer Detection (DPD) interval for an ISAKMP profile.

DPD is an IKE mechanism using a form of keep-alive to determine if a tunnel peer is still active.

The interval parameter specifies the amount of time the device waits for traffic from its peer before sending a DPD acknowledgment message.

Use the **no** variant to set the interval to its default (30 seconds).

**Syntax** `dpd-interval <10-86400>`  
`no dpd-interval`

| Parameter                     | Description                    |
|-------------------------------|--------------------------------|
| <code>&lt;10-86400&gt;</code> | Interval expressed in seconds. |

**Default** If you do not specify an interval, the default interval of 30 seconds applies.

**Mode** ISAKMP Profile Configuration

**Examples** To specify a DPD interval, use the following commands:

```
awplus(config)# crypto isakmp profile my_profile
awplus(config-isakmp-profile)# dpd-interval 20
```

To set the interval to its default, use the following commands:

```
awplus(config-isakmp-profile)# no dpd-interval
```

**Related Commands** [crypto isakmp profile](#)

**Validation Commands** [show isakmp profile](#)

# dpd-timeout

- Overview** Use this command to specify a Dead Peer Detection (DPD) timeout for IKEv1. DPD is an IKE mechanism using a form of keep-alive to determine if a tunnel peer is still active. DPD timeout defines the timeout interval after which all connections to a peer are deleted in case of inactivity. This only applies to IKEv1, in IKEv2 the default retransmission timeout applies as every exchange is used to detect dead peers. Use the **no** variant to set the timeout to its default (150 seconds).

- Syntax** `dpd-timeout <10-86400>`  
`no dpd-timeout`

| Parameter                     | Description         |
|-------------------------------|---------------------|
| <code>&lt;10-86400&gt;</code> | Timeout in seconds. |

- Default** If you do not specify a timeout, the default timeout of 150 seconds applies.

- Mode** ISAKMP Profile Configuration

- Examples** To specify a DPD timeout for IKEv1, use the following commands:

```
awplus(config)# crypto isakmp profile my_profile
awplus(config-isakmp-profile)# dpd-timeout 200
```

To set the timeout to its default, use the following command:

```
awplus(config-isakmp-profile)# no dpd-timeout
```

# interface tunnel

**Overview** Use this command to create a tunnel interface. Tunnel interfaces are identified by an index identifier that is an integer in the range from 0 through 255. Note that the **tunnel mode** command is needed to enable the tunnel.

Use the **no** variant of this command to remove a previously created tunnel interface.

**Syntax** `interface tunnel<0-255>`  
`no interface tunnel<tunnel-index>`

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| <0-255>   | Specify a tunnel interface index identifier in the range from 0 through 255. |

**Default** Tunnel interfaces do not exist.

**Mode** Global Configuration

**Usage** This command creates a new tunnel interface to configure in Global Configuration mode.

This command is also used to enter Interface Configuration mode for existing tunnel interfaces.

**Usage** Note that you need to designate a tunnel mode, tunnel source address, tunnel destination address, IP address of tunnel interface and use [tunnel protection ipsec \(IPsec\)](#) command to encrypt and authenticate the packets travelling though the tunnel.

**Examples** To configure an IPsec tunnel interface with index 100, enter the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel100
awplus(config-if)# tunnel mode ipsec ipv4
```

To remove the IPsec tunnel interface tunnel100, enter the commands below:

```
awplus# configure terminal
awplus(config)# no interface tunnel100
```

# lifetime (IPsec Profile)

- Overview** Use this command to specify a lifetime for an IPsec SA.
- Lifetime measures how long the IPsec SA can be maintained before it expires. Lifetime prevents a connection from being used too long.
- Use the **no** variant to set the lifetime to default (28800 seconds).

**Syntax** `lifetime seconds <300-31449600>`  
`no lifetime seconds`

| Parameter                         | Description          |
|-----------------------------------|----------------------|
| <code>&lt;300-31449600&gt;</code> | Lifetime in seconds. |

**Default** If you do not specify a lifetime, the default lifetime of 28800 seconds (8 hours) applies.

**Mode** IPsec Profile Configuration

**Examples** To specify a lifetime for an IPsec SA, use the following commands:

```
awplus(config)# crypto ipsec profile my_profile
awplus(config-ipsec-profile)# lifetime seconds 400
```

To set the lifetime to its default, use the following commands:

```
awplus(config)# crypto ipsec profile my_profile
awplus(config-ipsec-profile)# no lifetime seconds
```

**Related Commands** [crypto ipsec profile](#)

# lifetime (ISAKMP Profile)

- Overview** Use this command to specify a lifetime for an ISAKMP SA.
- Lifetime measures how long the ISAKMP SA can be maintained before it expires. Lifetime prevents a connection from being used too long.
- Use the **no** variant to set the lifetime to default (86400 seconds).

**Syntax** `lifetime <600-31449600>`  
`no lifetime`

| Parameter                         | Description          |
|-----------------------------------|----------------------|
| <code>&lt;600-31449600&gt;</code> | Lifetime in seconds. |

**Default** If you do not specify a lifetime, the default lifetime of 86400 seconds (8 hours) applies.

**Mode** ISAKMP Profile Configuration

**Examples** To specify a lifetime for an ISAKMP SA, use the following commands:

```
awplus(config)# configure isakmp profile my_profile
awplus(config-isakmp-profile)# lifetime 700
```

To set the lifetime to its default, use the following commands:

```
awplus(config-isakmp-profile)# no lifetime
```

**Related Commands** [crypto isakmp profile](#)

# no debug isakmp

**Overview** Use this command to disable debugging ISAKMP.  
To enable debugging ISAKMP, see [debug isakmp](#).

**Syntax** no [crypto] isakmp [info|trace|all]

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| no        | Disable debugging function.                                                                                           |
| crypto    | Security specific.                                                                                                    |
| isakmp    | Internet Security Association Key Management Protocol provides a common framework for key management implementations. |
| info      | Informational debug messages such as protocol events.                                                                 |
| trace     | Verbose debug messages including protocol events and message traces.                                                  |
| all       | All debug enabled.                                                                                                    |

**Mode** Privileged Exec

# pfs

**Overview** Use this command to enable PFS and set a Diffie-Hellman group for PFS in an IPsec profile.

Use the **no** variant to disable PFS.

**Syntax** `pfs {2|5|14|15|16|18}`  
`no pfs`

| Parameter | Description         |
|-----------|---------------------|
| 2         | 1024-bit MODP Group |
| 5         | 1536-bit MODP Group |
| 14        | 2048-bit MODP Group |
| 15        | 3072-bit MODP Group |
| 16        | 4096-bit MODP Group |
| 18        | 8192-bit MODP Group |

**Default** PFS is disabled.

**Mode** IPsec Profile Configuration

**Usage** Perfect Forward Secrecy (PFS) ensures generated keys, for example IPsec SA keys are not compromised if any other keys, for example, ISAKMP SA keys are compromised.

The specified PFS group must match the PFS group setting on the peer - especially when IKEv2 is used for ISAKMP SA negotiation. With IKEv2, if there is a PFS group mismatch an IPsec SA will be established and the tunnel will come up because PFS is not required for the initial child SA negotiation. However, when the IPsec SA rekeys it will fail due to the PFS group mismatch, and upon IPsec SA expiry the tunnel will no longer be able to carry traffic.

**Examples** To enable PFS and set a Diffie-Hellman group for PFS, use the following commands:

```
awplus(config)# crypto ipsec profile my_profile
awplus(config-ipsec-profile)# pfs 15
```

To disable PFS, use the following command:

```
awplus(config-ipsec-profile)# no pfs
```

**Related Commands** [crypto ipsec profile](#)

**Validation** show ipsec profile  
**Commands**

# show debugging isakmp

**Overview** Use this command to show if debugging ISAKMP is enabled.

**Syntax** show debugging [crypto] isakmp

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| debugging | Debugging information.                                                                                                |
| crypto    | Security specific command.                                                                                            |
| isakmp    | Internet Security Association Key Management Protocol provides a common framework for key management implementations. |

**Mode** Privileged Exec

**Examples** To show if debugging ISAKMP is enabled, enter the command below:

```
awplus# show debugging isakmp
```

**Output** Figure 69-2: Example output from the **show debugging isakmp** command

```
awplus#show debugging isakmp
ISAKMP Debugging status:
 ISAKMP Informational debugging is enabled
 ISAKMP Trace debugging is disabled
```

# show interface tunnel (IPsec)

**Overview** Use this command to display status information of tunnels.

The tunnel remains inactive if no valid tunnel source or tunnel destination is configured.

**Syntax** `show interface tunnel <tunnel-index>`

| Parameter      | Description                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------|
| tunnel         | Specify this parameter to display tunnel status information of a given tunnel identified by the <tunnel-index> parameter. |
| <tunnel-index> | Specify a tunnel index in the range from 0 through 255.                                                                   |

**Mode** Privileged Exec

**Examples** To display status information for IPsec tunnel1, enter the command below:

```
awplus# show interface tunnel1
```

**Output** Figure 69-3: Example output from the **show interface tunnel** command

```
awplus#show interface tunnel1
Interface tunnel1

```

# show ipsec profile

**Overview** Use this command to show IPsec default and custom profiles.

An IPsec profile consists of a set of parameters that are used by IPsec when establishing IPsec SAs with a remote peer. AlliedWare Plus provides default ISAKMP and IPsec profiles that contain a priority ordered set of transforms that are considered secure by the security community.

**Syntax** `show [crypto] ipsec profile [<profile_name>]`

| Parameter      | Description                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------|
| crypto         | Security specific.                                                                                   |
| ipsec          | Internet Protocol Security defines the protection of IP packets using encryption and authentication. |
| profile        | An IPsec profile consists of a set of parameters that are used by IPsec SAs with a remote peer.      |
| <profile_name> | Custom profile name.                                                                                 |

**Mode** Privileged Exec

**Examples** To show all IPsec profiles, including the default profile, use the following command:

```
awplus# show ipsec profile
```

**Output** Figure 69-7: Example output from the **show ipsec profile** command

```
awplus#show ipsec profile
IPsec Profile: default
 Replay-window: 32
 Expiry: 8h
 PFS group: disabled
 Transforms:
 Protocol Integrity Encryption
 1 ESP SHA256 AES256
 2 ESP SHA1 AES256
 3 ESP SHA256 AES128
 4 ESP SHA1 AES128
 5 ESP SHA256 3DES
 6 ESP SHA1 3DES
IPsec Profile: my_profile
 Replay-window: 32
 Expiry: 8h
 PFS group: disabled
 Transforms:
 Protocol Integrity Encryption
 2 ESP SHA1 3DES
```

**Examples** To show IPsec profile “my\_profile”, use the command:

```
awplus# show ipsec profile my_profile
```

**Output** Figure 69-8: Example output from the **show ipsec profile** command

```
awplus#show ipsec profile my_profile
IPsec Profile: my_profile
Replay-window: 32
Expiry: 8h

# show isakmp key (IPsec)

**Overview** Use this command to show the ISAKMP pre-shared key. Pre-shared key authentication using optionally encrypted shared keys identified by hostname, IPv4 or IPv6 address. Pre-shared keys are not viewable and stored encrypted in the running-configuration.

**Syntax** `show [crypto] isakmp key`

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| crypto    | Security specific command.                                                                                            |
| isakmp    | Internet Security Association Key Management Protocol provides a common framework for key management implementations. |
| key       | Pre-shared key.                                                                                                       |

**Mode** Privileged Exec

**Examples** To show ISAKMP pre-shared key, enter the command below:

```
awplus# show isakmp key
```

**Output** Figure 69-11: Example output from the **show isakmp key** command

```
awplus#show isakmp key
Hostname/IP address Key
10.2.0.10 mytunnelkey
```

# show isakmp peer

**Overview** Use this command to show ISAKMP profile and key status for ISAKMP peers.

**Syntax** `show isakmp peer [<hostname>|<ipv4-addr>|<ipv6-addr>]`

| Parameter                      | Description                                                          |
|--------------------------------|----------------------------------------------------------------------|
| <code>&lt;hostname&gt;</code>  | Destination hostname.                                                |
| <code>&lt;ipv4-addr&gt;</code> | Destination IPv4 address. The IPv4 address uses the format A.B.C.D.  |
| <code>&lt;ipv6-addr&gt;</code> | Destination IPv6 address. The IPv6 address uses the format X:X::X:X. |

**Mode** Privileged Exec

**Examples** To show ISAKMP profile and key status for ISAKMP peers, use the following command:

```
awplus# show isakmp peer
```

**Output** Figure 69-12: Example output from the **show isakmp peer** command

```
awplus#show isakmp peer
Peer Profile (* incomplete) Key

```

**Related Commands** [crypto isakmp peer](#)

**Command changes** Version 5.4.7-0.1: Parameter <hostname> added for DDNS feature.

# show isakmp profile

**Overview** Use this command to show ISAKMP default and custom profiles.

**Syntax** show [crypto] isakmp profile [<profile\_name>]

| Parameter      | Description          |
|----------------|----------------------|
| <profile_name> | Custom profile name. |

**Mode** Privileged Exec

**Examples** To show ISAKMP profiles, including the default profile, use the command:

```
awplus# show isakmp profile
```

**Output** Figure 69-13: Example output from the **show isakmp profile** command

```
awplus#show isakmp profile
ISAKMP Profile: default
 Version: IKEv2
 Authentication: PSK
 Expiry: 24h
 DPD Interval: 30s
 Transforms:

# transform (IPsec Profile)

**Overview** Use this command to create an IPsec profile transform, which specifies the encryption and authentication algorithms used to protect data.

Use the **no** variant to delete a previously created transform.

**Syntax** `transform <1-255> protocol esp integrity {sha1|sha256|sha512}  
encryption {3des|aes128|aes192|aes256|null}`  
`no transform <1-255>`

| Parameter | Description                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| <1-255>   | Transform priority (1 is the highest)                                                                              |
| sha1      | Secure Hash Standard with 160-bit digest size                                                                      |
| sha256    | Secure Hash Standard with 256-bit digest size                                                                      |
| sha512    | Secure Hash Standard with 512 bit digest size                                                                      |
| 3des      | Triple DES symmetric key block cipher with a 168-bit key                                                           |
| aes128    | Advanced Encryption Standard symmetric key block cipher with a 128-bit key                                         |
| aes192    | Advanced Encryption Standard symmetric key block cipher with a 192-bit key                                         |
| aes256    | Advanced Encryption Standard symmetric key block cipher with a 256-bit key                                         |
| null      | No encryption. This option is not intended for use in a live network. It should only be used for testing purposes. |

**Default** By default, an IPsec profile has no transforms and so will not be active.

**Mode** IPsec Profile Configuration

**Examples** To configure an IPsec profile transform, use the following commands:

```
awplus(config)# crypto ipsec profile my_profile
awplus(config-ipsec-profile)# transform 2 protocol esp
integrity sha1 encryption 3des
```

To delete a created transform, use the following command:

```
awplus(config-ipsec-profile)# no transform 2
```

**Related Commands** [crypto ipsec profile](#)

**Validation Commands** [show ipsec profile](#)

# transform (ISAKMP Profile)

**Overview** Use this command to create an ISAKMP profile transform which specifies the encryption and authentication algorithms used to protect data in the tunnel.

Use the **no** variant to delete a previously created transform.

**Syntax** `transform <1-255> integrity {sha1|sha256|sha512} encryption {3des|aes128|aes192|aes256} group {2|5|14|15|16|18}`  
`no transform <1-255>`

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| <1-255>   | Transform priority (1 is the highest)                                      |
| sha1      | Secure Hash Standard with 160-bit digest size                              |
| sha256    | Secure Hash Standard with 256-bit digest size                              |
| sha512    | Secure Hash Standard with 512 bit digest size                              |
| 3des      | Triple DES symmetric key block cipher with a 168-bit key                   |

| aes192    | Advanced Encryption Standard symmetric key block cipher with a 192-bit key |
| aes256    | Advanced Encryption Standard symmetric key block cipher with a 256-bit key |
| group     | Diffie-Hellman group                                                       |
| 2         | 1024-bit MODP Group                                                        |
| 5         | 1536-bit MODP Group                                                        |
| 14        | 2048-bit MODP Group                                                        |
| 15        | 3072-bit MODP Group                                                        |
| 16        | 4096-bit MODP Group                                                        |
| 18        | 8192-bit MODP Group                                                        |

**Default** By default, an ISASMP profile has no transforms and so will not be active.

**Mode** ISAKMP Profile Configuration

**Examples** To create an ISAKMP profile transform, use the following commands:

```
awplus(config)# crypto isakmp profile my_profile
awplus(config-isakmp-profile)# transform 2 integrity sha1
encryption 3des group 5
```

To delete a created transform, use the following command:

```
awplus(config-isakmp-profile)# no transform 2
```

**Related  
Commands** [crypto isakmp profile](#)

# tunnel destination (IPsec)

**Overview** Use this command to specify a destination IPv4 or IPv6 address or destination network name for the remote end of the tunnel.

Use the **no** variant of this command to remove a configured tunnel destination address.

**Syntax** tunnel destination {<WORD>|<ipv4-address>|<ipv6-address>}  
no tunnel destination {<WORD>|<ipv4-address>|<ipv6-address>}

| Parameter      | Description                                                                                                                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <WORD>         | Destination network name or "dynamic". The "dynamic" parameter allows you to specify a dynamic IP address for the remote endpoint. The dynamic IP address can be obtained, for example, via DHCP. |
| <ipv4-address> | Destination IPv4 address. The IPv4 address uses the format A.B.C.D.                                                                                                                               |
| <ipv6-address> | Destination IPv6 address. The IPv6 address uses the format X:X::X:X.                                                                                                                              |

**Mode** Interface Configuration

**Examples** To configure a destination IPv4 address for IPsec tunnel145, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel145
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel destination 192.0.3.1
```

To configure a destination IPv6 address for IPsec tunnel145, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel145
awplus(config-if)# tunnel mode ipsec ipv6
awplus(config-if)# tunnel destination 2001:0db8::
```

To configure a destination network name for IPsec tunnel145, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel145
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel destination www.z.com
```

To configure a dynamic IP address for the tunnel destination, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel145
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel destination dynamic
```

To remove the destination address of IPsec tunnel145, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel145
awplus(config-if)# no tunnel destination 192.0.3.1
```

**Related  
Commands** [tunnel source \(IPsec\)](#)

# tunnel local name (IPsec)

**Overview** Use this command to specify an IPsec tunnel hostname to send to the peer for authentication when you apply [tunnel protection ipsec \(IPsec\)](#) to encrypt the packets and configure an ISAKMP key.

Use the **no** variant of this command to remove a previously configured IPsec tunnel hostname.

**Syntax** tunnel local name *<local-name>*  
no tunnel local name

| Parameter                 | Description             |
|---------------------------|-------------------------|
| <i>&lt;local-name&gt;</i> | Source tunnel hostname. |

**Default** The default tunnel local name is the IP address of tunnel source.

**Mode** Interface Configuration

**Examples** To configure the tunnel local name office1 for tunnel6, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel local name office1
```

To remove a configured tunnel local name for tunnel6, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel local name
```

**Related Commands** [tunnel remote name \(IPsec\)](#)

# tunnel local selector

**Overview** Use this command to specify a local subnet for a traffic selector pair.

Use the **no** variant of this command to unset the local subnet for the traffic selector pair so that it matches all sources, i.e. 0.0.0.0/0 or ::/0 for IPv4 and IPv6, respectively. When local and remote subnets for a traffic selector pair are both unset, the traffic selector pair is removed.

**Syntax** tunnel local selector [*<traffic-selector-ID>*]  
{*<ipv4-subnet>*|*<ipv6-subnet>*}  
no tunnel local selector [*<traffic-selector-ID>*]

| Parameter                          | Description                                                          |
|------------------------------------|----------------------------------------------------------------------|
| <i>&lt;traffic-selector-ID&gt;</i> | Optional traffic selector ID from 1 through 65535. The default is 1. |
| <i>&lt;ipv4-subnet&gt;</i>         | IPv4 subnet in the format A.B.C.D/M.                                 |
| <i>&lt;ipv6-subnet&gt;</i>         | IPv6 subnet in the format of X:X::X:X/M                              |

**Default** When no traffic selector pairs are configured there is an implicit traffic selector pair, where the local and remote subnets are 0.0.0.0/0 or ::/0 depending on the tunnel IPsec mode.

**Mode** Interface configuration

**Usage** A traffic selector pair is an agreement between IKE peers to permit traffic through a tunnel if the traffic matches a specified pair of local and remote subnets. When the local selector is specified but the remote selector is not, the selector pair implicitly matches all destinations.

**Examples** To specify an IPv4 destination address as the traffic selector for the traffic to match for tunnel0, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel source eth1
awplus(config-if)# tunnel destination 10.0.0.2
awplus(config-if)# tunnel local name office
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel local selector 192.168.1.0/24
awplus(config-if)# tunnel remote selector 192.168.2.0/24
```

To configure an additional source and destination traffic selector pair for the traffic to match for tunnel0, use the commands:

```
awplus(config-if)# tunnel local selector 5 192.168.1.0/24
awplus(config-if)# tunnel remote selector 5 192.168.2.0/24
```

To specify an IPv6 source address as the traffic selector for the traffic to match for tunnel0, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel source eth1
awplus(config-if)# tunnel destination 2001:db8:10::1
awplus(config-if)# tunnel local name office
awplus(config-if)# tunnel mode ipsec ipv6
awplus(config-if)# tunnel local selector 2001:db8:1::/64
awplus(config-if)# tunnel remote selector 2001:db8:2::/64
```

To configure an additional source and destination traffic selector pair for the traffic to match for tunnel0, use the commands:

```
awplus(config-if)# tunnel local selector 5 2001:db8:1::/64
awplus(config-if)# tunnel remote selector 5 2001:db8:2::/64
```

To unset the destination traffic selector for the traffic selector pair with ID 1, for tunnel 6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel remote selector

or

awplus(config-if)# no tunnel remote selector 1
```

**Related Commands** [tunnel remote selector](#)  
[show interface tunnel \(IPsec\)](#)

# tunnel mode (IPsec)

**Overview** Use this command to configure the encapsulation tunneling mode to use.

Use the **no** variant of this command to remove an established tunnel.

**Syntax** tunnel mode {gre [ipv6]|ipsec {ipv4|ipv6}|l2tp v3  
[ipv6]|openvpn {tap|tun}}  
no tunnel mode

| Parameter    | Description                                                                         |
|--------------|-------------------------------------------------------------------------------------|
| gre          | GRE IPv4 or IPv6 as the payload over IPv4 tunneling. IPv4 is the delivery protocol. |
| gre ipv6     | GRE IPv4 or IPv6 as the payload over IPv6 tunneling. IPv6 is the delivery protocol. |
| ipsec ipv4   | IPv4 IPsec tunnel                                                                   |
| ipsec ipv6   | IPv6 IPsec tunnel                                                                   |
| l2tp v3      | Layer 2 Tunneling Protocol version 3. By default, IPv4 is the deliver protocol.     |
| l2tp v3 ipv6 | Set IPv6 as the deliver protocol for L2TPv3                                         |
| openvpn      | OpenVPN tunneling mode                                                              |
| openvpn tap  | OpenVPN TAP mode                                                                    |
| openvpn tun  | OpenVPN TUN mode                                                                    |

**Default** Virtual tunnel interfaces have no mode set.

**Mode** Interface Configuration

**Usage** A tunnel will not become operational until it is configured with this command.

**Examples** To configure IPsec in IPv4 tunnel mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel mode ipsec ipv4
```

To remove configured IPsec tunnels for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel mode
```

# tunnel protection ipsec (IPsec)

**Overview** Use this command to enable IPsec protection for packets encapsulated by this tunnel.

Use the **no** variant to disable IPsec protection.

**Syntax** tunnel protection ipsec [profile <profile\_name>]  
no tunnel protection ipsec

**Default** IPsec protection for packets encapsulated by tunnel is disabled. If no custom profile is specified, the default profile is used.

| Parameter      | Description                                                                                                  |
|----------------|--------------------------------------------------------------------------------------------------------------|
| <profile_name> | Custom profile name. You can use the <a href="#">crypto ipsec profile</a> command to create custom profiles. |

**Mode** Interface Configuration

**Usage** IPsec mode tunnels (IPv4 and IPv6) require this command for them to work. GRE IPv6 and L2TPv3 IPv6 tunnel have IPsec protection as an option.

**Examples** To enable IPsec protection by using default profile, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel14
awplus(config-if)# tunnel protection ipsec
```

To enable IPsec protection by using a custom profile, use the following commands:

```
awplus(config)# interface tunnel14
awplus(config-if)# tunnel protection ipsec profile
my_profile
```

To disable IPsec protection for packets encapsulated by tunnel14, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel14
awplus(config-if)# no tunnel protection ipsec
```

**Related Commands** [crypto ipsec profile](#)

# tunnel remote name (IPsec)

**Overview** Use this command to specify a tunnel remote name to authenticate the tunnel's remote peer device when you apply [tunnel protection ipsec \(IPsec\)](#) to encrypt the packets and configure an ISAKMP key.

Use the **no** variant of this command to remove a previously configured tunnel remote name.

**Syntax** tunnel remote name *<remote-name>*  
no tunnel local name

| Parameter                  | Description                 |
|----------------------------|-----------------------------|
| <i>&lt;remote-name&gt;</i> | Destination tunnel hostname |

**Default** The default tunnel remote name is the IP address of tunnel destination.

**Mode** Interface Configuration

**Examples** To configure tunnel remote name *office2* for *tunnel6*, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel remote name office2
```

To remove a configured tunnel local name for *tunnel6*, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel remote name
```

**Related Commands** [tunnel local name \(IPsec\)](#)

# tunnel remote selector

**Overview** Use this command to specify a destination subnet for a traffic selector pair.

Use the **no** variant of this command to unset the remote subnet for a traffic selector pair so that it matches all destinations, i.e. 0.0.0.0/0 or ::/0 for IPv4 and IPv6, respectively. When local and remote subnets for a traffic selector pair are both unset, the traffic selector pair is removed.

**Syntax** tunnel remote selector [<traffic-selector-ID>]  
{<IPv4-subnet>|<IPv6-subnet>}  
  
no tunnel remote selector [<traffic-selector-ID>]

| Parameter             | Description                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------|
| <traffic-selector-ID> | Traffic selector ID from 1 through 65535. If not specified the default value 1 is used. |
| <ipv4-subnet>         | IPv4 subnet in the format A.B.C.D/M.                                                    |
| <ipv6-subnet>         | IPv6 subnet in the format of X:X::X/M                                                   |

**Default** When no traffic selector pairs are configured there is an implicit traffic selector pair, where the local and remote subnets are 0.0.0.0/0 or ::/0 depending on the tunnel IPsec mode.

**Mode** Interface configuration

**Usage** A traffic selector pair is an agreement between IKE peers to permit traffic through a tunnel if the traffic matches a specified pair of local and remote subnets. When the remote selector is specified but the local selector is not, the selector pair implicitly matches all sources.

**Examples** To specify an IPv4 destination address as the traffic selector for the traffic to match for tunnel0, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel source eth1
awplus(config-if)# tunnel destination 10.0.0.2
awplus(config-if)# tunnel local name office
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel local selector 192.168.1.0/24
awplus(config-if)# tunnel remote selector 192.168.2.0/24
```

When no traffic selector ID is specified the default ID value is used. By specifying a traffic selector ID, additional selector pairs can be configured.

To configure an additional source and destination traffic selector pair for the traffic to match for tunnel0, use the commands:

```
awplus(config-if)# tunnel local selector 5 192.168.1.0/24
awplus(config-if)# tunnel remote selector 5 192.168.2.0/24
```

To specify an IPv6 source address as the traffic selector for the traffic to match for tunnel0, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel source eth1
awplus(config-if)# tunnel destination 2001:db8:10::1
awplus(config-if)# tunnel local name office
awplus(config-if)# tunnel mode ipsec ipv6
awplus(config-if)# tunnel local selector 2001:db8:1::/64
awplus(config-if)# tunnel remote selector 2001:db8:2::/64
```

To configure an additional source and destination traffic selector pair for the traffic to match for tunnel0, use the commands:

```
awplus(config-if)# tunnel local selector 5 2001:db8:1::/64
awplus(config-if)# tunnel remote selector 5 2001:db8:2::/64
```

To unset the destination traffic selector for the traffic selector pair with ID 1, for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel remote selector
```

or

```
awplus(config-if)# no tunnel remote selector 5
```

**Related Commands** [tunnel local selector](#)  
[show interface tunnel \(IPsec\)](#)

# tunnel source (IPsec)

**Overview** Use this command to specify an IPv4 or IPv6 source address or interface name for packets being encapsulated in the IPsec tunnel. The source address should be an existing IPv4 address or IPv6 address or interface name configured for an interface.

Note that if the tunnel source interface has multiple IP addresses, for example, one primary and one or more secondary IP addresses, the lowest IP address on the interface is used for transporting the tunnel encapsulated traffic.

Use the **no** variant of this command to remove a tunnel source address for a tunnel interface.

**Syntax** `tunnel source {<interface-name>|<ipv4-address>|<ipv6-address>}`  
`no tunnel source`  
`{<interface-name>|<ipv4-address>|<ipv6-address>}`

| Parameter                         | Description                                |
|-----------------------------------|--------------------------------------------|
| <code>&lt;interface&gt;</code>    | Interface name.                            |
| <code>&lt;ipv4-address&gt;</code> | The IPv4 address uses the format A.B.C.D.  |
| <code>&lt;ipv6-address&gt;</code> | The IPv6 address uses the format X:X::X:X. |

**Mode** Interface Configuration

**Examples** To configure a source IPv4 address for IPsec tunnel145, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel145
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel source 192.168.1.1
```

To configure a source IPv6 address for IPsec tunnel145, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel145
awplus(config-if)# tunnel mode ipsec ipv6
awplus(config-if)# tunnel source 2001:db8::
```

To configure a source interface for IPsec tunnel145, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel145
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel source eth1
```

To remove the source address of IPsec tunnel145, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel145
awplus(config-if)# no tunnel source 192.168.1.1
```

**Related  
Commands** [tunnel destination \(IPsec\)](#)

# undebg isakmp

**Overview** Use this command to disable debugging ISAKMP.

To enable debugging ISAKMP, see [debug isakmp](#).

**Syntax** undebg [crypto] isakmp [info|trace|all]

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| undebg    | Disable debugging function.                                                                                           |
| crypto    | Security specific command.                                                                                            |
| isakmp    | Internet Security Association Key Management Protocol provides a common framework for key management implementations. |
| info      | Informational debug messages such as protocol events.                                                                 |
| trace     | Verbose debug messages including protocol events and message traces.                                                  |
| all       | All debug enabled.                                                                                                    |

**Mode** Privileged Exec

**Related Commands** [debug isakmp](#)  
[no debug isakmp](#)

# version (ISAKMP)

**Overview** Use this command to set the ISAKMP protocol version.  
Use the **no** variant to set the protocol version to default (IKEv2).

**Syntax** `version {1 mode {aggressive|main}|2}`  
`no version`

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                           |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1          | IKEv1                                                                                                                                                                                                                                                                                                                                                                                 |
| main       | IKEv1 Main mode. An IKE session begins with the initiator and recipient sending three two-way exchanges to define what encryption and authentication protocols are acceptable, how long keys should remain active, and whether perfect forward secrecy should be enforced. Main mode uses more packets for the process than Aggressive mode, but Main mode is considered more secure. |
| aggressive | IKEv1 Aggressive mode. The initiator and recipient accomplish the same objectives, but in only two exchanges.                                                                                                                                                                                                                                                                         |
| 2          | IKEv2                                                                                                                                                                                                                                                                                                                                                                                 |

**Default** If you do not specify the version, the default version is IKEv2

**Mode** IPsec ISAKMP Configuration

**Examples** To set the ISAKMP protocol version of profile "my\_profile" to IKEv1 main mode, use the following commands:

```
awplus(config)# configure isakmp profile my_profile
awplus(config-isakmp-profile)# version 1 mode main
```

To set the version to its default, use the following command:

```
awplus# no version
```

# crypto isakmp key

**Overview** Use this command to configure a pre-shared authentication key.

Pre-shared key authentication uses optionally encrypted shared keys identified by hostname, IPv4 or IPv6 address. Pre-shared keys are not viewable and stored encrypted in the running-configuration.

You must configure this key whenever you specify pre-shared keys in an (Internet Key Exchange) IKE policy and at both peers.

To use the **no** variant to remove a previously created pre-shared key.

**Syntax** `crypto isakmp key [8] <key> {hostname <host-name>|address <ipv4-addr>|<ipv6-addr>}`  
`no crypto isakmp key [8] <key> {hostname <host-name>|address <ipv4-addr>|<ipv6-addr>}`

| Parameter   | Description                                                                                                           |
|-------------|-----------------------------------------------------------------------------------------------------------------------|
| crypto      | Security specific command.                                                                                            |
| isakmp      | Internet Security Association Key Management Protocol provides a common framework for key management implementations. |
| key         | Pre-shared key.                                                                                                       |
| <key>       | Specify the pre-shared key. Us any combination of alphanumeric characters up to 128 bytes.                            |
| 8           | Specifies that an encrypted key follows.                                                                              |
| <host-name> | Destination hostname.                                                                                                 |
| <ipv4-addr> | Destination IPv4 address. The IPv4 address uses the format A.B.C.D.                                                   |
| <ipv6-addr> | Destination IPv6 address. The IPv4 address uses the format X:X::X:X.                                                  |

**Default** ISAKMP keys do not exist.

**Mode** Global Configuration

**Examples** To configure a pre-shared authentication key for a destination host, use the commands below:

```
awplus# configure terminal
awplus(config)# crypto isakmp key friend hostname
mypeer@my.domain.com
```

To configure a pre-shared authentication key at a peer with IPv4 address, use the commands below:

```
awplus# configure terminal
awplus(config)# crypto isakmp key friend address
192.168.1.1
```

To configure a pre-shared encrypted authentication key at a peer with IPv4 address, use the commands below:

```
awplus# configure terminal
awplus(config)# crypto isakmp key 8 Nhe6ioQmzbysQaJr6Du+cA==
address
192.168.1.2
```

To remove a pre-shared key at a peer, use the commands below:

```
awplus# configure terminal
awplus(config)# no crypto isakmp key friend hostname
mypeer@my.domain.com
```

# interface tunnel

**Overview** Use this command to create a tunnel interface. Tunnel interfaces are identified by an index identifier that is an integer in the range from 0 through 255. Note that the **tunnel mode** command is needed to enable the tunnel.

Use the **no** variant of this command to remove a previously created tunnel interface.

**Syntax** `interface tunnel<0-255>`  
`no interface tunnel<tunnel-index>`

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| <0-255>   | Specify a tunnel interface index identifier in the range from 0 through 255. |

**Default** Tunnel interfaces do not exist.

**Mode** Global Configuration

**Usage** This command creates a new tunnel interface to configure in Global Configuration mode.

This command is also used to enter Interface Configuration mode for existing tunnel interfaces.

**Examples** To configure a tunnel interface with index 30 and enable GRE, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel30
awplus(config-if)# tunnel mode gre
```

To remove the GRE tunnel interface tunnel30, use the commands:

```
awplus# configure terminal
awplus(config)# no interface tunnel30
```

# ip address (GRE)

**Overview** This command sets a static IP address on a tunnel interface. To set the primary IP address on the interface, specify only **ip address**<ip-address/m>. This overwrites any configured primary IP address. To add additional IP addresses on this interface, use the **secondary** parameter. You must configure a primary address on the interface before configuring a secondary address. The secondary address should not be the same as the primary address.

**NOTE:** Use **show running-config interface** not **show ip interface brief** when you need to view a secondary address configured on an interface. **show ip interface brief** will only show the primary address not a secondary address for an interface.

The **no** variant of this command removes the IP address from the tunnel interface. You cannot remove the primary address when a secondary address is present.

**Syntax** ip address <ip-addr/prefix-length> [secondary] [label <label>]  
no ip address <ip-addr/prefix-length> [secondary]  
no ip address

| Parameter               | Description                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------|
| <ip-addr/prefix-length> | The IPv4 address and prefix length you are assigning to the tunnel interface.                                    |
| <label>                 | A user-defined description of the secondary IP address. Valid characters are any printable character and spaces. |

**Mode** Interface Configuration

**Examples** To add the primary IP address 172.16.1.1/24 to the tunnel interface tunnel20, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel20
awplus(config-if)# ip address 172.16.1.1/24
```

To add the secondary IP address 172.16.2.1/24 to the same tunnel interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel20
awplus(config-if)# ip address 172.168.2.1/24 secondary
```

To remove the secondary IP address 172.16.2.1/24, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel20
awplus(config-if)# no ip address 172.168.2.1/24 secondary
```

**Related  
Commands**    interface tunnel  
                  show ip interface  
                  show running-config interface

# ip tcp adjust-mss

**Overview** Use this command to set the Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

**Syntax** `ip tcp adjust-mss {<mss-size>|pmtu}`  
`no ip tcp adjust-mss`

| Parameter                     | Description                                                            |
|-------------------------------|------------------------------------------------------------------------|
| <code>&lt;mss-size&gt;</code> | <code>&lt;64-1460&gt;</code> Specifies the MSS size in bytes.          |
| <code>pmtu</code>             | Adjust TCP MSS automatically with respect to the MTU on the interface. |

**Default** The default setting allows a TCP server or a TCP client to set the MSS value for itself.

**Mode** Interface Configuration

**Usage** When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPPoE
- Ethernet
- VTI Tunnels (IPsec, GRE, IPv6, L2TP, OpenVPN)
- VLAN

**Examples** To configure an MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip tcp adjust-mss 1452
```

To configure an MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip tcp adjust-mss 1452
```

To restore the MSS size to the default size on PPP interface `ppp0`, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip tcp adjust-mss
```

**Related  
Commands**

[mtu \(PPP\)](#)  
[show interface](#)  
[show interface \(PPP\)](#)  
[show interface tunnel \(GRE\)](#)

# ipv6 address (GRE)

**Overview** Use this command to set an IPv6 address on a tunnel interface and enable IPv6. Use the optional **eui64** parameter to derive the interface identifier of the IPv6 address from the MAC address of the first Ethernet port.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

**Syntax** `ipv6 address <ipv6-addr/prefix-length> [eui64]`  
`no ipv6 address <ipv6-addr/prefix-length> [eui64]`

| Parameter                                    | Description                                                                                                                                                                                                                                                                  |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specifies an IPv6 address. The IPv6 address uses the format X:X::X/prefix-length.                                                                                                                                                                                            |
| <code>eui64</code>                           | Specifies the lower 64 bits of the IPv6 address from the eui64 interface identifier (EUI - Extended Unique Identifier). EUI-64 identifiers are used as the least significant 64 bits of a unicast network address or a link-local address using stateless autoconfiguration. |

**Mode** Interface Configuration

**Usage** If the **eui64** parameter is specified then the lower 64 bits of the IPv6 address are replaced with the same address that would be acquired through stateless address autoconfiguration (SLAAC) if the device received an RA (Router Advertisement) specifying this prefix. See [ipv6 address autoconfig](#) for a detailed command description and examples to enable and disable SLAAC.

Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them. See the [ipv6 enable](#) command for more information.

Also note that the link-local address is retained in the system if the global address is removed using another command, which was not used to establish the link-local address. For example, if a link local address is established with the [ipv6 enable](#) command then it will not be removed using a **no ipv6 address** command.

**Example** To assign the IPv6 address 2001:0db8::a2/64 to the tunnel interface `tunnel2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address 2001:0db8::a2/64 from the tunnel interface `tunnel2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

To assign the **eui64** derived address in the prefix 2001:db8::/48 to tunnel interface `tunnel2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# ipv6 address 2001:0db8::/48 eui64
```

To remove the **eui64** derived address in the prefix 2001:db8::/48 from tunnel interface `tunnel2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no ipv6 address 2001:0db8::/48 eui64
```

**Validation commands** [show running-config](#)

# ipv6 tcp adjust-mss

**Overview** Use this command to set the IPv6 Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

**Syntax** `ip tcp adjust-mss {<mss-size>|pmtu}`  
`no ip tcp adjust-mss`

| Parameter                     | Description                                                            |
|-------------------------------|------------------------------------------------------------------------|
| <code>&lt;mss-size&gt;</code> | <code>&lt;64-1460&gt;</code> Specifies the MSS size in bytes.          |
| <code>pmtu</code>             | Adjust TCP MSS automatically with respect to the MTU on the interface. |

**Default** The default setting allows a TCP server or a TCP client to set the MSS value for itself.

**Mode** Interface Configuration

**Usage** When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPPoE
- Ethernet
- VTI Tunnels (IPSec, GRE, IPv6, L2TP, OpenVPN)
- VLAN

**Examples** To configure an IPv6 MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 tcp adjust-mss 1452
```

To configure an IPv6 MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip tcp adjust-mss 1452
```

To restore the MSS size to the default size on PPP interface `ppp0`, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip tcp adjust-mss
```

**Related  
Commands**

[mtu \(PPP\)](#)  
[show interface](#)  
[show interface \(PPP\)](#)  
[show interface tunnel \(GRE\)](#)

# show interface tunnel (GRE)

**Overview** Use this command to display status information of tunnels.

The tunnel remains inactive if no valid tunnel source or tunnel destination is configured.

**Syntax** `show interface tunnel<tunnel-index>`

| Parameter | Description                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| tunnel    | Specify this parameter to display tunnel status information of a given tunnel identified by the <0-255> parameter. |
| <0-255>   | Specify a tunnel index in the range from 0 through 255.                                                            |

**Mode** Privileged Exec

**Example** To display status information for GRE tunnel tunnel20, use the command:

```
awplus# show interface tunnel20
```

Figure 70-1: Example output from the **show interface tunnel** command

```
awplus#show interface tunnel20
Interface tunnel20
 Link is UP, administrative state is UP
 Hardware is Tunnel
 IPv4 address 172.16.1.1/24 pointopoint 172.16.1.255

```

# show isakmp key (GRE)

**Overview** Use this command to show the ISAKMP pre-shared key. Pre-shared key authentication using optionally encrypted shared keys identified by hostname, IPv4 or IPv6 address. Pre-shared keys are not viewable and stored encrypted in the running-configuration.

**Syntax** `show [crypto] isakmp key`

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| crypto    | Security specific command.                                                                                            |
| isakmp    | Internet Security Association Key Management Protocol provides a common framework for key management implementations. |
| key       | Pre-shared key.                                                                                                       |

**Mode** Privileged Exec

**Examples** To show ISAKMP pre-shared key, enter the command below:

```
awplus# show isakmp key
```

**Output** Figure 70-2: Example output from the **show isakmp key** command

```
awplus#show isakmp key
Hostname/IP address Key
10.2.0.10 mytunnelkey
```

# tunnel checksum

**Overview** Use this command to enable GRE tunnel checksum insertion and checking. This results in the first two bytes after the protocol field in the IPv4 header containing the checksum. The tunnel checksum is used to detect packet corruption.

Use the **no** variant of this command to disable checksum insertion and checking.

**Syntax** tunnel checksum  
no tunnel checksum

**Default** Checksum insertion and checking is disabled.

**Mode** Interface Configuration

**Examples** To enable checksum insertion and checking, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel checksum
```

To disable checksum insertion and checking, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel checksum
```

# tunnel dscp

**Overview** Use this command to configure the Differentiated Services Code Point (DSCP) value for the DSCP field in the packet header that encapsulates the tunneled packets.

Use the **no** variant of this command to reset the DSCP field to its default value.

**Syntax** tunnel dscp <0-63>  
no tunnel dscp

| Parameter | Description                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------|
| <0-63>    | Specify the DSCP value in the range from 0 through 63 for the DSCP field in the packet header that encapsulates the tunneled packets. |

**Default** The IPv4 DSCP field value is inherited from the inner header to the outer header.

**Mode** Interface Configuration

**Examples** To configure the DSCP value to 10 for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel dscp 10
```

To remove a configured DSCP value for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel dscp
```

**Related commands** interface tunnel  
tunnel mode (GRE)

# tunnel destination (GRE)

**Overview** Use this command to specify a tunnel destination for the remote end of the tunnel. Tunnel destination can be specified by using a destination network name or an IPv4 address.

Use the **no** variant of this command to remove a configured tunnel destination.

**Syntax** tunnel source {<ipv4-addr>|<destination-network-name>}  
no tunnel destination

| Parameter                            | Description                                                                                                                                                                                                                                                                  |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv4-addr>                          | Specify the tunnel destination IPv4 address in the dotted decimal format A.B.C.D.<br>The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint. |
| <destination-network-name><br>-<br>> | Destination network name.<br>If the destination network name cannot be resolved, then the GRE tunnel remains inactive.                                                                                                                                                       |

**Mode** Interface Configuration

**Examples** To configure an IPv4 tunnel destination by using an IPv4 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel destination 2.2.2.2
```

To configure a GRE tunnel destination by using a destination network name, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel destination
corporate_lan.example.com
```

To remove a GRE tunnel destination, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# no tunnel destination
```

**Related commands** [interface tunnel](#)  
[tunnel mode \(GRE\)](#)  
[tunnel source \(GRE\)](#)

# tunnel local name (GRE)

**Overview** Use this command to specify an IPsec tunnel hostname to send to the peer for authentication when you apply [tunnel protection ipsec \(GRE\)](#) to encrypt the packets and configure an ISAKMP key.

Use the **no** variant of this command to remove a previously configured IPsec tunnel hostname.

**Syntax** tunnel local name *<local-name>*  
no tunnel local name

| Parameter                 | Description             |
|---------------------------|-------------------------|
| <i>&lt;local-name&gt;</i> | Source tunnel hostname. |

**Default** The default tunnel local name is the IP address of tunnel source.

**Mode** Interface Configuration

**Examples** To configure the tunnel local name office1 for tunnel6, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel local name office1
```

To remove a configured tunnel local name for tunnel6, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel local name
```

**Related Commands** [tunnel remote name \(GRE\)](#)

# tunnel mode (GRE)

**Overview** Use this command to configure the encapsulation tunneling mode to use.

Use the **no** variant of this command to remove an established tunnel.

**Syntax** tunnel mode {gre [ipv6]|ipsec {ipv4|ipv6}|l2tp v3 [ipv6]|openvpn {tap|tun}}

no tunnel mode

| Parameter    | Description                                                                         |
|--------------|-------------------------------------------------------------------------------------|
| gre          | GRE IPv4 or IPv6 as the payload over IPv4 tunneling. IPv4 is the delivery protocol. |
| gre ipv6     | GRE IPv4 or IPv6 as the payload over IPv6 tunneling. IPv6 is the delivery protocol. |
| ipsec ipv4   | IPv4 IPsec tunnel                                                                   |
| ipsec ipv6   | IPv6 IPsec tunnel                                                                   |
| l2tp v3      | Layer 2 Tunneling Protocol version 3. By default, IPv4 is the deliver protocol.     |
| l2tp v3 ipv6 | Set IPv6 as the deliver protocol for L2TPv3                                         |
| openvpn tap  | OpenVPN TAP mode                                                                    |
| openvpn tun  | OpenVPN TUN mode                                                                    |

**Default** Virtual tunnel interfaces have no mode set.

**Mode** Interface Configuration

**Usage** A tunnel will not become operational until it is configured with this command.

**Examples** To configure GRE as the encapsulation mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode gre
```

To remove a configured GRE tunnel for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel mode
```

**Related commands** [interface tunnel](#)

# tunnel protection ipsec (GRE)

**Overview** Use this command to optionally enable IPsec protection for packets encapsulated by this tunnel.

Use the **no** variant to disable IPsec protection.

**Syntax** tunnel protection ipsec  
no tunnel protection ipsec

**Default** IPsec protection for packets encapsulated by tunnel is disabled.

**Mode** Interface Configuration

**Usage** You also need to configure a pre-shared key in conjunction with this command. See the [crypto isakmp key](#) command for more information about configuring the pre-share key.

**Examples** To enable IPsec protection for packets encapsulated by tunnel14, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel14
awplus(config-if)# tunnel protection ipsec
```

To disable IPsec protection for packets encapsulated by tunnel14, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel14
awplus(config-if)# no tunnel protection ipsec
```

# tunnel remote name (GRE)

**Overview** Use this command to specify a tunnel remote name to authenticate the tunnel's remote peer device when you apply [tunnel protection ipsec \(GRE\)](#) to encrypt the packets and configure an ISAKMP key.

Use the **no** variant of this command to remove a previously configured tunnel remote name.

**Syntax** tunnel remote name *<remote-name>*  
no tunnel local name

| Parameter                  | Description                 |
|----------------------------|-----------------------------|
| <i>&lt;remote-name&gt;</i> | Destination tunnel hostname |

**Default** The default tunnel remote name is the IP address of tunnel destination.

**Mode** Interface Configuration

**Examples** To configure tunnel remote name *office2* for *tunnel6*, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel remote name office2
```

To remove a configured tunnel local name for *tunnel6*, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel remote name
```

**Related Commands** [tunnel local name \(GRE\)](#)

# tunnel source (GRE)

**Overview** Use this command to specify a tunnel source for the tunnel interface. Tunnel source can be specified by using an interface name or an IPv4 address. The source address must be an existing IPv4 address configured for an interface.

Use the **no** variant of this command to remove a tunnel source for a tunnel interface.

**Syntax** tunnel source {<ipv4-addr>|<interface-name>}  
no tunnel source

| Parameter        | Description                                                                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv4-addr>      | Specify the tunnel source IPv4 address for the GRE tunnel interface in the dotted decimal format A.B.C.D. The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint. |
| <interface-name> | Available interface name. Any AlliedWare Plus interface type (eth, vlan, ppp, tunnel, lo and so on). Using interface name can minimize the number of user-configured IP addresses and allow the tunnel source IP address to be dynamically issued via, for example, DHCP.                         |

**Mode** Interface Configuration

**Examples** To configure a GRE tunnel source IPv4 address, use the commands:

```
awplus# configure terminal
awplus# interface eth1
awplus(config-if)# ip address 1.1.1.1/24
awplus(config-if)# interface tunnel1
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel source 1.1.1.1
```

To use an interface name as the tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel source eth2
```

To remove a GRE tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel1
awplus(config-if)# no tunnel source
```

**Related commands** interface tunnel  
tunnel destination (GRE)  
tunnel mode (GRE)

# tunnel ttl

**Overview** Use this command to configure the value to use for the Time to Live (TTL) field in the IPv4 header that encapsulates the tunneled IPv4 or IPv6 packets.

Use the **no** variant of this command to set the TTL value to its default.

**Syntax** tunnel ttl <1-255>  
no tunnel ttl

| Parameter | Description                   |
|-----------|-------------------------------|
| <1-255>   | TTL value from 1 through 255. |

**Default** The default TTL value is inherited from the encapsulated packet.

**Mode** Interface Configuration

**Example** To set the TTL value of the packet to 255, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel20
awplus(config-if)# tunnel ttl 255
```

To remove the configured TTL value of the packet, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel20
awplus(config-if)# no tunnel ttl
```

**Related commands** [interface tunnel](#)

## Introduction

This chapter provides an alphabetical reference of commands used to configure AlliedWare Plus OpenVPN.

For introductory information about AlliedWare Plus OpenVPN, including overview and configuration information, see the [OpenVPN Feature Overview and Configuration\\_Guide](#).

The table below lists the OpenVPN commands and their applicable modes.

Figure 71-1: OpenVPN commands and applicable modes

| Mode                    | Command                                      |
|-------------------------|----------------------------------------------|
| Privileged Exec         | <code>show openvpn connections</code>        |
|                         | <code>show openvpn connections detail</code> |
| Interface Configuration | <code>tunnel mode openvpn tap</code>         |
|                         | <code>tunnel mode openvpn tun</code>         |
|                         | <code>tunnel openvpn port</code>             |
|                         | <code>tunnel openvpn tagging</code>          |

- Command List**

# ip tcp adjust-mss

**Overview** Use this command to set the Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

**Syntax** `ip tcp adjust-mss {<mss-size>|pmtu}`  
`no ip tcp adjust-mss`

| Parameter                     | Description                                                            |
|-------------------------------|------------------------------------------------------------------------|
| <code>&lt;mss-size&gt;</code> | <code>&lt;64-1460&gt;</code> Specifies the MSS size in bytes.          |
| <code>pmtu</code>             | Adjust TCP MSS automatically with respect to the MTU on the interface. |

**Default** The default setting allows a TCP server or a TCP client to set the MSS value for itself.

**Mode** Interface Configuration

**Usage** When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPPoE
- Ethernet
- VTI Tunnels (IPsec, GRE, IPv6, L2TP, OpenVPN)
- VLAN

**Examples** To configure an MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip tcp adjust-mss 1452
```

To configure an MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip tcp adjust-mss 1452
```

To restore the MSS size to the default size on PPP interface `ppp0`, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip tcp adjust-mss
```

**Related  
Commands**

[mtu \(PPP\)](#)  
[show interface](#)  
[show interface \(PPP\)](#)  
[show interface tunnel \(GRE\)](#)

# ipv6 tcp adjust-mss

**Overview** Use this command to set the IPv6 Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

**Syntax** `ip tcp adjust-mss {<mss-size>|pmtu}`  
`no ip tcp adjust-mss`

| Parameter                     | Description                                                            |
|-------------------------------|------------------------------------------------------------------------|
| <code>&lt;mss-size&gt;</code> | <code>&lt;64-1460&gt;</code> Specifies the MSS size in bytes.          |
| <code>pmtu</code>             | Adjust TCP MSS automatically with respect to the MTU on the interface. |

**Default** The default setting allows a TCP server or a TCP client to set the MSS value for itself.

**Mode** Interface Configuration

**Usage** When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPPoE
- Ethernet
- VTI Tunnels (IPSec, GRE, IPv6, L2TP, OpenVPN)
- VLAN

**Examples** To configure an IPv6 MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 tcp adjust-mss 1452
```

To configure an IPv6 MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip tcp adjust-mss 1452
```

To restore the MSS size to the default size on PPP interface `ppp0`, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip tcp adjust-mss
```

**Related  
Commands**

[mtu \(PPP\)](#)  
[show interface](#)  
[show interface \(PPP\)](#)  
[show interface tunnel \(GRE\)](#)

# show interface tunnel (OpenVPN)

**Overview** Use this command to display status information of tunnels.

The tunnel remains inactive if no valid tunnel source or tunnel destination is configured.

**Syntax** `show interface tunnel<tunnel-index>`

| Parameter      | Description                                                                                                        |
|----------------|--------------------------------------------------------------------------------------------------------------------|
| tunnel         | Specify this parameter to display tunnel status information of a given tunnel identified by the <0-255> parameter. |
| <tunnel-index> | Specify a tunnel index in the range from 0 through 255.                                                            |

**Mode** Privileged Exec

**Examples** To display brief status information for OpenVPN tunnel0, enter the command below:

```
awplus# show interface tunnel0
```

**Output** Figure 71-2: Example output from the **show interface tunnel** command

```
awplus#show interface tunnel0
Interface tunnel0
 Link is UP, administrative state is UP
 Hardware is Tunnel
 IPv4 address 192.168.1.1/24 pointopoint 192.168.1.255
 IPv6 address 2001:db8:1::1/64
 IPv6 address fe80::200:cdff:fe38:111/64
 index 12 metric 1 mtu 1500
 <UP, POINTOPOINT, RUNNING, MULTICAST>
 SNMP link-status traps: Disabled
 Tunnel source UNKNOWN, destination UNKNOWN
 Tunnel name local AR3050S, remote UNKNOWN
 Tunnel ID local (not set), remote (not set)
 Tunnel protocol/transport openvpn tun, key disabled, sequencing disabled
 Tunnel TTL -
 Checksumming of packets disabled, path MTU discovery disabled
 input packets 0, bytes 0, dropped 0, multicast packets 0
 output packets 8, bytes 488, multicast packets 0 broadcast packets 0
 Time since last state change: 0 days 00:00:36
```

# show openvpn connections

**Overview** Use this command to show information about connected OpenVPN users.

**Syntax** show openvpn connections

**Mode** Privileged Exec

**Examples** To show information about connected OpenVPN users, use the command:

```
awplus# show openvpn connections
```

**Output** Figure 71-3: Example output from the **show openvpn connections** command

```
awplus#show openvpn connections

Maximum connections: 100

Interface: tunnel0

Username Real Address Rx Tx Bytes Bytes Connected
Since

foo ::ffff:192.168.1.2 3553 3906 Wed Aug 13
01:09:07 2014
```

**Related Commands** [show openvpn connections detail](#)

# show openvpn connections detail

**Overview** Use this command to show detailed information about connected OpenVPN users.

Note that in the output parameters (such as Route, Address, DNS Server) for a specific user may vary because the parameters depend on the configuration information of the RADIUS server associated with the user.

**Syntax** `show openvpn connections detail`

**Mode** Privileged Exec

**Examples** To show detailed information about connected OpenVPN users, use the command:

```
awplus# show openvpn connections detail
```

**Output** Figure 71-4: Example output from the **show openvpn connections detail** command

```
awplus#show openvpn connections detail

Interface: tunnel0
Username: user1
Route: 192.168.20.0 255.255.255.0 192.168.10.2
Address: 192.168.10.3 255.255.255.0
DNS Server: 192.168.10.253
DNS Server: 192.168.10.254
VID: 20
Username: user2
Route: 192.168.20.0 255.255.255.0 192.168.10.2
Address: 192.168.10.4 255.255.255.0
DNS Server: 192.168.10.253
DNS Server: 192.168.10.254
VID: 20
```

**Related Commands** [show openvpn connections](#)

# tunnel openvpn authentication

**Overview** Use this command to configure the data channel authentication digest for an OpenVPN tunnel.

Use the **no** variant of this command to set the data channel authentication digest for an OpenVPN tunnel to its default value of SHA1.

**Syntax** tunnel openvpn authentication {sha1|sha256}  
no tunnel openvpn authentication

| Parameter | Description                                                                                  |
|-----------|----------------------------------------------------------------------------------------------|
| aes128    | Use Secure Hash Standard with 160-bit digest size as the data channel authentication digest. |
| aes256    | Use Secure Hash Standard with 256-bit digest size as the data channel authentication digest. |

**Default** SHA1

**Mode** Interface configuration

**Usage** You need to configure the client to use the same setting as the server. To do this, include one of the following lines in your client's OpenVPN configuration (.ovpn) file:

| Setting | Line        |
|---------|-------------|
| SHA1    | auth SHA1   |
| SHA256  | auth SHA256 |

**Example** To configure tunnel 5, which is an OpenVPN tunnel, to use SHA256 data channel authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# tunnel openvpn authentication SHA256
```

**Related Commands** [tunnel openvpn cipher](#)

**Command changes** Version 5.4.7-0.1: command added

# tunnel openvpn cipher

**Overview** Use this command to configure the data channel encryption cipher for an OpenVPN tunnel.

Use the **no** variant of this command to set the data channel encryption cipher for an OpenVPN tunnel to its default value of AES-128.

**Syntax** tunnel openvpn cipher {aes128|aes256}  
no tunnel openvpn cipher

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| aes128    | Use Advanced Encryption Standard symmetric key block cipher with a 128-bit key as the data channel encryption cipher. |
| aes256    | Use Advanced Encryption Standard symmetric key block cipher with a 256-bit key as the data channel encryption cipher. |

**Default** AES-128

**Mode** Interface configuration

**Usage** You need to configure the client to use the same setting as the server. To do this, include one of the following lines in your client's OpenVPN configuration (.ovpn) file:

| Setting | Line               |
|---------|--------------------|
| AES-128 | cipher AES-128-CBC |
| AES-256 | cipher AES-256-CBC |

For example, consider a client file tun.ovpn that has the following settings:

```
tun.ovpn
client
auth-user-pass
cipher AES-128-CBC
dev tap
proto udp
remote 192.168.1.1
ca c:/users/support/cacert.pem
verb 7
```

To change the client to AES-256, replace the line "cipher AES-128-CBC" with "cipher AES-256-CBC".

**Example** To configure tunnel 5, which is an OpenVPN tunnel, to use AES-256 data channel encryption, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# tunnel openvpn cipher aes256
```

**Related Commands** [tunnel openvpn authentication](#)

**Command changes** Version 5.4.7-0.1: command added

# tunnel mode openvpn tap

**Overview** Use this command to set the tunnel mode to OpenVPN TAP for a tunnel interface.

Use the **no** variant of this command to remove the mode.

TAP is a virtual network device. TAP creates a Virtual Tunnel Interface (VTI) that carries layer 2 frames. You may want to use TAP in the following scenarios:

- You want to use bridges to transport Ethernet frames
- You want to transport any network protocol, such as IPv4, IPv6, IPX

Note that TAP will cause broadcast overhead on the VPN tunnel and add the overhead of Ethernet headers on all packets transported over the VPN tunnel.

Note that the distribution of client IP addresses through DHCP is only supported in TAP mode.

**Syntax** tunnel mode openvpn tap  
no tunnel mode

**Mode** Interface Configuration

**Examples** To set tunnel15 to be an OpenVPN tunnel in TAP mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel15
awplus(config-if)# tunnel mode openvpn tap
```

To remove tunnel mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel15
awplus(config-if)# no tunnel mode
```

**Related Commands** [tunnel mode openvpn tun](#)

# tunnel mode openvpn tun

**Overview** Use this command to set the tunnel mode to OpenVPN TUN for a tunnel interface.

Use the **no** variant of this command to remove the mode.

TUN is a virtual network device. TUN creates a Virtual Tunnel Interface (VTI) that carries layer 3 packets. You may want to use TUN in the following scenarios:

- You want to transport traffic that is destined for the VPN client
- You want to transport only layer 3 packets
- You want to support VPN on mobile devices

Note that TUN cannot be used in bridges and broadcast traffic is not transported in TUN mode.

**Syntax** tunnel mode openvpn tun  
no tunnel mode

**Mode** Interface Configuration

**Examples** To set tunnel15 to be an OpenVPN tunnel in TUN mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel15
awplus(config-if)# tunnel mode openvpn tun
```

To remove tunnel mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel15
awplus(config-if)# no tunnel mode
```

**Related Commands** [tunnel mode openvpn tap](#)

# tunnel openvpn expiry-bytes

**Overview** Use this command to change how the firewall decides when to renegotiate client keys. By default, client keys are renegotiated after an hour; you can use this command to base rekeying on data usage instead of time.

Use the **no** variant of this command to return to time-based rekeying instead.

**Syntax** `tunnel openvpn expiry-bytes <0-4294967295>`  
`no tunnel openvpn expiry-bytes`

| Parameter                                                      | Description                                                                                                                                                                                                                                                                                              |
|----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>expiry-bytes</code><br><code>&lt;0-4294967295&gt;</code> | The number of bytes of traffic after which the firewall renegotiates client keys. A value of 0 bytes means that keys are not renegotiated after the VPN is formed. Otherwise, setting the expiry-bytes to a non-zero value will cause a rekey when the firewall has received that many bytes of traffic. |

**Default** Not configured - the firewall renegotiates keys every hour instead.

**Mode** Interface mode for a tunnel

**Usage** If you intend to use more than 100 concurrent tunnels, we recommend you use this command to change to rekeying based on data usage per VPN tunnel instead of timer-based rekeying. Each VPN tunnel will then independently rekey once it reaches the data limit. This prevents all tunnels from rekeying at the same time.

**Example** To configure tunnel2 to rekey after 1Gbyte of traffic, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel openvpn expiry-bytes 1000000000
```

To return tunnel2 to the default of rekeying hourly, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel openvpn expiry-bytes
```

**Related Commands** [tunnel openvpn expiry-seconds](#)

**Command changes** Version 5.4.7-0.1: command added

# tunnel openvpn expiry-seconds

**Overview** Use this command to change when client keys are renegotiated. By default, client keys are renegotiated after an hour; you can use this command to turn off renegotiation or to change that time period.

Use the **no** variant of this command to return to the default of 1 hour.

**Syntax** tunnel openvpn expiry-seconds <0-4294967295>  
no tunnel openvpn expiry-seconds

| Parameter                        | Description                                                                                                                                                                                                                                                             |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| expiry-seconds<br><0-4294967295> | The length of time after which the firewall renegotiates client keys. A value of 0 seconds means that keys are not renegotiated after the VPN is formed. Otherwise, setting the expiry-seconds to a non-zero timer value will cause a rekey when that time is exceeded. |

**Default** 3600 seconds (1 hour).

**Mode** Interface mode for a tunnel

**Usage** If you intend to use more than 100 concurrent tunnels, we recommend you change to rekeying based on data usage per VPN tunnel instead of timer-based rekeying. Each VPN tunnel will then independently rekey once it reaches the data limit. This prevents all tunnels from rekeying at the same time. To rekey based on data usage per VPN, use the [tunnel openvpn expiry-bytes](#) command.

**Example** To configure tunnel2 to rekey every 30 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel openvpn expiry-seconds 1800
```

To return tunnel2 to the default of rekeying hourly, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel openvpn expiry-seconds
```

**Related Commands** [tunnel openvpn expiry-bytes](#)

**Command changes** Version 5.4.7-0.1: command added

# tunnel openvpn port

**Overview** Use this command to specify the UDP listening port that is used to receive OpenVPN tunnel connections.

Use the **no** variant to set the port number to its default value which is 1194.

**Syntax** tunnel openvpn port <1-65535>  
no tunnel openvpn port

| Parameter | Description                       |
|-----------|-----------------------------------|
| <1-65535> | Port number from 1 through 65535. |

**Default** The default UDP port number is 1194.

**Mode** Interface Configuration

**Usage** If firewall protection is enabled, you need to create a firewall rule that allows the OpenVPN application traffic to traverse the firewall. OpenVPN is a pre-defined application with destination port number 1194. You can use the [show application detail](#) command to see the application details. If you specify a UDP number that is different to the default port number, you need to create an application with the same specified UDP port number for OpenVPN, and then create a firewall rule to allow the application to traverse the firewall. For more information about firewall rules, see the [rule \(Firewall\)](#) command.

**Examples** To configure tunnel `tunnel15` to receive incoming tunnel connections on UDP port 4567, use the commands:

```
awplus(config)# interface tunnel15
awplus(config-if)# tunnel openvpn port 4567
```

To remove the specified UDP port for tunnel `tunnel15` and set the UDP port to its default value, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel15
awplus(config-if)# no tunnel openvpn port
```

# tunnel openvpn tagging

**Overview** This command configures an OpenVPN tunnel to add an 802.1Q tag (a VLAN ID) to traffic received over the tunnel. VLAN ID (VID) is a VLAN identifier that is used to determine which VLAN the traffic belongs to. The VID is determined from information received from the RADIUS server during the authentication process. If no VID information is received from the RADIUS server, the value specified in this command is used.

Use the **no** variant of this command to remove the VID over the tunnel.

Note that you can add an 802.1Q tag in the TAP mode only.

**Syntax** tunnel openvpn tagging <1-4094>  
no tunnel openvpn tagging

| Parameter | Description                 |
|-----------|-----------------------------|
| <1-4094>  | VLAN ID from 1 through 4094 |

**Mode** Interface Configuration

**Examples** To add a 802.1Q tag to packets received over tunnel `tunnel5`, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# tunnel openvpn tagging 1
```

To remove the 802.1Q tag over tunnel `tunnel5`, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# no tunnel openvpn tagging
```

# 72

# L2TP Commands

## Introduction

This chapter provides an alphabetical reference of commands used to configure L2TPv2 and L2TPv3 tunnels.

For introductory information about L2TPv3 in AlliedWare Plus, including overview and configuration information, see the [L2TPv3 Ethernet Pseudowire Feature Overview and Configuration Guide](#).

For introductory information about tunneling of PPP over L2TPv2 in AlliedWare Plus, including overview and configuration information, see the [L2TPv2 Feature Overview and Configuration Guide](#).

# crypto isakmp key

**Overview** Use this command to configure a pre-shared authentication key.

Pre-shared key authentication uses optionally encrypted shared keys identified by hostname, IPv4 or IPv6 address. Pre-shared keys are not viewable and stored encrypted in the running-configuration.

You must configure this key whenever you specify pre-shared keys in an (Internet Key Exchange) IKE policy and at both peers.

To use the no variant to remove a previously created pre-shared key.

**Syntax** `crypto isakmp key [8] <key> {hostname <host-name>|address {<ipv4-address>|<ipv6-address>}}`  
`no crypto isakmp key [8] <key> {hostname <host-name>|address {<ipv4-address>|<ipv6-address>}}`

| Parameter   | Description                                                                                                           |
|-------------|-----------------------------------------------------------------------------------------------------------------------|
| crypto      | Security specific command.                                                                                            |
| isakmp      | Internet Security Association Key Management Protocol provides a common framework for key management implementations. |
| key         | Pre-shared key.                                                                                                       |
| <key>       | Specify the pre-shared key. Us any combination of alphanumeric characters up to 128 bytes.                            |
| 8           | Specifies that an encrypted key follows.                                                                              |
| <host-name> | Destination hostname.                                                                                                 |
| <ipv4-addr> | Destination IPv4 address. The IPv4 address uses the format A.B.C.D.                                                   |
| <ipv6-addr> | Destination IPv6 address. The IPv4 address uses the format X:X::X:X.                                                  |

**Default** ISAKMP keys do not exist.

**Mode** Global Configuration

**Examples** To configure a pre-shared authentication key for a destination host, use the commands:

```
awplus#configure terminal
awplus(config)#crypto isakmp key friend hostname
mypeer@my.domain.com
```

To configure a pre-shared authentication key at a peer with IPv4 address, use the commands:

```
awplus#configure terminal
awplus(config)#crypto isakmp key friend address 192.168.1.1
```

To configure a pre-shared encrypted authentication key at a peer with IPv4 address, use the commands:

```
awplus#configure terminal
awplus(config)#crypto isakmp key 8 Nhe6ioQmzbysQaJr6Du+cA==
address 192.168.1.2
```

To remove a pre-shared key at a peer, use the commands:

```
awplus#configure terminal
awplus(config)#no crypto isakmp key friend hostname
mypeer@my.domain.com
```

# debug l2tp

**Overview** Use this command to enable debugging of L2TPv2 tunnels.  
Use the **no** variant of this command to disable debugging of L2TPv2 tunnels.

**Syntax** debug l2tp  
no debug l2tp  
undebug l2tp

**Default** Debugging of L2TPv2 tunnels is disabled by default.

**Mode** Privileged Exec

**Example** To enable debugging for L2TPv2 tunnels, use the commands:

```
awplus# debug l2tp
awplus# terminal monitor
% Warning: Console logging enabled
```

To disable debugging of L2TPv2 tunnels, use the command:

```
awplus# no debug l2tp
```

or the command:

```
awplus# undebug l2tp
```

**Related  
Commands** [debug pppoe-ac](#)  
[show debugging l2tp](#)

# destination

**Overview** Use this command to set the destination of an L2TP tunnel.

Use the **no** variant of this command to remove the destination from the L2TP tunnel.

**Syntax** `destination [<ipv4-addr>|<ipv6-addr>|<domain-name>]`  
`no destination`

| Parameter                        | Description                                                          |
|----------------------------------|----------------------------------------------------------------------|
| <code>&lt;ipv4-addr&gt;</code>   | The destination of the L2TP tunnel as an IPv4 address.               |
| <code>&lt;ipv6-addr&gt;</code>   | The destination of the L2TP tunnel as an IPv6 address.               |
| <code>&lt;domain-name&gt;</code> | The destination of the L2TP tunnel as a fully-qualified domain name. |

**Default** No destination is set by default.

**Mode** L2TP Tunnel Configuration

**Example** To set the destination IP address for tunnel1 to 10.1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# destination 10.1.1.1
```

To remove the destination IP address from tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no destination
```

**Related Commands**

- [encapsulation ppp](#)
- [ip-version](#)
- [l2tp tunnel](#)
- [show l2tp tunnel config-check](#)
- [show running-config l2tp-tunnel](#)
- [source](#)
- [version](#)

# encapsulation ppp

**Overview** Use this command to enable PPP encapsulation and create one or more PPP interfaces over Ethernet, a cellular interface, or a L2TPv2 managed VPN.

Use the **no** variant of this command to disable PPP encapsulation and remove the specified PPP interface.

**Syntax** encapsulation ppp <index>  
no encapsulation ppp <index>

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| <index>   | The PPP interface index number in the range from 0 to 255. |

**Default** No PPP encapsulation or interfaces are configured by default.

**Mode** Interface Configuration mode for an Ethernet interface (e.g. **interface eth1**), or an Ethernet sub-interface (e.g. **interface eth1.1**), or a cellular interface (e.g. **interface cellular0**).

L2TP Tunnel Configuration mode for an L2TP tunnel (e.g. **l2tp tunnel tunnel0**).

**Examples** To configure a PPP interface with index 0 for Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# encapsulation ppp 0
```

To shut down the ppp0 interface and remove it from Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# shutdown
awplus(config-if)# interface eth1
awplus(config-if)# no encapsulation ppp 0
```

To set the L2TP tunnel tunnel1 to encapsulate the PPP interface with index 1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# encapsulation ppp 1
```

To remove the PPP interface with index 1 from L2TP tunnel tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no encapsulation ppp 1
```

**Related  
Commands**

[l2tp tunnel](#)  
[ppp service-name \(PPPoE\)](#)  
[show interface \(PPP\)](#)

# ip-version

**Overview** Use this command to set the IP version for the L2TP tunnel.  
The IP version must be set to the same value at both ends of the tunnel.

**Syntax** `ip-version [4|6]`

| Parameter | Description |
|-----------|-------------|
| 4         | IPv4        |
| 6         | IPv6        |

**Default** The IP version is set to IPv4 by default.

**Mode** L2TP Tunnel Configuration

**Example** To set the IP version for tunnel1 to IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# ip-version 6
```

To set the IP version for tunnel1 to the default (IPv4), use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# ip-version 4
```

# l2tp tunnel

**Overview** Use this command to create a named L2TP tunnel, and to enter L2TP Tunnel Configuration mode to configure it.

Use the **no** variant of this command to remove the named tunnel and all of its configuration.

**Syntax** `l2tp tunnel <tunnel-name>`  
`no l2tp tunnel <tunnel-name>`

| Parameter                        | Description                                         |
|----------------------------------|-----------------------------------------------------|
| <code>&lt;tunnel-name&gt;</code> | The name of the tunnel to create, change or delete. |

**Default** No L2TP tunnel is configured by default.

**Mode** Global Configuration

**Example** To create and begin configuring a new L2TP tunnel named 'tunnel1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)#
```

To remove the tunnel 'tunnel1' and its configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no l2tp tunnel tunnel1
```

# l2tp unmanaged port

**Overview** Use this command to set the UDP port for an (IPv4 and IPv6) unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires).

This command can only change the UDP port when there is no unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires) configured.

Use the **no** variant of this command to reset the UDP port to the default (1701).

**Syntax** `l2tp unmanaged port [<1-65535>]`  
`no l2tp unmanaged port`

| Parameter | Description                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------|
| <1-65535> | The number of the UDP port to use for an unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires). |

**Default** The UDP port is 1701 by default.

**Mode** Global Configuration

**Usage** The default UDP port for both unmanaged and managed L2TP tunnels is 1701. If both kinds of tunnel will be configured, the UDP port for the unmanaged tunnel must be changed to a different port by using the **l2tp unmanaged port** command.

Be aware of potential clashes with other UDP port users. Unless it is likely to be used for other purposes, we recommend configuring UDP port 1702 as a suitable alternative.

**Example** To set the UDP port for an L2TP unmanaged tunnel (L2TPv3 Ethernet Pseudowires) to 1702, use the following commands:

```
awplus# configure terminal
awplus(config)# l2tp unmanaged port 1702
```

**Related Commands** [tunnel mode \(L2TPv3\)](#)  
[show running-config](#)

# l2tp-profile

**Overview** Use this command to create an L2TP profile and to enter the L2TP Profile Configuration mode.

Use the **no** variant of this command to remove the L2TP profile and all its configuration.

**Syntax** `l2tp-profile <name>`  
`no l2tp-profile <name>`

| Parameter                 | Description                                               |
|---------------------------|-----------------------------------------------------------|
| <code>&lt;name&gt;</code> | The name of the L2TP profile being created or configured. |

**Default** No L2TP profile is configured by default. This command is not configured by default.

**Mode** Global Configuration

**Example** To create a L2TP profile named "public", use the commands:

```
awplus# configure terminal
awplus(config)# l2tp-profile public
awplus(config-l2tp-profile)#
```

To remove all configuration of this L2TP profile, use the commands:

```
awplus# configure terminal
awplus(config)# no l2tp-profile public
```

**Related Commands**

- [l2tp profile](#)
- [pppoe-ac](#)
- [shared-secret](#)
- [show running-config l2tp-profile](#)
- [version](#)

# local-subaddress

**Overview** Use this command to set the local sub-address for L2TPv2 tunnel authentication. Use the **no** variant of this command to remove the configured local sub-address.

**Syntax** `local-subaddress [<sub-address>]`  
`no local-subaddress`

| Parameter                        | Description                           |
|----------------------------------|---------------------------------------|
| <code>&lt;sub-address&gt;</code> | The local sub-address for the tunnel. |

**Default** The local sub-address is not set by default; by default, the received L2TPv2 sub-address AVP will not be checked before establishing the tunnel.

**Mode** L2TP Tunnel Configuration

**Usage** If a local sub-address is set, this is checked against incoming the sub-address AVP as a requirement for tunnel establishment. The received sub-address AVP content must match the configured local sub-address.

**Example** To set the local-sub address of tunnel1 to 'office1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# local-subaddress office1
```

To remove the local sub-address configuration from tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no local-subaddress
```

**Related Commands**

- [l2tp tunnel](#)
- [remote-subaddress](#)
- [show l2tp tunnel config-check](#)
- [show running-config l2tp-tunnel](#)

# protection ipsec

**Overview** Use this command to enable IPsec protection on the L2TP tunnel.  
Use the **no** variant of this command to disable IPsec on the tunnel.

**Syntax** `protection ipsec`  
`no protection ipsec`

**Default** IPsec protection is disabled by default.

**Mode** L2TP Tunnel Configuration

**Example** To protect tunnel1 with IPsec, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# protection ipsec
```

To disable IPsec protection for tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no protection ipsec
```

**Related Commands**

- [l2tp tunnel](#)
- [protection ipsec](#)
- [protection local-name](#)
- [protection profile](#)
- [protection remote-name](#)
- [show l2tp tunnel config-check](#)
- [show running-config l2tp-tunnel](#)

# protection local-name

**Overview** Use this command to set the IPsec local name for the L2TP tunnel. This is the local identifier for IKE.

Use the **no** variant of this command to reset the local name to the default—the source IP address of the L2TP tunnel.

**Syntax** protection local-name [<ipsec-local-name>]  
no protection local-name

| Parameter          | Description                          |
|--------------------|--------------------------------------|
| <ipsec-local-name> | The IPsec local name for the tunnel. |

**Default** By default, the IPsec local name is set to the source IP address of the L2TP tunnel.

**Mode** L2TP Tunnel Configuration

**Usage** If no local name is configured with this command, the source IP address of the tunnel is used. If a local name is configured with this command, the **crypto isakmp key** command is required to configure a preshared authentication key using this local name as the hostname.

**Example** To set the IPsec local name for tunnel1 to office1 and set the key to 'friend', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# protection ipsec
awplus(config-l2tp-tunnel)# protection local-name office1
awplus(config)# crypto isakmp key friend hostname office1
```

To remove the IPsec local name for tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no protection local-name
```

**Related Commands**

- [crypto isakmp key](#)
- [l2tp tunnel](#)
- [protection ipsec](#)
- [protection profile](#)
- [protection remote-name](#)
- [show l2tp tunnel config-check](#)

show running-config l2tp-tunnel

# protection profile

**Overview** Use this command to set the IPsec profile to use for this L2TP tunnel.  
Use the **no** variant of this command to set it back to the default IPsec profile: the profile named 'default'.

**Syntax** protection profile [*<profile-name>*]  
no protection profile

| Parameter                   | Description                                                                                                   |
|-----------------------------|---------------------------------------------------------------------------------------------------------------|
| <i>&lt;profile-name&gt;</i> | The name of the IPsec profile to use. This is the profile created by the <b>crypto ipsec profile</b> command. |

**Default** The L2TP tunnel protection profile is set to the IPsec profile named 'default' by default.

**Mode** L2TP Tunnel Configuration

**Example** To set up tunnel1 with IPsec protection using IPsec profile 'profile1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# protection ipsec
awplus(config-l2tp-tunnel)# protection profile profile1
```

To reset tunnel1 to use IPsec protection with IPsec profile 'default', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no protection profile
```

**Related Commands**

- [crypto ipsec profile](#)
- [l2tp tunnel](#)
- [protection ipsec](#)
- [protection local-name](#)
- [protection remote-name](#)
- [show l2tp tunnel config-check](#)

# protection remote-name

**Overview** Use this command to set the L2TP tunnel IPsec remote name. This is the remote identifier for IKE.

Use the **no** variant of this command to reset the remote name to the default—the destination IP address of the tunnel.

**Syntax** `protection remote-name [<ipsec-remote-name>]`  
`no protection remote-name`

| Parameter                              | Description                           |
|----------------------------------------|---------------------------------------|
| <code>&lt;ipsec-remote-name&gt;</code> | The IPsec remote name for the tunnel. |

**Default** By default, the IPsec remote name is set to the destination IP address of the tunnel.

**Mode** L2TP Tunnel Configuration

**Usage** In order to set the IPsec remote name for the tunnel and add a corresponding ISAKMP key for the tunnel, set the IPsec remote name with this command (**protection remote-name**) and set the key for this by using the **crypto isakmp key** command with this remote name as the hostname.

**Example** To set the IPsec remote name for tunnel1 to 'office2' and set the key to 'friend', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# protection ipsec
awplus(config-l2tp-tunnel)# protection remote-name office2
awplus(config)# crypto isakmp key friend hostname office2
```

To reset the IPsec remote name for tunnel1 to default (destination IP address of the tunnel), use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no protection remote-name
```

**Related Commands**

- [crypto isakmp key](#)
- [l2tp tunnel](#)

- [protection local-name](#)
- [protection profile](#)
- [show l2tp tunnel config-check](#)

show running-config l2tp-tunnel

# remote-subaddress

**Overview** Use this command to set the remote sub-address for L2TPv2 tunnel authentication.

Use the **no** variant of this command to remove the sub-address from the tunnel configuration.

**Syntax** `remote-subaddress [<sub-address>]`  
`no remote-subaddress`

| Parameter                        | Description                            |
|----------------------------------|----------------------------------------|
| <code>&lt;sub-address&gt;</code> | The remote sub-address for the tunnel. |

**Default** The remote sub-address is not set by default; the outgoing L2TP sub-address AVP for the tunnel will not be populated.

**Mode** L2TP Tunnel Configuration

**Usage** If the L2TP peer is also an AR-Series firewall, the remote-subaddress must match the local sub-address configured at the other end of the tunnel.

If a remote sub-address is configured for the tunnel, this value is placed in the outgoing sub-address AVP. The other tunnel end point can check this value against its configured local sub-address for the tunnel before establishing the tunnel.

**Example** To set the remote sub-address of tunnel1 to 'office1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# remote-subaddress office1
```

To remove the remote sub-address configuration from tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no remote-subaddress
```

# shared-secret

**Overview** Use this command to set the secret password that is shared with L2TP tunnel peers. Use the **no** variant of this command to remove the shared secret.

**Syntax** `shared-secret <secret>`  
`no shared-secret`

| Parameter                   | Description                               |
|-----------------------------|-------------------------------------------|
| <code>&lt;secret&gt;</code> | The password shared with the tunnel peer. |

**Default** No shared secret is configured by default.

**Mode** L2TP Profile Configuration and L2TP Tunnel Configuration

**Example** To set tunnel secret to "my\_password" for tunnel profile "public", use the commands:

```
awplus# configure terminal
awplus(config)# l2tp-profile public
awplus(config-l2tp-profile)# shared-secret my_password
```

To set tunnel secret to "my\_password" for tunnel "tunnelone", use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnelone
awplus(config-l2tp-tunnel)# shared-secret my_password
```

To remove the tunnel secret for the tunnel profile, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp-profile public
awplus(config-l2tp-profile)# no shared-secret
```

To remove the tunnel secret for the tunnel 'tunnelone', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnelone
awplus(config-l2tp-tunnel)# no shared-secret
```

# show debugging l2tp

**Overview** Use this command to display whether debugging of L2TP tunnels is on or off.

**Syntax** `show debugging l2tp`

**Mode** Privileged Exec

**Example** To display whether debugging of L2TP tunnels is on or off, use the command:

```
awplus# show debugging l2tp
```

**Output** Figure 72-1: Example output from **show debugging l2tp**

```
awplus#show debugging l2tp
L2TP Tunnel Debugging is on
```

**Related  
Commands** [debug l2tp](#)

# show interface tunnel (L2TPv3)

**Overview** Use this command to display status information of L2TPv3 tunnels.

**Syntax** show interface tunnel<0-255>

| Parameter | Description                                                     |
|-----------|-----------------------------------------------------------------|
| <0-255>   | Specify an L2TPv3 tunnel index in the range from 0 through 255. |

**Mode** Privileged Exec

**Examples** To display status information for L2TPv3 tunnel tunnel20, use the command.

```
awplus#show interface tunnel20
```

**Output** Figure 72-2: Example output of the **show tunnel interface** command on the console.

Table 72-1:

```
awplus#show interface tunnel20
Interface tunnel20
 Link is UP, administrative state is UP
 Hardware is Tunnel

```

# show isakmp key (L2TPv3)

**Overview** Use this command to show the ISAKMP pre-shared key. Pre-shared key authentication using optionally encrypted shared keys identified by hostname, IPv4 or IPv6 address. Pre-shared keys are not viewable and stored encrypted in the running-configuration.

**Syntax** `show [crypto] isakmp key`

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| crypto    | Security specific command.                                                                                            |
| isakmp    | Internet Security Association Key Management Protocol provides a common framework for key management implementations. |
| key       | Pre-shared key.                                                                                                       |

**Mode** Privileged Exec

**Examples** To show ISAKMP pre-share key, use the command.

```
awplus#show isakmp key
```

**Output** Figure 72-3: Example output of the **show isakmp key** command on the console.

Table 72-2:

|                        |             |
|------------------------|-------------|
| awplus#show isakmp key |             |
| Hostname/IP address    | key         |
| 10.2.0.10              | mytunnelkey |

# show l2tp session

**Overview** Use this command to display a summary or detailed list of information about L2TP sessions.

**Syntax** `show l2tp session [detail]`

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| detail    | Displays more detailed information about L2TP sessions. |

**Mode** Privileged Exec

**Example** To display summary information about all L2TPv2 sessions, use the command:

```
awplus# show l2tp session
```

**Output** Figure 72-4: Example output from **show l2tp session**

```
awplus#show l2tp session

L2TP Session Information

Session ID: 59400
Tunnel ID: 25351
State: RETRY
Type: LAIC
Created At: May 31 20:03:04 2016
Interface Name: ppp1
Remote Session ID: 61156
Establish Timeout: 120
```

Table 72-3: Parameters in the output from **show l2tp session**

| Parameter  | Description                                 |
|------------|---------------------------------------------|
| Session ID | L2TP session ID.                            |
| Tunnel ID  | The ID of the L2TP tunnel for this session. |

Table 72-3: Parameters in the output from **show l2tp session** (cont.)

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State             | The current state of the L2TP session: <ul style="list-style-type: none"> <li>idle—Idle</li> <li>wait-tunnel—Await tunnel</li> <li>wait-reply—Await reply</li> <li>wait-connect—Await connect</li> <li>wait-cs-answer—Await circuit switched answer</li> <li>established—Successful connection</li> <li>retry—Retrying connection</li> </ul> |
| Type              | The type of the L2TP session: <ul style="list-style-type: none"> <li>LAIC—LAC incoming call</li> <li>LAOC—LAC outgoing call</li> <li>LNIC—LNS incoming call</li> <li>LNOC—LNS outgoing call</li> <li>UNSPEC—unspecified call type</li> </ul>                                                                                                 |
| Created At        | The date and time when the session was created.                                                                                                                                                                                                                                                                                              |
| Interface Name    | The name of the interface for this session.                                                                                                                                                                                                                                                                                                  |
| Remote Session ID | The ID of the session on the peer.                                                                                                                                                                                                                                                                                                           |
| Establish Timeout | The time (in seconds) that a session will wait for the peer to complete the session setup message exchange.                                                                                                                                                                                                                                  |

**Related Commands** [l2tp tunnel](#)  
[show l2tp tunnel](#)

# show l2tp tunnel

**Overview** Use this command to display information about all the current L2TP tunnels.

**Syntax** `show l2tp tunnel [detail]`

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| detail    | Display additional detailed information about the tunnels. |

**Mode** Privileged Exec

**Usage** The output from this command depends on whether it won the tiebreaker and took the LAC role for the tunnel, or lost the tiebreaker and took the LNS role. In the latter case, a corresponding idle LAC tunnel is also displayed.

**Example** To display information about all L2TPv2 tunnels, use the command:

```
awplus# show l2tp tunnel
```

**Output** Figure 72-5: Example output from **show l2tp tunnel**

```
AWP-2#show l2tp tunnel

**Table 73:** Parameters in the output from **show l2tp tunnel** .

| Parameter          | Description                                                                                                                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tunnel ID          | The L2TP tunnel ID, (assigned automatically by the device).                                                                                                                                                                                                                                                             |
| Tunnel Name        | The name of the L2TP tunnel as specified by the <b>l2tp tunnel</b> command.                                                                                                                                                                                                                                             |
| Local IP Address   | The IPv4 or IPv6 address of the tunnel on this device. This is either specified by the configuration if the device is in LAC mode, or assigned automatically by the device if it is in LNS mode. This may be specified directly by the <b>source</b> command, or derived from the interface set by that command.        |
| Remote IP Address  | The IPv4 or IPv6 address of the device at the remote end of the tunnel. This may be specified directly by the <b>destination</b> command, or derived from a domain name set by that command.                                                                                                                            |
| State              | The current state of the tunnel: <ul style="list-style-type: none"> <li>idle—Idle</li> <li>wait-ctl-reply—Await control reply</li> <li>wait-ctl-conn—Await connect reply</li> <li>established—Successful connection</li> <li>closing—Closing connection</li> <li>retry—Tie breaker lost, retrying connection</li> </ul> |
| Created at         | The date and time when the tunnel was created.                                                                                                                                                                                                                                                                          |
| Tunnel Mode        | The tunnel mode: <ul style="list-style-type: none"> <li>LAC—L2TP Access Concentrator—the initiating end of the tunnel</li> <li>LNS—L2TP Network Server—the other end of the tunnel, authenticates the user and starts the PPP negotiation.</li> </ul>                                                                   |
| Remote Tunnel ID   | The tunnel ID on the L2TP peer.                                                                                                                                                                                                                                                                                         |
| Remote Host Name   | The host name of the L2TP peer.                                                                                                                                                                                                                                                                                         |
| Remote Vendor Name | The name of the vendor for the L2TP peer device. E.g. Allied Telesis International.                                                                                                                                                                                                                                     |
| Local UDP Port     | By default the local UDP port used for both L2TPv2 managed tunnels and L2TPv3 unmanaged tunnels (Ethernet Pseudowires) is 1701. If both are configured, change the UDP port for the unmanaged tunnel ( <b>l2tp unmanaged port</b> command).                                                                             |
| Remote UDP Port    | The UPD port used by the remote device for this L2TP tunnel.                                                                                                                                                                                                                                                            |

**Table 73:** Parameters in the output from **show l2tp tunnel** . (cont.)

| Parameter         | Description                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------|
| Hello Timeout     | The period between sending L2TP Hello messages (in seconds).                                              |
| Retry Timeout     | The delay (in seconds) before sending the first retry of unacknowledged control frames.                   |
| Idle Timeout      | The time (in seconds) that a tunnel will remain after its last session has been torn down.                |
| Establish Timeout | The time (in seconds) that a tunnel will wait for the peer to complete the tunnel setup message exchange. |

**Related  
Commands** [l2tp tunnel](#)

# show l2tp tunnel config-check

**Overview** Use this command to check the configuration of the specified L2TP tunnel or all L2TP tunnels for errors or missing required configuration.

**Syntax** `show l2tp tunnel [<tunnel-name>] config-check`

| Parameter                        | Description                                                                      |
|----------------------------------|----------------------------------------------------------------------------------|
| <code>&lt;tunnel-name&gt;</code> | The name of the L2TP tunnel to check. If not specified, all tunnels are checked. |

**Mode** Privileged Exec

**Usage** Only tunnels that have a complete configuration may appear in the **show l2tp tunnel** commands. For details of the configuration in the system, use the **show running-config l2tp-tunnel** command.

**Example** To check for missing L2TP tunnel configuration for the tunnel 'tunnel1', use the command:

```
awplus# show l2tp tunnel config-check
```

**Output** Figure 72-7: Example output from **show l2tp tunnel config-check**

```
awplus#show l2tp tunnel config-check

L2TP Tunnel tunnel1:
 Complete Configuration

L2TP Tunnel tunnel2:
 Incomplete Configuration
 Missing tunnel name or tunnel name mismatch
 Required: PPP interface
 Required: destination
 Source IP address required when IPSec protection on
```

Table 72-1: Parameters in the output from **show l2tp tunnel config-check**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Complete configuration   | The tunnel has a complete and valid configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Incomplete configuration | <p>There is configuration still required or invalid for this tunnel, as specified.</p> <p>Examples of possible messages indicating missing or invalid configuration include:</p> <ul style="list-style-type: none"><li>• Missing tunnel name or tunnel name mismatch</li><li>• Required: PPP interface</li><li>• Required: destination</li><li>• Required: IP version</li><li>• Destination IP address does not match the configured IP version</li><li>• Source IP address does not match the configured IP version</li><li>• Source IP address required when IPSec protection on</li></ul> |

**Related Commands** [show running-config l2tp-tunnel](#)

# show running-config l2tp-profile

**Overview** Use this command to display the running configuration for L2Tp profiles.

**Syntax** `show running-config l2tp-profile`

**Mode** Privileged Exec

**Example** To display the running configuration of L2TP profiles, use the command:

```
awplus# show running-config l2tp-profile
```

**Output** Figure 72-8: Example output from **show running-config l2tp-profile**

```
awplus#show running-config l2tp-profile

l2tp-profile public
version 2
secret "my_password"
```

[show l2tp tunnel config-check](#)  
[source](#)  
[version](#)

# source

**Overview** Use this command to set the source address or interface for an L2TP tunnel.  
Use the **no** variant of this command to remove the source address or interface from an L2TP tunnel.

**Syntax** `source [<interface-name>|<ipv4-addr>|<ipv6-addr>`  
`no source`

| Parameter                           | Description                                                        |
|-------------------------------------|--------------------------------------------------------------------|
| <code>&lt;interface-name&gt;</code> | The name of the interface to be used as the tunnel starting point. |
| <code>&lt;ipv4-addr&gt;</code>      | The IPv4 address to be used as the tunnel starting point.          |
| <code>&lt;ipv6-addr&gt;</code>      | The IPv6 address to be used as the tunnel starting point.          |

**Default** If no source address or interface is configured, the source address used will be calculated based on the route to the tunnel destination.

**Mode** L2TP Tunnel Configuration

**Example** To configure IP address 10.1.1.2 as the source address for the tunnel named 'tunnel1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# source 10.1.1.2
```

To remove the configured source address from 'tunnel1', so that it uses the default source, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no source
```

**Related Commands** [destination](#)  
[l2tp tunnel](#)  
[show l2tp tunnel](#)

# tunnel local id

**Overview** This command specifies a tunnel local identifier sent to the peer to match. Use the **no** variant of this command to remove the tunnel local ID.

**Syntax** tunnel local id <1-2147483647>  
no tunnel local id

| Parameter      | Description                         |
|----------------|-------------------------------------|
| <1-2147483647> | Tunnel ID from 1 through 2147483647 |

**Default** No tunnel local ID is set.

**Mode** Interface Configuration

**Usage** The endpoints of the tunnel must be configured by mirroring tunnel IDs, that is, the tunnel local ID on one endpoint must be specified as the tunnel remote ID on the other endpoint.

The local session ID defaults to the tunnel local ID and the local session ID is not configurable. A session provides the data channel in L2TPv3. There is a single pseudowire per L2TP session.

**Examples** To specify a tunnel local ID, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#tunnel mode l2tp v3
awplus(config-if)#tunnel local id 22
```

To remove the tunnel local ID, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#no tunnel local id
```

**Related Commands** [tunnel remote id](#)

**Validation Commands** [show interface tunnel \(L2TPv3\)](#)

# tunnel mode (L2TPv3)

**Overview** Use this command to configure the encapsulation tunneling mode.  
Use the **no** variant of this command to remove an established tunnel.

**Syntax** tunnel mode {gre [ipv6]|ipsec {ipv4|ipv6}|ipv6|l2tp v3  
[ipv6]|openvpn {tap|tun}}  
no tunnel mode

| Parameter    | Description                                                                         |
|--------------|-------------------------------------------------------------------------------------|
| gre          | GRE IPv4 or IPv6 as the payload over IPv4 tunneling. IPv4 is the delivery protocol. |
| gre ipv6     | GRE IPv4 or IPv6 as the payload over IPv6 tunneling. IPv6 is the delivery protocol. |
| ipsec ipv4   | IPv4 IPsec tunnel                                                                   |
| ipsec ipv6   | IPv6 IPsec tunnel                                                                   |
| l2tp v3      | Layer 2 Tunneling Protocol version 3. By default, IPv4 is the deliver protocol.     |
| l2tp v3 ipv6 | Set IPv6 as the deliver protocol for L2TPv3                                         |
| openvpn tap  | OpenVPN TAP mode                                                                    |
| openvpn tun  | OpenVPN TUN mode                                                                    |

**Mode** Interface Configuration

**Usage** A tunnel will not become operational until it is configured with this command.

**Examples** To configure L2TPv3 as the encapsulation tunneling mode, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#tunnel mode l2tp v3
```

To remove the established tunnel, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#no tunnel mode
```

**Validation Commands** [show interface tunnel \(L2TPv3\)](#)

# tunnel protection ipsec

**Overview** Use this command to optionally enable IPsec protection for packets encapsulated by this tunnel.

Use the no variant of this command to disable IPsec protection.

**Syntax** tunnel protection ipsec  
no tunnel protection ipsec

**Default** IPsec protection for packets encapsulated by tunnel is disabled.

**Mode** Interface Configuration

**Usage** You also need to configure a pre-shared key in conjunction with this command. See the crypto isakmpkey command for more information about configuring the pre-share key.

**Examples** To enable IPsec protection for packets encapsulated by tunnel114, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel114
awplus(config-if)#tunnel protection ipsec
```

To disable IPsec protection for packets encapsulated by tunnel114, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel114
awplus(config-if)#no tunnel protection ipsec
```

# tunnel remote id

**Overview** This command specifies a tunnel remote identifier sent to the peer for match. Use the **no** variant of this command to remove the tunnel remote ID.

**Syntax** tunnel remote id <1-2147483647>  
no tunnel remote id

| Parameter      | Description                         |
|----------------|-------------------------------------|
| <1-2147483647> | Tunnel ID from 1 through 2147483647 |

**Default** No tunnel remote ID is set.

**Mode** Interface Configuration

**Usage** The endpoints of the tunnel must be configured by mirroring tunnel IDs, that is, the tunnel remote ID on one endpoint must be specified as the tunnel local ID on the other endpoint.

The remote session ID defaults to the tunnel remote ID and the remote session ID is not configurable. A session provides the data channel in L2TPv3. There is a single pseudowire per L2TP session.

**Examples** To specify a tunnel remote ID, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#tunnel mode l2tp v3
awplus(config-if)#tunnel remote id 22
```

To remove the tunnel remote ID, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#no tunnel remote id
```

**Related Commands** [tunnel local id](#)

**Validation Commands** [show interface tunnel \(L2TPv3\)](#)

# version

**Overview** Use this command to specify the protocol version of a L2TP tunnel.

**Syntax** `version [<version>]`

| Parameter                    | Description                                                      |
|------------------------------|------------------------------------------------------------------|
| <code>&lt;version&gt;</code> | The protocol version of the L2TP tunnel. Version 2 is supported. |

**Default** The L2TP version is 2 by default.

**Mode** L2TP Profile Configuration and L2TP Tunnel Configuration

**Example** To use L2TPv2 for L2TP tunnel profile 'public', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp-profile public
awplus(config-l2tp-profile)# version 2
```

To use L2TPv2 for L2TP tunnel 'tunnelone', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnelone
awplus(config-l2tp-tunnel)# version 2
```
