# Contents

<b>PART 1:</b>	<b>Setup and Troubleshooting</b>	<b>116</b>
<b>Chapter 1:</b>	<b>CLI Navigation Commands</b>	<b>117</b>
	Introduction	117
	configure terminal	118
	disable (Privileged Exec mode)	119
	do	120
	enable (Privileged Exec mode)	121
	end	123
	exit	124
	help	125
	logout	126
	show history	127
<b>Chapter 2:</b>	<b>File and Configuration Management Commands</b>	<b>128</b>
	Introduction	128
	autoboot enable	132
	boot config-file	133
	boot config-file backup	135
	boot system	136
	boot system backup	138
	cd	139

mtu . . . . .	518
service statistics interfaces counter . . . . .	520
show interface . . . . .	521
show interface brief . . . . .	524
show interface memory . . . . .	525
show interface status . . . . .	527
shutdown . . . . .	530
<b>Chapter 13: Port Mirroring and Remote Mirroring Commands . . . . .</b>	<b>531</b>
Introduction . . . . .	531
mirror interface . . . . .	532
remote-mirror interface . . . . .	534
show mirror . . . . .	536
show mirror interface . . . . .	537
show remote-mirror . . . . .	538
switchport remote-mirror-egress . . . . .	540
vlan mode remote-mirror-vlan . . . . .	541

<b>PART 2:</b>	<b>Interfaces and Layer 2</b>	<b>543</b>
<b>Chapter 14:</b>	<b>Switching Commands</b>	<b>544</b>
	Introduction	544
	clear loop-protection counters	546
	clear mac address-table dynamic	547
	clear mac address-table static	549
	clear port counter	550
	clear port-security intrusion	551
	debug loopprot	554
	debug platform packet	555
	duplex	557
	fec	558
	flowcontrol (switch port)	560
	linkflap action	562
	loop-protection loop-detect	563
	loop-protection action	564
	loop-protection action-delay-time	565
	loop-protection timeout	566
	mac address-table acquire	567
	mac address-table ageing-time	568
	mac address-table logging	569
	mac address-table static	570
	mac address-table thrash-limit	571
	platform hwfilter-size	572
	platform load-balancing	573
	platform mac-vlan-hashing-algorithm	575
	platform multicast-ratelimit	576
	platform stop-unreg-mc-flooding	577
	platform vlan-stacking-tpid	579
	polarity	580
	show debugging loopprot	581
	show debugging platform packet	582
	show flowcontrol interface	583
	show interface err-disabled	584
	show interface switchport	585
	show loop-protection	586
	show mac address-table	588
	show mac address-table thrash-limit	590
	show platform	591
	show platform classifier statistics utilization brief	594
	show platform port	596
	show port-security interface	600
	show port-security intrusion	601
	show provisioning (xem)	602
	show storm-control	603
	speed	604
	storm-control level	606
	switch bay provision (xem)	607
	switchport port-security	608
	switchport port-security aging	609
	switchport port-security maximum	610
	switchport port-security violation	611

thrash-limiting . . . . .	612
undebbug loopprot . . . . .	614
undebbug platform packet . . . . .	615

**Chapter 15: VLAN Commands . . . . . 616**

Introduction . . . . .	616
clear vlan statistics . . . . .	618
port-vlan-forwarding-priority . . . . .	619
private-vlan . . . . .	622
private-vlan association . . . . .	623
show port-vlan-forwarding-priority . . . . .	624
show interface switchport vlan translation . . . . .	625
show vlan . . . . .	627
show vlan access-map . . . . .	628
show vlan classifier group . . . . .	629
show vlan classifier group interface . . . . .	630
show vlan classifier interface group . . . . .	631
show vlan classifier rule . . . . .	632
show vlan filter . . . . .	633
show vlan private-vlan . . . . .	634
show vlan statistics . . . . .	635
switchport access vlan . . . . .	636
switchport enable vlan . . . . .	637
switchport mode access . . . . .	638
switchport mode private-vlan . . . . .	639
switchport mode private-vlan trunk promiscuous . . . . .	640
switchport mode private-vlan trunk secondary . . . . .	642
switchport mode trunk . . . . .	644
switchport private-vlan host-association . . . . .	645
switchport private-vlan mapping . . . . .	646
switchport trunk allowed vlan . . . . .	647
switchport trunk native vlan . . . . .	650
switchport vlan translation . . . . .	651
switchport vlan translation default drop . . . . .	653
switchport vlan-stacking (double tagging) . . . . .	654
switchport voice dscp . . . . .	655
switchport voice vlan . . . . .	656
switchport voice vlan priority . . . . .	659

**Chapter 66: Ping-Polling Commands . . . . . 3553**

Introduction . . . . .	3553
active (ping-polling) . . . . .	3555
clear ping-poll . . . . .	3556
critical-interval . . . . .	3557
debug ping-poll . . . . .	3558
description (ping-polling) . . . . .	3559
fail-count . . . . .	3560
ip (ping-polling) . . . . .	3561
length (ping-poll data) . . . . .	3562
normal-interval . . . . .	3563
ping-poll . . . . .	3564
sample-size . . . . .	3565
show counter ping-poll . . . . .	3567

---

show ping-poll . . . . .	3569
source-ip . . . . .	3573
timeout (ping polling) . . . . .	3575
up-count . . . . .	3576
undebg ping-poll . . . . .	3577

**Chapter 67:**

<b>sFlow Commands . . . . .</b>	<b>3578</b>
Introduction . . . . .	3578
debug sflow . . . . .	3579
debug sflow agent . . . . .	3580
sflow agent (address) . . . . .	3581
sflow collector (address) . . . . .	3583
sflow collector max-datagram-size . . . . .	3585
sflow enable . . . . .	3586
sflow max-header-size . . . . .	3587
sflow polling-interval . . . . .	3589
sflow sampling-rate . . . . .	3590
show debugging sflow . . . . .	3591
show running-config sflow . . . . .	3593
show sflow . . . . .	3594
show sflow interface . . . . .	3596
undebg sflow . . . . .	3597

# List of Commands

(access-list extended ICMP filter) .....	2096
(access-list extended IP filter).....	2098
(access-list extended IP protocol filter).....	2101
(access-list extended TCP UDP filter).....	2105
(access-list standard named filter) .....	2112
(access-list standard numbered filter).....	2114
(ipv6 access-list extended IP protocol filter).....	2162
(ipv6 access-list extended TCP UDP filter).....	2165
(ipv6 access-list standard filter).....	2169
(named hardware ACL: ICMP entry).....	2056
(named hardware ACL: IP packet entry).....	2060
(named hardware ACL: IP protocol entry).....	2064
(named hardware ACL: MAC entry).....	2069
(named hardware ACL: TCP or UDP entry) .....	2072
(named IPv6 hardware ACL: ICMP entry).....	2136
(named IPv6 hardware ACL: IP protocol entry).....	2143
(named IPv6 hardware ACL: IPv6 packet entry).....	2140

# Part 1: Setup and Troubleshooting

# 1

# CLI Navigation Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for the commands used to navigate between different modes. This chapter also provides a reference for the help and show commands used to help navigate within the CLI.

- Command List**
- “[configure terminal](#)” on page 118
  - “[disable \(Privileged Exec mode\)](#)” on page 119
  - “[do](#)” on page 120
  - “[enable \(Privileged Exec mode\)](#)” on page 121
  - “[end](#)” on page 123
  - “[exit](#)” on page 124
  - “[help](#)” on page 125
  - “[logout](#)” on page 126
  - “[show history](#)” on page 127

# configure terminal

**Overview** This command enters the Global Configuration command mode.

**Syntax** `configure terminal`

**Mode** Privileged Exec

**Example** To enter the Global Configuration command mode (note the change in the command prompt), enter the command:

```
awplus# configure terminal  
awplus(config)#
```

# disable (Privileged Exec mode)

**Overview** This command exits the Privileged Exec mode, returning the prompt to the User Exec mode. To end a session, use the [exit](#) command.

**Syntax** `disable`

**Mode** Privileged Exec

**Example** To exit the Privileged Exec mode, enter the command:

```
awplus# disable  
awplus>
```

**Related Commands**

- [enable \(Privileged Exec mode\)](#)
- [end](#)
- [exit](#)

# do

**Overview** This command lets you to run User Exec and Privileged Exec mode commands when you are in any configuration mode.

**Syntax** `do <command>`

Parameter	Description
<code>&lt;command&gt;</code>	Specify the command and its parameters.

**Mode** Any configuration mode

**Example**  
`awplus# configure terminal`  
`awplus(config)# do ping 192.0.2.23`

# enable (Privileged Exec mode)

**Overview** This command enters the Privileged Exec mode and optionally changes the privilege level for a session. If a privilege level is not specified then the maximum privilege level (15) is applied to the session. If the optional privilege level is omitted then only users with the maximum privilege level can access Privileged Exec mode without providing the password as specified by the [enable password](#) or [enable secret](#) commands. If no password is specified then only users with the maximum privilege level set with the [username](#) command can assess Privileged Exec mode.

**Syntax** `enable [<privilege-level>]`

Parameter	Description
<code>&lt;privilege - level&gt;</code>	Specify the privilege level for a CLI session in the range <1-15>, where 15 is the maximum privilege level, 7 is the intermediate privilege level and 1 is the minimum privilege level. The privilege level for a user must match or exceed the privilege level set for the CLI session for the user to access Privileged Exec mode. Privilege level for a user is configured by <a href="#">username</a> .

**Mode** User Exec

**Usage** Many commands are available from the Privileged Exec mode that configure operating parameters for the device, so you should apply password protection to the Privileged Exec mode to prevent unauthorized use. Passwords can be encrypted but then cannot be recovered. Note that non-encrypted passwords are shown in plain text in configurations.

The [username](#) command sets the privilege level for the user. After login, users are given access to privilege level 1. Users access higher privilege levels with the [enable \(Privileged Exec mode\)](#) command. If the privilege level specified is higher than the users configured privilege level specified by the [username](#) command, then the user is prompted for the password for that level.

Note that a separate password can be configured for each privilege level using the [enable password](#) and the [enable secret](#) commands from the Global Configuration mode. The [service password-encryption](#) command encrypts passwords configured by the [enable password](#) and the [enable secret](#) commands, so passwords are not shown in plain text in configurations.

**Example** The following example shows the use of the **enable** command to enter the Privileged Exec mode (note the change in the command prompt).

```
awplus> enable
awplus#
```

The following example shows the **enable** command enabling access the Privileged Exec mode for users with a privilege level of 7 or greater. Users with a privilege level of 7 or greater do not need to enter a password to access Privileged Exec mode. Users with a privilege level 6 or less need to enter a password to access

Privilege Exec mode. Use the [enable password](#) command or the [enable secret](#) commands to set the password to enable access to Privileged Exec mode.

```
awplus> enable 7  
awplus#
```

**Related  
Commands**

[disable \(Privileged Exec mode\)](#)  
[enable password](#)  
[enable secret](#)  
[exit](#)  
[service password-encryption](#)  
[username](#)

# end

**Overview** This command returns the prompt to the Privileged Exec command mode from any other advanced command mode.

**Syntax** end

**Mode** All advanced command modes, including Global Configuration and Interface Configuration modes.

**Example** The following example shows the use of the **end** command to return to the Privileged Exec mode directly from Interface mode.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# end
awplus#
```

**Related Commands**

- disable (Privileged Exec mode)
- enable (Privileged Exec mode)
- exit

# exit

**Overview** This command exits the current mode, and returns the prompt to the mode at the previous level. When used in User Exec mode, the **exit** command terminates the session.

**Syntax** `exit`

**Mode** All command modes, including Global Configuration and Interface Configuration modes.

**Example** The following example shows the use of the **exit** command to exit Interface mode, and return to Configure mode.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# exit
awplus(config)#
```

**Related Commands**

- [disable \(Privileged Exec mode\)](#)
- [enable \(Privileged Exec mode\)](#)
- [end](#)

# help

**Overview** This command displays a description of the AlliedWare Plus™ OS help system.

**Syntax** help

**Mode** All command modes

**Example** To display a description on how to use the system help, use the command:

```
awplus# help
```

**Output** Figure 1-1: Example output from the **help** command

```
When you need help at the command line, press '?'.

If nothing matches, the help list will be empty. Delete
characters until entering a '?' shows the available options.

Enter '?' after a complete parameter to show remaining valid
command parameters (e.g. 'show ?').

Enter '?' after part of a parameter to show parameters that
complete the typed letters (e.g. 'show ip?').
```

# logout

**Overview** This command exits the User Exec or Privileged Exec modes and ends the session.

**Syntax** `logout`

**Mode** User Exec and Privileged Exec

**Example** To exit the User Exec mode, use the command:

```
awplus# logout
```

# show history

**Overview** This command lists the commands entered in the current session. The history buffer is cleared automatically upon reboot.

The output lists all command line entries, including commands that returned an error.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show history`

**Mode** User Exec and Privileged Exec

**Example** To display the commands entered during the current session, use the command:

```
awplus# show history
```

**Output** Figure 1-2: Example output from the **show history** command

```
1 en
2 show ru
3 conf t
4 route-map er deny 3
5 exit
6 ex
7 di
```

# 2

# File and Configuration Management Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of AlliedWare Plus™ OS file and configuration management commands.

**Filename Syntax and Keyword Usage** Many of the commands in this chapter use the placeholder “filename” to represent the name and location of the file that you want to act on. The following table explains the syntax of the filename for each different type of file location.

When you copy a file...	Use this syntax:	Example:
Copying in local Flash memory	<code>flash: [/] [&lt;directory&gt;/] &lt;filename&gt;</code>	To specify a file in the configs directory in Flash: <code>flash:configs/example.cfg</code>
Copying to or from a USB storage device	<code>usb: [/] [&lt;directory&gt;/] &lt;filename&gt;</code>	To specify a file in the top-level directory of the USB stick: <code>usb:example.cfg</code>
Copying with HTTP	<code>http:// [[&lt;username&gt;:&lt;password&gt;]@] {&lt;hostname&gt; &lt;host-ip&gt;} [/&lt;filepath&gt;] /&lt;filename&gt;</code>	To specify a file in the configs directory on the server: <code>http://www.company.com/configs/example.cfg</code>
Copying with TFTP	<code>tftp:// [ [&lt;location&gt;] /&lt;directory&gt;] /&lt;filename&gt;</code>	To specify a file in the top-level directory of the server: <code>tftp://172.1.1.1/example.cfg</code>
Copying with SCP	<code>scp://&lt;username&gt;@&lt;location&gt; [ /&lt;directory&gt;] [ /&lt;filename&gt;]</code>	To specify a file in the configs directory on the server, logging on as user “bob”: e.g. <code>scp://bob@10.10.0.12/configs/example.cfg</code>

When you copy a file...	Use this syntax:	Example:
Copying with SFTP	<code>sftp://[[&lt;location&gt;]/&lt;directory&gt;] /&lt;filename&gt;</code>	To specify a file in the top-level directory of the server: <code>sftp://10.0.0.5/example.cfg</code>
Copying to or from stack member Flash	<code>&lt;hostname&gt;-&lt;stack_ID&gt;/flash: [ / ] [ &lt;directory&gt; / ] &lt;stack_member_filename&gt;</code>	To specify a file in the configs directory on member 2 of a stack named vstack: <code>vcstack-2/flash:/configs/example.cfg</code>

**Valid characters** The filename and path can include characters from up to four categories. The categories are:

- 1) uppercase letters: A to Z
- 2) lowercase letters: a to z
- 3) digits: 0 to 9
- 4) special symbols: most printable ASCII characters not included in the previous three categories, including the following characters:

- -
- /
- .
- \_
- @
- "
- '
- \*
- :
- ~
- ?

Do not use spaces, parentheses or the + symbol within filenames. Use hyphens or underscores instead.

### Syntax for directory listings

A leading slash (/) indicates the root of the current filesystem location.

In commands where you need to specify the local filesystem's Flash base directory, you may use **flash** or **flash:** or **flash:/**. For example, these commands are all the same:

- `dir flash`
- `dir flash:`
- `dir flash:/`

Similarly, you can specify the USB storage device base directory with **usb** or **usb:** or **usb:/**

You cannot name a directory or subdirectory **flash**, **nvs**, **usb**, **card**, **tftp**, **scp**, **sftp** or **http**. These keywords are reserved for tab completion when using various file commands.

In a stacked environment you can only access flash and nvs using the stack member filepath (e.g. **dir awplus-2/flash:/**). To access a USB storage device on a backup stack member, use the [remote-login](#) command.

- “[write memory](#)” on page 184
- “[write terminal](#)” on page 185

# autoboot enable

**Overview** This command enables the device to restore a release file and/or a configuration file from a USB storage device.

When the Autoboot feature is enabled, the device looks for a special file called `autoboot.txt` on the external media. If this file exists, the device will check the key and values in the file and recover the device with a new release file and/or configuration file from the external media. An example of a valid `autoboot.txt` file is shown in the following figure.

Figure 2-1: Example `autoboot.txt` file

```
[AlliedWare Plus]
Copy_from_external_media_enabled=yes
Boot_Release=SBx908NG-5.4.8-2.1.rel
Boot_Config=network1.cfg
```

Use the **no** variant of this command to disable the Autoboot feature.

**NOTE:** *This command is not supported in a stacked configuration.*

**Syntax** `autoboot enable`  
`no autoboot enable`

**Default** The Autoboot feature operates the first time the device is powered up in the field, after which the feature is disabled by default.

**Mode** Global Configuration

**Example** To enable the Autoboot feature, use the command:

```
awplus# configure terminal
awplus(config)# autoboot enable
```

**Related Commands** [create autoboot](#)  
[show autoboot](#)  
[show boot](#)

# boot config-file

**Overview** Use this command to set the configuration file to use during the next boot cycle.

Use the **no** variant of this command to remove the configuration file.

**Syntax** `boot config-file <filepath-filename>`  
`no boot config-file`

Parameter	Description
<code>&lt;filepath-filename&gt;</code>	Filepath and name of a configuration file. The specified configuration file must exist in the specified filesystem. Valid configuration files must have a <b>.cfg</b> extension.

**Mode** Global Configuration

**Usage** You can only specify that the configuration file is on a USB storage device if there is a backup configuration file already specified in Flash. If you attempt to set the configuration file on a USB storage device and a backup configuration file is not specified in Flash, the following error message is displayed:

```
% Backup configuration files must be stored in the flash  
filesystem
```

For an explanation of the configuration fallback order, see the [File Management Feature Overview and Configuration Guide](#).

**Examples** To run the configuration file "branch.cfg" the next time the device boots up, when "branch.cfg" is stored on the device's Flash filesystem, use the commands:

```
awplus# configure terminal  
awplus(config)# boot config-file flash:/branch.cfg
```

To stop running the configuration file "branch.cfg" when the device boots up, when "branch.cfg" is stored on the device's Flash filesystem, use the commands:

```
awplus# configure terminal  
awplus(config)# no boot config-file flash:/branch.cfg
```

To run the configuration file "branch.cfg" the next time the device boots up, when "branch.cfg" is stored on a USB storage device, use the commands:

```
awplus# configure terminal  
awplus(config)# boot config-file usb:/branch.cfg
```

To stop running the configuration file “branch.cfg” when the device boots up, when “branch.cfg” is stored on a USB storage device, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no boot config-file usb:/branch.cfg
```

**Related  
Commands**

[boot config-file backup](#)

[boot system](#)

[boot system backup](#)

[show boot](#)

# boot config-file backup

**Overview** Use this command to set a backup configuration file to use if the main configuration file cannot be accessed.

Use the **no** variant of this command to remove the backup configuration file.

**Syntax** `boot config-file backup <filepath-filename>`  
`no boot config-file backup`

Parameter	Description
<code>&lt;filepath-filename&gt;</code>	Filepath and name of a backup configuration file. Backup configuration files must be in the Flash filesystem. Valid backup configuration files must have a <b>.cfg</b> extension.
<code>backup</code>	The specified file is a backup configuration file.

**Mode** Global Configuration

**Usage** For an explanation of the configuration fallback order, see the [File Management Feature Overview and Configuration Guide](#).

**Examples** To set the configuration file `backup.cfg` as the backup to the main configuration file, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file backup flash:/backup.cfg
```

To remove the configuration file `backup.cfg` as the backup to the main configuration file, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file backup flash:/backup.cfg
```

**Related Commands**

- [boot config-file](#)
- [boot system](#)
- [boot system backup](#)
- [show boot](#)

# boot system

**Overview** Use this command to set the release file to load during the next boot cycle.

Use the **no** variant of this command to stop specifying a primary release file to boot from. If the device boots up with no release file set, it will use autoboot or the backup release file if either of those are configured, or you can use the boot menu to select a release file source. To access the boot menu, type Ctrl-B at bootup.

**Syntax** `boot system <filepath-filename>`  
`no boot system`

Parameter	Description
<code>&lt;filepath-filename&gt;</code>	Filepath and name of a release file. The specified release file must exist and must be stored in the root directory of the specified filesystem. Valid release files must have a <b>.rel</b> extension.

**Mode** Global Configuration

**Usage** You can only specify that the release file is on a USB storage device if there is a backup release file already specified in Flash. If you attempt to set the release file on a USB storage device and a backup release file is not specified in Flash, the following error message is displayed:

```
% A backup boot image must be set before setting a current boot image on USB storage device
```

In a VCStack configuration, the stack only accepts a release file on a USB storage device if a USB storage device is inserted in all stack members and all stack members have a bootloader version that supports booting from it. If a stack member has a USB storage device removed an error message is displayed. For example, if stack member 2 does not have a USB storage device inserted the following message is displayed:

```
% Stack member 2 has no USB storage device inserted
```

**Examples** To boot up with the release SBx908NG-5.4.8-2.1.rel file the next time the device boots up, when the release file is stored on the device's Flash filesystem, use the commands:

```
awplus# configure terminal  
awplus(config)# boot system flash:/SBx908NG-5.4.8-2.1.rel
```

To run the release file SBx908NG-5.4.8-2.1.rel the next time the device boots up, when the release file is stored on a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# boot system usb:/SBx908NG-5.4.8-2.1.rel
```

In a VCStack configuration, if there is not enough space to synchronize the new release across the stack, the boot system command has an interactive mode that prompts you to delete old releases.

```
awplus# configure terminal
awplus(config)# boot system SBx908NG-5.4.8-2.1.rel
```

```
Insufficient flash available on stack member-2 (11370496)
to synchronize file SBx908NG-5.4.8-2.1.rel (14821895).

List of release files on stack member-2
      SBx908NG-5.4.8-1.1.rel (14822400)

Select files to free up space,
Delete awplus-2/flash:/SBx908NG-5.4.8-1.1.rel? (y/n) [n]:y
```

Answering “y” at the prompt will cause the system to delete the specified file:

```
awplus(config)# y
```

```
Deleting selected files, please wait.....
Successful operation
VCS synchronizing file across the stack, please wait.....
File synchronization with stack member-2 successfully completed
[DONE]
```

**Related  
Commands**

- [boot config-file](#)
- [boot config-file backup](#)
- [boot system backup](#)
- [show boot](#)

# boot system backup

**Overview** Use this command to set a backup release file to load if the main release file cannot be loaded.

Use the **no** variant of this command to stop specifying a backup release file.

**Syntax** `boot system backup <filepath-filename>`  
`no boot system backup`

Parameter	Description
<code>&lt;filepath-filename&gt;</code>	Filepath and name of a backup release file. Backup release files must be in the Flash filesystem. Valid release files must have a <b>.rel</b> extension.
<code>backup</code>	The specified file is a backup release file.

**Mode** Global Configuration

**Examples** To specify the file SBx908NG-5.4.8-1.1.rel as the backup to the main release file, use the commands:

```
awplus# configure terminal
awplus(config)# boot system backup
flash:/SBx908NG-5.4.8-1.1.rel
```

To stop specifying a backup to the main release file, use the commands:

```
awplus# configure terminal
awplus(config)# no boot system backup
```

**Related Commands** [boot config-file](#)  
[boot config-file backup](#)  
[boot system](#)  
[show boot](#)

# cd

**Overview** This command changes the current working directory.

**Syntax** `cd <directory-name>`

Parameter	Description
<code>&lt;directory-name&gt;</code>	Name and path of the directory.

**Mode** Privileged Exec

**Example** To change to the directory called `images`, use the command:

```
awplus# cd images
```

**Related Commands**

- `dir`
- `pwd`
- `show file systems`

# copy (filename)

**Overview** This command copies a file. This allows you to:

- copy files from your device to a remote device
- copy files from a remote device to your device
- copy files stored on Flash memory to or from a different memory type, such as a USB storage device
- create two copies of the same file on your device

**Syntax** `copy [force] <source-name> <destination-name>`

Parameter	Description
<code>force</code>	This parameter forces the copy command to overwrite the destination file, if it already exists, without prompting the user for confirmation.
<code>&lt;source-name&gt;</code>	The filename and path of the source file. See <a href="#">Introduction</a> on page 128 for valid syntax.
<code>&lt;destination-name&gt;</code>	The filename and path for the destination file. See <a href="#">Introduction</a> on page 128 for valid syntax.

**Mode** Privileged Exec

**Examples** To use TFTP to copy the file "bob.key" into the current directory from the remote server at 10.0.0.1, use the command:

```
awplus# copy tftp://10.0.0.1/bob.key bob.key
```

To use SFTP to copy the file "new.cfg" into the current directory from a remote server at 10.0.1.2, use the command:

```
awplus# copy sftp://10.0.1.2/new.cfg bob.key
```

To use SCP with the username "beth" to copy the file old.cfg into the directory config\_files on a remote server that is listening on TCP port 2000, use the command:

```
awplus# copy scp://beth@serv:2000/config_files/old.cfg old.cfg
```

To copy the file "newconfig.cfg" onto your device's Flash from a USB storage device, use the command:

```
awplus# copy usb:/newconfig.cfg flash:/newconfig.cfg
```

To copy the file "newconfig.cfg" to a USB storage device from your device's Flash, use the command:

```
awplus# copy flash:/newconfig.cfg usb:/newconfig.cfg
```

To copy the file "config.cfg" into the current directory from a USB storage device, and rename it to "configtest.cfg", use the command:

```
awplus# copy usb:/config.cfg configtest.cfg
```

To copy the file "config.cfg" into the current directory from a remote file server, and rename it to "configtest.cfg", use the command:

```
awplus# copy fserver:/config.cfg configtest.cfg
```

To copy the file "test.txt" from the top level of Flash on stack member 2 to the current directory in the stack master, use the command:

```
awplus# copy awplus-2/flash:/test.txt test.txt
```

Note that you must specify either the NVS or Flash filesystem on the (backup) stack member (**flash:** in this example).

On an AMF network, to copy the file "file.txt" from the node named master to the Flash memory of the local node, use the commands:

```
awplus# atmf working-set group all  
network-name[80]# copy master.atmf/flash:/file.txt flash:
```

**Related  
Commands**

[copy zmodem](#)  
[copy buffered-log](#)  
[copy permanent-log](#)  
[edit \(filename\)](#)  
[show file systems](#)

# copy current-software

**Overview** This command copies the AlliedWare Plus™ OS software that the device has booted from, to a destination file. Specify whether the destination is Flash or card when saving the software to the local filesystem.

**Syntax** `copy current-software <destination-name>`

Parameter	Description
<code>&lt;destination-name&gt;</code>	The filename and path where you would like the current running-release saved. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See <a href="#">Introduction</a> on page 128 for valid syntax.

**Mode** Privileged Exec

**Example** To copy the current software as installed in the working directory with the file name `my-release.rel`, use the command:

```
awplus# copy current-software my-release.rel
```

**Related Commands** [boot system backup](#)  
[show boot](#)

# copy debug

**Overview** This command copies a specified debug file to a destination file.

**Syntax** `copy debug {<destination-name>|debug|flash|nvs|scp|tftp|usb} {<source-name>|debug|flash|nvs|scp|tftp|usb}`

Parameter	Description
<code>&lt;destination-name&gt;</code>	The filename and path where you would like the debug output saved. See <a href="#">Introduction</a> on page 128 for valid syntax.
<code>&lt;source-name&gt;</code>	The filename and path where the debug output originates. See the <a href="#">Introduction</a> to this chapter for valid syntax.

**Mode** Privileged Exec

**Example** To copy debug output to a file on flash called “my-debug”, use the following command:

```
awplus# copy debug flash:my-debug
```

To copy debug output to a USB storage device with a filename “my-debug”, use the following command:

```
awplus# copy debug usb:my-debug
```

**Output** Figure 2-2: CLI prompt after entering the **copy debug** command

```
Enter source file name []:
```

**Related Commands** [delete debug](#)  
[move debug](#)

# copy running-config

**Overview** This command copies the running-config to a destination file, or copies a source file into the running-config. Commands entered in the running-config do not survive a device reboot unless they are saved in a configuration file.

**Syntax** `copy <source-name> running-config`  
`copy running-config [<destination-name>]`  
`copy running-config startup-config`

Parameter	Description
<code>&lt;source-name&gt;</code>	The filename and path of a configuration file. This must be a valid configuration file with a <b>.cfg</b> filename extension. Specify this when you want the script in the file to become the new running-config. See <a href="#">Introduction</a> on page 128 for valid syntax.
<code>&lt;destination-name&gt;</code>	The filename and path where you would like the current running-config saved. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See <a href="#">Introduction</a> on page 128 for valid syntax. If you do not specify a file name, the device saves the running-config to a file called default.cfg.
<code>startup-config</code>	Copies the running-config into the file set as the current startup-config file.

**Mode** Privileged Exec

**Examples** To copy the `running-config` into the `startup-config`, use the command:

```
awplus# copy running-config startup-config
```

To copy the file `layer3.cfg` into the `running-config`, use the command:

```
awplus# copy layer3.cfg running-config
```

To use SCP to copy the `running-config` as `current.cfg` to the remote server listening on TCP port 2000, use the command:

```
awplus# copy running-config  
scp://user@server:2000/config_files/current.cfg
```

**Related Commands** [copy startup-config](#)  
[write file](#)  
[write memory](#)

# copy startup-config

**Overview** This command copies the startup-config script into a destination file, or alternatively copies a configuration script from a source file into the startup-config file. Specify whether the destination is Flash or card when loading from the local filesystem.

**Syntax** `copy <source-name> startup-config`  
`copy startup-config <destination-name>`

Parameter	Description
<code>&lt;source-name&gt;</code>	The filename and path of a configuration file. This must be a valid configuration file with a <b>.cfg</b> filename extension. Specify this to copy the script in the file into the startup-config file. Note that this does not make the copied file the new startup file, so any further changes made in the configuration file are not added to the startup-config file unless you reuse this command. See <a href="#">Introduction</a> on page 128 for valid syntax.
<code>&lt;destination-name&gt;</code>	The destination and filename that you are saving the startup-config as. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See <a href="#">Introduction</a> on page 128 for valid syntax.

**Mode** Privileged Exec

**Examples** To copy the file `Layer3.cfg` to the `startup-config`, use the command:

```
awplus# copy Layer3.cfg startup-config
```

To copy the `startup-config` as the file `oldconfig.cfg` in the current directory, use the command:

```
awplus# copy startup-config oldconfig.cfg
```

**Related Commands** [copy running-config](#)

# copy zmodem

**Overview** This command allows you to copy files using ZMODEM using Minicom. ZMODEM works over a serial connection and does not need any interfaces configured to do a file transfer.

**Syntax** `copy <source-name> zmodem`  
`copy zmodem`

Parameter	Description
<code>&lt;source-name&gt;</code>	The filename and path of the source file. See <a href="#">Introduction</a> on page 128 for valid syntax.

**Mode** Privileged Exec

**Example** To copy the local file `asuka.key` using ZMODEM, use the command:

```
awplus# copy asuka.key zmodem
```

**Related Commands** [copy \(filename\)](#)  
[show file systems](#)

# create autoboot

**Overview** Use this command to create an autoboot.txt file on an external storage device. This command will automatically ensure that the keys and values that are expected in this file are correct. After the file is created the **create autoboot** command will copy the current release and configuration files across to the external storage device. The external storage device is then available to restore a release file and/or a configuration file to the device.

**Syntax** `create autoboot usb`

**Mode** Privileged Exec

**Example** To create an autoboot.txt file on a USB storage device, use the command:

```
awplus# create autoboot usb
```

**Related  
Commands** [autoboot enable](#)  
[show autoboot](#)  
[show boot](#)

# crypto verify

**Overview** Use this command to compare the SHA256 checksum of the release file with the correct checksum for the file. This ensures that the release file has not been corrupted or interfered with during download.

Use the **no** variant of this command to remove a verified filename/hash combination from the running configuration.

**Syntax** `crypto verify <filename> <hash-value>`  
`no crypto verify <filename>`

Parameter	Description
<code>&lt;filename&gt;</code>	The AlliedWare Plus release file that you want to verify
<code>&lt;hash-value&gt;</code>	The known correct checksum of the file. The correct checksum is listed in the release's sha256sum file, which is available from the Allied Telesis Download Center.

**Default** No default

**Mode** Global Configuration

**Usage** If the verification fails, the following error message will be generated:

```
"% Verification Failed"
```

If the verification fails, please delete the release file and contact Allied Telesis support.

All models of a particular series run the same release file and therefore have the same checksum. For example, all x930 Series switches have the same checksum.

Once the device has successfully verified the release file, it adds the **crypto verify** command to the running configuration.

If the device is in secure mode, it will verify the release file every time it boots up. To do this, it runs the **crypto verify** command while booting. Therefore, you need to copy the **crypto verify** command to the startup configuration, by using the command **copy running-config startup-config**. If the **crypto verify** command is not in the startup configuration, the device will report a verification error at bootup.

If there is a verification error at bootup, the device produces an error message and finishes booting up. If this happens, run the **crypto verify** command after bootup finishes, to verify the running release file. If verification of the running release file fails, delete the release file and contact Allied Telesis support.

**Example** To verify the release file for 5.4.8-1.2 on an x930 Series switch, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify x930-5.4.8-1.2.rel
50fae963b460ba02eb0bd609289c0491de404ba5b0d7e5fa79e64f56082ecf
ee
```

**Related  
Commands** [crypto secure-mode](#)  
[show secure-mode](#)

# delete

**Overview** This command deletes files or directories.

**Syntax** delete [force] [recursive] <filename>

Parameter	Description
force	Ignore nonexistent filenames and never prompt before deletion.
recursive	Remove the contents of directories recursively.
<filename>	The filename and path of the file to delete. See <a href="#">Introduction</a> on page 128 for valid syntax.

**Mode** Privileged Exec

**Examples** To delete the file `temp.cfg` from the current directory, use the command:

```
awplus# delete temp.cfg
```

To delete the read-only file `one.cfg` from the current directory, use the command:

```
awplus# delete force one.cfg
```

To delete the directory `old_configs`, which is not empty, use the command:

```
awplus# delete recursive old_configs
```

To delete the directory `new_configs`, which is not empty, without prompting if any read-only files are being deleted, use the command:

```
awplus# delete force recursive new_configs
```

**Related Commands** [erase startup-config](#)  
[rmdir](#)

# delete debug

**Overview** Use this command to delete a specified debug output file.

**Syntax** `delete debug <source-name>`

Parameter	Description
<code>&lt;source-name&gt;</code>	The filename and path where the debug output originates. See <a href="#">Introduction</a> on page 128 for valid URL syntax.

**Mode** Privileged Exec

**Example** To delete debug output, use the following command:

```
awplus# delete debug
```

**Output** Figure 2-3: CLI prompt after entering the **delete debug** command

```
Enter source file name []:
```

**Related  
Commands** [copy debug](#)  
[move debug](#)

# delete stack-wide force

**Overview** Use this command to delete files from all members of a stack.

**Syntax** `delete stack-wide force [recursive] <name>`

Parameter	Description
<code>recursive</code>	Delete directories that match the name, including their contents.
<code>&lt;name&gt;</code>	The name of the files or directories to delete. The filename can include the wildcard *. Use the wildcard with caution, because this command does not ask for confirmation before deleting files.

**Mode** Privileged Exec.

**Usage** This is a non-interactive command, so if the specified file or files exist, they are deleted without question or warning. This is indicated by the mandatory **force** parameter.

You can use this command within an AMF working set.

**Examples** To delete a file "test.scp" that is located in flash memory on all stack members, use the following command:

```
awplus# delete stack-wide force test.scp
```

To remove directories "output1" and "output2" from an external USB memory device on all stack members, use the following command:

```
awplus# delete stack-wide force recursive usb:output*
```

**Related Commands** [cd](#)  
[dir stack-wide](#)

**Command changes** Version 5.4.7-0.1: command added.

# dir

**Overview** This command lists the files on a filesystem. If you don't specify a directory or file, then this command lists the files in the current directory.

**Syntax** `dir [all] [recursive] [sort [reverse] [name|size|time]] [<filename>|debug|flash|nvs|usb]`

Parameter	Description
all	List all files.
recursive	List the contents of directories recursively.
sort	Sort directory listing.
reverse	Sort using reverse order.
name	Sort by name.
size	Sort by size.
time	Sort by modification time (default).
<i>&lt;filename&gt;</i>	The name of the directory or file. If you don't specify a directory or file, then this command lists the files in the current directory.
debug	Debug root directory
flash	Flash memory root directory
nvs	NVS memory root directory
usb	USB storage device root directory

**Mode** Privileged Exec

**Usage** In a stacked environment you can use the CLI on a stack master to access filesystems that are located on another stack member. The syntax is:

```
<hostname>-<stack_ID>/flash:[/][<directory>/]  
<stack_member_filename>
```

For example, to specify a file in the "configs" directory on member 2 of a stack, enter:

```
awplus-2/flash:/configs/example.cfg
```

Alternatively, you can use the command `dir stack-wide` to display files on all stack members.

**Examples** To list the files in the current working directory, use the command:

```
awplus# dir
```

To list the non-hidden files in the root of the Flash filesystem, use the command:

```
awplus# dir flash
```

To list all the files in the root of the Flash filesystem, use the command:

```
awplus# dir all flash:
```

To list recursively the files in the Flash filesystem, use the command:

```
awplus# dir recursive flash:
```

To list the files in alphabetical order, use the command:

```
awplus# dir sort name
```

To list the files by size, smallest to largest, use the command:

```
awplus# dir sort reverse size
```

To sort the files by modification time, oldest to newest, use the command:

```
awplus# dir sort reverse time
```

To list the files within the Flash filesystem for stack member 2, use the command:

```
awplus# dir awplus-2/flash:/
```

Note that you must specify the filesystem on the stack member (**flash** in this example).

**Output** Figure 2-4: Example output from the **dir** command

```
awplus#dir
 630 -rw- May 19 2016 23:36:31 example.cfg
23652123 -rw- May 17 2016 03:41:18
 149 -rw- Feb 9 2016 00:40:35 exception.log
```

**Related  
Commands** [cd](#)  
[pwd](#)

# dir stack-wide

**Overview** This command lists the files on all stack members at once. If you don't specify a directory or file, then this command lists the files in the current directory.

**Syntax** `dir stack-wide [all] [recursive] [sort [reverse]] [name|size|time]] [<filename>|debug|flash|nvs|usb]`

Parameter	Description
all	List all files.
recursive	List the contents of directories recursively.
sort	Sort directory listing.
reverse	Sort using reverse order.
name	Sort by name.
size	Sort by size.
time	Sort by modification time (default).
<filename>	The name of the directory or file. If you don't specify a directory or file, then this command lists the files in the current directory.
debug	Debug root directory
flash	Flash memory root directory
nvs	NVS memory root directory
usb	USB storage device root directory

**Mode** Privileged Exec

**Usage** The **dir stack-wide** command behaves the same as the **dir** command, except for running on all stack members.

**Examples** To list the files in the current directory across all stack members, use the command:

```
awplus# dir stack-wide
```

To list files in the root flash directory across all stack members, use the command:

```
awplus# dir stack-wide flash
```

To list all files recursively in the root flash directory across all stack members, use the command:

```
awplus# dir stack-wide all recursive flash
```

To list the files in alphabetical order, use the command:

```
awplus# dir stack-wide sort name
```

To list the files by size, smallest to largest, use the command:

```
awplus# dir stack-wide sort reverse size
```

To sort the files by modification time, oldest to newest, use the command:

```
awplus# dir stack-wide sort reverse time
```

**Output** Figure 2-5: Example output from using the **dir stack-wide** command to list files that start with atmf

```
awplus#dir stack-wide atmf*

Stack member 1:
263 rw Nov 15 2017 15:22:52 flash:/atmfStableNodes.sh
3117 rw Nov 14 2017 13:26:31 flash:/atmf-find.sh
2346 rw Nov 14 2017 13:26:19 flash:/atmf-rec.sh

Stack member 2:
263 rw Nov 15 2017 15:22:52 flash:/atmfStableNodes.sh
3117 rw Nov 14 2017 13:26:31 flash:/atmf-find.sh
2346 rw Nov 14 2017 13:26:19 flash:/atmf-rec.sh
```

**Related Commands** [cd](#)  
[delete stack-wide force](#)

**Command changes** Version 5.4.8-0.2: command added.

# edit

**Overview** This command opens a text file in the AlliedWare Plus™ text editor. Once opened you can use the editor to alter to the file.

If a filename is specified and it already exists, then the editor opens it in the text editor.

If no filename is specified, the editor prompts you for one when you exit it.

Before starting the editor make sure your terminal, terminal emulation program, or Telnet client is 100% compatible with a VT100 terminal. The editor uses VT100 control sequences to display text on the terminal.

For more information about using the editor, including control sequences, see the [File Management Feature Overview and Configuration Guide](#).

**Syntax** `edit [<filename>]`

Parameter	Description
<code>&lt;filename&gt;</code>	Name of a file in the local Flash filesystem.

**Mode** Privileged Exec

**Examples** To create and edit a new text file, use the command:

```
awplus# edit
```

To edit the existing configuration file `myconfig.cfg` stored on your device's Flash memory, use the command:

```
awplus# edit myconfig.cfg
```

**Related Commands** [edit \(filename\)](#)  
[show file](#)

# edit (filename)

**Overview** This command opens a remote text file as read-only in the AlliedWare Plus™ text editor.

Before starting the editor make sure your terminal, terminal emulation program, or Telnet client is 100% compatible with a VT100 terminal. The editor uses VT100 control sequences to display text on the terminal.

**Syntax** `edit <filename>`

Parameter	Description
<code>&lt;filename&gt;</code>	The filename and path of the remote file. See <a href="#">Introduction</a> on page 128 for valid syntax.

**Mode** Privileged Exec

**Example** To view the file `bob.key` stored in the security directory of a TFTP server, use the command:

```
awplus# edit tftp://security/bob.key
```

**Related Commands**

- [copy \(filename\)](#)
- [edit](#)
- [show file](#)

# erase factory-default

**Overview** This command erases all data from NVS and all data from Flash **except** the following:

- the boot release file (a .rel file) and its release setting file
- all license files
- the latest GUI release file

The device is then rebooted and returned to its factory default condition. The device can then be used for AMF automatic node recovery.

**Syntax** `erase factory-default`

**Mode** Privileged Exec.

**Usage** This command is an alias to the [atmf cleanup](#) command.

Note that this command can only be used on standalone switches, not stacked switches.

**Example** To erase data, use the command:

```
Node_1# erase factory-default
```

```
This command will erase all NVS, all flash contents except for  
the boot release, a GUI resource file, and any license files,  
and then reboot the switch. Continue? (y/n):y
```

**Related  
Commands** [atmf cleanup](#)

# erase startup-config

**Overview** This command deletes the file that is set as the startup-config file, which is the configuration file that the system runs when it boots up.

At the next restart, the device loads the default configuration file, default.cfg. If default.cfg no longer exists, then the device loads with the factory default configuration. This provides a mechanism for you to return the device to the factory default settings.

**Syntax** `erase startup-config`

**Mode** Privileged Exec

**Example** To delete the file currently set as the startup-config, use the command:

```
awplus# erase startup-config
```

**Related Commands**

- [boot config-file backup](#)
- [copy running-config](#)
- [copy startup-config](#)
- [show boot](#)

# ip tftp source-interface

**Overview** Use this command to manually specify the IP address that all TFTP requests originate from. This is useful in network configurations where TFTP servers only accept requests from certain devices, or where the server cannot dynamically determine the source of the request.

Use the **no** variant of this command to stop specifying a source.

**Syntax** `ip tftp source-interface [<interface>|<ip-add>]`  
`no ip tftp source-interface`

Parameter	Description
<code>&lt;interface&gt;</code>	The VLAN that TFTP requests originate from. The device will use the IP address of this interface as its source IP address.
<code>&lt;ip-add&gt;</code>	The IP address that TFTP requests originate from, in dotted decimal format

**Default** There is no default source specified.

**Mode** Global Configuration

**Usage** This command is helpful in network configurations where TFTP traffic needs to traverse point-to-point links or subnets within your network, and you do not want to propagate those point-to-point links through your routing tables.

In those circumstances, the TFTP server cannot dynamically determine the source of the TFTP request, and therefore cannot send the requested data to the correct device. Specifying a source interface or address enables the TFTP server to send the data correctly.

**Example** To specify that TFTP requests originate from the IP address 192.0.2.1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip tftp source-interface 192.0.2.1
```

**Related Commands** [copy \(filename\)](#)

# ipv6 tftp source-interface

**Overview** Use this command to manually specify the IPv6 address that all TFTP requests originate from. This is useful in network configurations where TFTP servers only accept requests from certain devices, or where the server cannot dynamically determine the source of the request.

Use the **no** variant of this command to stop specifying a source.

**Syntax** `ipv6 tftp source-interface [<interface>|<ipv6-add>]`  
`no ipv6 tftp source-interface`

Parameter	Description
<code>&lt;interface&gt;</code>	The VLAN that TFTP requests originate from. The device will use the IPv6 address of this interface as its source IPv6 address.
<code>&lt;ipv6-add&gt;</code>	The IPv6 address that TFTP requests originate from, in the format x:x:x:x, for example, 2001:db8::8a2e:7334.

**Default** There is no default source specified.

**Mode** Global Configuration

**Usage** This command is helpful in network configurations where TFTP traffic needs to traverse point-to-point links or subnets within your network, and you do not want to propagate those point-to-point links through your routing tables.

In those circumstances, the TFTP server cannot dynamically determine the source of the TFTP request, and therefore cannot send the requested data to the correct device. Specifying a source interface or address enables the TFTP server to send the data correctly.

**Example** To specify that TFTP requests originate from the IPv6 address 2001:db8::8a2e:7334, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 tftp source-interface 2001:db8::8a2e:7334
```

**Related Commands** [copy \(filename\)](#)

# mkdir

**Overview** This command makes a new directory.

**Syntax** mkdir <name>

Parameter	Description
<name>	The name and path of the directory that you are creating.

**Mode** Privileged Exec

**Usage** You cannot name a directory or subdirectory **flash**, **nvs**, **usb**, **card**, **tftp**, **scp**, **sftp** or **http**. These keywords are reserved for tab completion when using various file commands.

**Example** To make a new directory called `images` in the current directory, use the command:

```
awplus# mkdir images
```

**Related  
Commands** `cd`  
`dir`  
`pwd`

# move

**Overview** This command renames or moves a file.

**Syntax** `move <source-name> <destination-name>`

Parameter	Description
<code>&lt;source-name&gt;</code>	The filename and path of the source file. See <a href="#">Introduction</a> on page 128 for valid syntax.
<code>&lt;destination-name&gt;</code>	The filename and path of the destination file. See <a href="#">Introduction</a> on page 128 for valid syntax.

**Mode** Privileged Exec

**Examples** To rename the file `temp.cfg` to `startup.cfg`, use the command:

```
awplus# move temp.cfg startup.cfg
```

To move the file `temp.cfg` from the root of the Flash filesystem to the directory `myconfigs`, use the command:

```
awplus# move temp.cfg myconfigs/temp.cfg
```

**Related  
Commands** [delete](#)  
[edit](#)

[show file](#)

[show file systems](#)

# move debug

**Overview** This command moves a specified debug file to a destination debug file.

**Syntax** `move debug {<destination-name>|debug|nvs|flash|usb}`

Parameter	Description
<code>&lt;destination-name&gt;</code>	The filename and path where you would like the debug output moved to. See <a href="#">Introduction</a> on page 128 for valid syntax.

**Mode** Privileged Exec

**Example** To move debug output into Flash memory with a filename “my-debug”, use the following command:

```
awplus# move debug flash:my-debug
```

To move debug output onto a USB storage device with a filename “my-debug”, use the following command:

```
awplus# move debug usb:my-debug
```

**Output** Figure 2-6: CLI prompt after entering the **move debug** command

```
Enter source file name []:
```

**Related Commands** [copy debug](#)  
[delete debug](#)

# pwd

**Overview** This command prints the current working directory.

**Syntax** `pwd`

**Mode** Privileged Exec

**Example** To print the current working directory, use the command:

```
awplus# pwd
```

**Related  
Commands** `cd`

# rmdir

**Overview** This command removes a directory. This command only works on empty directories, unless you specify the optional **force** keyword.

**Syntax** `rmdir [force] <name>`

Parameter	Description
<code>force</code>	Optional keyword that allows you to delete directories that are not empty and contain files or subdirectories.
<code>&lt;name&gt;</code>	The name and path of the directory.

**Mode** Privileged Exec

**Usage** In a stacked environment you can use the CLI on a stack master to access filesystems that are located on another stack member. See the [Introduction](#) on page 128 for syntax details.

**Examples** To remove the directory “images” from the top level of the Flash filesystem, use the command:

```
awplus# rmdir flash:/images
```

To create a directory called “level1” containing a subdirectory called “level2”, and then force the removal of both directories, use the commands:

```
awplus# mkdir level1
awplus# mkdir level1/level2
awplus# rmdir force level1
```

To remove a directory called “test” from the top level of the Flash filesystem on stack member 3, use the command:

```
awplus# rmdir awplus-3/flash:/test
```

Note that you must specify the filesystem (**flash:** in this example).

**Related Commands**

- [cd](#)
- [dir](#)
- [mkdir](#)
- [pwd](#)

# show autoboot

**Overview** This command displays the Autoboot configuration and status.

**Syntax** show autoboot

**Mode** Privileged Exec

**Example** To show the Autoboot configuration and status, use the command:

```
awplus# show autoboot
```

**Output** Figure 2-7: Example output from the **show autoboot** command

```
awplus#show autoboot
Autoboot configuration
-----
Autoboot status           : enabled
USB file autoboot.txt exists : yes

Restore information on USB
Autoboot enable in autoboot.txt : yes
Restore release file       : SBx908NG-5.4.8-2.1.rel (file exists)
Restore configuration file  : network_1.cfg (file exists)
```

Figure 2-8: Example output from the **show autoboot** command when an external media source is not present

```
awplus#show autoboot
Autoboot configuration
-----
Autoboot status           : enabled
External media source     : USB not found.
```

**Related Commands**

- [autoboot enable](#)
- [create autoboot](#)
- [show boot](#)

# show boot

**Overview** This command displays the current boot configuration. We recommend that the currently running release is set as the current boot image.

**Syntax** show boot

**Mode** Privileged Exec

**Example** To show the current boot configuration, use the command:

```
awplus# show boot
```

**Output** Figure 2-9: Example output from **show boot** when the current boot config is on a USB storage device

```
awplus#show boot
Boot configuration
-----
Current software   : SBx908NG-5.4.8-2.1.rel
Current boot image : usb:/SBx908NG-5.4.8-2.1.rel
Backup boot image  : flash:/SBx908NG-5.4.8-1.1.rel
Default boot config: flash:/default.cfg
Current boot config: usb:/my.cfg (file exists)
Backup boot config: flash:/backup.cfg (file not found)
Autoboot status    : enabled
```

Table 2-1: Parameters in the output from **show boot**

Parameter	Description
Current software	The current software release that the device is using.
Current boot image	The boot image currently configured for use during the next boot cycle.
Backup boot image	The boot image to use during the next boot cycle if the device cannot load the main image.
Default boot config	The default startup configuration file. The device loads this configuration script if no file is set as the startup-config file.
Current boot config	The configuration file currently configured as the startup-config file. The device loads this configuration file during the next boot cycle if this file exists.

Table 2-1: Parameters in the output from **show boot** (cont.)

Parameter	Description
Backup boot config	The configuration file to use during the next boot cycle if the main configuration file cannot be loaded.
Autoboot status	The status of the Autoboot feature; either enabled or disabled.

**Related  
Commands**

- [autoboot enable](#)
- [boot config-file backup](#)
- [boot system backup](#)
- [show autoboot](#)

# show file

**Overview** This command displays the contents of a specified file.

**Syntax** `show file <filename>`

Parameter	Description
<code>&lt;filename&gt;</code>	Name of a file on the local Flash filesystem, or name and directory path of a file.

**Mode** Privileged Exec

**Example** To display the contents of the file `oldconfig.cfg`, which is in the current directory, use the command:

```
awplus# show file oldconfig.cfg
```

**Related Commands**

- [edit](#)
- [edit \(filename\)](#)
- [show file systems](#)

# show file systems

**Overview** This command lists the filesystems and their utilization information where appropriate.

**Syntax** show file systems

**Mode** Privileged Exec

**Examples** To display the filesystems, use the command:

```
awplus# show file systems
```

**Output** Figure 2-10: Example output from the **show file systems** command

```
awplus#show file systems

Stack member 1:

Size (b)   Free (b)   Type      Flags   Prefixes  S/D/V   Lcl/Ntwk  Avail
-----
 3.6G      3.5G      flash     rw      flash:    static  local     Y
-          -          system    rw      system:   virtual local     -
10.0M      9.8M      debug     rw      debug:    static  local     Y

-          -          tftp      rw      tftp:     -       network  -
-          -          scp       rw      scp:      -       network  -
-          -          sftp      ro      sftp:     -       network  -
-          -          http      ro      http:     -       network  -
-          -          rsync     rw      rsync:    -       network  -
```

**Table 3:** Parameters in the output of the **show file systems** command

Parameter	Description
Size (B) Available	The total memory available to this filesystem. The units are given after the value and are M for Megabytes or k for kilobytes.
Free (B)	The total memory free within this filesystem. The units are given after the value and are M for Megabytes or k for kilobytes.
Type	The memory type used for this filesystem, such as: flash system nvs usbstick tftp scp sftp http.

**Table 3:** Parameters in the output of the **show file systems** command (cont.)

Parameter	Description
Flags	The file setting options: rw (read write), ro (read only).
Prefixes	The prefixes used when entering commands to access the filesystems, such as: flash system nvs usb tftp scp sftp http.
S/V/D	The memory type: static, virtual, dynamic.
Lcl / Ntwk	Whether the memory is located locally or via a network connection.
Avail	Whether the memory is accessible: Y (yes), N (no), - (not applicable)

**Related Commands**

- [edit](#)
- [edit \(filename\)](#)
- [show file](#)

# show running-config

**Overview** This command displays the current configuration of your device. Its output includes all non-default configuration. The default settings are not displayed.

**NOTE:** You can control the output by entering `|` or `>` at the end of the command:

- To display only lines that contain a particular word, enter:

```
| include <word>
```

- To start the display at the first line that contains a particular word, enter:

```
| begin <word>
```

- To save the output to a file, enter:

```
> <filename>
```

**Syntax** `show running-config [full|<feature>]`

Parameter	Description
full	Display the running-config for all features. This is the default setting, so it is the same as entering <b>show running-config</b> .
<feature>	Display only the configuration for a single feature. The features available depend on your device and will be some of the following list:
access-list	ACL configuration
antivirus	Antivirus configuration
application	Application configuration
as-path	Autonomous system path filter configuration
as-path access-list	Configuration of ACLs for AS path filtering
atmf	Allied Telesis Management Framework configuration
bgp	Border Gateway Protocol (BGP) configuration
community-list	Community-list configuration
crypto	Security-specific configuration
dhcp	DHCP configuration
dpi	Deep Packet Inspection configuration
entity	Entity configuration
firewall	Firewall configuration
interface	Interface configuration. See <a href="#">show running-config interface</a> for further options.

Parameter	Description
ip	Internet Protocol (IP) configuration
ip pim dense-mode	PIM-DM configuration
ip pim sparse-mode	PIM-SM configuration
ip route	IP static route configuration
ip-reputation	IP Reputation configuration
ips	IPS configuration
ipsec	Internet Protocol Security (IPsec) configuration
ipv6	Internet Protocol version 6 (IPv6) configuration
ipv6 access-list	IPv6 ACL configuration
ipv6 mroute	IPv6 multicast route configuration
ipv6 prefix-list	IPv6 prefix list configuration
ipv6 route	IPv6 static route configuration
isakmp	Internet Security Association Key Management Protocol (ISAKMP) configuration
key chain	Authentication key management configuration
l2tp-profile	L2TP tunnel profile configuration
lldp	LLDP configuration
log	Logging utility configuration
malware-protection	Malware protection configuration
nat	Network Address Translation configuration
power-inline	Power over Ethernet (PoE) configuration
policy-based-routing	Policy-based routing (PBR) configuration
pppoe-ac	PPPoE access concentrator configuration
prefix-list	Prefix-list configuration
route-map	Route-map configuration
router	Router configuration
router-id	Configuration of the router identifier for this system
security-password	Strong password security configuration
snmp	SNMP configuration
ssh	Secure Shell configuration

Parameter	Description
switch	Switch configuration
web-control	Web Control configuration

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of your device, use the command:

```
awplus# show running-config
```

**Output** Figure 2-11: Example output from **show running-config**

```
awplus#show running-config
!
service password-encryption
!
no banner motd
!
username manager privilege 15 password 8 $1$bJoVec4D$JwOJGPr7YqoExA0GVasdE0
!

!
service telnet
!
service http
!
no clock timezone

...

line con 0
line vty 0 4
!
end
```

**Related Commands** [copy running-config](#)  
[show running-config interface](#)

# show running-config interface

**Overview** This command displays the current configuration of one or more interfaces on the device.

**Syntax** `show running-config interface [<interface-list>] [dot1x|ip igmp|ip multicast|ip pim dense-mode|ip pim sparse-mode|ipv6 rip|lacp|mstp|ospf|rip|rstp|stp]`

Parameter	Description
<interface-list>	<p>The interfaces or ports to display information about. An interface-list can be:</p> <ul style="list-style-type: none"> <li>a VLAN (e.g. vlan2), a switch port (e.g. port1.1.12), a static channel group (e.g. sa3) or a dynamic (LACP) channel group (e.g. po4)</li> <li>a continuous range of VLANs, ports, static channel groups or dynamic (LACP) channel groups, separated by a hyphen (e.g. vlan2-8, or port1.1.1-1.1.24, or sa2-4, or po1-3)</li> <li>a comma-separated list of the above (e.g. port1.1.1,port1.1.8-1.1.24). Do not mix interface types in a list.</li> </ul> <p>The specified interfaces must exist.</p>
dot1x	Displays running configuration for 802.1X port authentication for the specified interfaces.
lacp	Displays running configuration for LACP (Link Aggregation Control Protocol) for the specified interfaces.
ip igmp	Displays running configuration for IGMP (Internet Group Management Protocol) for the specified interfaces.
ip multicast	Displays running configuration for general multicast settings for the specified interfaces.
ip pim sparse-mode	Displays running configuration for PIM-SM (Protocol Independent Multicast - Sparse Mode) for the specified interfaces.
ip pim dense-mode	Displays running configuration for PIM-DM (Protocol Independent Multicasting - Dense Mode) for the specified interfaces.
mstp	Displays running configuration for MSTP (Multiple Spanning Tree Protocol) for the specified interfaces.
ospf	Displays running configuration for OSPF (Open Shortest Path First) for the specified interfaces.
rip	Displays running configuration for RIP (Routing Information Protocol) for the specified interfaces.
ipv6 rip	Displays running configuration for RIPng (RIP for IPv6) for the specified interfaces.

Parameter	Description
rstp	Displays running configuration for RSTP (Rapid Spanning Tree Protocol) for the specified interfaces.
stp	Displays running configuration for STP (Spanning Tree Protocol) for the specified interfaces.

**Mode** Privileged Exec and Global Configuration

**Default** Displays information for all protocols on all interfaces

**Examples** To display the current running configuration of your switch for port1.1.1 to port1.1.24, use the command:

```
awplus# show running-config interface port1.1.1-port1.1.24
```

To display the current running configuration of a device for VLAN 1, use the command:

```
awplus# show running-config interface vlan1
```

To display the current running configuration of a device for VLANs 1 and 3-5, use the command:

```
awplus# show running-config interface vlan1,vlan3-vlan5
```

To display current OSPF configuration of your switch for port1.1.1 to port1.1.24, use the command:

```
awplus# show running-config interface port1.1.1-port1.1.24 ospf
```

To display current IGMP configuration for ports 1 to 12 on XEM 1 and 3, use the command:

```
awplus# show running-config interface  
port1.1.1-1.1.12,port1.3.1-1.3.12 ip igmp
```

**Output** Figure 2-12: Example output from a **show running-config interface port1.2.12** command

```
awplus#show running-config interface port1.2.12  
!  
interface port1.2.12  
  switchport  
  switchport mode access  
  switchport access vlan 2  
!
```

**Related Commands** [copy running-config](#)  
[show running-config](#)

# show startup-config

**Overview** This command displays the contents of the start-up configuration file, which is the file that the device runs on start-up.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show startup-config`

**Mode** Privileged Exec

**Example** To display the contents of the current start-up configuration file, use the command:

```
awplus# show startup-config
```

**Output** Figure 2-13: Example output from the **show startup-config** command

```
awplus#show startup-config
!
service password-encryption
!
no banner motd
!
username manager privilege 15 password 8 $1$bJoVec4D$JwOJGPr7YqoExA0GVasdE0
!
no service ssh
!
service telnet
!
service http
!
no clock timezone

...

line con 0
line vty 0 4
!
end
```

  - [erase startup-config](#)
  - [show boot](#)

# show version

**Overview** This command displays the version number and copyright details of the current AlliedWare Plus™ OS your device is running.

**Syntax** show version

**Mode** User Exec and Privileged Exec

**Example** To display the version details of your currently installed software, use the command:

```
awplus# show version
```

**Output** Figure 2-14: Example output from **show version**

```
awplus#show version

AlliedWare Plus (TM) 5.4.3 19/11/12 13:22:32

**Related** [boot system backup](#)  
**Commands** [show boot](#)

# unmount

**Overview** Use this command to unmount an external storage device. We recommend you unmount storage devices before removing them, to avoid file corruption. This is especially important if files may be automatically written to the storage device, such as external log files or AMF backup files.

**Syntax** `unmount usb`  
`unmount usb member [<stack-ID>]`

Parameter	Description
<code>usb</code>	Unmount the USB storage device.
<code>member &lt;stack-ID&gt;</code>	Stack member number, from 1 to 8.

**Mode** Privileged Exec

**Example** To unmount a USB storage device and safely remove it from the device, use the command:

```
awplus# unmount usb
```

**Related Commands** [clear log external](#)  
[log external](#)

**Command changes** Version 5.4.7-1.1: command added

# write file

**Overview** This command copies the running-config into the file that is set as the current startup-config file. This command is a synonym of the **write memory** and **copy running-config startup-config** commands.

**Syntax** write [file]

**Mode** Privileged Exec

**Example** To write configuration data to the start-up configuration file, use the command:

```
awplus# write file
```

**Related  
Commands**

- [copy running-config](#)
- [write memory](#)
- [show running-config](#)

# write memory

**Overview** This command copies the running-config into the file that is set as the current startup-config file. This command is a synonym of the **write file** and **copy running-config startup-config** commands.

**Syntax** `write [memory]`

**Mode** Privileged Exec

**Example** To write configuration data to the start-up configuration file, use the command:

```
awplus# write memory
```

**Related Commands**

- [copy running-config](#)
- [write file](#)
- [show running-config](#)

# write terminal

**Overview** This command displays the current configuration of the device. This command is a synonym of the [show running-config](#) command.

**Syntax** `write terminal`

**Mode** Privileged Exec

**Example** To display the current configuration of your device, use the command:

```
awplus# write terminal
```

**Related  
Commands** [show running-config](#)

# 3

# User Access Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure user access.

- Command List**
- “clear line console” on page 188
  - “clear line vty” on page 189
  - “enable password” on page 190
  - “enable secret” on page 193
  - “exec-timeout” on page 196
  - “flowcontrol hardware (asyn/console)” on page 198
  - “length (asyn)” on page 200
  - “line” on page 201
  - “privilege level” on page 203
  - “security-password history” on page 204
  - “security-password forced-change” on page 205
  - “security-password lifetime” on page 206
  - “security-password min-lifetime-enforce” on page 207
  - “security-password minimum-categories” on page 208
  - “security-password minimum-length” on page 209
  - “security-password reject-expired-pwd” on page 210
  - “security-password warning” on page 211
  - “service advanced-vty” on page 212
  - “service password-encryption” on page 213
  - “service telnet” on page 214

- [“service terminal-length \(deleted\)”](#) on page 215
- [“show privilege”](#) on page 216
- [“show security-password configuration”](#) on page 217
- [“show security-password user”](#) on page 218
- [“show telnet”](#) on page 219
- [“show users”](#) on page 220
- [“telnet”](#) on page 221
- [“telnet server”](#) on page 222
- [“terminal length”](#) on page 223
- [“terminal resize”](#) on page 224
- [“username”](#) on page 225

# clear line console

**Overview** This command resets a console line. If a terminal session exists on the line then the terminal session is terminated. If console line settings have changed then the new settings are applied.

**Syntax** `clear line console 0`

**Mode** Privileged Exec

**Example** To reset the console line (asyn), use the command:

```
awplus# clear line console 0
```

```
awplus# % The new settings for console line 0 have been applied
```

**Related Commands**

- [clear line vty](#)
- [flowcontrol hardware \(asyn/console\)](#)
- [line](#)
- [show users](#)

# clear line vty

**Overview** This command resets a VTY line. If a session exists on the line then it is closed.

**Syntax** `clear line vty <0-32>`

Parameter	Description
<0-32>	Line number

**Mode** Privileged Exec

**Example** To reset the first VTY line, use the command:

```
awplus# clear line vty 1
```

**Related Commands**

- [privilege level](#)
- [line](#)
- [show telnet](#)
- [show users](#)

# enable password

**Overview** To set a local password to control access to various privilege levels, use the `enable password` Global Configuration command. Use the `enable password` command to modify or create a password to be used, and use the `no enable password` command to remove the password.

Note that the `enable secret` command is an alias for the `enable password` command, and the `no enable secret` command is an alias for the `no enable password` command. Issuing a `no enable password` command removes a password configured with the `enable secret` command. The `enable password` command is shown in the running and startup configurations. Note that if the `enable secret` command is entered then `enable password` is shown in the configuration.

**NOTE:** Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option 8 for GUI users.

**Syntax** `enable password [<plain>|8 <hidden>|level <1-15> 8 <hidden>]`  
`no enable password [level <1-15>]`

Parameter	Description
<code>&lt;plain&gt;</code>	Specifies the unencrypted password.
8	Specifies a hidden password will follow.
<code>&lt;hidden&gt;</code>	Specifies the hidden encrypted password. Use an encrypted password for better security where a password crosses the network or is stored on a TFTP server.
level	Privilege level <1-15>. Level for which the password applies. You can specify up to 16 privilege levels, using numbers 1 through 15. Level 1 is normal EXEC-mode user privileges for User Exec mode. If this argument is not specified in the command or the <b>no</b> variant of the command, the privilege level defaults to 15 (enable mode privileges) for Privileged Exec mode. A privilege level of 7 can be set for intermediate CLI security.

**Default** The privilege level for enable password is level 15 by default. Previously the default was level 1.

**Mode** Global Configuration

**Usage** This command enables the Network Administrator to set a password for entering the Privileged Exec mode when using the `enable (Privileged Exec mode)` command. There are three methods to enable a password. In the examples below, for each method, note that the configuration is different and the configuration file output is different, but the password string to be used to enter the Privileged Exec mode with the **enable** command is the same (**mypasswd**).

A user can now have an intermediate CLI security level set with this command for privilege level 7 to access all the show commands in Privileged Exec mode and all

the commands in User Exec mode, but not any configuration commands in Privileged Exec mode.

Note that the `enable password` command is an alias for the `enable secret` command and one password per privilege level is allowed using these commands. Do not assign one password to a privilege level with `enable password` and another password to a privilege level with `enable secret`. Use `enable password` or `enable secret` commands. Do not use both on the same level.

### Using plain passwords

The plain password is a clear text string that appears in the configuration file as configured.

```
awplus# configure terminal
awplus(config)# enable password mypasswd
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
hostname awplus
enable password mypasswd
!
interface lo
```

### Using encrypted passwords

You can configure an encrypted password using the `service password-encryption` command. First, use the `enable password` command to specify the string that you want to use as a password (**myspasswd**). Then, use the `service password-encryption` command to encrypt the specified string (**myspasswd**). The advantage of using an encrypted password is that the configuration file does not show **myspasswd**, it will only show the encrypted string **fU7zHzuutY2SA**.

**NOTE:** Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option 8 for GUI users.

```
awplus# configure terminal
awplus(config)# enable password mypasswd
awplus(config)# service password-encryption
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
service password-encryption
!
interface lo
```

### Using hidden passwords

You can configure an encrypted password using the **HIDDEN** parameter (**8**) with the `enable password` command. Use this method if you already know the encrypted string corresponding to the plain text string that you want to use as a

password. It is not required to use the [service password-encryption](#) command for this method. The output in the configuration file will show only the encrypted string, and not the text string.

```
awplus# configure terminal
awplus(config)# enable password 8 fU7zHzuutY2SA
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
!
interface lo
```

**Related  
Commands**

[enable secret](#)  
[service password-encryption](#)  
[privilege level](#)  
[show privilege](#)  
[username](#)  
[show running-config](#)

# enable secret

**Overview** To set a local password to control access to various privilege levels, use the `enable secret` Global Configuration command. Use the `enable secret` command to modify or create a password to be used, and use the `no enable secret` command to remove the password.

Note that the `enable secret` command is an alias for the `enable password` command, and the `no enable secret` command is an alias for the `no enable password` command. Issuing a `no enable password` command removes a password configured with the `enable secret` command. The `enable password` command is shown in the running and startup configurations. Note that if the `enable secret` command is entered then `enable password` is shown in the configuration.

**NOTE:** Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option 8 for GUI users.

**Syntax** `enable secret [<plain>|8 <hidden>|level <0-15> 8 <hidden>]`  
`no enable secret [level <1-15>]`

Parameter	Description
<code>&lt;plain&gt;</code>	Specifies the unencrypted password.
8	Specifies a hidden password will follow.
<code>&lt;hidden&gt;</code>	Specifies the hidden encrypted password. Use an encrypted password for better security where a password crosses the network or is stored on a TFTP server.
level	Privilege level <1-15>. Level for which the password applies. You can specify up to 16 privilege levels, using numbers 1 through 15. Level 1 is normal EXEC-mode user privileges for User Exec mode. If this argument is not specified in the command or the <b>no</b> variant of the command, the privilege level defaults to 15 (enable mode privileges) for Privileged Exec mode. A privilege level of 7 can be set for intermediate CLI security.

**Default** The privilege level for enable secret is level 15 by default.

**Mode** Global Configuration

**Usage** This command enables the Network Administrator to set a password for entering the Privileged Exec mode when using the `enable (Privileged Exec mode)` command. There are three methods to enable a password. In the examples below, for each method, note that the configuration is different and the configuration file output is different, but the password string to be used to enter the Privileged Exec mode with the **enable** command is the same (**mypasswd**).

A user can have an intermediate CLI security level set with this command for privilege level 7 to access all the show commands in Privileged Exec mode and all

the commands in User Exec mode, but not any configuration commands in Privileged Exec mode.

Note that the `enable secret` command is an alias for the `enable password` command and one password per privilege level is allowed using these commands. Do not assign one password to a privilege level with `enable password` and another password to a privilege level with `enable secret`. Use `enable password` or `enable secret` commands. Do not use both on the same level.

### Using plain passwords

The plain password is a clear text string that appears in the configuration file as configured.

```
awplus# configure terminal
awplus(config)# enable secret mypasswd
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
hostname awplus
enable password mypasswd
!
interface lo
```

### Using encrypted passwords

Configure an encrypted password using the `service password-encryption` command. First, use the `enable password` command to specify the string that you want to use as a password (**mypasswd**). Then, use the `service password-encryption` command to encrypt the specified string (**mypasswd**). The advantage of using an encrypted password is that the configuration file does not show **mypasswd**, it will only show the encrypted string **fU7zHzuutY2SA**.

**NOTE:** Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option 8 for GUI users.

```
awplus# configure terminal
awplus(config)# enable secret mypasswd
awplus(config)# service password-encryption
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
service password-encryption
!
interface lo
```

### Using hidden passwords

Configure an encrypted password using the **HIDDEN** parameter (**8**) with the `enable password` command. Use this method if you already know the encrypted string corresponding to the plain text string that you want to use as a password. It

is not required to use the [service password-encryption](#) command for this method. The output in the configuration file will show only the encrypted string, and not the text string:

```
awplus# configure terminal
awplus(config)# enable secret 8 fU7zHzuutY2SA
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
!
interface lo
```

**Related  
Commands**

[enable \(Privileged Exec mode\)](#)  
[enable secret](#)  
[service password-encryption](#)  
[privilege level](#)  
[show privilege](#)  
[username](#)  
[show running-config](#)

# exec-timeout

**Overview** This command sets the interval your device waits for user input from either a console or VTY connection. Once the timeout interval is reached, the connection is dropped. This command sets the time limit when the console or VTY connection automatically logs off after no activity.

The **no** variant of this command removes a specified timeout and resets to the default timeout (10 minutes).

**Syntax** `exec-timeout {<minutes>} [<seconds>]`  
`no exec-timeout`

Parameter	Description
<minutes>	<0-35791> Required integer timeout value in minutes
<seconds>	<0-2147483> Optional integer timeout value in seconds

**Default** The default for the **exec-timeout** command is 10 minutes and 0 seconds (**exec-timeout 10 0**).

**Mode** Line Configuration

**Usage** This command is used set the time the telnet session waits for an idle VTY session, before it times out. An **exec-timeout 0 0** setting will cause the telnet session to wait indefinitely. The command **exec-timeout 0 0** is useful while configuring a device, but reduces device security.

If no input is detected during the interval then the current connection resumes. If no connections exist then the terminal returns to an idle state and disconnects incoming sessions.

**Examples** To set VTY connections to timeout after 2 minutes, 30 seconds if there is no response from the user, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# exec-timeout 2 30
```

To reset the console connection to the default timeout of 10 minutes 0 seconds if there is no response from the user, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no exec-timeout
```

**Validation Commands** `show running-config`

**Related  
Commands** [line](#)  
[service telnet](#)

# flowcontrol hardware (asyn/console)

**Overview** Use this command to enable RTS/CTS (Ready To Send/Clear To Send) hardware flow control on a terminal console line (asyn port) between the DTE (Data Terminal Equipment) and the DCE (Data Communications Equipment).

**Syntax** `flowcontrol hardware`  
`no flowcontrol hardware`

**Mode** Line Configuration

**Default** Hardware flow control is disabled by default.

**Usage** Hardware flow control makes use of the RTS and CTS control signals between the DTE and DCE where the rate of transmitted data is faster than the rate of received data. Flow control is a technique for ensuring that a transmitting entity does not overwhelm a receiving entity with data. When the buffers on the receiving device are full, a message is sent to the sending device to suspend the transmission until the data in the buffers has been processed.

Hardware flow control can be configured on terminal console lines (e.g. asyn0). For Reverse Telnet connections, hardware flow control must be configured to match on both the Access Server and the Remote Device. For terminal console sessions, hardware flow control must be configured to match on both the DTE and the DCE. Settings are saved in the running configuration. Changes are applied after reboot, clear line console, or after closing the session.

Use **show running-config** and **show startup-config** commands to view hardware flow control settings that take effect after reboot for a terminal console line. See the **show running-config** command output:

```
awplus#show running-config
!
line con 1
  speed 9600
  mode out 2001
  flowcontrol hardware
!
```

Note that line configuration commands do not take effect immediately. Line configuration commands take effect after one of the following commands or events:

- issuing a [clear line console](#) command
- issuing a [reboot](#) command
- logging out of the current session

**Examples** To enable hardware flow control on terminal console line asyn0, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# flowcontrol hardware
```

To disable hardware flow control on terminal console line asyn0, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no flowcontrol hardware
```

**Related Commands**

- [clear line console](#)
- [show running-config](#)
- [speed \(asyn\)](#)

# length (asyn)

**Overview** Use this command to specify the number of rows of output that the device will display before pausing, for the console or VTY line that you are configuring.

The **no** variant of this command restores the length of a line (terminal session) attached to a console port or to a VTY to its default length of 22 rows.

**Syntax** length <0-512>  
no length

Parameter	Description
<0-512>	Number of lines on screen. Specify 0 for no pausing.

**Mode** Line Configuration

**Default** The length of a terminal session is 22 rows. The **no length** command restores the default.

**Usage** If the output from a command is longer than the length of the line the output will be paused and the ‘-More-’ prompt allows you to move to the next screen full of data.

A length of 0 will turn off pausing and data will be displayed to the console as long as there is data to display.

**Examples** To set the terminal session length on the console to 10 rows, use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# length 10
```

To reset the terminal session length on the console to the default (22 rows), use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no length
```

To display output to the console continuously, use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# length 0
```

**Related Commands** [terminal resize](#)  
[terminal length](#)

# line

**Overview** Use this command to enter line configuration mode for the specified VTYS or the console. The command prompt changes to show that the device is in Line Configuration mode.

**Syntax** `line vty <first-line> [<last-line>]`  
`line console 0`

Parameter	Description
<code>&lt;first-line&gt;</code>	<code>&lt;0-32&gt;</code> Specify the first line number.
<code>&lt;last-line&gt;</code>	<code>&lt;0-32&gt;</code> Specify the last line number.
<code>console</code>	The console terminal line(s) for local access.
<code>vty</code>	Virtual terminal for remote console access.

**Mode** Global Configuration

**Usage** This command puts you into Line Configuration mode. Once in Line Configuration mode, you can configure console and virtual terminal settings, including setting [speed \(asyn\)](#), [length \(asyn\)](#), [privilege level](#), and authentication ([login authentication](#)) or accounting ([accounting login](#)) method lists.

To change the console (asyn) port speed, use this **line** command to enter Line Configuration mode before using the [speed \(asyn\)](#) command. Set the console speed (Baud rate) to match the transmission rate of the device connected to the console (asyn) port on your device.

Note that line configuration commands do not take effect immediately. Line configuration commands take effect after one of the following commands or events:

- issuing a [clear line console](#) command
- issuing a [reboot](#) command
- logging out of the current session

**Examples** To enter Line Configuration mode in order to configure all VTYS, use the commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)#
```

To enter Line Configuration mode to configure the console (asyn 0) port terminal line, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)#
```

**Related  
Commands**

- accounting login
- clear line console
- clear line vty
- flowcontrol hardware (asyn/console)
- length (asyn)
- login authentication
- privilege level
- speed (asyn)

# privilege level

**Overview** This command sets a privilege level for VTY or console connections. The configured privilege level from this command overrides a specific user's initial privilege level at the console login.

**Syntax** `privilege level <1-15>`

**Mode** Line Configuration

**Usage** You can set an intermediate CLI security level for a console user with this command by applying privilege level 7 to access all show commands in Privileged Exec and all User Exec commands. However, intermediate CLI security will not show configuration commands in Privileged Exec.

**Examples** To set the console connection to have the maximum privilege level, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# privilege level 15
```

To set all VTY connections to have the minimum privilege level, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# privilege level 1
```

To set all VTY connections to have an intermediate CLI security level, to access all show commands, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# privilege level 7
```

**Related Commands**

- [enable password](#)
- [line](#)
- [show privilege](#)
- [username](#)

# security-password history

**Overview** This command specifies the number of previous passwords that are unable to be reused. A new password is invalid if it matches a password retained in the password history.

The **no** variant of the command disables this feature.

**Syntax** `security-password history <0-15>`  
`no security-password history`

Parameter	Description
<0-15>	The allowable range of previous passwords to match against. A value of 0 will disable the history functionality and is equivalent to the <b>no security-password history</b> command. If the history functionality is disabled, all users' password history is reset and all password history is lost.

**Default** The default history value is 0, which will disable the history functionality.

**Mode** Global Configuration

**Examples** To restrict reuse of the three most recent passwords, use the command:

```
awplus# configure terminal
awplus(config)# security-password history 3
```

To allow the reuse of recent passwords, use the command:

```
awplus# configure terminal
awplus(config)# no security-password history
```

- [show security-password user](#)

# security-password forced-change

**Overview** This command specifies whether or not a user is forced to change an expired password at the next login. If this feature is enabled, users whose passwords have expired are forced to change to a password that must comply with the current password security rules at the next login.

Note that to use this command, the lifetime feature must be enabled with the [security-password lifetime](#) command and the reject-expired-pwd feature must be disabled with the [security-password reject-expired-pwd](#) command.

The **no** variant of the command disables this feature.

**Syntax** `security-password forced-change`  
`no security-password forced-change`

**Default** The forced-change feature is disabled by default.

**Mode** Global Configuration

**Example** To force a user to change their expired password at the next login, use the command:

```
awplus# configure terminal
awplus(config)# security-password forced-change
```

# security-password lifetime

**Overview** This command enables password expiry by specifying a password lifetime in days.

Note that when the password lifetime feature is disabled, it also disables the [security-password forced-change](#) command and the [security-password warning](#) command.

The **no** variant of the command disables this feature.

**Syntax** `security-password lifetime <0-1000>`  
`no security-password lifetime`

Parameter	Description
<code>&lt;0-1000&gt;</code>	Password lifetime specified in days. A value of 0 will disable lifetime functionality and the password will never expire. This is equivalent to the <b>no security-password lifetime</b> command.

**Default** The default password lifetime is 0, which will disable the lifetime functionality.

**Mode** Global Configuration

**Example** To configure the password lifetime to 10 days, use the command:

```
awplus# configure terminal
awplus(config)# security-password lifetime 10
```

- [show security-password configuration](#)
- [show security-password user](#)

# security-password min-lifetime-enforce

**Overview** Use this command to configure a minimum number of days before a password can be changed by a user. With this feature enabled, once a user sets the password, the user cannot change it again until the minimum lifetime has passed.

Use the **no** variant of this command to remove the minimum lifetime.

**Syntax** `security-password min-lifetime-enforce <0-1000>`  
`no security-password min-lifetime-enforce`

Parameter	Description
<code>&lt;0-1000&gt;</code>	The minimum number of days before a password can be changed

**Default** By default, no minimum lifetime is enforced.

**Mode** Global Configuration

**Usage** The minimum lifetime is helpful in conjunction with a security policy that prevents people from re-using old passwords. For example, if you do not allow people to re-use any of their last 5 passwords, a person can bypass that restriction by changing their password 5 times in quick succession and then re-setting it to their previous password. The minimum lifetime prevents that by preventing people from changing their password in quick succession.

**Example** To force users to wait at least 2 days between changing passwords, use the command:

```
awplus(config)# security-password min-lifetime-enforce 2
```

**Related Commands**

- [show running-config security-password](#)
- [show security-password configuration](#)
- [show security-password user](#)

**Command changes** Version 5.4.7-0.2: command added

# security-password minimum-categories

**Overview** This command specifies the minimum number of categories that the password must contain in order to be considered valid. The password categories are:

- uppercase letters: A to Z
- lowercase letters: a to z
- digits: 0 to 9
- special symbols: all printable ASCII characters not included in the previous three categories. The question mark (?) cannot be used as it is reserved for help functionality.

Note that to ensure password security, the minimum number of categories should align with the lifetime selected, i.e. the fewer categories specified the shorter the lifetime specified.

**Syntax** `security-password minimum-categories <1-4>`

Parameter	Description
<1-4>	Number of categories the password must satisfy, in the range 1 to 4.

**Default** The default number of categories that the password must satisfy is 1.

**Mode** Global Configuration

**Example** To configure the required minimum number of character categories to be 3, use the command:

```
awplus# configure terminal
awplus(config)# security-password minimum-categories 3
```

**Related Commands**

- [show running-config security-password](#)
- [show security-password configuration](#)
- [show security-password user](#)

# security-password minimum-length

**Overview** This command specifies the minimum allowable password length. This value is checked against when there is a password change or a user account is created.

**Syntax** `security-password minimum-length <1-23>`

Parameter	Description
<1-23>	Minimum password length in the range from 1 to 23.

**Default** The default minimum password length is 1.

**Mode** Global Configuration

**Example** To configure the required minimum password length as 8, use the command:

```
awplus# configure terminal
awplus(config)# security-password minimum-length 8
```

**Related Commands**

# security-password reject-expired-pwd

**Overview** This command specifies whether or not a user is allowed to login with an expired password. Users with expired passwords are rejected at login if this functionality is enabled. Users then have to contact the Network Administrator to change their password.

**CAUTION:** *Once all users' passwords are expired you are unable to login to the device again if the security-password reject-expired-pwd command has been executed. You will have to reboot the device with a default configuration file, or load an earlier software version that does not have the security password feature.*

*We recommend you never have the command line "security-password reject-expired-pwd" in a default config file.*

Note that when the reject-expired-pwd functionality is disabled and a user logs on with an expired password, if the forced-change feature is enabled with [security-password forced-change](#) command, a user may have to change the password during login depending on the password lifetime specified by the [security-password lifetime](#) command.

The **no** variant of the command disables this feature.

**Syntax** security-password reject-expired-pwd  
no security-password reject-expired-pwd

**Default** The reject-expired-pwd feature is disabled by default.

**Mode** Global Configuration

**Example** To configure the system to reject users with an expired password, use the command:

```
awplus# configure terminal
awplus(config)# security-password reject-expired-pwd
```

**Related Commands**

- [security-password warning](#)
- [show running-config security-password](#)
- [show security-password configuration](#)
- [show security-password user](#)

# security-password warning

**Overview** This command specifies the number of days before the password expires that the user will receive a warning message specifying the remaining lifetime of the password.

Note that the warning period cannot be set unless the lifetime feature is enabled with the [security-password lifetime](#) command.

The **no** variant of the command disables this feature.

**Syntax** `security-password warning <0-1000>`  
`no security-password warning`

Parameter	Description
<code>&lt;0-1000&gt;</code>	Warning period in the range from 0 to 1000 days. A value 0 disables the warning functionality and no warning message is displayed for expiring passwords. This is equivalent to the <b>no security-password warning</b> command. The warning period must be less than, or equal to, the password lifetime set with the <a href="#">security-password lifetime</a> command.

**Default** The default warning period is 0, which disables warning functionality.

**Mode** Global Configuration

**Example** To configure a warning period of three days, use the command:

```
awplus# configure terminal
awplus(config)# security-password warning 3
```

**Related Commands**

- [security-password forced-change](#)
- [security-password history](#)
- [security-password lifetime](#)
- [security-password min-lifetime-enforce](#)
- [security-password minimum-categories](#)

# service advanced-vty

**Overview** This command enables the advanced-vty help feature. This allows you to use TAB completion for commands. Where multiple options are possible, the help feature displays the possible options.

The **no service advanced-vty** command disables the advanced-vty help feature.

**Syntax** `service advanced-vty`  
`no service advanced-vty`

**Default** The advanced-vty help feature is enabled by default.

**Mode** Global Configuration

**Examples** To disable the advanced-vty help feature, use the command:

```
awplus# configure terminal
awplus(config)# no service advanced-vty
```

To re-enable the advanced-vty help feature after it has been disabled, use the following commands:

```
awplus# configure terminal
awplus(config)# service advanced-vty
```

# service password-encryption

**Overview** Use this command to enable password encryption. This is enabled by default. When password encryption is enabled, the device displays passwords in the running config in encrypted form instead of in plain text.

Use the **no service password-encryption** command to stop the device from displaying newly-entered passwords in encrypted form. This does not change the display of existing passwords.

**NOTE:** Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option 8 for GUI users.

**Syntax** `service password-encryption`  
`no service password-encryption`

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# service password-encryption`

**Validation Commands** `show running-config`

**Related Commands** `enable password`

# service telnet

**Overview** Use this command to enable the telnet server. The server is enabled by default. Enabling the telnet server starts the device listening for incoming telnet sessions on the configured port.

The server listens on port 23, unless you have changed the port by using the [privilege level](#) command.

Use the **no** variant of this command to disable the telnet server. Disabling the telnet server will stop the device listening for new incoming telnet sessions. However, existing telnet sessions will still be active.

**Syntax** `service telnet [ip|ipv6]`  
`no service telnet [ip|ipv6]`

**Default** The IPv4 and IPv6 telnet servers are enabled by default.  
The configured telnet port is TCP port 23 by default.

**Mode** Global Configuration

**Examples** To enable both the IPv4 and IPv6 telnet servers, use the following commands:

```
awplus# configure terminal
awplus(config)# service telnet
```

To enable the IPv6 telnet server only, use the following commands:

```
awplus# configure terminal
awplus(config)# service telnet ipv6
```

To disable both the IPv4 and IPv6 telnet servers, use the following commands:

```
awplus# configure terminal
awplus(config)# no service telnet
```

To disable the IPv6 telnet server only, use the following commands:

```
awplus# configure terminal
awplus(config)# no service telnet ipv6
```

**Related  
Commands** [clear line vty](#)  
[show telnet](#)  
[telnet server](#)

# service terminal-length (deleted)

**Overview** This command has been deleted in Software Version 5.4.5-0.1 and later.

# show privilege

**Overview** This command displays the current user privilege level, which can be any privilege level in the range <1-15>. Privilege levels <1-6> allow limited user access (all User Exec commands), privilege levels <7-14> allow restricted user access (all User Exec commands plus Privileged Exec show commands). Privilege level 15 gives full user access to all Privileged Exec commands.

**Syntax** `show privilege`

**Mode** User Exec and Privileged Exec

**Usage** A user can have an intermediate CLI security level set with this command for privilege levels <7-14> to access all show commands in Privileged Exec mode and all commands in User Exec mode, but no configuration commands in Privileged Exec mode.

**Example** To show the current privilege level of the user, use the command:

```
awplus# show privilege
```

**Output** Figure 3-1: Example output from the **show privilege** command

```
awplus#show privilege
Current privilege level is 15
awplus#disable
awplus>show privilege
Current privilege level is 1
```

**Related Commands** [privilege level](#)

# show security-password configuration

**Overview** This command displays the configuration settings for the various security password rules.

**Syntax** `show security-password configuration`

**Mode** Privileged Exec

**Example** To display the current security-password rule configuration settings, use the command:

```
awplus# show security-password configuration
```

**Output** Figure 3-2: Example output from the **show security-password configuration** command

```
Security Password Configuration
Minimum password length ..... 8
Minimum password character categories to match ..... 3
Number of previously used passwords to restrict..... 4
Password lifetime ..... 30 day(s)
  Warning period before password expires ..... 3 day(s)
Reject expired password at login ..... Disabled
  Force changing expired password at login ..... Enabled
```

  - [security-password warning](#)
  - [show security-password user](#)

# show security-password user

**Overview** This command displays user account and password information for all users.

**Syntax** `show security-password user`

**Mode** Privileged Exec

**Example** To display the system users' remaining lifetime or last password change, use the command:

```
awplus# show security-password user
```

**Output** Figure 3-3: Example output from the **show security-password** user command

User account and password information			
UserName	Privilege	Last-PWD-Change	Remaining-lifetime
manager	15	4625 day(s) ago	No Expiry
bob15	15	0 day(s) ago	30 days
ted7	7	0 day(s) ago	No Expiry
mike1	1	0 day(s) ago	No Expiry

# show telnet

**Overview** This command shows the Telnet server settings.

**Syntax** `show telnet`

**Mode** User Exec and Privileged Exec

**Example** To show the Telnet server settings, use the command:

```
awplus# show telnet
```

**Output** Figure 3-4: Example output from the **show telnet** command

```
Telnet Server Configuration
-----
Telnet server           : Enabled
Protocol                : IPv4, IPv6
Port                    : 23
```

**Related  
Commands**

- [clear line vty](#)
- [service telnet](#)
- [show users](#)
- [telnet server](#)

# show users

**Overview** This command shows information about the users who are currently logged into the device.

**Syntax** `show users`

**Mode** User Exec and Privileged Exec

**Example** To show the users currently connected to the device, use the command:

```
awplus# show users
```

**Output** Figure 3-5: Example output from the **show users** command

Line	User	Host(s)	Idle	Location	Priv	Idletime	Timeout
con 0	manager	idle	00:00:00	ttyS0	15	10	N/A
vtty 0	bob	idle	00:00:03	172.16.11.3	1	0	5

**Table 1:** Parameters in the output of the **show users** command

Parameter	Description
Line	Console port user is connected to.
User	Login name of user.
Host(s)	Status of the host the user is connected to.
Idle	How long the host has been idle.
Location	URL location of user.
Priv	The privilege level in the range 1 to 15, with 15 being the highest.
Idletime	The time interval the device waits for user input from either a console or VTY connection.
Timeout	The time interval before a server is considered unreachable.

# telnet

**Overview** Use this command to open a telnet session to a remote device.

**Syntax** `telnet {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [<port>]`

**Syntax (VRF-lite)** `telnet [vrf <vrf-name>] {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [<port>]`

Parameter	Description
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
<hostname>	The host name of the remote system.
ip	Keyword used to specify the IPv4 address or host name of a remote system.
<ipv4-addr>	An IPv4 address of the remote system.
ipv6	Keyword used to specify the IPv6 address of a remote system
<ipv6-addr>	Placeholder for an IPv6 address in the format <code>x:x::x:x</code> , for example, <code>2001:db8::8a2e:7334</code>
<port>	Specify a TCP port number (well known ports are in the range 1-1023, registered ports are 1024-49151, and private ports are 49152-65535).

**Mode** User Exec and Privileged Exec

**Examples** To connect to TCP port 2602 on the device at 10.2.2.2, use the command:

```
awplus# telnet 10.2.2.2 2602
```

To connect to the telnet server `host.example`, use the command:

```
awplus# telnet host.example
```

To connect to the telnet server `host.example` on TCP port 100, use the command:

```
awplus# telnet host.example 100
```

**Example (VRF-lite)** To open a telnet session to a remote host `192.168.0.1` associated with VRF instance `red`, use the command:

```
awplus# telnet vrf red ip 192.168.0.1
```

# telnet server

**Overview** This command enables the telnet server on the specified TCP port. If the server is already enabled then it will be restarted on the new port. Changing the port number does not affect the port used by existing sessions.

**Syntax** `telnet server {<1-65535>|default}`

Parameter	Description
<1-65535>	The TCP port to listen on.
default	Use the default TCP port number 23.

**Mode** Global Configuration

**Example** To enable the telnet server on TCP port 2323, use the following commands:

```
awplus# configure terminal
awplus(config)# telnet server 2323
```

**Related Commands** [show telnet](#)

# terminal length

**Overview** Use the **terminal length** command to specify the number of rows of output that the device will display before pausing, for the currently-active terminal only.

Use the **terminal no length** command to remove the length specified by this command. The default length will apply unless you have changed the length for some or all lines by using the [length \(asyn\)](#) command.

**Syntax** `terminal length <length>`  
`terminal no length [<length>]`

Parameter	Description
<code>&lt;length&gt;</code>	<code>&lt;0-512&gt;</code> Number of rows that the device will display on the currently-active terminal before pausing.

**Mode** User Exec and Privileged Exec

**Examples** The following example sets the number of lines to 15:

```
awplus# terminal length 15
```

The following example removes terminal length set previously:

```
awplus# terminal no length
```

**Related Commands** [terminal resize](#)  
[length \(asyn\)](#)

# terminal resize

**Overview** Use this command to automatically adjust the number of rows of output on the console, which the device will display before pausing, to the number of rows configured on the user's terminal.

**Syntax** `terminal resize`

**Mode** User Exec and Privileged Exec

**Usage** When the user's terminal size is changed, then a remote session via SSH or TELNET adjusts the terminal size automatically. However, this cannot normally be done automatically for a serial or console port. This command automatically adjusts the terminal size for a serial or console port.

**Examples** The following example automatically adjusts the number of rows shown on the console:

```
awplus# terminal resize
```

**Related  
Commands** [length \(asyn\)](#)  
[terminal length](#)

# username

**Overview** This command creates or modifies a user to assign a privilege level and a password.

**NOTE:** *The default username privilege level of 1 is not shown in running-config output. Any username privilege level that has been modified from the default is shown.*

**Syntax**

```
username <name> privilege <1-15> [password [8] <password>]  
username <name> password [8] <password>  
no username <name>
```

Parameter	Description
<name>	The login name for the user. Do not use punctuation marks such as single quotes ('), double quotes ("), or colons (:) with the user login name.
privilege	The user's privilege level. Use the privilege levels to set the access rights for each user.  <1-15> A privilege level: either 1-14 (limited access) or 15 (full access). A user with privilege level 1-14 can only access higher privilege levels if an <a href="#">enable password</a> has been configured for the level the user tries to access and the user enters that password. A user at privilege level 1 can access the majority of show commands. A user at privilege level 7 can access the majority of show commands including platform show commands. Privilege Level 15 (to access the Privileged Exec command mode) is required to access configuration commands as well as show commands in Privileged Exec.
password	A password that the user must enter when logging in.  8 Specifies that you are entering a password as a string that has already been encrypted, instead of entering a plain-text password. The running-config displays the new password as an encrypted string even if password encryption is turned off. Note that the user enters the plain-text version of the password when logging in.  <password> The user's password. The password can be up to 23 characters in length and include characters from up to four categories. The password categories are: <ul style="list-style-type: none"><li>uppercase letters: A to Z</li><li>lowercase letters: a to z</li><li>digits: 0 to 9</li><li>special symbols: all printable ASCII characters not included in the previous three categories. The question mark ? cannot be used as it is reserved for help functionality.</li></ul>

**Mode** Global Configuration

**Default** The privilege level is 1 by default. Note the default is not shown in running-config output.

**Usage** An intermediate CLI security level (privilege level 7 to privilege level 14) allows a CLI user access to the majority of show commands, including the platform show commands that are available at privilege level 1 to privilege level 6. Note that some show commands, such as **show running-configuration** and **show startup-configuration**, are only available at privilege level 15.

**Examples** To create the user "bob" with a privilege level of 15, for all show commands including show running-configuration and show startup-configuration and to access configuration commands in Privileged Exec command mode, and the password "bobs\_secret", use the commands:

```
awplus# configure terminal
awplus(config)# username bob privilege 15 password bobs_secret
```

To create a user "junior\_admin" with a privilege level of 7, which will have intermediate CLI security level access for most show commands, and the password "show\_only", use the commands:

```
awplus# configure terminal
awplus(config)# username junior_admin privilege 7 password
show_only
```

# Feature and Release Licensing Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for each of the Feature and Release Licensing commands. Feature Licensing enables you to use advanced features such as Layer 3 routing. Release Licensing enables you to upgrade to a newer AlliedWare Plus software version, such as 5.4.8.

To see which Feature Licenses are available for your device, see the [AlliedWare Plus Datasheet](#).

With Software Version 5.4.6-1.x and later, new installations of Allied Telesis Management Framework (AMF) require a Subscription License instead of a Feature License. For information about Subscription Licensing commands, see the Subscription Licensing Commands chapter.

Note that AMF Feature Licenses purchased prior to 5.4.6-1.x will still operate with 5.4.6-x.x and later software versions.

For step-by-step instructions about how to license AlliedWare Plus devices, see the [Licensing Feature Overview and Configuration\\_Guide](#).

- Command List**
- [“license”](#) on page 228
  - [“license certificate”](#) on page 230
  - [“show license”](#) on page 231
  - [“show license brief”](#) on page 234
  - [“show license brief member”](#) on page 236
  - [“show license member”](#) on page 238
  - [“show system mac license”](#) on page 240

# license

**Overview** This command activates the licensed software feature set on a standalone switch, or a stack of switches.

Use the **no** variant of this command to deactivate the licensed software feature set on a standalone switch, or a stack of switches.

For feature licenses, contact your authorized distributor or reseller. If a license key expires or is incorrect so the license key is invalid, then some software features will be unavailable.

**NOTE:** See the *AlliedWare Plus™ datasheet* for a list of current feature licenses available by product. Purchase licenses from your authorized dealer or reseller.

In a live network, only install feature licenses during scheduled maintenance. For example, if a feature license includes EPSR, installing that licence will cause EPSR to be restarted with a temporary loss of EPSR network traffic.

**Syntax** `license <label> <key>`  
`no license <label>`

Parameter	Description
<code>&lt;label&gt;</code>	A name for the feature license. To determine names already in use, use the <a href="#">show license</a> command. This can be the default name supplied for the feature, or a renamed feature name.
<code>&lt;key&gt;</code>	The encrypted license key to enable a set of software features.

**Mode** Privileged Exec

**Usage** You can change the license label using this command to make it specific to you when you initially add a license. Once a license is added, any change to the license label first requires removal of the license before adding a license again with a new license label.

The default feature license labels are issued along with encrypted license keys by e-mail for you to apply using this command to activate features. You can change default feature license labels, but they must be 15 characters or less.

For example, you may want to change the label of the premium license to "premium-license". You can check your new license label by using the [show license](#) command.

In a stacked configuration, the **license** command will add a license to all stack members and the **no license** command will remove a license from all stack members. If you introduce a new stack member and it lacks a feature license that is possessed by the other stack members, a warning message will be generated at bootup. If this occurs, use the the **license** command to add the license to all stack members, including the new stack members.

If you add a feature license you will be prompted at the console that the feature needs to restart. Restarting of individual protocols in this manner could result in the loss of network traffic. Only install licenses in scheduled maintenance periods for devices in a live environment.

For example, if the feature license contains a license for the EPSR protocol, then that protocol will restart, but you do not need to manually restart the whole device for the new license to take effect.

**Examples** To activate the license called "Premium" that has the key 12345678ABCDE123456789ABCDE, use the command:

```
awplus# license Premium 12345678ABCDE123456789ABCDE
```

To deactivate the license called "Premium", use the command:

```
awplus# no license Premium
```

**Related  
Commands** [license certificate](#)

[show license](#)

[show license member](#)

# license certificate

**Overview** This command enables you to apply software release licenses from a license certificate file to a standalone switch, or a stack of switches.

**NOTE:** Contact your authorized Allied Telesis support center to obtain a release license.

**Syntax** `license certificate <certificate-url>`

Parameter	Description
<code>&lt;certificate-url&gt;</code>	Specify the URL of the certificate file. This can be a file name of a certificate file stored on the device, or it can be a TFTP path specifying the address of the site plus the file name.

**Mode** Privileged Exec

**Example** To apply release licenses from the certificate file "certificate.txt" stored at the TFTP IP address 172.16.1.121, use the following command:

```
awplus# license certificate tftp://172.16.1.121/  
certificate.txt
```

**Output** Figure 4-1: Example output from **license certificate** showing the number of license keys applied to a device

```
awplus# license certificate tftp://172.16.1.121/certificate.txt  
%% 2 licenses applied
```

**Related Commands**

- [license](#)
- [show license](#)
- [show system mac license](#)

# show license

**Overview** This command displays information about a specific software feature or release license, or all enabled software feature or release licenses on the device.

**Syntax** `show license [feature] [<label>|index <index-number>]`

Parameter	Description
feature	Only display license information for any applied feature licenses.
release	Only display license information for any applied release licenses.
<label>	The license name to show information about. This can be used instead of the index number to identify a specific license.
index <index-number>	The index number of the license to show information about. This can be used instead of the license name to identify a specific license.

**Mode** User Exec and Privileged Exec

**Usage** In a stacked configuration, this command will display licenses applied to a stack master only.

Use the [show license member](#) command instead if you need to display license information for a specific stack member or all stack members.

**Examples** To display full information about all enabled licenses, use the command:

```
awplus# show license
```

To display full information about the licenses with index number 1, use the command:

```
awplus# show license index 1
```

**Output** Figure 4-2: Example output from **show license** showing base license and any other feature and release licenses installed on the switch.

```
awplus#show license
Board region: Global
Software Licenses
-----
Index                : 1
License name         : Base License
Customer name        : Base License
Quantity of licenses : 1
Type of license      : Full
License issue date   : 20-Mar-2019
License expiry date  : N/A
Features included    : IAMF-APP-PROXY, AMF-GUEST, AMF-Starter, ...

Index                : 2
License name         : 5.4.9
Customer name        : ABC Consulting
Quantity of licenses : 1
Type of license      : Full
License issue date   : 30-May-2018
License expiry date  : N/A
Release              : 5.4.9
```

Table 4-1: Parameters in the output of **show license**

Parameter	Description
Board region	Name of the region for the Base License features.
Index	Index identifying entry. The index is assigned automatically by the software. It is not configured.
License name	Name of the license key bundle (case-sensitive).
Customer name	Customer name.
Quantity of licenses	Quantity of licensed installations.
Type of license	Full or Trial.
License issue date	Date the license was generated.
License expiry date	Expiry date for trial license.
Features included	List of features included in the feature license.
Release	Software version supported in the release license.

**Related  
Commands** [license](#)  
[license certificate](#)  
[show license brief](#)  
[show license member](#)

# show license brief

**Overview** This command displays information about a specific software feature or release license, or all enabled software feature or release licenses on the device.

**Syntax** `show license brief`  
`show license [feature|release] [<label>|index <index-number>]  
brief`

Parameter	Description
feature	Only display license information for any applied feature licenses.
release	Only display license information for any applied release licenses.
<label>	The license name to show information about. This can be used instead of the index number to identify a specific license.
index <index-number>	The index number of the license to show information about. This can be used instead of the license name to identify a specific license.
brief	Displays a brief summary of license information.

**Mode** User Exec and Privileged Exec

**Usage** In a stacked configuration, this command will display licenses applied to a stack master only.

Use the [show license brief member](#) command instead if you need to display license information for a specific stack member or all stack members.

**Examples** To display a brief summary of information about all licenses, use the command:

```
awplus# show license brief
```

**Output** Figure 4-3: Example output from **show license brief**

```
awplus#show license brief
Board region: Global
Software Licenses
-----
Index License name      Quantity  Customer name
      Type              Version   Period
-----
1     Base License      1         Base License
      Full              N/A
-----

Current enabled features for displayed licenses:
IPv6Basic, LAG-FULL, MLDSnoop ...
```

**Output** To display a brief summary of information about all release licenses, use the command:

```
awplus# show license release brief
```

Figure 4-4: Example output from the **show license release brief** command

```
awplus#show license release brief
Board region: Global
Software Release Licenses
-----
Index License name      Quantity  Customer name
      Type              Version   Period
-----
1      549                -         ABC Consulting
      Trial              5.4.9    N/A
```

Table 4-2: Parameters in the output of **show license brief**

Parameter	Description
Board region	Name of the region for the Base License features.
Index	Index identifying entry. The index is assigned automatically by the software. It is not configured.
License name	Name of the license key bundle (case-sensitive).
Quantity	Quantity of licensed installations.
Version	Software version supported by a release license.
Customer name	Customer name.
Type	Full or Trial.
Period	Expiry date for trial license.
Current enabled features for displayed licenses	List of features included in the license.

- Related Commands**
- [license](#)
  - [license certificate](#)
  - [show license](#)
  - [show license brief member](#)
  - [show license member](#)

# show license brief member

**Overview** Use this command to display information about either a specific software license, or all software feature licenses enabled on either a specific stack member or all stack members.

**Syntax** `show license [<label>] brief member [1-8|all]`

Parameter	Description
<label>	The name of the license to show information about.
brief	Display a brief summary of license information.
<1-8>	The ID of the stack member to show information about.
all	Display information about all stack members.

**Mode** User Exec and Privileged Exec

**Usage** Use the **show license brief member all** command for brief table output of all licenses per stack member.

**Examples** To display a brief summary of information about all enabled licenses on stack member 2, use the command:

```
awplus# show license brief member 2
```

To display a brief summary about all enabled licenses on all stack members, use the command:

```
awplus# show license brief member all
```

To display a brief summary about the license "name1" on all stack members, use the command:

```
awplus# show license name1 brief member all
```

**Output** Figure 4-5: Example output from **show license brief member**

```
awplus#show license brief member 1

Board region: Global

Feature licenses on stack member 1:

-----
Index License name          Quantity  Customer name
      Type
-----
1     Base License          -         Base License
      Full                  N/A

Current enabled features for displayed licenses:
IPv6Basic, LAG-FULL, MLDSnoop, ...
```

Table 4-3: Parameters in the output of **show license brief member**

Parameter	Description
Board region	Name of the region for the Base License features.
Index	Index identifying entry. The index is assigned automatically by the software. It is not configured.
License name	Name of the license key bundle (case-sensitive).
Quantity	Quantity of licensed installations.
Customer name	Customer name.
Type	Full or Trial.
Period	Expiry date for trial license.
Current enabled features for displayed licenses	List of features included in the license.

- Related Commands**
- [license](#)
  - [show license](#)
  - [show license member](#)

# show license member

**Overview** Use this command to display information about either a specific software license, or all software feature licenses enabled on either a specific stack member or all stack members.

**Syntax** `show license [<label>] member [1-8|all]`

Parameter	Description
<label>	The name of the license to show information about.
<1-8>	The ID of the stack member to show information about.
all	Display information about all stack members.

**Mode** User Exec and Privileged Exec

**Usage** Use the **show license member all** command to display full list output of all licenses per stack member.

**Examples** To display full information about all enabled licenses on all stack members, use the command:

```
awplus# show license member all
```

To display full information about all enabled licenses on stack member 2, use the command:

```
awplus# show license member 2
```

To display full information about the license called "name1" on all stack members, use the command:

```
awplus# show license name1 member all
```

**Output** Figure 4-6: Example output from **show license member**

```
awplus#show license member all
Board region: Global
Software Feature Licenses
-----
Index                : 1
License name         : Base License
Customer name        : Base License
Quantity of licenses : 1
Type of license      : Full
License issue date   : 12-Jan-2019
License expiry date  : N/A
Features included    : IPv6Basic, LAG-FULL, MLDSnoop ...
...
```

Table 4-4: Parameters in the output of **show license member**

Parameter	Description
Board region	Name of the region for the Base License features.
Index	Index identifying entry. The index is assigned automatically by the software. It is not configured.
License name	Name of the license key bundle (case-sensitive).
Customer name	Customer name.
Quantity of licenses	Quantity of licensed installations.
Type of license	Full or Trial.
License issue date	Date the license was generated.
License expiry date	Expiry date for trial license.
Features included	List of features included in the license.

**Related Commands**

- [license](#)
- [show license](#)
- [show license brief member](#)

# show system mac license

**Overview** This command displays the physical MAC address on a chassis, or a stack. This information is required when you buy a release license.

**Syntax** `show system mac license`

**Mode** User Exec and Privileged Exec

**Usage** Once you have bought a release license, use the [license certificate](#) command to apply the license certificate file to the device. The certificate file contains the release licenses for the relevant MAC address or addresses.

**Example** To display the needed physical MAC address, enter the following command:

```
awplus# show system mac license
```

**Output** Figure 4-7: Example output from **show system mac license** showing the MAC address required for release licensing

```
awplus#show system mac license

MAC address for licensing:
eccd.6d9d.4eed
```

**Related  
Commands**

- [license](#)
- [license certificate](#)
- [show system mac](#)

# 5

# Subscription Licensing Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for each of the Subscription Licensing commands.

Subscription Licensing enables you to use Allied Telesis Management Framework (AMF). You need to purchase an AMF subscription for each AMF master or controller node in your AMF network. To see the AMF subscriptions for your device, see the [AlliedWare Plus Datasheet](#).

Subscription Licensing enables you to use OpenFlow. To see the OpenFlow subscriptions for your device, see the [AlliedWare Plus Datasheet](#).

For step-by-step instructions about how to license AlliedWare Plus devices, see the [Licensing Feature Overview and Configuration Guide](#).

- Command List**
- “[license redistribute](#)” on page 242
  - “[license update \(filename\)](#)” on page 243
  - “[license update online](#)” on page 244
  - “[show license external](#)” on page 246

# license redistribute

**Overview** For subscription licenses on VCStacks, use this command to force the stack to re-synchronise its license entitlements. You need to do this when you permanently replace the stack member that you originally bought the license for. See the Example section for details.

**Syntax** `license redistribute`

**Default** n/a

**Mode** User Exec/Privileged Exec

**Example** If you buy a subscription license for a stack member, and later have to permanently replace that stack member, you can transfer the license to another stack member.

To do this:

- 1) Check which stack member the license entitlement came from originally, by using the command:

```
awplus# show license external stored
```

- 2) If you are replacing that stack member, in the [Allied Telesis Download center](#), transfer the license to another stack member's serial number.

- 3) Update the stack's licenses by using the command:

```
awplus# license update online
```

- 4) Force the stack to re-synchronise its license entitlement by using the command:

```
awplus# license redistribute
```

**Related Commands** [license update online](#)  
[show license external](#)

**Command changes** Version 5.4.6-2.1: usage changed by introduction of [license update online](#)

# license update (filename)

**Overview** Use this command to load a license, after you have manually copied the license file onto the device.

Only use this command if you cannot directly access the [Allied Telesis Download Center](#) from this device. Otherwise, use the command [license update online](#) instead.

**Syntax** `license update <filename>`

Parameter	Description
<code>&lt;filename&gt;</code>	Name and path of the license file on the device.

**Mode** Privileged Exec

**Usage** You can download subscription licenses from the [Allied Telesis Download Center](#), in order to copy them onto the device.

**Examples** To load a license onto a device from a file called "license\_file.bin" that is stored at the top level of Flash memory, use the following command:

```
awplus#license update license_file.bin
```

**Related Commands**

- [license redistribute](#)
- [license update online](#)
- [show license external](#)

**Command changes** Version 5.4.6-2.1: usage changed by introduction of [license update online](#)

# license update online

**Overview** Use this command to add or update subscription licenses from the [Allied Telesis Download Center](#), to subscribe to features such as AMF master.

When you enter this command, the device will:

- 1) Connect to the Download Center
- 2) Check if new or changed licenses are available for the device, keyed to the device's serial number
- 3) For each such license it finds, download and install the license.

**Syntax** `license update online`

**Default** AlliedWare Plus devices do not automatically connect to the Download Center and check whether licenses are available. They only check when you run the **license update online** command.

**Mode** User Exec/Privileged Exec

**Usage** On VCStacks, running **license update online** updates all stack members. Each stack member individually checks for licenses on the Download Center and installs any that are found.

## Verifying the update

The update process normally takes approximately 5 seconds.

If the console does not respond for 10 or more seconds after typing the command, a network, routing or firewall configuration error is probably preventing the connection from establishing. If this happens, you can abort the command by pressing Ctrl-C, or wait for the command to time out after 30 seconds.

If the connection to the Download Centers fails and times out, an error message will be generated on the CLI to indicate the problem. If you abort the command, no error message is displayed.

If the update is successful, the device will produce log messages to say which features have had their licensing state updated (activated, deactivated, number of items changed, or expiry date changed). If the command completes successfully but there are no licenses available for the device, or no change in the licenses already on the device, no log messages will be produced.

You should also use the [show license external](#) command to confirm which licenses are active on the device after the update has been applied.

If [show license external](#) shows that the license entitlements are not from the stack member you expect, run the command [license redistribute](#) to re-synchronise the license entitlements.

**Example** To add a subscription license, use the command:

```
awplus# license update online
```

**Related  
Commands** [show license external](#)

**Command  
changes** Version 5.4.6-2.1: command added

# show license external

**Overview** Use this command to show information about subscription (external) licenses.

For products with stacking, additional information may be displayed to indicate the source of the current feature entitlements. If this information indicates that a device is "NOT PRESENT", you need to take action as described in the warning in the output.

**Syntax** `show license external [stored]`

Parameter	Description
stored	Display all licenses that are on all stack members, including licenses that are not currently in use. Without this parameter, the output only displays licenses that are in use. In most situations, all licenses on the stack will be in use, so this parameter is only useful if the output of <b>show license external</b> does not include all the licenses that you expect to be present.

**Mode** Privileged Exec

**Usage** If you subscribe to a feature on a VCStack, you only need to purchase a subscription license for one member of the stack. This command enables you to see which stack member you purchased the license for.

Subscription licenses are contained in a Capability Response File (CRF). When you load the license onto the stack, the software checks that the CRF is valid for one of the stack members (the "source stack member"). The software then applies the license entitlement to all members of the stack.

If you need to modify the license, for example to extend its expiry date, you need to know which stack member you purchased the license for. This lets you make sure you modify the source stack member's license, instead of accidentally creating a new license for a different stack member.

**Examples** To show information about what subscription features the device is licensed for, use the following command:

```
awplus#show license external
```

**Output** Figure 5-1: Example output from **show license external**, when an AMF master license was bought for stack member 2 and that stack member is still in the stack.

```
awplus#show license external

Features with installed entitlements:

AMF Master

    Sourced from:                stack member 2, serial A04430H101200026

    Currently licensed:          Yes
    Maximum AMF nodes:           20

    Start date:                  25 Apr 2016 00:00
    Expiry date:                  19 Apr 2017 23:59
    Maximum AMF nodes:           20

    Start date:                  20 Apr 2017 00:00
    Expiry date:                  20 Apr 2018 23:59
    Maximum AMF nodes:           50
```

Figure 5-2: Example output from **show license external**, when an AMF master license was bought for stack member 2 but that stack member has since left the stack.

```
awplus#show license external

Features with installed entitlements:

AMF Master

    Sourced from:                stack member 2, serial A04430H101200026
                                [NOT PRESENT]

    Currently licensed:          Yes
    Maximum AMF nodes:           20

    Start date:                  25 Apr 2016 00:00
    Expiry date:                  19 Apr 2017 23:59
    Maximum AMF nodes:           20

    Start date:                  20 Apr 2017 00:00
    Expiry date:                  20 Apr 2018 23:59
    Maximum AMF nodes:           50

WARNING: The following features have license entitlements that were sourced
         from stack members that are no longer part of the stack. Upon reboot
         these entitlements will be lost. To avoid loss of functionality
         re-connect the device to the stack, or transfer the license to another
         stack member using the RMA feature on the Allied Telesis Download
         Center website.

AMF Master from stack member 2, serial A04430H101200026
```

Commands** [license update online](#)

# 6

# GUI Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure the GUI.

For more information, see [Getting Started with the Device GUI on Switches](#).

- Command List**
- [“atmf topology-gui enable”](#) on page 250
  - [“gui-timeout”](#) on page 251
  - [“http port”](#) on page 253
  - [“http secure-port”](#) on page 254
  - [“log event-host”](#) on page 255
  - [“service http”](#) on page 256
  - [“show http”](#) on page 257

# atmf topology-gui enable

**Overview** Use this command to enable the operation of Vista Manager EX on the Master device.

Vista Manager EX delivers state-of-the-art monitoring and management for your Autonomous Management Framework™ (AMF) network, by automatically creating a complete topology map of switches, firewalls and wireless access points (APs). An expanded view includes third-party devices such as security cameras.

Use the **no** variant of this command to disable operation of Vista Manager EX.

**Syntax** `atmf topology-gui enable`  
`no atmf topology-gui enable`

**Default** Disabled by default on AMF Master and member nodes. Enabled by default on Controllers.

**Mode** Global Configuration mode

**Usage** To use Vista Manager EX, you must also enable the HTTP service on all AMF nodes, including all AMF masters and controllers. The HTTP service is enabled by default on AlliedWare Plus switches and disabled by default on AR-Series firewalls. To enable it, use the commands:

```
Node1# configure terminal
Node1(config)# service http
```

On one master in each AMF area in your network, you also need to configure the master to send event notifications to Vista Manager EX. To do this, use the commands:

```
Node1# configure terminal
Node1(config)# log event-host <ip-address> atmf-topology-event
```

**Example** To enable Vista Manager EX on Node1, use the following commands:

```
Node1# configure terminal
Node1(config)# atmf topology-gui enable
```

To disable Vista Manager EX on Node1, use the following commands:

```
Node1# configure terminal
Node1(config)# no atmf topology-gui enable
```

**Related  
Commands** [atmf enable](#)  
[gui-timeout](#)  
[log event-host](#)  
[service http](#)

# gui-timeout

**Overview** Use this command to configure an idle timeout period for a GUI session. The time can be set in minutes and/or seconds.

Use the **no** variant of this command to disable the GUI session idle timeout.

**Syntax** `gui-timeout <minutes> [<seconds>]`  
`no gui-timeout`

Parameter	Description
<code>&lt;minutes&gt;</code>	Specifies the idle time in minutes from 0 through 35791
<code>&lt;seconds&gt;</code>	Specifies the idle time in seconds from 0 through 2147483

**Default** Disabled

**Mode** Global Configuration

**Usage** The GUI uses the configured timeout period (set in either minutes and/or seconds) to determine when a GUI session should be closed. Once the GUI timeout has expired, you will need to login to reactivate your session.

To enter seconds only, enter 0 for minutes, followed by a space, and then enter the seconds.

If the GUI timeout is disabled, a GUI session will remain active until you terminate it. No idle time will be configured.

The same timeout period will apply to all GUI sessions logged into a specific stand-alone device or stack.

**Examples** Use this command to configure the GUI timeout period for 3 minutes and 30 seconds for a GUI session.

```
awplus# gui-timeout 3 30
```

Use this command to configure the GUI timeout period for 0 minutes and 61 seconds for a GUI session.

```
awplus# gui-timeout 0 61
```

Use this command to disable the GUI timeout period.

```
awplus# no gui-timeout
```

**Output** Figure 6-1: Example output from **gui-timeout**

```
awplus#configure terminal
awplus(config)#gui-timeout 3 30
The new gui-timeout settings [3 min 30 sec] will apply to new sessions only
```

**Related  
Commands** [show running-config](#)

# http port

**Overview** Use this command to change the HTTP port used to access the web-based device GUI, or to disable HTTP management.

Use the **no** variant of this command to return to using the default port, which is 80.

**Syntax** `http port {<1-65535>|none}`  
`no http port`

Parameter	Description
<1-65535>	The HTTP port number
none	Disable HTTP management. You may want to do this if you need to use port 80 for a different service or you do not need to use HTTP at all.

**Default** The default port for accessing the GUI is port 80.

**Mode** Global Configuration

**Usage** Do not configure the HTTP port to be the same as the HTTPS port.

Note that the device will redirect from HTTP to HTTPS unless you have disabled HTTPS access, which we do not recommend doing.

**Example** To set the port to 8080, use the commands:

```
awplus# configure terminal
awplus(config)# http port 8080
```

To return to using the default port of 80, use the commands:

```
awplus# configure terminal
awplus(config)# no http port
```

To stop users from accessing the GUI via HTTP, use the commands:

```
awplus# configure terminal
awplus(config)# http port none
```

**Related Commands** [http secure-port](#)  
[service http](#)  
[show http](#)

**Command changes** Version 5.4.7-2.4: command added on AR-Series devices  
Version 5.4.8-0.2: command added on AlliedWare Plus switches

# http secure-port

**Overview** Use this command to change the HTTPS port used to access the web-based device GUI, or to disable HTTPS management.

Use the **no** variant of this command to return to using the default port, which is 443.

**Syntax** `http secure-port {<1-65535>|none}`  
`no http secure-port`

Parameter	Description
<1-65535>	The HTTPS port number
none	Disable HTTPS management. Do not do this if you want to use Vista Manager EX or the GUI.

**Default** The default port for accessing the GUI is port 443.

**Mode** Global Configuration

**Usage** Do not configure the HTTPS port to be the same as the HTTP port.

Note that if you are using Vista Manager EX and need to change the HTTPS port, you must use certificate-based authorization in Vista Manager EX. See the [Vista Manager EX Installation and User Guide](#) for instructions.

**Example** To set the port to 8443, use the commands:

```
awplus# configure terminal
awplus(config)# http secure-port 8443
```

To return to using the default port of 443, use the commands:

```
awplus# configure terminal
awplus(config)# no http secure-port
```

To stop users from accessing the GUI via HTTPS, use the commands:

```
awplus# configure terminal
awplus(config)# http secure-port none
```

**Related Commands** [http port](#)  
[service http](#)  
[show http](#)

**Command changes** Version 5.4.7-1.1: command added on AR-Series devices  
Version 5.4.7-2.4: **none** parameter added

Version 5.4.8-0.2: command added on AlliedWare Plus switches

# log event-host

**Overview** Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

**Syntax** `log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`  
`no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	ipv4 address of the event host
<code>&lt;ipv6-addr&gt;</code>	ipv6 address of the event host

**Default** Log events are disabled by default.

**Mode** Global Configuration

**Usage** Event hosts are set so syslog sends the messages out as they come.

Note that there is a difference between log event and log host messages:

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

**Example** To enable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

**Related Commands** [atmf topology-gui enable](#)

# service http

**Overview** Use this command to enable the HTTP (Hypertext Transfer Protocol) service. This service is required to support Vista Manager EX™ and the device GUI. Use the **no** variant of this command to disable the HTTP feature.

**Syntax** `service http`  
`no service http`

**Default** Enabled

**Mode** Global Configuration

**Example** To enable the HTTP service, use the following commands:

```
awplus# configure terminal  
awplus(config)# service http
```

To disable the HTTP service, use the following commands:

```
awplus# configure terminal  
awplus(config)# no service http
```

**Related  
Commands** [http port](#)  
[http secure-port](#)  
[show http](#)

# show http

**Overview** This command shows the HTTP server settings.

**Syntax** `show http`

**Mode** User Exec and Privileged Exec

**Example** To show the HTTP server settings, use the command:

```
awplus# show http
```

**Output** Figure 6-2: Example output from the **show http** command

```
awplus#show http
HTTP Server Configuration
-----
HTTP server           : Enabled
Port                  : 80
```

- [“undebg all”](#) on page 339

# banner exec

**Overview** This command configures the User Exec mode banner that is displayed on the console after you login. The **banner exec default** command restores the User Exec banner to the default banner. Use the **no banner exec** command to disable the User Exec banner and remove the default User Exec banner.

**Syntax** banner exec <banner-text>  
banner exec default  
no banner exec

**Default** By default, the AlliedWare Plus™ version and build date is displayed at console login, such as:

```
AlliedWare Plus (TM) 5.4.8 01/08/18 12:00:00
```

**Mode** Global Configuration

**Examples** To configure a User Exec mode banner after login (in this example, to tell people to use the **enable** command to move to Privileged Exec mode), enter the following commands:

```
awplus#configure terminal
awplus(config)#banner exec Use enable to move to Priv Exec mode
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

Use enable to move to Priv Exec mode

awplus>
```

To restore the default User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner exec default
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.4.8 01/08/18 12:00:00

awplus>
```

To remove the User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal
awplus(config)#no banner exec
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

awplus>
```

**Related  
Commands**    [banner login \(system\)](#)  
                  [banner motd](#)

# banner login (system)

**Overview** This command configures the login banner that is displayed on the console when you login. The login banner is displayed on all connected terminals. The login banner is displayed after the MOTD (Message-of-the-Day) banner and before the login username and password prompts.

Use the **no banner login** command to disable the login banner.

**Syntax** banner login  
no banner login

**Default** By default, no login banner is displayed at console login.

**Mode** Global Configuration

**Examples** To configure a login banner of “Authorized users only” to be displayed when you login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner login
Type CNTL/D to finish.

Authorized users only

awplus(config)#exit
awplus#exit

Authorized users only

awplus login: manager
Password:

AlliedWare Plus (TM) 5.4.8 01/08/18 12:00:00

awplus>
```

To remove the login banner, enter the following commands:

```
awplus#configure terminal
awplus(config)#no banner login
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.4.8 01/08/18 12:00:00

awplus>
```

**Related  
Commands** [banner exec](#)  
[banner motd](#)

# banner motd

**Overview** Use this command to create or edit the text MotD (Message-of-the-Day) banner displayed before login. The MotD banner is displayed on all connected terminals. The MotD banner is useful for sending messages that affect all network users, for example, any imminent system shutdowns.

Use the **no** variant of this command to delete the MotD banner.

**Syntax** banner motd <motd-text>  
no banner motd

Parameter	Description
<motd-text>	The text to appear in the Message of the Day banner.

**Default** By default, the device displays the AlliedWare Plus™ OS version and build date when you login.

**Mode** Global Configuration

**Examples** To configure a MotD banner of "System shutdown at 6pm today" to be displayed when you log in, enter the following commands:

```
awplus>enable
awplus#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
awplus(config)#banner motd System shutdown at 6pm today
awplus(config)#exit
awplus#exit

System shutdown at 6pm today
awplus login: manager
Password:

AlliedWare Plus (TM) 5.4.8 01/08/18 12:00:00

awplus>
```

To delete the login banner, enter the following commands:

```
awplus>enable
awplus#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
awplus(config)#no banner motd
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.4.8 01/08/18 12:00:00

awplus>
```

**Related  
Commands** [banner exec](#)  
[banner login \(system\)](#)

# clock set

**Overview** This command sets the time and date for the system clock.

**Syntax** `clock set <hh:mm:ss> <day> <month> <year>`

Parameter	Description
<hh:mm:ss>	Local time in 24-hour format
<day>	Day of the current month, from 1 to 31
<month>	The first three letters of the current month
<year>	Current year, from 2000 to 2035

**Mode** Privileged Exec

**Usage** Configure the timezone before setting the local time. Otherwise, when you change the timezone, the device applies the new offset to the local time.

**NOTE:** *If Network Time Protocol (NTP) is enabled, then you cannot change the time or date using this command. NTP maintains the clock automatically using an external time source. If you wish to manually alter the time or date, you must first disable NTP.*

**Example** To set the time and date on your system to 2pm on the 2nd of October 2016, use the command:

```
awplus# clock set 14:00:00 2 oct 2016
```

**Related Commands** [clock timezone](#)

# clock summer-time date

**Overview** This command defines the start and end of summertime for a specific year only, and specifies summertime's offset value to Standard Time for that year.

The **no** variant of this command removes the device's summertime setting. This clears both specific summertime dates and recurring dates (set with the [clock summer-time recurring](#) command).

By default, the device has no summertime definitions set.

**Syntax**

```
clock summer-time <timezone-name> date <start-day>
<start-month> <start-year> <start-time> <end-day> <end-month>
<end-year> <end-time> <1-180>

no clock summer-time
```

Parameter	Description
<timezone-name>	A description of the summertime zone, up to 6 characters long.
date	Specifies that this is a date-based summertime setting for just the specified year.
<start-day>	Day that the summertime starts, from 1 to 31.
<start-month>	First three letters of the name of the month that the summertime starts.
<start-year>	Year that summertime starts, from 2000 to 2035.
<start-time>	Time of the day that summertime starts, in the 24-hour time format HH:MM.
<end-day>	Day that summertime ends, from 1 to 31.
<end-month>	First three letters of the name of the month that the summertime ends.
<end-year>	Year that summertime ends, from 2000 to 2035.
<end-time>	Time of the day that summertime ends, in the 24-hour time format HH:MM.
<1-180>	The offset in minutes.

**Mode** Global Configuration

**Examples** To set a summertime definition for New Zealand using NZST (UTC+12:00) as the standard time, and NZDT (UTC+13:00) as summertime, with the summertime set to begin on the 25th of September 2016 and end on the 2nd of April 2017:

```
awplus(config)# clock summer-time NZDT date 25 sep 2:00 2016 2
apr 2:00 2017 60
```

To remove any summertime settings on the system, use the command:

```
awplus(config)# no clock summer-time
```

**Related  
Commands** [clock summer-time recurring](#)  
[clock timezone](#)

# clock summer-time recurring

**Overview** This command defines the start and end of summertime for every year, and specifies summertime's offset value to Standard Time.

The **no** variant of this command removes the device's summertime setting. This clears both specific summertime dates (set with the [clock summer-time date](#) command) and recurring dates.

By default, the device has no summertime definitions set.

**Syntax**

```
clock summer-time <timezone-name> recurring <start-week>
<start-day> <start-month> <start-time> <end-week> <end-day>
<end-month> <end-time> <1-180>

no clock summer-time
```

Parameter	Description
<timezone-name>	A description of the summertime zone, up to 6 characters long.
recurring	Specifies that this summertime setting applies every year from now on.
<start-week>	Week of the month when summertime starts, in the range 1-5. The value 5 indicates the last week that has the specified day in it for the specified month. For example, to start summertime on the last Sunday of the month, enter 5 for <start-week> and sun for <start-day>.
<start-day>	Day of the week when summertime starts. Valid values are mon, tue, wed, thu, fri, sat or sun.
<start-month>	First three letters of the name of the month that summertime starts.
<start-time>	Time of the day that summertime starts, in the 24-hour time format HH:MM.
<end-week>	Week of the month when summertime ends, in the range 1-5. The value 5 indicates the last week that has the specified day in it for the specified month. For example, to end summertime on the last Sunday of the month, enter 5 for <end-week> and sun for <end-day>.
<end-day>	Day of the week when summertime ends. Valid values are mon, tue, wed, thu, fri, sat or sun.
<end-month>	First three letters of the name of the month that summertime ends.
<end-time>	Time of the day that summertime ends, in the 24-hour time format HH:MM.
<1-180>	The offset in minutes.

**Mode** Global Configuration

**Examples** To set a summertime definition for New Zealand using NZST (UTC+12:00) as the standard time, and NZDT (UTC+13:00) as summertime, with summertime set to start on the last Sunday in September, and end on the 1st Sunday in April, use the command:

```
awplus(config)# clock summer-time NZDT recurring 5 sun sep 2:00  
1 sun apr 2:00 60
```

To remove any summertime settings on the system, use the command:

```
awplus(config)# no clock summer-time
```

**Related  
Commands** [clock summer-time date](#)  
[clock timezone](#)

# clock timezone

**Overview** This command defines the device's clock timezone. The timezone is set as a offset to the UTC.

The **no** variant of this command resets the system time to UTC.

By default, the system time is set to UTC.

**Syntax** `clock timezone <timezone-name> {minus|plus}  
[<0-13>|<0-12>:<00-59>]`  
`no clock timezone`

Parameter	Description
<timezone-name>	A description of the timezone, up to 6 characters long.
minusorplus	The direction of offset from UTC. The <b>minus</b> option indicates that the timezone is behind UTC. The <b>plus</b> option indicates that the timezone is ahead of UTC.
<0-13>	The offset in hours or from UTC.
<0-12>:<00-59>	The offset in hours or from UTC.

**Mode** Global Configuration

**Usage** Configure the timezone before setting the local time. Otherwise, when you change the timezone, the device applies the new offset to the local time.

**Examples** To set the timezone to New Zealand Standard Time with an offset from UTC of +12 hours, use the command:

```
awplus(config)# clock timezone NZST plus 12
```

To set the timezone to Indian Standard Time with an offset from UTC of +5:30 hours, use the command:

```
awplus(config)# clock timezone IST plus 5:30
```

To set the timezone back to UTC with no offsets, use the command:

```
awplus(config)# no clock timezone
```

**Related Commands** [clock set](#)  
[clock summer-time date](#)  
[clock summer-time recurring](#)

# continuous-reboot-prevention

**Overview** Use this command to enable and to configure the continuous reboot prevention feature. Continuous reboot prevention allows the user to configure the time period during which reboot events are counted, the maximum number of times the switch can reboot within the specified time period, referred to as the threshold, and the action to take if the threshold is exceeded.

Use the **no** variant of this command to disable the continuous reboot prevention feature or to return the **period**, **threshold** and **action** parameters to the defaults.

**Syntax**

```
continuous-reboot-prevention enable
continuous-reboot-prevention [period <0-604800>] [threshold <1-10>] [action [linkdown|logonly|stopreboot]]
no continuous-reboot-prevention enable
no continuous-reboot-prevention [period] [threshold] [action]
```

Parameter	Description
enable	Enable the continuous reboot prevention feature.
period	Set the period of time in which reboot events are counted.
	<0-604800>      Period value in seconds. The default is 600.
threshold	Set the maximum number of reboot events allowed in the specified period.
	<1-10>      Threshold value. The default is 1.
action	Set the action taken if the threshold is exceeded.
	linkdown      Reboot procedure continues and all switch ports and stack ports stay link-down. The reboot event is logged. This is the default action.
	logonly      Reboot procedure continues normally and the reboot event is logged.
	stopreboot      Reboot procedure stops until the user enters the key "c" via the CLI. Normal reboot procedure then continues and the reboot event is logged.

**Default** Continuous reboot prevention is disabled by default. The default period value is 600, the default threshold value is 1 and the default action is linkdown.

**Mode** Global Configuration

**Usage** Note that user-initiated reboots via the CLI, and software version auto-synchronization reboots, are not counted toward the threshold value.

**Examples** To enable continuous reboot prevention, use the commands:

```
awplus# configure terminal
awplus(config)# continuous-reboot-prevention enable
```

To set the period to 500 and action to stopreboot, use the commands:

```
awplus# configure terminal
awplus(config)# continuous-reboot-prevention period 500 action
stopreboot
```

To return the period and action to the defaults and keep the continuous reboot prevention feature enabled, use the commands:

```
awplus# configure terminal
awplus(config)# no continuous-reboot-prevention period action
```

To disable continuous reboot prevention, use the commands:

```
awplus# configure terminal
awplus(config)# no continuous-reboot-prevention enable
```

**Related  
Commands** [show continuous-reboot-prevention](#)  
[show reboot history](#)  
[show tech-support](#)

# diagnostic monitor pcsping

**Overview** Use this command to disable or configure the background PCS (Physical Coding Sublayer) ping monitoring feature to either output a log message or to power off a XEM when a background PCS ping check fails.

Use the **no** variant of this command to re-enable the PCS ping monitoring feature, or restore default behavior to output a log message and not power off a XEM.

The background PCS ping feature is enabled by default to output log messages.

**Syntax** `diagnostic monitor pcsping {disable|power-off}`  
`no diagnostic monitor pcsping {disable|power-off}`

Parameter	Description
<code>disable</code>	Select this required parameter to disable the background PCS (Physical Coding Sublayer) ping monitoring feature (not recommended). Negate a <b>diagnostic monitor pcsping disable</b> command to re-enable the background PCS ping feature.
<code>power-off</code>	Select this required parameter to power off a XEM if a background PCS (Physical Coding Sublayer) ping is not received on a XEM. Negate a <b>diagnostic monitor pcsping power-off</b> command to output a log message instead of powering off a XEM, restoring default behavior.

**Default** This feature is enabled by default to log a message when a background PCS ping check fails. Default behavior is restored by negating a **diagnostic monitor pcsping power-off** command.

**Mode** Global Configuration

**Usage** The background PCS ping feature implements background hardware monitoring to ensure the connections between the switch and the XEMs are working correctly, which is done by this feature periodically sending PCS pings to connected XEMs on a switch, by default.

A PCS ping is a small message that is sent across a switch link at the PHY layer. The PCS ping message contains data that identifies the source at one end of the link. If a PCS ping message is delivered then a XEM to switch link works.

To re-enable background PCS ping monitoring negate a **diagnostic monitor pcsping disable** command. A **no diagnostic monitor pcsping disable** command will re-enable the feature.

To log a message and not power off a XEM, negate a **diagnostic monitor pcsping power-off** command. A **no diagnostic monitor pcsping power-off** command will not power off a XEM.

**NOTE:** We recommend that you do not disable the PCSping function, because this may conceal the existence of a faulty XEM module.

**Examples** To disable the background PCS ping monitoring feature, use the following commands:

```
awplus# configure terminal
awplus(config)# diagnostic monitor pcsping disable
```

**Output** Figure 7-1: Example output from a **show diagnostic monitor pcsping** command after issuing a **diagnostic monitor pcsping disable** command to disable the feature

```
awplus# configure terminal
awplus(config)# diagnostic monitor pcsping disable
awplus(config)# exit
awplus# show diagnostic monitor pcsping
Background PCS Ping Monitoring Information
Enabled: No
Power-off XEM if a PCS Ping fails: No
```

To re-enable the background PCS ping monitoring feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no diagnostic monitor pcsping disable
```

**Output** Figure 7-2: Example output from a **show diagnostic monitor pcsping** command after issuing a **no diagnostic monitor pcsping disable** command to re-enable the feature

```
awplus# configure terminal
awplus(config)# no diagnostic monitor pcsping disable
awplus(config)# exit
awplus# show diagnostic monitor pcsping
Background PCS Ping Monitoring Information
Enabled: Yes
Power-off XEM if a PCS Ping fails: No
```

To power off a XEM when a background PCS ping check fails, use the following commands:

```
awplus# configure terminal
awplus(config)# diagnostic monitor pcsping power-off
```

**Output** Figure 7-3: Example output from a **show diagnostic monitor pcsping** command after issuing a **diagnostic monitor pcsping power-off** command to configure XEM power-off

```
awplus# configure terminal
awplus(config)# diagnostic monitor pcsping power-off
awplus(config)# exit
awplus# show diagnostic monitor pcsping
Background PCS Ping Monitoring Information
Enabled: Yes
Power-off XEM if a PCS Ping fails: Yes
```

To not power off a XEM, and only log a message, when a background PCS ping check fails, use the following commands:

```
awplus# configure terminal
awplus(config)# no diagnostic monitor pcsping power-off
```

**Output** Figure 7-4: Example output from a **show diagnostic monitor pcsping** command after issuing a **no diagnostic monitor pcsping power-off** command to restore log output

```
awplus# configure terminal
awplus(config)# no diagnostic monitor pcsping power-off
awplus(config)# exit
awplus# show diagnostic monitor pcsping
Background PCS Ping Monitoring Information
Enabled: Yes
Power-off XEM if a PCS Ping fails: No
```

**Validation Commands** [show diagnostic monitor pcsping](#)  
[show running-config](#)

# ecofriendly led

**Overview** Use this command to enable the eco-friendly LED (Light Emitting Diode) feature which turns off power to the port LEDs, except the eth0 port. In addition, only one segment of the seven segment LED is lit - the top segment if the switch is the VCStack master, the bottom if it is a VCStack member and the middle if it is a standalone switch.

You can also use the front-panel eco-switch button to enable or disable the eco-friendly feature. Using this button overrides the configuration set with the **ecofriendly led** command.

Use the **no** variant of this command to disable the eco-friendly LED feature.

**Syntax** `ecofriendly led`  
`no ecofriendly led`

**Default** The eco-friendly LED feature is disabled by default.

**Mode** Global Configuration

**Usage** When the eco-friendly LED feature is enabled, a change in port status will not affect the display of the associated LED. When the eco-friendly LED feature is disabled and power is returned to port LEDs, the LEDs will correctly show the current state of the ports.

In a stacked environment, enabling the eco-friendly LED feature on the stack master will apply the feature to every member of the stack.

For an example of how to configure a trigger to turn off power to port LEDs, see the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To enable the eco-friendly LED feature which turns off power to all port LEDs, use the following commands:

```
awplus# configure terminal
awplus(config)# ecofriendly led
```

To disable the eco-friendly LED feature, use the following command:

```
awplus# configure terminal
awplus(config)# no ecofriendly led
```

**Related Commands** [ecofriendly lpi](#)  
[show ecofriendly](#)

## ecofriendly lpi

Use this command to conserve power by enabling the eco-friendly LPI (Low Power Idle) feature. This feature reduces the power supplied to the ports on XEM2s installed in the switch, whenever ports are idle and are connected to IEEE802.3az Energy Efficient Ethernet compliant host devices.

LPI is a feature of the IEEE 802.3az Energy Efficient Ethernet (EEE) standard. LPI lowers power consumption of switch ports during periods of low link utilization when connected to IEEE 802.3az compliant host devices. If no data is sent then the switch port can enter a sleep state, called Low Power Idle (LPI), to conserve power used by the switch.

Use the **no** variant of this command to disable the eco-friendly LPI feature.

**Syntax** `ecofriendly lpi`  
`no ecofriendly lpi`

**Default** The eco-friendly LPI feature is disabled by default.

**Mode** Interface Configuration for a switch port, or Interface Configuration for a range of switch ports.

**Usage** For an example of how to configure a trigger to enable the eco-friendly LPI feature, see the [Triggers Feature Overview and Configuration Guide](#).

All ports configured for LPI must support LPI in hardware and must be configured to auto negotiate by default or by using the `speed` and `duplex` commands as needed.

**Examples** To enable the eco-friendly LPI feature on a switch port, port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# ecofriendly lpi
```

To enable the eco-friendly LPI feature on a range of switch ports, port1.1.2-port1.1.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2-port1.1.4
awplus(config-if)# ecofriendly lpi
```

To disable the eco-friendly feature on port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no ecofriendly lpi
```

**Related  
Commands** duplex  
ecofriendly led  
show ecofriendly  
show interface  
speed

# findme

**Overview** Use this command to physically locate a specific device from a group of similar devices. Activating the command causes a selected number of port LEDs to alternately flash green then amber (if that device has amber LEDs) at a rate of 1 Hz.

Use the **no** variant of this command to deactivate the Find Me feature prior to the timeout expiring.

**Syntax** `findme [interface <port-list>|member <stack-ID>] [timeout <duration>]`  
`no findme`

Parameter	Description
<code>interface &lt;port-list&gt;</code>	The ports to flash. The port list can be: <ul style="list-style-type: none"><li>• a switch port, e.g. port1.1.4</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.1.1-1.1.4</li><li>• a comma-separated list of ports and port ranges, e.g. port1.1.1,port1.1.5-1.1.6.</li></ul>
<code>member &lt;stack-ID&gt;</code>	Stack member number, from 1 to 8.
<code>timeout &lt;duration&gt;</code>	How long the LEDs flash, in seconds, in the range 5 to 3600 seconds.

**Default** By default all port LEDs flash for 60 seconds.

**Mode** Privileged Exec

**Usage** Running the **findme** command causes the device's port LEDs to flash. An optional **timeout** parameter specifies the flash behavior duration. Normal LED behavior is restored automatically after either the default time, or a specified time has elapsed, or a **no findme** command is used. You can specify which interface or interfaces are flashed with the optional **interface** parameter.

You can specify a particular stack member with the optional **member** parameter. All available interfaces are flashed by default.

**NOTE:** The **interface** and **member** parameters are mutually exclusive.

**Example** To activate the Find Me feature for the default duration (60 seconds) on all ports, use the following command:

```
awplus# findme
```

To activate the Find Me feature for 120 seconds on all ports, use the following command:

```
awplus# findme timeout 120
```

To activate the Find Me feature for the default duration (60 seconds) on switch port interfaces port1.1.2 through port1.1.4, use the following command:

```
awplus# findme interface port1.1.2-1.1.4
```

In the example above, ports 2 to 4 will flash 4 times and then all ports will flash twice. Each alternate flash will be amber (if that device has amber LEDs). This pattern will repeat until **timeout** (default or set) or **no findme** commands are used.

To deactivate the Find Me feature, use the following command:

```
awplus# no findme
```

To activate the Find Me feature for the default duration on stack member 2, use the following command:

```
awplus# findme member 2
```

In the example above, all ports on member 2 will flash 4 times and then all ports in the stack will flash twice. Each alternate flash will be amber (if that device has amber LEDs). This pattern will repeat until the timeout (default or set) expires or the **no findme** command is used.

# findme trigger

**Overview** When this command is enabled, the LED flashing functionality of the **find-me** command is applied whenever any or all of the selected parameter conditions is detected.

Use the **no** variant to remove the findme trigger function for the selected parameter.

**Syntax** `findme trigger {all|loopprot|thrash-limit|qsp}`  
`no findme trigger {all|loopprot|thrash-limit|qsp}`

Parameter	Description
all	Enable the find-me function whenever any of the listed parameter conditions are detected
loopprot	Enable the findme function whenever a loop protection condition is detected.
thrash-limit	Enable the findme function whenever a MAC address thrash-limiting condition is detected.
qsp	Enable the findme function whenever a QoS Storm Protection condition is detected.

**Default** The findme trigger function is disabled.

**Mode** Global config

**Usage** Note that findme trigger is not available if you have set the switch to take the following actions in response to an event:

- For loop detection, the actions **log-only** and **none**
- For MAC address thrash-limiting, the actions **learn-disable** and **none**.

**Example** To enable action LED flashing for the loop protection function:

```
awplus# findme trigger loopprot
```

**Related Commands** [findme](#)  
[loop-protection loop-detect](#)  
[storm-protection](#)

# hostname

**Overview** This command sets the name applied to the device as shown at the prompt. The hostname is:

- displayed in the output of the `show system` command
- displayed in the CLI prompt so you know which device you are configuring
- stored in the MIB object sysName

Use the **no** variant of this command to revert the hostname setting to its default. For devices that are not part of an AMF network, the default is "awplus".

**Syntax** `hostname <hostname>`  
`no hostname [<hostname>]`

Parameter	Description
<code>&lt;hostname&gt;</code>	Specifies the name given to a specific device. This is also referred to as the Node name in AMF output screens.

**Default** awplus

**Mode** Global Configuration

**Usage** On a stack, in a network that is not running AMF, the stack master will have a host name of "awplus" by default, and this also becomes the name of the stack. Individual stack members (excluding the master) will have a host name that is the stack name hyphenated with a numeric suffix. For example, "awplus-1", "awplus-2" and so on.

The **hostname** command can then be used to change the stack name and the stack master's host name. For example, for the hostname "Lab", the stack master's host name will be "Lab" and the other stack members will have host names "Lab-1", "Lab-2" and so on.

In case of stack master fail-over, or stack split, the new stack will use the previous stack name as its host name and the stack name, unless you change it by executing the **hostname** command on the new stack master.

Within an AMF network, any device without a user-defined hostname will automatically be assigned a name based on its MAC address.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network devices and apply an appropriate hostname to each device.

The name must also follow the rules for ARPANET host names. The name must start with a letter, end with a letter or digit, and use only letters, digits, and hyphens. Refer to RFC 1035.

**Example** To set the system name to HQ-Sales, use the command:

```
awplus# configure terminal
awplus(config)# hostname HQ-Sales
```

This changes the prompt to:

```
HQ-Sales(config)#
```

To revert to the default hostname awplus, use the command:

```
HQ-Sales(config)# no hostname
```

This changes the prompt to:

```
awplus(config)#
```

**NOTE:** When AMF is configured, running the **no hostname** command will apply a hostname that is based on the MAC address of the device node, for example, **node\_0000\_5e00\_5301**.

**Related  
Commands** [show system](#)

# max-fib-routes

**Overview** This command enables you to control the maximum number of FIB routes configured. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds.

**NOTE:** When using VRF-lite, this command applies to the Global VRF instance; to set the max-fib-routes for a user-defined VRF instance use the *max-fib-routes (VRF)* command. For static routes use the *max-static-routes* command for the Global VRF instance and the *max-static-routes (VRF)* command for a user-defined VRF instance.

Use the **no** variant of this command to set the maximum number of FIB routes to the default of 4294967294 FIB routes.

**Syntax** `max-fib-routes <1-4294967294> [<1-100>|warning-only]`  
`no max-fib-routes`

Parameter	Description
max-fib-routes	This is the maximum number of routes that can be stored in the device's Forwarding Information dataBase. In practice, other practical system limits would prevent this maximum being reached.
<1-4294967294>	The allowable configurable range for setting the maximum number of FIB-routes.
<1-100>	This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached.
warning-only	This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value is reached. Routes can continue to be added until your device reaches either the maximum capacity value of 4294967294, or a practical system limit.

**Default** The default number of FIB routes is the maximum number of FIB routes (4294967294).

**Mode** Global Configuration

**Examples** To set the maximum number of dynamic routes to 2000 and warning threshold of 75%, use the following commands:

```
awplus# config terminal
awplus(config)# max-fib-routes 2000 75
```

**Related  
Commands** [max-fib-routes \(VRF\)](#)

# max-static-routes

**Overview** Use this command to set the maximum number of static routes, excluding FIB (Forwarding Information Base) routes.

**NOTE:** When using VRF-lite, this command applies to the Global VRF instance; to set the max-static-routes for a user-defined VRF instance use the [max-static-routes \(VRF\)](#) command. For FIB routes use the [max-fib-routes](#) command for the Global VRF instance and the [max-fib-routes \(VRF\)](#) command for a user-defined VRF instance.

Use the **no** variant of this command to set the maximum number of static routes to the default of 1000 static routes.

**Syntax** max-static-routes <1-1000>  
no max-static-routes

**Default** The default number of static routes is the maximum number of static routes (1000).

**Mode** Global Configuration

**Example** To reset the maximum number of static routes to the default maximum, use the command:

```
awplus# configure terminal
awplus(config)# no max-static-routes
```

**NOTE:** Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

**Related Commands** [max-fib-routes](#)

# no debug all

**Overview** This command disables the debugging facility for all features on your device. This stops the device from generating any diagnostic debugging messages.

The debugging facility is disabled by default.

**Syntax** no debug all [bgp|ipv6|dot1x|nsm|ospf|pim  
dense-mode|pim sparse-mode|rip|vrrp]

Parameter	Description
bgp	Turns off all debugging for BGP (Border Gateway Protocol).
dot1x	Turns off all debugging for IEEE 802.1X port-based network access- control.
ipv6	Turns off all debugging for IPv6 (Internet Protocol version 6).
nsm	Turns off all debugging for the NSM (Network Services Module).
ospf	Turns off all debugging for OSPF (Open Shortest Path First).
pim dense-mode	Turns off all debugging for PIM (Protocol Independent Multicast) Dense Mode.
pim sparse-mode	Turns off all debugging for PIM (Protocol Independent Multicast) Sparse Mode.
rip	Turns off all debugging for RIP (Routing Information Protocol).
vrrp	Turns off all debugging for VRRP (Virtual Router Redundancy Protocol).

**Mode** Global Configuration and Privileged Exec

**Example** To disable debugging for all features, use the command:

```
awplus# no debug all
```

To disable all BGP debugging, use the command:

```
awplus# no debug all bgp
```

To disable all 802.1X debugging, use the command:

```
awplus# no debug all dot1x
```

To disable all IPv6 debugging, use the command:

```
awplus# no debug all ipv6
```

To disable all NSM debugging, use the command:

```
awplus# no debug all nsm
```

To disable all OSPF debugging, use the command:

```
awplus# no debug all ospf
```

To disable all PIM Dense Mode debugging, use the command:

```
awplus# no debug all pim dense-mode
```

To disable all PIM Sparse Mode debugging, use the command:

```
awplus# no debug all pim sparse-mode
```

To disable all RIP debugging, use the command:

```
awplus# no debug all rip
```

To disable all VRRP debugging, use the command:

```
awplus# no debug all vrrp
```

**Related  
Commands** [undebug all](#)

- Command  
changes**
- Version 5.4.7-1.1: PIM Dense Mode parameter added
  - Version 5.4.7-1.1: PIM Sparse Mode parameter added
  - Version 5.4.7-1.1: RIP parameter added

# reboot

**Overview** This command halts the device and performs a cold restart (also known as reload). It displays a confirmation request before restarting.

You can reboot a stand-alone device, a stack, or a specified stack member.

**Syntax** `reboot [<stack-ID>]`  
`reload [<stack-ID>]`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.

**Mode** Privileged Exec

**Usage** The **reboot** and **reload** commands perform the same action.

When restarting the whole stack, you can either use this **reboot** command to reboot all stack members immediately, or to minimize downtime, reboot the stack members in a rolling sequence by using the [reboot rolling](#) command.

**Examples** To restart a stand-alone device, use the command:

```
awplus# reboot
reboot system? (y/n): y
```

To restart all devices in a stack, use the command:

```
awplus# reboot
Are you sure you want to reboot the whole
stack? (y/n): y
```

To restart stack member 2, use the command:

```
awplus# reboot stack-member 2
reboot stack-member 2 system? (y/n): y
```

If the specified stack member ID does not exist in the current stack, the command is rejected.

**Related  
Commands** [reboot rolling](#)  
[reload rolling](#)

# reload

**Overview** This command performs the same function as the [reboot](#) command.

# show clock

**Overview** This command displays the system's current configured local time and date. It also displays other clock related information such as timezone and summertime configuration.

**Syntax** show clock

**Mode** User Exec and Privileged Exec

**Example** To display the system's current local time, use the command:

```
awplus# show clock
```

**Output** Figure 7-5: Example output from the **show clock** command for a device using New Zealand time

```
Local Time: Mon, 17 Oct 2016 13:56:06 +1200
UTC Time: Mon, 17 Oct 2016 01:56:06 +0000
Timezone: NZST
Timezone Offset: +12:00
Summer time zone: NZDT
Summer time starts: Last Sunday in September at 02:00:00
Summer time ends: First Sunday in April at 02:00:00
Summer time offset: 60 mins
Summer time recurring: Yes
```

**Table 1:** Parameters in the output of the **show clock** command

Parameter	Description
Local Time	Current local time.
UTC Time	Current UTC time.
Timezone	The current configured timezone name.
Timezone Offset	Number of hours offset to UTC.
Summer time zone	The current configured summertime zone name.
Summer time starts	Date and time set as the start of summer time.
Summer time ends	Date and time set as the end of summer time.
Summer time offset	Number of minutes that summer time is offset from the system's timezone.
Summer time recurring	Whether the device will apply the summer time settings every year or only once.

**Related  
Commands** [clock set](#)  
[clock summer-time date](#)  
[clock summer-time recurring](#)

# show continuous-reboot-prevention

**Overview** This command displays the current continuous reboot prevention configuration.

**Syntax** `show continuous-reboot-prevention`

**Mode** User Exec and Privileged Exec

**Examples** To show the current continuous reboot prevention configuration, use the command:

```
awplus# show continuous-reboot-prevention
```

**Output** Figure 7-6: Example output from the **show continuous-reboot-prevention** command

```
-----  
Continuous reboot prevention  
-----  
status=disabled  
period=600  
threshold=1  
action=linkdown  
-----
```

**Related Commands** [continuous-reboot-prevention](#)  
[show reboot history](#)

# show cpu

**Overview** This command displays a list of running processes with their CPU utilization.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show cpu [<stack-ID>] [sort {thrds|pri|sleep|runtime}]`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.
sort	Changes the sorting order using the following fields. If you do not specify a field, then the list is sorted by percentage CPU utilization.
thrds	Sort by the number of threads.
pri	Sort by the process priority.
sleep	Sort by the average time sleeping.
runtime	Sort by the runtime of the process.

**Mode** User Exec and Privileged Exec

**Examples** To show the CPU utilization of current processes, sorting them by the number of threads the processes are using, use the command:

```
awplus# show cpu sort thrds
```

To show CPU utilization for a specific stack member (in this example stack member 2), use the following command:

```
awplus# show cpu 2
```

**Output** Figure 7-7: Example output from **show cpu**

```
Stack member 2:

CPU averages:
 1 second: 12%, 20 seconds: 2%, 60 seconds: 2%
System load averages:
 1 minute: 0.03, 5 minutes: 0.02, 15 minutes: 0.00

...
```

**Table 2:** Parameters in the output of the **show cpu** command

Parameter	Description
Stack member	Stack member number.
CPU averages	Average CPU utilization for the periods stated.
System load averages	The average number of processes waiting for CPU time for the periods stated.
Current CPU load	Current CPU utilization specified by load types.
pid	Identifier number of the process.
name	A shortened name for the process
thrds	Number of threads in the process.
cpu%	Percentage of CPU utilization that this process is consuming.
pri	Process priority state.

**Table 2:** Parameters in the output of the **show cpu** command (cont.)

Parameter	Description
state	Process state; one of "run", "sleep", "zombie", and "dead".
sleep%	Percentage of time that the process is in the sleep state.
runtime	The time that the process has been running for, measured in jiffies. A jiffy is the duration of one tick of the system timer interrupt.

# show cpu history

**Overview** This command prints a graph showing the historical CPU utilization. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show [<stack-ID>] cpu history`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.

**Mode** User Exec and Privileged Exec

**Usage** This command’s output displays three graphs of the percentage CPU utilization:

- per second for the last minute, then
- per minute for the last hour, then
- per 30 minutes for the last 30 hours.

If this command is entered on the stack master, it will print graphs for all the stack members. A stack member heading will be displayed to distinguish the different graphs for every stack member.

**Examples** To display a graph showing the historical CPU utilization of the device, use the command:

```
awplus# show cpu history
```

To display the CPU utilization history graph for stack member 2, use the command:

```
awplus# show 2 cpu history
```

where 2 is the node ID of the stack member.

**Output** Figure 7-8: Example output from the **show cpu history** command

# show diagnostic monitor pcsping

**Overview** Use this command to show the status of the background PCS (Physical Coding Sublayer) ping feature used to check the link status between a XEM and the switch. See the [diagnostic monitor pcsping](#) command for further information about the feature. The background PCS ping feature is enabled by default to output log messages.

**Syntax** `show diagnostic monitor pcsping`

**Mode** User Exec and Privileged Exec

**Example** To monitor the status of the background PCS ping feature, use the following command:

```
awplus# show diagnostic monitor pcsping
```

**Output** Figure 7-10: Example output from a **show diagnostic monitor pcsping** command showing default behaviour (enabled with log message output) for the background PCS ping feature

```
awplus# show diagnostic monitor pcsping
Background PCS Ping Monitoring Information
Enabled: Yes
Power-off XEM if a PCS Ping fails: No
```

Figure 7-11: Example output from a **show diagnostic monitor pcsping** command showing the background PCS ping feature disabled

```
awplus# show diagnostic monitor pcsping
Background PCS Ping Monitoring Information
Enabled: No
Power-off XEM if a PCS Ping fails: No
```

Figure 7-12: Example output from a **show diagnostic monitor pcsping** command showing the background PCS ping feature configured to power off a XEM if PCS ping fails

```
awplus# show diagnostic monitor pcsping
Background PCS Ping Monitoring Information
Enabled: Yes
Power-off XEM if a PCS Ping fails: Yes
```

# show ecofriendly

**Overview** This command displays the switch's eco-friendly configuration status. The `ecofriendly led` and `ecofriendly lpi` configuration status are shown in the `show ecofriendly` output.

**Syntax** `show ecofriendly`

**Mode** Privileged Exec and Global Configuration

**Example** To display the switch's eco-friendly configuration status, use the following command:

```
awplus# show ecofriendly
```

**Output** Figure 7-13: Example output from the `show ecofriendly` command

```
awplus#show ecofriendly
Front panel LEDs          normal
Energy efficient ethernet
Port      Name      Configured  Status
port1.1.1  Port 1    lpi        lpi
port1.1.2             lpi        lpi
port1.1.3             lpi        lpi
port1.1.4             off        off
port1.1.5             lpi        off
port1.1.6  Port 6    off        off
port1.1.7             off        -
port1.1.8             off        -
port1.1.9             off        -
port1.1.10            off        -
```

**Table 3:** Parameters in the output of the `show ecofriendly` command

Parameter	Description
normal	The eco-friendly LED feature is disabled and port LEDs show the current state of the ports. This is the default setting.
off	The eco-friendly LED feature is enabled and power to the port LEDs is disabled.
Port	Displays the port number as assigned by the switch.
Name	Displays the port name if a name is configured for a port number.

**Table 3:** Parameters in the output of the **show ecofriendly** command (cont.)

Parameter	Description
Configured	The eco-friendly LPI feature is configured on the port. Either LPI or off is displayed.
Status	The eco-friendly LPI feature is active on the port. Either LPI or off is displayed. Ports that are not running show a dash (-).

**Related  
Commands** [ecofriendly led](#)  
[ecofriendly lpi](#)

# show interface memory

**Overview** This command displays the shared memory used by either all interfaces, or the specified interface or interfaces. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show interface memory`  
`show interface <port-list> memory`

Parameter	Description
<code>&lt;port-list&gt;</code>	The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.2.12), a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po3)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.1.1-1.1.12, or sa1-2, or po1-4)</li><li>• a comma-separated list of ports and port ranges (e.g. port1.1.1,port1.1.4-1.2.12). Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list.</li></ul>

**Mode** User Exec and Privileged Exec

**Example** To display the shared memory used by all interfaces, use the command:

```
awplus# show interface memory
```

To display the shared memory used by port1.1.1 and port1.1.5 to port1.1.8, use the command:

```
awplus# show interface port1.1.1,port1.1.5-1.1.8 memory
```

**Output** Figure 7-14: Example output from the **show interface memory** command

```

# show memory

**Overview** This command displays the memory used by each process that is currently running. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show memory [<stack-ID>] [sort {size|peak|stk}]`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.
sort	Changes the sorting order for the list of processes. If you do not specify this, then the list is sorted by percentage memory utilization.
size	Sort by the amount of memory the process is currently using.
peak	Sort by the amount of memory the process is currently using.
stk	Sort by the stack size of the process.

**Mode** User Exec and Privileged Exec

**Example** To display the memory used by the current running processes, use the command:

```
awplus# show memory
```

**Output** Figure 7-16: Example output from **show memory**

```
awplus#show memory

Stack member 1:

RAM total: 514920 kB; free: 382716; buffers: 16368 kB

843 inetd       0   256  1256   136   84
...
```

**Table 4:** Parameters in the output of the **show memory** command

Parameter	Description
Stack member	Stack member number.
RAM total	Total amount of RAM memory free.
free	Available memory size.
buffers	Memory allocated kernel buffers.
pid	Identifier number for the process.
name	Short name used to describe the process.
mem%	Percentage of memory utilization the process is currently using.
size	Amount of memory currently used by the process.
peak	Greatest amount of memory ever used by the process.
data	Amount of memory used for data.
stk	The stack size.

# show memory history

**Overview** This command prints a graph showing the historical memory usage. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show memory history [<stack-ID>]`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.

**Mode** User Exec and Privileged Exec

**Usage** This command’s output displays three graphs of the percentage memory utilization:

- per second for the last minute, then
- per minute for the last hour, then
- per 30 minutes for the last 30 hours.

**Examples** To show a graph displaying the historical memory usage for either a single unstacked device, or a complete stack, use the command:

```
awplus# show memory history
```

To show a graph displaying the historical memory usage for specific stack member (stack member 2 in this example) within a stack, use the command:

```
awplus# show memory history 2
```

**Output** Figure 7-18: Example output from the **show memory history** command

# show process

**Overview** This command lists a summary of the current running processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show process [<stack-ID>] [sort {cpu|mem}]`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.
sort	Changes the sorting order for the list of processes.
cpu	Sorts the list by the percentage of CPU utilization.
mem	Sorts the list by the percentage of memory utilization.

**Mode** User Exec and Privileged Exec

**Usage** This command displays a snapshot of currently-running processes. If you want to see CPU or memory utilization history instead, use the commands [show cpu history](#) or [show memory history](#).

**Example** To display a summary of the current running processes, use the command:

```
awplus# show process
```

To display a summary of the current running processes on stack member 2, use the command:

```
awplus# show process 2
```

**Output** Figure 7-21: Example output from the **show process** command

```
Stack member 2:

```

**Table 5:** Parameters in the output from the **show process** command

Parameter	Description
Stack member	Stack member number.
CPU averages	Average CPU utilization for the periods stated.
System load averages	The average number of processes waiting for CPU time for the periods stated.
Current CPU load	Current CPU utilization specified by load types
RAM total	Total memory size.
free	Available memory.
buffers	Memory allocated to kernel buffers.
pid	Identifier for the process.
name	Short name to describe the process.
thrds	Number of threads in the process.
cpu%	Percentage of CPU utilization that this process is consuming.
mem%	Percentage of memory utilization that this process is consuming.

**Table 5:** Parameters in the output from the **show process** command (cont.)

Parameter	Description
pri	Process priority.
state	Process state; one of "run", "sleep", "stop", "zombie", or "dead".
sleep%	Percentage of time the process is in the sleep state.

**Related  
Commands** [show cpu](#)

reboot prevention)
2016-10-09  19:51:20  Expected    User Request
```

**Table 6:** Parameters in the output from the **show reboot history** command

Parameter	Description
Unexpected	A non-intended reboot. The reboot is counted by the continuous reboot prevention feature, as long as the reboot occurred in the time period specified for continuous reboot prevention.
Expected	A planned or user-triggered reboot. The reboot is not counted by the continuous reboot prevention feature.

**Table 6:** Parameters in the output from the **show reboot history** command

Parameter	Description
Continuous reboot prevention	A continuous reboot prevention event has occurred. The action taken is configured with the <b>continuous-reboot-prevention</b> command. The next time period during which reboot events are counted begins from this event.
User request	User initiated reboot via the CLI.

**Related Commands** [show continuous-reboot-prevention](#)

**Related Commands** [show system environment](#)

# show system environment

**Overview** This command displays the current environmental status of your device and any attached PSU, XEM, or other expansion option. The environmental status covers information about temperatures, fans, and voltage.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show system environment

**Mode** User Exec and Privileged Exec

**Example** To display the system’s environmental status, use the command:

```
awplus# show system environment
```

**Output** Figure 7-25: Example output from **show system environment**

```
awplus#show system environment
Environment Monitoring Status

**Commands**

# show system interrupts

**Overview** Use this command to display the number of interrupts for each IRQ (Interrupt Request) used to interrupt input lines on a PIC (Programmable Interrupt Controller) on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show system interrupts`

**Mode** User Exec and Privileged Exec

**Example** To display information about the number of interrupts for each IRQ in your device, use the command:

```
awplus# show system interrupts
```

**Output** Figure 7-26: Example output from the **show system interrupts** command

```
awplus>show system interrupts
      CPU0
  1:      2   CPM2 SIU  Level Enabled  0   i2c-mpc
  2:     145  CPM2 SIU  Level Enabled  0   spi-mpc

**Related Commands** [show system environment](#)

# show system mac

**Overview** This command displays the physical MAC address available on a standalone switch or a stack. This command also shows the virtual MAC address for a stack if the stack virtual MAC address feature is enabled with the [stack virtual-mac](#) command or the [stack enable](#) command.

**Syntax** `show system mac`

**Mode** User Exec and Privileged Exec

**Usage** For more information about the virtual MAC address feature, see the [VCStack Feature Overview and Configuration Guide](#).

**Example** To display the physical MAC address enter the following command:

```
awplus# show system mac
```

**Output** Figure 7-27: Example output from the **show system mac** command

```
awplus#show system mac
eccd.6d9d.4eed (system)
```

**Output** Figure 7-28: Example output showing how to use the **stack virtual-mac** command and the **show system mac** command

```
awplus#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
awplus(config)#stack virtual-mac
% Please check that the new MAC 0000.cd37.0065 is unique within
the network.
% Save the config and restart the system for this change to take
effect.

# show system serialnumber

**Overview** This command shows the serial number information for the device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show system serialnumber`

**Mode** User Exec and Privileged Exec

**Example** To display the serial number information for the device, use the command:

```
awplus# show system serialnumber
```

**Output** Figure 7-32: Example output from the **show system serial number** command

```
awplus#show system serialnumber  
45AX5300X
```

# show tech-support

**Overview** This command generates system and debugging information for the device and saves it to a file.

This command is useful for collecting a large amount of information so that it can then be analyzed for troubleshooting purposes. The output of this command can be provided to technical support staff when reporting a problem.

You can optionally limit the command output to display only information for a given protocol or feature. The features available depend on your device and will be a subset of the features listed in the table below.

**Syntax** `show tech-support`  
{ [all|atmf|auth|bgp|card|dhcpcsn|epsr|firewall|igmp|ip|ipv6|mld|openflow|ospf|ospf6|pim|rip|ripng|stack|stp|system|tacacs+|update]} [outfile <filename>]

Parameter	Description
all	Display full information
atmf	Display ATMF-specific information
auth	Display authentication-related information
bgp	Display BGP-related information
card	Display Chassis Card specific information
dhcpcsn	Display DHCP Snooping specific information
epsr	Display EPSR specific information
firewall	Display firewall specific information
igmp	Display IGMP specific information
ip	Display IP specific information
ipv6	Display IPv6 specific information
mld	Display MLD specific information
openflow	Display information related to OpenFlow
ospf	Display OSPF related information
ospf6	Display OSPF6 specific information
pim	Display PIM related information
rip	RIP related information
ripng	Display RIPNG specific information
stack	Display stacking device information
stp	Display STP specific information
system	Display general system information

Parameter	Description
tacacs+	Display TACACS+ information
update	Display resource update specific information
	Output modifier
>	Output redirection
>>	Output redirection (append)
outfile	Output file name
<filename>	Specifies a name for the output file. If no name is specified, this file will be saved as: tech-support.txt.gz.

**Default** Captures **all** information for the device.

By default the output is saved to the file 'tech-support.txt.gz' in the current directory. If this file already exists in the current directory then a new file is generated with the time stamp appended to the file name, for example 'tech-support20161009.txt.gz', so the previous file is retained.

**Usage** The command generates a large amount of output, which is saved to a file in compressed format. The output file name can be specified by outfile option. If the output file already exists, a new file name is generated with the current time stamp. If the output filename does not end with ".gz", then ".gz" is appended to the filename. Since output files may be too large for Flash on the device we recommend saving files to external memory or a TFTP server whenever possible to avoid device lockup. This method is not likely to be appropriate when running the working set option of AMF across a range of physically separated devices.

**Mode** Privileged Exec

**Examples** To produce the output needed by technical support staff, use the command:

```
awplus# show tech-support
```

# speed (asyn)

**Overview** This command changes the console speed from the device. Note that a change in console speed is applied for subsequent console sessions. Exit the current session to enable the console speed change using the [clear line console](#) command.

**Syntax** `speed <console-speed-in-bps>`

Parameter	Description
<code>&lt;console-speed-in-bps&gt;</code>	Console speed Baud rate in bps (bits per second).
	1200            1200 Baud
	2400            2400 Baud
	9600            9600 Baud
	19200           19200 Baud
	38400           38400 Baud
	57600           57600 Baud
	115200          115200 Baud

**Default** The default console speed baud rate is 9600 bps.

**Mode** Line Configuration

**Usage** This command is used to change the console (asyn) port speed. Set the console speed to match the transmission rate of the device connected to the console (asyn) port on your device.

**Example** To set the terminal console (asyn0) port speed from the device to 57600 bps, then exit the session, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# speed 57600
awplus(config-line)# exit
awplus(config)# exit
awplus# exit
```

Then log in again to enable the change:

```
awplus login:
Password:
awplus>
```

**Related  
Commands** `clear line console`  
`line`  
`show running-config`  
`show startup-config`  
`speed`

# system overtemperature-shutdown

**Overview** Use this command to enable the switch to power off if its temperature gets too high (over approximately 80°C).

Use the **no** variant of this command to stop the switch from powering off if its temperature gets too high.

**CAUTION:** *Overheating can seriously damage switch components. Only disable the over-temperature shutdown if the switch has a faulty temperature sensor that gives an incorrect high reading. If you do disable the over-temperature shutdown, you must carefully monitor the switch, and replace the faulty sensor as soon as possible.*

**Syntax** `system overtemperature-shutdown`  
`no system overtemperature-shutdown`

**Default** Enabled

**Mode** Global Configuration

**Usage** If the switch detects that its temperature is approaching the temperature limit, it will monitor the temperature closely for a few minutes. During this time, it will log warning messages and generate SNMP traps if SNMP is configured.

If the temperature exceeds the limit, the switch will power off the power supply unit (PSU).

You can turn the switch back on by power cycling the PSU. The first time the switch boots up after power is restored, it will print a message to the console and generate a log message to tell you the reason for the shutdown.

If the switch is in a stack, only the overheated stack member will shut down.

If you have disabled the over-temperature shutdown, the switch will still generate warning log messages and SNMP traps, to warn you that the temperature is too high. However, it will not power off.

**Example** To stop the switch from powering off when its temperature gets too high, use the commands:

```
awplus# configure terminal
awplus(config)# no system overtemperature-shutdown
```

Only do this if the switch's temperature sensors are faulty.

**Related Commands** [show system environment](#)

**Command changes** Version 5.4.8-0.2: command added to SBx908 GEN2

# system territory (deprecated)

**Overview** This command has been deprecated in Software Version 5.4.4-0.1 and later. It now has no effect.

It is no longer useful to specify a system territory, so there is no alternative command.

# terminal monitor

**Overview** Use this command to display debugging output on a terminal.

To display the cursor after a line of debugging output, press the Enter key.

Use the command **terminal no monitor** or **no terminal monitor** to stop displaying debugging output on the terminal. Alternatively, you can use the timeout option to stop displaying debugging output on the terminal after a set time.

**Syntax** terminal monitor [<1-60>]  
terminal no monitor  
no terminal monitor

Parameter	Description
<1-60>	Set a timeout between 1 and 60 seconds for terminal output.

**Default** Disabled

**Mode** User Exec and Privileged Exec

**Examples** To display debugging output on a terminal, enter the command:

```
awplus# terminal monitor
```

To display debugging on the terminal for 60 seconds, enter the command:

```
awplus# terminal monitor 60
```

To stop displaying debugging output on the terminal, use the command:

```
awplus# no terminal monitor
```

**Related Commands** All debug commands

**Command changes** Version 5.4.8-0.2: **no terminal monitor** added as an alias for **terminal no monitor**

# undebug all

**Overview** This command applies the functionality of the [no debug all](#) command.

# 8

# Pluggables and Cabling Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure and monitor Pluggables and Cabling, including:

- Cable Fault Locator for finding faults in copper cabling
- Optical Digital Diagnostic Monitoring (DDM) to help find fiber issues when links go down
- Active Fiber Monitoring for detecting changes in optical power received over fiber cables.

For more information, see the [Pluggables and Cabling Feature Overview and Configuration Guide](#).

- Command List**
- “clear fiber-monitoring interface” on page 341
  - “clear test cable-diagnostics tdr” on page 342
  - “debug fiber-monitoring” on page 343
  - “fiber-monitoring action” on page 345
  - “fiber-monitoring baseline” on page 347
  - “fiber-monitoring enable” on page 349
  - “fiber-monitoring interval” on page 350
  - “fiber-monitoring sensitivity” on page 351
  - “show system fiber-monitoring” on page 353
  - “show system pluggable” on page 356
  - “show system pluggable detail” on page 358
  - “show system pluggable diagnostics” on page 362
  - “show test cable-diagnostics tdr” on page 365
  - “test cable-diagnostics tdr interface” on page 366

# clear fiber-monitoring interface

**Overview** Use this command to clear the Active Fiber Monitoring state of a port. It clears the alarm, baseline and history and starts monitoring from the beginning. It does not change the configuration.

**Syntax** `clear fiber-monitoring interface <port>`

Parameter	Description
<code>&lt;port&gt;</code>	The name of the port to reset Active Fiber Monitoring on.

**Default** n/a

**Mode** Privileged Exec

**Usage** Normally, you do not need to clear the Active Fiber Monitoring state of a port. If the issue resolves itself and the monitored optical power returns to the baseline, the alarm clears automatically.

However, you may need to clear the Active Fiber Monitoring state if the optical power level reduces for a known reason, causing the port to be stuck in the alarm state. In this situation, the alarm will not clear automatically, because Active Fiber Monitoring does not update the baseline when the port is in the alarm state, for security reasons.

**Example** To clear the Active Fiber Monitoring state for interface port1.1.1, use the command:

```
awplus# clear fiber-monitoring interface port1.1.1
```

**Related Commands** [show system fiber-monitoring](#)

**Command changes** Version 5.4.8-0.2: command added

# clear test cable-diagnostics tdr

**Overview** Use this command to clear the results of the last cable test that was run.

**Syntax** `clear test cable-diagnostics tdr`

**Mode** Privileged Exec

**Examples** To clear the results of a previous cable-diagnostics test use the following commands:

```
awplus# clear test cable-diagnostics tdr
```

**Related  
Commands** [show test cable-diagnostics tdr](#)  
[test cable-diagnostics tdr interface](#)

# debug fiber-monitoring

**Overview** Use this command to enable debugging of active fiber monitoring on the specified ports.

Use the **no** variant of this command to disable debugging on all ports or the specified ports.

**Syntax** `debug fiber-monitoring interface <port-list>`  
`no debug fiber-monitoring [interface <port-list>]`

Parameter	Description
<code>&lt;port-list&gt;</code>	The list of fiber ports to enable or disable debugging for, as a single port, a comma separated list or a hyphenated range.

**Default** Debugging of active fiber monitoring is disabled by default.

**Mode** User Exec/Privileged Exec

**Usage** While debugging is enabled by this command for a port, all the optical power readings for the port are sent to the console.

**Example** To enable debugging messages for active fiber monitoring of port1.1.1 to be sent to the console, use the commands:

```
awplus# debug fiber-monitoring interface port1.1.1  
awplus# terminal monitor
```

To disable debugging messages for active fiber monitoring on port1.1.1, use the command:

```
awplus# no debug fiber-monitoring interface port1.1.1
```

To disable all debugging messages for active fiber monitoring, use the command:

```
awplus# no debug fiber-monitoring
```

**Output** Figure 8-1: Example output from **debug fiber-monitoring**

```
awplus#debug fiber-monitoring interface port1.1.1
awplus#terminal monitor
% Warning: Console logging enabled

Baseline:1709 Threshold:1357
```

**Related Commands** [show system fiber-monitoring](#)

# fiber-monitoring action

**Overview** Use this command to specify an action to be taken if the optical power received on the port changes from the baseline by the amount specified in the **fiber-monitoring sensitivity** command.

Use the **no** variant of this command to remove the specified action or all actions from the port.

**Syntax** `fiber-monitoring action [trap] [shutdown] [continuous]`  
`no fiber-monitoring action [trap|shutdown]`

Parameter	Description
trap	Send an SNMP notification.
shutdown	Shutdown the port.
continuous	Make the action or actions happen continuously (every polling interval) while the sensor is in the alarm state. Otherwise, the action only happens when the alarm is triggered or cleared.

**Default** By default a log message is generated, but no additional action is performed.

**Mode** Interface Configuration mode for a fiber port.

**Usage** If fiber monitoring is enabled and this command is not used to set an action, a change in received power on a fiber port only generates a log message.

**Example** To set the device to send an SNMP trap when port1.1.1 or port1.1.4 receive reduced power and when that reduced-power alarm is cleared, use the commands:

```
awplus(config)# interface port1.1.1-port1.1.4  
awplus(config-if)# fiber-monitoring action trap
```

To set the device to send an SNMP trap when port1.1.1 or port1.1.4 receive reduced power, and every polling interval after that until the alarm is cleared, use the commands:

```
awplus(config)# interface port1.1.1-port1.1.4  
awplus(config-if)# fiber-monitoring action trap continuous
```

To set the device to send an SNMP trap and to shut down the port when port1.1.1 or port1.1.4 receive reduced power, use the commands:

```
awplus(config)# interface port1.1.1-port1.1.4  
awplus(config-if)# fiber-monitoring action trap shutdown
```

To set the device to stop shutting down the port if port1.1.1 or port1.1.4 receive reduced power, use the commands:

```
awplus(config)# interface port1.1.1-port1.1.4  
awplus(config-if)# no fiber-monitoring action shutdown
```

If the device is set to send an SNMP trap for those ports, it will continue to do so.

To set the device not to perform any action when it receives reduced power on port1.1.1 or port1.1.4, except sending a log message, use the commands:

```
awplus(config)# interface port1.1.1-port1.1.4  
awplus(config-if)# no fiber-monitoring action
```

# fiber-monitoring baseline

**Overview** Use this command to configure how the baseline value for comparison is calculated for active fiber monitoring on the port.

Note that alarm generation will not commence until the link has been up for a full averaging period.

Use the **no** variant of this command to set the fiber-monitoring baseline to its default value.

**Syntax** `fiber-monitoring baseline average <12-150> [interval <2-86400>]`  
`fiber-monitoring baseline fixed <1-65535>`  
`no fiber-monitoring baseline`

Parameter	Description
average <12-150>	Set the baseline optical power received to be based on the moving average of the specified number of most recent (non-zero) values. Default is to use this setting and 12 values.
interval <2-86400>	Optionally, specify the optical power polling interval for determining the baseline, in seconds. By default, the baseline polling interval is the same as the monitoring polling interval, which is 5 seconds by default. If specified, this baseline interval should be larger than the monitoring interval. Even if you specify a baseline interval, Active Fiber Monitoring will use the monitoring interval to calculate the initial baseline average. This means the first x baseline readings will be taken at the monitoring interval, where x is the number of readings specified in the <b>average</b> parameter. See Usage below for more information.
fixed <1-65535>	Set the baseline to a fixed level of received optical power in 0.0001mW. Not recommended—see Usage below.

**Default** The default is a moving average of the last 12 values, taken at the same interval as the monitoring interval. The monitoring interval is set using the **fiber-monitoring interval** command. If the monitoring interval is set to its default of 5 seconds, the **fiber-monitoring baseline** default will be the average over the last minute.

**Mode** Interface Configuration for a fiber port

**Usage** There are two ways to configure the baseline. The first is to choose a number of readings to average. This is the default and recommended method. The second is to set a fixed value in units of x0.0001mW.

If a fixed value is required, the easiest way to choose a value is to enable fiber monitoring on the port and use the **show system fiber-monitoring** command to see what readings you can expect.

**CAUTION:** *We do not recommend setting a fixed value because gradual change over time caused by temperature fluctuations, etc. could lead to unnecessary alarms.*

If you use the averaging method, you can optionally specify how often Active Fiber Monitoring polls the cable to determine the baseline. This allows Active Fiber Monitoring to update the baseline less often than it polls the device for monitoring.

In order to prevent the theoretical possibility of slow clamping, you can set the baseline interval to a large value, so that the baseline average is only updated with the current reading (for example) once per day or once per hour.

As fiber attenuation can be affected by ambient temperature, take care if changing the baseline interval in environments with large daily temperature fluctuations.

**Example** To set the baseline optical power to a moving average of the last 30 monitoring readings on port1.1.1 and port1.1.4, use the command:

```
awplus(config)# interface port1.1.1-port1.1.4
awplus(config-if)# fiber-monitoring baseline average 30
```

To calculate the baseline based on 12 values taken 24 hours (86400 seconds) apart, instead of using the monitoring interval, use the command:

```
awplus(config)# interface port1.1.1-port1.1.4
awplus(config-if)# fiber-monitoring baseline average 12
interval 86400
```

To set the baseline to its default, averaging the last 12 readings, use the command:

```
awplus(config)# interface port1.1.1-port1.1.4
awplus(config-if)# no fiber-monitoring baseline
```

**Related Commands** [fiber-monitoring interval](#)  
[fiber-monitoring sensitivity](#)

**Command changes** Version 5.4.8-0.2: **interval** parameter added

# fiber-monitoring enable

**Overview** Use this command to enable active fiber monitoring on a fiber port. If the port can support fiber monitoring but does not have the correct SFP or fiber type installed, the configuration will be saved, and monitoring will commence when a supported SFP is inserted. Disabling and re-enabling fiber monitoring on a port resets the baseline calculation.

Use the **no** variants of this command to disable active fiber monitoring on the interface, or to remove all the configuration and state for the ports, respectively.

**Syntax** `fiber-monitoring enable`  
`no fiber-monitoring enable`  
`no fiber-monitoring`

**Default** Active fiber monitoring is disabled by default.

**Mode** Interface Configuration mode for a fiber port

**Examples** To enable active fiber monitoring on port1.1.1 and port1.1.4, use the commands:

```
awplus(config)# interface port1.1.1-port1.1.4  
awplus(config-if)# fiber-monitoring enable
```

To disable fiber monitoring on the ports, use the commands:

```
awplus(config)# interface port1.1.1-port1.1.4  
awplus(config-if)# no fiber-monitoring enable
```

To remove all fiber-monitoring configuration and state for the ports, use the commands:

```
awplus(config)# interface port1.1.1-port1.1.4  
awplus(config-if)# no fiber-monitoring
```

**Related Commands** [fiber-monitoring action](#)  
[fiber-monitoring sensitivity](#)  
[show system fiber-monitoring](#)

# fiber-monitoring interval

**Overview** Use this command to configure the fiber monitoring polling interval in seconds for the port. The optical power will be read every <interval> seconds and compared against the calculated threshold values to see if a log message or other action is required.

Use the **no** variant of this command to reset the polling interval to the default (5 seconds).

**Syntax** fiber-monitoring interval <2-60>  
no fiber-monitoring interval

Parameter	Description
<2-60>	Optical power polling interval in seconds.

**Default** The interval is set to 5 seconds by default.

**Mode** Interface configuration mode for a fiber port.

**Example** To set the fiber monitoring polling interval for port1.1.1 to 30 seconds, use the commands:

```
awplus(config)# interface port1.1.1  
awplus(config-if)# fiber-monitoring interval 30
```

To reset the fiber monitoring polling interval back to the default (5s), use the commands:

```
awplus(config)# interface port1.1.1  
awplus(config-if)# no fiber-monitoring interval
```

**Related Commands** [fiber-monitoring baseline](#)  
[show system fiber-monitoring](#)

# fiber-monitoring sensitivity

**Overview** Use this command to configure the sensitivity of the alarm thresholds on the port for active fiber monitoring.

Use the **no** variant of this command to reset the sensitivity to the default.

**Syntax** `fiber-monitoring sensitivity (low|medium|high|highest|fixed <25-65535>)|relative <0.01-10.0>`  
`no fiber-monitoring sensitivity`

Parameter	Description
low	Low sensitivity (+/-2 dB)
medium	Medium sensitivity (1 dB) (default)
high	High sensitivity (the greater of 0.5 dB and 0.0025 mW)
highest	The highest sensitivity available: 0.0025mW
fixed<25-65535>	Fixed sensitivity at the specified level in 0.0001 mW.
relative <0.01-10.0>	Relative sensitivity at the specified level in dB.

**Default** The default is medium sensitivity.

**Mode** User Exec/Privileged Exec

**Usage** A log message is generated and configured actions are taken if the received optical power drops below the baseline value by the sensitivity configured with this command.

The sensitivity can be configured to one of four pre-defined levels in decibels or to a fixed absolute delta in units of 0.0001mW. The alarm thresholds can be seen in the **show system fiber-monitoring** output. The maximum absolute sensitivity configurable is 0.0025 mW. Note that 0.0025 mW equates to a reduction of approximately 1dB at the maximum attenuation of an AT-SPLX10/1.

**Example** To set the fiber monitoring sensitivity for port1.1.1 to a relative sensitivity of 0.1 dB, use the commands:

```
awplus(config)# interface port1.1.1  
awplus(config-if)# fiber-monitoring sensitivity relative 0.1
```

To reset the fiber monitoring sensitivity to the default (medium), use the commands:

```
awplus(config)# interface port1.1.1  
awplus(config-if)# no fiber-monitoring sensitivity
```

**Related Commands** [fiber-monitoring action](#)  
[fiber-monitoring baseline](#)

`show system fiber-monitoring`

# show system fiber-monitoring

**Overview** Use this command to display settings and current status for Active Fiber Monitoring.

**Syntax** show system fiber-monitoring

**Mode** User Exec and Privileged Exec

**Example** To display configuration and status for active fiber monitoring on ports, use the command:

```
awplus# show system fiber-monitoring
```

**Output** Figure 8-2: Example output from **show system fiber-monitoring**

```
awplus#show sys fiber-monitoring
Fiber Monitoring Status
  Reading units 0.0001mW

Interface port1.1.1
Status:          enabled
Supported:       Supported pluggable
Debugging:       disabled
Interval:        2 seconds
Sensitivity:     1.00dB
Baseline type:   average of last 35 values greater than 50
Status:
  Baseline value: 496
  Alarm threshold: 393
  Alarm:          no
  Last 12 Readings: 498 498 498 498 498 498 498 498 498 498 498 498
  Minimum reading: 486
  Maximum reading: 498

Interface port1.1.4
Status:          enabled
Supported:       Supported pluggable
Debugging:       disabled
Interval:        2 seconds
Sensitivity:     1.00dB
Baseline type:   average of last 30 values greater than 50
Status:
  Baseline value: 0
  Alarm threshold: 0
  Alarm:          no
  Last 12 Readings: 0 0 0 0 0 0 0 0 0 0 0 0
  Minimum reading: 0
  Maximum reading: 0
```

Table 8-1: Parameters in the output from **show system fiber-monitoring**

Parameter	Description
Reading units	The units for optical power readings in the rest of the display, e.g. 0.0001mW.
Status	Whether active fiber monitoring is enabled or disabled for this port.
Supported	Whether the pluggable inserted in this port supports active fiber monitoring.
Debugging	Whether debugging of active fiber monitoring is enabled or disabled for this port.
Interval	The configured interval between readings of optical power on this port.
Sensitivity	The configured sensitivity threshold for optical power changes on this port.
Baseline type	How the baseline optical power level is calculated: either the average of the specified number of previous readings or a specified fixed value in 0.0001mW.
Status	Current values for the following parameters.
Baseline value	The baseline value, calculated according to the configured baseline method, in 0.0001mW.
Alarm threshold	The current threshold for a change in optical power, calculated according to the configured sensitivity method, that will result in action.
Alarm	Whether the optical power at the most recent reading fallen below the threshold.
Last 12 readings	The last 12 optical power values measured, in 0.0001mW, with oldest value first.
Minimum reading	The lowest optical power reading since the fiber pluggable was last inserted, or since active fiber monitoring was last enabled on the port.
Maximum reading	The highest optical power reading since the fiber pluggable was last inserted, or since active fiber monitoring was last enabled on the port.

# show system pluggable

**Overview** This command displays **brief** pluggable transceiver information showing the pluggable type, the pluggable serial number, and the pluggable port on the device. Different types of pluggable transceivers are supported in different models of device. See your Allied Telesis dealer for more information about the models of pluggables that your device supports.

**Syntax** `show system pluggable [<port-list>]`

Parameter	Description
<port-list>	The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>a switch port (e.g. port1.1.1)</li><li>a continuous range of ports separated by a hyphen (e.g. portport1.1.1-port1.1.4)</li><li>a comma-separated list of ports and port ranges (e.g. port1.1.1,port1.1.4)</li></ul>

**Mode** User Exec and Privileged Exec

**Example** To display brief information about all installed pluggable transceivers, use the command:

```
awplus# show system pluggable
```

**Output** Figure 8-3: Example output from **show system pluggable**

```
awplus#show system pluggable
System Pluggable Information

Port      Vendor      Device      Serial Number  Datecode Type
-----
port1.1.1  ATI         AT-SPSX    A03240R151300867  15032801  1000BASE-SX
port1.1.4  ATI         AT-SPSX    A03240R111800076  15032801  1000BASE-SX
-----
```

**Table 9:** Parameters in the output from the **show system pluggable** command

Parameter	Description
Stack member	The stack member number.
Port	Specifies the port number for the installed pluggable transceiver.
Vendor	Specifies the vendor's name for the installed pluggable transceiver.

**Table 9:** Parameters in the output from the **show system pluggable** command

Parameter	Description
Device	Specifies the device name for the installed pluggable transceiver.
Serial Number	Specifies the serial number for the installed pluggable transceiver.
Datecode	Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. For more information, see "Troubleshooting Fiber and Pluggable Issues" in the "Pluggables and Cabling" <a href="#">Feature Overview and Configuration Guide</a> .
Type	Specifies the device type for the installed pluggable transceiver.

  - [show system pluggable detail](#)
  - [show system pluggable diagnostics](#)

# show system pluggable detail

**Overview** This command displays detailed pluggable transceiver information showing the pluggable type, the pluggable serial number, and the pluggable port on the device. Different types of pluggable transceivers are supported in different models of device. See your Allied Telesis dealer for more information about the models of pluggables that your device supports.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show system pluggable [<port-list>] detail`

Parameter	Description
<code>&lt;port-list&gt;</code>	The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.1.1)</li><li>• a continuous range of ports separated by a hyphen (e.g. portport1.1.1-port1.1.4)</li><li>• a comma-separated list of ports and port ranges (e.g. port1.1.1,port1.1.4)</li></ul>

**Mode** User Exec and Privileged Exec

**Usage** In addition to the information about pluggable transceivers displayed using the `show system pluggable` command (port, manufacturer, serial number, manufacturing datecode, and type information), the **show system pluggable detail** command displays the following information:

- **SFP Laser Wavelength:** Specifies the laser wavelength of the installed pluggable transceiver
- **Single mode Fiber:** Specifies the link length supported by the pluggable transceiver using single mode fiber
- **OM1 (62.5µ m) Fiber:** Specifies the link length, in meters (m) or kilometers (km) supported by the pluggable transceiver using 62.5 micron multi-mode fiber.
- **OM2 (50µ m) Fiber:** Specifies the link length (in meters or kilometers) supported by the pluggable transceiver using 50 micron multi-mode fiber.
- **Diagnostic Calibration:** Specifies whether the pluggable transceiver supports DDM or DOM Internal or External Calibration.
  - **Internal** is displayed if the pluggable transceiver supports DDM or DOM Internal Calibration.
  - **External** is displayed if the pluggable transceiver supports DDM or DOM External Calibration.
  - a dash (-) is displayed if neither Internal Calibration or External Calibration is supported.

- **Power Monitoring:** Displays the received power measurement type, which can be either **OMA**(Optical Module Amplitude) or **Avg**(Average Power) measured in  $\mu$ W.
- **TX power monitor support:** For QSFP+ modules, this indicates whether the module supports monitoring of the transmitted optical power level (Yes or No). If yes, you can view the average output optical power in the output of the command [show system pluggable diagnostics](#).

**NOTE:** For parameters that are not supported or not specified, a hyphen is displayed instead.

**Example** To display detailed information about the pluggable transceivers installed in a particular port on the device, use a command like:

```
awplus# show system pluggable port1.1.1 detail
```

To display detailed information about all the pluggable transceivers installed on the device, use the command:

```
awplus# show system pluggable detail
```

**Output** Figure 8-4: Example output from **show system pluggable detail** for a port

```
awplus#show system pluggable port1.1.1 detail

Table 8-1: Parameters in the output from **show system pluggable detail**

Parameter	Description
Stack member	The stack member number.
Port	Specifies the port the pluggable transceiver is installed in.
Vendor Name	Specifies the vendor's name for the installed pluggable transceiver.
Device Name	Specifies the device name for the installed pluggable transceiver.
Device Revision	Specifies the hardware revision code for the pluggable transceiver. This may be useful for troubleshooting because different devices may support different pluggable transceiver revisions.
Device Type	Specifies the device type for the installed pluggable transceiver.
Serial Number	Specifies the serial number for the installed pluggable transceiver.
Manufacturing Datecode	Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. For more information, see "Troubleshooting Fiber and Pluggable Issues" in the <a href="#">"Pluggables and Cabling" Feature Overview and Configuration Guide</a> .

Table 8-1: Parameters in the output from **show system pluggable detail** (cont.)

Parameter	Description
SFP Laser Wavelength	Specifies the laser wavelength of the installed pluggable transceiver.
Single Mode Fiber	Specifies the link length supported by the pluggable transceiver using single mode fiber.
OM1 (62.5um) Fiber	Specifies the link length (in $\mu\text{m}$ - micron) supported by the pluggable transceiver using 62.5 micron multi-mode fiber.
OM2 (50um) Fiber	Specifies the link length (in $\mu\text{m}$ - micron) supported by the pluggable transceiver using 50 micron multi-mode fiber.
Diagnostic Calibration	Specifies whether the pluggable transceiver supports DDM or DOM Internal or External Calibration: <b>Internal</b> is displayed if the pluggable transceiver supports DDM or DOM Internal Calibration. <b>External</b> is displayed if the pluggable transceiver supports DDM or DOM External Calibration. - is displayed if neither Internal Calibration or External Calibration is supported.
Power Monitoring	Displays the received power measurement type, which can be either <b>OMA</b> (Optical Module Amplitude) or <b>Avg</b> (Average Power) measured in $\mu\text{W}$ .
TX power monitor support	For QSFP+ modules, indicates whether the module supports monitoring of the transmitted optical power level (Yes or No). If yes, you can view the average output optical power in the output of the command <a href="#">show system pluggable diagnostics</a> .

# show system pluggable diagnostics

**Overview** This command displays diagnostic information about pluggable transceivers that support Digital Diagnostic Monitoring (DDM).

Different types of pluggable transceivers are supported in different models of device. See your device's Datasheet for more information about the models of pluggables that your device supports.

For information on filtering and saving command output, see the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

**Syntax** `show system pluggable [<port-list>] diagnostics`

Parameter	Description
<port-list>	The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.1.1)</li><li>• a continuous range of ports separated by a hyphen (e.g. portport1.1.1-port1.1.4)</li><li>• a comma-separated list of ports and port ranges (e.g. port1.1.1,port1.1.4)</li></ul>

**Mode** User Exec and Privileged Exec

**Usage** Diagnostic monitoring features allow you to monitor real-time parameters of the pluggable transceiver, such as optical output power, optical input power, temperature, laser bias current, and transceiver supply voltage. Additionally, RX LOS (Loss of Signal) is shown when the received optical level is below a preset threshold. Monitor these parameters to check on the health of all transceivers, selected transceivers or a specific transceiver installed in a device.

**Examples** To display detailed information about all pluggable transceivers installed on a standalone device, use the command:

```
awplus# show system pluggable diagnostics
```

**Output** Figure 8-6: Example output from the **show system pluggable diagnostics** command on a device

```
awplus#show system pluggable diagnostics

# show test cable-diagnostics tdr

**Overview** Use this command to display the results of the last cable-diagnostics test that was run using the TDR (Time Domain Reflectometer) on a fixed copper cable port.

The displayed status of the cable can be either:

- OK
- Open
- Short (within-pair)
- Short (across-pair)
- Error

**Syntax** `show test cable-diagnostics tdr`

**Mode** Privileged Exec

**Examples** To show the results of a cable-diagnostics test use the following command:

```
awplus# show test cable-diagnostics tdr
```

**Output** Figure 8-8: Example output from the **show test cable-diagnostics tdr** command

Port	Pair	Length	Status
1.1.1	A	-	OK
	B	-	OK
	C	-	OK
	D	-	OK

**Related Commands** [clear test cable-diagnostics tdr](#)  
[test cable-diagnostics tdr interface](#)

# test cable-diagnostics tdr interface

**Overview** Use this command to apply the Cable Fault Locator's cable-diagnostics tests to twisted pair data cables for a selected port. The tests will detect either correct, short circuit, or open, circuit terminations. For more information on running the CFL, see the [Pluggables and Cabling Feature Overview and Configuration Guide](#).

The test can take several seconds to complete. See the related show command to display the test results.

A new test can only be started if no other test is in progress. CFL cannot run on a port that is currently supplying power via PoE.

The displayed status of the cable can be either, OK, Short (within-pair), or Open. The "Open" or "Short" status is accompanied with the distance from the source port to the incorrect termination.

**Syntax** test cable-diagnostics tdr interface <interface>

Parameter	Description
cable-diagnostics	The cable diagnostic tests.
tdr	Time Domain Reflectometry.
interface	Selects the interface to test.
<interface>	Interface number of the port to be tested, e.g. port1.1.2.

**Mode** Privileged Exec

**Example** To run a cable test on the cable inserted into port1.1.1 use the following command:

```
awplus# test cable-diagnostics tdr interface port1.1.1
```

You will receive the following message:

```
Link will go down while test is in progress. Continue? (y/n): y  
Select y to continue.
```

```
awplus# y
```

You will then receive the following message:

```
Test started. This will take several seconds to complete. Use  
"show test cable-diagnostics tdr" to print results.
```

# Connectivity Fault Management Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Connectivity Fault Management.

For more information, see the [Connectivity Fault Management \(CFM\) Feature Overview and Configuration Guide](#).

- Command List**
- “cc interval” on page 369
  - “cc multicast” on page 371
  - “cc unicast” on page 372
  - “clear (MEP Attribute)” on page 373
  - “clear ethernet cfm errorlog” on page 374
  - “clear mep counter” on page 375
  - “ethernet cfm domain-name” on page 376
  - “ethernet cfm mep” on page 379
  - “mep (FNG attributes)” on page 381
  - “mep active” on page 383
  - “mep ccm-ltm-priority” on page 385
  - “mep crosscheck” on page 387
  - “service ma-name” on page 389
  - “show ethernet cfm details” on page 392
  - “show ethernet cfm domain” on page 397
  - “show ethernet cfm errorlog” on page 400
  - “show ethernet cfm maintenance-points local mep” on page 402
  - “show ethernet cfm maintenance-points remote mep” on page 408

- “show ethernet cfm service” on page 411
- “show mep-alarm status” on page 414

# cc interval

**Overview** Use this command to set the CCM Interval.

**Syntax** `cc ma-name <ma-name> interval <interval>`

Parameter	Description
ma-name	Specify the Maintenance Association for which the Interval is used.
<ma-name>	Specify the Maintenance Association's CLI instance name.
interval	Specify the CCM Interval.
<interval>	Specify the CCM Interval (CCI), using one of the following: 1 - CCI of 3 milliseconds (currently not supported) 2 - CCI of 10 milliseconds (currently not supported) 3 - CCI of 100 milliseconds 4 - CCI of 1 second 5 - CCI of 10 seconds 6 - CCI of 1 minute 7 - CCI of 10 minutes.

**Default** The default interval is 4 (1 second).

**Mode** Ethernet CFM Configuration

**Usage** Continuity Checks is another term for connectivity fault detection. This makes use of Continuity Check Messages (CCMs) that are periodically sent by an MEP (multicast or unicast) and received by other MEP(s). CCMs can be used to detect connectivity faults across a link (using Link Level MEPs) or across a segment of a VLAN using VLAN aware MEPs, both of which are used within an MD/MA. CCMs are sent periodically at a given rate (or frame interval) that is agreed upon by all the MEPs in the MA. The faster the rate, the more quickly faults can be detected.

If an MEP does not receive a CCM within 3.5 times the expected interval from a peer MEP(s), that MEP declares a connectivity fault. This is known as a "defect". Upon detecting a defect, the detecting MEP will also set the Remote Defect Indicator (RDI) bit for its outgoing CCM messages to its peer MEP(s) so as to notify the peer MEPs that a defect has been detected. If the defect persists long enough (generally 2.5 seconds), then an "alarm" is declared. If an alarm is declared, then the defect has to abate long enough (generally 10 seconds) for the alarm to clear.

**Example** To set the CCM interval of a Maintenance Association named "MA-INST2-1" to the value of "4", use the commands:

```
awplus(config)# ethernet cfm domain-name MD-INST2
awplus(config-ether-cfm)# cc ma-name MA-INST2-1 interval 4
```

**Related Commands** [ethernet cfm domain-name](#)

service ma-name

# cc multicast

**Overview** Use this command to enable a Local MEP to send CCMs using multicast, or to disable sending CCMs altogether.

**Syntax** `cc multicast state {enable|disable}`

Parameter	Description
state	Specify to either enable or disable CFM multicast CCMs.
enable	Start sending periodic multicast frames.
disable	Stop sending multicast frames.

**Default** Multicast is disabled by default.

**Mode** Interface Ethernet CFM MEP Configuration

**Usage** Continuity Checks is another term for connectivity fault detection. This makes use of Continuity Check Messages (CCMs) that are periodically sent by an MEP (multicast or unicast) and received by other MEP(s). CCMs can be used to detect connectivity faults across a link (using Link Level MEPs) or across a segment of a VLAN using VLAN aware MEPs, both of which are used within an MD/MA. CCMs are sent using multicast or unicast (but not both).

In order to enable a Local MEP to send, the Local MEP's "active" administrative state must be set to true, using the command [mep active](#).

**Example** To configure a Local MEP to send CCMs using multicast, use the commands:

```
awplus(config)# interface port1.1.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# cc multicast state enable
```

**Related Commands** [ethernet cfm domain-name](#)  
[ethernet cfm mep](#)  
[service ma-name](#)

**Command changes** Version 5.4.7-1.1: command added  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# cc unicast

**Overview** Use this command to enable a Local MEP to send CCMs using unicast, or to disable sending CCMs altogether.

**Syntax** `cc unicast rmpid <rmep-id> state {enable|disable}`

Parameter	Description
rmpid	The remote MEP that the Local MEP is to unicast to.
<rmep-id>	The remote MEP ID in the range 1-8191.

**Mode** Interface Ethernet CFM MEP Configuration

**Usage** Continuity Checks is another term for connectivity fault detection. This makes use of Continuity Check Messages (CCMs) that are periodically sent by an MEP (multicast or unicast) and received by other MEP(s). CCMs can be used to detect connectivity faults across a link (using Link Level MEPs) or across a segment of a VLAN using VLAN aware MEPs, both of which are used within an MD/MA. CCMs are sent using multicast or unicast (but not both).

In order to enable a Local MEP to send, the Local MEP's "active" administrative state must be set to true, using the command [mep active](#).

In order to send unicast CCMs, the Remote MEP has to be configured along with its MAC address.

**Example** To configure a Local MEP to send CCMs using unicast, use the commands:

```
awplus(config)# interface port1.1.2
awplus(config-if)# ethernet cfm mep down rmpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# cc unicast rmpid 21 state enable
```

**Related Commands**

- [ethernet cfm domain-name](#)
- [ethernet cfm mep](#)
- [mep crosscheck](#)
- [service ma-name](#)

**Command changes**

- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear (MEP Attribute)

**Overview** Use this command to clear a Local MEP attribute.

**Syntax** `clear {ccm-ltm-priority|lowest-priority-defect|fng-alarm-time  
|reset-fng-time|active|all}`

Parameter	Description
<code>ccm-ltm-priority</code>	Set the queuing and p-bit priority for CCM messages to their default value of 7.
<code>lowest-priority-defect</code>	Set the Fault Notification Generation (FNG) lowest alarm priority defect to the default value of 2.
<code>fng-alarm-time</code>	Set the Fault Notification Generation (FNG) time for a defect to be present before an alarm is raised to the default value of 2.5 seconds.
<code>reset-fng-time</code>	Set the Fault Notification Generation (FNG) time for a defect to abate before an alarm is cleared to the default value of 10 seconds.
<code>active</code>	Set the Local MEP's Active state to the default value of False, which sets the Local MEP's Administrative State to Down.
<code>all</code>	Set all of the above attributes to their default values.

**Mode** Interface Ethernet CFM MEP Configuration

**Example** To set the active state of the Local MEP to False, use the commands:

```
awplus(config)# interface port1.1.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# clear active
```

**Related Commands**

- [ethernet cfm domain-name](#)
- [ethernet cfm mep](#)
- [mep \(FNG attributes\)](#)
- [service ma-name](#)

**Command changes**

- Version 5.4.8-0.2: added to SBx8100 series products
- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear ethernet cfm errorlog

**Overview** Use this command to clear the Event List for all Maintenance Associations (MAs) associated with the specified Maintenance Domain (MD).

**Syntax** `clear ethernet cfm errorlog domain <domain-name>`

Parameter	Description
<code>&lt;domain-name&gt;</code>	Specify the domain name

**Mode** Privileged Exec

**Usage** When a new error is detected for an MA that is associated with an MD, and the error is due to an error from a received or missing CCM from a Remote MEP, an event is logged to the CFM Errors Event List.

**Example** To clear the event list for all MA's associated with an MD named "MD-INST2", use the command:

```
awplus# clear ethernet cfm errorlog domain MD-INST2
```

**Related Commands** [show ethernet cfm errorlog](#)

**Command changes** Version 5.4.7-1.1: command added

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear mep counter

**Overview** Use this command to clear statistics counters for all Local MEPs within a given Maintenance Association (MA) and its associated Maintenance Domain (MD), or to optionally clear counters for one specific Local MEP.

**Syntax** `clear mep counter domain <domain-name> service <ma-name> [mep <mep-id>]`

Parameter	Description
domain	Specify the Maintenance Domain that Local MEP(s) are to have their counters cleared for. Both domain and service must be specified.
<domain-name>	Specify the Maintenance Domain's CLI instance name.
service	Specify the Maintenance Association that the Local MEP(s) are to have their counters cleared for. Both domain and service must be specified.
<ma-name>	Specify the CLI name that identifies the service (Maintenance Association (MA)) instance.
mep	Specify one specific Local MEP.
<mep-id>	Specify the Local MEP instance by MEP-id.

**Mode** User Exec/Privileged Exec

**Example** To clear the statistic counter for an MEP with the MEP ID "12", use the command:

```
awplus# clear mep counter domain MD-INST1 service MA-INST1-1 mep 12
```

**Related Commands** [show ethernet cfm maintenance-points local mep](#)

**Command changes** Version 5.4.7-1.1: command added

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# ethernet cfm domain-name

**Overview** Use this command to create and configure a CFM Maintenance Domain, or to enter Ethernet CFM Configuration mode for an existing Maintenance Domain instance.

Use the **no** variant of this command to destroy the Maintenance Domain's instance that was previously created.

**Syntax**

```
ethernet cfm domain-name <domain-name>
ethernet cfm domain-name <domain-name> md-type character-string
md-type-name <md-type-name> level <level> [mip-creation none]
ethernet cfm domain-name <domain-name> md-type dns-based
md-type-name <md-type-name> level <level> [mip-creation none]
ethernet cfm domain-name <domain-name> md-type mac md-type-name
<md-type-name> level <level> [mip-creation none]
ethernet cfm domain-name <domain-name> md-type no-name level
<level> [mip-creation none]
no ethernet cfm domain-name <domain-name>
```

Parameter	Description
<domain-name>	The name that identifies this Maintenance Domain instance. If creating this instance, specify the remaining parameters. If re-entering configuration mode for this instance, use this parameter to identify this instance, and do not enter the remaining parameters.
md-type	Specify the name type. The MD name part of the MAID field may or may not appear in the CCM message. There are different formats and conventions for the name depending on type.
character-string	Specify the md-type as Character String-based MD name format. The <md-type-name> is a character string of 1 to 43 characters. This character string plus the Short MA name that is configured for an MA make up the MAID field in a CCM message.
md-type-name	The Maintenance Domain type.
<md-type-name>	The value of the MD type name, which depends on the md-type selected.
dns-based	Specify the md-type as DNS-based MD name format. The <md-type-name> is a Domain Name like string of 1 to 43 characters. This is a globally unique text string derived from a DNS name. This DNS based string plus the Short MA name that is configured for an MA make up the MAID field in a CCM message.

Parameter	Description
mac	Specify the md-type as MAC-based MD name format. The <md-type-name> consists of a MAC address + 2-octet (unsigned) integer in the form of HHHH.HHHH.HHHH:<2-octet integer>. This MAC based string plus the Short MA name that is configured for an MA make up the MAID field in a CCM message.
no-name	Specify the md-type whereby no MD name is to appear in the CCM message.
level	Specify the Level the Domain operates in.
<level>	0 to 7.
mip-creation	Optional parameter that specifies the MIP creation permission value.
none	Specifies that no MIPs are to be created (default and only choice).

**Mode** Global Configuration

**Usage** A Maintenance Domain is a Connectivity Fault Management (CFM) term that represents the administrative area of a network from which an operator can manage VLANs that traverse their area. An MD can also be scoped to a simple Ethernet link. To differentiate different administrative areas, an MD is made up of a name and a level. As part of CFM, a Connectivity Check Message (CCM) is used to detect Ethernet connectivity faults amongst nodes that participate in CFM. CCM messages carry the MD name within the MAID field as well as carries the level of the MD.

This command is used to configure the MD name, which can be chosen from a variety of name format types, as well as the level.

**Example** To create a Maintenance Domain instance named "MD-INST2" with a character string-based name of "MD-12L3" and a level of 3, use the command:

```
awplus(config)# ethernet cfm domain-name MD-INST2 md-type
character-string md-type-name MD-12L3 level 3
```

To enter Ethernet CFM Configuration mode for an existing MD instance named "MD-INST2", use the command:

```
awplus(config)# ethernet cfm domain-name MD-INST2
awplus(config-ether-cfm)#
```

To destroy a Maintenance Domain instance named "MD-INST2", use the command:

```
awplus(config)# no ethernet cfm domain-name MD-INST2
```

# ethernet cfm mep

**Overview** Use this command to create a Local MEP instance, or to enter Interface Ethernet CFM MEP Configuration mode for an existing Local MEP's instance, so you can configure it.

Use the **no** variant of this command to destroy the Local MEP instance.

**Syntax** ethernet cfm mep down mpid <mep-id> domain-name <domain-name>  
ma-name <ma-name>

no ethernet cfm mep down mpid <mep-id> domain-name <domain-name>  
ma-name <ma-name>

Parameter	Description
down	Specify the Local MEP as a Down MEP.
mpid	Specify the Local MEP ID.
<mep-id>	1-8191. This must be unique ID for all MEPs in the MA (both local and remote).
domain-name	Specify the Maintenance Domain that the Local MEP is to be associated with.
<domain-name>	Specify the Maintenance Domain's CLI instance name.
ma-name	Specify the Maintenance Association that the Local MEP is to be associated with.
<ma-name>	Specify the Maintenance Association's CLI instance name.

**Mode** Interface Configuration

**Usage** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link. MPs live on bridge ports and station ports. On a bridge port, there are two types.

- An Up Maintenance Entity is considered an inward MP. It communicates across the inside of the bridge to the other side, and this allows it to reach the outside world. It lives on a bridge port for a given VLAN, but it does not use this port to send or receive to get to the outside world. Instead, it sends and receives through the inside of the bridge and communicates to the outside world through the other VLAN port members. An Up MP cannot be used for Link Level CFM.
- A Down Maintenance Entity is considered an outward MP. It sends and receives only through its bridge port outwardly to the outside world, and does not communicate inside the bridge. A Down MP is not subject to blocking due to Spanning Tree Protocol (STP) or any other protocol trying to

prevent loops in the network. As such, it is important that Down MPs be used in an MD/MA that is not subject to topology loops. A Down MP can be VLAN aware or link-local.

An MEP can be either Up or Down for a given MD/MA, but within a bridge for the same MD/MA, there can only be one Up or Down MEP (not both). An Up MEP must be VLAN aware. A Down MEP may be VLAN aware. Otherwise, a Down MEP is allowed to be link local (VLAN unaware), and its scope is that of the entire link.

AlliedWare Plus supports Down Maintenance Entities only.

**Example** To create a local MEP instance context with a domain name of “MD-INST2” and an MA name of “MA-INST2-1”, use the commands:

```
awplus(config)# interface port1.1.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
```

To re-enter a local MEP instance context with the domain name “MD-INST2” and the MA name “MA-INST2-1”, use the commands:

```
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)#
```

To destroy a local MEP instance context with the domain name “MD-INST2” and the MA name “MA-INST2-1”, use the commands:

```
awplus(config-if)# no ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
```

# mep (FNG attributes)

**Overview** Use this command to configure the Fault Notification Generation (FNG) attributes of a Local MEP.

**Syntax** `mep {lowest-priority-defect <defect-priority>|  
fng-alarm-time <soak-time>|reset-fng-time <abate-time>}`

Parameter	Description
<code>lowest-priority-defect &lt;defect-priority&gt;</code>	The lowest level defect allowed to generate alarms. An integer in the range 1 to 6. The default is 2.
<code>fng-alarm-time &lt;soak-time&gt;</code>	The time that the defects must be present before an alarm is generated. An integer in the range of 250 to 1000 in increments of 10 ms. The default is 250 (2.5 seconds).
<code>reset-fng-time &lt;abate-time&gt;</code>	The time that the defect must be absent before the alarm is cleared. An integer in the range of 250 to 1000 in increments of 10 ms. The default is 1000 (10 seconds).

**Mode** Interface Ethernet CFM MEP Configuration

**Usage** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link.

A Local MEP can detect defects in connectivity of a VLAN or a local link using Continuity Check Messages (CCM) by sending and receiving CCMs with Remote MEP peers. Any defects detected locally can also be conveyed to Remote MEP peers by sending a Remote Defect Indicator (RDI) to the peers within a Continuity Check Message (CCM). If defects persist long enough, an alarm can be generated.

Use this command to configure the following attributes of a Local MEP:

- **Fault Notification Generation Lowest Alarm Priority Defect** — the lowest defect priority that can cause an alarm to be raised. This configuration parameter specifies the lowest defect that has to occur before an alarm can be generated. Any priority less than this will not result in an alarm notification. Note that if a local defect is detected and its priority is not high enough to generate an alarm, then the Local MEP will not send an RDI to its Remote MEP peers, which is used to notify the peers of a connectivity fault. We recommend you keep the lowest alarm priority defect set to 2.
- **Fault Notification Generation Alarm timers** — the timers that determine whether a defect has been present long enough to result in an alarm being generated, or whether a defect has been abated for long enough to clear an alarm.

**Example** To clear an alarm after the defect has been abated for 6 seconds, use the commands:

```
awplus(config)# interface port1.1.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# mep reset-fng-time 600
```

**Related  
Commands**

- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# mep active

**Overview** Use this command to specify the administrative state of the Local MEP.

**Syntax** `mep active {true|false}`

Parameter	Description
true	Put the Local MEP into a state of active, which enables it to perform various functions such as processing CCM messages.
false	Specify the state of the Local MEP to cease functioning.

**Default** false

**Mode** Interface Ethernet CFM MEP Configuration

**Usage** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link.

A Local MEP can detect defects in connectivity of a VLAN or a local link using Continuity Check Messages (CCM) by sending and receiving CCMs with Remote MEP peers. Any defects detected locally can also be conveyed to Remote MEP peers by sending a Remote Defect Indicator (RDI) to the peers within a Continuity Check Message (CCM). If defects persist long enough, an alarm can be generated.

Setting the Local MEP's Administrative State to true enables it to perform various functions such as processing CCM messages. Setting the state to false deactivates the Local MEP.

**Example** To set the administrative state of the local MEP to "active", use the commands:

```
awplus(config)# interface port1.1.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# mep active true
```

# mep ccm-ltm-priority

**Overview** Use this command to specify the queuing and p-bit priority for CCM messages.

**Syntax** `mep ccm-ltm-priority <0-7>`

Parameter	Description
<0-7>	The queuing and p-bit priority for CCM messages.

**Default** 7

**Mode** Interface Ethernet CFM MEP Configuration

**Usage** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link.

A Local MEP can detect defects in connectivity of a VLAN or a local link using Continuity Check Messages (CCM) by sending and receiving CCMs with Remote MEP peers. CCMs are high priority messages by default, but the priority is configurable, although we do not recommend changing it. Any defects detected locally can also be conveyed to Remote MEP peers by sending a Remote Defect Indicator (RDI) to the peers within a Continuity Check Message (CCM). If defects persist long enough, an alarm can be generated.

**Example** To set the queuing and p-bit priority for CCM messages to 6, use the commands:

```
awplus(config)# interface port1.1.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# mep ccm-ltm-priority 6
```

CCMs should be the highest priority message so we recommend leaving their priority as 7.

# mep crosscheck

**Overview** Use this command within the MD instance context to create a Remote MEP instance and configure its parameters.

Use the **no** variant of this command to destroy the Remote MEP instance.

**Syntax** `mep crosscheck mpid <rmep-id> ma-name <ma-name> [mac <HHHH.HHHH.HHHH>]`  
`no mep crosscheck mpid <rmep-id> ma-name <ma-name>`

Parameter	Description
mpid	Specify the Remote MEP id.
<rmep-id>	1-8191. This must be unique ID for all MEPs in the MA (both local and remote).
ma-name	Specify the Maintenance Association that the Remote MEP is to be associated with.
<ma-name>	Specify the Maintenance Association's CLI instance name.
mac	Optionally, when using unicast for communication between a Local MEP and a Remote MEP, specify the remote MEP's MAC address.
<HHHH.HHHH.HHHH>	Specify the Remote MEP's MAC address using the HHHH.HHHH.HHHH format where H is a hexadecimal value.

**Mode** Ethernet CFM Configuration

**Usage** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link. MPs live on bridge ports and station ports. On a bridge port, there are two types.

- An Up Maintenance Entity is considered an inward MP. It communicates across the inside of the bridge to the other side, and this allows it to reach the outside world. It lives on a bridge port for a given VLAN, but it does not use this port to send or receive to get to the outside world. Instead, it sends and receives through the inside of the bridge and communicates to the outside world through the other VLAN port members. An Up MP cannot be used for Link Level CFM.
- A Down Maintenance Entity is considered an outward MP. It sends and receives only through its bridge port outwardly to the outside world, and does not communicate inside the bridge. A Down MP is not subject to blocking due to Spanning Tree Protocol (STP) or any other protocol trying to prevent loops in the network. As such, it is important that Down MPs be used

in an MD/MA that is not subject to topology loops. A Down MP can be VLAN aware or link-local.

An MEP can be either Up or Down for a given MD/MA, but within a bridge for the same MD/MA, there can only be one Up or Down MEP (not both). An Up MEP must be VLAN aware. A Down MEP may be VLAN aware. Otherwise, a Down MEP is allowed to be link local (VLAN unaware), and its scope is that of the entire link.

**Example** To create a remote MEP instance named "MA-INST2-1" with an MEP ID of 21, use the command:

```
awplus(config-ether-cfm)# mep crosscheck mpid 21 ma-name  
MA-INST2-1
```

To destroy the remote MEP instance named "MA-INST2-1" with the MEP ID of 21, use the command:

```
awplus(config-ether-cfm)# no mep crosscheck mpid 21 ma-name  
MA-INST2-1
```

## service ma-name

**Overview** Use this command to create a Maintenance Association instance within the MD instance context and configure its parameters.

Use the **no** variant of this command to destroy the Maintenance Association instance.

**Syntax** `service ma-name <ma-name> ma-type  
{icc|integer|primary-vid|string|vpn-id} ma-type-name  
<ma-type-name> [vlan <primary-vid> [mip-creation {none}]]  
no service <ma-name>`

Parameter	Description
<ma-name>	The CLI name that identifies this Maintenance Association (MA) instance.
ma-type	Specify the MA name type. The MA name part of the MAID field appears in the CCM message. There are different formats and conventions for the name depending on the type.
icc	Specify the ma-type as ICC based MA name format. The <ma-type-name> is a 13 byte character string consisting of a 1 to 6 character ITU Carrier Code (ICC) plus a 1 to 6 character Unique MEGID (UMC) code for the name. Any remaining characters are padding out with NULLs by the system to fill out the 13 bytes. This can only be used with Maintenance Domain whose name md-type is set to "No name".
integer	Specify the ma-type as Integer based MA name format. The <ma-type-name> is a number up to 2 Bytes (0..65535).
primary-vid	Specify the ma-type as Primary VLAN-id based MA name format. The <ma-type-name> is the VLAN id number that has been assigned to the MA as the primary VLAN.
string	Specify the ma-type as Character String based MA name format. The <ma-type-name> is a string of 1 to 45 characters.
vpn-id	Specify the ma-type as an RFC2685 VPN ID based MA name format. The <ma-type-name> is a 7 Byte value divided into two parts. The first part makes up the VPN's OUI which is three octets and the remaining four octets make up the VPN Index. The format is HHHHHH.HHHHHHHH where H is a hexadecimal digit.
ma-type-name	The Maintenance Association (MA) name type.
<ma-type-name>	The value of the MA type name, which depends on the ma-type selected (icc, integer, primary-vid, string, vpn-id).
vlan	An optional parameter that specifies the VLAN.
<primvary-vid>	Specify the ID of the primary VLAN in the MA.

Parameter	Description
mip-creation	Optional parameter that specifies the MIP creation permission value.
none	Specifies that no MIPs are to be created (the default and only choice).

**Mode** Ethernet CFM Configuration

**Usage** A Maintenance Association is a Connectivity Fault Management (CFM) term that represents a particular segment of a network within a Maintenance Domain. An MA can represent a segment of a VLAN that is managed for connectivity within that segment. As a VLAN is often the granularity that a Network Service Provider sells to their customer, an MA is often referred to as a "Service". An MA can also be used to represent a link and in this case the MA is VLAN unaware.

As part of CFM, a Connectivity Check Message (CCM) is used to detect Ethernet connectivity faults amongst nodes that participate in CFM. CCM messages carry the MA name within the MAID field. Within an MD instance context, this command is used to configure the MA name, which can be chosen from a variety of format types.

**Example** To create a Maintenance Association instance named "MA-INST2-1" with an MA name type of "string" and value of "MA-12V100", use the command:

```
awplus(config-ether-cfm)# service ma-name MA-INST2-1 ma-type  
string ma-type-name MA-12V100
```

To destroy a Maintenance Association instance named "MA-INST2-1", use the command:

```
awplus(config-ether-cfm)# no service MA-INST2-1
```

# show ethernet cfm details

**Overview** Use this command to show CFM configuration, status, and statistics in detail for all CFM entities that the system knows about.

**Syntax** show ethernet cfm details

**Mode** User Exec/Privileged Exec

**Example** To show CFM configuration, status, and statistics in detail for all CFM entities, use the command:

```
awplus# show ethernet cfm details
```

The output loops through the hierarchy of MDs, then MAs within each MD, then local MEPs within that MA, and finally remote MEPs within that MA.

**Output** Figure 9-1: Example output from **show ethernet cfm details**

```
awplus#show ethernet cfm details

# show ethernet cfm domain

**Overview** Use this command to show the Ethernet CFM Domain(s) that have been configured in summary format. Options include the ability to show all domains with detailed information, or to show a specified domain with detailed information.

**Syntax**

```
show ethernet cfm domain  
show ethernet cfm domain details  
show ethernet cfm domain <domain-name> details
```

Parameter	Description
<domain-name>	The CLI name that identifies this Maintenance Domain instance.
details	Provide detailed information in the output.

**Mode** Privileged Exec

**Example** To show all domain configurations in summary format, use the command:

```
awplus# show ethernet cfm domain
```

To show all domains in detail, use the command:

```
awplus# show ethernet cfm domain details
```

To show a specific domain named "MD-INST1" in detail, use the command:

```
awplus# show ethernet cfm domain MD-INST1 details
```

**Output** Figure 9-2: Example output from **show ethernet cfm domain**

```
awplus#show ethernet cfm domain  
  
CFM Domain Name          Level  
-----  
MD-INST1                  0  
MD-INST2                  3
```

Table 9-1: Parameters in the output from **show ethernet cfm domain**

Parameter	Description
CFM Domain Name	The Maintenance Domain name for the managed object.
Level	The level for the domain.

# show ethernet cfm errorlog

**Overview** Use this command to list the CFM Errors that are in the CFM Errors Event List, starting from the oldest at the top to the latest at the end.

**Syntax** `show ethernet cfm errorlog domain <domain-name>`

Parameter	Description
<code>&lt;domain-name&gt;</code>	Specify the domain name value.

**Mode** Privileged Exec

**Usage** When a new error is detected for a Maintenance Association (MA) that is associated with a Maintenance Domain (MD), and such is due to an error from a received or missing CCM from a Remote MEP, an event is logged to the CFM Errors Event List.

**Example** To show the list of errors for an MD named "MD-INST2", use the command:

```
awplus# show ethernet cfm errorlog domain MD-INST2
```

**Output** Figure 9-5: Example output from **show ethernet cfm errorlog domain MD-INST2**

```
awplus#show ethernet cfm errorlog domain MD-INST2
```

CFM Service Name	Level	VLAN	MEPID	Remote MAC	Error Reason
MA-INST2-1	0	0	12	0000.0000.0000	Remote MEP Down

Table 9-3: Parameters in the output from **show ethernet cfm errorlog domain MD-INST2**

Parameter	Description
Level	The level configured for the MD.
VLAN	The VLAN ID used by the MA if any, otherwise is "0".
MEPID	The MEP ID of the local MEP that detected the error.
Remote MAC	The source MAC address of the received CCM causing the error if known, 0000.0000.0000 otherwise.

Table 9-3: Parameters in the output from **show ethernet cfm errorlog domain MD-INST2** (cont.)

Parameter	Description
Error Reason	<p>One of the following:</p> <p>“Remote MEP Down” - an RMEPCCMDefect has been declared for this remote MEP. CCMs have not been received from this remote MEP within the CCM interval.</p> <p>“MEP Configuration” - the CCM received from the remote MEP has the same MEP ID as the local MEP that received the CCM. For unicast remote MEPs this error can also indicate that even though the CCM received from the remote MEP has an MEP ID that matches a configured remote MEP ID in the MA, the source MAC address differs from the configured MAC address for that remote MEP.</p> <p>“Forwarding Loop” - the CCM received from the remote MEP has an MEP ID that matches a configured local MEP ID in the MA, and also has the same source MAC address as the local MEP's MAC address that received the CCM.</p> <p>“Cross Connected” - a xconCCMdefect was detected.</p>
CFM Service Name	The name of the MA associated with the MD for this error(s).

# show ethernet cfm maintenance-points local mep

**Overview** Use this command to show one or more Local MEPs, and their configuration and status in summary format. Options include the ability to show Local MEP(s) for a given interface with further option to show statistics counters. Another option is to show Local MEPs for a given Maintenance Association (MA) and Maintenance Domain (MD) either for statistics counters, or for one specific Local MEP with either detailed information or statistics counters.

**Syntax** `show ethernet cfm maintenance-points local mep interface <port> [counters]`

`show ethernet cfm maintenance-points local mep domain <domain-name> service <ma-name> [counters]`

`show ethernet cfm maintenance-points local mep domain <domain-name> service <ma-name> mep <mep-id> {details|counters}`

Parameter	Description
interface	Specify the interface for which Local MEP(s) are to be shown.
<interface-name>	Specify the interface by name.
counters	Specify that counter statistics are to be shown.
domain	Specify the Maintenance Domain that Local MEP(s) are to be shown for. Both this and service must be specified.
<domain-name>	Specify the Maintenance Domain's CLI instance name.
service	Specify the Maintenance Association that the Local MEP(s) are to be shown for. Both this and domain must be specified.
<ma-name>	Specify CLI name that identifies the service (Maintenance Association (MA)) instance of interest.
mep	Specify one particular Local MEP of interest.
<mep-id>	Specify the Local MEP instance by MEP-id.
details	Specify that details are to be included in the output.

**Mode** User Exec/Privileged Exec

**Examples** To show the configuration and status of all the Local MEP(s) on an interface, use the command:

```
awplus# show ethernet cfm maintenance-points local mep  
interface port1.0.2
```

To show details of a specific Local MEP on an MA and its associated MD, use the command:

```
awplus# show ethernet cfm maintenance-points local mep domain
MD-INST1 service MA-INST1-1 mep 12 details
```

**Output** Figure 9-6: Example output from **show ethernet cfm maintenance-points local mep interface port1.0.2**

```
awplus#show ethernet cfm maintenance-points local mep interface
port1.0.2

Service Name    MEPID    Dir    Interface    State    Defect
-----
MA-INST1-1     12       D      port1.0.2    En       ..3..
```

Table 9-4: Parameters in the output from **show ethernet cfm maintenance-points local mep interface <interface-name>**

Parameter	Description
Service Name	The MA service name.
MEPID	The MEP ID of the local MEP of interest within the MA.
Dir	The direction of this local MEP: D - Down MEP. U - Up MEP. Note: Only Down is currently supported.
Interface	The interface on which the local MEP resides.
State	Whether the local MEP's CCM processing is enabled "En" or disabled "Dis".
Defect	Defect bit list <dbl> indicating which of 5 possible defects are currently being detected with each bit showing the detected <defect-number> or . if there is no defect.

Figure 9-7: Example output from **show ethernet cfm maintenance-points local mep domain MD-INST1 service MA-INST1-1 mep 12 details**

```

Table 9-5: Parameters in the output from **show ethernet cfm maintenance-points local mep domain <domain-name> service <ma-name> mep <mep-id> details**

Parameter	Description
Domain Name and MA Service Name	Uniquely identify the MD and MA this local MEP is associated with.
MA Primary VLAN	The VLAN used by this MEP. A link-local MEP VLAN is indicated by "-".
MEP ID	The local MEP's ID.
Direction	The direction of the local MEP, either Down or Up.
Interface	The Interface port or Interface lag that the local MEP is configured against.
MEP Active State	The MEP's configured administrative state: Up: True Down: False.

Table 9-5: Parameters in the output from **show ethernet cfm maintenance-points local mep domain <domain-name> service <ma-name> mep <mep-id> details** (cont.)

Parameter	Description
CC State	The MEP's CCM configured administrative state: Up: Enable Down: Disable.
CC Type	The configured CCM sending and receiving type, either multicast or unicast. If not yet configured, it shows as None.
Tx-RDI	Whether this local MEP is sending RDI or not. An RDI is sent when one or more of the following defects have been declared by the local MEP: someRMEPCCMdefect someMACstatusDefect errorCCMdefect xconCCMdefect
Current Defects	A list of defects the local MEP is currently detecting. It shows the defect(s), as both a defect priority and name.
Current Highest Defect Alarm	The highest defect priority that has been encountered while the local MEP has been in an alarm state.
Alarm Minimum Defect	The minimum defect the local MEP has to see before declaring an alarm.
Alarm Trip Time	The amount of time the defect has to exist before an alarm is declared.
Configured Remote MEP IDs	A comma separated list of configured remote MEPs (by MEP IDs) known by this local MEP. If the remote MEP also has a configured unicast MAC address, the MEP ID will also include -HHHH.HHHH.HHHH.
Missing Remote MEPs	The remote MEPs (by MEP ID) that have been configured against this local MEP but have not been heard from.

Table 9-5: Parameters in the output from **show ethernet cfm maintenance-points local mep domain <domain-name> service <ma-name> mep <mep-id> details** (cont.)

Parameter	Description
Error CCM Reason	<p>The reason that the local MEP is detecting the errorCCMdefect condition (if any):</p> <p>Wrong MEP ID Received - CCM received with correct level and MAID, but MEP ID has not been configured in this MA.</p> <p>My MEP ID Received - CCM received with correct level and MAID, but an MEP ID that is the same as a local MEP in this MA.</p> <p>My MEP ID Received (loop) - as above, but the CCM received also has the same MAC address as the local MEP in the MA.</p> <p>CCM Interval Mismatch - CCM received with correct level and MAID, but CCM interval does not match that configured for this MA.</p> <p>MAC address mismatch - for a configured unicast RMEP (via crosscheck) the MAC address did not match the provisioned value in the associated MA.</p> <p>N/A - indicates there is no error CCM defect being detected.</p>
Last Error CCM	If an errorCCMdefect condition is detected, portions of the CCM that caused this condition are displayed.
Cross Connect Defect Reason	<p>The reason that the local MEP is detecting the xconCCMdefect condition (if any):</p> <p>Wrong MAID - CCM received with correct level but incorrect MAID (mismatch in the domain name and/or short MA name versus configured).</p> <p>Wrong Level - CCM received with a level that is lower than the level configured for this local MEP's domain.</p> <p>N/A - indicates there is no error CCM defect being detected.</p>
Last Cross Connect CCM	If a xconCCMdefect condition is detected, portions of the CCM that caused this condition are displayed.

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# show ethernet cfm maintenance-points remote mep

**Overview** Use this command to show one or more Ethernet CFM maintenance points, namely Remote Maintenance End Points (MEPs) within a given Maintenance Association (MA) and its associated Maintenance Domain (MD), and their configuration and status in summary format. Options include the ability to show an individual Remote MEP in detail.

**Syntax** `show ethernet cfm maintenance-points remote mep domain <domain-name> service <ma-name> [{mac <rmep-mac-address>|rmep <mep-id>} details]`

Parameter	Description
domain	Specify the Maintenance Domain that Remote MEP(s) are to be shown for.
<domain-name>	Specify the Maintenance Domain's CLI instance name.
service	Specify the Maintenance Association that the Remote MEP(s) are to be shown for.
<ma-name>	Specify the service's (Maintenance Association (MA)) CLI instance name.
mac	Specify the remote MEP of interest by its MAC address.
<rmep-mac-address>	Specify the value of the remote MEP's MAC address using the format HHHH.HHHH.HHHH where H is a hexadecimal digit.
rmep	Specify the remote MEP of interest by its ID.
<mep-id>	Specify the value of the remote MEP's ID in the range 1 to 8191.

**Mode** User Exec/Privileged Exec

**Example** To show all the remote MEP(s)'s status for this MA and MD in summary form, use the command:

```
awplus# show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1
```

To show a specific remote MEP by its ID in detail, use the command:

```
awplus# show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1 rmep 21 details
```

To show a specific remote MEP by its MAC address in detail, use the command:

```
awplus# show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1 mac 000c.2526.95bf details
```

**Output** Figure 9-8: Example output from **show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1**

```
awplus#show ethernet cfm maintenance-points remote mep domain
MD-INST1 service MA-INST1-1

CFM Domain Name: MD-INST1
CFM Service Name: MA-INST1-1
      RX      RX      Port  Intf
MEPID  CCM      RDI      Stat  Stat
-----
21      Yes     No       Up     Up
```

Figure 9-9: Example output from **show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1 rmep 21 details**

```
awplus#show ethernet cfm maintenance-points remote mep domain
MD-INST1 service MA-INST1-1 rmep 21 details

CFM Service Name..... MA-INST1-1
CFM Domain Name..... MD-INST1
Remote MEPID..... 21
Receiving CCMS..... Yes
Rx RDI..... No
MAC Address..... 000c.2526.95bf
Port Status..... Up
Interface Status..... Up
```

Figure 9-10: Example output from **show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1 mac 000c.2526.95bf details**

```
awplus#show ethernet cfm maintenance-points remote mep domain
MD-INST1 service MA-INST1-1 mac 000c.2526.95bf details

CFM Service Name..... MA-INST1-1
CFM Domain Name..... MD-INST1
Remote MEPID..... 21
Receiving CCMS..... Yes
Rx RDI..... No
MAC Address..... 000c.2526.95bf
Port Status..... Up
Interface Status..... Up
```

Table 9-6: Parameters in the output from **show ethernet cfm maintenance-points remote mep**

Parameter	Description
CFM Domain Name and CFM Service Name	The instance identifiers that uniquely identify the MA and MD for the remote MEP(s) of interest.
Remote MEPID	The remote MEP ID that is configured for this MA.
Receiving CCMs	The current state of the 802.1ag remote MEP state machine: Yes - RMEP_OK. CCMs are being received without any error. Wait - RMEP_START. Still preparing to receive remote MEP CCMs without a timeout occurring. Failed - RMEP_FAILED. While waiting to receive CCMs from a remote MEP, a timeout occurred. -- the state machine is not running.
RX RDI	The current RDI being received from this remote MEP: True - the last CCM received from the remote MEP has the RDI set. This means the remote MEP itself is seeing one of the following defects: someRMEPCCMDefect, someMACstatusDefect, errorCCMdefect, xconCCMdefect. False - the last CCM received from the remote MEP does not have its RDI set.
MAC Address	The configured or discovered MAC address of the remote MEP.
Port Status	If the CCM was received with a port status TLV, this indicates the last value received, or "-" if none received.
Interface Status	If the CCM was received with an interface status TLV, this indicates the last value received, or "-" if none received.

# show ethernet cfm service

**Overview** Use this command to show the Ethernet CFM Services (Maintenance Associations (MA)) configuration in summary format, or show a specified MA with detailed information.

**Syntax** show ethernet cfm service [<ma-name> domain <domain-name> details]

Parameter	Description
<ma-name>	The CLI name that identifies the service (Maintenance Association (MA)) instance of interest.
domain	Specify the domain name by name.
<domain-name>	The CLI name that identifies this Maintenance Domain instance.

**Mode** User Exec/Privileged Exec

**Example** To show details for all MAs in summary form, use the command:

```
awplus# show ethernet cfm service
```

To show a specified MA in detailed form, use the command:

```
awplus# show ethernet cfm service MA-INST2-1 domain MD-INST2 details
```

**Output** Figure 9-11: Example output from **show ethernet cfm service**

```
awplus#show ethernet cfm service
```

CFM Domain Name	CFM Service Name	VLAN	Defect
MD-INST1	MA-INST1-1	NONE	.....
MD-INST2	MA-INST2-1	NONE	..3..

Table 9-7: Parameters in the output from **show ethernet cfm service**

Parameter	Description
CFM Domain Name	The Maintenance Domain name for the managed object.
CFM Service Name	The Maintenance Associations (MA) instance name.

Table 9-7: Parameters in the output from **show ethernet cfm service** (cont.)

Parameter	Description
VLAN	The Primary VLAN.
Defect	A list of defects detected by the MA's Local MEPs. The defects shown can be: 1 - someRDldefect is declared 2 - someMACstatusDefect is declared 3 - someRMEPCCMdefect is declared 4 - errorCCMdefect is declared 5 - xconCCMdefect is declared

Figure 9-12: Example output from **show ethernet cfm service MA-INST2-1 domain MD-INST2 details**

```

details

CFM Service Name..... MA-INST2-1
CFM Domain Name..... MD-INST2
CFM Domain Level..... 3
Primary VLAN..... -

Maintenance Assoc Name Format... string
Maintenance Assoc Name Value... MA-12V100
CCM Transmission Interval..... 1 second
Local MEPs..... MEP DOWN      12 (interface
port1.0.2)

Configured Remote MEPs..... 21
Missing Remote MEPs..... 21
Current MEP Defects..... 3 (someRMEPCCMdefect)
MIP Creation..... None
```

Table 9-8: Parameters in the output from **show ethernet cfm service <ma-name> domain <domain-name> details**

Parameter	Description
CFM Service Name	The Maintenance Associations (MA) instance name.
CFM Domain Name	The Maintenance Domain name for the managed object.
CFM Domain Level	The level of the domain.
Primary VLAN	The Primary VLAN that was configured (if any).

Table 9-8: Parameters in the output from **show ethernet cfm service <ma-name> domain <domain-name> details** (cont.)

Parameter	Description
Maintenance Assoc Name Format and Value	The name and name format of the MA. The name format is one of the following: ICC - ICC string based name format Integer - Integer based name format Primary-vid - Primary VLAN based name format String - Character string based name format VPN-ID - VPN-ID based name format
CCM Transmission Interval	The CCI that was configured for this MA. It can be one of the following: 3 - CCI of 100 milliseconds 4 - CCI of 1 second (default) 5 - CCI of 10 seconds 6 - CCI of 1 minute 7 - CCI of 10 minutes
Local MEPs	A list of the Local MEPs configured for this MA. For each MEP, it displays the MEP direction Up or Down, its MEP-id, and the interface it was configured on.
Configured Remote MEPs	A list of Remote MEPs by MEP-id.
Missing Remote MEPs	A list of the configured Remote MEPs that this MA has not received any CCM messages from within 3.5 times the configured CCI.
Defect	A list of defects detected by the MA's Local MEPs. The defects shown can be: 1 - someRDldefect is declared 2 - someMACstatusDefect is declared 3 - someRMEPCCMdefect is declared 4 - errorCCMdefect is declared 5 - xconCCMdefect is declared

# show mep-alarm status

**Overview** Use this command to show any alarms that have been declared by Local MEPs, and the defect(s) that caused the alarm.

**Syntax** `show mep-alarm status`

**Mode** User Exec/Privileged Exec

**Usage** A Local MEP is used to detect connectivity faults with other remote MEPs that are in the same Maintenance Association (MA) and Maintenance Domain (MD) as the Local MEP. A Local MEP looks first for connectivity defects, and if these defects persist for a long enough period of time (typically 2.5 seconds), then an alarm is declared.

**Example** To show the alarms on local MEPs, use the command:

```
awplus# show mep-alarm status
```

**Output** Figure 9-13: Example output from **show mep-alarm status**

```
awplus#show mep-alarm status
```

CFM Domain Name	CFM Service Name	MEP	Active Alarm
MD-INST1	MA-INST1-1	12	someRMEPCCM

Table 9-9: Parameters in the output from **show mep-alarm status**

Parameter	Description
CFM Domain Name	The domain name.
CFM Service Name	The MA name.
Active Alarms	The highest priority defect causing the alarm, one of the following: someRDI, someMACstatus, someRMEPCCM, errorCCM, or xconCCM.
MEP	The local MEP's ID.

- [“show log external”](#) on page 503
- [“show log permanent”](#) on page 504
- [“show running-config log”](#) on page 506
- [“unmount”](#) on page 507

# clear exception log

**Overview** This command resets the contents of the exception log, but does not remove the associated core files.

**NOTE:** *When this command is used within a stacked environment, it will remove the contents of the exception logs in all stack members.*

**Syntax** `clear exception log`

**Mode** Privileged Exec

**Example** `awplus# clear exception log`

# clear log

**Overview** This command removes the contents of the buffered and permanent logs.

**NOTE:** *When this command is used within a stacked environment, it will remove the contents of the buffered and permanent logs in all stack members.*

**Syntax** `clear log`

**Mode** Privileged Exec

**Example** To delete the contents of the buffered and permanent log use the command:

```
awplus# clear log
```

**Related  
Commands** [clear log buffered](#)  
[clear log permanent](#)  
[show log](#)

# clear log buffered

**Overview** This command removes the contents of the buffered log.

**NOTE:** *When this command is used within a stacked environment, it will remove the contents of the buffered logs in all stack members.*

**Syntax** `clear log buffered`

**Mode** Privileged Exec

**Example** To delete the contents of the buffered log use the following commands:

```
awplus# clear log buffered
```

**Related Commands**

- default log buffered
- log buffered
- log buffered (filter)
- log buffered size
- log buffered exclude
- show log
- show log config

# clear log external

**Overview** Use this command to delete the external log file from the USB storage device it is stored on.

If the external log is rotating between multiple files, this command deletes all those files, not just the most recent one.

When this command is used within a stacked environment, it will delete the external logs on all stack members.

**Syntax** `clear log external`

**Mode** Privileged Exec

**Example** To delete the external log file, use the command:

```
awplus# clear log external
```

**Related Commands**

- [default log external](#)
- [log external](#)
- [log external \(filter\)](#)
- [log external exclude](#)
- [log external rotate](#)
- [log external size](#)
- [show log config](#)
- [show log external](#)
- [unmount](#)

**Command changes** Version 5.4.7-1.1: command added

# clear log permanent

**Overview** This command removes the contents of the permanent log.

**NOTE:** *When this command is used within a stacked environment, it will remove the contents of the permanent logs in all stack members.*

**Syntax** `clear log permanent`

**Mode** Privileged Exec

**Example** To delete the contents of the permanent log use the following commands:

```
awplus# clear log permanent
```

**Related Commands**

- [default log permanent](#)
- [log permanent](#)
- [log permanent \(filter\)](#)
- [log permanent exclude](#)
- [log permanent size](#)
- [show log config](#)
- [show log permanent](#)

# copy buffered-log

**Overview** Use this command to copy the buffered log to an internal or external destination.

**Syntax** `copy buffered-log <destination-name>`

Parameter	Description
<code>&lt;destination-name&gt;</code>	The filename and path for the destination file. See <a href="#">Introduction</a> on page 128 for valid syntax.

**Mode** Privileged Exec

**Example** To copy the buffered log file into a folder in Flash named “buffered-log” and name the file “buffered-log.log”, use the command:

```
awplus# copy buffered-log flash:/buffered-log/buffered-log.log
```

To copy the buffered log file onto a USB storage device and name the file “buffered-log.log”, use the command:

```
awplus# copy buffered-log usb:/buffered-log.log
```

**Related Commands**

- [log buffered](#)
- [show file systems](#)
- [show log](#)

**Command changes** Version 5.4.7-1.1: command added

# copy permanent-log

**Overview** Use this command to copy the permanent log to an internal or external destination.

**Syntax** `copy permanent-log <destination-name>`

Parameter	Description
<code>&lt;destination-name&gt;</code>	The filename and path for the destination file. See <a href="#">Introduction</a> on page 128 for valid syntax.

**Mode** Privileged Exec

**Example** To copy the permanent log file into a folder in Flash named “perm-log” and name the file “permanent-log.log”, use the command:

```
awplus# copy permanent-log flash:/perm-log/permanent-log.log
```

To copy the permanent log file onto a USB storage device and name the file “permanent-log.log”, use the command:

```
awplus# copy permanent-log usb:/permanent-log.log
```

**Related Commands**

- [log permanent](#)
- [show file systems](#)
- [show log permanent](#)

**Command changes** Version 5.4.7-1.1: command added

# default log buffered

**Overview** This command restores the default settings for the buffered log stored in RAM. By default the size of the buffered log is 50 kB and it accepts messages with the severity level of “warnings” and above.

**Syntax** `default log buffered`

**Default** The buffered log is enabled by default.

**Mode** Global Configuration

**Example** To restore the buffered log to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log buffered
```

**Related Commands**

- [clear log buffered](#)
- [log buffered](#)
- [log buffered \(filter\)](#)
- [log buffered size](#)
- [log buffered exclude](#)
- [show log](#)
- [show log config](#)

# default log console

**Overview** This command restores the default settings for log messages sent to the terminal when a `log console` command is issued. By default all messages are sent to the console when a `log console` command is issued.

**Syntax** `default log console`

**Mode** Global Configuration

**Example** To restore the log console to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log console
```

**Related Commands**

- `log console`
- `log console (filter)`
- `log console exclude`
- `show log config`

# default log email

**Overview** This command restores the default settings for log messages sent to an email address. By default no filters are defined for email addresses. Filters must be defined before messages will be sent. This command also restores the remote syslog server time offset value to local (no offset).

**Syntax** `default log email <email-address>`

Parameter	Description
<code>&lt;email-address&gt;</code>	The email address to send log messages to

**Mode** Global Configuration

**Example** To restore the default settings for log messages sent to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# default log email admin@alliedtelesis.com
```

**Related Commands**

- [log email](#)
- [log email \(filter\)](#)
- [log email exclude](#)
- [log email time](#)
- [show log config](#)

# default log external

**Overview** Use this command to restore the default settings for the external log. By default, the size of the external log is 50 kB, it rotates through 1 additional file, and it accepts messages with a severity level of notices and above.

Note that this command does not clear the configured filename for the external log.

**Syntax** `default log external`

**Mode** Global Configuration

**Example** To restore the default settings for the external log, use the commands:

```
awplus# configure terminal
awplus(config)# default log external
```

**Related Commands**

- [clear log external](#)
- [log external](#)
- [log external \(filter\)](#)
- [log external exclude](#)
- [log external rotate](#)
- [log external size](#)
- [show log config](#)
- [show log external](#)
- [unmount](#)

**Command changes** Version 5.4.7-1.1: command added

# default log host

**Overview** This command restores the default settings for log sent to a remote syslog server. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent. This command also restores the remote syslog server time offset value to local (no offset).

**Syntax** `default log host <ip-addr>`

Parameter	Description
<code>&lt;ip-addr&gt;</code>	The IP address of a remote syslog server

**Mode** Global Configuration

**Example** To restore the default settings for messages sent to the remote syslog server with IP address 10.32.16.21 use the following commands:

```
awplus# configure terminal
awplus(config)# default log host 10.32.16.21
```

**Related Commands**

- [log host](#)
- [log host \(filter\)](#)
- [log host exclude](#)
- [log host source](#)
- [log host time](#)
- [show log config](#)

# default log monitor

**Overview** This command restores the default settings for log messages sent to the terminal when a [terminal monitor](#) command is used.

**Syntax** `default log monitor`

**Default** All messages are sent to the terminal when a [terminal monitor](#) command is used.

**Mode** Global Configuration

**Example** To restore the log monitor to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log monitor
```

**Related  
Commands** [log monitor \(filter\)](#)  
[log monitor exclude](#)  
[show log config](#)  
[terminal monitor](#)

# default log permanent

**Overview** This command restores the default settings for the permanent log stored in NVS. By default, the size of the permanent log is 50 kB and it accepts messages with the severity level of `warnings` and above.

**Syntax** `default log permanent`

**Default** The permanent log is enabled by default.

**Mode** Global Configuration

**Example** To restore the permanent log to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log permanent
```

**Related Commands**

- [clear log permanent](#)
- [log permanent](#)
- [log permanent \(filter\)](#)
- [log permanent exclude](#)
- [log permanent size](#)
- [show log config](#)
- [show log permanent](#)

# log buffered

**Overview** This command configures the device to store log messages in RAM. Messages stored in RAM are not retained on the device over a restart. Once the buffered log reaches its configured maximum allowable size old messages will be deleted to make way for new ones.

**Syntax** `log buffered`  
`no log buffered`

**Default** The buffered log is configured by default.

**Mode** Global Configuration

**Examples** To configured the device to store log messages in RAM use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered
```

To configure the device to not store log messages in a RAM buffer use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered
```

**Related Commands**

- [clear log buffered](#)
- [copy buffered-log](#)
- [default log buffered](#)
- [log buffered \(filter\)](#)
- [log buffered size](#)
- [log buffered exclude](#)
- [show log](#)
- [show log config](#)

# log buffered (filter)

**Overview** Use this command to create a filter to select messages to be sent to the buffered log. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the buffered log.

**Syntax** `log buffered [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log buffered [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

Parameter	Description
level	Filter messages to the buffered log by severity level.
<level>	The minimum severity of message to send to the buffered log. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:
0 emergencies	System is unusable
1 alerts	Action must be taken immediately
2 critical	Critical conditions
3 errors	Error conditions
4 warnings	Warning conditions
5 notices	Normal, but significant, conditions
6 informational	Informational messages
7 debugging	Debug-level messages
program	Filter messages to the buffered log by program. Include messages from a specified program in the buffered log.
<program-name>	The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.
rip	Routing Information Protocol (RIP)
ripng	Routing Information Protocol - next generation (RIPng)
ospf	Open Shortest Path First (OSPF)
ospfv3	Open Shortest Path First (OSPF) version 3 (OSPFv3)
bgp	Border Gateway Protocol (BGP)
rsvp	Resource Reservation Protocol (RSVP)
pim-dm	Protocol Independent Multicast - Dense Mode (PIM-DM)

Parameter	Description
pim-sm	Protocol Independent Multicast - Sparse Mode (PIM-SM)
pim-smv6	PIM-SM version 6 (PIM-SMv6)
dot1x	IEEE 802.1X Port-Based Access Control
lacp	Link Aggregation Control Protocol (LACP)
stp	Spanning Tree Protocol (STP)
rstp	Rapid Spanning Tree Protocol (RSTP)
mstp	Multiple Spanning Tree Protocol (MSTP)
imi	Integrated Management Interface (IMI)
imish	Integrated Management Interface Shell (IMISH)
epsr	Ethernet Protection Switched Rings (EPSR)
irdp	ICMP Router Discovery Protocol (IRDP)
rmon	Remote Monitoring
loopprot	Loop Protection
poe	Power-inline (Power over Ethernet)
dhcpsn	DHCP snooping (DHCP SN)
facility	Filter messages to the buffered log by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from in the buffered log:
kern	Kernel messages
user	Random user-level messages
mail	Mail system
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by syslogd
lpr	Line printer subsystem
news	Network news subsystem
uucp	UUCP subsystem
cron	Clock daemon
authpriv	Security/authorization messages (private)
ftp	FTP daemon
msgtext	Select messages containing a certain text string.
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

**Default** By default the buffered log has a filter to select messages whose severity level is “notices (5)” or higher. This filter may be removed using the **no** variant of this command.

**Mode** Global Configuration

**Examples** To add a filter to send all messages generated by EPSR that have a severity of **notices** or higher to the buffered log, use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered level notices program epsr
```

To add a filter to send all messages containing the text “Bridging initialization” to the buffered log, use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered msgtext Bridging initialization
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the buffered log, use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered level notices program epsr
```

To remove a filter that sends all messages containing the text “Bridging initialization” to the buffered log, use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered msgtext Bridging initialization
```

**Related  
Commands**

[log buffered](#)

[log buffered size](#)

[log buffered exclude](#)

[show log](#)

[show log config](#)

# log buffered exclude

**Overview** Use this command to exclude specified log messages from the buffered log. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log buffered exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log buffered exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

Parameter	Description
level	Exclude messages of the specified severity level.
<level>	The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:
0 emergencies	System is unusable
1 alerts	Action must be taken immediately
2 critical	Critical conditions
3 errors	Error conditions
4 warnings	Warning conditions
5 notices	Normal, but significant, conditions
6 informational	Informational messages
7 debugging	Debug-level messages
program	Exclude messages from a specified program.
<program-name>	The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.
rip	Routing Information Protocol (RIP)
ripng	Routing Information Protocol - next generation (RIPng)
ospf	Open Shortest Path First (OSPF)

epsr	Ethernet Protection Switched Rings (EPSR)
irdp	ICMP Router Discovery Protocol (IRDP)
rmon	Remote Monitoring
loopprot	Loop Protection
poe	Power-inline (Power over Ethernet)
dhcpsn	DHCP snooping (DHPCPSN)
facility	Exclude messages from a syslog facility.
<facility>	Specify one of the following syslog facilities to exclude messages from:
kern	Kernel messages
user	Random user-level messages
mail	Mail system
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by syslogd
lpr	Line printer subsystem
news	Network news subsystem
uucp	UUCP subsystem
cron	Clock daemon
authpriv	Security/authorization messages (private)
ftp	FTP daemon
msgtext	Exclude messages containing a certain text string.
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered exclude msgtext example of
irrelevant message
```

**Related  
Commands**

- clear log buffered
- default log buffered
- log buffered
- log buffered (filter)
- log buffered size
- show log
- show log config

# log buffered size

**Overview** This command configures the amount of memory that the buffered log is permitted to use. Once this memory allocation has been filled old messages will be deleted to make room for new messages.

**Syntax** `log buffered size <50-250>`

Parameter	Description
<50-250>	Size of the RAM log in kilobytes

**Mode** Global Configuration

**Example** To allow the buffered log to use up to 100 kB of RAM use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered size 100
```

**Related Commands**

# log console

**Overview** This command configures the device to send log messages to consoles. The console log is configured by default to send messages to the device's main console port.

Use the **no** variant of this command to configure the device not to send log messages to consoles.

**Syntax** `log console`  
`no log console`

**Mode** Global Configuration

**Examples** To configure the device to send log messages use the following commands:

```
awplus# configure terminal
awplus(config)# log console
```

To configure the device not to send log messages in all consoles use the following commands:

```
awplus# configure terminal
awplus(config)# no log console
```

**Related Commands** [default log console](#)  
[log console \(filter\)](#)  
[log console exclude](#)  
[show log config](#)

# log console (filter)

**Overview** This command creates a filter to select messages to be sent to all consoles when the **log console** command is given. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

**Syntax** `log console [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log console [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

Parameter	Description
level	Filter messages by severity level.
<level>	The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:
0 emergencies	System is unusable
1 alerts	Action must be taken immediately
2 critical	Critical conditions
3 errors	Error conditions
4 warnings	Warning conditions
5 notices	Normal, but significant, conditions
6 informational	Informational messages
7 debugging	Debug-level messages
program	Filter messages by program. Include messages from a specified program.
<program-name>	The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.
rip	Routing Information Protocol (RIP)

imish	Integrated Management Interface Shell (IMISH)
epsr	Ethernet Protection Switched Rings (EPSR)
irdp	ICMP Router Discovery Protocol (IRDP)
rmon	Remote Monitoring
loopprot	Loop Protection
poe	Power-inline (Power over Ethernet)
dhcpcsn	DHCP snooping (DHPCPSN)
facility	Filter messages by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from:
kern	Kernel messages
user	Random user-level messages
mail	Mail system
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by syslogd
lpr	Line printer subsystem
news	Network news subsystem
uucp	UUCP subsystem
cron	Clock daemon
authpriv	Security/authorization messages (private)
ftp	FTP daemon
msgtext	Select messages containing a certain text string.
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

**Default** By default the console log has a filter to select messages whose severity level is `critical` or higher. This filter may be removed using the **no** variant of this command. This filter may be removed and replaced by filters that are more selective.

**Mode** Global Configuration

**Examples** To create a filter to send all messages containing the text "Bridging initialization" to console instances where the **log console** command has been entered, use the following commands:

```
awplus# configure terminal
awplus(config)# log console msgtext "Bridging initialization"
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to consoles, use the following commands:

```
awplus# configure terminal
awplus(config)# no log console level notices program epsr
```

To remove a default filter that includes sending **critical**, **alert** and **emergency** level messages to the console, use the following commands:

```
awplus# configure terminal
awplus(config)# no log console level critical
```

**Related  
Commands**

- [default log console](#)
- [log console](#)
- [log console exclude](#)
- [show log config](#)

# log console exclude

**Overview** Use this command to prevent specified log messages from being sent to the console, when console logging is turned on. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`  
`no log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

Parameter	Description
level	Exclude messages of the specified severity level.
<level>	The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:
	0 emergencies      System is unusable
	1 alerts            Action must be taken immediately
	2 critical          Critical conditions
	3 errors            Error conditions
	4 warnings        Warning conditions
	5 notices          Normal, but significant, conditions
	6 informational    Informational messages
	7 debugging        Debug-level messages
program	Exclude messages from a specified program.
<program-name>	The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.

- [show log config](#)

# log email

**Overview** This command configures the device to send log messages to an email address. The email address is specified in this command.

**Syntax** `log email <email-address>`

Parameter	Description
<code>&lt;email-address&gt;</code>	The email address to send log messages to

**Default** By default no filters are defined for email log targets. Filters must be defined before messages will be sent.

**Mode** Global Configuration

**Example** To have log messages emailed to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@alliedtelesis.com
```

**Related Commands**

- [default log email](#)
- [log email \(filter\)](#)
- [log email exclude](#)
- [log email time](#)
- [show log config](#)

# log email (filter)

**Overview** This command creates a filter to select messages to be sent to an email address. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a specified email address. All configuration relating to this log target will be removed.

**Syntax**

```
log email <email-address> [level <level>] [program
<program-name>] [facility <facility>] [msgtext <text-string>]
no log email <email-address> [level <level>] [program
<program-name>] [facility <facility>] [msgtext <text-string>]
```

Parameter	Description
<email-address>	The email address to send logging messages to
level	Filter messages by severity level.
<level>	The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:
0 emergencies	System is unusable
1 alerts	Action must be taken immediately
2 critical	Critical conditions
3 errors	Error conditions
4 warnings	Warning conditions
5 notices	Normal, but significant, conditions
6 informational	Informational messages
7 debugging	Debug-level messages
program	Filter messages by program. Include messages from a specified program.
<program-name>	The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.

<facility>	Specify one of the following syslog facilities to include messages from:
kern	Kernel messages
user	Random user-level messages
mail	Mail system
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by syslogd
lpr	Line printer subsystem
news	Network news subsystem
uucp	UUCP subsystem
cron	Clock daemon
authpriv	Security/authorization messages (private)
ftp	FTP daemon
msgtext	Select messages containing a certain text string.
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

**Mode** Global Configuration

**Examples** To create a filter to send all messages generated by EPSR that have a severity of **notices** or higher to the email address admin@homebase.com, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@homebase.com level notices
program epsr
```

To create a filter to send all messages containing the text "Bridging initialization", to the email address admin@homebase.com, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@homebase.com msgtext "Bridging
initialization"
```

To create a filter to send messages with a severity level of **informational** and above to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@alliedtelesis.com level
informational
```

To stop the device emailing log messages emailed to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@homebase.com
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the email address admin@homebase.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@homebase.com level notices
program epsr
```

To remove a filter that sends messages with a severity level of **informational** and above to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@alliedtelesis.com level
informational
```

**Related  
Commands**

- [default log email](#)
- [log email](#)
- [log email exclude](#)
- [log email time](#)
- [show log config](#)

# log email exclude

**Overview** Use this command to prevent specified log messages from being emailed, when the device is configured to send log messages to an email address. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log email exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`  
`no log email exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

Parameter	Description
level	Exclude messages of the specified severity level.
<level>	The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:
0 emergencies	System is unusable
1 alerts	Action must be taken immediately
2 critical	Critical conditions
3 errors	Error conditions
4 warnings	Warning conditions
5 notices	Normal, but significant, conditions
6 informational	Informational messages
7 debugging	Debug-level messages
program	Exclude messages from a specified program.
<program-name>	The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.

<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log email exclude msgtext example of irrelevant
message
```

**Related Commands**

- default log email
- log email
- log email (filter)
- log email time
- show log config

# log email time

**Overview** This command configures the time used in messages sent to an email address. If the syslog server is in a different time zone to your device then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

**Syntax** `log email <email-address> time {local|local-offset|utc-offset {plus|minus}<0-24>}`

Parameter	Description
<code>&lt;email-address&gt;</code>	The email address to send log messages to
<code>time</code>	Specify the time difference between the email recipient and the device you are configuring.
<code>local</code>	The device is in the same time zone as the email recipient
<code>local-offset</code>	The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from local time of the device to the email recipient in hours.
<code>utc-offset</code>	The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from UTC time of the device to the email recipient in hours.
<code>plus</code>	Negative offset (difference) from the device to the email recipient.
<code>minus</code>	Positive offset (difference) from the device to the email recipient.
<code>&lt;0-24&gt;</code>	World Time zone offset in hours

**Default** The default is **local** time.

**Mode** Global Configuration

**Usage** Use the **local** option if the email recipient is in the same time zone as this device. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the email recipient in hours. Messages will display the time they were generated on this device but converted to the time zone of the email recipient.

**Examples** To send messages to the email address `test@home.com` in the same time zone as the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@base.com time local 0
```

To send messages to the email address `admin@base.com` with the time information converted to the time zone of the email recipient, which is 3 hours ahead of the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@base.com time local-offset plus
3
```

To send messages to the email address `user@remote.com` with the time information converted to the time zone of the email recipient, which is 3 hours behind the device's UTC time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email user@remote.com time utc-offset minus
3
```

**Related  
Commands**

- [default log email](#)
- [log email](#)
- [log email \(filter\)](#)
- [log email exclude](#)
- [show log config](#)

# log external

**Overview** Use this command to enable external logging. External logging sends syslog messages to a file on a USB storage device.

If the file does not already exist on the storage device, it (and any specified subdirectory) will be automatically created. If the file already exists, messages are appended to it.

Use the **no** variant of this command to disable external logging.

**Syntax** `log external <filename>`  
`no log external`

Parameter	Description
<code>&lt;filename&gt;</code>	The file and optionally directory path to store the log messages in. See <a href="#">Introduction</a> on page 128 for valid syntax.

**Default** External logging is disabled by default.

**Mode** Global Configuration

**Usage** We strongly recommend using ext3 or ext4 as the file system on the external storage device. These file systems have a lower risk of file corruption occurring if the switch or firewall loses power.

You should also unmount the storage device before removing it from the switch or firewall, to avoid corrupting the log file. To unmount the device, use the **unmount** command.

If you are using this on a VCStack, each stack member needs to have its own external storage device. Enabling or disabling external logging enables or disables it on all stack members.

**Example** To save messages to a file called "messages.log" in a directory called "log" on a USB storage device, use the command:

```
awplus# configure terminal
awplus(config)# log external usb:/log/messages.log
```

**Related Commands**

- [log external \(filter\)](#)
- [log external exclude](#)
- [log external rotate](#)
- [log external size](#)
- [show log config](#)

show log external

unmount

**Command changes** Version 5.4.7-1.1: command added

# log external (filter)

**Overview** Use this command to create a filter to select messages to be sent to the external log. You can include messages based on:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the external log.

**Syntax** `log external [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log external [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

Parameter	Description
level	Filter messages to the external log by severity level.
<level>	The minimum severity of message to send to the external log. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:
0 emergencies	System is unusable
1 alerts	Action must be taken immediately
2 critical	Critical conditions
3 errors	Error conditions
4 warnings	Warning conditions
5 notices	Normal, but significant, conditions
6 informational	Informational messages
7 debugging	Debug-level messages
program	Filter messages to the external log by program. Include messages from a specified program in the external log.
<program-name>	The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.
rip	Routing Information Protocol (RIP)
ripng	Routing Information Protocol - next generation (RIPng)
ospf	Open Shortest Path First (OSPF)

Parameter	Description
ospfv3	Open Shortest Path First (OSPF) version 3 (OSPFv3)
bgp	Border Gateway Protocol (BGP)
rsvp	Resource Reservation Protocol (RSVP)
pim-dm	Protocol Independent Multicast - Dense Mode (PIM-DM)
pim-sm	Protocol Independent Multicast - Sparse Mode (PIM-SM)
pim-smv6	PIM-SM version 6 (PIM-SMv6)
dot1x	IEEE 802.1X Port-Based Access Control
lacp	Link Aggregation Control Protocol (LACP)
stp	Spanning Tree Protocol (STP)
rstp	Rapid Spanning Tree Protocol (RSTP)
mstp	Multiple Spanning Tree Protocol (MSTP)
imi	Integrated Management Interface (IMI)
imish	Integrated Management Interface Shell (IMISH)
epsr	Ethernet Protection Switched Rings (EPSR)
irdp	ICMP Router Discovery Protocol (IRDP)
rmon	Remote Monitoring
loopprot	Loop Protection
poe	Power-inline (Power over Ethernet)
dhcpcsn	DHCP snooping (DHPCPSN)
facility	Filter messages to the external log by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from in the log:
kern	Kernel messages
user	Random user-level messages
mail	Mail system
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by syslogd
lpr	Line printer subsystem
news	Network news subsystem
uucp	UUCP subsystem
cron	Clock daemon
authpriv	Security/authorization messages (private)
ftp	FTP daemon

Parameter	Description
msgtext	Select messages containing a certain text string.
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

**Default** By default the external log has a filter to select messages whose severity level is “notices (5)” or higher. This filter may be removed using the **no** variant of this command.

**Mode** Global Configuration

**Examples** To add a filter to send all messages generated by EPSR that have a severity of **notices** or higher to the external log, use the following commands:

```
awplus# configure terminal
awplus(config)# log external level notices program epsr
```

To add a filter to send all messages containing the text “Bridging initialization” to the external log, use the following commands:

```
awplus# configure terminal
awplus(config)# log external msgtext Bridging initialization
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the external log, use the following commands:

```
awplus# configure terminal
awplus(config)# no log external level notices program epsr
```

To remove a filter that sends all messages containing the text “Bridging initialization” to the external log, use the following commands:

```
awplus# configure terminal
awplus(config)# no log external msgtext Bridging initialization
```

**Command  
changes** Version 5.4.7-1.1: command added

# log external exclude

**Overview** Use this command to exclude specified log messages from the external log. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log external exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log external exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

Parameter	Description
level	Exclude messages of the specified severity level.
<level>	The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:
0 emergencies	System is unusable
1 alerts	Action must be taken immediately
2 critical	Critical conditions
3 errors	Error conditions
4 warnings	Warning conditions
5 notices	Normal, but significant, conditions
6 informational	Informational messages
7 debugging	Debug-level messages
program	Exclude messages from a specified program.
<program-name>	The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.
rip	Routing Information Protocol (RIP)
ripng	Routing Information Protocol - next generation (RIPng)
ospf	Open Shortest Path First (OSPF)
ospfv3	Open Shortest Path First (OSPF) version 3 (OSPFv3)
bgp	Border Gateway Protocol (BGP)

Parameter	Description
rsvp	Resource Reservation Protocol (RSVP)
pim-dm	Protocol Independent Multicast - Dense Mode (PIM-DM)
pim-sm	Protocol Independent Multicast - Sparse Mode (PIM-SM)
pim-smv6	PIM-SM version 6 (PIM-SMv6)

irdp	ICMP Router Discovery Protocol (IRDP)
rmon	Remote Monitoring
loopprot	Loop Protection
poe	Power-inline (Power over Ethernet)
dhcpsn	DHCP snooping (DHCP SN)
facility	Exclude messages from a syslog facility.
<facility>	Specify one of the following syslog facilities to exclude messages from:
kern	Kernel messages
user	Random user-level messages
mail	Mail system
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by syslogd
lpr	Line printer subsystem
news	Network news subsystem
uucp	UUCP subsystem
cron	Clock daemon
authpriv	Security/authorization messages (private)
ftp	FTP daemon
msgtext	Exclude messages containing a certain text string.
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

**Default** No log messages are excluded

**Mode** Global Configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log external exclude msgtext example of
irrelevant message
```

**Related  
Commands** [clear log external](#)  
[default log external](#)

[log external](#)

[log external \(filter\)](#)

[log external rotate](#)

[log external size](#)

[show log config](#)

[show log external](#)

[unmount](#)

**Command  
changes** Version 5.4.7-1.1: command added

# log external rotate

**Overview** Use this command to configure the number of files that the external log can rotate through.

Use the **no** variant of this command to return to the default.

**Syntax** `log external rotate <0-255>`  
`no log external rotate`

Parameter	Description
<code>&lt;0-255&gt;</code>	The number of additional files to rotate through. Note that the device rotates between the initial file and the number of additional files specified by this value - see the Usage section below.

**Default** The default is 1, which rotates between the initial file and 1 additional file (for example, rotates between `messages.log` and `messages.log.1`)

**Mode** Global Configuration

**Usage** The device rotates between the initial file and the number of additional files specified by this command. For example, the diagram below shows how setting rotate to 2 makes the device rotate through 3 files.

Note that if you set rotate to 0, and the external log file becomes full, then the device deletes the full log file and creates a new (empty) file of the same name to save messages into. For this reason, we recommend setting rotate to at least 1.

**Example** To set the rotation value to 2, and therefore rotate between 3 files, use the commands:

```
awplus# configure terminal
awplus(config)# log external rotate 2
```

**Related  
Commands**

- clear log external
- default log external
- log external
- log external (filter)
- log external exclude
- log external size
- show log config
- show log external
- unmount

**Command  
changes**

- Version 5.4.7-1.1: command added

# log external size

**Overview** Use this command to configure the total amount of size that the external log is permitted to use, in kilobytes. The maximum possible depends on the storage device's file system.

Note that if you are rotating between multiple files, this is the maximum size of all files, not of each individual file. For example, if you are rotating between 2 files (**log external rotate 1**), each file will have a maximum size of 25 kBytes by default.

Use the **no** variant of this command to return to the default size.

**Syntax** `log external size [<50-4194304>]`  
`no log external size`

Parameter	Description
<50-4194304>	The total amount of size that the external log is permitted to use, in kilobytes.

**Default** 50 kBytes

**Mode** Global Configuration

**Example** To configure a total log size of 100 kBytes, use the commands:

```
awplus# configure terminal
awplus(config)# log external size 100
```

**Related Commands**

- [clear log external](#)
- [default log external](#)
- [log external](#)
- [log external \(filter\)](#)
- [log external exclude](#)
- [log external rotate](#)
- [log external size](#)
- [show log config](#)
- [show log external](#)
- [unmount](#)

**Command changes** Version 5.4.7-1.1: command added

# log facility

**Overview** Use this command to assign a facility to all log messages generated on this device. This facility overrides any facility that is automatically generated as part of the log message.

Use the **no** variant of this command to remove the configured facility.

**Syntax** `log facility {kern|user|mail|daemon|auth|syslog|lpr|news|uucp|cron|authpriv|ftp|local0|local1|local2|local3|local4|local5|local6|local7}`  
`no log facility`

**Default** None. The outgoing syslog facility depends on the log message.

**Mode** Global Configuration

**Usage** Specifying different facilities for log messages generated on different devices can allow messages from multiple devices sent to a common server to be distinguished from each other.

Ordinarily, the facility values generated in log messages have meanings as shown in the following table. Using this command will override these meanings, and the new meanings will depend on the use you put them to.

Table 10-1: Ordinary meanings of the facility parameter in log messages

Facility	Description
kern	Kernel messages
user	User-level messages
mail	Mail system
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by the syslog daemon
lpr	Line printer subsystem
news	Network news subsystem
uucp	UNIX-to-UNIX Copy Program subsystem
cron	Clock daemon
authpriv	Security/authorization (private) messages

Table 10-1: Ordinary meanings of the facility parameter in log messages (cont.)

Facility	Description
ftp	FTP daemon
local<0..7>	The facility labels above have specific meanings, while the local facility labels are intended to be put to local use. In AlliedWare Plus, some of these local facility labels are used in log messages. In particular, local5 is assigned to log messages generated by UTM Firewall security features.

**Example** To specify a facility of local6, use the following commands:

```
awplus# configure terminal
awplus(config)# log facility local6
```

**Related  
Commands** [show log config](#)

# log host

**Overview** This command configures the device to send log messages to a remote syslog server via UDP port 514. The IP address of the remote server must be specified. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent.

Use the **no** variant of this command to stop sending log messages to the remote syslog server.

**Syntax**

```
log host <ipv4-addr> [secure]
log host <ipv6-addr>
no log host <ipv4-addr>|<ipv6-addr>
```

Parameter	Description
<ipv4-addr>	Specify the source IPv4 address, in dotted decimal notation (A.B.C.D).
<ipv6-addr>	Specify the source IPv6 address, in X::X::X::X notation.
secure	Optional value to create a secure log destination. This option is only valid for IPv4 hosts.

**Mode** Global Configuration

**Usage** Use the optional **secure** parameter to configure a secure IPv4 syslog host. For secure hosts, syslog over TLS is used to encrypt the logs. The certificate received from the remote log server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

The remote server may also request that a certificate is transmitted from the local device. In this situation the first trustpoint added to the syslog application will be transmitted to the remote server.

For detailed information about securing syslog, see the [PKI Feature Overview\\_and Configuration\\_Guide](#).

**Examples** To configure the device to send log messages to a remote secure syslog server with IP address 10.32.16.99, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.99 secure
```

To stop the device from sending log messages to the remote syslog server with IP address 10.32.16.99, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.99
```

**Related Commands**

- [default log host](#)
- [log host \(filter\)](#)

log host exclude  
log host source  
log host startup-delay  
log host time  
log trustpoint  
show log config

# log host (filter)

**Overview** This command creates a filter to select messages to be sent to a remote syslog server. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a substring within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a remote syslog server. The IP address of the syslog server must be specified. All configuration relating to this log target will be removed.

**Syntax** `log host <ip-addr> [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log host <ip-addr> [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

Parameter	Description
<code>&lt;ip-addr&gt;</code>	The IP address of a remote syslog server.
<code>level</code>	Filter messages by severity level.
<code>&lt;level&gt;</code>	The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:
0 emergencies	System is unusable
1 alerts	Action must be taken immediately
2 critical	Critical conditions
3 errors	Error conditions
4 warnings	Warning conditions
5 notices	Normal, but significant, conditions
6 informational	Informational messages
7 debugging	Debug-level messages
<code>program</code>	Filter messages by program. Include messages from a specified program.
<code>&lt;program-name&gt;</code>	The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.
rip	Routing Information Protocol (RIP)
ripng	Routing Information Protocol - next generation (RIPng)
ospf	Open Shortest Path First (OSPF)
ospfv3	Open Shortest Path First (OSPF) version 3 (OSPFv3)
bgp	Border Gateway Protocol (BGP)
rsvp	Resource Reservation Protocol (RSVP)

Parameter	Description
pim-dm	Protocol Independent Multicast - Dense Mode (PIM-DM)
pim-sm	Protocol Independent Multicast - Sparse Mode (PIM-SM)
pim-smv6	PIM-SM version 6 (PIM-SMv6)
dot1x	IEEE 802.1X Port-Based Access Control
lacp	Link Aggregation Control Protocol (LACP)
stp	Spanning Tree Protocol (STP)
rstp	Rapid Spanning Tree Protocol (RSTP)

imi	Integrated Management Interface (IMI)
imish	Integrated Management Interface Shell (IMISH)
epsr	Ethernet Protection Switched Rings (EPSR)
irdp	ICMP Router Discovery Protocol (IRDP)
rmon	Remote Monitoring
loopprot	Loop Protection
poe	Power-inline (Power over Ethernet)
dhcpcsn	DHCP snooping (DHPCPSN)
facility	Filter messages by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from:
kern	Kernel messages
user	Random user-level messages
mail	Mail system
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by syslogd
lpr	Line printer subsystem
news	Network news subsystem
uucp	UUCP subsystem
cron	Clock daemon
authpriv	Security/authorization messages (private)
ftp	FTP daemon
msgtext	Select messages containing a certain text string.
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

**Mode** Global Configuration

**Examples** To create a filter to send all messages generated by EPSR that have a severity of **notices** or higher to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level notices program epsr
```

To create a filter to send all messages containing the text "Bridging initialization", to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 msgtext "Bridging
initialization"
```

To create a filter to send messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level informational
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 level notices program
epsr
```

To remove a filter that sends all messages containing the text "Bridging initialization", to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 msgtext "Bridging
initialization"
```

To remove a filter that sends messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, use the following commands:

```
awplusawplus# configure terminal
awplus(config)# no log host 10.32.16.21 level informational
```

**Related  
Commands**

- [default log host](#)
- [log host](#)
- [log host exclude](#)
- [log host source](#)
- [log host time](#)
- [show log config](#)

# log host exclude

**Overview** Use this command to prevent specified log messages from being sent to the remote syslog server, when `log host` is enabled. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log host exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`  
`no log host exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

Parameter	Description
level	Exclude messages of the specified severity level.
<level>	The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:
0 emergencies	System is unusable
1 alerts	Action must be taken immediately
2 critical	Critical conditions
3 errors	Error conditions
4 warnings	Warning conditions
5 notices	Normal, but significant, conditions
6 informational	Informational messages
7 debugging	Debug-level messages
program	Exclude messages from a specified program.
<program-name>	The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.
rip	Routing Information Protocol (RIP)
ripng	Routing Information Protocol - next generation (RIPng)

epsr	Ethernet Protection Switched Rings (EPSR)
irdp	ICMP Router Discovery Protocol (IRDP)
rmon	Remote Monitoring
loopprot	Loop Protection
poe	Power-inline (Power over Ethernet)
dhcpsn	DHCP snooping (DHCP SN)
facility	Exclude messages from a syslog facility.
<facility>	Specify one of the following syslog facilities to exclude messages from:
kern	Kernel messages
user	Random user-level messages
mail	Mail system
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by syslogd
lpr	Line printer subsystem
news	Network news subsystem
uucp	UUCP subsystem
cron	Clock daemon
authpriv	Security/authorization messages (private)
ftp	FTP daemon

Parameter	Description
msgtext	Exclude messages containing a certain text string.
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log host exclude msgtext example of irrelevant
message
```

**Related  
Commands**

- default log host
- log host
- log host (filter)
- log host source
- log host time
- show log config

# log host source

**Overview** Use this command to specify a source interface or IP address for the device to send syslog messages from. You can specify any one of an interface name, an IPv4 address or an IPv6 address.

This is useful if the device can reach the syslog server via multiple interfaces or addresses and you want to control which interface/address the device uses.

Note that AlliedWare Plus does not support source interface settings on secure log hosts (which are hosts configured using "log host <ip-address> secure").

Use the **no** variant of this command to stop specifying a source interface or address.

**Syntax** `log host source {<interface-name>|<ipv4-addr>|<ipv6-addr>}`  
`no log host source`

Parameter	Description
<interface-name>	Specify the source interface name. You can enter a VLAN, eth interface or loopback interface.
<ipv4-addr>	Specify the source IPv4 address, in dotted decimal notation (A.B.C.D).
<ipv6-addr>	Specify the source IPv6 address, in X:X::X:X notation.

**Default** None (no source is configured)

**Mode** Global Configuration

**Example** To send syslog messages from 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# log host source 192.168.1.1
```

**Related Commands**

- [default log host](#)
- [log host](#)
- [log host \(filter\)](#)
- [log host exclude](#)
- [log host time](#)
- [show log config](#)

# log host startup-delay

**Overview** Use this command to set the delay between the device booting up and it attempting to connect to remote log hosts. This is to allow time for network connectivity to the remote host to be established. During this period, the device buffers log messages and sends them once it has connected to the remote host.

The startup delay begins when the message "syslog-ng starting up" appears in the log.

If the default startup delay is not long enough for the boot and configuration process to complete and the links to come up, you may see logging failure messages on startup. In these cases, you can use the command to increase the startup delay.

Use the **no** variant of this command to return to the default delay values.

**Syntax** `log host startup-delay [delay <1-600>] [messages <1-5000>]`  
`no log host startup-delay`

Parameter	Description
<code>delay &lt;1-600&gt;</code>	The time, in seconds, from when syslog starts before the device attempts to filter and transmit the buffered messages to remote hosts.
<code>messages &lt;1-5000&gt;</code>	The maximum number of messages that the device will buffer during the delay period.

**Default** By default the system will buffer up to 2000 messages and wait 120 seconds from when syslog starts before attempting to filter and transmit the buffered messages to remote hosts.

**Mode** Global Configuration

**Example** To increase the delay to 180 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# log host startup-delay delay 180
```

**Related Commands**

- [default log host](#)
- [log host \(filter\)](#)
- [log host exclude](#)
- [log host source](#)

- [log trustpoint](#)
- [show log config](#)

**Command changes** Version 5.4.8-0.2: defaults changed

# log host time

**Overview** This command configures the time used in messages sent to a remote syslog server. If the syslog server is in a different time zone to your device then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

**Syntax** `log host <email-address> time {local|local-offset|utc-offset {plus|minus} <0-24>}`

Parameter	Description
<code>&lt;email-address&gt;</code>	The email address to send log messages to
<code>time</code>	Specify the time difference between the email recipient and the device you are configuring.
<code>local</code>	The device is in the same time zone as the email recipient
<code>local-offset</code>	The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from local time of the device to the email recipient in hours.
<code>utc-offset</code>	The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from UTC time of the device to the email recipient in hours.
<code>plus</code>	Negative offset (difference) from the device to the syslog server.
<code>minus</code>	Positive offset (difference) from the device to the syslog server.
<code>&lt;0-24&gt;</code>	World Time zone offset in hours

**Default** The default is **local** time.

**Mode** Global Configuration

**Usage** Use the **local** option if the remote syslog server is in the same time zone as the device. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the remote syslog server in hours. Messages will display the time they were generated on this device but converted to the time zone of the remote syslog server.

**Examples** To send messages to the remote syslog server with the IP address 10.32.16.21 in the same time zone as the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 time local 0
```

To send messages to the remote syslog server with the IP address 10.32.16.12 with the time information converted to the time zone of the remote syslog server, which is 3 hours ahead of the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.12 time local-offset plus 3
```

To send messages to the remote syslog server with the IP address 10.32.16.02 with the time information converted to the time zone of the email recipient, which is 3 hours behind the device's UTC time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.02 time utc-offset minus 3
```

Commands**

[default log host](#)

[log host](#)

[log host \(filter\)](#)

[log host exclude](#)

[log host source](#)

[show log config](#)

# log monitor (filter)

**Overview** This command creates a filter to select messages to be sent to the terminal when the **terminal monitor** command is given. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

**Syntax** `log monitor [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log monitor [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

Parameter	Description
level	Filter messages by severity level.
<level>	The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:
0 emergencies	System is unusable
1 alerts	Action must be taken immediately
2 critical	Critical conditions
3 errors	Error conditions
4 warnings	Warning conditions
5 notices	Normal, but significant, conditions
6 informational	Informational messages
7 debugging	Debug-level messages
program	Filter messages by program. Include messages from a specified program.
<program-name>	The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.
rip	Routing Information Protocol (RIP)
ripng	Routing Information Protocol - next generation (RIPng)
ospf	Open Shortest Path First (OSPF)
ospfv3	Open Shortest Path First (OSPF) version 3 (OSPFv3)
bgp	Border Gateway Protocol (BGP)
rsvp	Resource Reservation Protocol (RSVP)
pim-dm	Protocol Independent Multicast - Dense Mode (PIM-DM)
pim-sm	Protocol Independent Multicast - Sparse Mode (PIM-SM)
pim-smv6	PIM-SM version 6 (PIM-SMv6)

Parameter	Description
dot1x	IEEE 802.1X Port-Based Access Control
lacp	Link Aggregation Control Protocol (LACP)
stp	Spanning Tree Protocol (STP)
rstp	Rapid Spanning Tree Protocol (RSTP)
mstp	Multiple Spanning Tree Protocol (MSTP)
imi	Integrated Management Interface (IMI)
imish	Integrated Management Interface Shell (IMISH)
epsr	Ethernet Protection Switched Rings (EPSR)
irdp	ICMP Router Discovery Protocol (IRDP)
rmon	Remote Monitoring
loopprot	Loop Protection
poe	Power-inline (Power over Ethernet)
dhcpcsn	DHCP snooping (DHPCPSN)
facility	Filter messages by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from:
kern	Kernel messages
user	Random user-level messages
mail	Mail system
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by syslogd
lpr	Line printer subsystem
news	Network news subsystem
uucp	UUCP subsystem
cron	Clock daemon
authpriv	Security/authorization messages (private)
ftp	FTP daemon
msgtext	Select messages containing a certain text string.
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

**Default** By default there is a filter to select all messages. This filter may be removed and replaced by filters that are more selective.

**Mode** Global Configuration

**Examples** To create a filter to send all messages that are generated by authentication and have a severity of **info** or higher to terminal instances where the terminal monitor command has been given, use the following commands:

```
awplus# configure terminal
awplus(config)# log monitor level info program auth
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the terminal, use the following commands:

```
awplus# configure terminal
awplus(config)# no log monitor level notices program epsr
```

To remove a default filter that includes sending everything to the terminal, use the following commands:

```
awplus# configure terminal
awplus(config)# no log monitor level debugging
```

**Related  
Commands**

- [default log monitor](#)
- [log monitor exclude](#)
- [show log config](#)
- [terminal monitor](#)

# log monitor exclude

**Overview** Use this command to prevent specified log messages from being displayed on a terminal, when **terminal monitor** is enabled. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`  
`no log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

Parameter	Description
level	Exclude messages of the specified severity level.
<level>	The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:
0 emergencies	System is unusable
1 alerts	Action must be taken immediately
2 critical	Critical conditions
3 errors	Error conditions
4 warnings	Warning conditions
5 notices	Normal, but significant, conditions
6 informational	Informational messages
7 debugging	Debug-level messages
program	Exclude messages from a specified program.
<program-name>	The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.
rip	Routing Information Protocol (RIP)
ripng	Routing Information Protocol - next generation (RIPng)
ospf	Open Shortest Path First (OSPF)
ospfv3	Open Shortest Path First (OSPF) version 3 (OSPFv3)

Parameter	Description
bgp	Border Gateway Protocol (BGP)
rsvp	Resource Reservation Protocol (RSVP)
pim-dm	Protocol Independent Multicast - Dense Mode (PIM-DM)
pim-sm	Protocol Independent Multicast - Sparse Mode (PIM-SM)
pim-smv6	PIM-SM version 6 (PIM-SMv6)
dot1x	IEEE 802.1X Port-Based Access Control
lacp	Link Aggregation Control Protocol (LACP)
stp	Spanning Tree Protocol (STP)
rstp	Rapid Spanning Tree Protocol (RSTP)
mstp	Multiple Spanning Tree Protocol (MSTP)
imi	Integrated Management Interface (IMI)
imish	Integrated Management Interface Shell (IMISH)
epsr	Ethernet Protection Switched Rings (EPSR)
irdp	ICMP Router Discovery Protocol (IRDP)
rmon	Remote Monitoring
loopprot	Loop Protection
poe	Power-inline (Power over Ethernet)
dhcpsn	DHCP snooping (DHCP SN)
facility	Exclude messages from a syslog facility.
<facility>	Specify one of the following syslog facilities to exclude messages from:
kern	Kernel messages
user	Random user-level messages
mail	Mail system
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by syslogd
lpr	Line printer subsystem
news	Network news subsystem
uucp	UUCP subsystem
cron	Clock daemon
authpriv	Security/authorization messages (private)
ftp	FTP daemon

Parameter	Description
msgtext	Exclude messages containing a certain text string.
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log monitor exclude msgtext example of
irrelevant message
```

**Related Commands**

- default log monitor
- log monitor (filter)
- show log config
- terminal monitor

# log permanent

**Overview** This command configures the device to send permanent log messages to non-volatile storage (NVS) on the device. The content of the permanent log is retained over a reboot. Once the permanent log reaches its configured maximum allowable size old messages will be deleted to make way for new messages.

The **no** variant of this command configures the device not to send any messages to the permanent log. Log messages will not be retained over a restart.

**Syntax** `log permanent`  
`no log permanent`

**Mode** Global Configuration

**Examples** To enable permanent logging use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent
```

To disable permanent logging use the following commands:

```
awplus# configure terminal
awplus(config)# no log permanent
```

**Related Commands**

- `clear log permanent`
- `copy permanent-log`
- `default log permanent`
- `log permanent (filter)`
- `log permanent exclude`
- `log permanent size`
- `show log config`
- `show log permanent`

# log permanent (filter)

**Overview** This command creates a filter to select messages to be sent to the permanent log. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the permanent log.

**Syntax** `log permanent [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`  
`no log permanent [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

Parameter	Description
level	Filter messages sent to the permanent log by severity level.
<level>	The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:
0 emergencies	System is unusable
1 alerts	Action must be taken immediately
2 critical	Critical conditions
3 errors	Error conditions
4 warnings	Warning conditions
5 notices	Normal, but significant, conditions
6 informational	Informational messages
7 debugging	Debug-level messages
program	Filter messages by program. Include messages from a specified program.
<program-name>	The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.
rip	Routing Information Protocol (RIP)
ripng	Routing Information Protocol - next generation (RIPng)
ospf	Open Shortest Path First (OSPF)
ospfv3	Open Shortest Path First (OSPF) version 3 (OSPFv3)
bgp	Border Gateway Protocol (BGP)
rsvp	Resource Reservation Protocol (RSVP)
pim-dm	Protocol Independent Multicast - Dense Mode (PIM-DM)
pim-sm	Protocol Independent Multicast - Sparse Mode (PIM-SM)

Parameter	Description
pim-smv6	PIM-SM version 6 (PIM-SMv6)
dot1x	IEEE 802.1X Port-Based Access Control
lacp	Link Aggregation Control Protocol (LACP)
stp	Spanning Tree Protocol (STP)
rstp	Rapid Spanning Tree Protocol (RSTP)
mstp	Multiple Spanning Tree Protocol (MSTP)
imi	Integrated Management Interface (IMI)
imish	Integrated Management Interface Shell (IMISH)
epsr	Ethernet Protection Switched Rings (EPSR)
irdp	ICMP Router Discovery Protocol (IRDP)
rmon	Remote Monitoring
loopprot	Loop Protection
poe	Power-inline (Power over Ethernet)
dhcpsn	DHCP snooping (DHCP SN)
facility	Filter messages by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from:
kern	Kernel messages
user	Random user-level messages
mail	Mail system
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by syslogd
lpr	Line printer subsystem
news	Network news subsystem
uucp	UUCP subsystem
cron	Clock daemon
authpriv	Security/authorization messages (private)
ftp	FTP daemon
msgtext	Select messages containing a certain text string.
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

**Default** By default the buffered log has a filter to select messages whose severity level is `notices` (5) or higher. This filter may be removed using the **no** variant of this command.

**Mode** Global Configuration

**Examples** To create a filter to send all messages generated by EPSR that have a severity of notices or higher to the permanent log use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent level notices program epsr
```

To create a filter to send all messages containing the text "Bridging initialization", to the permanent log use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent msgtext Bridging initialization
```

**Related Commands**

- clear log permanent
- default log permanent
- log permanent
- log permanent exclude
- log permanent size
- show log config
- show log permanent

# log permanent exclude

**Overview** Use this command to prevent specified log messages from being sent to the permanent log. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log permanent exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log permanent exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

Parameter	Description
level	Exclude messages of the specified severity level.
<level>	The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:
0 emergencies	System is unusable
1 alerts	Action must be taken immediately
2 critical	Critical conditions
3 errors	Error conditions
4 warnings	Warning conditions
5 notices	Normal, but significant, conditions
6 informational	Informational messages
7 debugging	Debug-level messages
program	Exclude messages from a specified program.
<program-name>	The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.
rip	Routing Information Protocol (RIP)
ripng	Routing Information Protocol - next generation (RIPng)
ospf	Open Shortest Path First (OSPF)

rmon	Remote Monitoring
loopprot	Loop Protection
poe	Power-inline (Power over Ethernet)
dhcpsn	DHCP snooping (DHPCPSN)
facility	Exclude messages from a syslog facility.
<facility>	Specify one of the following syslog facilities to exclude messages from:
kern	Kernel messages
user	Random user-level messages
mail	Mail system
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by syslogd
lpr	Line printer subsystem
news	Network news subsystem
uucp	UUCP subsystem
cron	Clock daemon
authpriv	Security/authorization messages (private)
ftp	FTP daemon
msgtext	Exclude messages containing a certain text string.
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent exclude msgtext example of
irrelevant message
```

**Related  
Commands**

- clear log permanent
- default log permanent
- log permanent
- log permanent (filter)
- log permanent size
- show log config
- show log permanent

# log permanent size

**Overview** This command configures the amount of memory that the permanent log is permitted to use. Once this memory allocation has been filled old messages will be deleted to make room for new messages.

**Syntax** `log permanent size <50-250>`

Parameter	Description
<50-250>	Size of the permanent log in kilobytes

**Mode** Global Configuration

**Example** To allow the permanent log to use up to 100 kB of NVS use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent size 100
```

**Related Commands**

- [clear log permanent](#)
- [copy permanent-log](#)
- [default log permanent](#)
- [log permanent](#)
- [log permanent \(filter\)](#)
- [log permanent exclude](#)
- [show log config](#)
- [show log permanent](#)

# log-rate-limit nsm

**Overview** This command limits the number of log messages generated by the device for a given interval.

Use the **no** variant of this command to revert to the default number of log messages generated by the device of up to 200 log messages per second.

**Syntax** `log-rate-limit nsm messages <message-limit> interval <time-interval>`  
`no log-rate-limit nsm`

Parameter	Description
<code>&lt;message-limit&gt;</code>	<code>&lt;1-65535&gt;</code> The number of log messages generated by the device.
<code>&lt;time-interval&gt;</code>	<code>&lt;0-65535&gt;</code> The time period for log message generation in 1/100 seconds. If an interval of 0 is specified then no log message rate limiting is applied.

**Default** By default, the device will allow 200 log messages to be generated per second.

**Mode** Global Configuration

**Usage** This log rate limiting feature constrains the rate that log messages are generated by the device. This makes sure that the device does not run out of memory from generating a lot of log messages in extreme circumstances, such as if a packet storm occurs.

Note that if within the given time interval, the number of log messages exceeds the limit, then any excess log messages are discarded. At the end of the time interval, a single log message is generated indicating that log messages were discarded due to the log rate limit being exceeded.

If you expect that there will be a lot of discarded log messages due to log rate limiting, then we recommend setting the time interval to no less than 100, which means that there would only be one log message, indicating excessive log messages have been discarded.

**Examples** To limit the device to generate up to 300 log messages per second, use the following commands:

```
awplus# configure terminal
awplus(config)# log-rate-limit nsm messages 300 interval 100
```

To return the device the default setting, to generate up to 200 log messages per second, use the following commands:

```
awplus# configure terminal
awplus(config)# no log-rate-limit nsm
```

# log trustpoint

**Overview** This command adds one or more trustpoints to be used with the syslog application. Multiple trustpoints may be specified, or the command may be executed multiple times, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** `log trustpoint [<trustpoint-list>]`  
`no log trustpoint [<trustpoint-list>]`

Parameter	Description
<trustpoint-list>	Specify one or more trustpoints to be added or deleted.

**Default** No trustpoints are created by default.

**Mode** Global Configuration

**Usage** The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no log trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# log trustpoint trustpoint_1
awplus(config)# log trustpoint trustpoint_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config)# log trustpoint trustpoint_2 trustpoint_3
```

Disassociate all trustpoints from the syslog application using the command:

```
awplus(config)# no log trustpoint trustpoint_2 trustpoint_3
```

**Related Commands** [log host](#)  
[show log config](#)

# show counter log

**Overview** This command displays log counter information.

**Syntax** show counter log

**Mode** User Exec and Privileged Exec

**Example** To display the log counter information, use the command:

```
awplus# show counter log
```

**Output** Figure 10-1: Example output from the **show counter log** command

```
Log counters
Total Received          ..... 2328
Total Received P0      ..... 0
Total Received P1      ..... 0
Total Received P2      ..... 1
Total Received P3      ..... 9
Total Received P4      ..... 32
Total Received P5      ..... 312
Total Received P6      ..... 1602
Total Received P7      ..... 372
```

**Table 11:** Parameters in output of the **show counter log** command

Parameter	Description
Total Received	Total number of messages received by the log
Total Received P0	Total number of Priority 0 (Emergency) messages received
Total Received P1	Total number of Priority 1 (Alert) messages received
Total Received P2	Total number of Priority 2 (Critical) messages received
Total Received P3	Total number of Priority 3 (Error) messages received
Total Received P4	Total number of Priority 4 (Warning) messages received
Total Received P5	Total number of Priority 5 (Notice) messages received
Total Received P6	Total number of Priority 6 (Info) messages received
Total Received P7	Total number of Priority 7 (Debug) messages received

**Related Commands** [show log config](#)

# show exception log

**Overview** This command displays the contents of the exception log.

**Syntax** show exception log

**Mode** User Exec and Privileged Exec

**Example** To display the exception log, use the command:

```
awplus# show exception log
```

**Output** Figure 10-2: Example output from the **show exception log** command on a device

```
awplus#show exception log

Stack member 1:

<date> <time> <facility>.<severity> <program[<pid>]>: <message>

# show log

**Overview** This command displays the contents of the buffered log.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show log [tail [<10-250>]]`

Parameter	Description
tail	Display only the latest log entries.
<10-250>	Specify the number of log entries to display.

**Default** By default the entire contents of the buffered log is displayed.

**Mode** User Exec, Privileged Exec and Global Configuration

**Usage** If the optional **tail** parameter is specified, only the latest 10 messages in the buffered log are displayed. A numerical value can be specified after the **tail** parameter to select how many of the latest messages should be displayed.

The **show log** command is only available to users at privilege level 7 and above. To set a user’s privilege level, use the command:

```
awplus(config)# username <name> privilege <1-15>
```

**Examples** To display the contents of the buffered log use the command:

```
awplus# show log
```

To display the 10 latest entries in the buffered log use the command:

```
awplus# show log tail 10
```

**Output** Figure 10-4: Example output from **show log**

```
awplus#show log

<date> <time> <facility>.<severity> <program[<pid>]>: <message>

# show log config

**Overview** This command displays information about the logging system. This includes the configuration of the various log destinations, such as buffered, permanent, syslog servers (hosts) and email addresses. This also displays the latest status information for each log destination.

**Syntax** `show log config`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the logging configuration use the command:

```
awplus# show log config
```

**Output** Figure 10-5: Example output from **show log config**

```
Facility: default
PKI trustpoints: example_trustpoint

Buffered log:
Status ..... enabled
Maximum size ... 100kb
Filters:
*1 Level ..... notices
  Program ..... any
  Facility ..... any
  Message text . any
  2 Level ..... informational
  Program ..... auth
  Facility ..... daemon
  Message text . any
  Statistics .... 1327 messages received, 821 accepted by filter (2016 Oct 11
10:36:16)
Permanent log:
Status ..... enabled
Maximum size ... 60kb
Filters:
  1 Level ..... error
  Program ..... any
  Facility ..... any
  Message text . any
*2 Level ..... warnings
  Program ..... dhcp
  Facility ..... any
  Message text . "pool exhausted"
  Statistics .... 1327 messages received, 12 accepted by filter (2016 Oct 11
10:36:16)
```

```
Host 10.32.16.21:
  Time offset .... +2:00
  Offset type .... UTC
  Source ..... -
  Secured ..... enabled
  Filters:
  1 Level ..... critical
    Program ..... any
    Facility ..... any
    Message text . any
  Statistics ..... 1327 messages received, 1 accepted by filter (2016 Oct 11
10:36:16)
Email admin@alliedtelesis.com:
  Time offset .... +0:00
  Offset type .... Local
  Filters:
  1 Level ..... emergencies
    Program ..... any
    Facility ..... any
    Message text . any
  Statistics ..... 1327 messages received, 0 accepted by filter (2016 Oct 11
10:36:16)
...
```

In the above example the '\*' next to filter 1 in the buffered log configuration indicates that this is the default filter. The permanent log has had its default filter removed, so none of the filters are marked with '\*'.

**NOTE:** Terminal log and console log cannot be set at the same time. If console logging is enabled then the terminal logging is turned off.

Commands**

- [show counter log](#)
- [show log](#)
- [show log permanent](#)

# show log external

**Overview** Use this command to display the contents of the external log, which is stored on a USB storage device.

**Syntax** `show log external [tail [<10-250>]]`

Parameter	Description
tail	Display only the latest log entries.
<10-250>	Specify the number of log entries to display.

**Mode** Global Configuration

Privileged Exec

User Exec

**Usage** If the optional **tail** parameter is specified, only the latest 10 messages in the permanent log are displayed. A numerical value can be specified after the **tail** parameter to change how many of the latest messages should be displayed.

**Example** To display the last 5 entries in the external log, use the command:

```
awplus# show log external tail 5
```

# show log permanent

**Overview** This command displays the contents of the permanent log.

**Syntax** show log permanent [*<stack-ID>*] [tail [*<10-250>*]]

Parameter	Description
<i>&lt;stack-ID&gt;</i>	Stack member number, from 1 to 8.
tail	Display only the latest log entries.
<i>&lt;10-250&gt;</i>	Specify the number of log entries to display.

**Usage** If the optional **tail** parameter is specified only, the latest 10 messages in the permanent log are displayed. A numerical value can be specified after the **tail** parameter to change how many of the latest messages should be displayed.

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the permanent log of stack member 2, use the command:

```
awplus# show log permanent 2
```

**Output** Figure 10-6: Example output from **show log permanent**

```
awplus#show log permanent 2

Stack member 2:

show log config

# show running-config log

**Overview** This command displays the current running configuration of the Log utility.

**Syntax** `show running-config log`

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of the log utility, use the command:

```
awplus# show running-config log
```

**Related  
Commands** [show log](#)  
[show log config](#)

# unmount

**Overview** Use this command to unmount an external storage device. We recommend you unmount storage devices before removing them, to avoid file corruption. This is especially important if files may be automatically written to the storage device, such as external log files or AMF backup files.

**Syntax** `unmount usb`  
`unmount usb member [<stack-ID>]`

Parameter	Description
<code>usb</code>	Unmount the USB storage device.
<code>member &lt;stack-ID&gt;</code>	Stack member number, from 1 to 8.

**Mode** Privileged Exec

**Example** To unmount a USB storage device and safely remove it from the device, use the command:

```
awplus# unmount usb
```

# 11

# Scripting Commands

## Introduction

**Overview** This chapter provides commands used for command scripts.

- Command List**
- [“activate”](#) on page 509
  - [“echo”](#) on page 511
  - [“wait”](#) on page 512

# activate

**Overview** This command activates a script file.

**Syntax** activate [background] <script>

Parameter	Description
background	Activate a script to run in the background. A process that is running in the background will operate as a separate task, and will not interrupt foreground processing. Generally, we recommend running short, interactive scripts in the foreground and longer scripts in the background. The default is to run the script in the foreground.
<script>	The file name of the script to activate. The script is a command script consisting of commands documented in this software reference. Note that you must use either a <b>.scp</b> or a <b>.sh</b> filename extension for a valid script text file, as described below in the usage section for this command.

**Mode** Privileged Exec

**Usage** In a stacked environment you can use the CLI on a stack master to access file systems that are located on a stack backup member. In this case the command specifies a file on the backup member. The stack member's file system will be denoted by: <hostname>- <member-id> For example, **awplus-1** for member 1, **awplus-2** for member 2.

When a script is activated, the privilege level is set to 1 enabling User Exec commands to run in the script. If you need to run Privileged Exec commands in your script you need to add an [enable \(Privileged Exec mode\)](#) command to the start of your script. If you need to run Global Configuration commands in your script you need to add a [configure terminal](#) command after the **enable** command at the start of your script.

The **activate** command executes the script in a new shell. A [terminal length](#) shell command, such as **terminal length 0** may also be required to disable a delay that would pause the display.

A script must be a text file with a filename extension of either **.sh** or **.scp** only for the AlliedWare Plus™ CLI to activate the script file. The **.sh** filename extension indicates the file is an ASH script, and the **.scp** filename extension indicates the file is an AlliedWare Plus™ script.

**Examples** To activate a command script to run as a background process, use the command:

```
awplus# activate background test.scp
```

To activate a script named "/flash:/test.scp" on stack member 2, use the command:

```
awplus-2# activate awplus-2/flash:/test.scp
```

**Related  
Commands**    configure terminal  
                  echo  
                  enable (Privileged Exec mode)  
                  wait

# echo

**Overview** This command echoes a string to the terminal, followed by a blank line.

**Syntax** `echo <line>`

Parameter	Description
<code>&lt;line&gt;</code>	The string to echo

**Mode** User Exec and Privileged Exec

**Usage** This command may be useful in CLI scripts, to make the script print user-visible comments.

**Example** To echo the string `Hello World` to the console, use the command:

```
awplus# echo Hello World
```

## Output

```
Hello World
```

**Related  
Commands** [activate](#)  
[wait](#)

# wait

**Overview** This command pauses execution of the active script for the specified period of time.

**Syntax** `wait <delay>`

Parameter	Description
<code>&lt;delay&gt;</code>	<code>&lt;1-65335&gt;</code> Specify the time delay in seconds

**Default** No wait delay is specified by default.

**Mode** Privileged Exec (when executed from a script not directly from the command line)

**Usage** Use this command to pause script execution in an **.scp** (AlliedWare Plus™ script) or an **.sh** (ASH script) file executed by the [activate](#) command. The script must contain an **enable** command, because the **wait** command is only executed in the Privileged Exec mode.

**Example** See an **.scp** script file extract below that will show port counters for interface port1.1.2 over a 10 second interval:

```
enable

show interface port1.1.2

wait 10

show interface port1.1.2
```

**Related Commands**

- [activate](#)
- [echo](#)
- [enable \(Privileged Exec mode\)](#)

# 12

# Interface Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure and display interfaces.

- Command List**
- “[description \(interface\)](#)” on page 514
  - “[interface \(to configure\)](#)” on page 515
  - “[mru](#)” on page 517
  - “[mtu](#)” on page 518
  - “[service statistics interfaces counter](#)” on page 520
  - “[show interface](#)” on page 521
  - “[show interface brief](#)” on page 524
  - “[show interface memory](#)” on page 525
  - “[show interface status](#)” on page 527
  - “[shutdown](#)” on page 530

# description (interface)

**Overview** Use this command to add a description to a specific port or interface.

**Syntax** `description <description>`

Parameter	Description
<code>&lt;description&gt;</code>	Text describing the specific interface. Descriptions can contain any printable ASCII characters (ASCII 32-126).

**Mode** Interface Configuration

**Example** The following example uses this command to describe the device that a switch port is connected to.

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# description Boardroom PC
```

**Command changes** Version 5.4.7-1.1: valid character set changed to printable ASCII characters

# interface (to configure)

**Overview** Use this command to select one or more interfaces to configure.

**Syntax** `interface <interface-list>`  
`interface lo`

Parameter	Description
<code>&lt;interface-list&gt;</code>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"><li>• an interface such as a VLAN (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.1.12</code>), a static channel group (e.g. <code>sa3</code>) or a dynamic (LACP) channel group (e.g. <code>po4</code>)</li><li>• a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.1.1-1.1.24</code>, or <code>sa2-4</code>, or <code>po1-3</code></li><li>• a comma-separated list of the above; e.g. <code>port1.1.1, port1.1.8-1.1.24</code>. Do not mix interface types in a list</li></ul> <p>The specified interfaces must exist.</p>
<code>lo</code>	The local loopback interface.

**Usage** A local loopback interface is one that is always available for higher layer protocols to use and advertise to the network. Although a local loopback interface is assigned an IP address, it does not have the usual requirement of connecting to a lower layer physical entity. This lack of physical attachment creates the perception of a local loopback interface always being accessible via the network.

Local loopback interfaces can be utilized by a number of protocols for various purposes. They can be used to improve access to the device and also increase its reliability, security, scalability and protection. In addition, local loopback interfaces can add flexibility and simplify management, information gathering and filtering.

One example of this increased reliability is for OSPF to advertise a local loopback interface as an interface-route into the network irrespective of the physical links that may be “up” or “down” at the time. This provides a higher probability that the routing traffic will be received and subsequently forwarded.

**Mode** Global Configuration

**Example** The following example shows how to enter Interface mode to configure `vlan1`. Note how the prompt changes.

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)#
```

The following example shows how to enter Interface mode to configure the local loopback interface.

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)#
```

**Related  
Commands**

- [ip address \(IP Addressing and Protocol\)](#)
- [show interface](#)
- [show interface brief](#)

# mru

**Overview** Use this command to set the Maximum Receive Unit (MRU) size for switch ports, where MRU is the maximum frame size (excluding headers) that switch ports can receive. For more information, see the [Switching Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to remove a previously specified Maximum Receive Unit (MRU) size for switch ports, and restore the default MRU size (1500 bytes) for switch ports.

**NOTE:** The MRU sizes specify the payload only. For an IEEE 802.1q frame, provision is made (internally) for the following additional components:

- Source and Destination addresses
- EtherType field
- Priority and VLAN tag fields
- FCS

These additional components increase the frame size internally by 22 bytes. For example, the default frame size is 1522 bytes, including headers.

**Syntax** `mru <mru-size>`  
`no mru`

Parameter	Description
<code>&lt;mru-size&gt;</code>	68-9394. This value specifies the Maximum Receive Unit (MRU) size in bytes, where 1500 bytes is the default Ethernet MRU size for an interface.

**Default** The default MRU size is 1500 bytes for switch ports.

**Mode** Interface Configuration for switch ports.

**Examples** To configure an MRU of 9394 bytes on port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# mru 9394
```

To restore the MRU default size of 1500 bytes on port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no mru
```

**Related Commands** [show interface](#)

# mtu

**Overview** Use this command to set the Maximum Transmission Unit (MTU) size for interfaces, where MTU is the maximum packet size that interfaces can transmit. The MTU size setting is applied to both IPv4 and IPv6 packet transmission.

Use the **no** variant of this command to remove a previously specified Maximum Transmission Unit (MTU) size, and restore the default MTU size. For example the VLAN interface default is 1500 bytes.

**Syntax** `mtu <68-1582>`  
`no mtu`

**Default** The default MTU size, for example 1500 bytes for VLAN interfaces.

**Mode** Interface Configuration

**Usage** If a device receives an IPv4 packet for Layer 3 switching to another interface with an MTU size smaller than the packet size, and if the packet has the **'don't fragment'** bit set, then the device will send an ICMP **'destination unreachable'** (3) packet type and a **'fragmentation needed and DF set'** (4) code back to the source. For IPv6 packets bigger than the MTU size of the transmitting interface, an ICMP **'packet too big'** (ICMP type 2 code 0) message is sent to the source.

Note that `show interface` output will only show MTU size for VLAN interfaces.

**Examples** To configure an MTU size of 1500 bytes on interface "vlan2", use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# mtu 1500
```

To configure an MTU size of 1500 bytes on interfaces "vlan2" to "vlan4", use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# mtu 1500
```

To restore the MTU size to the default MTU size of 1500 bytes on "vlan2", use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no mtu
```

To restore the MTU size to the default MTU size of 1500 bytes on "vlan2" to "vlan4", use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no mtu
```

**Related  
Commands** [show interface](#)

# service statistics interfaces counter

**Overview** Use this command to enable the interface statistics counter.  
Use the **no** variant of this command to disable the interface statistics counter.

**Syntax** `service statistics interfaces counter`  
`no service statistics interfaces counter`

**Default** The interface statistics counter is enabled by default.

**Mode** Global Configuration

**Example** To enable the interface statistics counter, use the following commands:

```
awplus# configure terminal  
awplus(config)# service statistics interfaces counter
```

To disable the interface statistics counter, use the following commands:

```
awplus# configure terminal  
awplus(config)# no service statistics interfaces counter
```

**Command changes** Version 5.4.7-2.1: command added

# show interface

**Overview** Use this command to display interface configuration and status.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show interface [<interface-list>]`  
`show interface lo`

Parameter	Description
<code>&lt;interface-list&gt;</code>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"><li>• an interface such as a VLAN (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.1.12</code>), a static channel group (e.g. <code>sa3</code>) or a dynamic (LACP) channel group (e.g. <code>po4</code>)</li><li>• a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.1.1-1.1.24</code>, or <code>sa2-4</code>, or <code>po1-3</code></li><li>• a comma-separated list of the above; e.g. <code>port1.1.1,port1.1.8-1.1.24</code>. Do not mix interface types in a list</li></ul> <p>The specified interfaces must exist.</p>
<code>lo</code>	The local loopback interface.

**Mode** User Exec and Privileged Exec

**Usage** Note that the output displayed with this command will show MTU (Maximum Transmission Unit) size for VLAN interfaces, and MRU (Maximum Received Unit) size for switch ports.

**Example** To display configuration and status information for all interfaces, use the command:

```
awplus# show interface
```

Figure 12-1: Example output from the **show interface** command

```
awplus#show interface
Interface port1.1.1
  Link is DOWN, administrative state is UP
  Thrash-limiting
    Status Not Detected, Action learn-disable, Timeout 1(s)
  Hardware is Ethernet, address is eccd.6d03.1123
  index 5001 metric 1 mru 1522
  configured duplex auto, configured speed auto, configured polarity auto
  <UP,BROADCAST,MULTICAST>
  current duplex half, current speed 100
  configured duplex auto, configured speed auto, configured polarity auto
  current ecofriendly lpi
  configured ecofriendly lpi
  SNMP link-status traps: Disabled
    input packets 1328, bytes 143605, dropped 0, multicast packets 0
    output packets 1847, bytes 218999, multicast packets 1 broadcast packets 3
  input average rate : 30 seconds 3.00 Kbps, 5 minutes 1.02 Kbps
  output average rate: 30 seconds 5.32 Kbps, 5 minutes 2.06 Kbps
  input peak rate 8.19 Kbps at 2017/11/13 05:09:59
  output peak rate 17.05 Kbps at 2017/11/13 05:11:23
  Time since last state change: 0 days 16:35:52
...
```

To display configuration and status information for interface `lo`, use the command:

```
awplus# show interface lo
```

Figure 12-2: Example output from the **show interface lo** command

```
awplus#show interface lo
Interface lo
  Scope: both
  Link is UP, administrative state is UP
  Hardware is Loopback
  index 1 metric 1
  <UP,LOOPBACK,RUNNING>
  SNMP link-status traps: Disabled
  Router Advertisement is disabled

  Router Advertisement is disabled
  Router Advertisement default routes are accepted
  Router Advertisement prefix info is accepted
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0, broadcast packets 0
  Time since last state change: 8 days 19:55:46
```

**Related Commands** [ecofriendly lpi](#)  
[mtu](#)  
[show interface brief](#)

**Command changes** Version 5.4.7-2.1: average rate and peak rate added to output

# show interface brief

**Overview** Use this command to display brief interface, configuration, and status information, including provisioning information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show interface brief`

**Mode** User Exec and Privileged Exec

**Output** Figure 12-4: Example output from **show interface brief**

```
awplus#show int brief
Interface          Status           Protocol
port1.1.1          admin up         down
port1.1.2          admin up         down
port1.1.3          admin up         down
port1.1.4          admin up         down
.
.
port1.2.23         admin up         provisioned
port1.2.24         admin up         provisioned
eth0               admin up         running
lo                 admin up         running
vlan1              admin up         down
vlan2              admin up         down
```

Table 12-1: Parameters in the output of **show interface brief**

Parameter	Description
Interface	The name or type of interface.
Status	The administrative state. This can be either <b>admin up</b> or <b>admin down</b> .
Protocol	The link state. This can be either <b>down</b> , <b>running</b> , or <b>provisioned</b> .

**Related Commands** [show interface](#)  
[show interface memory](#)

# show interface memory

**Overview** This command displays the shared memory used by either all interfaces, or the specified interface or interfaces. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show interface memory`  
`show interface <port-list> memory`

Parameter	Description
<code>&lt;port-list&gt;</code>	The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.2.12), a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po3)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.1.1-1.1.12, or sa1-2, or po1-4)</li><li>• a comma-separated list of ports and port ranges (e.g. port1.1.1,port1.1.4-1.2.12). Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list.</li></ul>

**Mode** User Exec and Privileged Exec

**Example** To display the shared memory used by all interfaces, use the command:

```
awplus# show interface memory
```

To display the shared memory used by port1.1.1 and port1.1.5 to port1.1.8, use the command:

```
awplus# show interface port1.1.1,port1.1.5-1.1.8 memory
```

**Output** Figure 12-5: Example output from the **show interface memory** command

```
awplus#show interface memory

  - [show interface status](#)
  - [show interface switchport](#)

# show interface status

**Overview** Use this command to display the status of the specified interface or interfaces. Note that when no interface or interfaces are specified then the status of all interfaces on the device are shown.

**Syntax** `show interface [<port-list>] status`

Parameter	Description
<port-list>	The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.2.12), a static channel group (e.g. sa3) or a dynamic (LACP) channel group (e.g. po3)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.1.1-1.1.24, or sa1-2, or po1-4</li><li>• a comma-separated list of ports and port ranges, e.g. port1.1.1,port1.1.4-1.2.24. Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list</li></ul>

**Examples** To display the status of ports 1.1.1 to 1.1.5, use the commands:

```
awplus# show interface port1.1.1-1.1.5 status
```

**Table 13:** Example output from the **show interface <port-list> status** command

```
awplus#show interface port1.1.1-1.1.5 status
```

Port	Name	Status	Vlan	Duplex	Speed	Type
port1.1.1		notconnect	1	auto	auto	1000BASE-T
port1.1.2		notconnect	1	auto	auto	1000BASE-T
port1.1.3		notconnect	1	auto	auto	1000BASE-T
port1.1.4		notconnect	1	auto	auto	1000BASE-T
port1.1.5		notconnect	1	auto	auto	1000BASE-T

To display the status of all ports, use the commands:

```
awplus# show interface status
```

**Table 14:** Example output from the **show interface status** command

```
awplus#sho int status
Port      Name              Status            Vlan Duplex  Speed Type
port1.1.1              notconnect        1 auto    auto
port1.1.2              notconnect        1 auto    auto
port1.1.3              notconnect        1 auto    auto
port1.1.4              notconnect        1 auto    auto
port1.2.1              notconnect        1 auto    auto
port1.2.2              notconnect        1 auto    auto
port1.2.3              notconnect        1 auto    auto
port1.2.4              notconnect        1 auto    auto
port1.2.5              notconnect        1 auto    auto
port1.2.6              notconnect        1 auto    auto
port1.2.7              notconnect        1 auto    auto
port1.2.8              notconnect        1 auto    auto
.
.
port1.4.23             provisioned        1 auto    auto
port1.4.24             provisioned        1 auto    auto
eth0                  connected         none a-full a-100 1000BASE-T
```

**Table 15:** Parameters in the output from the **show interface status** command

Parameter	Description
Port	Name/Type of the interface.
Name	Description of the interface.
Status	The administrative and operational status of the interface; one of: <ul style="list-style-type: none"> <li>disabled: the interface is administratively down.</li> <li>connect: the interface is operationally up.</li> <li>notconnect: the interface is operationally down.</li> </ul>
Vlan	VLAN type or VLAN IDs associated with the port: <ul style="list-style-type: none"> <li>When the VLAN mode is trunk, it displays <b>trunk</b> (it does not display the VLAN IDs).</li> <li>When the VLAN mode is access, it displays the VLAN ID.</li> <li>When the VLAN mode is private promiscuous, it displays the primary VLAN ID if it has one, and <b>promiscuous</b> if it does not have a VLAN ID.</li> <li>When the VLAN mode is private host, it displays the primary and secondary VLAN IDs.</li> <li>When the port is an Eth port, it displays <b>none</b>: there is no VLAN associated with it.</li> <li>When the VLAN is dynamically assigned, it displays the current dynamically assigned VLAN ID (not the access VLAN ID), or <b>dynamic</b> if it has multiple VLANs dynamically assigned.</li> </ul>

**Table 15:** Parameters in the output from the **show interface status** command

Parameter	Description
Duplex	The actual duplex mode of the interface, preceded by <b>a-</b> if it has autonegotiated this duplex mode. If the port is disabled or not connected, it displays the configured duplex setting.
Speed	The actual link speed of the interface, preceded by <b>a-</b> if it has autonegotiated this speed. If the port is disabled or not connected, it displays the configured speed setting.
Type	The type of interface, e.g. 1000BaseTX. For SFP bays, it displays <b>Unknown</b> if it does not recognize the type of SFP installed, or <b>Not present</b> if an SFP is not installed or is faulty.

**Related Commands** [show interface](#)  
[show interface memory](#)

# shutdown

**Overview** This command shuts down the selected interface. This administratively disables the link and takes the link down at the physical (electrical) layer.

Use the **no** variant of this command to disable this function and therefore to bring the link back up again.

**Syntax** shutdown  
no shutdown

**Mode** Interface Configuration

**Usage** If you shutdown an aggregator, the device shows the admin status of the aggregator and its component ports as “admin down”. While the aggregator is down, the device accepts **shutdown** and **no shutdown** commands on component ports, but these have no effect on port status. Ports will not come up again while the aggregator is down.

**Example** To shut down port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# shutdown
```

To bring up port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no shutdown
```

To shut down vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# shutdown
```

To bring up vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no shutdown
```

# Port Mirroring and Remote Mirroring Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Port Mirroring and Remote Mirroring (also known as RSPAN).

For more information, see the [Mirroring Feature Overview and Configuration Guide](#).

- Command List**
- [“mirror interface”](#) on page 532
  - [“remote-mirror interface”](#) on page 534
  - [“show mirror”](#) on page 536
  - [“show mirror interface”](#) on page 537
  - [“show remote-mirror”](#) on page 538
  - [“switchport remote-mirror-egress”](#) on page 540
  - [“vlan mode remote-mirror-vlan”](#) on page 541

# mirror interface

**Overview** Use this command to define a mirror port and mirrored (monitored) ports and direction of traffic to be mirrored. The port for which you enter interface mode will be the mirror port.

The destination port is removed from all VLANs, and no longer participates in other switching.

Use the **no** variant of this command to disable port mirroring by the destination port on the specified source port.

Use the **none** variant of this command when using copy-to-mirror ACL and QoS commands.

**Syntax**

```
mirror interface <source-port-list> direction
{both|receive|transmit}

mirror interface none

no mirror interface <source-port-list>

no mirror interface none
```

Parameter	Description
<source-port-list>	The source switch ports to mirror. A port-list can be: <ul style="list-style-type: none"> <li>a port (e.g. port1.1.2)</li> <li>a continuous range of ports separated by a hyphen, e.g. port1.1.1-port1.1.3</li> <li>a comma-separated list of ports and port ranges, e.g. port1.1.1,port1.1.2-port1.1.4</li> </ul> The source port list cannot include dynamic or static channel groups (link aggregators).
direction	Specifies whether to mirror traffic that the source port receives, transmits, or both.
both	Mirroring traffic both received and transmitted by the source port.
receive	Mirroring traffic received by the source port.
transmit	Mirroring traffic transmitted by the source port.
none	Specify this parameter for use with the <b>copy-to-mirror</b> parameter of: <ul style="list-style-type: none"> <li>the ACL (Access Control List) <b>access-list</b> and <b>ipv6 access-list</b> commands or</li> <li>the QoS (Quality of Service) <b>default action</b> command.</li> </ul> The <b>none</b> parameter lets you specify the destination port (the analyzer port) for the traffic without specifying a source mirror port.

**Mode** Interface Configuration

**Usage** Use this command to send traffic to another device connected to the mirror port for monitoring.

For more information, see the [Mirroring Feature Overview and Configuration Guide](#).

A mirror port cannot be associated with a VLAN. If a switch port is configured to be a mirror port, it is automatically removed from any VLAN it was associated with.

This command can only be applied to a single mirror (destination) port, not to a range of ports, nor to a static or dynamic channel group. Do not apply multiple interfaces with an interface command before issuing the mirror interface command. One interface may have multiple mirror interfaces.

Access control lists can be used to mirror a subset of traffic from the mirrored port by using the copy-to-mirror parameter in hardware ACL commands.

**NOTE:** *A port cannot be configured as a mirror or mirrored port, if it is already configured for sFlow monitoring.*

**Example** To mirror traffic received and transmitted on port1.1.1 to destination port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# mirror interface port1.1.1 direction both
```

To enable use with the [access-list \(numbered hardware ACL for IP packets\)](#) ACL and [default-action](#) QoS commands to destination port1.1.1 without specifying a source port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# mirror interface none
```

To mirror all received or transmitted TCP traffic to analyzer port1.1.1, use the sample configuration snippet below:

```
awplus#show running-config

mls qos enable
access-list 3000 copy-to-mirror tcp any any
access-group 3000
!
interface port1.1.1
 mirror interface none
```

**Related Commands**

[access-list \(numbered hardware ACL for IP packets\)](#)

[access-list \(numbered hardware ACL for MAC addresses\)](#)

[default-action](#)

[ipv6 access-list \(named IPv6 hardware ACL\)](#)

# remote-mirror interface

**Overview** Use this command on the source device to specify the source port whose traffic is to be remote-mirrored (monitored), and the remote mirroring VLAN ID these mirrored frames will be tagged with when they egress from the source device. The port for which Interface Configuration mode is entered is the port via which the mirrored traffic egresses the source device towards the remote destination device.

Use the **no** variant of this command to disable remote mirroring of the specified mirrored port by the egress (destination) port on the source device.

**Syntax**

```
remote-mirror interface <port-list> direction  
{both|receive|transmit} vlan <2-4090> [priority <0-7>]  
  
remote-mirror interface none vlan <2-4090> [priority <0-7>]  
  
no remote-mirror interface <port-list> [direction  
{receive|transmit}]  
  
no remote-mirror interface none
```

Parameter	Description
<port-list>	The ports from which to mirror traffic. A port-list can be: <ul style="list-style-type: none"><li>• a port (e.g. port1.1.1)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.1.1-port1.1.4</li><li>• a comma-separated list of ports and port ranges, e.g. port1.1.1,port1.1.3-port1.1.4</li></ul>
direction	Specifies whether to mirror traffic that the source port receives, transmits, or both.
both	Mirroring traffic both received and transmitted by the source port.
receive	Mirroring traffic received by the source port.
transmit	Mirroring traffic transmitted by the source port.
2-4090	The VLAN ID of the remote mirroring VLAN that this mirrored traffic is to be tagged with at the egress port on the source device.
priority	The 802.1p priority tag to apply to mirrored packets.

**Default** No ports are set to be remote mirrored by default.

**Mode** Interface Configuration

**Usage** To prevent unwanted processing of mirrored traffic, we recommend configuring remote monitoring on the receiving device before configuring it on the source device.

This command can only be used to configure a single egress port on the source device, not a range of egress ports. Do not use the **interface** command with multiple interfaces before using this **remote-mirror interface** command. One egress (destination) port on the source device can transmit mirrored frames from up to four remote mirrored (source) ports.

The egress port on the source device can be associated with other VLANs in addition to the remote mirror VLAN, so it can function as an uplink for traffic from multiple VLANs. This command does not change the VLAN associations of the mirrored ports.

Only one port on the device can be configured as either a mirror port for port mirroring (**mirror interface** command) or as an egress port on the source device for remote mirroring (**remote-mirror interface** command).

All mirrored ports on a single device must use the same remote mirror VLAN and priority.

Access control lists can be used to mirror a subset of traffic from the mirrored port by using the copy-to-mirror parameter in hardware ACL commands.

**Example** To configure the source device to send all the traffic that it receives on remote-mirrored port port1.1.2 out egress port port1.1.1 tagged with remote mirroring VLAN ID 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# remote-mirror interface port1.1.2 direction
receive vlan 2
```

To stop port1.1.1 remote-mirroring traffic received on mirrored port port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no remote-mirror interface port1.1.2
direction receive
```

**Related  
Commands**

[show remote-mirror](#)  
[switchport remote-mirror-egress](#)  
[vlan mode remote-mirror-vlan](#)

# show mirror

**Overview** Use this command to display the status of all mirrored ports.

**Syntax** `show mirror`

**Mode** User Exec and Privileged Exec

**Example** To display the status of all mirrored ports, use the following command:

```
awplus# show mirror
```

**Output** Figure 13-1: Example output from the **show mirror** command

```
Mirror Test Port Name: port1.1.1  
Mirror option: Enabled  
Mirror direction: both  
Monitored Port Name: port1.1.2
```

# show mirror interface

**Overview** Use this command to display port mirroring configuration for a mirrored (monitored) switch port.

**Syntax** `show mirror interface <port>`

Parameter	Description
<port>	The monitored switch port to display information about.

**Mode** User Exec, Privileged Exec and Interface Configuration

**Example** To display port mirroring configuration for port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# show mirror interface port1.1.2
```

**Output** Figure 13-2: Example output from the **show mirror interface** command

```
Mirror Test Port Name: port1.1.1
Mirror option: Enabled
Mirror direction: both
Monitored Port Name: port1.1.2
```

# show remote-mirror

**Overview** Use this command to display information for remote-mirroring.

**Syntax** `show remote-mirror`

**Mode** User Exec

**Example** To display information about remote mirroring, use the command:

```
awplus# show remote-mirror
```

**Output** Figure 13-3: Example output from **show remote-mirror**

```
awplus#show remote-mirror
Remote mirror information:
Remote mirror destination:
  Port: port1.1.3
  VLAN: 259
  User priority: 0

Monitored ports:
  port1.1.1
  direction: both

Remote mirror egress ports:

Remote mirror VLANs:
  VLAN 259
```

Table 13-1: Parameters in the output from **show remote-mirror**

Parameter	Description
Remote mirror destination	On the source device, this displays information about: <ul style="list-style-type: none"><li>the egress port for the mirrored traffic on the source device</li><li>the remote mirroring VLAN ID this traffic is tagged with on egress</li><li>the user priority this traffic is tagged with on egress</li></ul>
Monitored ports	On the source device, this displays: <ul style="list-style-type: none"><li>the ports being mirrored (monitored)</li><li>the direction—whether both received traffic, transmitted traffic or both are mirrored</li><li>'none (via ACL)' if it is configured with the command <b>remote-mirror interface none</b> to allow ACLs to select the traffic to be mirrored</li></ul>

Table 13-1: Parameters in the output from **show remote-mirror** (cont.)

Parameter	Description
Remote mirror egress ports	On the destination device, this displays : <ul style="list-style-type: none"><li>• the remote mirror egress ports</li><li>• the remote mirror VLANs they are associated with</li></ul>
Remote mirror VLANs	On source, destination and intermediate devices, this displays a list of any VLANs configured in remote mirror VLAN mode. To see a list of the ports associated with these VLANs, use the command <b>show vlan brief</b> .

**Related Commands**

- remote-mirror interface
- switchport remote-mirror-egress
- vlan mode remote-mirror-vlan

# switchport remote-mirror-egress

**Overview** Use this command on the device receiving remote mirrored traffic to set the remote mirroring egress port for the specified remote mirroring VLAN. This port removes the remote mirror VLAN tagging before transmitting the mirrored traffic. Ingress traffic on this port is disabled.

Use the **no** variant of this command to reset the port to no longer function as a remote mirror egress port.

**Syntax** `switchport remote-mirror-egress vlan <vlan-id>`  
`no switchport remote-mirror-egress`

Parameter	Description
<vlan-id>	The port will transmit the mirrored traffic it receives from this remote mirror VLAN.

**Default** There is no remote mirror egress port by default.

**Mode** Interface Configuration for a switch port

**Usage** To prevent unwanted processing of mirrored traffic, we recommend configuring remote monitoring on the receiving device before configuring it on the source device.

This command would typically be used for the port that transmits the remote-mirrored traffic to a device that will analyze it. The port effectively functions as an access port in the remote mirror VLAN, with the added feature of not allowing ingress traffic on the port.

**Example** To set port1.1.2 on the destination device as the remote mirror egress port for mirrored traffic that is tagged with VLAN ID 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport remote-mirror-egress vlan 2
```

To unset port1.1.2 as a remote mirror egress port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no switchport remote-mirror-egress
```

**Related Commands** [remote-mirror interface](#)  
[show remote-mirror](#)  
[vlan mode remote-mirror-vlan](#)

# vlan mode remote-mirror-vlan

**Overview** Use this command to create a single VLAN or a range of VLANs in remote mirror mode to be used for remote mirroring.

Use the **no** variant of this command to remove the remote mirror VLAN from the VLAN database and its configurations.

**Syntax** `vlan [<vid>|<vid-range>] mode remote-mirror-vlan`  
`no vlan [<vid>|<vid-range>]`

Parameter	Description
<code>&lt;vid&gt;</code>	The VLAN ID of the remote mirroring VLAN to be created.
<code>&lt;vid-range&gt;</code>	The range of VLAN IDs for the remote mirroring VLANs to be created.

**Default** There is no remote mirror VLAN by default.

**Mode** VLAN Configuration

**Usage** This remote mirror VLAN needs to be configured on the remote mirroring source device, the destination (receiving) device, and any devices in between that are to forward the mirrored traffic. We recommend configuring this on the receiving device and intermediate devices before configuring the source device.

The remote mirror VLAN operates in a special mode— all traffic on the remote mirror VLAN is flooded, and no learning or CPU processing is done for packets in the VLAN. BPDU packets (link-local packets used to control features like spanning tree or AMF) are dropped on remote mirror VLANs.

Disabling the remote-mirroring VLAN on the source switch does not prevent the mirrored packets from being sent with the remote-mirror VLAN tag. To stop the mirroring, the command **no remote-mirror interface** must be used.

**Example** To create a VLAN with VLAN ID 3 in remote mirror VLAN mode, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 3 mode remote-mirror-vlan
```

To remove the remote mirror VLAN with ID 3, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 3
```

# clear loop-protection counters

**Overview** Use this command to clear the counters for the Loop Protection counters.

**Syntax** `clear loop-protection [interface <port-list>] counters`

Parameters	Description
<code>interface</code>	The interface whose counters are to be cleared.
<code>&lt;port-list&gt;</code>	A port, a port range, or an aggregated link.

**Mode** Privileged Exec

**Examples** To clear the counter information for all interfaces:

```
awplus# clear loop-protection counters
```

To clear the counter information for a single port:

```
awplus# clear loop-protection interface port1.1.1 counters
```

# clear mac address-table dynamic

**Overview** Use this command to clear the filtering database of all entries learned for a selected MAC address, an MSTP instance, a switch port interface or a VLAN interface.

**Syntax** `clear mac address-table dynamic [address <mac-address>|interface <port> [instance <inst>]|vlan <vid>]`

Parameter	Description
address	Specify a MAC (Media Access Control) address to be cleared from the filtering database.
<mac-address>	Enter a MAC address to be cleared from the database in the format HHHH.HHHH.HHHH.
interface	Specify a switch port to be cleared from the filtering database.
<port>	Specify the switch port from which address entries will be cleared. This can be a single switch port, (e.g. port1.1.2), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).
instance	Specify an MSTP (Multiple Spanning Tree) instance to be cleared from the filtering database.
<inst>	Enter an MSTP instance in the range 1 to 63 to be cleared from the filtering database.
vlan	Specify a VLAN to be cleared from the filtering database.
<vid>	Enter a VID (VLAN ID) in the range 1 to 4094 to be cleared from the filtering database.

**Mode** Privileged Exec

**Usage** Use this command with options to clear the filtering database of all entries learned for a given MAC address, interface or VLAN. Use this command without options to clear any learned entries.

Use the optional **instance** parameter to clear the filtering database entries associated with a specified MSTP instance. Note that you must first specify a switch port interface before you can specify an MSTP instance.

Compare this usage and operation with the [clear mac address-table static](#) command. Note that an MSTP instance cannot be specified with the command **clear mac address-table static**.

**Examples** This example shows how to clear all dynamically learned filtering database entries for all interfaces, addresses and VLANs.

```
awplus# clear mac address-table dynamic
```

This example shows how to clear all dynamically learned filtering database entries when learned through device operation for the MAC address 0000.5E00.5302.

```
awplus# clear mac address-table dynamic address 0000.5E00.5302
```

This example shows how to clear all dynamically learned filtering database entries when learned through switch operation for a given MSTP instance 1 on switch port interface port1.1.2.

```
awplus# clear mac address-table dynamic interface port1.1.2  
instance 1
```

**Related  
Commands** [clear mac address-table static](#)  
[show mac address-table](#)

# clear mac address-table static

**Overview** Use this command to clear the filtering database of all statically configured entries for a selected MAC address, interface, or VLAN.

**Syntax** `clear mac address-table static [address <mac-address>|interface <port>|vlan <vid>]`

Parameter	Description
address	The MAC address whose entries are to be cleared from the filtering database.
<mac-address>	Specifies the MAC (Media Access Control) address to be cleared from. Enter this address in the format HHHH.HHHH.HHHH.
interface	Specify the interface from which statically configured entries are to be cleared.
<port>	Specify the switch port from which address entries will be cleared. This can be a single switch port, (e.g. port1.1.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).
vlan	A VLAN whose statically configured entries are to be cleared.
<vid>	Specifies the VLAN ID whose statically configured entries are to be cleared.

**Mode** Privileged Exec

**Usage** Use this command with options to clear the filtering database of all entries made from the CLI for a given MAC address, interface or VLAN. Use this command without options to clear any entries made from the CLI.

Compare this usage with [clear mac address-table dynamic](#) command.

**Examples** This example shows how to clear all filtering database entries configured through the CLI.

```
awplus# clear mac address-table static
```

This example shows how to clear all filtering database entries for a specific interface configured through the CLI.

```
awplus# clear mac address-table static interface port1.1.3
```

This example shows how to clear filtering database entries configured through the CLI for the mac address 0000.5E00.5302.

```
awplus# clear mac address-table static address 0000.5E00.5302
```

**Related Commands**

- [clear mac address-table dynamic](#)
- [mac address-table static](#)
- [show mac address-table](#)

# clear port counter

**Overview** Use this command to clear the packet counters of the port.

**Syntax** `clear port counter [<port>]`

Parameter	Description
<code>&lt;port&gt;</code>	The port number or range

**Mode** Privileged Exec

**Example** To clear the packet counter for port1.1.1, use the command:

```
awplus# clear port counter port1.1.1
```

**Related  
Commands** [show platform port](#)

# clear port-security intrusion

**Overview** Use this command to clear the history of the port-security intrusion list on all ports, or an individual port. If a port is not specified, the intrusion lists of all ports are cleared. This command does not clear any MAC addresses the device has already learned on the ports. If you want to clear MAC addresses on a switch port from the filtering database, you can use the [clear mac address-table dynamic](#) command or the [clear mac address-table static](#) command.

**Syntax** `clear port-security intrusion [interface <port>]`

Parameter	Description
<port>	Specify the switch port from which the history of violated address entries will be cleared. The port can be a single switch port, (e.g. port1.1.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2).

**Mode** Privileged Exec

**Examples** To see the port-security status on port1.1.2, use the following command:

```
awplus# show port-security interface port1.1.2
```

Table 14-1: Example output from **show port-security interface**

```
awplus#show port-security interface port1.1.2
Port Security configuration
-----
Security Enabled : YES
Port Status : ENABLED
Violation Mode : TRAP
Aging : OFF
Maximum MAC Addresses : 1
Total MAC Addresses : 1
Lock Status : LOCKED
Security Violation Count : 1
Last Violation Source Address : 801f.0200.19da
```

To see the intrusion list on port1.1.2, use the following command:

```
awplus# show port-security intrusion interface port1.1.2
```

Table 14-2: Example output from **show port-security intrusion**

```
awplus#show port-security intrusion interface port1.1.2
Port Security Intrusion List
-----
Interface: port1.1.2      - 1 intrusion(s) detected
801f.0200.19da
```

To clear the history of port-security intrusion list on port1.1.2, use the following command:

```
awplus# clear port-security intrusion interface port1.1.2
```

To see the port-security status on port1.1.2, use the following command:

```
awplus# show port-security interface port1.1.2
```

Table 14-3: Example output from **show port-security interface**

```
awplus#show port-security interface port1.1.2
Port Security configuration
-----
Security Enabled : YES
Port Status : ENABLED
Violation Mode : TRAP
Aging : OFF
Maximum MAC Addresses : 1
Total MAC Addresses : 1
Lock Status : LOCKED
Security Violation Count : 0
Last Violation Source Address : None
```

**NOTE:** Note that the port status is still locked while the history of port violation is cleared from the database.

To see the intrusion list on port1.1.2, use the following command:

```
awplus# show port-security intrusion interface port1.1.2
```

Table 14-4: Example output from **show port-security intrusion**

```
awplus#show port-security intrusion interface port1.1.2
Port Security Intrusion List
-----
Interface: port1.1.2      - no intrusions detected
```

**Related  
Commands** show port-security interface  
show port-security intrusion  
switchport port-security  
switchport port-security aging  
switchport port-security maximum  
switchport port-security violation

# debug loopprot

**Overview** This command enables Loop Protection debugging.  
The **no** variant of this command disables Loop Protection debugging.

**Syntax** `debug loopprot {info|msg|pkt|state|nsm|all}`  
`no debug loopprot {info|msg|pkt|state|nsm|all}`

Parameter	Description
info	General Loop Protection information.
msg	Received and transmitted Loop Detection Frames (LDFs).
pkt	Echo raw ASCII display of received and transmitted LDF packets to the console.
state	Loop Protection states transitions.
nsm	Network Service Module information.
all	All debugging information.

**Mode** Privileged Exec and Global Configuration

**Example** To enable debug for all state transitions, use the command:

```
awplus# debug loopprot state
```

**Related Commands** [show debugging loopprot](#)  
[undebug loopprot](#)

# debug platform packet

**Overview** This command enables platform to CPU level packet debug functionality on the device.

Use the **no** variant of this command to disable platform to CPU level packet debug. If the result means both send and receive packet debug are disabled, then any active timeout will be canceled.

**Syntax** debug platform packet [recv] [send] [sflow] [timeout <timeout>]  
[vlan <vlan-id>|all]  
no debug platform packet [recv] [send]

Parameter	Description
recv	Debug packets received.
send	Debug packets sent.
sflow	Debug sFlow packets.
timeout	Stop debug after a specified time.
<timeout>	<0-3600>The timeout period, specified in seconds.
vlan	Limit debug to a single VLAN ID specified.
<vlan-id>	<1-4094> The VLAN ID to limit the debug output on.
all	Debug all VLANs (default setting).

**Default** A 5 minute timeout is configured by default if no other timeout duration is specified.

**Mode** Privileged Exec and Global Configuration

**Usage** This command can be used to trace packets sent and received by the CPU. If a timeout is not specified, then a default 5 minute timeout will be applied.

If a timeout of 0 is specified, packet debug will be generated until the **no** variant of this command is used or another timeout value is specified. The timeout value applies to both send and receive debug and is updated whenever the **debug platform packet** command is used.

**Examples** To enable both receive and send packet debug for the default timeout of 5 minutes, enter:

```
awplus# debug platform packet
```

To enable receive packet debug for 10 seconds, enter:

```
awplus# debug platform packet recv timeout 10
```

To enable packet debug for sFlow packets only for the default timeout of 5 minutes, enter:

```
awplus# debug platform packet sflow
```

To enable send packet debug with no timeout, enter:

```
awplus# debug platform packet send timeout 0
```

To enable VLAN packet debug for VLAN 2 with a timeout duration of 3 minutes, enter:

```
awplus# debug platform packet vlan 2 timeout 150
```

To disable receive packet debug, enter:

```
awplus# no debug platform packet recv
```

**Related  
Commands** [show debugging platform packet](#)  
[undebug platform packet](#)

# duplex

**Overview** This command changes the duplex mode for the specified port.

To see the currently-negotiated duplex mode for ports whose links are up, use the command [show interface](#). To see the configured duplex mode (when different from the default), use the command [show running-config](#).

**Syntax** duplex {auto|full}

Parameter	Description
auto	Auto-negotiate duplex mode.
full	Operate in full duplex mode only.

**Default** By default, ports auto-negotiate duplex mode (except for 100Base-FX ports which do not support auto-negotiation, so default to full duplex mode).

**Mode** Interface Configuration

**Usage** Switch ports in a static or dynamic (LACP) channel group must have the same port speed and be in full duplex mode. Once switch ports have been aggregated into a channel group, you can set the duplex mode of all the switch ports in the channel group by applying this command to the channel group.

**Examples** To specify full duplex for port1.1.4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.4
awplus(config-if)# duplex full
```

To auto-negotiate duplex mode for port1.1.4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.4
awplus(config-if)# duplex auto
```

**Related Commands**

- [polarity](#)
- [speed](#)
- [show interface](#)

# fec

**Overview** Use this command to set Forward Error Correction parameters on a 100 Gigabit interface.

Use the **auto** parameter to set Forward Error Correction back to the default.

**Syntax** `fec {auto|c191|off}`

Parameter	Description
auto	Configure Forward Error Correction automatically based on transceiver type
c191	Enable clause 91 Forward Error Correction on a 100 Gbps interface
off	Disable Forward Error Correction on a 100 Gbps interface

**Default** Forward Error Correction is set to **auto** on 100 Gbps interfaces by default.

**Mode** Interface Configuration for switch ports

**Usage** This command supports the XEM2-1CQ model for SBx908 GEN2 switches. It allows you to enable or disable the IEEE802.3 Clause 91 RS-FEC feature on the PHY for 100 Gigabit interfaces.

FEC auto mode configures FEC automatically based on the transceiver type inserted. With FEC auto mode, all transceivers except the 100GBASE-LR4 module will automatically enable FEC.

**NOTE:** The FEC state needs to be the same on both sides of the link for a link to come up. For example, if one side of the link is set to FEC auto and the other side of the link is set to FEC off, this causes a link failure with 100GBASE-SR4 transceiver modules.

**Examples** To enable FEC on a 100 Gbps interface, enter the commands:

```
awplus# configure terminal
awplus(config)# int port1.1.1
awplus(config-if)# fec c191
```

To disable FEC on a 100 Gbps interface, enter the commands:

```
awplus# configure terminal
awplus(config)# int port1.1.1
awplus(config-if)# fec off
```

To configure FEC automatically based on transceiver type, enter the commands:

```
awplus# configure terminal
awplus(config)# int port1.1.1
awplus(config-if)# fec auto
```

**Output** Figure 14-1: Example output from **show running-config interface port1.1.1**

```
awplus#show running-config interface port1.1.1
!
interface port1.1.1
 fec c191
 switchport
 switchport mode access
!
awplus#show interface port1.1.1
Interface port1.1.1
  Scope: both
  Link is DOWN, administrative state is UP
  Thrash-limiting
    Status Not Detected, Action learn-disable, Timeout 1(s)
  Hardware is Ethernet, address is e01a.ea23.e534
  index 5101 metric 1 mru 1500
  configured duplex auto, configured speed auto, configured polarity auto
  current FEC state c191
  configured FEC mode c191

SNMP link-status traps: Disabled
  input packets 0, bytes 0, dropped0, multicast packets 0
  output packets 0, bytes 0, multicast packets 0, broadcast packets 0
  input average rate : 30 seconds 0 bps, 5 minutes 0 bps
  output average rate: 30 seconds 0 bps, 5 minutes 0 bps
Time since last state change: 0 days 00:55:21
```

**Related Commands** [show running-config](#)  
[show running-config interface](#)  
[show interface](#)

**Command changes** Version 5.4.8-0.2: command added

# flowcontrol (switch port)

**Overview** Use this command to enable flow control, and configure the flow control mode for the switch port.

Use the **no** variant of this command to disable flow control for the specified switch port.

**Syntax** `flowcontrol both`  
`no flowcontrol`

Parameter	Description
<code>both</code>	Use this parameter to specify send and receive flow control for the port.

**Default** By default, flow control is disabled.

**Mode** Interface Configuration

**Usage** The flow control mechanism specified by 802.3x is only for full duplex links. It operates by sending PAUSE frames to the link partner to temporarily suspend transmission on the link.

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If one port experiences congestion, and cannot receive any more traffic, it notifies the other port to stop sending until the condition clears. When the local device detects congestion at its end, it notifies the remote device by sending a pause frame. On receiving a pause frame, the remote device stops sending data packets, which prevents loss of data packets during the congestion period.

Flow control is not recommended when running QoS or ACLs, because the complex queuing, scheduling, and filtering configured by QoS or ACLs may be slowed by applying flow control.

For flow control on async serial (console) ports, see the [flowcontrol hardware \(async/console\)](#) command.

**Examples** To enable flow control on port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# flowcontrol both
```

To disable flow control on port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no flowcontrol
```

**Related  
Commands** [show running-config](#)

# linkflap action

**Overview** Use this command to detect flapping on all ports. If more than 15 flaps occur in less than 15 seconds the flapping port will shut down.

Use the **no** variant of this command to disable flapping detection at this rate.

**Syntax** linkflap action [shutdown]  
no linkflap action

Parameter	Description
linkflap	Global setting for link flapping.
action	Specify the action for port.
shutdown	Shutdown the port.

**Default** Linkflap action is disabled by default.

**Mode** Global Configuration

**Example** To enable the linkflap action command on the device, use the following commands:

```
awplus# configure terminal  
awplus(config)# linkflap action shutdown
```

# loop-protection loop-detect

**Overview** Use this command to enable the loop-protection loop-detect feature and configure its parameters.

Use the **no** variant of this command to disable the loop-protection loop-detect feature.

**Syntax** `loop-protection loop-detect [ldf-interval <period>]  
[ldf-rx-window <frames>] [fast-block]`  
`no loop-protection loop-detect`

Parameter	Description
<code>ldf-interval</code>	The time (in seconds) between successive loop-detect frames being sent.
<code>&lt;period&gt;</code>	Specify a period between 1 and 600 seconds. The default is 10 seconds.
<code>ldf-rx-window</code>	The number of transmitted loop detect frames whose details are held for comparing with frames arriving at the same port.
<code>&lt;frames&gt;</code>	Specify a value for the window size between 1 and 5 frames. The default is 3 frames.
<code>[fast-block]</code>	The fast-block blocks transmitting port to keep partial connectivity.

**Default** The loop-protection loop-detect feature is disabled by default. The default interval is 10 seconds, and the default window size is 3 frames.

**Mode** Global Configuration

**Usage** See the “Loop Protection” section in the [Switching Feature Overview and Configuration Guide](#) for relevant conceptual, configuration, and overview information prior to applying this command.

**Example** To enable the loop-detect mechanism on the switch, and generate loop-detect frames once every 5 seconds, use the following commands:

```
awplus# configure terminal  
awplus(config)# loop-protection loop-detect ldf-interval 5
```

**Related Commands** [loop-protection action](#)  
[loop-protection timeout](#)  
[show loop-protection](#)

# loop-protection action

**Overview** Use this command to specify the protective action to apply when a network loop is detected on an interface.

Use the **no** variant of this command to reset the loop protection actions to the default action, `vlan-disable`, on an interface.

**Syntax** `loop-protection action`  
{`link-down`|`log-only`|`port-disable`|`vlan-disable`|`none`}  
`no loop-protection action`

Parameter	Description
<code>link-down</code>	Block all traffic on a port (or aggregated link) that detected the loop, and take <b>down</b> the link.
<code>log-only</code>	Details of loop conditions are logged. No action is applied to the port (or aggregated link).
<code>port-disable</code>	Block all traffic on interface for which the loop occurred, but keep the link in the <b>up</b> state.
<code>vlan-disable</code>	Block all traffic for the VLAN on which the loop traffic was detected. Note that setting this parameter will also enable ingress filtering. This is the default action.
<code>none</code>	Applies no protective action.

**Default** `loop-protection action vlan-disable`

**Mode** Interface Configuration

**Usage** See the “Loop Protection” section in the [Switching Feature Overview and Configuration Guide](#) for relevant conceptual, configuration, and overview information prior to applying this command.

**Example** To disable the interface `port1.1.2` and bring the link down when a network loop is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# loop-protection action link-down
```

**Related Commands** [loop-protection loop-detect](#)  
[loop-protection timeout](#)  
[show loop-protection](#)

# loop-protection action-delay-time

**Overview** Use this command to sets the loop protection action delay time for an interface to specified values in seconds. The action delay time specifies the waiting period for the action.

Use the **no** variant of this command to reset the loop protection action delay time for an interface to default.

**Syntax** `loop-protection action-delay-time <0-86400>`  
`no loop-protection action`

Parameter	Description
<code>&lt;0-86400&gt;</code>	Time in seconds; 0 means action delay timer is disabled.

**Default** Action delay timer is disabled by default.

**Mode** Interface Configuration

**Example** To configure a loop protection action delay time of 10 seconds on port1.1.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.4
awplus(config-if)# loop-protection action-delay-time 10
```

**Related Commands** [loop-protection loop-detect](#)  
[loop-protection timeout](#)  
[show loop-protection](#)

# loop-protection timeout

**Overview** Use this command to specify the Loop Protection recovery action duration on an interface.

Use the **no** variant of this command to set the loop protection timeout to the default.

**Syntax** `loop-protection timeout <duration>`  
`no loop-protection timeout`

Parameter	Description
<code>&lt;duration&gt;</code>	The time (in seconds) for which the configured action will apply before being disabled. This duration can be set between 0 and 86400 seconds (24 hours). The set of 0 means infinity so timeout does not expire.

**Default** The default is 7 seconds.

**Mode** Interface Configuration

**Usage** See the “Loop Protection” section in the [Switching\\_Feature\\_Overview\\_and\\_Configuration\\_Guide](#) for relevant conceptual, configuration, and overview information prior to applying this command.

**Example** To configure a loop protection action timeout of 10 seconds for port1.1.4, use the command:

```
awplus# configure terminal
awplus(config)# interface port1.1.4
awplus(config-if)# loop-protection timeout 10
```

**Related Commands** [loop-protection loop-detect](#)  
[loop-protection action](#)  
[show loop-protection](#)

# mac address-table acquire

**Overview** Use this command to enable MAC address learning on the device.

Use the **no** variant of this command to disable learning.

**Syntax** mac address-table acquire  
no mac address-table acquire

**Default** Learning is enabled by default for all instances.

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# mac address-table acquire

# mac address-table ageing-time

**Overview** Use this command to specify an ageing-out time for a learned MAC address. The learned MAC address will persist for at least the specified time.

The **no** variant of this command will reset the ageing-out time back to the default of 300 seconds (5 minutes).

**Syntax** `mac address-table ageing-time <ageing-timer> none`  
`no mac address-table ageing-time`

Parameter	Description
<code>&lt;ageing-timer&gt;</code>	<code>&lt;10-1000000&gt;</code> The number of seconds of persistence.
<code>none</code>	Disable learned MAC address timeout.

**Default** The default ageing time is 300 seconds.

**Mode** Global Configuration

**Examples** The following commands specify various ageing timeouts on the device:

```
awplus# configure terminal
awplus(config)# mac address-table ageing-time 1000
awplus# configure terminal
awplus(config)# mac address-table ageing-time none
awplus# configure terminal
awplus(config)# no mac address-table ageing-time
```

# mac address-table logging

**Overview** Use this command to create log entries when the content of the FDB (forwarding database) changes. Log messages are produced when a MAC address is added to or removed from the FDB.

**CAUTION:** *MAC address table logging may impact the performance of the switch. Only enable it when necessary as a debug tool.*

Use the **no** variant of this command to stop creating log entries when the content of the FDB changes.

**Syntax** `mac address-table logging`  
`no mac address-table logging`

**Default** MAC address table logging is disabled by default.

**Mode** User Exec/Privileged Exec

**Usage** When MAC address table logging is enabled, the switch produces the following messages:

Change	Message format	Example
MAC added	MAC add <mac> <port> <vlan>	MAC add eccd.6db5.68a7 port1.1.1 vlan2
MAC removed	MAC remove <mac> <port> <vlan>	MAC remove eccd.6db5.68a7 port1.1.1 vlan2

Note that rapid changes may not be logged. For example, if an entry is added and then removed within a few seconds, those actions may not be logged.

To see whether MAC address table logging is enabled, use the command [show running-config](#).

**Example** To create log messages when the content of the FDB changes, use the command:

```
awplus# mac address-table logging
```

**Related Commands** [show running-config](#)

# mac address-table static

**Overview** Use this command to statically configure the MAC address-table to forward or discard frames with a matching destination MAC address.

**Syntax** `mac address-table static <mac-addr> {forward|discard} interface <port> [vlan <vid>]`  
`no mac address-table static <mac-addr> {forward|discard} interface <port> [vlan <vid>]`

Parameter	Description
<mac-addr>	The destination MAC address in HHHH . HHHH . HHHH format.
<port>	The port to apply this command on. The port may be a switch port (e.g. port1.1.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).
<vid>	The VLAN ID. If you do not specify a VLAN, its value defaults to vlan 1.

**Mode** Global Configuration

**Usage** The **mac address-table static** command is only applicable to Layer 2 switched traffic within a single VLAN. Do not apply the **mac address-table static** command to Layer 3 switched traffic passing from one VLAN to another VLAN. Frames will not be discarded across VLANs because packets are routed across VLANs. This command only works on Layer 2 traffic.

**Example**

```
awplus# configure terminal
awplus(config)# mac address-table static 2222.2222.2222 forward
interface port1.1.4 vlan 3
```

**Related Commands** [clear mac address-table static](#)  
[show mac address-table](#)

# mac address-table thrash-limit

**Overview** Use this command to set the thrash limit on the device or stack.

Thrashing occurs when a MAC address table rapidly “flips” its mapping of a single MAC address between two switchports on the same VLAN. This is usually because of a network loop.

Use the **no** variant of this command to return the thrash limit to its default setting.

**Syntax** `mac address-table thrash-limit <rate>`  
`no mac address-table thrash-limit`

Parameter	Description
<code>&lt;rate&gt;</code>	The maximum thrash rate at which limiting is applied. This rate can be set to between 5 and 255 MAC thrashing flips per second. Once the thrash limit rate is reached, the port is considered to be thrashing.

**Default** 10 MAC thrashing flips per second

**Mode** Global Configuration

**Usage** Use this command to limit thrashing on the selected port range.

**Example** To apply a thrash limit of 20 MAC address flips per second:

```
awplus# configure terminal  
awplus(config)# mac address-table thrash-limit 20
```

**Related Commands** [show interface](#)  
[show mac address-table thrash-limit](#)  
[thrash-limiting](#)

# platform hwfilter-size

**Overview** You can use this command to control the configuration of hardware Access Control Lists (ACLs), which determines the total available number and functionality of hardware ACLs.

For this command to take effect, you need to reboot the affected service.

You cannot attach an IPv6 ACL to a port if the ACL contains a specified source or destination IPv6 address or both and the **hw-filter size** setting is **ipv4-limited-ipv6**. If you do so, a diagnostic message will be generated.

**Syntax** `platform hwfilter-size {ipv4-limited-ipv6|ipv4-full-ipv6}`

Parameter	Description
<code>hwfilter-size</code>	Configure hardware ACLs command.
<code>ipv4-full-ipv6</code>	Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic, including filtering on source or destination IPv6 addresses, or both; however, this will reduce the total number of filters available in the hardware table.
<code>ipv4-limited-ipv6</code>	Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic. Source or destination IPv6 addresses or both are not filtered.

**Default** The default mode is **ipv4-limited-ipv6**.

**Mode** Global Configuration

**Example** To configure hardware ACLs to filter IPv4 and IPv6 traffic, use the following commands:

```
awplus# configure terminal
awplus(config)# platform hwfilter-size ipv4-full-ipv6
```

**Related Commands** [show platform](#)  
[ipv6 access-list \(named IPv6 hardware ACL\)](#)

# platform load-balancing

**Overview** This command selects which address fields are used as inputs into the load balancing algorithm for aggregated links. The output from this algorithm is used to select which individual path a given packet will traverse within an aggregated link.

The **no** variant of this command turns off the specified inputs.

**Syntax** `platform load-balancing [src-dst-mac] [src-dst-ip]  
[src-dst-port] [ethertype]`  
`no platform load-balancing [src-dst-mac] [src-dst-ip]  
[src-dst-port] [ethertype]`

Parameter	Description
<code>src-dst-mac</code>	Include the source and destination MAC addresses (Layer 2)
<code>src-dst-ip</code>	Include the source and destination IP addresses (Layer 3). If you choose this option, the algorithm will use MAC addresses to calculate load balancing for Layer 2 and non-IP packets.
<code>src-dst-port</code>	The source and destination TCP/UDP port data (Layer 4). If you include this option, make sure that <b>src-dst-ip</b> is also selected.
<code>ethertype</code>	A two-octet field in an Ethernet frame that shows which protocol is encapsulated in the payload of the Ethernet frame. Ethertype is the same for all IP traffic, but is different for different kinds of non-IP traffic.

**Default** By default, all load-balancing input options are used.

**Mode** Global configuration

**Usage** By default, all load-balancing input options are turned on. Therefore, to use a different set of inputs, you must **turn off** the inputs you do not want.

Useful combinations of inputs include:

- all four inputs
- MAC address, IP address and Layer 4 port number
- MAC address and Ethertype
- MAC address only
- IP address and Layer 4 port number
- IP address only

The following examples show how to configure some of these combinations.

Use the `show platform` command to verify this command's setting.

**Examples** To use all four inputs, you do not have to enter any commands, because this is the default. Note that this setting is not displayed in the **show running-config** output. Use the **show platform** command to verify this setting.

To use MAC addresses, IP addresses and Layer 4 port numbers, remove Ethertype by using the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing ethertype
```

To use MAC addresses and Ethertype, remove the IP inputs by using the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-ip
src-dst-port
```

To use MAC addresses only, remove the other inputs by using the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-ip
src-dst-port ethertype
```

To use IP addresses and Layer 4 port numbers, remove MAC addresses and Ethertype by using the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-mac
ethertype
```

**Related  
Commands** [show platform](#)

# platform mac-vlan-hashing-algorithm

**Overview** This command enables you to change the MAC VLAN hash-key-generating algorithm.

The **no** variant of this command returns the hash-key algorithm to the default of `crc32l`

**Syntax** `platform mac-vlan-hashing-algorithm`  
`{crc16l|crc16u|crc32l|crc32u}`  
`no platform mac-vlan-hashing-algorithm`

Parameter	Description
<code>crc16l</code>	The algorithm that will apply to the lower bits of CRC-16
<code>crc16u</code>	The algorithm that will apply to the upper bits of CRC-16
<code>crc32l</code>	The algorithm that will apply to the lower bits of CRC-32
<code>crc32u</code>	The algorithm that will apply to the upper bits of CRC-32

**Default** The hash-key algorithm is `crc32l` by default.

**Mode** Global configuration

**Usage** Occasionally, when using the Multiple Dynamic VLAN feature, a supplicant cannot be authenticated because a collision occurs within the VLAN MAC table. This can happen when more than four different MAC addresses produce the same hash-key.

When this situation occurs, collisions can sometimes be avoided by changing the hashing algorithm from its default of `crc32l`. Several different algorithms may need to be tried to rectify the problem.

You must restart the switch for this command to take effect.

Note that this command is intended for technical support staff, or advanced end users.

**Example** To change the hash-key generating algorithm applying to the lower bits of CRC-16, use the command:

```
awplus# configure terminal
awplus(config)# platform mac-vlan-hashing-algorithm crc16l
```

**Related Commands** [show platform](#)

# platform multicast-ratelimit

**Overview** Use this command to set the maximum number of multicast packets to be forwarded to the CPU (in packets per second). Setting the value to zero disables rate limiting.

This command should be used with care. Increasing or removing the limit could make the device less responsive under heavy multicast load.

Use the **no** variant of this command to return the limit to its default.

**Syntax** `platform multicast-ratelimit <0-100>`  
`no platform multicast-ratelimit`

**Default** 100 packets per second (pps)

**Mode** Global Configuration

**Usage** If you find that the CPU load on your device from multicast traffic is higher than desired, reducing this rate may reduce the CPU load.

**Example** To set the rate to 30pps, use the commands:

```
awplus# configure terminal
awplus(config)# platform multicast-ratelimit 30
```

**Command changes** Version 5.4.8-1.1: default changed to 100pps on SBx908 GEN2, SBx8100, and x930 Series switches.

# platform stop-unreg-mc-flooding

**Overview** If a multicast stream is arriving at a network device, and that network device has received no IGMP reports that request the receipt of the stream, then that stream is referred to as "unregistered". IGMP snooping actively prevents the flooding of unregistered streams to all ports in the VLAN on which the stream is received. However, there are brief moments at which this prevention is not in operation, and an unregistered stream may be briefly flooded. This command stops this flooding during even those brief periods when IGMP snooping is not explicitly preventing the flooding.

Use the **no** variant of this command to revert to default behavior and disable this feature.

**NOTE:** *This command should not be used within any IPv6 networks. IPv6 neighbor discovery operation is inhibited by this feature.*

This command does not affect the flooding of Local Network Control Block IPv4 multicast packets in the address range 224.0.0.1 to 224.0.0.255 (224.0.0/24). Such packets will continue to be uninterruptedly flooded, as they need to be.

**Syntax** `platform stop-unreg-mc-flooding`  
`no platform stop-unreg-mc-flooding`

**Default** This feature is disabled by default.

**Mode** Global Configuration

**Usage** This command stops the periodic flooding of unknown or unregistered multicast packets when the Group Membership interval timer expires and there are no subscribers to a multicast group. If there is multicast traffic in a VLAN without subscribers, multicast traffic temporarily floods out of the VLAN when the Group Membership interval timer expires, which happens when the switch does not get replies from Group Membership queries.

This command also stops the initial flood of multicast packets that happens when a new multicast source starts to send traffic. This flooding lasts until snooping realises that this the multicast group is arriving at the switch, and puts an entry into hardware to prevent it from being flooded.

This command is useful in networks where low-performance devices are attached. The operation of such devices can be impaired by them receiving unnecessary streams of traffic. For example, in sites where IP cameras are in use, the flooding of video streams to a whole VLAN can send enough traffic to the cameras to cause interruption of their video streaming.

**Output** Do not use this command in IPv6 networks. The following console message is displayed after entering this command to warn you of this:

```
% WARNING: IPv6 will not work with this setting enabled
% Please consult the documentation for more information
```

**Examples** To enable this feature and stop multicast packet flooding, use the following commands:

```
awplus# configure terminal
awplus(config)# platform stop-unreg-mc-flooding
```

To disable this feature and allow multicast packet flooding, use the following commands:

```
awplus# configure terminal
awplus(config)# no platform stop-unreg-mc-flooding
```

**Related  
Commands** [show platform](#)  
[show running-config](#)

# platform vlan-stacking-tpid

**Overview** This command specifies the Tag Protocol Identifier (TPID) value that applies to all frames that are carrying double tagged VLANs. All nested VLANs must use the same TPID value. (This feature is sometimes referred to as VLAN stacking or VLAN double-tagging.)

Use the **no** variant of this command to revert to the default TPID value (0x8100).

**NOTE:** Because the additional tag increases the frame size beyond 1522 bytes, you must increase the MRU size to activate VLAN-stacking. Go into interface mode for the appropriate ports and use the [mru](#) command.

**Syntax** platform vlan-stacking-tpid <tpid>  
no platform vlan-stacking-tpid

Parameter	Description
<tpid>	The Ethernet type of the tagged packet, as a two byte hexadecimal number.

**Default** The default TPID value is 0x8100.

**Mode** Global Configuration

**Examples** To set the VLAN stacking TPID value to 0x9100, use the following commands:

```
awplus# configure terminal  
awplus(config)# platform vlan-stacking-tpid 9100
```

To reset the VLAN stacking TPID value to the default (0x8100), use the following commands:

```
awplus# configure terminal  
awplus(config)# no platform vlan-stacking-tpid
```

**Related Commands** [switchport vlan-stacking \(double tagging\)](#)  
[show platform](#)  
[show running-config](#)

# polarity

**Overview** This command sets the MDI/MDIX polarity on a copper-based switch port.

**Syntax** `polarity {auto|mdi|mdix}`

Parameter	Description
mdi	Sets the polarity to MDI (medium dependent interface).
mdix	Sets the polarity to MDI-X (medium dependent interface crossover).
auto	The switch port sets the polarity automatically. This is the default option.

**Default** By default, switch ports set the polarity automatically (**auto**).

**Mode** Interface Configuration

**Usage** We recommend the default **auto** setting for MDI/MDIX polarity. Polarity applies to copper 10BASE-T, 100BASE-T, and 1000BASE-T switch ports; it does not apply to fiber ports. See the “MDI/MDIX Connection Modes” section in the [Switching Feature Overview and Configuration Guide](#) for more information.

**Example** To set the polarity for port1.1.4 to fixed MDI mode, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.4
awplus(config-if)# polarity mdi
```

# show debugging loopprot

**Overview** This command shows Loop Protection debugging information.

**Syntax** `show debugging loopprot`

**Mode** User Exec and Privileged Exec

**Example** To display the enabled Loop Protection debugging modes, use the command:

```
awplus# show debugging loopprot
```

**Related  
Commands** [debug loopprot](#)

# show debugging platform packet

**Overview** This command shows platform to CPU level packet debugging information.

**Syntax** `show debugging platform packet`

**Mode** User Exec and Privileged Exec

**Example** To display the platform packet debugging information, use the command:

```
awplus# show debugging platform packet
```

**Related  
Commands** [debug platform packet](#)  
[undebug platform packet](#)

# show flowcontrol interface

**Overview** Use this command to display flow control information.

**Syntax** `show flowcontrol interface <port>`

Parameter	Description
<port>	Specifies the name of the port to be displayed.

**Mode** User Exec and Privileged Exec

**Example** To display the flow control for the port1.1.5, use the command:

```
awplus# show flowcontrol interface port1.1.5
```

**Output** Figure 14-2: Example output from the **show flowcontrol interface** command for a specific interface

Port	Send admin	FlowControl oper	Receive admin	FlowControl oper	RxPause	TxPause
port1.1.5	on	on	on	on	0	0

# show interface err-disabled

**Overview** Use this command to show the ports which have been dynamically shut down by protocols running on the device and the protocols responsible for the shutdown.

**Syntax** `show interface [<interface-range> err-disabled]`

Parameter	Description
<code>&lt;interface-range&gt;</code>	Interface range
<code>err-disabled</code>	Brief summary of interfaces shut down by protocols

**Mode** User Exec and Privileged Exec

**Example** To show which protocols have shut down ports, use the commands:

```
awplus# show interface err-disabled
```

**Output** Figure 14-3: Example output from **show interface err-disabled**

```
awplus#show interface err-disabled
Interface          Reason
port1.1.1          loop protection
port1.1.2          loop protection
```

# show interface switchport

**Overview** Use this command to show VLAN information about each switch port.

**Syntax** `show interface switchport`

**Mode** User Exec and Privileged Exec

**Example** To display VLAN information about each switch port, enter the command:

```
awplus# show interface switchport
```

**Output** Figure 14-4: Example output from the **show interface switchport** command

```
Interface name      : port1.1.1

**Related Commands** [show interface memory](#)

# show loop-protection

**Overview** Use this command to display the current loop protection setup for the device.

**Syntax** `show loop-protection [interface <port-list>] [counters]`

Parameter	Description
interface	The interface selected for display.
<port-list>	A port, a port range, or an aggregated link.
counters	Displays counter information for loop protection.

**Mode** User Exec and Privileged Exec

**Usage** This command is used to display the current configuration and operation of the Loop Protection feature

**Examples** To display the current configuration status, use the command:

```
awplus# show loop-protection
```

Figure 14-5: Example output from the **show loop-protection** command

```
awplus#show loop-protection

...
```

# show mac address-table

**Overview** Use this command to display the mac address-table for all configured VLANs.

**Syntax** show mac address-table

**Mode** User Exec and Privileged Exec

**Usage** The **show mac address-table** command is only applicable to view a mac address-table for Layer 2 switched traffic within VLANs.

**Example** To display the mac address-table, use the following command:

```
awplus# show mac address-table
```

**Output** See the below sample output captured when there was no traffic being switched:

```
awplus#show mac address-table

VLAN port          mac                type
1     unknown        0000.cd28.0752    forward  static
ARP  -                0000.cd00.0000    forward  static
```

See the sample output captured when packets were switched and mac addresses were learned:

```
awplus#show mac address-table

VLAN port          mac                type
1     unknown        0000.cd28.0752    forward  static
1     port1.1.11      0030.846e.9bf4    forward  dynamic
1     port1.1.9       0030.846e.bac7    forward  dynamic
ARP  -                0000.cd00.0000    forward  static
```

Note the new mac addresses learned for port1.1.9 and port1.1.11 added as dynamic entries.

Note the first column of the output below shows VLAN IDs if multiple VLANs are configured:

```
awplus#show mac address-table

VLAN port          mac                type
1     unknown        0000.cd28.0752    forward  static
1     port1.1.9       0030.846e.bac7    forward  dynamic
2     unknown        0000.cd28.0752    forward  static
2     port1.1.11      0030.846e.9bf4    forward  dynamic
ARP  -                0000.cd00.0000    forward  static
```

Also note manually configured static mac-addresses are shown to the right of the type column:

```
awplus(config)#mac address-table static 0000.1111.2222 for int
port1.1.11 vlan 2
awplus(config)#end
awplus#
awplus#show mac address-table
```

VLAN	port	mac	type	
1	unknown	0000.cd28.0752	forward	static
1	port1.1.9	0030.846e.bac7	forward	dynamic
2	port1.1.11	0000.1111.2222	forward	static
2	unknown	0000.cd28.0752	forward	static
2	port1.1.11	0030.846e.9bf4	forward	dynamic
ARP	-	0000.cd00.0000	forward	static

# show mac address-table thrash-limit

**Overview** Use this command to display the current thrash limit set for all interfaces on the device.

**Syntax** `show mac address-table thrash-limit`

**Mode** User Exec and Privileged Exec

**Example** To display the current, use the following command:

```
awplus# show mac address-table thrash-limit
```

**Output** Figure 14-7: Example output from the **show mac address-table thrash-limit** command

```
% Thrash-limit 7 movements per second
```

**Related Commands** [mac address-table thrash-limit](#)

# show platform

**Overview** This command displays the settings configured by using the **platform** commands.

**Syntax** `show platform`

**Mode** Privileged Exec

**Usage** This command displays the settings in the running config. For changes in some of these settings to take effect, the device must be rebooted with the new settings in the startup config.

**Example** To check the settings configured with **platform** commands on the device, use the following command:

```
awplus# show platform
```

**Output** Figure 14-8: Example output from the **show platform** command

```
awplus# show platform

MAC vlan hashing algorithm      crc32l
L3 hashing algorithm           unknown
Load Balancing                 src-dst-ip,src-dst-ip,src-dst-port
Vlan-stacking TPID             0x8100
Hardware Filter Size           ipv4-limited-ipv6
```

**Table 15:** Parameters in the output of the **show platform** command. Note that the parameters displayed depends on your device, and that not all displayed parameters can be modified on all devices.

Parameter	Description
Routing Ratio	Whether all memory is allocated to IPv4 address table entries only, or whether it is allocated evenly to both IPv4 and IPv6 addresses (set with the <b>platform routingratio</b> command).
Route Weighting	The split between multicast and unicast route entries (set with the <b>platform routingratio</b> command).
MAC vlan hashing algorithm	The MAC VLAN hash-key-generating algorithm (set with the <b>platform mac-vlan-hashing-algorithm</b> command). The default algorithm is crc32l. The algorithm may need to be changed in rare circumstances in which hash collisions occur.
L3 hashing algorithm	The L3 VLAN hash-key-generating algorithm (set with the <b>platform l3-vlan-hashing-algorithm</b> command). The default algorithm is crc32l. The algorithm may need to be changed in rare circumstances in which hash collisions occur.
Load Balancing	Which packet fields are used in the channel load balancing algorithm (set with the <b>platform load-balancing</b> command).

**Table 15:** Parameters in the output of the **show platform** command. Note that the parameters displayed depends on your device, and that not all displayed parameters can be modified on all devices. (cont.)

Parameter	Description
Control-plane-prioritization	Maximum traffic rate on the CPU port (set with the <b>platform control-plane-prioritization rate</b> command).
Fdb-chain-length	The length of the FDB hash chain (set with the <b>platform fdb-chain-length</b> command). FDB entries are hashed and indexed using a hash. In rare circumstances it may be useful to reduce the chain length.
L2MC overlapped group check	Whether Layer 2 multicast entries are checked before deletion (set with the <b>platform l2mc-overlap</b> command).
silicon-profile	The silicon profile setting (set with the <b>platform silicon-profile</b> command) for the switch hardware; one of: <ul style="list-style-type: none"> <li>• profile 1</li> <li>• profile 2</li> <li>• profile 3</li> <li>• None (default)</li> </ul>
fdb-l3-hosts mode	Whether Host Mode is turned on or not. Host Mode increases the number of host entries and is available for systems containing SBx81CFC960 controller cards and SBx81XLEM line cards. See <b>platform silicon-profile</b> and <b>platform fdb-l3-hosts</b> for details.
Jumboframe support	Whether the jumbo frames setting is enabled or disabled (set with the <b>platform jumboframe</b> command).
Traffic Manager	A test setting that is disabled by default.
stop-unreg-mc-flooding	Whether the stop-unreg-mc-flooding feature is on or off (set with the <b>platform stop-unreg-mc-flooding</b> command). This feature prevents flooding of unregistered multicast packets in the occasional situations in which IGMP snooping does not prevent it.
Port Mode	Whether each port on the AT-StackQS is configured as one 40Gbps port or four 10Gbps ports, if they are operating as network ports (set with the <b>platform portmode interface</b> command).
Vlan-stacking TPID	The value of the TPID set in the Ethernet type field when a frame has a double VLAN tag (set with the <b>platform vlan-stacking-tpid</b> command).
PBR enabled	Whether policy-based routing is globally enabled or not (set with the <b>platform pbr-enable</b> command).

**Table 15:** Parameters in the output of the **show platform** command. Note that the parameters displayed depends on your device, and that not all displayed parameters can be modified on all devices. (cont.)

Parameter	Description
Hardware Filter Size	Whether hardware ACLs can filter on IPv6 addresses (ipv4-full-ipv6) or not (ipv4-limited-ipv6). This is set with the <b>platform hwfilter-size</b> command.
Vlan Ingress Filter Hard Drop	The Bridge Vlan Ingress Filtering drops traffic if the VID assigned to the packet does not match with the port's VLAN membership. There are two ways the traffic is dropped by the Ingress Filtering mechanism: <ul style="list-style-type: none"><li>• HARD DROP - Traffic is dropped by the Bridge Engine and not forwarded or trapped.</li><li>• SOFT DROP - Traffic may be mirrored or trapped by the Bridge Engine.</li></ul>

# show platform classifier statistics utilization brief

**Overview** This command displays the number of used entries available for various platform functions, and the percentage that number of entries represents of the total available.

**Syntax** `show platform classifier statistics utilization brief`

**Mode** Privileged Exec

**Example** To display the platform classifier utilization statistics, use the following command:  
`awplus# show platform classifier statistics utilization brief`

**Output** Figure 14-9: Output from **show platform classifier statistics utilization brief**

```
awplus#show platform classifier statistics utilization brief

[Instance 4]
Capacity: 8183

Rule Limit Reached (clear on read): 0
Total Rule Limit Reached from startup: 0

Space will be allocated to ACL and QOS as required.
```

**Output parameters** Depending on your switch, you will see some of the following parameters in the output from **show platform classifier statistics utilization brief**

Parameter	Description
IPv6 Multicast	Reserved hardware space for use by IPv6 multicast, when the <code>ipv6 multicast-routing</code> command is used.
System	Fixed system entries. For example, resiliency links make use of system ACLs.
MLD Snooping	Entries to send various packets that MLD Snooping is interested in to the CPU.
DHCP Snooping	Entries used to send DHCP and ARP packets to the CPU. User-added DHCP Snooping filters under ACLs are counted under the ACL or QoS categories.
Loop Detection	Entries uses to send the special loop detection frame to the CPU.
EPSR	Entries used to send EPSR control traffic to the CPU.
CFM	Entries used by Connectivity Fault Management.
G8032	Entries used to send G.8032 control traffic to the CPU.
Global ACLs	Entries for ACLs appear here if the ACLs are applied globally instead of per switchport.
ACL	Entries for ACL filters that have been applied directly to ports using the <code>access-group</code> command.
VACL	Entries for VLAN-based ACLs (ACLs that are applied to VLANs instead of ports).
DOS	Entries used for Denial of Service protection.
UFO	Entries used by Upward Forwarding Only (UFO).
QoS	Entries for ACL filters and other class-map configurations, such as policers, applied through policy maps using the service input command. w
RA Guard	Entries used to block IPv6 router advertisements, configured with the <code>ipv6 nd raguard</code> command.
AMFAPPS	Entries used by AMF Application Proxy. These entries enable the SES Controller to block infected ports.
Pre-Ingress	Entries used for VLAN ID Translation (and also for subnet-based and MAC-based VLAN entries on SBx81XLEM cards).
Egress	Entries used for VLAN ID Translation.
UDB	User Defined Bytes (UDB), which are a limited resource of bytes that can be used to implement additional arbitrary matching on packet bytes on some switches. The software manages the use and allocation of these bytes automatically. The output of this table is intended for use by Allied Telesis Customer Support only.

[ipv6 access-list \(named IPv6 hardware ACL\)](#)

# show platform port

**Overview** This command displays the various port registers or platform counters for specified switchports.

**Syntax** `show platform port [<port-list>] [counters]`

Parameter	Description
<port-list>	The ports to display information about. A port-list can be: <ul style="list-style-type: none"><li>a continuous range of ports separated by a hyphen, e.g. port1.1.1-port1.1.4</li><li>a comma-separated list of ports and port ranges, e.g. port1.1.1,port1.1.4-port1.1.8.</li></ul>
counters	Show the platform counters.

**Mode** Privileged Exec

**Examples** To display port registers for port1.1.1 to port1.1.4 use the following command:

```
awplus# show platform port port1.1.1-port1.1.4
```

To display platform counters for port1.1.1 to port1.1.4 use the following command:

```
awplus# show platform port port1.1.1-port1.1.4 counters
```

**Output** Figure 14-10: Example output from the **show platform port** command

```
awplus#show platform port port1.1.1

# show port-security interface

**Overview** Use this command to show the current port-security configuration and the switch port status.

**Syntax** `show port-security interface <port>`

Parameter	Description
<code>&lt;port&gt;</code>	The port to display information about. The port may be a switch port (e.g. port1.1.2), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).

**Mode** Privileged Exec

**Example** To see the port-security status on port1.1.2, use the following command:

```
awplus# show port-security interface port1.1.2
```

**Output** Figure 14-11: Example output from the **show port-security interface** command

```
Port Security configuration
Security Enabled           : YES
Port Status                : ENABLED
Violation Mode             : TRAP
Aging                      : OFF
Maximum MAC Addresses     : 3
Total MAC ddresses        : 1
Lock Status                : UNLOCKED
Security Violation Count   : 0
Last Violation Source Address : None
```

# show port-security intrusion

**Overview** Use this command to show the intrusion list. If the port is not specified, the entire intrusion table is shown.

**Syntax** `show port-security intrusion [interface <port>]`

Parameter	Description
interface	Specify a port
<port>	The port to display information about. The port may be a switch port (e.g. port1.1.2), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).

**Mode** Privileged Exec

**Example** To see the intrusion list on port1.1.2, use the following command:

```
awplus# show port-security intrusion interface port1.1.2
```

**Output** Figure 14-12: Example output from the **show port-security intrusion** command for port1.1.2

```
Port Security Intrusion List
Interface: port1.1.2 -3 intrusion(s) detected
11-22-33-44-55-04 11-22-33-44-55-06 11-22-33-44-55-08
```

# show provisioning (xem)

**Overview** This command shows the provisioning status of all installed or provisioned hardware. Provisioning is the preconfiguration necessary to accommodate future connection of hardware items such as a XEM.

**Syntax** `show provisioning`

**Mode** User Exec and Privileged Exec

**Example** To show provisioning, use the following command:

```
awplus# show provisioning
```

**Output** Figure 14-13: Example output from the **show provisioning** command

```
awplus#show provisioning
Switch provisioning summary information

ID   Board class Status
1.0  sbx908ng   Hardware present
1.1  xem2-12    Hardware present
1.4  xem2-12    Provisioned
1.7  xem2-4     Hardware present
```

**Table 16:** Output parameters from the **show provisioning** command

Parameter	Meaning
ID	The unit.bay-location of the hardware provision.
Board class	The hardware type.
Status	The provisioned state: <ul style="list-style-type: none"><li>• Hardware Present means that the hardware is currently installed in the stack or switch.</li><li>• Provisioned means that although the hardware is not currently installed, the stack or bay is preconfigured, ready to accept the hardware installation.</li></ul>

**Related Commands** [show stack](#)  
[switch bay provision \(xem\)](#)

# show storm-control

**Overview** Use this command to display storm-control information for all interfaces or a particular interface.

**Syntax** `show storm-control [<port>]`

Parameter	Description
<code>&lt;port&gt;</code>	The port to display information about. The port may be a switch port (e.g. port1.1.2), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2).

**Mode** User Exec and Privileged Exec

**Example** To display storm-control information for port1.1.2, use the following command:

```
awplus# show storm-control port1.1.2
```

**Output** Figure 14-14: Example output from the **show storm-control** command for port1.1.2

Port	BcastLevel	McastLevel	DlfLevel
port1.1.2	40.0%	100.0%	100.0%

**Related Commands** [storm-control level](#)

# speed

**Overview** This command changes the speed of the specified port. You can optionally specify the speed or speeds that get autonegotiated, so autonegotiation is only attempted at the specified speeds.

To see the currently-negotiated speed for ports whose links are up, use the [show interface](#) command. To see the configured speed (when different from the default), use the [show running-config](#) command.

**Syntax** `speed {1000|10000|40000|100000}`  
`speed auto [1000] [10000] [40000] [100000]`

The following table shows the speed options for each type of port.

Port type	Speed Options (units are Mbps)
RJ-45 copper ports	auto (default) 1000 10000
1000 Mbps fiber SFPs	auto (default) 1000
1000 Mbps copper SFPs	auto (default) 1000
10000 Mbps fiber SFP+	auto (default) 10000
10000 Mbps copper SFP+	auto (default) 10000
10000 Mbps Direct Attach Cable (DAC)	auto (default) 10000
40000 Mbps QSFP+	auto (default) 40000
40000 Mbps Direct Attach Cable (DAC)	auto (default) 40000
Breakout DACs for 4 x 10G connections	auto (default) 10000
100000 Mbps QSFP28	auto (default) 100000

**Mode** Interface Configuration

**Default** By default, ports autonegotiate speed.

**Usage** We recommend having autonegotiation enabled for link speeds of 1000 Mbps and above. For example, to apply a fixed speed of 1000 Mbps use the command **speed auto 1000**.

Switch ports in a static or dynamic (LACP) channel group must have the same port speed and be in full duplex mode. Once switch ports have been aggregated into a channel group, you can set the speed of all the switch ports in the channel group by applying this command to the channel group.

**NOTE:** *If multiple speeds are specified after the auto option to autonegotiate speeds, then the device only attempts autonegotiation at those specified speeds.*

**Examples** To set a port to auto-negotiate its speed at 10 Gbps only, which will fix this port speed to 10 Gbps, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# speed auto 10000
```

To return the port to auto-negotiating its speed, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# speed auto
```

- [show interface](#)
- [speed \(asyn\)](#)

# storm-control level

**Overview** Use this command to specify the speed limiting level for broadcasting, multicast, or destination lookup failure (DLF) traffic for the port. Storm-control limits the selected traffic type to the specified percentage of the maximum port speed.

Use the **no** variant of this command to disable storm-control for broadcast, multicast or DLF traffic.

**Syntax** `storm-control {broadcast|multicast|dlf} level <level>`  
`no storm-control {broadcast|multicast|dlf} level`

Parameter	Description
<level>	<0-100> Specifies the percentage of the maximum port speed allowed for broadcast, multicast or destination lookup failure traffic.
broadcast	Applies the storm-control to broadcast frames.
multicast	Applies the storm-control to multicast frames.
dlf	Applies the storm-control to destination lookup failure traffic.

**Default** By default, storm-control is disabled.

**Mode** Interface Configuration

**Usage** Flooding techniques are used to block the forwarding of unnecessary flooded traffic. A packet storm occurs when a large number of broadcast packets are received on a port. Forwarding these packets can cause the network to slow down or time out.

**Example** To limit broadcast traffic on port1.1.2 to 30% of the maximum port speed, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# storm-control broadcast level 30
```

**Related Commands** [show storm-control](#)

# switch bay provision (xem)

**Overview** This command enables you to pre-configure a specific empty bay within a switch ready for inserting a particular XEM type. To run this command, the bay must be empty.

Use the **no** variant of this command to remove an existing switch provision.

**Syntax** `switch <stack-ID> bay <bay-ID> provision  
{xem2-1 | xem2-4 | xem2-8 | xem2-12}`  
`no switch <stack-ID> bay <bay-ID> provision`

Parameter	Description
<stack-ID>	The stack member switch position to be provisioned, from 1 to 8.
<bay-ID>	The switch bay to be provisioned, from 1 to 8.
xem2-1	Provision a 1-port XEM2.
xem2-4	Provision a 4-port XEM2.
xem2-8	Provision an 8-port XEM2.
xem2-12	Provision a 12-port XEM2.

**Mode** Global Configuration

**Examples** To provision a XEM2-12XS or XEM2-12XT in bay 1, use the following commands:

```
awplus# configure terminal  
awplus(config)# switch 1 bay 1 provision xem2-12
```

To remove the above provisioning, use the following commands:

```
awplus# configure terminal  
awplus(config)# no switch 1 bay 1 provision
```

**Related Commands** [show stack](#)  
[show provisioning \(stack\)](#)  
[show provisioning \(xem\)](#)  
[switch provision \(stack\)](#)

# switchport port-security

**Overview** Use this command to enable the port-security feature. This feature is also known as the port-based learn limit. It allows the user to set the maximum number of MAC addresses that each port can learn.

Use the **no** variant of this command to disable the port-security feature.

**Syntax** `switchport port-security`  
`no switchport port-security`

**Mode** Interface Configuration

**Examples** To enable the port-security feature on port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport port-security
```

To disable the port-security feature on port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no switchport port-security
```

**Related Commands**

- [clear port-security intrusion](#)
- [show port-security interface](#)
- [show port-security intrusion](#)
- [switchport port-security aging](#)
- [switchport port-security maximum](#)
- [switchport port-security violation](#)

# switchport port-security aging

**Overview** Use this command to set MAC addresses that have been learned by port security to age out.

Use the **no** variant of this command to set the MAC addresses to not age out.

**Syntax** `switchport port-security aging`  
`no switchport port-security aging`

**Mode** Interface Configuration

**Examples** To set port1.1.2 so that the MAC addresses that have been learned by port security age out, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport port-security aging
```

To stop the MAC addresses that have been learned by port security from aging out on port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no switchport port-security aging
```

**Related Commands**

# switchport port-security maximum

**Overview** Use this command to set the maximum number of MAC addresses that each port can learn.

Use the **no** variant of this command to unset the maximum number of MAC addresses that each port can learn. This is same as setting the maximum number to 0. This command also resets the intrusion list table.

If a new MAC is seen on a port with port security enabled and the MAC is statically configured for another port, a violation is triggered. The maximum learn limit will be ignored and the specified intrusion action for the port will be carried out.

**Syntax** `switchport port-security maximum <0-256>`  
`no switchport port-security maximum`

Parameter	Description
maximum <0-256>	Specify the maximum number of addresses to learn.

**Mode** Interface Configuration

**Examples** To learn 3 MAC addresses on port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport port-security maximum 3
```

To remove the MAC learning limit on port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no switchport port-security maximum
```

**Related Commands**

- [show port-security intrusion](#)
- [switchport port-security](#)
- [switchport port-security aging](#)
- [switchport port-security violation](#)

# switchport port-security violation

**Overview** Use this command to set the action taken on a switch port when the port exceeds the learning limits. The port action can be either **shutdown**, **restrict** or **protect**. If **shutdown** is set, the physical link will be disabled and "shutdown" will be shown in the config. If **restrict** is set, the packet from the un-authorized MAC will be discarded and SNMP TRAP will be generated to alert management. If **protect** is set, the packet will simply be discarded by the packet processor silently.

Use the **no** variant of this command to set the violation action to default. The default violation action is protect.

**Syntax** `switchport port-security violation {shutdown|restrict|protect}`  
`no switchport port-security violation`

Parameter	Description
shutdown	Disable the port.
restrict	Alert the network administrator.
protect	Discard the packet.

**Mode** Interface Configuration

**Examples** To set the action to be shutdown on port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport port-security violation shutdown
```

To set the port-security action to the default (protect) on port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no switchport port-security violation
```

# thrash-limiting

**Overview** Use this command to configure the thrash limit action that will be applied to a port on the device when a thrashing condition is detected. The thrash-limiting timeout specifies the time, in seconds, for which the action is employed.

Use the **no** variant of this command to return the action or timeout to its default setting.

**Syntax** thrash-limiting {[action  
{learn-disable|link-down|port-disable|vlan-disable|none}}  
[timeout <0-86400>]}  
  
no thrash-limiting {action|timeout}

Parameter	Description
action	The action taken when MAC thrashing is detected.
learn-disable	Disable MAC address learning
link-down	Block all traffic on an interface - link down
port-disable	Block all traffic on an interface - link remains up
vlan-disable	Block all traffic on a VLAN if the switch detects thrashing for that VLAN on the selected port. Note that setting this parameter will also enable ingress filtering.
none	No thrash action
timeout	Set the duration for the thrash action
<0-86400>	The duration of the applied thrash action in seconds. The default is 1 seconds.

**Default** The default action is learn-disable and the default timeout is 1 second.

**Mode** Interface Configuration

**Usage** Thrash-limiting actions are initiated when MAC addresses are added and removed from a port's MAC table faster than a given rate. The rate is 10 MAC address changes per second by default. You can change it with the [mac address-table thrash-limit](#) command.

See the "Thrash Limiting" section in the [Switching Feature Overview and Configuration Guide](#) for more information.

**Examples** To set the action to learn disable for port1.1.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# thrash-limiting action learn-disable
```

To block all traffic on a VLAN on port1.1.1 if the switch detects thrashing for that VLAN on that port, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# thrash-limiting action vlan-disable
```

To set the thrash limiting action to its default on port1.1.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no thrash-limiting action
```

To set the thrash limiting timeout to 5 seconds on port1.1.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# thrash-limiting timeout 5
```

To set the thrash limiting timeout value to its default on port1.1.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no thrash-limiting timeout
```

- [“vlan statistics”](#) on page 673

# clear vlan statistics

**Overview** This command resets the counters for either a specific VLAN statistics instance or (by not specifying an instance) resets the counters for all instances.

The terms **frame** and **packet** are used interchangeably.

**Syntax** `clear vlan statistics [name <instance-name>]`

Parameter	Description
<code>vlan statistics</code>	The count of incoming frames or bytes collected on a per VLAN basis.
<code>&lt;instance-name&gt;</code>	The name of the instance for which incoming frames and their bytes are counted.

**Mode** Privileged Exec

**Examples** To reset all packet counters for the packet counter instance "vlan2-data", use the command:

```
awplus# clear vlan statistics name vlan2-data
```

To reset all packet counters for all packet counter instances, use the command:

```
awplus# clear vlan statistics
```

**Related Commands** [show vlan statistics](#)  
[vlan statistics](#)

# port-vlan-forwarding-priority

**Overview** Use this command to specify which protocol has the highest priority for controlling transitions from blocking to forwarding traffic, when more than one of EPSR, Loop Protection, and MAC thrashing protection are used on the switch.

These protocols use the same mechanism to block or forward traffic. This command specifies either EPSR or Loop Protection as the highest priority protocol. Setting the priority stops contention between protocols.

For more information, see the Usage section below.

**CAUTION:** The *loop-protection* and *none* parameter options must not be set on an EPSR master node. Use the *epsr* parameter option on an EPSR master node instead. Setting this command incorrectly on an EPSR master node could cause unexpected broadcast storms.

Use the **no** variant of this command to restore the default highest priority protocol back to the default of EPSR.

For more information about EPSR, see the [EPSR Feature Overview and Configuration\\_Guide](#).

**Syntax** `port-vlan-forwarding-priority {epsr|loop-protection|none}`  
`no port-vlan-forwarding-priority`

Parameter	Description
<code>epsr</code>	Sets EPSR as the highest priority protocol. Use this parameter on an EPSR master node to avoid unexpected broadcast storms.
<code>loop-protection</code>	Sets Loop Protection as the highest priority protocol. Note that this option must not be set on an EPSR master node. Use the <b>epsr</b> parameter option on an EPSR master node to avoid unexpected broadcast storms.
<code>none</code>	Sets the protocols to have equal priority. This allows protocols to override each other to set a port to forwarding for a VLAN. Note that this option must not be set on a EPSR master node. Use the <b>epsr</b> parameter option on an EPSR master node to avoid unexpected broadcast storms.

**Default** By default, the highest priority protocol is EPSR

**Mode** Global Configuration

**Usage** Usually, you only need to configure one of EPSR, Loop Protection and MAC Thrashing protection on a switch, because they perform similar functions—each prevents network loops by blocking a selected port for each (loop-containing) VLAN.

However, if more than one of these three features is configured on a switch, you can use this command to prioritize either EPSR or Loop Protection when their

effects on a port would conflict and override each other. Without this command, each protocol could set a port to forwarding for a VLAN, sometimes overriding the previous setting by another protocol to block the port. This could sometimes lead to unexpected broadcast storms.

This command means that, when a protocol is set to have the highest priority over a data VLAN on a port, it will not allow other protocols to put that port-vlan into a forwarding state if the highest priority protocol blocked it.

The priority mechanism is only used for blocking-to-forwarding transitions; protocols remain independent on the forwarding-to-blocking transitions.

For example, consider an EPSR master node in a two-node ESPR ring with the following settings:

- The EPSR master node primary port is configured to switchport interface port1.1.1
- The EPSR master node secondary port is configured to switchport interface port1.1.2
- The EPSR master node control VLAN is configured to VLAN interface vlan10
- The EPSR master node has a first data VLAN configured to VLAN interface vlan20
- The EPSR master node has a second data VLAN configured to VLAN interface vlan30.

Initially, the EPSR ring is complete, with port1.1.2 blocking data VLANs vlan20 and vlan30 and some broadcast traffic flowing through. If the user removes vlan30 from EPSR, a storm is created on vlan30. MAC thrashing protection detects it and blocks vlan30.

Then after the storm has stopped, MAC thrashing protection sets it to forwarding again and it keeps oscillating between forwarding and blocking. In the meantime, the user adds back vlan30 to EPSR as a data VLAN and EPSR blocks it on port1.1.2.

If the priority is set to none (**port-vlan-forwarding-priority none**), MAC thrashing protection notices that the storm has stopped again and decides to put vlan30 on port1.1.2 into forwarding state. This overrides what EPSR requires for this port-VLAN and creates a storm.

If the priority is set to EPSR (**port-vlan-forwarding-priority epsr**), MAC thrashing protection notices that the storm has stopped again and attempts to put vlan30 on port1.1.2 into forwarding state. The higher priority protocol (EPSR) is blocking the VLAN on this port, so it stays blocking and no storm occurs.

**Example** To prioritize EPSR over Loop Protection or MAC Thrashing protection settings, so that Loop Protection or MAC Thrashing protection cannot set a port to the forwarding state for a VLAN if EPSR has set it to the blocking state, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority epsr
```

To prioritize Loop Protection over EPSR or MAC Thrashing protection settings, so that EPSR or MAC Thrashing protection cannot set a port to the forwarding state for a VLAN if Loop Protection has set it to the blocking state, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority loop-protection
```

To set EPSR, Loop Protection, and MAC Thrashing protection protocols to have equal priority for port forwarding and blocking, which allows the protocols to override each other to set a port to the forwarding or blocking states, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority none
```

To restore the default highest priority protocol back to the default of EPSR, use the commands:

```
awplus# configure terminal
awplus(config)# no port-vlan-forwarding-priority
```

**Related Commands** [show port-vlan-forwarding-priority](#)

# private-vlan

**Overview** Use this command to create a private VLAN. Private VLANs can be either primary or secondary. Secondary VLANs can be either community or isolated.

Use the **no** variant of this command to remove the specified private VLAN.

For more information, see the [VLAN Feature Overview and Configuration Guide](#).

**Syntax** `private-vlan <vlan-id> {community|isolated|primary}`  
`no private-vlan <vlan-id> {community|isolated|primary}`

Parameter	Description
<vlan-id>	VLAN ID in the range <2-4094> for the VLAN which is to be made a private VLAN.
community	Community VLAN.
isolated	Isolated VLAN.
primary	Primary VLAN.

**Mode** VLAN Configuration

**Examples** To configure a set of private VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2 name vlan2 state enable
awplus(config-vlan)# vlan 3 name vlan3 state enable
awplus(config-vlan)# vlan 4 name vlan4 state enable
awplus(config-vlan)# private-vlan 2 primary
awplus(config-vlan)# private-vlan 3 isolated
awplus(config-vlan)# private-vlan 4 community
```

To remove a set of private VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no private-vlan 2 primary
awplus(config-vlan)# no private-vlan 3 isolated
awplus(config-vlan)# no private-vlan 4 community
```

**Related Commands** [show vlan private-vlan](#)

# private-vlan association

**Overview** Use this command to associate a secondary VLAN to a primary VLAN. Only one isolated VLAN can be associated to a primary VLAN. Multiple community VLANs can be associated to a primary VLAN.

Use the **no** variant of this command to remove association of all the secondary VLANs to a primary VLAN.

For more information, see the [VLAN\\_Feature Overview and Configuration Guide](#).

**Syntax**

```
private-vlan <primary-vlan-id> association {add  
<secondary-vlan-id>|remove <secondary-vlan-id>}  
no private-vlan <primary-vlan-id> association
```

Parameter	Description
<primary-vlan-id>	VLAN ID of the primary VLAN.
<secondary-vlan-id>	VLAN ID of the secondary VLAN (either isolated or community).

**Mode** VLAN Configuration

**Examples** The following commands associate primary VLAN 2 with secondary VLAN 3:

```
awplus# configure terminal  
awplus(config)# vlan database  
awplus(config-vlan)# private-vlan 2 association add 3
```

The following commands remove the association of primary VLAN 2 with secondary VLAN 3:

```
awplus# configure terminal  
awplus(config)# vlan database  
awplus(config-vlan)# private-vlan 2 association remove 3
```

The following commands remove all secondary VLAN associations of primary VLAN 2:

```
awplus# configure terminal  
awplus(config)# vlan database  
awplus(config-vlan)# no private-vlan 2 association
```

# show port-vlan-forwarding-priority

**Overview** Use this command to display the highest priority protocol that controls port-vlan forwarding or blocking traffic. This command displays whether EPSR or Loop Protection is set as the highest priority for determining whether a port forwards a VLAN, as set by the [port-vlan-forwarding-priority](#) command.

For more information about EPSR, see the [EPSR Feature Overview and Configuration\\_Guide](#).

**Syntax** `show port-vlan-forwarding-priority`

**Mode** Privileged Exec

**Example** To display the highest priority protocol, use the command:

```
awplus# show port-vlan-forwarding-priority
```

**Output** Figure 15-1: Example output from the **show port-vlan-forwarding-priority** command

```
Port-vlan Forwarding Priority: EPSR
```

**Related Commands** [port-vlan-forwarding-priority](#)

# show interface switchport vlan translation

**Overview** Use this command to display VLAN translation information for some or all interfaces.

**Syntax** `show interface switchport vlan translation [interface <int>]`

Parameter	Description
<code>interface &lt;int&gt;</code>	The interface to display information about. An interface can be a switch port (e.g. port1.1.4), a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2).

**Mode** User Exec/Privileged Exec

**Example** To display VLAN translation information for port1.1.1, use the command:

```
awplus# show interface switchport vlan translation interface port1.1.1
```

**Output** Figure 15-2: Example output from **show interface switchport vlan translation interface port1.1.1**

```
awplus#show interface switchport vlan translation interface port1.1.1

Interface: port1.1.1
VLAN on Wire    VLAN
-----
1649            100
default         drop
```

**Output** Figure 15-3: Example output from **show interface switchport vlan translation**

```
awplus#show interface switchport vlan translation

Interface: port1.1.1
VLAN on Wire    VLAN
-----
1649            100
default         drop

Interface: port1.1.2
VLAN on Wire    VLAN
-----
69              1
default         accept
```

Table 15-1: Parameters in the output from **show interface switchport vlan translation**

Parameter	Description
Interface	The interface on which VLAN-IDs will be translated
VLAN on Wire	VLAN-ID of the packet as it will be seen on the wire
VLAN	VLAN-ID of the VLAN as it was assigned when the VLAN was created
default	The action taken on inbound tagged packets that do not match a VLAN translation entry; either <b>drop</b> or <b>accept</b>

**Related Commands** [switchport vlan translation](#)  
[switchport vlan translation default drop](#)

**Command changes** Version 5.4.8-0.2: added to SBx908 GEN2, x930 Series products  
Version 5.4.8-1.1: added to SBx8100 Series products

# show vlan

**Overview** Use this command to display information about a particular VLAN by specifying its VLAN ID. Selecting **all** will display information for all the VLANs configured.

**Syntax** `show vlan`  
{all|brief|dynamic|static|auto|static-ports|<1-4094>}

Parameter	Description
<1-4094>	Display information about the VLAN specified by the VLAN ID.
all	Display information about all VLANs on the device.
brief	Display information about all VLANs on the device.
dynamic	Display information about all VLANs learned dynamically.
static	Display information about all statically configured VLANs.
auto	Display information about all auto-configured VLANs.
static-ports	Display static egress/forbidden ports.

**Mode** User Exec and Privileged Exec

**Example** To display information about VLAN 2, use the command:

```
awplus# show vlan 2
```

**Output** Figure 15-4: Example output from the **show vlan** command

```
VLAN ID  Name          Type    State  Member ports
=====  =====
1        default        STATIC  ACTIVE  port1.1.1(u) port1.1.2(u) port1.1.3(u)
                                     port1.1.4(u) port1.1.5(u) port1.1.6(u)
                                     port1.1.7(u) port1.1.8(u) port1.1.9(u)
...

```

**Related Commands** [vlan](#)

# show vlan access-map

**Overview** Use this command to display information about the configured VLAN access-maps. VLAN access-maps contain a series of ACLs and enable you to filter traffic ingressing specified VLANs.

**Syntax** `show vlan access-map [<name>]`

Parameter	Description
<name>	The name of the access-map to display.

**Mode** User Exec/Privileged Exec

**Example** To display the ACLs in all access-maps, use the command:

```
awplus# show vlan access-map
```

**Output** Figure 15-5: Example output from **show vlan access-map**

```
awplus#show vlan access-map

Vlan access map : deny_all
Hardware MAC access list 4000
  10 deny any any

Vlan access map : ip_range
Hardware IP access list 3000
  10 deny ip 192.168.1.1/24 any
```

**Related Commands** [vlan access-map](#)

**Command changes** Version 5.4.6-2.1: command added

# show vlan classifier group

**Overview** Use this command to display information about all configured VLAN classifier groups or a specific group.

**Syntax** `show vlan classifier group [<1-16>]`

Parameter	Description
<1-16>	VLAN classifier group identifier

**Mode** User Exec and Privileged Exec

**Usage** If a group ID is not specified, all configured VLAN classifier groups are shown. If a group ID is specified, a specific configured VLAN classifier group is shown.

**Example** To display information about VLAN classifier group 1, enter the command:

```
awplus# show vlan classifier group 1
```

**Related Commands** [vlan classifier group](#)

# show vlan classifier group interface

**Overview** Use this command to display information about a single switch port interface for all configured VLAN classifier groups.

**Syntax** `show vlan classifier group interface <switch-port>`

Parameter	Description
<code>&lt;switch-port&gt;</code>	Specify the switch port interface classifier group identifier

**Mode** User Exec and Privileged Exec

**Usage** All configured VLAN classifier groups are shown for a single interface.

**Example** To display VLAN classifier group information for switch port interface port1.1.2, enter the command:

```
awplus# show vlan classifier group interface port1.1.2
```

**Output** Figure 15-6: Example output from the **show vlan classifier group interface port1.1.1** command:

```
vlan classifier group 1 interface port1.1.1
```

**Related Commands** [vlan classifier group](#)  
[show vlan classifier interface group](#)

# show vlan classifier interface group

**Overview** Use this command to display information about all interfaces configured for a VLAN group or all the groups.

**Syntax** `show vlan classifier interface group [<1-16>]`

Parameter	Description
<1-16>	VLAN classifier interface group identifier

**Mode** User Exec and Privileged Exec

**Usage** If a group ID is not specified, all interfaces configured for all VLAN classifier groups are shown. If a group ID is specified, the interfaces configured for this VLAN classifier group are shown.

**Example** To display information about all interfaces configured for all VLAN groups, enter the command:

```
awplus# show vlan classifier interface group
```

To display information about all interfaces configured for VLAN group 1, enter the command:

```
awplus# show vlan classifier interface group 1
```

**Output** Figure 15-7: Example output from the **show vlan classifier interface group** command

```
vlan classifier group 1 interface port1.1.1  
vlan classifier group 1 interface port1.1.2  
vlan classifier group 2 interface port1.1.3  
vlan classifier group 2 interface port1.1.4
```

Figure 15-8: Example output from the **show vlan classifier interface group 1** command

```
vlan classifier group 1 interface port1.1.1  
vlan classifier group 1 interface port1.1.2
```

**Related Commands** [vlan classifier group](#)  
[show vlan classifier group interface](#)

# show vlan classifier rule

**Overview** Use this command to display information about all configured VLAN classifier rules or a specific rule.

**Syntax** `show vlan classifier rule [<1-256>]`

Parameter	Description
<1-256>	VLAN classifier rule identifier

**Mode** User Exec and Privileged Exec

**Usage** If a rule ID is not specified, all configured VLAN classifier rules are shown. If a rule ID is specified, a specific configured VLAN classifier rule is shown.

**Example** To display information about VLAN classifier rule 1, enter the command:

```
awplus# show vlan classifier rule 1
```

**Output** Figure 15-9: Example output from the **show vlan classifier rule1** command

```
vlan classifier group 1 add rule 1
```

**Related Commands**

- [vlan classifier activate](#)
- [vlan classifier rule ipv4](#)
- [vlan classifier rule proto](#)

# show vlan filter

**Overview** Use this command to display information about the configured VLAN filters. VLAN filters apply access-maps (and therefore ACLs) to VLANs. This enables you to filter traffic ingressing specified VLANs.

**Syntax** `show vlan filter [<access-map-name>]`

Parameter	Description
<code>&lt;access-map-name&gt;</code>	The name of an access-map. The command output displays only the filters that use that access-map.

**Mode** User Exec/Privileged Exec

**Example** To display information about the filter that uses the access-map named "deny\_all", use the command:

```
awplus# show vlan filter deny_all
```

**Output** Figure 15-10: Example output from **show vlan filter**

```
awplus#show vlan filter deny_all
Vlan filter : deny_all
  direction : ingress
  vlan list : 48-49
  access map : deny_all
Hardware MAC access list 4000
  10 deny any any
```

**Related Commands** [vlan access-map](#)  
[vlan filter](#)

**Command changes** Version 5.4.6-2.1: command added

# show vlan private-vlan

**Overview** Use this command to display the private VLAN configuration and associations.

**Syntax** `show vlan private-vlan`

**Mode** User Exec and Privileged Exec

**Example** To display the private VLAN configuration and associations, enter the command:

```
awplus# show vlan private-vlan
```

**Output** Figure 15-11: Example output from the **show vlan private-vlan** command

```
awplus#show vlan private-vlan
```

PRIMARY	SECONDARY	TYPE	INTERFACES
-----	-----	-----	-----
2	3	isolated	
2	4	community	
	8	isolated	

**Related Commands** [private-vlan](#)  
[private-vlan association](#)

# show vlan statistics

**Overview** Use this command to display the current configuration for either a specific VLAN statistics instance, or (by not specifying an instance) display all VLAN packet counter instances.

**Syntax** `show vlan statistics [name <instance-name>]`

Parameter	Description
<vid>	The VID of the VLAN that is associated with <instance-name>.
<instance-name>	The name of the instance for which incoming frames and their bytes are counted.

**Mode** User Exec and Privileged Exec

**Examples** To display all packet counters for the packet counter instance "vlan2-data", use the command:

```
awplus# show vlan statistics name vlan2-data
```

To display all packet counters for all packet counter instances, use the command:

```
awplus# show vlan statistics
```

**Table 16:** Example output from the **show vlan statistics** command

```
VLAN Stats Collection: vlan2-data
VLAN ID: 2
Port Map: port1.1.1, port1.1.2, port1.1.4
Ingress Packets: total 941, bytes 66185
```

**Related Commands** [clear vlan statistics](#)  
[vlan statistics](#)

# switchport access vlan

**Overview** Use this command to change the port-based VLAN of the current port.  
Use the **no** variant of this command to change the port-based VLAN of this port to the default VLAN, vlan1.

**Syntax** `switchport access vlan <vlan-id>`  
`no switchport access vlan`

Parameter	Description
<vlan-id>	<1-4094> The port-based VLAN ID for the port.

**Default** Reset the default VLAN 1 to specified switchports using the negated form of this command.

**Mode** Interface Configuration

**Usage** Any untagged frame received on this port will be associated with the specified VLAN.

**Examples** To change the port-based VLAN to VLAN 3 for port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport access vlan 3
```

To reset the port-based VLAN to the default VLAN 1 for port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no switchport access vlan
```

**Related Commands** [show interface switchport](#)  
[show vlan](#)

# switchport enable vlan

**Overview** This command enables the VLAN on the port manually once disabled by certain actions, such as QSP (QoS Storm Protection) or EPSR (Ethernet Protection Switching Ring). Note that if the VID is not given, all disabled VLANs are re-enabled.

**Syntax** `switchport enable vlan [<1-4094>]`

Parameter	Description
<code>vlan</code>	Re-enables the VLAN on the port.
<code>&lt;1-4094&gt;</code>	VLAN ID.

**Mode** Interface Configuration

**Example** To re-enable port1.1.2 from VLAN 1:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport enable vlan 1
```

**Related Commands** [show mls qos interface storm-status](#)  
[storm-window](#)

# switchport mode access

**Overview** Use this command to set the switching characteristics of the port to access mode. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

**Syntax** `switchport mode access [ingress-filter {enable|disable}]`

Parameter	Description
<code>ingress-filter</code>	Set the ingress filtering for the received frames.
<code>enable</code>	Turn on ingress filtering for received frames. This is the default.
<code>disable</code>	Turn off ingress filtering to accept frames that do not meet the classification criteria.

**Default** By default, ports are in access mode with ingress filtering on.

**Usage** Use access mode to send untagged frames only.

**Mode** Interface Configuration

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport mode access ingress-filter enable
```

**Validation Command** `show interface switchport`

# switchport mode private-vlan

**Overview** Use this command to make a Layer 2 port a private VLAN host port or a promiscuous port.

Use the **no** variant of this command to remove the configuration.

**Syntax** `switchport mode private-vlan {host|promiscuous}`  
`no switchport mode private-vlan {host|promiscuous}`

Parameter	Description
host	This port type can communicate with all other host ports assigned to the same community VLAN, but it cannot communicate with the ports in the same isolated VLAN. All communications outside of this VLAN must pass through a promiscuous port in the associated primary VLAN.
promiscuous	A promiscuous port can communicate with all interfaces, including the community and isolated ports within a private VLAN.

**Mode** Interface Configuration

**Examples** To configure host mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport mode private-vlan host
```

To configure promiscuous mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.3
awplus(config-if)# switchport mode private-vlan promiscuous
```

To remove promiscuous mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.3
awplus(config-if)# no switchport mode private-vlan promiscuous
```

**Related Commands** [switchport private-vlan mapping](#)

# switchport mode private-vlan trunk promiscuous

**Overview** Use this command to enable a port in trunk mode to be promiscuous port for isolated VLANs.

**NOTE:** Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. Private VLAN trunk ports and GVRP are mutually exclusive.

Use the **no** variant of this command to remove a port in trunk mode as a promiscuous port for isolated VLANs. You must first remove the secondary port, or ports, in trunk mode associated with the promiscuous port with the **no switchport mode private-vlan trunk secondary** command.

**Syntax** `switchport mode private-vlan trunk promiscuous group <group-id>`  
`no switchport mode private-vlan trunk promiscuous`

Parameter	Description
<code>&lt;group-id&gt;</code>	The group ID is a numeric value in the range 1 to 32 that is used to associate the promiscuous port with secondary ports.

**Default** By default, a port in trunk mode is disabled as a promiscuous port.

**Mode** Interface Configuration

**Usage** A port must be put in trunk mode with [switchport mode trunk](#) command before it can be enabled as a promiscuous port.

To add VLANs to be trunked over the promiscuous port, use the [switchport trunk allowed vlan](#) command. These VLANs can be isolated VLANs, or non-private VLANs.

To configure the native VLAN for the promiscuous port, use the [switchport trunk native vlan](#) command. The native VLAN can be an isolated VLAN, or a non-private VLAN.

When you enable a promiscuous port, all of the secondary port VLANs associated with the promiscuous port via the group ID number must be added to the promiscuous port. In other words, the set of VLANs on the promiscuous port must be a superset of all the VLANs on the secondary ports within the group.

**Examples** To create the isolated VLANs 2, 3 and 4 and then enable port1.1.2 in trunk mode as a promiscuous port for these VLANs with the group ID of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2-4
awplus(config-vlan)# private-vlan 2 isolated
awplus(config-vlan)# private-vlan 3 isolated
awplus(config-vlan)# private-vlan 4 isolated
awplus(config-vlan)# exit
awplus(config)# interface port1.1.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan add 2-4
awplus(config-if)# switchport mode private-vlan trunk
promiscuous group 3
```

To remove port1.1.2 in trunk mode as a promiscuous port for a private VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no switchport mode private-vlan trunk
promiscuous
```

Note that you must remove the secondary port or ports enabled as trunk ports that are associated with the promiscuous port before removing the promiscuous port.

**Related Commands**

- [switchport mode private-vlan trunk secondary](#)
- [switchport mode trunk](#)
- [switchport trunk allowed vlan](#)
- [switchport trunk native vlan](#)
- [show vlan private-vlan](#)

# switchport mode private-vlan trunk secondary

**Overview** Use this command to enable a port in trunk mode to be a secondary port for isolated VLANs.

**NOTE:** Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. Private VLAN trunk ports and GVRP are mutually exclusive.

Use the **no** variant of this command to remove a port in trunk mode as a secondary port for isolated VLANs.

**Syntax** `switchport mode private-vlan trunk secondary group <group-id>`  
`no switchport mode private-vlan trunk secondary`

Parameter	Description
<code>&lt;group-id&gt;</code>	The group ID is a numeric value in the range 1 to 32 that is used to associate a secondary port with its promiscuous port.

**Default** By default, a port in trunk mode is disabled as a secondary port.

When a port in trunk mode is enabled to be a secondary port for isolated VLANs, by default it will have a native VLAN of **none** (no native VLAN specified).

**Mode** Interface Configuration

**Usage** A port must be put in trunk mode with `switchport mode trunk` command before the port is enabled as a secondary port in trunk mode.

To add VLANs to be trunked over the secondary port use the `switchport trunk allowed vlan` command. These must be isolated VLANs and must exist on the associated promiscuous port.

To configure the native VLAN for the secondary port, use the `switchport trunk native vlan` command. The native VLAN must be an isolated VLAN and must exist on the associated promiscuous port.

**Examples** To create isolated private VLAN 2 and then enable port1.1.3 in trunk mode as a secondary port for the this VLAN with the group ID of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2
awplus(config-vlan)# private-vlan 2 isolated
awplus(config-vlan)# exit
awplus(config)# interface port1.1.3
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan add 2
awplus(config-if)# switchport mode private-vlan trunk secondary
group 3
```

To remove port1.1.3 in trunk mode as a secondary port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.3
awplus(config-if)# no switchport mode private-vlan trunk
secondary
```

**Related Commands**

- [switchport mode private-vlan trunk promiscuous](#)
- [switchport mode trunk](#)
- [switchport trunk allowed vlan](#)
- [switchport trunk native vlan](#)
- [show vlan private-vlan](#)

# switchport mode trunk

**Overview** Use this command to set the switching characteristics of the port to trunk. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

**Syntax** `switchport mode trunk [ingress-filter {enable|disable}]`

Parameter	Description
<code>ingress-filter</code>	Set the ingress filtering for the frames received.
<code>enable</code>	Turn on ingress filtering for received frames. This is the default.
<code>disable</code>	Turn off ingress filtering to accept frames that do not meet the classification criteria.

**Default** By default, ports are in access mode, are untagged members of the default VLAN (vlan1), and have ingress filtering on.

**Mode** Interface Configuration

**Usage** A port in trunk mode can be a tagged member of multiple VLANs, and an untagged member of one native VLAN.

To configure which VLANs this port will trunk for, use the [switchport trunk allowed vlan](#) command.

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.1.3
awplus(config-if)# switchport mode trunk ingress-filter enable
```

**Validation Command** [show interface switchport](#)

# switchport private-vlan host-association

**Overview** Use this command to associate a primary VLAN and a secondary VLAN to a host port. Only one primary and secondary VLAN can be associated to a host port.

Use the **no** variant of this command to remove the association.

**Syntax** `switchport private-vlan host-association <primary-vlan-id> add <secondary-vlan-id>`  
`no switchport private-vlan host-association`

Parameter	Description
<code>&lt;primary-vlan-id&gt;</code>	VLAN ID of the primary VLAN.
<code>&lt;secondary-vlan-id&gt;</code>	VLAN ID of the secondary VLAN (either isolated or community).

**Mode** Interface Configuration

**Examples** `awplus# configure terminal`  
`awplus(config)# interface port1.1.2`  
`awplus(config-if)# switchport private-vlan host-association 2`  
`add 3`  
`awplus# configure terminal`  
`awplus(config)# interface port1.1.2`  
`awplus(config-if)# no switchport private-vlan host-association`

# switchport private-vlan mapping

**Overview** Use this command to associate a primary VLAN and a set of secondary VLANs to a promiscuous port.

Use the **no** variant of this to remove all the association of secondary VLANs to primary VLANs for a promiscuous port.

**Syntax** `switchport private-vlan mapping <primary-vlan-id> add <secondary-vid-list>`  
`switchport private-vlan mapping <primary-vlan-id> remove <secondary-vid-list>`  
`no switchport private-vlan mapping`

Parameter	Description
<code>&lt;primary-vlan-id&gt;</code>	VLAN ID of the primary VLAN.
<code>&lt;secondary-vid-list&gt;</code>	VLAN ID of the secondary VLAN (either isolated or community), or a range of VLANs, or a comma-separated list of VLANs and ranges.

**Mode** Interface Configuration

**Usage** This command can be applied to a switch port or a static channel group, but not a dynamic (LACP) channel group. LACP channel groups (dynamic/LACP aggregators) cannot be promiscuous ports in private VLANs.

**Examples** `awplus# configure terminal`  
`awplus(config)# interface port1.1.2`  
`awplus(config-if)# switchport private-vlan mapping 2 add 3-4`  
`awplus(config-if)# switchport private-vlan mapping 2 remove 3-4`  
`awplus(config-if)# no switchport private-vlan mapping`

**Related Commands** [switchport mode private-vlan](#)

# switchport trunk allowed vlan

**Overview** Use this command to add VLANs to be trunked over this switch port. Traffic for these VLANs can be sent and received on the port.

Use the **no** variant of this command to reset switching characteristics of a specified interface to negate a trunked configuration specified with **switchport trunk allowed vlan** command.

**Syntax**

```
switchport trunk allowed vlan all
switchport trunk allowed vlan none
switchport trunk allowed vlan add <vid-list>
switchport trunk allowed vlan remove <vid-list>
switchport trunk allowed vlan except <vid-list>
no switchport trunk
```

Parameter	Description
all	Allow all VLANs to transmit and receive through the port.
none	Allow no VLANs to transmit and receive through the port.
add	Add a VLAN to the list of VLANs that are allowed to transmit and receive through the port. Only use this parameter if a list of VLANs is already configured on a port.
remove	Remove a VLAN from the list of VLANs that are allowed to transmit and receive through the port. Only use this parameter if a list of VLANs is already configured on a port. If you are removing VLAN port membership for a large number of switchports and VLANs, note that this command may take a number of minutes to run.
except	All VLANs, except the VLAN for which the VID is specified, are part of its port member set. Only use this parameter to remove VLANs after either this parameter or the <b>all</b> parameter have added VLANs to a port.
<vid-list>	<2-4094> The ID of the VLAN or VLANs that will be added to, or removed from, the port. A single VLAN, VLAN range, or comma-separated VLAN list can be set. For a VLAN range, specify two VLAN numbers: lowest, then highest number in the range, separated by a hyphen. For a VLAN list, specify the VLAN numbers separated by commas. Do not enter spaces between hyphens or commas when setting parameters for VLAN ranges or lists.

**Default** By default, ports are untagged members of the default VLAN (vlan1).

**Mode** Interface Configuration

**Usage** The **all** parameter sets the port to be a tagged member of all the VLANs configured on the device. The **none** parameter removes all VLANs from the port's tagged member set. The **add** and **remove** parameters will add and remove VLANs to and from the port's member set. The **except** parameter creates an exception to the list.

If you use the **all** parameter, and then you want to remove VLANs from the port's member list, you must use the **except** parameter to remove the unwanted VLANs. Similarly, if you use the **except** parameter to remove a list of VLANs, and you want to change that list, you must use the **except** parameter to make that change (not the **add** and **remove** parameters).

For example, if you want to remove VLAN3-5 from a port and the port's configuration is currently **switchport trunk allowed vlan all**, then you should remove VLAN3-5 by entering the **except** parameter, instead of using the **remove** parameter. This means using the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.18
awplus(config-if)# switchport trunk allowed vlan except 3-5
```

If you do this, then the configuration changes to:

```
awplus#show running-config

interface port1.1.18
switchport
switchport mode trunk
switchport trunk allowed vlan except 3-5
```

For example, if you want to add VLAN4 back in again, and the port configuration is currently **switchport trunk allowed vlan except 3-5**, then you should add VLAN4 by re-entering the **except** parameter with the list of VLANs to remove, instead of using the **add** parameter. This means using the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.18
awplus(config-if)# switchport trunk allowed vlan except 3,5
```

If you do this, then the configuration changes to:

```
awplus#show running-config

interface port1.1.18
switchport
switchport mode trunk
switchport trunk allowed vlan except 3,5
```

**Examples** The following shows adding a single VLAN to the port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport trunk allowed vlan add 2
```

The following shows adding a range of VLANs to the port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport trunk allowed vlan add 2-4
```

The following shows adding a list of VLANs to the port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport trunk allowed vlan add 2,3,4
```

# switchport trunk native vlan

**Overview** Use this command to configure the native VLAN for this port. The native VLAN is used for classifying the incoming untagged packets. Use the **none** parameter with this command to remove the native VLAN from the port and set the acceptable frame types to vlan-tagged only.

Use the **no** variant of this command to revert the native VLAN to the default VLAN ID 1. Command negation removes tagged VLANs, and sets the native VLAN to the default VLAN.

**Syntax** `switchport trunk native vlan {<vid>|none}`  
`no switchport trunk native vlan`

Parameter	Description
<vid>	The ID of the VLAN that will be used to classify the incoming untagged packets, in the range 2-2094. The VLAN ID must be a part of the VLAN member set of the port.
none	No native VLAN specified. This option removes the native VLAN from the port and sets the acceptable frame types to vlan-tagged only. Note: Use the <b>no</b> variant of this command to revert to the default VLAN 1 as the native VLAN for the specified interface switchport - not <b>none</b> .

**Default** VLAN 1 (the default VLAN), which is reverted to using the **no** form of this command.

**Mode** Interface Configuration

**Examples** The following commands show configuration of VLAN 2 as the native VLAN for port1.1.2:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport trunk native vlan 2
```

The following commands show the removal of the native VLAN for interface port1.1.2:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport trunk native vlan none
```

The following commands revert the native VLAN to the default VLAN 1 for interface port1.1.2:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no switchport trunk native vlan
```

# switchport vlan translation

**Overview** Use this command to create a VLAN translation entry on an interface. The translation entry translates a packet's VLAN-ID as seen on the wire.

Use the **no** variant of this command to remove all translation entries or a specific entry.

This command can be applied to a switch port or a static channel group, or a dynamic (LACP) channel group. The interface must be in a mode that supports tagged packets.

**Syntax** `switchport vlan translation vlan <wire-vid> vlan <vid>`  
`no switchport vlan translation [all|vlan <wire-vid>]`

Parameter	Description
<code>vlan &lt;wire-vid&gt;</code>	VLAN-ID of the packet as you want it to be seen on the wire.
<code>vlan &lt;vid&gt;</code>	VLAN-ID of the VLAN as it was assigned when the VLAN was created.
<code>all</code>	Delete all translation entries.

**Default** None (by default, no translation entries exist)

**Mode** Interface Configuration for a switch port or a static channel group, or a dynamic (LACP) channel group. The interface must be in a mode that supports tagged packets.

**Usage** In Metro networks, it is common for the Network Service Provider to give each customer their own unique VLAN, yet at the customer location, give all the customers the same VLAN ID for tagged packets to use on the wire. VLAN ID translation can be used by the Service Provider to change the tagged packet's VLAN ID at the customer location to the VLAN-ID for tagged packets to use within the NSP's network.

VLAN ID translation is also useful in Enterprise environments where it can be used to merge two networks together without manually reconfiguring the VLAN numbering scheme. This situation can occur if two companies have merged and the same VLAN ID is used for two different purposes.

Similarly, within a Network Service Provider's network, Layer 2 networks may need to be rearranged, and VLAN ID translations make such rearrangement more convenient.

**Example** To translate VLAN100 to VLAN200 on port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# switchport vlan translation vlan 200 vlan
100
```

**Related  
Commands** [show interface switchport vlan translation](#)  
[switchport vlan translation default drop](#)

**Command  
changes** Version 5.4.8-0.2: added to SBx908 GEN2, x930 Series products  
Version 5.4.8-1.1: added to SBx8100 Series products

# switchport vlan translation default drop

**Overview** Use this command to configure a default behavior of dropping inbound tagged packets that have a VLAN-ID that does not match any entries in the VLAN translation table for an interface.

Use the **no** variant of this command to stop dropping non-matching inbound packets and let them be accepted as is for further processing.

**Syntax** `switchport vlan translation default drop`  
`no switchport vlan translation default drop`

**Default** Do not drop packets

**Mode** Interface Configuration for a switch port or a static channel group, or a dynamic (LACP) channel group. The interface must be in a mode that supports tagged packets.

**Example** To drop inbound tagged packets arriving at port1.1.1 unless they match a VLAN translation entry, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# switchport vlan translation default drop
```

To accept inbound tagged packets arriving at port1.1.1 regardless of whether they match a VLAN translation entry, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no switchport vlan translation default drop
```

**Related Commands** [show interface switchport vlan translation](#)  
[switchport vlan translation](#)

**Command changes** Version 5.4.8-0.2: added to SBx908 GEN2, x930 Series products  
Version 5.4.8-1.1: added to SBx8100 Series products

# switchport vlan-stacking (double tagging)

**Overview** Use this command to enable VLAN stacking on a port and set it to be a customer-edge-port or provider-port. This is sometimes referred to as VLAN double-tagging, nested VLANs, or Q in Q.

Use **no** parameter with this command to disable VLAN stacking on an interface.

**Syntax** `switchport vlan-stacking {customer-edge-port|provider-port}`  
`no switchport vlan-stacking`

Parameter	Description
customer-edge-port	Set the port to be a customer edge port. This port must already be in access mode.
provider-port	Set the port to be a provider port. This port must already be in trunk mode.

**Default** By default, ports are not VLAN stacking ports.

**Mode** Interface Configuration

**Usage** Use VLAN stacking to separate traffic from different customers so that they can be managed over a provider network.

Note that you must also set an MRU of 1504 or higher on the customer edge port, using the [mru](#) command.

Traffic with an extra VLAN header added by VLAN stacking cannot be routed.

**Example** To apply vlan-stacking to the selected port, configure it to be a customer edge port, and increase the MRU, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport vlan-stacking customer-edge-port
awplus(config-if)# mru 10240
```

# switchport voice dscp

**Overview** Use this command for a specific port to configure the Layer 3 DSCP value advertised when the transmission of LLDP-MED Network Policy TLVs for voice devices is enabled. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified DSCP value.

Use the **no** variant of this command to reset the DSCP value to the default, 0.

**Syntax** `switchport voice dscp <0-63>`  
`no switchport voice dscp`

Parameter	Description
dscp	Specify a DSCP value for voice data.
<0-63>	DSCP value.

**Default** A DSCP value of 0 will be advertised.

**Mode** Interface Configuration

**Usage** LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (`lldp run` command)
- Voice VLAN is configured for the port (`switchport voice vlan` command)
- The port is configured to transmit LLDP advertisements—enabled by default (`lldp transmit receive` command)
- The port is configured to transmit Network Policy TLVs—enabled by default (`lldp med-tlv-select` command)
- There is an LLDP-MED device connected to the port

**Example** To tell IP phones connected to port1.1.2 to send voice data with DSCP value 27, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport voice dscp 27
```

**Related Commands** `lldp med-tlv-select`  
`show lldp`  
`switchport voice vlan`

# switchport voice vlan

**Overview** Use this command to configure the Voice VLAN tagging advertised when the transmission of LLDP-MED Network Policy TLVs for voice endpoint devices is enabled. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified tagging. This command also sets the ports to be spanning tree edge ports, that is, it enables spanning tree portfast on the ports.

Use the **no** variant of this command to remove LLDP-MED network policy configuration for voice devices connected to these ports. This does not change the spanning tree edge port status.

**Syntax** `switchport voice vlan [<vid>|dot1p|dynamic|untagged]`  
`no switchport voice vlan`

Parameter	Description
<vid>	VLAN identifier, in the range 1 to 4094.
dot1p	The IP phone should send User Priority tagged packets, that is, packets in which the tag contains a User Priority value, and a VID of 0. (The User Priority tag is also known as the 802.1p priority tag, or the Class of Service (CoS) tag.)
dynamic	The VLAN ID with which the IP phone should send tagged packets will be assigned by RADIUS authentication.
untagged	The IP phone should send untagged packets.

**Default** By default, no Voice VLAN is configured, and therefore no network policy is advertised for voice devices.

**Mode** Interface Configuration

**Usage** LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (`lldp run` command)
- Voice VLAN is configured for the port using this command (`switchport voice vlan`)
- The port is configured to transmit LLDP advertisements—enabled by default (`lldp transmit receive` command)
- The port is configured to transmit Network Policy TLVs—enabled by default (`lldp med-tlv-select` command)
- There is an LLDP-MED device connected to the port.

To set the priority value to be advertised for tagged frames, use the `switchport voice vlan priority` command.

If the Voice VLAN details are to be assigned by RADIUS, then the RADIUS server must be configured to send the attribute "Egress-VLANID (56)" or "Egress-VLAN-Name (58)" in the RADIUS Accept message when authenticating a phone attached to this port.

To set these attributes on the local RADIUS server, use the `egress-vlan-id` command or the `egress-vlan-name` command.

For more information about configuring authentication for Voice VLAN, see the [LLDP Feature Overview and Configuration Guide](#).

If the ports have been set to be edge ports by the `switchport voice vlan` command, the **no** variant of this command will leave them unchanged as edge ports. To set them back to their default non-edge port configuration, use the `spanning-tree edgeport (RSTP and MSTP)` command.

**Examples** To tell IP phones connected to `port1.1.5` to send voice data tagged for VLAN 10, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.5
awplus(config-if)# switchport voice vlan 10
```

To tell IP phones connected to ports 1.1.8-1.1.12 to send priority tagged packets (802.1p priority tagged with VID 0, so that they will be assigned to the port VLAN) use the following commands. The priority value is 5 by default, but can be configured with the `switchport voice vlan priority` command.

```
awplus# configure terminal
awplus(config)# interface port1.1.8-port1.1.12
awplus(config-if)# switchport voice vlan dot1p
```

To dynamically configure the VLAN ID advertised to IP phones connected to `port1.1.1` based on the VLAN assigned by RADIUS authentication (with RADIUS attribute "Egress-VLANID" or "Egress-VLAN-Name" in the RADIUS accept packet), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# switchport voice vlan dynamic
```

To remove the Voice VLAN, and therefore disable the transmission of LLDP-MED network policy information for voice devices on `port1.1.24`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.24
awplus(config-if)# no switchport voice vlan
```

**Related  
Commands**

- egress-vlan-id
- egress-vlan-name
- lldp med-tlv-select
- spanning-tree edgeport (RSTP and MSTP)
- switchport voice dscp
- switchport voice vlan priority
- show lldp

# switchport voice vlan priority

**Overview** Use this command to configure the Layer 2 user priority advertised when the transmission of LLDP-MED Network Policy TLVs for voice devices is enabled. This is the priority in the User Priority field of the IEEE 802.1Q VLAN tag, also known as the Class of Service (CoS), or 802.1p priority. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified priority.

**Syntax** `switchport voice vlan priority <0-7>`  
`no switchport voice vlan priority`

Parameter	Description
<code>priority</code>	Specify a user priority value for voice data.
<code>&lt;0-7&gt;</code>	Priority value.

**Default** By default, the Voice VLAN user priority value is 5.

**Mode** Interface Configuration

**Usage** LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (`lldp run` command)
- Voice VLAN is configured for the port (`switchport voice vlan` command)
- The port is configured to transmit LLDP advertisements—enabled by default (`lldp transmit receive` command)
- The port is configured to transmit Network Policy TLVs—enabled by default (`lldp med-tlv-select` command)
- There is an LLDP-MED device connected to the port.

To set the Voice VLAN tagging to be advertised, use the `switchport voice vlan` command.

**Example** To tell IP phones connected to port1.1.5 to send voice data with a user priority value of 6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.5
awplus(config-if)# switchport voice vlan priority 6
```

**Related Commands** [lldp med-tlv-select](#)  
[show lldp](#)  
[switchport voice vlan](#)

# vlan

**Overview** This command creates VLANs, assigns names to them, and enables or disables them. Disabling the VLAN causes all forwarding over the specified VLAN ID to cease. Enabling the VLAN allows forwarding of frames on the specified VLAN.

The **no** variant of this command destroys the specified VLANs or returns their MTU to the default.

**Syntax**

```
vlan <vid> [name <vlan-name>] [state {enable|disable}]
vlan <vid-range> [state {enable|disable}]
vlan {<vid>|<vlan-name>} [mtu <mtu-value>]
no vlan {<vid>|<vid-range>} [mtu]
```

Parameter	Description
<vid>	The VID of the VLAN to enable or disable, in the range 1-4094.
<vlan-name>	The ASCII name of the VLAN. Maximum length: 32 characters.
<vid-range>	Specifies a range of VLAN identifiers.
<mtu-value>	Specifies the Maximum Transmission Unit (MTU) size in bytes, in the range 68 to 1500 bytes, for the VLAN.
enable	Puts the VLAN into an enabled state.
disable	Puts the VLAN into a disabled state.

**Default** By default, VLANs are enabled when they are created.

**Mode** VLAN Configuration

**Examples** To enable vlan 45, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 45 name accounts state enable
```

To destroy vlan 45, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 45
```

**Related Commands**

- [mtu](#)
- [vlan database](#)
- [show vlan](#)

# vlan access-map

**Overview** Use this command to create a VLAN access-map and enter into VLAN access-map mode, so you can add ACLs to the map. You can use any IPv4 or IPv6 hardware ACLs. VLAN access-maps are used to attach ACLs to VLANs, and therefore to filter traffic as it ingresses VLANs.

See the [ACL Feature Overview and Configuration Guide](#) for more information, including information about the number of rules consumed by per-VLAN ACLs, and ACL processing order.

Use the **no** variant of this command to delete a VLAN access-map.

**Syntax** `vlan access-map <name>`  
`no vlan access-map <name>`

Parameter	Description
<name>	A name for the access-map.

**Default** By default, no VLAN access-maps exist.

**Mode** Global Configuration

**Example** To apply ACL 3001 to VLAN 48, where the ACL drops IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 deny ip any any
awplus(config)# vlan access-map deny_all
awplus(config-vlan-access-map)# match access-group 3001
awplus(config-vlan-access-map)# exit
awplus(config)# vlan filter deny_all vlan-list 48 input
```

**Related Commands** [match access-group](#)  
[show vlan access-map](#)  
[vlan filter](#)

**Command changes** Version 5.4.6-2.1: command added

# vlan classifier activate

**Overview** Use this command in Interface Configuration mode to associate a VLAN classifier group with the switch port.

Use the **no** variant of this command to remove the VLAN classifier group from the switch port.

**Syntax** `vlan classifier activate <vlan-class-group-id>`  
`no vlan classifier activate <vlan-class-group-id>`

Parameter	Description
<code>&lt;vlan-class-group-id&gt;</code>	Specify a VLAN classifier group identifier in the range <1-16>.

**Mode** Interface Configuration mode for a switch port or link aggregator.

**Usage** See the protocol-based VLAN configuration example in the [VLAN Feature Overview and Configuration Guide](#) for configuration details.

**Example** To associate VLAN classifier group 3 with switch port1.1.3, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.3
awplus(config-if)# vlan classifier activate 3
```

To remove VLAN classifier group 3 from switch port1.1.3, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.3
awplus(config-if)# no vlan classifier activate 3
```

**Related Commands**

- [show vlan classifier rule](#)
- [vlan classifier group](#)
- [vlan classifier rule ipv4](#)
- [vlan classifier rule proto](#)

# vlan classifier group

**Overview** Use this command to create a group of VLAN classifier rules. The rules must already have been created.

Use the **no** variant of this command to delete a group of VLAN classifier rules.

**Syntax** `vlan classifier group <1-16> {add|delete} rule  
<vlan-class-rule-id>`  
`no vlan classifier group <1-16>`

Parameter	Description
<1-16>	VLAN classifier group identifier
add	Add the rule to the group.
delete	Delete the rule from the group.
<vlan-class-rule-id>	The VLAN classifier rule identifier.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# vlan classifier group 3 add rule 5`

**Related  
Commands** [show vlan classifier rule](#)  
[vlan classifier activate](#)  
[vlan classifier rule ipv4](#)  
[vlan classifier rule proto](#)

# vlan classifier rule ipv4

**Overview** Use this command to create an IPv4 subnet-based VLAN classifier rule and map it to a specific VLAN. Use the **no** variant of this command to delete the VLAN classifier rule.

**Syntax** `vlan classifier rule <1-256> ipv4 <ip-addr/prefix-length> vlan <1-4094>`  
`no vlan classifier rule <1-256>`

Parameter	Description
<1-256>	Specify the VLAN Classifier Rule identifier.
<ip-addr/prefix-length>	Specify the IP address and prefix length.
<1-4094>	Specify a VLAN ID to which an untagged packet is mapped in the range <1-4094>.

**Mode** Global Configuration

**Usage** If the source IP address matches the IP subnet specified in the VLAN classifier rule, the received packets are mapped to the specified VLAN.

You can set up to twelve IPv4 subnet-based VLAN classifier rules.

If you attempt to set more than twelve rules, the following error message is displayed:

```
%% Maximum number (12) of ipv4 classifier rules already reached
```

**NOTE:** *The subnet VLAN classifier only matches IPv4 packets. It does not match ARP packets. To ensure ARP traffic is classified into the correct subnet VLAN, you can use a hardware based policy map that sends ARP packets to the CPU, which will then process them appropriately. This means that if you use subnet-based VLANs, you should also configure the following:*

```
!  
vlan database  
  vlan 10 state enable  
!  
vlan classifier rule 1 ipv4  
192.168.10.0/24 vlan 10  
vlan classifier group 1 add  
rule 1  
!  
mls qos enable  
access-list 4000 send-to-cpu  
any any  
!  
class-map 1  
  match access-group 4000  
  match eth-format ethii-untagged  
protocol 0806  
!  
policy-map 1  
  class default  
  class  
1
```

**NOTE:** The policy map should be applied to each port that uses a subnet based VLAN using the service-policy input command:

```
!  
interface port1.1.2  
  switchport  
  switchport mode access  
  vlan classifier activate  
1  
  service-policy  
input 1
```

**Example** awplus# configure terminal  
awplus(config)# vlan classifier rule 3 ipv4 3.3.3.3/8 vlan 5

**Related  
Commands** [show vlan classifier rule](#)  
[vlan classifier activate](#)  
[vlan classifier rule proto](#)

# vlan classifier rule proto

**Overview** Use this command to create a protocol type-based VLAN classifier rule, and map it to a specific VLAN. See the published IANA EtherType IEEE 802 numbers here:

[www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt](http://www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt).

Instead of a protocol name the decimal value of the protocol's EtherType can be entered. The EtherType field is a two-octet field in an Ethernet frame. It is used to show which protocol is encapsulated in the payload of the Ethernet frame. Note that EtherTypes in the IANA 802 numbers are given as hexadecimal values.

The **no** variant of this command removes a previously set rule.

**Syntax**

```
vlan classifier rule <1-256> proto <protocol> encap
{ethv2|nosnapllc|snapllc} vlan <1-4094>

no vlan classifier rule <1-256>
```

Parameter	Description
<1-256>	VLAN Classifier identifier
proto	Protocol type
<protocol>	Specify a protocol either by its decimal number (0-65535) or by one of the following protocol names:
[arp 2054]	Address Resolution protocol
[atalkarp 33011]	Appletalk AARP protocol
[atalkddp 32923]	Appletalk DDP protocol
[atmmulti 34892]	MultiProtocol Over ATM protocol
[atmtransport 34948]	Frame-based ATM Transport protocol
[dec 24576]	DEC Assigned protocol
[deccustom 24582]	DEC Customer use protocol
[decdiagnostics 24581]	DEC Systems Comms Arch protocol
[decdnadumpload 24577]	DEC DNA Dump/Load protocol
[decdnaremoteconsole 24578]	DEC DNA Remote Console protocol
[decdnarouting 24579]	DEC DNA Routing protocol
[declat 24580]	DEC LAT protocol

Parameter	Description
[decsyscomm 24583]	DEC Systems Comms Arch protocol
[g8bpqx25 2303]	G8BPQ AX.25 protocol
[ieeeaddrtrans 2561]	Xerox IEEE802.3 PUP Address
[ieeepup 2560]	Xerox IEEE802.3 PUP protocol
[ip 2048]	IP protocol
[ipv6 34525]	IPv6 protocol
[ipx 33079]	IPX protocol
[netbeui 61680]	IBM NETBIOS/NETBEUI protocol
[netbeui 61681]	IBM NETBIOS/NETBEUI protocol
[pppdiscovery 34915]	PPPoE discovery protocol
[pppsession 34916]	PPPoE session protocol
[rarp 32821]	Reverse Address Resolution protocol
[x25 2056]	CCITT.25 protocol
[xeroxaddrtrans 513]	Xerox PUP Address Translation protocol
[xeroxpup 512]	Xerox PUP protocol
ethv2	Ethernet Version 2 encapsulation
nosnapllc	LLC without SNAP encapsulation
snapllc	LLC SNAP encapsulation
<1-4094>	Specify a VLAN ID to which an untagged packet is mapped in the range <1-4094>

**Mode** Global Configuration

**Usage** If the protocol type matches the protocol specified in the VLAN classifier rule, the received packets are mapped to the specified VLAN. Ethernet Frame Numbers may be entered in place of the protocol names listed. For a full list please refer to the IANA list online:

[www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt](http://www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt)

**Example** awplus# configure terminal  
awplus(config)# vlan classifier rule 1 proto x25 encaps ethv2  
vlan 2  
awplus(config)# vlan classifier rule 2 proto 512 encaps ethv2  
vlan 2  
awplus(config)# vlan classifier rule 3 proto 2056 encaps ethv2  
vlan 2  
awplus(config)# vlan classifier rule 4 proto 2054 encaps ethv2  
vlan 2

**Validation Output** awplus# show vlan classifier rule

```
vlan classifier rule 16 proto rarp encaps ethv2 vlan 2  
  
vlan classifier rule 8 proto encaps ethv2 vlan 2  
  
vlan classifier rule 4 proto arp encaps ethv2 vlan 2  
  
vlan classifier rule 3 proto xeroxpup encaps ethv2 vlan 2  
vlan classifier rule 2 proto ip encaps ethv2 vlan 2  
vlan classifier rule 1 proto ipv6 encaps ethv2 vlan 2
```

**Related Commands** [show vlan classifier rule](#)  
[vlan classifier activate](#)  
[vlan classifier group](#)

# vlan database

**Overview** Use this command to enter the VLAN Configuration mode.

**Syntax** `vlan database`

**Mode** Global Configuration

**Usage** Use this command to enter the VLAN configuration mode. You can then add or delete a VLAN, or modify its values.

**Example** In the following example, note the change to VLAN configuration mode from Configure mode:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)#
```

**Related  
Commands** [vlan](#)

# vlan filter

**Overview** Use this command to apply a VLAN access-map to a list of VLANs. The switch uses the ACLs in the access-map to filter traffic ingressing those VLANs.

See the [ACL Feature Overview and Configuration Guide](#) for more information, including information about the number of rules consumed by per-VLAN ACLs, and ACL processing order.

Use the **no** variant of this command to to remove the access-map filter from the listed VLANs.

**Syntax**

```
vlan filter <access-map-name> vlan-list <vid> input
no vlan filter <access-map-name> vlan-list <vid> input
```

Parameter	Description
<access-map-name>	The name of the VLAN access-map to apply to the specified list of VLANs
vlan-list <vid>	The list of VLANs to filter. You can specify a single VLAN (e.g. 49), a comma-separated list of VLANs (e.g. 49, 51), a hyphenated range of VLANs (e.g. 49-51), or a combination (e.g. 49,51-53)
input	Apply the filter to ingress traffic

**Default** By default, no VLAN filters exist.

**Mode** Global Configuration

**Example** To apply ACL 3001 to VLAN 48, where the ACL drops IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 deny ip any any
awplus(config)# vlan access-map deny_all
awplus(config-vlan-access-map)# match access-group 3001
awplus(config-vlan-access-map)# exit
awplus(config)# vlan filter deny_all vlan-list 48 input
```

**Related Commands**

- [match access-group](#)
- [show vlan filter](#)
- [vlan access-map](#)

**Command changes** Version 5.4.6-2.1: command added

# vlan mode stack-local-vlan

**Overview** This command enables you to create stack-local-VLANs and use ICMP to monitor and diagnose issues within specific members of the stack. When a VLAN is added using this method, all its traffic will be trapped to and processed by the CPU of the specific local stack member, rather than the CPU of the stack master.

The **no** variant of this command destroys the specified VLAN.

**Syntax** `vlan <vid> mode stack-local-vlan <member-id>`  
`no vlan <vid>`

Parameter	Description
<code>&lt;vid&gt;</code>	The VID of the VLAN to be created in the range 2-4094. We recommend that the first stack-local-vlan be assigned the number 4001 for the first stack member, then incremented by one for each stack member. For example, a stack of four members would be assigned the following VID numbers: <ul style="list-style-type: none"><li>• stack member one: VID 4001</li><li>• stack member two: VID 4002</li><li>• stack member three: VID 4003</li><li>• stack member four: VID 4004</li></ul>
<code>mode stack-local-vlan</code>	Specifies that the new VLAN will function as a stack-local-VLAN.
<code>&lt;member-id&gt;</code>	Specifies the stack member ID. Enter a decimal number in the range 1-8.

**Default** By default, VLANs are automatically enabled as they are added.

**Mode** VLAN Configuration

**Usage** If IGMP snooping is operating on a stack-local-VLAN, the device will try to process some multicast traffic via that VLAN, if it is connected to a Microsoft Windows PC. To avoid this, we recommend disabling IGMP snooping on stack-local-VLANs, by using the command **no ip igmp snooping**.

**Examples** To add a stack-local-VLAN with the VID of 4002 and assign it to stack member 2, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 4002 mode stack-local-vlan 2
awplus(config-vlan)# exit
awplus(config)# interface vlan4002
awplus(config-if)# no ip igmp snooping
```

To remove VLAN 4002, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 4002
```

**Related  
Commands**

- [ip igmp snooping](#)
- [mtu](#)
- [vlan database](#)

# vlan statistics

**Overview** This command creates a VLAN packet counter instance, and enables you to add one or more ports to a defined counter instance. This command can only be applied to switch ports. You cannot apply it to aggregated links or eth ports.

The **no** variant of this command enables the deletion of VLAN packet counter instances, or for removing one or more ports that are currently mapped to a counter instance. Note that the selected range of ports must all be switch ports.

**NOTE:** *In describing this command, the terms frame and packet are used interchangeably.*

**Syntax**

```
vlan <vid> statistics name <instance-name>
no vlan statistics name <instance-name>
```

Parameter	Description
<vid>	The VID of the VLAN that is associated with <instance-name>.
<instance-name>	The name of the instance for which incoming frames and their bytes are counted.

**Mode** Interface Configuration

**Usage** A maximum of 128 packet counter instances can be created. When the first instance is configured, the switch will reserve sufficient resources to support 128 packet counter instances. These resources are also shared with other features such as QoS and ACLs. Where the remaining resources are insufficient to support the VLAN Statistics feature the feature will not be enabled, and an error message will display.

**Examples** To create a VLAN packet counter instance named "vlan2-data", and apply this to count incoming vlan2 tagged frames on port1.1.3 and port1.1.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.3,port1.1.4
awplus(config-if)# vlan 2 statistics name vlan2-data
```

To extend the previous example by adding port1.1.1 and port1.1.2 to the VLAN packet counter instance, use the following commands. The vlan2-data instance will now count all incoming vlan2 tagged frames on ports within the range port1.1.1 to port1.1.4

```
awplus(config)# interface port1.1.1-port1.1.2
awplus(config-if)# vlan 2 statistics name vlan2-data
```

To remove port1.1.4 from the packet counter instance named vlan2-data, use the commands:

```
awplus(config)# interface port1.1.4  
awplus(config-if)# no vlan statistics name vlan2-data
```

To remove the remaining ports port1.1.1 to port1.1.3 from the packet counter instance named vlan2-data, use the following commands. Note that because there will then be no ports associated with the vlan2-data, this instance will be removed.

```
awplus(config)# interface port1.1.1-port1.1.3  
awplus(config-if)# no vlan statistics name vlan2-data
```

# clear spanning-tree statistics

**Overview** Use this command to clear all the STP BPDU (Bridge Protocol Data Unit) statistics.

**Syntax** `clear spanning-tree statistics`  
`clear spanning-tree statistics [instance <mstp-instance>]`  
`clear spanning-tree statistics [interface <port> [instance <mstp-instance>]]`

Parameter	Description
<port>	The port to clear STP BPDU statistics for. The port may be a switch port (e.g. port1.1.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).
<mstp-instance>	The MSTP instance (MSTI - Multiple Spanning Tree Instance) to clear MSTP BPDU statistics.

**Mode** User Exec and Privileged Exec

**Usage** Use this command with the **instance** parameter in MSTP mode. Specifying this command with the **interface** parameter only not the instance parameter will work in STP and RSTP mode.

**Examples** `awplus# clear spanning-tree statistics`  
`awplus# clear spanning-tree statistics instance 1`  
`awplus# clear spanning-tree statistics interface port1.1.2`  
`awplus# clear spanning-tree statistics interface port1.1.2 instance 1`

# clear spanning-tree detected protocols (RSTP and MSTP)

**Overview** Use this command to clear the detected protocols for a specific port, or all ports. Use this command in RSTP or MSTP mode only.

**Syntax** `clear spanning-tree detected protocols [interface <port>]`

Parameter	Description
<code>&lt;port&gt;</code>	The port to clear detected protocols for. The port may be a switch port (e.g. <code>port1.1.4</code> ), a static channel group (e.g. <code>sa3</code> ), or a dynamic (LACP) channel group (e.g. <code>po4</code> ).

**Mode** Privileged Exec

**Example** `awplus# clear spanning-tree detected protocols`

# debug mstp (RSTP and STP)

**Overview** Use this command to enable debugging for the configured spanning tree mode, and echo data to the console, at various levels. Note that although this command uses the keyword **mstp** it displays debugging output for RSTP and STP protocols as well the MSTP protocol.

Use the **no** variant of this command to disable spanning tree debugging.

**Syntax**

```
debug mstp {all|cli|protocol [detail]|timer [detail]}
debug mstp {packet {rx|tx} [decode] [interface <interface>]}
debug mstp {topology-change [interface <interface>]}
no debug mstp {all|cli|protocol [detail]|timer [detail]}
no debug mstp {packet {rx|tx} [decode] [interface <interface>]}
no debug mstp {topology-change [interface <interface>]}
```

Parameter	Description
all	Echoes all spanning tree debugging levels to the console.
cli	Echoes spanning tree commands to the console.
packet	Echoes spanning tree packets to the console.
rx	Received packets.
tx	Transmitted packets.
protocol	Echoes protocol changes to the console.
timer	Echoes timer information to the console.
detail	Detailed output.
decode	Interprets packet contents
topology-change	Interprets topology change messages
interface	Keyword before <interface> placeholder to specify an interface to debug
<interface>	Placeholder used to specify the name of the interface to debug.

**Mode** Privileged Exec and Global Configuration mode

**Usage 1** Use the **debug mstp topology-change interface** command to generate debugging messages when the device receives an indication of a topology change in a BPDU from another device. The debugging can be activated on a per-port basis. Although this command uses the keyword **mstp**, it displays debugging output for RSTP and STP protocols as well as the MSTP protocol.

Due to the likely volume of output, these debug messages are best viewed using the [terminal monitor](#) command before issuing the relevant **debug mstp**

command. The default terminal monitor filter will select and display these messages. Alternatively, the messages can be directed to any of the other log outputs by adding a filter for the MSTP application using [log buffered \(filter\)](#) command:

```
awplus# configure terminal
awplus(config)# log buffered program mstp
```

### Output 1

```
awplus#terminal monitor
awplus#debug mstp topology-change interface port1.1.19
10:09:09 awplus MSTP[1409]: Topology change rcvd on port1.1.19 (internal)
10:09:09 awplus MSTP[1409]: Topology change rcvd on MSTI 1 port1.1.19
aawplus#debug mstp topology-change interface port1.1.21
10:09:29 awplus MSTP[1409]: Topology change rcvd on port1.1.21 (external)
10:09:29 awplus MSTP[1409]: Topology change rcvd on MSTI 1 port1.1.21
```

**Usage 2** Use the **debug mstp packet rx|tx decode interface** command to generate debugging messages containing the entire contents of a BPDU displayed in readable text for transmitted and received xSTP BPDUs. The debugging can be activated on a per-port basis and transmit and receive debugging is controlled independently. Although this command uses the keyword **mstp**, it displays debugging output for RSTP and STP protocols as well as the MSTP protocol.

Due to the likely volume of output, these debug messages are best viewed using the [terminal monitor](#) command before issuing the relevant **debug mstp** command. The default terminal monitor filter will select and display these messages. Alternatively, the messages can be directed to any of the other log outputs by adding a filter for the MSTP application using the [log buffered \(filter\)](#) command:

```
awplus(config)# log buffered program mstp
```

**Output 2** In MSTP mode - an MSTP BPDU with 1 MSTI:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.1.19
17:23:42 awplus MSTP[1417]: port1.1.19 xSTP BPDU rx - start
17:23:42 awplus MSTP[1417]: Protocol version: MSTP, BPDU type: RST
17:23:42 awplus MSTP[1417]: CIST Flags: Agree Forward Learn role=Desig
17:23:42 awplus MSTP[1417]: CIST root id      : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST ext pathcost : 0
17:23:42 awplus MSTP[1417]: CIST reg root id  : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST port id     : 8001 (128:1)
17:23:42 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:23:42 awplus MSTP[1417]: Version 3 length : 80
17:23:42 awplus MSTP[1417]: Format id       : 0
17:23:42 awplus MSTP[1417]: Config name    : test
17:23:42 awplus MSTP[1417]: Revision level : 0
17:23:42 awplus MSTP[1417]: Config digest  : 3ab68794d602fdf43b21c0b37ac3bca8
17:23:42 awplus MSTP[1417]: CIST int pathcost : 0
17:23:42 awplus MSTP[1417]: CIST bridge id   : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST hops remaining : 20
17:23:42 awplus MSTP[1417]: MSTI flags      : Agree Forward Learn role=Desig
17:23:42 awplus MSTP[1417]: MSTI reg root id  : 8001:0000cd1000fe
17:23:42 awplus MSTP[1417]: MSTI pathcost   : 0
17:23:42 awplus MSTP[1417]: MSTI bridge priority : 32768 port priority : 128
17:23:42 awplus MSTP[1417]: MSTI hops remaining : 20
17:23:42 awplus MSTP[1417]: port1.1.19 xSTP BPDU rx - finish
```

**In STP mode transmitting a TCN BPDU:**

```
awplus#terminal monitor
awplus#debug mstp packet tx decode interface port1.1.19
17:28:09 awplus MSTP[1417]: port1.1.19 xSTP BPDU tx - start
17:28:09 awplus MSTP[1417]: Protocol version: STP, BPDU type: TCN
17:28:09 awplus MSTP[1417]: port1.1.19 xSTP BPDU tx - finish
```

**In STP mode receiving an STP BPDU:**

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.1.19
17:31:36 awplus MSTP[1417]: port1.1.19 xSTP BPDU rx - start
17:31:36 awplus MSTP[1417]: Protocol version: STP, BPDU type: Config
17:31:36 awplus MSTP[1417]: Flags: role=none
17:31:36 awplus MSTP[1417]: Root id       : 8000:0000cd1000fe
17:31:36 awplus MSTP[1417]: Root pathcost : 0
17:31:36 awplus MSTP[1417]: Bridge id    : 8000:0000cd1000fe
17:31:36 awplus MSTP[1417]: Port id     : 8001 (128:1)
17:31:36 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:31:36 awplus MSTP[1417]: port1.0.19 xSTP BPDU rx - finish
```

**In RSTP mode receiving an RSTP BPDU:**

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.1.19
awplus#17:30:17 awplus MSTP[1417]: port1.1.19 xSTP BPDU rx - start
17:30:17 awplus MSTP[1417]: Protocol version: RSTP, BPDU type: RST
17:30:17 awplus MSTP[1417]: CIST Flags: Forward Learn role=Desig
17:30:17 awplus MSTP[1417]: CIST root id      : 8000:0000cd1000fe
17:30:17 awplus MSTP[1417]: CIST ext pathcost : 0
17:30:17 awplus MSTP[1417]: CIST reg root id  : 8000:0000cd1000fe
17:30:17 awplus MSTP[1417]: CIST port id     : 8001 (128:1)
17:30:17 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:30:17 awplus MSTP[1417]: port1.1.19 xSTP BPDU rx - finish
```

**Examples**

```
awplus# debug mstp all
awplus# debug mstp cli
awplus# debug mstp packet rx
awplus# debug mstp protocol detail
awplus# debug mstp timer
awplus# debug mstp packet rx decode interface port1.1.2
awplus# debug mstp packet tx decode interface port1.1.12
```

- [terminal monitor](#)
- [undebug mstp](#)

# instance priority (MSTP)

**Overview** Use this command to set the priority for this device to become the root bridge for the specified MSTI (Multiple Spanning Tree Instance).

Use this command for MSTP only.

Use the **no** variant of this command to restore the root bridge priority of the device for the instance to the default.

**Syntax** `instance <instance-id> priority <priority>`  
`no instance <instance-id> priority`

Parameter	Description
<code>&lt;instance-id&gt;</code>	Specify an MSTP instance in the range 1-15.
<code>&lt;priority&gt;</code>	Specify the root bridge priority for the device for the MSTI in the range <0-61440>. Note that a lower priority number indicates a greater likelihood of the device becoming the root bridge. The priority values can be set only in increments of 4096. If you specify a number that is not a multiple of 4096, it will be rounded down. The default priority is 32768.

**Default** The default priority value for all instances is 32768.

**Mode** MST Configuration

**Usage** MSTP lets you distribute traffic more efficiently across a network by blocking different links for different VLANs. You do this by making different devices into the root bridge for each MSTP instance, so that each instance blocks a different link.

If all devices have the same root bridge priority for the instance, MSTP selects the device with the lowest MAC address to be the root bridge. Give the device a higher priority for becoming the root bridge for a particular instance by assigning it a lower priority number, or vice versa.

**Examples** To set the root bridge priority for MSTP instance 2 to be the highest (0), so that it will be the root bridge for this instance when available, use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# instance 2 priority 0
```

To reset the root bridge priority for instance 2 to the default (32768), use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# no instance 2 priority
```

**Related  
Commands** region (MSTP)  
revision (MSTP)  
show spanning-tree mst config  
spanning-tree mst instance  
spanning-tree mst instance priority

# instance vlan (MSTP)

**Overview** Use this command to create an MST Instance (MSTI), and associate the specified VLANs with it. An MSTI is a spanning tree instance that exists within an MST region (MSTR).

When a VLAN is associated with an MSTI the member ports of the VLAN are automatically configured to send and receive spanning-tree information for the associated MSTI. You can disable this automatic configuration of member ports of the VLAN to the associated MSTI by using a **no spanning-tree mst instance** command to remove the member port from the MSTI.

Use the **instance vlan** command for MSTP only.

Use the **no** variant of this command to remove the specified VLANs from the MSTI.

**Syntax** `instance <instance-id> vlan <vid-list>`  
`no instance <instance-id> vlan <vid-list>`

Parameter	Description
<code>&lt;instance-id&gt;</code>	Specify an MSTP instance in the range 1-15.
<code>&lt;vid-list&gt;</code>	Specify one or more VLAN identifiers (VID) to be associated with the MSTI specified. This can be a single VID in the range 1-4094, or a hyphen-separated range or a comma-separated list of VLAN IDs.

**Mode** MST Configuration

**Usage** The VLANs must be created before being associated with an MST instance (MSTI). If the VLAN range is not specified, the MSTI will not be created.

This command removes the specified VLANs from the CIST and adds them to the specified MSTI. If you use the **no** variant of this command to remove the VLAN from the MSTI, it returns it to the CIST. To move a VLAN from one MSTI to another, you must first use the **no** variant of this command to return it to the CIST.

Ports in these VLANs will remain in the control of the CIST until you associate the ports with the MSTI using the [spanning-tree mst instance](#) command.

**Example** To associate VLAN 30 with MSTI 2, use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mode mstp
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# instance 2 vlan 30
```

**Related  
Commands** region (MSTP)  
revision (MSTP)  
show spanning-tree mst config  
spanning-tree mst instance  
vlan

# region (MSTP)

**Overview** Use this command to assign a name to the device's MST Region. MST Instances (MSTI) of a region form different spanning trees for different VLANs.

Use this command for MSTP only.

Use the **no** variant of this command to remove this region name and reset it to the default.

**Syntax** `region <region-name>`  
`no region`

Parameter	Description
<code>&lt;region-name&gt;</code>	Specify the name of the region, up to 32 characters. Valid characters are upper-case, lower-case, digits, underscore.

**Default** By default, the region name is My Name.

**Mode** MST Configuration

**Usage** The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree mst configuration`  
`awplus(config-mst)# region ATL`

**Related Commands** [revision \(MSTP\)](#)  
[show spanning-tree mst config](#)

# revision (MSTP)

**Overview** Use this command to specify the MST revision number to be used in the configuration identifier.

Use this command for MSTP only.

**Syntax** `revision <revision-number>`

Parameter	Description
<code>&lt;revision-number&gt;</code>	<code>&lt;0-65535&gt;</code> Revision number.

**Default** The default of revision number is 0.

**Mode** MST Configuration

**Usage** The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# revision 25
```

**Related Commands**

- [region \(MSTP\)](#)

# show debugging mstp

**Overview** Use this command to show the MSTP debugging options set.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging mstp`

**Mode** User Exec and Privileged Exec mode

**Example** To display the MSTP debugging options set, enter the command:

```
awplus# show debugging mstp
```

**Output** Figure 16-1: Example output from **show debugging mstp**

```
MSTP debugging status:  
MSTP receiving packet debugging is on
```

**Related Commands** [debug mstp \(RSTP and STP\)](#)

# show spanning-tree

**Overview** Use this command to display detailed spanning tree information on the specified port or on all ports. Use this command for RSTP, MSTP or STP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show spanning-tree [interface <port-list>]`

Parameter	Description
<code>interface</code>	Display information about the following port only.
<code>&lt;port-list&gt;</code>	The ports to display information about. A port-list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.2.12) a static channel group (e.g. sa3) or a dynamic (LACP) channel group (e.g. po3)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.1.1-1.1.24, or sa1-2, or po1-4</li><li>• a comma-separated list of ports and port ranges, e.g. port1.1.1,port1.1.4-1.2.24. Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list</li></ul>

**Mode** User Exec and Privileged Exec

**Usage** Note that any list of interfaces specified must not span any interfaces that are not installed.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

**Example** To display spanning tree information about port1.1.23, use the command:

```
awplus# show spanning-tree interface port1.1.23
```

**Output** Figure 16-2: Example output from **show spanning-tree** in RSTP mode

```
awplus#show spanning-tree

# show spanning-tree mst detail interface

**Overview** This command displays detailed information about the specified switch port, and the MST instances associated with it.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show spanning-tree mst detail interface <port>`

Parameter	Description
<port>	The port to display information about. The port may be a switch port (e.g. port1.1.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).

**Mode** User Exec, Privileged Exec and Interface Configuration

**Example** To display detailed information about port1.1.3 and the instances associated with it, enter the command:

```
awplus# show spanning-tree mst detail interface port1.1.3
```

**Output** Figure 16-8: Example output from **show spanning-tree mst detail interface**

```

# show spanning-tree mst instance

**Overview** This command displays detailed information for the specified instance, and all switch ports associated with that instance.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the [show spanning-tree](#) command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show spanning-tree mst instance <instance-id>`

Parameter	Description
<instance-id>	Specify an MSTP instance in the range 1-15.

**Mode** User Exec, Privileged Exec, and Interface Configuration

**Example** To display detailed information for **instance 2**, and all switch ports associated with that instance, use the command:

```
awplus# show spanning-tree mst instance 2
```

**Output** Figure 16-9: Example output from **show spanning-tree mst instance**

```
% 1: MSTI Root Path Cost 0 - MSTI Root Port 0 - MSTI Bridge Priority 32768

# show spanning-tree mst instance interface

**Overview** This command displays detailed information for the specified MST (Multiple Spanning Tree) instance, and the specified switch port associated with that MST instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show spanning-tree mst instance <instance-id> interface <port>`

Parameter	Description
<instance-id>	Specify an MSTP instance in the range 1-15.
<port>	The port to display information about. The port may be a switch port (e.g. port1.1.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).

**Mode** User Exec, Privileged Exec, and Interface Configuration

**Example** To display detailed information for instance 2, interface port1.1.2, use the command:

```
awplus# show spanning-tree mst instance 2 interface port1.1.2
```

**Output** Figure 16-10: Example output from **show spanning-tree mst instance**

```

# show spanning-tree mst interface

**Overview** This command displays the number of instances created, and VLANs associated with it for the specified switch port.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show spanning-tree mst interface <port>`

Parameter	Description
<code>&lt;port&gt;</code>	The port to display information about. The port may be a switch port (e.g. <code>port1.1.4</code> ), a static channel group (e.g. <code>sa3</code> ), or a dynamic (LACP) channel group (e.g. <code>po4</code> ).

**Mode** User Exec, Privileged Exec, and Interface Configuration

**Example** To display detailed information about each instance, and all interfaces associated with them, for port1.1.4, use the command:

```
awplus# show spanning-tree mst interface port1.1.4
```

**Output** Figure 16-11: Example output from **show spanning-tree mst interface**

```
% 1: Bridge up - Spanning Tree Enabled

# show spanning-tree statistics

**Overview** This command displays BPDU (Bridge Protocol Data Unit) statistics for all spanning-tree instances, and all switch ports associated with all spanning-tree instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show spanning-tree statistics

**Mode** Privileged Exec

**Usage** To display BPDU statistics for all spanning-tree instances, and all switch ports associated with all spanning-tree instances, use the command:

```
awplus# show spanning-tree statistics
```

**Output** Figure 16-12: Example output from **show spanning-tree statistics**

```

**Related Commands** [show spanning-tree statistics](#)

# show spanning-tree vlan range-index

**Overview** Use this command to display information about MST (Multiple Spanning Tree) instances and the VLANs associated with them including the VLAN range-index value for the device.

**Syntax** `show spanning-tree vlan range-index`

**Mode** Privileged Exec

**Example** To display information about MST instances and the VLANs associated with them for the device, including the VLAN range-index value, use the following command:

```
awplus# show spanning-tree vlan range-index
```

**Output** Figure 16-16: Example output from **show spanning-tree vlan range-index**

```
awplus#show spanning-tree vlan range-index
% MST Instance  VLAN      RangeIdx
%      1         1         1%
```

**Related Commands** [show spanning-tree statistics](#)

# spanning-tree autoedge (RSTP and MSTP)

**Overview** Use this command to enable the autoedge feature on the port.

The autoedge feature allows the port to automatically detect that it is an edge port. If it does not receive any BPDUs in the first three seconds after linkup, enabling, or entering RSTP or MSTP mode, it sets itself to be an edgeport and enters the forwarding state.

Use this command for RSTP or MSTP.

Use the **no** variant of this command to disable this feature.

**Syntax** `spanning-tree autoedge`  
`no spanning-tree autoedge`

**Default** Disabled

**Mode** Interface Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# interface port1.1.3`  
`awplus(config-if)# spanning-tree autoedge`

**Related Commands** [spanning-tree edgeport \(RSTP and MSTP\)](#)

# spanning-tree bpdu

**Overview** Use this command to configure BPDU (Bridge Protocol Data Unit) discarding or forwarding, when STP is disabled on the switch. This may be needed for correct STP operation in complex networks.

There is no **no** variant for this command. Instead, apply the **discard** parameter to reset it back to the default then re-enable STP with the command `spanning-tree enable`.

**Syntax** `spanning-tree bpdu  
{discard|forward|forward-untagged-vlan|forward-vlan}`

Parameter	Description
bpdu	A port that has BPDU filtering enabled will not transmit any BPDUs and will ignore any BPDUs received. This port type has one of the following parameters (in Global Configuration mode):
discard	Discards all ingress STP BPDU frames.
forward	Forwards any ingress STP BPDU packets to all ports, regardless of any VLAN membership.
forward-untagged-vlan	Forwards any ingress STP BPDU frames to all ports that are untagged members of the ingress port's native VLAN.
forward-vlan	Forwards any ingress STP BPDU frames to all ports that are tagged members of the ingress port's native VLAN.

**Default** The discard parameter is enabled by default.

**Mode** Global Configuration

**Usage** This command enables the switch to forward unsupported BPDUs with an unsupported Spanning Tree Protocol, such as proprietary STP protocols with unsupported BPDUs, by forwarding BPDU (Bridge Protocol Data Unit) frames unchanged through the switch.

You must disable RSTP with the **no spanning-tree rstp enable** command before you can use this command.

When you want to revert to default behavior on the switch, issue a **spanning-tree bpdu discard** command and re-enable Spanning Tree with a **spanning-tree rstp enable** command.

**Examples** To enable STP BPDU discard in Global Configuration mode with STP disabled, which discards all ingress STP BPDU frames, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
awplus(config)# spanning-tree bpdu discard
```

To enable STP BPDU forward in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports regardless of any VLAN membership, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
awplus(config)# spanning-tree bpdu forward
```

To enable STP BPDU forwarding for untagged frames in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports that are untagged members of the ingress port's native VLAN, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
awplus(config)# spanning-tree bpdu forward-untagged-vlan
```

To enable STP BPDU forwarding for tagged frames in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports that are tagged members of the ingress port's native VLAN, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
awplus(config)# spanning-tree bpdu forward-vlan
```

To reset STP BPDU back to the default `discard` parameter and re-enable RSTP on the switch, enter the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree bpdu discard
awplus(config)# spanning-tree rstp enable
```

**Related Commands** [show spanning-tree](#)  
[spanning-tree enable](#)

# spanning-tree cisco-interoperability (MSTP)

**Overview** Use this command to enable/disable Cisco-interoperability for MSTP.  
Use this command for MSTP only.

**Syntax** `spanning-tree cisco-interoperability {enable|disable}`

Parameter	Description
enable	Enable Cisco interoperability for MSTP.
disable	Disable Cisco interoperability for MSTP.

**Default** If this command is not used, Cisco interoperability is disabled.

**Mode** Global Configuration

**Usage** For compatibility with certain Cisco devices, all devices in the switched LAN running the AlliedWare Plus™ Operating System must have Cisco-interoperability enabled. When the AlliedWare Plus Operating System is interoperating with Cisco, the only criteria used to classify a region are the region name and revision level. VLAN to instance mapping is not used to classify regions when interoperating with Cisco.

**Examples** To enable Cisco interoperability on a Layer 2 device:

```
awplus# configure terminal
awplus(config)# spanning-tree cisco-interoperability enable
```

To disable Cisco interoperability on a Layer 2 device:

```
awplus# configure terminal
awplus(config)# spanning-tree cisco-interoperability disable
```

# spanning-tree edgeport (RSTP and MSTP)

**Overview** Use this command to set a port as an edge-port.

Use this command for RSTP or MSTP.

This command has the same effect as the [spanning-tree portfast \(STP\)](#) command, but the configuration displays differently in the output of some show commands.

Use the **no** variant of this command to set a port to its default state (not an edge-port).

**Syntax** `spanning-tree edgeport`  
`no spanning-tree edgeport`

**Default** Not an edge port.

**Mode** Interface Configuration

**Usage** Use this command on a switch port connected to a LAN that has no other bridges attached. If a BPDU is received on the port that indicates that another bridge is connected to the LAN, then the port is no longer treated as an edge port.

**Example** `awplus# configure terminal`  
`awplus(config)# interface port1.1.2`  
`awplus(config-if)# spanning-tree edgeport`

**Related Commands** [spanning-tree autoedge \(RSTP and MSTP\)](#)

# spanning-tree enable

**Overview** Use this command in Global Configuration mode to enable the specified spanning tree protocol for all switch ports. Note that this must be the spanning tree protocol that is configured on the device by the [spanning-tree mode](#) command.

Use the **no** variant of this command to disable the configured spanning tree protocol. This places all switch ports in the forwarding state.

**Syntax** `spanning-tree {mstp|rstp|stp} enable`  
`no spanning-tree {mstp|rstp|stp} enable`

Parameter	Description
mstp	Enables or disables MSTP (Multiple Spanning Tree Protocol).
rstp	Enables or disables RSTP (Rapid Spanning Tree Protocol).
stp	Enables or disables STP (Spanning Tree Protocol).

**Default** RSTP is enabled by default for all switch ports.

**Mode** Global Configuration

**Usage** With no configuration, spanning tree is enabled, and the spanning tree mode is set to RSTP. To change the mode, see [spanning-tree mode](#) command.

**Examples** To enable STP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree stp enable
```

To disable STP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
```

To enable MSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mstp enable
```

To disable MSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree mstp enable
```

To enable RSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree rstp enable
```

To disable RSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
```

```
awplus(config)# no spanning-tree rstp enable
```

**Related  
Commands** [spanning-tree mode](#)

# spanning-tree errdisable-timeout enable

**Overview** Use this command to enable the errdisable-timeout facility, which sets a timeout for ports that are disabled due to the BPDU guard feature.

Use this command for RSTP or MSTP.

Use the **no** variant of this command to disable the errdisable-timeout facility.

**Syntax** `spanning-tree errdisable-timeout enable`  
`no spanning-tree errdisable-timeout enable`

**Default** By default, the errdisable-timeout is disabled.

**Mode** Global Configuration

**Usage** The BPDU guard feature shuts down the port on receiving a BPDU on a BPDU-guard enabled port. This command associates a timer with the feature such that the port is re-enabled without manual intervention after a set interval. This interval can be configured by the user using the [spanning-tree errdisable-timeout interval](#) command.

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree errdisable-timeout enable`

**Related Commands** [show spanning-tree](#)  
[spanning-tree errdisable-timeout interval](#)  
[spanning-tree portfast bpdu-guard](#)

# spanning-tree errdisable-timeout interval

**Overview** Use this command to specify the time interval after which a port is brought back up when it has been disabled by the BPDU guard feature.

Use this command for RSTP or MSTP.

**Syntax** `spanning-tree errdisable-timeout interval <10-1000000>`  
`no spanning-tree errdisable-timeout interval`

Parameter	Description
<code>&lt;10-1000000&gt;</code>	Specify the errdisable-timeout interval in seconds.

**Default** By default, the port is re-enabled after 300 seconds.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree errdisable-timeout interval 34`

**Related Commands** [show spanning-tree](#)  
[spanning-tree errdisable-timeout enable](#)  
[spanning-tree portfast bpdu-guard](#)

# spanning-tree force-version

**Overview** Use this command in Interface Configuration mode for a switch port interface only to force the protocol version for the switch port. Use this command for RSTP or MSTP only.

**Syntax** `spanning-tree force-version <version>`  
`no spanning-tree force-version`

Parameter	Description
<code>&lt;version&gt;</code>	<code>&lt;0-3&gt;</code> Version identifier.
0	Forces the port to operate in STP mode.
1	Not supported.
2	Forces the port to operate in RSTP mode. If it receives STP BPDUs, it can automatically revert to STP mode.
3	Forces the port to operate in MSTP mode (this option is only available if MSTP mode is configured). If it receives RSTP or STP BPDUs, it can automatically revert to RSTP or STP mode.

**Default** By default, no version is forced for the port. The port is in the spanning tree mode configured for the device, or a lower version if it automatically detects one.

**Mode** Interface Configuration mode for a switch port interface only.

**Examples** Set the value to enforce the spanning tree protocol (STP):

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# spanning-tree force-version 0
```

Set the default protocol version:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no spanning-tree force-version
```

**Related Commands** [show spanning-tree](#)

# spanning-tree forward-time

**Overview** Use this command to set the forward delay value. Use the **no** variant of this command to reset the forward delay value to the default setting of 15 seconds.

The **forward delay** sets the time (in seconds) to control how fast a port changes its spanning tree state when moving towards the forwarding state. If the mode is set to STP, the value determines how long the port stays in each of the listening and learning states which precede the forwarding state. If the mode is set to RSTP or MSTP, this value determines the maximum time taken to transition from discarding to learning and from learning to forwarding.

This value is used only when the device is acting as the root bridge. Devices not acting as the Root Bridge use a dynamic value for the **forward delay** set by the root bridge. The **forward delay**, **max-age**, and **hello time** parameters are interrelated.

**Syntax** `spanning-tree forward-time <forward-delay>`  
`no spanning-tree forward-time`

Parameter	Description
<code>&lt;forward-delay&gt;</code>	<code>&lt;4-30&gt;</code> The forwarding time delay in seconds.

**Default** The default is 15 seconds.

**Mode** Global Configuration

**Usage** The allowable range for forward-time is 4-30 seconds.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

$2 \times (\text{forward delay} - 1.0 \text{ seconds}) \geq \text{max-age}$

$\text{max-age} \geq 2 \times (\text{hello time} + 1.0 \text{ seconds})$

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree forward-time 6
```

**Related Commands** [show spanning-tree](#)  
[spanning-tree forward-time](#)  
[spanning-tree hello-time](#)  
[spanning-tree mode](#)

# spanning-tree guard root

**Overview** Use this command in Interface Configuration mode for a switch port only to enable the Root Guard feature for the switch port. The root guard feature disables reception of superior BPDUs. You can use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to disable the root guard feature for the port.

**Syntax** `spanning-tree guard root`  
`no spanning-tree guard root`

**Mode** Interface Configuration mode for a switch port interface only.

**Usage** The Root Guard feature makes sure that the port on which it is enabled is a designated port. If the Root Guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP).

**Example** `awplus# configure terminal`  
`awplus(config)# interface port1.1.2`  
`awplus(config-if)# spanning-tree guard root`

# spanning-tree hello-time

**Overview** Use this command to set the hello-time. This sets the time in seconds between the transmission of device spanning tree configuration information when the device is the Root Bridge of the spanning tree or is trying to become the Root Bridge.

Use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to restore the default of the hello time.

**Syntax** `spanning-tree hello-time <hello-time>`  
`no spanning-tree hello-time`

Parameter	Description
<code>&lt;hello-time&gt;</code>	<code>&lt;1-10&gt;</code> The hello BPDU interval in seconds.

**Default** Default is 2 seconds.

**Mode** Global Configuration and Interface Configuration for switch ports.

**Usage** The allowable range of values is 1-10 seconds.

The forward delay, max-age, and hello time parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

$2 \times (\text{forward delay} - 1.0 \text{ seconds}) \geq \text{max-age}$

$\text{max-age} \geq 2 \times (\text{hello time} + 1.0 \text{ seconds})$

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree hello-time 3`

**Related Commands** [spanning-tree forward-time](#)  
[spanning-tree max-age](#)  
[show spanning-tree](#)

# spanning-tree link-type

**Overview** Use this command in Interface Configuration mode for a switch port interface only to enable or disable point-to-point or shared link types on the switch port.

Use this command for RSTP or MSTP only.

Use the **no** variant of this command to return the port to the default link type.

**Syntax** `spanning-tree link-type {point-to-point|shared}`  
`no spanning-tree link-type`

Parameter	Description
shared	Disable rapid transition.
point-to-point	Enable rapid transition.

**Default** The default link type is point-to-point.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage** You may want to set link type to shared if the port is connected to a hub with multiple devices connected to it.

**Examples** `awplus# configure terminal`  
`awplus(config)# interface port1.1.2`  
`awplus(config-if)# spanning-tree link-type point-to-point`

# spanning-tree max-age

**Overview** Use this command to set the max-age. This sets the maximum age, in seconds, that dynamic spanning tree configuration information is stored in the device before it is discarded.

Use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to restore the default of max-age.

**Syntax** `spanning-tree max-age <max-age>`  
`no spanning-tree max-age`

Parameter	Description
<code>&lt;max-age&gt;</code>	<code>&lt;6-40&gt;</code> The maximum time, in seconds.

**Default** The default of spanning-tree max-age is 20 seconds.

**Mode** Global Configuration

**Usage** Max-age is the maximum time in seconds for which a message is considered valid. Configure this value sufficiently high, so that a frame generated by the root bridge can be propagated to the leaf nodes without exceeding the max-age.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

$2 \times (\text{forward delay} - 1.0 \text{ seconds}) \geq \text{max-age}$

$\text{max-age} \geq 2 \times (\text{hello time} + 1.0 \text{ seconds})$

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree max-age 12`

**Related Commands** [show spanning-tree](#)  
[spanning-tree forward-time](#)  
[spanning-tree hello-time](#)

# spanning-tree max-hops (MSTP)

**Overview** Use this command to specify the maximum allowed hops for a BPDU in an MST region. This parameter is used by all the instances of the MST region.

Use the **no** variant of this command to restore the default.

Use this command for MSTP only.

**Syntax** `spanning-tree max-hops <hop-count>`  
`no spanning-tree max-hops <hop-count>`

Parameter	Description
<code>&lt;hop-count&gt;</code>	Specify the maximum hops the BPDU will be valid for in the range <1-40>.

**Default** The default max-hops in a MST region is 20.

**Mode** Global Configuration

**Usage** Specifying the max hops for a BPDU prevents the messages from looping indefinitely in the network. The hop count is decremented by each receiving port. When a device receives an MST BPDU that has a hop count of zero, it discards the BPDU.

**Examples** `awplus# configure terminal`  
`awplus(config)# spanning-tree max-hops 25`  
`awplus# configure terminal`  
`awplus(config)# no spanning-tree max-hops`

# spanning-tree mode

**Overview** Use this command to change the spanning tree protocol mode on the device. The spanning tree protocol mode on the device can be configured to either STP, RSTP or MSTP.

**Syntax** `spanning-tree mode {stp|rstp|mstp}`

**Default** The default spanning tree protocol mode on the device is RSTP.

**Mode** Global Configuration

**Usage** With no configuration, the device will have spanning tree enabled, and the spanning tree mode will be set to RSTP. Use this command to change the spanning tree protocol mode on the device. MSTP is VLAN aware, but RSTP and STP are not VLAN aware. To enable or disable spanning tree operation, see the [spanning-tree enable](#) command.

**Examples** To change the spanning tree mode from the default of RSTP to MSTP, use the following commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mode mstp
```

**Related Commands** [spanning-tree enable](#)

# spanning-tree mst configuration

**Overview** Use this command to enter the MST Configuration mode to configure the Multiple Spanning-Tree Protocol.

**Syntax** `spanning-tree mst configuration`

**Mode** Global Configuration

**Examples** The following example uses this command to enter MST Configuration mode. Note the change in the command prompt.

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)#
```

# spanning-tree mst instance

**Overview** Use this command to assign a Multiple Spanning Tree instance (MSTI) to a switch port or channel group.

Note that ports are automatically configured to send and receive spanning-tree information for the associated MSTI when VLANs are assigned to MSTIs using the [instance vlan \(MSTP\)](#) command.

Use the **no** variant of this command in Interface Configuration mode to remove the MSTI from the specified switch port or channel group.

**Syntax**

```
spanning-tree mst instance <instance-id>  
no spanning-tree mst instance <instance-id>
```

Parameter	Description
<instance-id>	Specify an MSTP instance in the range 1-15. The MST instance must have already been created using the <a href="#">instance vlan (MSTP)</a> command.

**Default** A port automatically becomes a member of an MSTI when it is assigned to a VLAN.

**Mode** Interface Configuration mode for a switch port or channel group.

**Usage** You can disable automatic configuration of member ports of a VLAN to an associated MSTI by using a **no spanning-tree mst instance** command to remove the member port from the MSTI. Use the **spanning-tree mst instance** command to add a VLAN member port back to the MSTI.

**Examples** To assign instance 3 to a switch port, use the commands:

```
awplus# configure terminal  
awplus(config)# interface port1.1.2  
awplus(config-if)# spanning-tree mst instance 3
```

To remove instance 3 from a switch port, use the commands:

```
awplus# configure terminal  
awplus(config)# interface port1.1.2  
awplus(config-if)# no spanning-tree mst instance 3
```

**Related Commands**

- [instance vlan \(MSTP\)](#)
- [spanning-tree mst instance path-cost](#)
- [spanning-tree mst instance priority](#)
- [spanning-tree mst instance restricted-role](#)
- [spanning-tree mst instance restricted-tcn](#)

# spanning-tree mst instance path-cost

**Overview** Use this command to set the cost of a path associated with a switch port, for the specified MSTI.

This specifies the switch port's contribution to the cost of a path to the MSTI regional root via that port. This applies when the port is the root port for the MSTI.

Use the **no** variant of this command to restore the default cost value of the path.

**Syntax** `spanning-tree mst instance <instance-id> path-cost <path-cost>`  
`no spanning-tree mst instance <instance-id> path-cost`

Parameter	Description
<code>&lt;instance-id&gt;</code>	Specify an MSTP instance in the range 1-15.
<code>&lt;path-cost&gt;</code>	Specify the cost of path in the range of <1-200000000>, where a lower path-cost indicates a greater likelihood of the specific interface becoming a root.

**Default** The default path cost values and the range of recommended path cost values depend on the port speed, as shown in the following table from the IEEE 802.1q-2003 standard.

Port speed	Default path cost	Recommended path cost range
Less than 100 Kb/s	200,000,000	20,000,000-200,000,000
1Mbps	20,000,000	2,000,000-20,000,000
10Mbps	2,000,000	200,000-2,000,000
100 Mbps	200,000	20,000-200,000
1 Gbps	20,000	2,000-20,000
10 Gbps	2,000	200-2,000
100 Gbps	200	20-200
1Tbps	20	2-200
10 Tbps	2	2-20

**Mode** Interface Configuration mode for a switch port interface only.

**Usage** Before you can use this command to set a path-cost in a VLAN configuration, you must explicitly add an MST instance to a port using the [spanning-tree mst instance](#) command.

**Examples** To set a path cost of 1000 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# spanning-tree mst instance 3 path-cost 1000
```

To return the path cost to its default value on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no spanning-tree mst instance 3 path-cost
```

**Related  
Commands**

[instance vlan \(MSTP\)](#)  
[spanning-tree mst instance](#)  
[spanning-tree mst instance priority](#)  
[spanning-tree mst instance restricted-role](#)  
[spanning-tree mst instance restricted-tcn](#)

# spanning-tree mst instance priority

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the port priority for an MST instance (MSTI).

Use the **no** variant of this command to restore the default priority value (128).

**Syntax** `spanning-tree mst instance <instance-id> priority <priority>`  
`no spanning-tree mst instance <instance-id> [priority]`

Parameter	Description
<code>&lt;instance-id&gt;</code>	Specify an MSTP instance in the range 1-15.
<code>&lt;priority&gt;</code>	This must be a multiple of 16 and within the range <0-240>. A lower priority indicates greater likelihood of the port becoming the root port.

**Default** The default is 128.

**Mode** Interface Configuration mode for a switch port interface.

**Usage** This command sets the value of the priority field contained in the port identifier. The MST algorithm uses the port priority when determining the root port for the switch in the MSTI. The port with the lowest value has the highest priority, so it will be chosen as root port over a port that is equivalent in all other aspects but with a higher priority value.

**Examples** To set the priority to 112 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# spanning-tree mst instance 3 priority 112
```

To return the priority to its default value of 128 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no spanning-tree mst instance 3 priority
```

## Related Commands

[spanning-tree mst instance path-cost](#)  
[spanning-tree mst instance restricted-role](#)  
[spanning-tree mst instance restricted-tcn](#)

# spanning-tree mst instance restricted-role

**Overview** Use this command in Interface Configuration mode for a switch port interface only to enable the restricted role for an MSTI (Multiple Spanning Tree Instance) on a switch port. Configuring the restricted role for an MSTI on a switch port prevents the switch port from becoming the root port in a spanning tree topology.

Use the **no** variant of this command to disable the restricted role for an MSTI on a switch port. Removing the restricted role for an MSTI on a switch port allows the switch port to become the root port in a spanning tree topology.

**Syntax** `spanning-tree mst instance <instance-id> restricted-role`  
`no spanning-tree mst instance <instance-id> restricted-role`

Parameter	Description
<code>&lt;instance-id&gt;</code>	Specify an MSTP instance in the range 1-15. The MST instance must have already been created using the <a href="#">instance vlan (MSTP)</a> command.

**Default** The restricted role for an MSTI instance on a switch port is disabled by default.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage** The root port is the port providing the best path from the bridge to the root bridge. Use this command to disable a port from becoming a root port. Use the **no** variant of this command to enable a port to become a root port. See the [STP Feature Overview and Configuration Guide](#) for root port information.

**Examples** To prevent a switch port from becoming the root port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# spanning-tree mst instance 3 restricted-role
```

To stop preventing the switch port from becoming the root port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no spanning-tree mst instance 3
restricted-role
```

**Related  
Commands** instance vlan (MSTP)  
spanning-tree priority (port priority)  
spanning-tree mst instance  
spanning-tree mst instance path-cost  
spanning-tree mst instance restricted-tcn

# spanning-tree mst instance restricted-tcn

**Overview** Use this command to prevent a switch port from propagating received topology change notifications and topology changes to other switch ports. This is named restricted TCN (Topology Change Notification). A TCN is a simple Bridge Protocol Data Unit (BPDU) that a bridge sends out to its root port to signal a topology change.

Use the **no** variant of this command to stop preventing the switch port from propagating received topology change notifications and topology changes to other switch ports for the specified MSTI (Multiple Spanning Tree Instance).

The restricted TCN setting applies only to the specified MSTI (Multiple Spanning Tree Instance).

**Syntax** `spanning-tree mst instance <instance-id> restricted-tcn`  
`no spanning-tree mst instance <instance-id> restricted-tcn`

Parameter	Description
<code>&lt;instance-id&gt;</code>	Specify an MSTP instance in the range 1-15. The MST instance must have already been created using the <a href="#">instance vlan (MSTP)</a> command.

**Default** Disabled. By default, switch ports propagate TCNs.

**Mode** Interface Configuration mode for a switch port interface only.

**Examples** To prevent a switch port from propagating received topology change notifications and topology changes to other switch ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# spanning-tree mst instance 3 restricted-tcn
```

To stop preventing a switch port from propagating received topology change notifications and topology changes to other switch ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no spanning-tree mst instance 3
restricted-tcn
```

**Related Commands**

- [spanning-tree priority \(port priority\)](#)
- [spanning-tree mst instance](#)
- [spanning-tree mst instance path-cost](#)
- [spanning-tree mst instance restricted-role](#)

# spanning-tree path-cost

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the cost of a path for the specified port. This value then combines with others along the path to the root bridge in order to determine the total cost path value from the particular port, to the root bridge. The lower the numeric value, the higher the priority of the path. This applies when the port is the root port.

Use this command for RSTP, STP or MSTP. When MSTP mode is configured, this will apply to the port's path cost for the CIST.

**Syntax** `spanning-tree path-cost <pathcost>`  
`no spanning-tree path-cost`

Parameter	Description
<code>&lt;pathcost&gt;</code>	<code>&lt;1-200000000&gt;</code> The cost to be assigned to the port.

**Default** The default path cost values and the range of recommended path cost values depend on the port speed, as shown in the following table from the IEEE 802.1q-2003 and IEEE 802.1d-2004 standards.

Port speed	Default path cost	Recommended path cost range
Less than 100 Kb/s	200,000,000	20,000,000-200,000,000
1Mbps	20,000,000	2,000,000-20,000,000
10Mbps	2,000,000	200,000-2,000,000
100 Mbps	200,000	20,000-200,000
1 Gbps	20,000	2,000-20,000
10 Gbps	2,000	200-2,000
100 Gbps	200	20-200
1Tbps	20	2-200
10 Tbps	2	2-20

**Mode** Interface Configuration mode for switch port interface only.

**Example** `awplus# configure terminal`  
`awplus(config)# interface port1.1.2`  
`awplus(config-if)# spanning-tree path-cost 123`

# spanning-tree portfast (STP)

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set a port as an edge-port. The portfast feature enables a port to rapidly move to the forwarding state, without having first to pass through the intermediate spanning tree states. This command has the same effect as the [spanning-tree edgeport \(RSTP and MSTP\)](#) command, but the configuration displays differently in the output of some show commands.

**NOTE:** You can run either of two additional parameters with this command. To simplify the syntax these are documented as separate commands. See the following additional portfast commands:

- [spanning-tree portfast bpdu-filter](#) command
- [spanning-tree portfast bpdu-guard](#) command.

You can obtain the same effect by running the [spanning-tree edgeport \(RSTP and MSTP\)](#) command. However, the configuration output may display differently in some show commands.

Use the **no** variant of this command to set a port to its default state (not an edge-port).

**Syntax** `spanning-tree portfast`  
`no spanning-tree portfast`

**Default** Not an edge port.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage** Portfast makes a port move from a blocking state to a forwarding state, bypassing both listening and learning states. The portfast feature is meant to be used for ports connected to end-user devices. Enabling portfast on ports that are connected to a workstation or server allows devices to connect to the network without waiting for spanning-tree to converge.

For example, you may need hosts to receive a DHCP address quickly and waiting for STP to converge would cause the DHCP request to time out. Ensure you do not use portfast on any ports connected to another device to avoid creating a spanning-tree loop on the network.

Use this command on a switch port that connects to a LAN with no other bridges attached. An edge port should never receive BPDUs. Therefore if an edge port receives a BPDU, the portfast feature takes one of three actions.

- Cease to act as an edge port and pass BPDUs as a member of a spanning tree network ([spanning-tree portfast \(STP\)](#) command disabled).
- Filter out the BPDUs and pass only the data and continue to act as a edge port ([spanning-tree portfast bpdu-filter](#) command enabled).
- Block the port to all BPDUs and data ([spanning-tree portfast bpdu-guard](#) command enabled).

**Example** awplus# configure terminal  
awplus(config)# interface port1.1.2  
awplus(config-if)# spanning-tree portfast

**Related  
Commands** spanning-tree edgeport (RSTP and MSTP)  
show spanning-tree  
spanning-tree portfast bpdu-filter  
spanning-tree portfast bpdu-guard

# spanning-tree portfast bpdu-filter

**Overview** This command sets the bpdu-filter feature and applies a filter to any BPDUs (Bridge Protocol Data Units) received. Enabling this feature ensures that configured ports will not transmit any BPDUs and will ignore (filter out) any BPDUs received. BPDU Filter is not enabled on a port by default.

Using the **no** variant of this command to turn off the bpdu-filter, but retain the port's status as an enabled port. If the port then receives a BPDU it will change its role from an **edge-port** to a **non edge-port**.

**Syntax (Global Configuration)**

```
spanning-tree portfast bpdu-filter  
no spanning-tree portfast bpdu-filter
```

**Syntax (Interface Configuration)**

```
spanning-tree portfast bpdu-filter  
{default|disable|enable}  
no spanning-tree portfast bpdu-filter
```

Parameter	Description
bpdu-filter	A port that has bpdu-filter enabled will not transmit any BPDUs and will ignore any BPDUs received. This port type has one of the following parameters (in Interface Configuration mode):
default	Takes the setting that has been configured for the whole device, i.e. the setting made from the Global configuration mode.
disable	Turns off BPDU filter.
enable	Turns on BPDU filter.

**Default** BPDU Filter is not enabled on any ports by default.

**Mode** Global Configuration and Interface Configuration

**Usage** This command filters the BPDUs and passes only data to continue to act as an edge port. Using this command in Global Configuration mode applies the portfast bpdu-filter feature to all ports on the device. Using it in Interface mode applies the feature to a specific port, or range of ports. The command will operate in both RSTP and MSTP networks.

Use the [show spanning-tree](#) command to display status of the bpdu-filter parameter for the switch ports.

**Example** To enable STP BPDU filtering in Global Configuration mode, enter the commands:

```
awplus# configure terminal  
awplus(config)# spanning-tree portfast bpdu-filter
```

To enable STP BPDU filtering in Interface Configuration mode, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# spanning-tree portfast bpdu-filter enable
```

**Related  
Commands**

[spanning-tree edgeport \(RSTP and MSTP\)](#)  
[show spanning-tree](#)  
[spanning-tree portfast \(STP\)](#)  
[spanning-tree portfast bpdu-guard](#)

# spanning-tree portfast bpdu-guard

**Overview** This command applies a BPDU (Bridge Protocol Data Unit) guard to the port. A port with the bpdu-guard feature enabled will block all traffic (BPDUs and user data), if it starts receiving BPDUs.

Use this command in Global Configuration mode to apply BPDU guard to all ports on the device. Use this command in Interface mode for an individual interface or a range of interfaces specified. BPDU Guard is not enabled on a port by default.

Use the **no** variant of this command to disable the BPDU Guard feature on a device in Global Configuration mode or to disable the BPDU Guard feature on a port in Interface mode.

## Syntax (Global Configuration)

```
spanning-tree portfast bpdu-guard  
no spanning-tree portfast bpdu-guard
```

## Syntax (Interface Configuration)

```
spanning-tree portfast bpdu-guard  
{default|disable|enable}  
no spanning-tree portfast bpdu-guard
```

Parameter	Description
bpdu-guard	A port that has bpdu-guard turned on will enter the STP blocking state if it receives a BPDU. This port type has one of the following parameters (in Interface Configuration mode):
default	Takes the setting that has been configured for the whole device, i.e. the setting made from the Global configuration mode.
disable	Turns off BPDU guard.
enable	Turns on BPDU guard and will also set the port as an edge port.

**Default** BPDU Guard is not enabled on any ports by default.

**Mode** Global Configuration or Interface Configuration

**Usage** This command blocks the port(s) to all devices and data when enabled. BPDU Guard is a port-security feature that changes how a portfast-enabled port behaves if it receives a BPDU. When **bpdu-guard** is set, then the port shuts down if it receives a BPDU. It does not process the BPDU as it is considered suspicious. When **bpdu-guard** is not set, then the port will negotiate spanning-tree with the device sending the BPDUs. By default, bpdu-guard is not enabled on a port.

You can configure a port disabled by the bpdu-guard to re-enable itself after a specific time interval. This interval is set with the [spanning-tree errdisable-timeout interval](#) command. If you do not use the **errdisable-timeout** feature, then you will need to manually re-enable the port by using the **no shutdown** command.

Use the `show spanning-tree` command to display the device and port configurations for the BPDU Guard feature. It shows both the administratively configured and currently running values of `bpdu-guard`.

**Example** To enable STP BPDU guard in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree portfast bpdu-guard
```

To enable STP BPDU guard in Interface Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# spanning-tree portfast bpdu-guard enable
```

**Related Commands**

- `show spanning-tree`
- `spanning-tree portfast (STP)`
- `spanning-tree portfast bpdu-filter`

# spanning-tree priority (bridge priority)

**Overview** Use this command to set the bridge priority for the device. A lower priority value indicates a greater likelihood of the device becoming the root bridge.

Use this command for RSTP, STP or MSTP. When MSTP mode is configured, this will apply to the CIST.

Use the **no** variant of this command to reset it to the default.

**Syntax** `spanning-tree priority <priority>`  
`no spanning-tree priority`

Parameter	Description
<code>&lt;priority&gt;</code>	<code>&lt;0-61440&gt;</code> The bridge priority, which will be rounded to a multiple of 4096.

**Default** The default priority is 32678.

**Mode** Global Configuration

**Usage** To force a particular device to become the root bridge use a lower value than other devices in the spanning tree.

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree priority 4096`

**Related Commands** [spanning-tree mst instance priority](#)  
[show spanning-tree](#)

# spanning-tree priority (port priority)

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the port priority for port. A lower priority value indicates a greater likelihood of the port becoming part of the active topology.

Use this command for RSTP, STP, or MSTP. When the device is in MSTP mode, this will apply to the CIST.

Use the **no** variant of this command to reset it to the default.

**Syntax** `spanning-tree priority <priority>`  
`no spanning-tree priority`

Parameter	Description
<code>&lt;priority&gt;</code>	<code>&lt;0-240&gt;</code> , in increments of 16. The port priority, which will be rounded down to a multiple of 16.

**Default** The default priority is 128.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage** To force a port to be part of the active topology (for instance, become the root port or a designated port) use a lower value than other ports on the device. (This behavior is subject to network topology, and more significant factors, such as bridge ID.)

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# spanning-tree priority 16
```

**Related Commands**

- [spanning-tree mst instance priority](#)
- [spanning-tree priority \(bridge priority\)](#)
- [show spanning-tree](#)

# spanning-tree restricted-role

**Overview** Use this command in Interface Configuration mode for a switch port interface only to restrict the port from becoming a root port.

Use the **no** variant of this command to disable the restricted role functionality.

**Syntax** `spanning-tree restricted-role`  
`no spanning-tree restricted-role`

**Default** The restricted role is disabled.

**Mode** Interface Configuration mode for a switch port interface only.

**Example** `awplus# configure terminal`  
`awplus(config)# interface port1.1.2`  
`awplus(config-if)# spanning-tree restricted-role`

# spanning-tree restricted-tcn

**Overview** Use this command in Interface Configuration mode for a switch port interface only to prevent TCN (Topology Change Notification) BPDUs (Bridge Protocol Data Units) from being sent on a port. If this command is enabled, after a topology change a bridge is prevented from sending a TCN to its designated bridge.

Use the **no** variant of this command to disable the restricted TCN functionality.

**Syntax** `spanning-tree restricted-tcn`  
`no spanning-tree restricted-tcn`

**Default** The restricted TCN is disabled.

**Mode** Interface Configuration mode for a switch port interface only.

**Example** `awplus# configure terminal`  
`awplus(config)# interface port1.1.2`  
`awplus(config-if)# spanning-tree restricted-tcn`

# spanning-tree transmit-holdcount

**Overview** Use this command to set the maximum number of BPDU transmissions that are held back.

Use the **no** variant of this command to restore the default transmit hold-count value.

**Syntax** `spanning-tree transmit-holdcount`  
`no spanning-tree transmit-holdcount`

**Default** Transmit hold-count default is 3.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree transmit-holdcount`

# undebbug mstp

**Overview** This command applies the functionality of the no `debug mstp` (RSTP and STP) command.

# 17

# Unidirectional Link Detection (UDLD) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure the Unidirectional Link Detection (UDLD) protocol.

UDLD is a data link protocol which monitors network cables and detects broken bidirectional links. It complements the spanning tree protocol (STP), which is used to eliminate Layer 2 loops.

A license is required to use this feature. Please contact your authorized Allied Telesis representative for more information.

# debug udld

**Overview** Use this command to enable UDLD debugging.  
Use the **no** variant of this command to disable UDLD debugging.

**Syntax** `debug udld [info|pkt|state|nsm|all]`  
`no debug udld [info|pkt|state|nsm|all]`

Parameter	Description
info	Enable or disable general UDLD debugging information.
pkt	Enable or disable debugging of UDLD packets.
state	Enable or disable UDLD state transition debugging.
nsm	Enable or disable UDLD Network Service Module (NSM) debugging information.
all	Enable or disable the all UDLD debugging.

**Default** Debugging is disabled for **all** by default.

**Mode** Global Configuration  
Privileged Exec

**Example** To enable UDLD packet debugging, use the commands:

```
awplus# configure terminal  
awplus(config)# debug udld pkt
```

**Related Commands** [show debugging udld](#)  
[undebug udld](#)

# show debugging udld

**Overview** Use this command to show which UDLD debugging options are set.

**Syntax** show debugging udld

**Mode** Privileged Exec

**Example** To show which UDLD debugging options are set, use the command:

```
awplus# show debugging udld
```

**Output** Figure 17-1: Example output from **show debugging udld**

```
awplus# show debugging udld
UDLD debugging status:
  Info debugging   : off
  Packet debugging: off
  State debugging  : on
  NSM debugging    : off
```

**Related Commands** [debug udld](#)

# show udld

**Overview** Use this command to display global UDLD status and configuration settings.

**Syntax** show udld

**Mode** Privileged Exec

**Example** To show global UDLD information, use the command:

```
awplus# show udld
```

**Output** Figure 17-2: Example output from **show udld**

```
awplus#show udld
Status          : Enabled
Mode            : Normal
Message-Interval: 7 seconds
Timeout-Interval: 5 seconds
Disable-Period  : 15 seconds

[Fiber-Ports]
Port           Status   Mode      Directional-State
-----
port1.1.1     Enabled  Aggressive Bidirectional
port1.1.2     Disabled Normal    -
```

**Related Commands**

- [udld port](#)
- [udld port disable](#)
- [udld enable](#)

# show udld neighbors

**Overview** Use this command to display UDLD neighbor status.

**Syntax** `show udld neighbors [<interface-name>] [detail]`

Parameter	Description
<interface-name>	Show UDLD neighbor information for a specified interface.
detail	This option provides a greater level of detail.

**Mode** Privileged Exec

**Example** To show UDLD information for all neighbors, use the command:

```
awplus# show udld neighbors
```

To show detailed UDLD neighbor information for port1.1.1, use the command:

```
awplus# show udld neighbours port1.1.1 detail
```

**Output** Figure 17-3: Example output from **show udld neighbors**

```
awplus#show udld neighbors
```

Port	Device-ID	Port-ID	Device-Name	Neighbor-State
port1.1.1	0000F4272DA2	port2.0.1	X930	Bidirectional
port1.1.2	0000F5572632	port1.0.15	X610	Bidirectional

Figure 17-4: Example output from **show udld neighbor port1.1.1 detail**

```
awplus# show udld neighbor port1.1.1 detail
[port1.1.1]
Device-ID       : 0000F4272DA2
Port-ID        : port2.0.1
Device-Name    : X930
Operational-State: Bidirectional
Expiration-time : 35 seconds
Message-Interval : 15 seconds
Timeout-Interval : 5 seconds

Neighbors in Echo:
Device-ID      Port-ID
-----
0000F4272DA2  port2.0.1
0000F5572632  port1.0.15
```

**Related Commands**

- [udld port](#)
- [udld port disable](#)
- [udld enable](#)

# show udld port

**Overview** Use this command to display UDLD port status and configuration settings.

**Syntax** `show udld port [<interface-name>] [detail]`

Parameter	Description
<interface-name>	Show UDLD information for a specified interface.
detail	This option provides a greater level of detail.

**Mode** Privileged Exec

**Example** To show UDLD information for all ports, use the command:

```
awplus# show udld port
```

To show detailed UDLD information for port1.1.1, use the command:

```
awplus# show udld port port1.1.1 detail
```

**Output** Figure 17-5: Example output from **show udld port**

```
awplus#show udld port
Port          Status   Mode      Directional-State
-----
port1.1.1    Enabled Aggressive Bidirectional
port1.1.2    Disabled Normal      -
```

Figure 17-6: Example output from **show udld port port1.1.1 detail**

```
awplus#show udld port port1.1.1 detail
[port1.1.1]
Status          : Enabled
Mode            : Aggressive
Directional-State: Bidirectional
Operational-State: Advertisement - single neighbor detected

Neighbors:
Device-ID      Port-ID      Device-Name   Directional-State
-----
0000F4272DA2  port2.0.1    awplus       Bidirectional
```

**Related Commands**

- [udld port](#)
- [udld port disable](#)
- [udld enable](#)

# udld aggressive-mode

**Overview** Use this command to set UDLD to aggressive mode on all interfaces.

In **normal mode**, when the UDLD information times out:

- No action is taken by UDLD.
- The UDLD port state is set to undetermined.
- The port behaves according to its STP state.

In **aggressive mode**, when the UDLD information times out:

- UDLD tries to re-establish the state of the port.
- If not successful, after 8 retries, the port is disabled.

**NOTE:** *If stacking is configured with UDLD then only configure aggressive-mode on the ports that require it. If it is configured on all ports, it will be disabled on all but the resilience link when a stack member reboots.*

Use the **no** variant of this command to disable aggressive mode on all interfaces.

**Syntax** `udld aggressive-mode`  
`no udld aggressive-mode`

**Default** Aggressive mode is disabled by default.

**Mode** Global Configuration

**Example** To enable aggressive mode on interfaces, use the commands:

```
awplus# configure terminal
awplus(config)# udld aggressive-mode
```

To disable aggressive mode, use the commands:

```
awplus# configure terminal
awplus(config)# no udld aggressive-mode
```

**Related Commands** [udld port aggressive-mode](#)  
[show udld](#)

# udld enable

**Overview** Use this command to enable UDLD on all of a device's fiber-optic ports. It has no effect on copper ports. Use the [udld port](#) command to enable UDLD on copper ports.

Use the **no** variant of this command to disable the UDLD feature on all of a device's fiber interfaces.

**Syntax** `udld enable`  
`no udld enable`

**Default** UDLD is disabled by default.

**Mode** Global Configuration

**Example** To enable the UDLD feature on all fiber interfaces, use the command:

```
awplus# configure terminal
awplus(config)# udld enable
```

**Related Commands**

- [show udld](#)
- [show udld neighbors](#)
- [udld aggressive-mode](#)
- [udld port](#)
- [udld port disable](#)
- [udld reset](#)
- [udld time disable-period](#)
- [udld time message-interval](#)

# udld port

**Overview** Use this command to enable UDLD on an interface. This command enables UDLD on both copper and fiber ports.

Use the **no** variant of this command to disable UDLD on an interface.

**Syntax** `udld port`  
`no udld port`

**Default** UDLD is disabled on an interface by default.

**Mode** Interface Configuration

- Usage**
- This command always enables the UDLD feature on a port.
  - The `udld port disable` command overwrites this command and disables UDLD on an interface.
  - If UDLD has been set globally, using the `udld enable` command, then AlliedWare Plus ignores the **no udld port** command on a fiber interface.

**Example** To enable UDLD on port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# udld port
```

To disable UDLD on port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no udld port
```

**Related Commands**

- `show udld port`
- `show udld neighbors`
- `udld enable`
- `udld port disable`
- `udld reset`
- `udld time disable-period`
- `udld time message-interval`

# udld port aggressive-mode

**Overview** Use this command to enable UDLD aggressive mode on an interface.

In **normal mode**, when the UDLD information times out:

- No action is taken by UDLD.
- The UDLD port state is set to undetermined.
- The port behaves according to its STP state.

In **aggressive mode**, when the UDLD information times out:

- UDLD tries to re-establish the state of the port.
- If not successful, after 8 retries, the port is disabled.

Use the **no** variant of this command to disable aggressive mode on an interface.

**Syntax** `udld port aggressive-mode`  
`no udld port aggressive-mode`

**Default** Aggressive mode is disabled on an interface by default.

**Mode** Interface Configuration

**Example** To change the UDLD mode to aggressive on port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# udld port aggressive-mode
```

To disable aggressive mode on port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no port aggressive-mode
```

**Related  
Commands** [udld aggressive-mode](#)  
[show udld port](#)

# udld port disable

**Overview** Use this command to disable UDLD on an interface. This command disables UDLD on both copper and fiber ports

Use the **no** variant of this command to allow UDLD on a fiber port.

**Syntax** `udld port disable`  
`no udld port disable`

**Default** UDLD disable is not set by default.

- Usage**
- This command always disables the UDLD feature on a port.
  - The `udld port` command overwrites this command and enables UDLD on an interface.
  - If UDLD has been set globally, using the `udld enable` command, then AlliedWare Plus ignores the **no udld port** command on a fiber interface.

**Mode** Interface Configuration

**Example** To disable UDLD on port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# udld port disable
```

To enable UDLD on port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no udld port disable
```

**Related Commands** `udld enable`  
`udld port`  
`show udld port`

# udld reset

**Overview** Use this command to reset the status of any interface disabled by UDLD.

**Syntax** `udld reset`

**Mode** Global Configuration

**Example** To reset an interface that has been disabled by UDLD, use the commands:

```
awplus# configure terminal
awplus(config)# udld reset
```

**Output** Figure 17-7: Example output from **udld reset**, when 2 ports are disabled

```
awplus#udld reset
2 ports disabled by udld reset
```

Figure 17-8: Example output from **udld reset**, when no ports are disabled

```
awplus#udld reset
No ports are disabled by udld reset
```

**Related  
Commands** [show udld](#)  
[udld enable](#)

# udld time disable-period

**Overview** Use this command to set the UDLD disable period on all interfaces. The disable period is the time (in seconds) that a port is marked disabled before UDLD attempts to recheck it.

Manually reset the UDLD status of a port using the [udld reset](#) command.

Use the **no** variant of this command to reset the disable period to infinite.

**Syntax** `udld time disable-period <seconds>`  
`no udld time disable-period`

Parameter	Description
<code>&lt;seconds&gt;</code>	30-86400 Specify the disable period in seconds.

**Default** The default time disable period is infinite.

**Mode** Global Configuration

**Example** To change the UDLD disable period to 60 sec on all interfaces, use the commands:

```
awplus# configure terminal
awplus(config)# udld time disable-period 60
```

To reset the disable period to infinite, use the commands:

```
awplus# configure terminal
awplus(config)# no udld time disable-period
```

**Related Commands** [udld enable](#)  
[udld port](#)  
[show udld](#)

# udld time message-interval

**Overview** Use this command to set the UDLD message send interval on all interfaces.

This is the time, in seconds, between UDLD probe messages.

Use the **no** variant of this command to reset the message send interval to 15 seconds.

**Syntax** `udld time message-interval <seconds>`  
`no udld time message-interval`

Parameter	Description
<code>&lt;seconds&gt;</code>	7-90 Specify the message send interval in seconds.

**Default** The default message send interval is 15 seconds.

**Mode** Global Configuration

**Example** To change UDLD message sending interval to 30 sec on all interfaces, use the commands:

```
awplus# configure terminal  
awplus(config)# udld time message-interval 30
```

To reset the message sending interval to 15 seconds, use the commands:

```
awplus# configure terminal  
awplus(config)# no udld time message-interval
```

**Related  
Commands** [udld enable](#)  
[udld port](#)  
[show udld](#)

# undebbug udlld

**Overview** This command applies the functionality of the **no debug udlld** command.

# 18

# Link Aggregation Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure a static channel group (static aggregator) and dynamic channel group (LACP channel group, etherchannel or LACP aggregator). Link aggregation is also sometimes referred to as channeling.

**NOTE:** *AlliedWare Plus™ supports IEEE 802.3ad link aggregation and uses the Link Aggregation Control Protocol (LACP). LACP does not interoperate with devices that use Port Aggregation Protocol (PAgP).*

*Link aggregation does not necessarily achieve exact load balancing across the links. The load sharing algorithm is designed to ensure that any given data flow always goes down the same link. It also aims to spread data flows across the links as evenly as possible.*

*For example, for a 2 Gbps LAG that is a combination of two 1 Gbps ports, any one flow of traffic can only ever reach a maximum throughput of 1 Gbps. However, the hashing algorithm should spread the flows across the links so that when many flows are operating, the full 2 Gbps can be utilized.*

*For information about load balancing see the [platform load-balancing](#) command.*

For a description of static and dynamic link aggregation (LACP), and configuration examples, see the [Link Aggregation Feature Overview and Configuration Guide](#).

# channel-group

**Overview** Use this command to either create a new dynamic channel group while at the same time adding a port to it, or to add a port to an existing dynamic channel group. Note that you must also set the LACP mode to be either active or passive.

You can create up to 32 dynamic (LACP) channel groups (and up to 96 static channel groups).

Use the **no** variant of this command to turn off link aggregation on the device port. You will be returned to Global Configuration mode from Interface Configuration mode.

**Syntax** `channel-group <dynamic-channel-group-number> mode {active|passive}`  
`no channel-group`

Parameter	Description
<code>&lt;dynamic-channel-group-number&gt;</code>	<code>&lt;1-32&gt;</code> Specify a dynamic channel group number for an LACP link. You can create up to 32 dynamic (LACP) channel groups (in addition to up to 96 static channel groups).
<code>active</code>	Enables initiation of LACP negotiation on a port. The port will transmit LACP dialogue messages whether or not it receives them from the partner device.
<code>passive</code>	Disables initiation of LACP negotiation on a port. The port will only transmit LACP dialogue messages if the partner device is transmitting them, i.e., the partner is in the active mode.

**Mode** Interface Configuration

**Usage** All the device ports in a channel-group must belong to the same VLANs, have the same tagging status, and can only be operated on as a group. All device ports within a channel group must have the same port speed and be in full duplex mode.

Once the LACP channel group has been created, it is treated as a device port, and can be referred to in most other commands that apply to device ports.

To refer to an LACP channel group in other LACP commands, use the channel group number. To specify an LACP channel group (LACP aggregator) in other commands, prefix the channel group number with **po**. For example, 'po2' refers to the LACP channel group with channel group number 2.

For more information about LACP, see the [Link Aggregation Feature Overview and Configuration Guide](#) which is available on our website at [alliedtelesis.com](#).

**Examples** To add port1.1.8 to a newly created LACP channel group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.8
awplus(config-if)# channel-group 2 mode active
```

To remove device port1.1.8 from any created LACP channel groups, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.8
awplus(config-if)# no channel-group
```

To reference channel group 2 as an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface po2
awplus(config-if)#
```

**Related  
Commands**

- [show etherchannel](#)
- [show etherchannel detail](#)
- [show etherchannel summary](#)
- [show port etherchannel](#)

# clear lacp counters

**Overview** Use this command to clear all counters of all present LACP aggregators (channel groups) or a given LACP aggregator.

**Syntax** `clear lacp [<1-32>] counters`

Parameter	Description
<1-32>	Channel-group number.

**Mode** Privileged Exec

**Example** `awplus# clear lacp 2 counters`

# debug lacp

**Overview** Use this command to enable all LACP troubleshooting functions.

Use the **no** variant of this command to disable this function.

**Syntax** `debug lacp {all|cli|event|ha|packet|sync|timer[detail]}`  
`no debug lacp {all|cli|event|ha|packet|sync|timer[detail]}`

Parameter	Description
all	Turn on all debugging for LACP.
cli	Specifies debugging for CLI messages. Echoes commands to the console.
event	Specifies debugging for LACP events. Echoes events to the console.
ha	Specifies debugging for HA (High Availability) events. Echoes High Availability events to the console.
packet	Specifies debugging for LACP packets. Echoes packet contents to the console.
sync	Specified debugging for LACP synchronization. Echoes synchronization to the console.
timer	Specifies debugging for LACP timer. Echoes timer expiry to the console.
detail	Optional parameter for LACP timer-detail. Echoes timer start/stop details to the console.

**Mode** Privileged Exec and Global Configuration

**Examples** `awplus# debug lacp timer detail`  
`awplus# debug lacp all`

**Related Commands** [show debugging lacp](#)  
[undebug lacp](#)

# lacp global-passive-mode enable

**Overview** Use this command to enable LACP channel-groups to dynamically self-configure when they are connected to another device that has LACP channel-groups configured with Active Mode.

**Syntax** lacp global-passive-mode enable  
no lacp global-passive-mode enable

**Default** Enabled

**Mode** Global Configuration

**Usage** Do not mix LACP configurations (manual and dynamic). When LACP global passive mode is turned on (by using the **lacp global-passive-mode enable** command), we do not recommend using a mixed configuration in a LACP channel-group; i.e. some links are manually configured (by the **channel-group** command) and others are dynamically learned in the same channel-group.

**Example** To enable global passive mode for LACP channel groups, use the command:

```
awplus(config)# lacp global-passive-mode enable
```

To disable global passive mode for LACP channel groups, use the command:

```
awplus(config)# no lacp global-passive-mode enable
```

**Related Commands** [show etherchannel](#)  
[show etherchannel detail](#)

# lacp port-priority

**Overview** Use this command to set the priority of a device port. Ports are selected for aggregation based on their priority, with the higher priority (numerically lower) ports selected first.

Use the **no** variant of this command to reset the priority of port to the default.

**Syntax** lacp port-priority <1-65535>  
no lacp port-priority

Parameter	Description
<1-65535>	Specify the LACP port priority.

**Default** The default is 32768.

**Mode** Interface Configuration

**Example** awplus# configure terminal  
awplus(config)# interface port1.1.2  
awplus(config-if)# lacp port-priority 34

# lacp system-priority

**Overview** Use this command to set the system priority of a local system. This is used in determining the system responsible for resolving conflicts in the choice of aggregation groups.

Use the **no** variant of this command to reset the system priority of the local system to the default.

**Syntax** lacp system-priority <1-65535>  
no lacp system-priority

Parameter	Description
<1-65535>	LACP system priority. Lower numerical values have higher priorities.

**Default** The default is 32768.

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# lacp system-priority 6700

# lacp timeout

**Overview** Use this command to set the short or long timeout on a port. Ports will time out of the aggregation if three consecutive updates are lost.

**Syntax** lacp timeout {short|long}

Parameter	Description
timeout	Number of seconds before invalidating a received LACP data unit (DU).
short	LACP short timeout. The <b>short</b> timeout value is <b>1</b> second.
long	LACP long timeout. The <b>long</b> timeout value is <b>30</b> seconds.

**Default** The default is **long** timeout (30 seconds).

**Mode** Interface Configuration

**Usage** This command enables the device to indicate the rate at which it expects to receive LACPDU's from its neighbor.

If the timeout is set to **long**, then the device expects to receive an update every **30** seconds, and this will time a port out of the aggregation if no updates are seen for 90 seconds (i.e. 3 consecutive updates are lost).

If the timeout is set to **short**, then the device expects to receive an update every second, and this will time a port a port out of the aggregation if no updates are seen for 3 seconds (i.e. 3 consecutive updates are lost).

The device indicates its preference by means of the Timeout field in the Actor section of its LACPDU's. If the Timeout field is set to 1, then the device has set the **short** timeout. If the Timeout field is set to 0, then the device has set the **long** timeout.

Setting the **short** timeout enables the device to be more responsive to communication failure on a link, and does not add too much processing overhead to the device (1 packet per second).

**NOTE:** It is not possible to configure the rate that the device sends LACPDU's; the device must send at the rate which the neighbor indicates it expects to receive LACPDU's.

**Examples** The following commands set the LACP long timeout period for 30 seconds on port1.1.2.

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# lacp timeout long
```

The following commands set the LACP short timeout for 1 second on port 1.1.2.

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# lacp timeout short
```

# platform load-balancing

**Overview** This command selects which address fields are used as inputs into the load balancing algorithm for aggregated links. The output from this algorithm is used to select which individual path a given packet will traverse within an aggregated link.

The **no** variant of this command turns off the specified inputs.

**Syntax** `platform load-balancing [src-dst-mac] [src-dst-ip]  
[src-dst-port] [ethertype]`  
`no platform load-balancing [src-dst-mac] [src-dst-ip]  
[src-dst-port] [ethertype]`

Parameter	Description
<code>src-dst-mac</code>	Include the source and destination MAC addresses (Layer 2)
<code>src-dst-ip</code>	Include the source and destination IP addresses (Layer 3). If you choose this option, the algorithm will use MAC addresses to calculate load balancing for Layer 2 and non-IP packets.
<code>src-dst-port</code>	The source and destination TCP/UDP port data (Layer 4). If you include this option, make sure that <b>src-dst-ip</b> is also selected.
<code>ethertype</code>	A two-octet field in an Ethernet frame that shows which protocol is encapsulated in the payload of the Ethernet frame. Ethertype is the same for all IP traffic, but is different for different kinds of non-IP traffic.

**Default** By default, all load-balancing input options are used.

**Mode** Global configuration

**Usage** By default, all load-balancing input options are turned on. Therefore, to use a different set of inputs, you must **turn off** the inputs you do not want.

Useful combinations of inputs include:

- all four inputs
- MAC address, IP address and Layer 4 port number
- MAC address and Ethertype
- MAC address only
- IP address and Layer 4 port number
- IP address only

The following examples show how to configure some of these combinations.

Use the `show platform` command to verify this command's setting.

**Examples** To use all four inputs, you do not have to enter any commands, because this is the default. Note that this setting is not displayed in the **show running-config** output. Use the **show platform** command to verify this setting.

To use MAC addresses, IP addresses and Layer 4 port numbers, remove Ethertype by using the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing ethertype
```

To use MAC addresses and Ethertype, remove the IP inputs by using the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-ip
src-dst-port
```

To use MAC addresses only, remove the other inputs by using the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-ip
src-dst-port ethertype
```

To use IP addresses and Layer 4 port numbers, remove MAC addresses and Ethertype by using the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-mac
ethertype
```

**Related  
Commands** [show platform](#)

# show debugging lacp

**Overview** Use this command to display the LACP debugging option set.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging lacp`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show debugging lacp`

**Output** Figure 18-1: Example output from the **show debugging lacp** command

```
LACP debugging status:
LACP timer debugging is on
LACP timer-detail debugging is on
LACP cli debugging is on
LACP packet debugging is on
LACP event debugging is on
LACP sync debugging is on
```

**Related** [show tech-support](#)  
**Commands**

# show etherchannel

**Overview** Use this command to display information about a LACP channel specified by the channel group number.

The command output also shows the thrash limiting status. If thrash limiting is detected and the **action** parameter of the [thrash-limiting](#) command is set to **vlan-disable**, the output will also show the VLANs on which thrashing is detected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** `show etherchannel [<1-32>]`

Parameter	Description
<1-32>	Channel-group number.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show etherchannel`

**Output** Figure 18-3: Example output from **show etherchannel**

```
awplus#show etherchannel
LAG Maximum      : 128
LAG Static Maximum: 96
LAG Dynamic Maximum: 32
LAG Static Count : 0
LAG Dynamic Count : 1
LAG Total Count  : 1
Lacp Aggregator: pol
Member:
  port1.1.5
  port1.1.6
```

**Example** `awplus# show etherchannel 1`

**Output** Figure 18-4: Example output from **show etherchannel** for a particular channel

```
awplus#show etherchannel 1
Aggregator pol (4601)
Mac address: 00:00:00:00:00:00
Admin Key: 0001 - Oper Key 0000
Receive link count: 0 - Transmit link count: 0
Individual: 0 - Ready: 0
Partner LAG: 0x0000,00-00-00-00-00-00
  Link: port1.1.1 (5001) disabled
  Link: port1.1.2 (5002) disabled
```

# show etherchannel detail

**Overview** Use this command to display detailed information about all LACP channels. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** `show etherchannel detail`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show etherchannel detail`

**Output** Example output from **show etherchannel detail**

```
awplus#show etherchannel detail
Aggregator po1 (IfIndex: 4601)
  Mac address: 00:00:cd:37:05:17
  Admin Key: 0001 - Oper Key 0001
  Receive link count: 2 - Transmit link count: 2
  Individual: 0 - Ready: 1
  Partner LAG: 0x8000,00-00-cd-37-02-9a,0x0001
    Link: port1.1.1 (IfIndex: 8002) synchronized
    Link: port1.1.2 (IfIndex: 20002) synchronized
Aggregator po2 (IfIndex: 4602)
  Mac address: 00:00:cd:37:05:17
  Admin Key: 0002 - Oper Key 0002
  Receive link count: 2 - Transmit link count: 2
  Individual: 0 - Ready: 1
  Partner LAG: 0x8000,ec-cd-6d-aa-c8-56,0x0002
    Link: port1.1.3 (IfIndex: 8001) synchronized
    Link: port1.1.4 (IfIndex: 20001) synchronized
```

# show etherchannel summary

**Overview** Use this command to display a summary of all LACP channels.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** `show etherchannel summary`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show etherchannel summary`

**Output** Example output from **show etherchannel summary**

```
awplus#show etherchannel summary
Aggregator po10 (IfIndex: 4610)
Admin Key: 0010 - Oper Key 0010
  Link: port1.1.1 (IfIndex: 7007) synchronized
  Link: port1.1.2 (IfIndex: 8007) synchronized
  Link: port1.1.3 (IfIndex: 11007) synchronized
```

# show lacp sys-id

**Overview** Use this command to display the LACP system ID and priority.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** `show lacp sys-id`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show lacp sys-id`

**Output** Example output from **show lacp sys-id**

```
System Priority: 0x8000 (32768)
MAC Address: 0200.0034.5684
```

# show lacp-counter

**Overview** Use this command to display the packet traffic on all ports of all present LACP aggregators, or a given LACP aggregator.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** `show lacp-counter [<1-32>]`

Parameter	Description
<1-32>	Channel-group number.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show lacp-counter 2`

**Output** Example output from **show lacp-counter**

```
% Traffic statistics
Port          LACPDU      Marker      Pckt err
              Sent   Recv   Sent   Recv   Sent   Recv
% Aggregator po4 (IfIndex: 4604)
port1.1.2    0       0       0       0       0       0
```

# show port etherchannel

**Overview** Use this command to show LACP details of the device port specified.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** `show port etherchannel <port>`

Parameter	Description
<code>&lt;port&gt;</code>	Name of the device port to display LACP information about.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show port etherchannel port1.1.2`

**Output** Example output from **show port etherchannel**

```
awplus#show port etherchannel port1.1.2
LACP link info: port1.1.2 - 7007
Link: port1.1.2 (IfIndex: 7007)

Expired ..... No
```

# show static-channel-group

**Overview** Use this command to display all configured static channel groups and their corresponding member ports. Note that a static channel group is the same as a static aggregator.

The command output also shows the thrash limiting status. If thrash limiting is detected and the **action** parameter of the [thrash-limiting](#) command is set to **vlan-disable**, the output will also show the VLANs on which thrashing is detected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** `show static-channel-group`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show static-channel-group`

**Output** Example output from **show static-channel-group**

```
% LAG Maximum      : 128
% LAG Static  Maximum: 96
% LAG Dynamic Maximum: 32
% Static  Count    : 2
% LAG Dynamic Count : 2
% LAG Total  Count : 4
% Static Aggregator: sa2
% Member:
  port1.1.1
% Static Aggregator: sa3
% Member:
  port1.1.2
```

**Related Commands** [static-channel-group](#)

# static-channel-group

**Overview** Use this command to create a static channel group, or add a member port to an existing static channel group. Static channel groups are also known as static aggregators.

You can create up to 96 static channel groups (and up to 32 dynamic channel groups).

Use the **no** variant of this command to remove the device port from the static channel group.

**Syntax** `static-channel-group <static-channel-group-number>`  
`[member-filters]`  
`no static-channel-group`

Parameter	Description
<code>&lt;static-channel-group-number&gt;</code>	<1-96> Static channel group number. You can create up to 96 static channel groups (as well as up to 32 dynamic (LACP) channel groups). Each channel group can include up to 8 ports.
<code>member-filters</code>	Allow QoS and ACL settings to be configured on the aggregator's individual member ports, instead of the aggregator itself. This configuration is required when using QoS Storm Protection on a static aggregator.

**Mode** Interface Configuration

**Usage** This command adds the device port to the static channel group with the specified channel group number. If the channel group does not exist, it is created, and the port is added to it. The **no** prefix detaches the port from the static channel group. If the port is the last member to be removed, the static channel group is deleted.

All the ports in a channel group must have the same VLAN configuration: they must belong to the same VLANs and have the same tagging status, and can only be operated on as a group.

Once the static channel group has been created, it is treated as a device port, and can be referred to in other commands that apply to device ports.

To refer to a static channel group in other static channel group commands, use the channel group number. To specify a static channel group in other commands, prefix the channel group number with **sa**. For example, 'sa2' refers to the static channel group with channel group number 2.

**Examples** To define static channel group 2 on a device port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.6
awplus(config-if)# static-channel-group 2
```

To reference static channel group 2 as an interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface sa2
awplus(config-if)#
```

To make it possible to use QoS Storm Protection on static channel group 2 on port1.1.8, with an ACL named "test-acl", use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.8
awplus(config-if)# static-channel-group 2 member-filters
awplus(config-if)# access-group test-acl
```

**Related Commands** [show static-channel-group](#)

# undebbug lacp

**Overview** This command applies the functionality of the no `debug lacp` command.

# 19

# GVRP Commands

## Introduction

**Overview** With GVRP enabled the switch can exchange VLAN configuration information with other GVRP enabled switches. VLANs can be dynamically created and managed through trunk ports.

- There is a limit of 400 VLANs supported by the AlliedWare Plus GVRP implementation. VLANs may be numbered 1-4094, but a limit of 400 of these VLANs are supported.
- MSTP is not supported by the AlliedWare Plus GVRP implementation. GVRP and MSTP are mutually exclusive. STP and RSTP are supported by GVRP.
- VCStack is not supported by the current AlliedWare Plus GVRP implementation.

This chapter provides an alphabetical reference for commands used to configure GVRP. For information about GVRP, including configuration, see the [GVRP Feature Overview and Configuration Guide](#).

- Command List**
- [“clear gvrp statistics”](#) on page 792
  - [“debug gvrp”](#) on page 793
  - [“gvrp \(interface\)”](#) on page 795
  - [“gvrp dynamic-vlan-creation”](#) on page 796
  - [“gvrp enable \(global\)”](#) on page 797
  - [“gvrp registration”](#) on page 798
  - [“gvrp timer”](#) on page 799
  - [“show debugging gvrp”](#) on page 801
  - [“show gvrp configuration”](#) on page 802
  - [“show gvrp machine”](#) on page 803
  - [“show gvrp statistics”](#) on page 804

- [“show gvrp timer”](#) on page 805

# clear gvrp statistics

**Overview** Use this command to clear the GVRP statistics for all switchports, or for a specific switchport.

**Syntax** `clear gvrp statistics {all|<interface>}`

Parameter	Description
all	Specify all switchports to clear GVRP statistics.
<interface>	Specify the switchport to clear GVRP statistics.

**Mode** Privileged Exec

**Usage** Use this command together with the [show gvrp statistics](#) command to troubleshoot GVRP.

**Examples** To clear all GVRP statistics for all switchport on the switch, enter the command:

```
awplus# clear gvrp statistics all
```

To clear GVRP statistics for switchport interface `port1.1.3`, enter the command:

```
awplus# clear gvrp statistics port1.1.3
```

**Related Commands** [show gvrp statistics](#)

# debug gvrp

**Overview** Use this command to debug GVRP packets and commands, sending output to the console.

Use the **no** variant of this command to turn off debugging for GVRP packets and commands.

**Syntax** debug gvrp {all|cli|event|packet}  
no debug gvrp {all|cli|event|packet}

Parameter	Description
all	Specifies debugging for all levels.
cli	Specifies debugging for commands.
event	Specified debugging for events.
packet	Specifies debugging for packets.

**Mode** Privileged Exec and Global Configuration

**Examples** To send debug output to the console for GVRP packets and GVRP commands, and to enable the display of debug output on the console first, enter the commands:

```
awplus# terminal monitor
awplus# configure terminal
awplus(config)# debug gvrp all
```

To send debug output for GVRP packets to the console, enter the commands:

```
awplus# terminal monitor
awplus# configure terminal
awplus(config)# debug gvrp packets
```

To send debug output for GVRP commands to the console, enter the commands:

```
awplus# terminal monitor
awplus# configure terminal
awplus(config)# debug gvrp cli
```

To stop sending debug output for GVRP packets and GVRP commands to the console, and to stop the display of any debug output on the console, enter the commands:

```
awplus# terminal no monitor
awplus# configure terminal
awplus(config)# no debug gvrp all
```

**Related  
Commands** [show debugging gvrp](#)  
[terminal monitor](#)

# gvrp (interface)

**Overview** Use this command to enable GVRP for switchport interfaces.  
Use the **no** variant of this command to disable GVRP for switchport interfaces.

**Syntax** gvrp  
no gvrp

**Mode** Interface Configuration (for switchport interfaces).

**Default** Disabled by default.

**Usage** Use this command to enable GVRP on switchport interfaces. Note this command does not enable GVRP for the switch. To enable GVRP on switchports use this command in Interface Configuration mode. You must issue a [gvrp enable \(global\)](#) command before issuing a [gvrp \(interface\)](#) command.

You must enable GVRP on both ends of a link for GVRP to propagate VLANs between links.

**NOTE:** *MSTP is not supported by the current AlliedWare Plus GVRP implementation. GVRP and MSTP are mutually exclusive. STP and RSTP are supported by GVRP.*

*Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. GVRP and private VLAN trunk ports are mutually exclusive.*

**Examples** To enable GVRP on interfaces port1.1.1-port1.1.2, enter the commands:

```
awplus# configure terminal
awplus(config)# gvrp enable
awplus(config)# interface port1.1.1-port1.1.2
awplus(config-if)# gvrp
```

To disable GVRP on interfaces port1.1.1-port1.1.2, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1-port1.1.2
awplus(config-if)# no gvrp
```

**Validation Commands** [show gvrp configuration](#)

**Related Commands** [gvrp dynamic-vlan-creation](#)  
[gvrp enable \(global\)](#)

# gvrp dynamic-vlan-creation

**Overview** Use this command to enable dynamic VLAN creation globally for the switch.

Use the **no** variant of this command to disable dynamic VLAN creation globally for the switch.

**Syntax** `gvrp dynamic-vlan-creation`  
`no gvrp dynamic-vlan-creation`

**Mode** Global Configuration

**Default** Disabled by default.

**Usage** You must enable GVRP on both ends of a link for GVRP to propagate VLANs between links.

You must also enable GVRP globally in Global Configuration mode before enabling GVRP on an interface in Interface Configuration mode. Both of these tasks must occur to create VLANs.

**NOTE:** *There is limit of 400 VLANs supported by the AlliedWare Plus GVRP implementation. VLANs may be numbered 1-4094, but a limit of 400 of these VLANs are supported.*

**Examples** Enter the following commands for switches with hostnames `switch1` and `switch2` respectively, so `switch1` propagates VLANs to `switch2` and `switch2` propagates VLANs to `switch1`:

Switch1:

```
switch1# configure terminal
switch1(config)# gvrp enable
switch1(config)# gvrp dynamic-vlan-creation
```

Switch2:

```
switch2# configure terminal
switch2(config)# gvrp enable
switch2(config)# gvrp dynamic-vlan-creation
```

To disable GVRP dynamic VLAN creation on the switch, enter the commands:

```
awplus# configure terminal
awplus(config)# no gvrp dynamic-vlan-creation
```

**Validation Commands** `show gvrp configuration`

**Related Commands** `gvrp enable (global)`

# gvrp enable (global)

**Overview** Use this command to enable GVRP globally for the switch.  
Use the **no** variant of this command to disable GVRP globally for the switch.

**Syntax** gvrp enable  
no gvrp enable

**Mode** Global Configuration

**Default** Disabled by default.

**Usage** Use this command to enable GVRP on the switch. Note that this command does not enable GVRP on switchports. To enable GVRP on switchports use the [gvrp \(interface\)](#) command in Interface Configuration mode. You must issue a [gvrp enable \(global\)](#) command before issuing a [gvrp \(interface\)](#) command.

You must enable GVRP on both ends of a link for GVRP to propagate VLANs between links.

**NOTE:** *MSTP is not supported by the current AlliedWare Plus GVRP implementation. GVRP and MSTP are mutually exclusive. STP and RSTP are supported by GVRP.*

*Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. GVRP and private VLAN trunk ports are mutually exclusive.*

**Examples** To enable GVRP for the switch, before enabling GVRP on switchports, enter the commands:

```
awplus# configure terminal  
awplus(config)# gvrp enable
```

To disable GVRP on the switch, which will also disable GVRP enabled on switchports, enter the commands:

```
awplus# configure terminal  
awplus(config)# no gvrp enable
```

**Validation Commands** [show gvrp configuration](#)

**Related Commands** [gvrp \(interface\)](#)  
[gvrp dynamic-vlan-creation](#)

# gvrp registration

**Overview** Use this command to set GVRP registration to normal, fixed, and forbidden registration modes.

Use the **no** variant of this command to disable GVRP registration.

**Syntax** `gvrp registration {normal|fixed|forbidden}`  
`no gvrp registration {normal|fixed|forbidden}`

Parameter	Description
normal	Specify dynamic GVRP registration and deregistration of VLANs.
fixed	Specify fixed GVRP registration and deregistration of VLANs.
forbidden	Specify no GVRP registration of VLANs. VLANs are deregistered.

**Mode** Interface Configuration

**Default** Normal registration is the default.

**Usage** Configuring a trunk port in normal registration mode allows dynamic creation of VLANs. Normal mode is the default mode. Validate using the [show gvrp configuration](#) command.

Configuring a trunk port in fixed registration mode allows manual creation of VLANs.

Configuring a trunk port in forbidden registration mode prevents VLAN creation on the port.

**Examples** To configure GVRP registration to fixed on port1.1.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# gvrp registration fixed
```

To disable GVRP registration on interfaces port1.1.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no gvrp registration
```

**Validation Commands** [show gvrp configuration](#)

# gvrp timer

**Overview** Use this command to set GVRP timers in Interface Configuration mode for a given interface.

Use the **no** variant of this command to reset the GVRP timers to the defaults specified in the table below.

**Syntax** `gvrp timer {join <timer-value>|leave <timer-value>|leaveall <timer-value>}`  
`no gvrp timer {join|leave|leaveall}`

Parameter	Description
join	Specifies the timer for joining the group (default is 20 centiseconds / hundredths of a second, or 200 milliseconds).
leave	Specifies the timer for leaving a group (default is 60 centiseconds / hundredths of a second, or 600 milliseconds).
leaveall	Specifies the timer for leaving all groups (default is 1000 centiseconds / hundredths of a second, or 10,000 milliseconds).
<timer-value>	<1-65535> The timer value in hundredths of a second (centiseconds).

**Mode** Interface Configuration

**Defaults** The default join time value is 20 centiseconds (200 milliseconds), the default leave timer value is 60 centiseconds (600 milliseconds), and the default leaveall timer value is 1000 centiseconds (10,000 milliseconds).

**Usage** When configuring the `leave` timer, set it to more than or equal to three times the `join` timer value. The settings for the `leave` and `join` timers must be the same for all GVRP enabled switches. See also the section “Setting the GVRP Timers” in the [GVRP Feature Overview and Configuration Guide](#).

Use the `show gvrp timer` command to confirm GVRP timers set with this command.

**Examples** To set the GVRP join timer to 30 hundredths of a second (300 milliseconds) for interface port1.1.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# gvrp timer join 30
```

To set the GVRP leave timer to 90 hundredths of a second (900 milliseconds) for interface port1.1.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# gvrp timer leave 90
```

To reset the GVRP join timer to its default of 20 hundredths of a second for interface port1.1.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no gvrp timer join
```

**Related  
Commands** [show gvrp timer](#)

# show debugging gvrp

**Overview** Use this command to display the GVRP debugging option set.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging gvrp`

**Mode** User Exec and Privileged Exec

**Example** Enter the following commands to display GVRP debugging output on the console:

```
awplus# configure terminal
awplus(config)# debug gvrp all
awplus(config)# exit
awplus# show debugging gvrp
```

**Output** See sample output from the **show debugging gvrp** command after entering **debug gvrp all**:

```
GVRP debugging status:
  GVRP Event debugging is on
  GVRP CLI debugging is on
  GVRP Timer debugging is on
  GVRP Packet debugging is on
```

**Related Commands** [debug gvrp](#)

# show gvrp configuration

**Overview** Use this command to display GVRP configuration data for a switch.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show gvrp configuration

**Mode** User Exec and Privileged Exec

**Example** To show GVRP configuration for the switch, enter the command:

```
awplus# show gvrp configuration
```

**Output** The following is an output of this command displaying the GVRP configuration for a switch:

```
awplus#show gvrp configuration
Global GVRP Configuration:
GVRP Feature: Enabled
Dynamic Vlan Creation: Disabled
Port based GVRP Configuration:

```

Port	GVRP Status	Registration	Applicant	Timers (centiseconds)		
				Join	Leave	LeaveAll
port1.1.1	Enabled	Normal	Normal	20	60	1000
port1.1.2	Enabled	Normal	Normal	200	600	10000

# show gvrp machine

**Overview** Use this command to display the state machine for GVRP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show gvrp machine`

**Mode** User Exec and Privileged Exec

**Example** To show the GVRP state machine for the switch, enter the command:

```
awplus# show gvrp machine
```

**Output** See the following output of this command displaying the GVRP state machine.

```
awplus show gvrp machine
port = 1.1.1 applicant state = QA registrar state = INN
port = 1.1.2 applicant state = QA registrar state = INN
```

# show gvrp statistics

**Overview** Use this command to display a statistical summary of GVRP information for the switch.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show gvrp statistics [<interface>]`

Parameter	Description
<interface>	The name of the switchport interface.

**Mode** User Exec and Privileged Exec

**Usage** Use this command together with the [clear gvrp statistics](#) command to troubleshoot GVRP.

**Examples** To show the GVRP statistics for all switchport interfaces, enter the command:

```
awplus# show gvrp statistics
```

To show the GVRP statistics for switchport interfaces port1.1.1 and port1.1.2, enter the commands:

```
awplus# show gvrp statistics port1.1.1-port1.1.2
```

**Output** The following is an output of this command displaying a statistical summary for port1.1.1-port1.1.2

```
awplus# show gvrp statistics port1.1.1-port1.1.2
```

Port	JoinEmpty	JoinIn	LeaveEmpty	LeaveIn	Empty
1.1.1	RX	0	2	0	0
	TX	0	0	0	0
1.1.2	RX	0	1	0	0
	TX	0	0	0	0

**Related Commands** [clear gvrp statistics](#)

# show gvrp timer

**Overview** Use this command to display data for the GVRP timers set with the `gvrp timer` command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show gvrp timer <interface>`

Parameter	Description
<code>&lt;interface&gt;</code>	The name of the switchport interface.

**Mode** User Exec and Privileged Exec

**Examples** To show the GVRP timers for all switchport interfaces, enter the command:

```
awplus# show gvrp timer
```

To show the GVRP timers for switchport interface port1.1.1, enter the commands:

```
awplus# show gvrp statistics port1.1.1
```

**Output** The following show output displays data for timers on the switchport interface port1.1.1

```
awplus# show gvrp timer port1.1.1
Timer                Timer Value (centiseconds)
-----
Join                  20
Leave                  60
Leave All              1000
```

# arp-aging-timeout

**Overview** This command sets a timeout period on dynamic ARP entries associated with a specific interface. If your device stops receiving traffic for the host specified in a dynamic ARP entry, it deletes the ARP entry from the ARP cache after this timeout is reached.

Your device times out dynamic ARP entries to ensure that the cache does not fill with entries for hosts that are no longer active. Static ARP entries are not aged or automatically deleted.

By default the time limit for dynamic ARP entries is 300 seconds on all interfaces. The **no** variant of this command sets the time limit to the default of 300 seconds.

**Syntax** `arp-aging-timeout <0-432000>`  
`no arp-aging timeout`

Parameter	Description
<code>&lt;0-432000&gt;</code>	The timeout period in seconds.

**Default** 300 seconds (5 minutes)

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the ARP entries on interface `vlan30` to time out after two minutes, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan30
awplus(config-if)# arp-aging-timeout 120
```

**Related Commands** [clear arp-cache](#)  
[show arp](#)

# arp-mac-disparity

**Overview** Use this command to enable the switch to support services like Microsoft Network Load Balancing (MS-NLB).

Such services use ARP with disparate MAC addresses to ensure that packets destined for a server cluster virtual address are sent to all servers in the cluster. Disparate MAC addresses mean that the MAC address in the “sender hardware address” field of an ARP reply is different to the MAC address in the “Source MAC address” field of the Ethernet header that the ARP packet is encapsulated in.

The **no** variant of this command reverts to the default behavior. See the Default section below for more information.

**Syntax** `arp-mac-disparity {multicast|multicast-igmp|unicast}`  
`no arp-mac-disparity {multicast|multicast-igmp|unicast}`

Parameter	Description
multicast	Enables support of server clusters operating in multicast mode. Packets destined for the server cluster are flooded to all ports in the VLAN.
multicast-igmp	Enables support of server clusters operating in multicast/IGMP mode. In multicast/IGMP mode, the MS-NLB server cluster uses IGMP reports to forward server traffic to a limited set of ports.
unicast	Enables support of server clusters operating in unicast mode. Packets destined for the server cluster are flooded to all ports in the VLAN.

**Default** ARP-MAC disparity support is disabled and:

- If the Disparate ARP has a multicast MAC address in the ARP reply, the switch drops the ARP reply and does not learn any associated addresses
- If the Disparate ARP has a unicast MAC address in the ARP reply, the switch learns the address in the ARP reply. The learned ARP entry points to the single port that the ARP reply arrived on. Matching traffic will go out this port.

**Mode** Interface Configuration for a VLAN interface.

**Usage Multicast mode**

When you are using **multicast** mode, you can limit the number of ports that packets are flooded to, instead of flooding to all ports in the VLAN. To do this, specify the list of ports when creating the ARP entry.

For example, to flood only port1.1.1 to port1.1.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-mac-disparity multicast
awplus(config-if)# arp 10.10.1.100 010e.11ff.2222
port1.1.1-port1.1.3
```

### Multicast IGMP mode

You can enable Multicast-IGMP mode by using the command **arp-mac-disparity multicast-igmp**.

In this mode, the only difference to standard multicast mode is that the reception of IGMP reports now controls the ports to which the L3 switch floods traffic. That is, rather than simply flooding each packet destined for the NLB cluster IP address to all ports on the egress VLAN, those packets are only sent to the switchports in the VLAN that have received IGMP reports for the multicast group corresponding to the NLB cluster MAC address.

Like **arp-mac-disparity multicast**, the command **arp-mac-disparity multicast-igmp** puts the switch into a mode where it will accept Disparate ARP responses. Similarly, upon receiving a Disparate ARP response, an ARP entry is created for the IP/MAC in the content of the ARP packet. The difference with the **arp-mac-disparity multicast-igmp** command is that the egress port is set to the subset of ports in the VLAN that have received IGMP reports for the NLB cluster MAC address.

Note that the ARP entry is updated as ports join/leave the IGMP group. If no ports have received IGMP reports for the NLB cluster MAC address then the ARP entry will have no egress ports and will simply drop packets destined for the NLB cluster IP address.

Again, no FDB entry is created in response to receiving the ARP packet. However, since the NLB server is operating in multicast mode with the IGMP option set and is sending IGMP reports, an FDB entry will already exist for the IGMP group (and, as a result, the NLB cluster MAC address).

When the **arp-mac-disparity multicast-igmp** command is configured on the VLAN, ARP entries appear in the output of the command **show arp** like this:

```
awplus#show arp
IP Address    MAC Address      Interface  Port          Type
10.100.0.56   0100.5e7f.0038   vlan200   igmp-group    dynamic
```

**Examples** To enable support for MS-NLB in unicast mode on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-mac-disparity unicast
```

To disable support for MS-NLB in unicast mode on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no arp-mac-disparity unicast
```

**Related  
Commands**

[arp](#)  
[clear arp-cache](#)  
[show arp](#)

# arp

**Overview** This command adds a static ARP entry to the ARP cache. This is typically used to add entries for hosts that do not support ARP or to speed up the address resolution function for a host. The ARP entry must not already exist. Use the **alias** parameter to allow your device to respond to ARP requests for this IP address.

If VRF-lite is configured, you can add ARP entries to either the global cache or for a specific VRF instance.

The **no** variant of this command removes the static ARP entry. Use the [clear arp-cache](#) command to remove the dynamic ARP entries in the ARP cache.

**Syntax**

```
arp <ip-addr> <mac-address> [<port-number>] [alias]
arp <ip-addr> <multicast-mac-address> [<port-list>]
no arp <ip-addr>
```

**Syntax (VRF-lite)**

```
arp [vrf <vrf-name>] <ip-addr> <mac-address> [<port-number>]
[alias]
arp [vrf <vrf-name>] <ip-addr> <multicast-mac-address>
[<port-list>]
no arp [vrf <vrf-name>] <ip-addr>
```

Parameter	Description
<ip-addr>	The IPv4 address of the device you are adding as a static ARP entry.
<mac-address>	The MAC address of the device you are adding as a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.
<port-number>	The port number associated with the IP address. Specify this when the IP address is part of a VLAN.
<multicast-mac-address>	The multicast MAC address for which you are adding a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.
<port-list>	The list of port numbers associated with the IP address. You can only specify multiple egress ports when the MAC address is a multicast MAC address.
alias	Allows your device to respond to ARP requests for the IP address. Proxy ARP must be enabled on the interface before using this parameter.
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode** Global Configuration

**Usage** One use of this command is to limit packet flooding when using services like Microsoft Network Load Balancing (MS-NLB). With such services, packets destined for server cluster virtual address must be sent to all servers in the cluster. The server cluster can operate in multicast mode, in which it uses a multicast MAC address. To support this, this command allows you to create a static ARP entry with a multicast MAC address, and specify which ports the packets will be forwarded out.

Creating a static ARP entry enables the switch to correctly forward server cluster traffic. If you want the switch to also respond to pings from the server cluster, you need to also enable server cluster support, using the [arp-mac-disparity](#) command.

**Examples** To add the IP address 10.10.10.9 with the MAC address 0010.2533.4655 into the ARP cache, and have your device respond to ARP requests for this address, use the commands:

```
awplus# configure terminal
awplus(config)# arp 10.10.10.9 0010.2355.4566 alias
```

**Example (VRF-lite)** To apply the above example within a VRF instance called `red` use the following commands:

```
awplus# configure terminal
awplus(config)# arp vrf red 10.10.10.9 0010.2355.4566 alias
```

- [ip proxy-arp](#)
- [show arp](#)

# arp log

**Overview** This command enables the logging of dynamic and static ARP entries in the ARP cache. The ARP cache contains mappings of device ports, VLAN IDs, and IP addresses to physical MAC addresses for hosts.

This command can display the MAC addresses in the ARP log either using the notation HHHH.HHHH.HHHH, or using the IEEE standard hexadecimal notation (HH-HH-HH-HH-HH-HH).

Use the **no** variant of this command to disable the logging of ARP entries.

**Syntax** `arp log [mac-address-format ieee]`  
`no arp log [mac-address-format ieee]`

Parameter	Description
<code>mac-address-format ieee</code>	Display the MAC address in the standard IEEE format (HH-HH-HH-HH-HH-HH), instead of displaying the MAC address with the format HHHH.HHHH.HHHH.

**Default** The ARP logging feature is disabled by default.

**Mode** Global Configuration

**Usage** You have the option to change how the MAC address is displayed in the ARP log message. The output can either use the notation HHHH.HHHH.HHHH or HH-HH-HH-HH-HH-HH.

Enter **arp log** to use HHHH.HHHH.HHHH notation.

Enter **arp log mac-address-format ieee** to use HH-HH-HH-HH-HH-HH notation.

Enter **no arp log mac-address-format ieee** to revert from HH-HH-HH-HH-HH-HH to HHHH.HHHH.HHHH.

Enter **no arp log** to disable ARP logging.

To display ARP log messages use the command **show log | include ARP\_LOG**.

**Examples** To enable ARP logging and specify that the MAC address in the log message is displayed in HHHH.HHHH.HHHH notation, use the following commands:

```
awplus# configure terminal
awplus(config)# arp log
```

To disable ARP logging on the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no arp log
```

To enable ARP logging and specify that the MAC address in the log message is displayed in the standard IEEE format hexadecimal notation (HH-HH-HH-HH-HH-HH), use the following commands:

```
awplus# configure terminal
awplus(config)# arp log mac-address-format ieee
```

To leave ARP logging enabled, but stop using HH-HH-HH-HH-HH-HH format and use HHHH.HHHH.HHHH format instead, use the following commands:

```
awplus# configure terminal
awplus(config)# no arp log mac-address-format ieee
```

To display ARP log messages, use the following command:

```
awplus# show log | include ARP_LOG
```

**Output** Figure 20-1: Output from **show log | include ARP\_LOG** after enabling ARP logging using **arp log**. Note that this output uses HHHH.HHHH.HHHH format.

```
awplus#configure terminal
awplus(config)#arp log

```

The following table lists the parameters in output of the **show log | include ARP\_LOG** command. The ARP log message format is:

```
<date> <time> <severity> <hostname> <program-name>  
ARP_LOG <port-number> <vid> <operation> <MAC> <IP>
```

Table 20-1: Parameters in the output from **show log | include ARP\_LOG**

Parameter	Description
ARP_LOG	Indicates that ARP log entry information follows.
<port-number>	Indicates device port number for the ARP log entry.
<vid>	Indicates the VLAN ID for the ARP log entry.
<operation>	Indicates "add" if the ARP log entry displays an ARP addition. Indicates "del" if the ARP log entry displays an ARP deletion.
<MAC>	Indicates the MAC address for the ARP log entry, either in the default hexadecimal notation (HHHH.HHHH.HHHH) or in the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) as specified with the <b>arp log mac-address-format ieee</b> command.
<IP>	Indicates the IP address for the ARP log entry.

**Related Commands** [show log](#)  
[show running-config](#)

# arp opportunistic-nd

**Overview** Use this command to enable opportunistic neighbor discovery for the global ARP cache. This command changes the behavior for unsolicited ARP packet forwarding on the device.

When using VRF-lite, you can use this command to enable opportunistic neighbor discovery for a named VRF instance.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global ARP cache.

**Syntax** `arp opportunistic-nd`  
`no arp opportunistic-nd`

**Syntax (VRF-lite)** `arp opportunistic-nd [vrf <vrf-name>]`  
`no arp opportunistic-nd [vrf <vrf-name>]`

Parameter	Description
<code>vrf</code>	Apply this command to a VRF instance.
<code>&lt;vrf-name&gt;</code>	The name of the VRF instance.

**Default** Opportunistic neighbor discovery is disabled by default.

**Mode** Global Configuration

**Usage** When opportunistic neighbor discovery is enabled, the device will reply to any received unsolicited ARP packets (but not gratuitous ARP packets). The source MAC address for the unsolicited ARP packet is added to the ARP cache, so the device forwards the ARP packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ARP packet is not added to the ARP cache, so the ARP packet is not forwarded by the device.

Note this command enables or disables opportunistic neighbor discovery for a VRF instance if the **vrf** parameter and an instance name are applied. If a VRF instance is not specified, then opportunistic neighbor discovery is enabled or disabled for device ports configured for IPv4.

**Examples** To enable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd
```

To disable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd
```

**Example (VRF-lite)** To enable opportunistic neighbor discovery for the VRF instance 'blue', enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd vrf blue
```

To disable opportunistic neighbor discovery for the VRF instance 'blue', enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd vrf blue
```

**Related Commands**

- [ipv6 opportunistic-nd](#)
- [show arp](#)
- [show running-config interface](#)

# arp-reply-bc-dmac

**Overview** Use this command to allow processing of ARP replies that arrive with a broadcast destination MAC (ffff.ffff.ffff). This makes neighbors reachable if they send ARP responses that contain a broadcast destination MAC.

Use the **no** variant of this command to turn off processing of ARP replies that arrive with a broadcast destination MAC.

**Syntax** `arp-reply-bc-dmac`  
`no arp-reply-bc-dmac`

**Default** By default, this functionality is disabled.

**Mode** Interface Configuration for VLAN interfaces

**Example** To allow processing of ARP replies that arrive on VLAN2 with a broadcast destination MAC, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-reply-bc-dmac
```

**Related  
Commands** `clear arp-cache`  
`show arp`

# clear arp-cache

**Overview** This command deletes dynamic ARP entries from the ARP cache. You can optionally specify the IPv4 address of an ARP entry to be cleared from the ARP cache.

When running VRF-lite, this command deletes dynamic ARP entries either from the ARP cache of a specific VRF instance, or from the ARP cache of the Global VRF instance. To delete all ARP entries from both the Global VRF instance and all VRF instances, use the command with no parameters. You can optionally specify the IPv4 address for the VRF instance to clear an ARP entry from the ARP cache.

**Syntax** `clear arp-cache [<ip-address>]`

**Syntax (VRF-lite)** `clear arp-cache [vrf <vrf-name>|global] [<ip-address>]`

Parameter	Description
<ip-address>	Specifies a specific IPv4 address for a VRF instance whose entries are to be cleared from the ARP cache.
global	When VRF-lite is configured, apply this command to the global routing and forwarding table.
vrf	Apply this command to the specified VRF instance.
<vrf-name>	The VRF instance name

**Mode** Privileged Exec

**Usage** To display the entries in the ARP cache, use the [show arp](#) command. To remove static ARP entries, use the no variant of the [arp](#) command.

**Example** To clear all dynamic ARP entries, use the command:

```
awplus# clear arp-cache
```

To clear all dynamic ARP entries associated with the IPv4 address 192.168.1.1, use the command:

```
awplus# clear arp-cache 192.168.1.1
```

**Example (VRF-lite)** To clear the dynamic ARP entries from the VRF instance named blue, use the commands:

```
awplus# clear arp-cache vrf blue
```

To clear the dynamic ARP entries from the VRF instance named blue with the IPv4 address 192.168.1.1, use the commands:

```
awplus# clear arp-cache vrf blue 192.168.1.1
```

When running VRF-lite, to clear the dynamic ARP entries from the global VRF-lite and all VRF instances, use the command:

```
awplus# clear arp-cache
```

**Related  
Commands**

- [arp-mac-disparity](#)
- [arp](#)
- [show arp](#)

# debug ip packet interface

**Overview** The **debug ip packet interface** command enables IP packet debug and is controlled by the **terminal monitor** command.

If the optional **icmp** keyword is specified then ICMP packets are shown in the output.

The **no** variant of this command disables the **debug ip interface** command.

**Syntax**

```
debug ip packet interface {<interface-name>|all} [address <ip-address>|verbose|hex|arp|udp|tcp|icmp]
no debug ip packet interface [<interface-name>]
```

Parameter	Description
<interface>	Specify a single Layer 3 interface name (not a range of interfaces). This keyword can be specified as either all or as a single Layer 3 interface to show debugging for either all interfaces or a single interface.
all	Specify all Layer 3 interfaces on the device.
<ip-address>	Specify an IPv4 address. If this keyword is specified, then only packets with the specified IP address as specified in the ip-address placeholder are shown in the output.
verbose	Specify <b>verbose</b> to output more of the IP packet. If this keyword is specified then more of the packet is shown in the output.
hex	Specify <b>hex</b> to output the IP packet in hexadecimal. If this keyword is specified, then the output for the packet is shown in hex.
arp	Specify <b>arp</b> to output ARP protocol packets. If this keyword is specified, then ARP packets are shown in the output.
udp	Specify <b>udp</b> to output UDP protocol packets. If this keyword is specified then UDP packets are shown in the output.
tcp	Specify <b>tcp</b> to output TCP protocol packets. If this keyword is specified, then TCP packets are shown in the output.
icmp	Specify <b>icmp</b> to output ICMP protocol packets. If this keyword is specified, then ICMP packets are shown in the output.

**Mode** Privileged Exec and Global Configuration

**Examples** To turn on ARP packet debugging on `vlan1`, use the command:

```
awplus# debug ip packet interface vlan1 arp
```

To turn on all packet debugging on all interfaces on the device, use the command:

```
awplus# debug ip packet interface all
```

To turn on TCP packet debugging on `vlan1` and IP address `192.168.2.4`, use the command:

```
awplus# debug ip packet interface vlan1 address 192.168.2.4 tcp
```

To turn off IP packet interface debugging on all interfaces, use the command:

```
awplus# no debug ip packet interface
```

To turn off IP packet interface debugging on interface `vlan2`, use the command:

```
awplus# no debug ip packet interface vlan2
```

**Related  
Commands**

[no debug all](#)

[show debugging ip dns forwarding](#)

[tcpdump](#)

[terminal monitor](#)

[undebug ip packet interface](#)

# debug ip irdp

**Overview** This command enables debugging of ICMP Router Discovery Protocol (IRDP) events and messages on your device. IRDP debugging is disabled by default.

The **no** variant of this command disables IRDP debugging. Negating any packet debug mode will switch detail off.

**Syntax** `debug ip irdp {event|nsm|receive|send|both|detail|all}`  
`no debug ip irdp {event|nsm|receive|send|both|detail|all}`

Parameter	Description
event	Enables debugging of IRDP events.
nsm	Enables debugging of IRDP processing of NSM messages.
receive	Enables debugging of IRDP input packet processing.
send	Enables debugging of IRDP output packet processing.
both	Enables debugging of both IRDP input and output packet processing.
detail	Enables detailed debugging of both IRDP input and output packet processing. Note that setting detail also sets both, so if you set <b>detail</b> , the output will show "packet debugging mode is all". Negating any packet debug mode will switch detail off.
all	Enables all IRDP debugging types.

**Default** IRDP protocol debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable IRDP input packet process debugging, use the following command:

```
awplus# debug ip irdp receive
```

To disable all IRDP debugging, use the following command:

```
awplus# no debug ip irdp all
```

- [router ip irdp](#)
- [show ip irdp](#)
- [undebug ip irdp](#)

# ip address (IP Addressing and Protocol)

**Overview** This command sets a static IP address on an interface.

The **no** variant of this command removes the IP address from the interface. You cannot remove the primary address when a secondary address is present.

**Syntax** `ip address <ip-addr/prefix-length> [secondary] [label <label>]`  
`no ip address [<ip-addr/prefix-length>] [secondary]`

Parameter	Description
<ip-addr/prefix-length>	The IPv4 address and prefix length you are assigning to the interface.
secondary	Secondary IP address.
label	Adds a user-defined description of the secondary IP address.
<label>	A user-defined description of the secondary IP address. Valid characters are any printable character and spaces.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage** To set the primary IP address on the interface, specify only **ip address** <ip-address/m>. This overwrites any configured primary IP address. To add additional IP addresses on this interface, use the **secondary** parameter. You must configure a primary address on the interface before configuring a secondary address.

**NOTE:** Use **show running-config interface** not **show ip interface brief** when you need to view a secondary address configured on an interface. **show ip interface brief** will only show the primary address, not a secondary address for an interface.

**Examples** To add the primary IP address 10.10.10.50/24 to the interface `vlan3`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip address 10.10.10.50/24
```

To add the secondary IP address 10.10.11.50/24 to the same interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip address 10.10.11.50/24 secondary
```

To add the IP address 10.10.11.50/24 to the local loopback interface lo, use the following commands:

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.11.50/24
```

**Related  
Commands**

- interface (to configure)
- show ip interface
- show running-config interface

# ip directed-broadcast

**Overview** Use this command to enable flooding of directed broadcast packets into a directly connected subnet. If this command is configured on a VLAN interface, then directed broadcasts received on other VLAN interfaces, destined for the subnet on this VLAN, will be flooded to the subnet broadcast address of this VLAN.

Use the **no** variant of this command to disable **ip directed-broadcast**. When this feature is disabled using the **no** variant of this command, directed broadcasts are not forwarded.

**Syntax** `ip directed-broadcast`  
`no ip directed-broadcast`

**Default** The **ip directed-broadcast** command is disabled by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage** IP directed-broadcast is enabled and disabled per VLAN interface. When enabled a directed broadcast packet is forwarded to an enabled VLAN interface if received on another subnet.

An IP directed broadcast is an IP packet whose destination address is a broadcast address for some IP subnet, but originates from a node that is not itself part of that destination subnet. When a directed broadcast packet reaches a device that is directly connected to its destination subnet, that packet is flooded as a broadcast on the destination subnet.

The **ip directed-broadcast** command controls the flooding of directed broadcasts when they reach target subnets. The command affects the final transmission of the directed broadcast on its destination subnet. It does not affect the transit unicast routing of IP directed broadcasts. If directed broadcast is enabled for an interface, incoming directed broadcast IP packets intended for the subnet assigned to interface will be flooded as broadcasts on that subnet.

If the **no ip directed-broadcast** command is configured for an interface, directed broadcasts destined for the subnet where the interface is attached will be dropped instead of broadcast.

**Examples** To enable the flooding of broadcast packets out via vlan2, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip directed-broadcast
```

To disable the flooding of broadcast packets via vlan2, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip directed-broadcast
```

**Related  
Commands**    ip forward-protocol udp  
                  ip helper-address  
                  show running-config

# ip forward-protocol udp

**Overview** This command enables you to control which UDP broadcasts will be forwarded to the helper address(es). A UDP broadcast will only be forwarded if the destination UDP port number in the packet matches one of the port numbers specified using this command.

Refer to the IANA site ([www.iana.org](http://www.iana.org)) for a list of assigned UDP port numbers for protocols to forward using **ip forward-protocol udp**.

Use the **no** variant of this command to remove a port number from the list of destination port numbers that are used as the criterion for deciding if a given UDP broadcast should be forwarded to the IP helper address(es).

**Syntax** `ip forward-protocol udp <port>`  
`no ip forward-protocol udp <port>`

Parameter	Description
<port>	UDP Port Number.

**Default** The **ip forward-protocol udp** command is not enabled by default.

**Mode** Global Configuration

**Usage** Combined with the **ip helper-address** command in interface mode, the **ip forward-protocol udp** command in Global Configuration mode allows control of which protocols (destination port numbers) are forwarded. The **ip forward-protocol udp** command configures protocols for forwarding, and the **ip helper-address** command configures the destination address(es).

**NOTE:**

*The types of UDP broadcast packets that the device will forward are ONLY those specified by the **ip forward-protocol** command(s). There are no other UDP packet types that the IP helper process forwards by default.*

**NOTE:**

*The **ip forward-protocol udp** command does not support BOOTP / DHCP Relay. The **ip dhcp-relay** command must be used instead. For this reason, you may not configure UDP ports 67 and 68 with the **ip forward-protocol udp** command.*

See the [IP Feature Overview and Configuration Guide](#) for more information about DNS Relay.

**Examples** To configure forwarding of packets on a UDP port, use the following commands:

```
awplus# configure terminal
awplus(config)# ip forward-protocol udp <port>
```

To delete a UDP port from the UDP ports that the device forwards, use the following commands:

```
awplus# configure terminal  
awplus(config)# no ip forward-protocol udp <port>
```

**Related  
Commands**

- [ip helper-address](#)
- [ip directed-broadcast](#)
- [show running-config](#)

# ip gratuitous-arp-link

**Overview** This command sets the Gratuitous ARP time limit for all switchports. The time limit restricts the sending of Gratuitous ARP packets to one Gratuitous ARP packet within the time in seconds.

**NOTE:** *This command specifies time between sequences of Gratuitous ARP packets, and time between individual Gratuitous ARP packets occurring in a sequence, to allow legacy support for older devices and interoperation between other devices that are not ready to receive and forward data until several seconds after linkup.*

*Additionally, jitter has been applied to the delay following linkup, so Gratuitous ARP packets applicable to a given port are spread over a period of 1 second so are not all sent at once. Remaining Gratuitous ARP packets in the sequence occur after a fixed delay from the first one.*

**Syntax** ip gratuitous-arp-link <0-300>  
no ip gratuitous-arp-link

Parameter	Description
<0-300>	Specify the minimum time between sequences of Gratuitous ARPs and the fixed time between Gratuitous ARPs occurring in a sequence, in seconds. 0 disables the sending of Gratuitous ARP packets. The default is 8 seconds.

**Default** The default Gratuitous ARP time limit for all switchports is 8 seconds.

**Mode** Global Configuration

**Usage** Every switchport will send a sequence of 3 Gratuitous ARP packets to each VLAN that the switchport is a member of, whenever the switchport moves to the forwarding state. The first Gratuitous ARP packet is sent 1 second after the switchport becomes a forwarding switchport. The second and third Gratuitous ARP packets are each sent after the time period specified by the Gratuitous ARP time limit.

Additionally, the Gratuitous ARP time limit specifies the minimum time between the end of one Gratuitous ARP sequence and the start of another Gratuitous ARP sequence. When a link is flapping, the switchport's state is set to forwarding several times. The Gratuitous ARP time limit is imposed to prevent Gratuitous ARP packets from being sent undesirably often.

**Examples** To disable the sending of Gratuitous ARP packets, use the commands :

```
awplus# configure terminal
awplus(config)# ip gratuitous-arp-link 0
```

To restrict the sending of Gratuitous ARP packets to one every 20 seconds, use the commands:

```
awplus# configure terminal  
awplus(config)# ip gratuitous-arp-link 20
```

**Validation  
Commands** `show running-config`

# ip helper-address

**Overview** This command adds a forwarding destination address for IP Helper to enable forwarding of User Datagram Protocol (UDP) broadcasts on an interface.

Use the **no** variant of this command to disable the forwarding of broadcast packets to specific addresses.

**Syntax** `ip helper-address <ip-addr>`  
`no ip helper-address <ip-addr>`

Parameter	Description
<code>&lt;ip-addr&gt;</code>	Forwarding destination IP address for IP Helper.

**Default** The destination address for the **ip helper-address** command is not configured by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage** Combined with the **ip forward-protocol udp** command in global configuration mode, the **ip helper-address** command in interface mode allows control of which protocols (destination port numbers) are forwarded. The **ip forward-protocol udp** command configures protocols for forwarding, and the **ip helper-address** command configures the destination address(es).

The destination address can be a unicast address or a subnet broadcast address. The UDP destination port is configured separately with the **ip forward-protocol udp** command. If multiple destination addresses are registered then UDP packets are forwarded to each IP address added to an IP Helper. Up to 32 destination addresses may be added using IP Helper.

The device will only forward the types of UDP broadcast packets that are specified by the **ip forward-protocol** command(s). The device does not forward any other UDP packet types by default.

The **ip helper-address** command does not support BOOTP / DHCP Relay. The **service dhcp-relay** command must be used instead. For this reason, you may not configure UDP ports 67 and 68 with the **ip forward-protocol** command.

See the [IP Feature Overview and Configuration Guide](#) for more information about DHCP Relay.

**Examples** The following example defines IPv4 address 192.168.1.100 as an IP Helper destination address to which to forward UDP broadcasts received on vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip helper-address 192.168.1.100
```

The following example removes IPv4 address 192.168.1.100 as an IP Helper destination address to which to forward UDP broadcasts received on vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip helper-address 192.168.1.100
```

**Related  
Commands**

- [ip forward-protocol udp](#)
- [ip directed-broadcast](#)
- [show running-config](#)

# ip irdp

**Overview** This command enables ICMP Router Discovery advertising on an interface. However, the interface does not send or process Router Discovery messages until at least one IP address is configured on the interface with the [ip address \(IP Addressing and Protocol\)](#) command.

The **no** variant of this command disables ICMP Router Discovery advertisements on an IP interface. All transmitting and processing of Router Discovery messages ceases immediately on the interface.

**Syntax** `ip irdp`  
`no ip irdp`

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To enable Router Discovery advertisements on `vlan4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip irdp
```

To disable Router Discovery advertisements on `vlan4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ip irdp
```

**Related Commands** [ip address \(IP Addressing and Protocol\)](#)  
[show ip irdp](#)  
[show ip irdp interface](#)

# ip irdp address preference

**Overview** When multiple routers connected to a LAN are all sending Router Discovery advertisements, hosts need to be able to choose the best router to use. Therefore the IRDP defines a preference value to place in the Router Discovery advertisements. Hosts choose the router with the highest preference value.

This command sets the preference value to include in Router Discovery advertisements sent for the specified IP address.

The **no** variant of this command sets the preference for a specific address to the default of **0**.

**Syntax** `ip irdp address <ip-address> preference <0-2147483647>`  
`no ip irdp address <ip-address> preference`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The IP address to be advertised with the specified preference value.
<code>&lt;0-2147483647&gt;</code>	The preference value advertised. A higher number increases the preference level for this address.

**Default** The default preference value is 0.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the preference value to 3000 for the address 192.168.1.1 advertised on `vlan5`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip irdp address 192.168.1.1 preference 3000
```

To set the preference value to the default of 0 for the address 192.168.1.1 advertised on `vlan5`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# no ip irdp address 192.168.1.1 preference
```

## Related Commands

[ip irdp](#)  
[ip irdp preference](#)  
[show ip irdp interface](#)

# ip irdp broadcast

**Overview** This command configures broadcast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the broadcast address (255.255.255.255) as the IP destination address.

The **no** variant of this command configures multicast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the all-system multicast address (224.0.0.1) as the IP destination address.

**Syntax** ip irdp broadcast  
no ip irdp broadcast

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To enable broadcast Router Discovery advertisements on `vlan13`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# ip irdp broadcast
```

To enable multicast Router Discovery advertisements on `vlan13`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# no ip irdp broadcast
```

**Related Commands** ip irdp  
ip irdp multicast  
show ip irdp interface

# ip irdp holdtime

**Overview** This command sets the maximum length of time that the advertised addresses are to be considered as valid router addresses by hosts.

The **no** variant of this command resets the holdtime back to the default of 1800 seconds.

**Syntax** `ip irdp holdtime <0-9000>no ip irdp holdtime`

Parameter	Description
<code>&lt;0-9000&gt;</code>	The holdtime value in seconds of addresses advertised.

**Default** The IRDP holdtime is set to 1800 seconds (30 minutes) by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the holdtime value of addresses advertised on `vlan2` to 4000 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip irdp holdtime 4000
```

To set the holdtime value of addresses advertised on `vlan2` back to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip irdp holdtime
```

**Related Commands** [show ip irdp interface](#)

# ip irdp lifetime

**Overview** This command sets the maximum length of time that hosts should consider the Router Discovery advertised addresses as valid router addresses. If you change the lifetime value, also change the **maxadvertisementinterval** and the **minadvertisementinterval** to maintain the following ratios:

This command is synonymous with the **ip irdp hostname**<0-9000> command.

The **no** variant of this command sets the lifetime back to the default of 1800 seconds.

**Syntax** ip irdp lifetime <0-9000>  
no ip irdp lifetime

Parameter	Description
<0-9000>	Lifetime value in seconds of the advertised addresses.

**Default** The lifetime value is 1800 seconds.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the lifetime value to 4000 seconds for addresses advertised on `vlan6`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# ip irdp lifetime 4000
```

To set the lifetime value to the default of 1800 seconds for addresses advertised on `vlan6`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# no ip irdp lifetime
```

**Related  
Commands**

[ip irdp](#)  
[ip irdp maxadvertinterval](#)  
[ip irdp minadvertinterval](#)  
[show ip irdp interface](#)

# ip irdp maxadvertinterval

**Overview** This command sets the maximum time allowed between sending router advertisements from the interface. If you change the **maxadvertisementinterval** value, also change the **lifetime** and the **minadvertisementinterval** to maintain the following ratios:

```
lifetime=3 x maxadvertisementinterval  
minadvertisementinterval=0.75 x maxadvertisementinterval
```

You cannot set the maximum advertisement interval below the minimum interval. If you are lowering the maximum interval to a value below the current minimum interval, you must change the minimum value first.

The **no** variant of this command sets the **maxadvertinterval** back to the default of 600 seconds.

**Syntax** ip irdp maxadvertinterval <4-1800>  
no ip irdp maxadvertinterval

Parameter	Description
<4-1800>	The maximum time, in seconds, between Router Discovery advertisements.

**Default** The IRDP maximum advertisement interval is set to 600 seconds (10 minutes) by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the maximum interval between Router Discovery advertisements on `vlan7` to 950 seconds, use the following commands:

```
awplus# configure terminal  
awplus(config)# interface vlan7  
awplus(config-if)# ip irdp maxadvertinterval 950
```

To set the maximum interval between advertisements on `vlan7` back to the default, use the following commands:

```
awplus# configure terminal  
awplus(config)# interface vlan7  
awplus(config-if)# no ip irdp maxadvertinterval
```

**Related  
Commands**

- ip irdp
- ip irdp lifetime
- ip irdp minadvertinterval
- show ip irdp interface

# ip irdp minadvertinterval

**Overview** This command sets the minimum time allowed between sending router advertisements from the interface. If you change the **minadvertisementinterval** value, also change the **lifetime** and the **maxadvertisementinterval** to maintain the following ratios:

```
lifetime=3 x maxadvertisementinterval  
minadvertisementinterval=0.75 x maxadvertisementinterval
```

You cannot set the minimum advertisement interval above the maximum interval. If you are raising the minimum interval to a value above the current maximum interval, you must change the maximum value first.

The **no** variant of this command sets the **minadvertinterval** back to the default of 450 seconds.

**Syntax** `ip irdp minadvertinterval <3-1800>`  
`no ip irdp minadvertinterval`

Parameter	Description
<3-1800>	The minimum time between advertisements in seconds.

**Default** The IRDP minimum advertisement interval is set to 450 seconds (7.5 minutes) by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the minimum interval between advertisements on `vlan4` to 900 seconds, use the following commands:

```
awplus# configure terminal  
awplus(config)# interface vlan4  
awplus(config-if)# ip irdp minadvertinterval 900
```

To set the minimum interval between advertisements on `vlan4` back to the default of 450 seconds, use the following commands:

```
awplus# configure terminal  
awplus(config)# interface vlan4  
awplus(config-if)# no ip irdp minadvertinterval
```

**Related  
Commands**

- ip irdp
- ip irdp lifetime
- ip irdp maxadvertinterval
- show ip irdp interface

# ip irdp multicast

**Overview** This command configures multicast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the all-system multicast address (224.0.0.1) as the IP destination address.

The **no** variant of this command configures broadcast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the broadcast address (255.255.255.255) as the IP destination address.

The multicast address is the default IP destination address for Router Discovery advertisements.

**Syntax** `ip irdp multicast`  
`no ip irdp multicast`

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To enable multicast Router Discovery advertisements on `vlan5`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip irdp multicast
```

To enable broadcast Router Discovery advertisements on `vlan5`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# no ip irdp multicast
```

**Related Commands** [ip irdp](#)  
[ip irdp broadcast](#)  
[show ip irdp interface](#)

# ip irdp preference

**Overview** When multiple routers connected to a LAN are all sending Router Discovery advertisements, hosts need to be able to choose the best router to use. Therefore the IRDP defines a preference value to place in the Router Discovery advertisements. Hosts choose the router with the highest preference value.

This command sets the preference value to include in Router Discovery advertisements sent for the specified interface.

When this command is used, all IP addresses on the interface are assigned the same preference value, except the addresses that have specific preference value assignment using the command [ip irdp address preference](#).

The **no** variant of this command sets the preference value to the default of 0.

**Syntax** `ip irdp preference <0-2147483647>`  
`no ip irdp preference`

Parameter	Description
<code>&lt;0-2147483647&gt;</code>	The preference value for the interface. A higher number increases the preference level for addresses on the specific interface.

**Default** The default preference value is 0.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the preference of addresses advertised on `vlan6` to 500, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# ip irdp preference 500
```

To set the preference value for addresses on `vlan6` back to the default of 0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# no ip irdp preference
```

**Related Commands** [ip irdp](#)  
[ip irdp address preference](#)  
[show ip irdp interface](#)

# ip limited-local-proxy-arp

**Overview** Use this command to enable local proxy ARP, but only for a specified set of IP addresses. This makes the device respond to ARP requests for those IP addresses when the addresses are reachable via the interface you are configuring.

To specify the IP addresses, use the command [local-proxy-arp](#).

Use the **no** variant of this command to disable limited local proxy ARP. This stops your device from intercepting and responding to ARP requests for the specified hosts. This allows the hosts to use MAC address resolution to communicate directly with one another.

**Syntax** `ip limited-local-proxy-arp`  
`no ip limited-local-proxy-arp`

**Default** Limited local proxy ARP is disabled by default.

**Mode** Interface Configuration

**Usage** This command allows you to stop MAC address resolution for specified hosts. Limited local proxy ARP works by intercepting ARP requests for the specified hosts and responding with your device's own MAC address details instead of the destination host's details. This stops hosts from learning the MAC address of the other hosts through ARP requests.

Limited local proxy ARP ensures that the specified devices cannot send traffic that bypasses Layer 3 routing on your device. This gives you control over which hosts may communicate with one another.

**Example** To enable limited local proxy ARP, so that the device makes ARP responses to ARP requests for specified addresses, when the ARP requests are received on VLAN2 and the addresses are routed out VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip limited-local-proxy-arp
```

**Related  
Commands** [ip local-proxy-arp](#)  
[local-proxy-arp](#)

# ip local-proxy-arp

**Overview** This command allows you to stop MAC address resolution between hosts within a private VLAN edge interface. Local Proxy ARP works by intercepting ARP requests between hosts within a subnet and responding with your device's own MAC address details instead of the destination host's details. This stops hosts from learning the MAC address of other hosts within its subnet through ARP requests.

Local Proxy ARP ensures that devices within a subnet cannot send traffic that bypasses Layer 3 routing on your device. This lets you monitor and filter traffic between hosts in the same subnet, and enables you to have control over which hosts may communicate with one another.

When Local Proxy ARP is operating on an interface, your device does not generate or forward any ICMP-Redirect messages on that interface. This command does not enable proxy ARP on the interface; see the [ip proxy-arp](#) command for more information on enabling proxy ARP.

The **no** variant of this command disables Local Proxy ARP to stop your device from intercepting and responding to ARP requests between hosts within a subnet. This allows the hosts to use MAC address resolution to communicate directly with one another. Local Proxy ARP is disabled by default.

**Syntax** `ip local-proxy-arp`  
`no ip local-proxy-arp`

**Default** Local proxy ARP is disabled by default

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To enable your device to apply Local Proxy ARP on the interface `vlan7`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# ip local-proxy-arp
```

To disable your device to apply Local Proxy ARP on the interface `vlan7`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# no ip local-proxy-arp
```

**Related  
Commands** [ip proxy-arp](#)  
[show arp](#)  
[show running-config](#)

# ip proxy-arp

**Overview** This command enables Proxy ARP responses to ARP requests on an interface. When enabled, your device intercepts ARP broadcast packets and substitutes its own physical address for that of the remote host. By responding to the ARP request, your device ensures that subsequent packets from the local host are directed to its physical address, and it can then forward these to the remote host.

Your device responds only when it has a specific route to the address being requested, excluding the interface route that the ARP request arrived from. It ignores all other ARP requests. See the [ip local-proxy-arp](#) command about enabling your device to respond to other ARP messages.

The **no** variant of this command disables Proxy ARP responses on an interface. Proxy ARP is disabled by default.

**Syntax** `ip proxy-arp`  
`no ip proxy-arp`

**Default** Proxy ARP is disabled by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To enable your device to Proxy ARP on the interface `vlan13`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# ip proxy-arp
```

To disable your device to Proxy ARP on the interface `vlan13`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# no ip proxy-arp
```

**Related Commands** [arp](#)  
[ip local-proxy-arp](#)  
[show arp](#)  
[show running-config](#)

# ip redirects

**Overview** This command enables the device to send ICMP redirects on one or more interfaces.

Use the **no** variant of this command to stop the device from sending ICMP redirects on one or more interfaces.

**Syntax** `ip redirects`  
`no ip redirects`

**Default** ICMP redirects are disabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** ICMP redirect messages are used to notify hosts that a better route is available to a destination.

ICMP redirects are used when a packet is routed into the device on the same interface that the packet is routed out of the device. ICMP redirects are only sent to packet sources that are directly connected to the device.

**Examples** To enable the device to send ICMP redirects on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip redirects
```

To stop the device from sending ICMP redirects on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip redirects
```

# ip tcp synack-retries

**Overview** Use this command to specify how many times the switch will retry sending a SYN ACK for a TCP connection for which it has received a SYN but not an ACK. Such connections are called half-open TCP connections. This command allows you to influence how long half-open TCP connections take to time out.

Use the **no** variant of this command to return to the default setting of 5 retries.

**Syntax** `ip tcp synack-retries <0-255>`  
`no ip tcp synack-retries`

Parameter	Description
<0-255>	Number of times to retry sending the SYN ACK

**Default** 5 retries

**Mode** Global Configuration

**Usage** The following table shows the approximate correlation between the number of retries and the time half-open TCP connections take to time out.

Number of retries	Approximate lower bound for the timeout
0 retries	1 second
1 retry	3 seconds
2 retries	7 seconds
3 retries	15 seconds
4 retries	31 seconds
5 retries	63 seconds

**Example** To retry twice, which leads to a timeout of approximately 7 seconds, use the commands:

```
awplus# configure terminal  
awplus(config)# ip tcp synack-retries 2
```

**Related Commands** [show running-config](#)

**Command changes** Version 5.4.7-0.2: command added

# ip unreachables

**Overview** Use this command to enable ICMP (Internet Control Message Protocol) type 3, destination unreachable, messages.

Use the **no** variant of this command to disable destination unreachable messages. This prevents an attacker from using these messages to discover the topology of a network.

**Syntax** `ip unreachables`  
`no ip unreachables`

**Default** Destination unreachable messages are enabled by default.

**Mode** Global Configuration

**Usage** When a device receives a packet for a destination that is unreachable it returns an ICMP type 3 message, this message includes a reason code, as per the table below. An attacker can use these messages to obtain information regarding the topology of a network. Disabling destination unreachable messages, using the **no ip unreachables** command, secures your network against this type of probing.

**NOTE:** *Disabling ICMP destination unreachable messages breaks applications such as traceroute and Path MTU Discovery (PMTUD), which depend on these messages to operate correctly.*

Table 20-2: ICMP type 3 reason codes and description

Code	Description [RFC]
0	Network unreachable [RFC792]
1	Host unreachable [RFC792]
2	Protocol unreachable [RFC792]
3	Port unreachable [RFC792]
4	Fragmentation required, and DF flag set [RFC792]
5	Source route failed [RFC792]
6	Destination network unknown [RFC1122]
7	Destination host unknown [RFC1122]
8	Source host isolated [RFC1122]
9	Network administratively prohibited [RFC768]
10	Host administratively prohibited [RFC869]
11	Network unreachable for Type of Service [RFC908]
12	Host unreachable for Type of Service [RFC938]
13	Communication administratively prohibited [RFC905]

Table 20-2: ICMP type 3 reason codes and description (cont.)

Code	Description [RFC]
14	Host Precedence Violation [RFC1812]
15	Precedence cutoff in effect [RFC1812]

**Example** To disable destination unreachable messages, use the commands

```
awplus# configure terminal  
awplus(config)# no ip unreachable
```

To enable destination unreachable messages, use the commands

```
awplus# configure terminal  
awplus(config)# ip unreachable
```

# local-proxy-arp

**Overview** Use this command to specify an IP subnet for use with limited local proxy ARP. When limited local proxy ARP is enabled with the command `ip limited-local-proxy-arp`, the device will respond to ARP requests for addresses in that subnet.

Use the **no** variant of this command to stop specifying a subnet for use with limited local proxy ARP.

**Syntax** `local-proxy-arp [<ip-add/mask>]`  
`no local-proxy-arp [<ip-add/mask>]`

Parameter	Description
<code>&lt;ip-add/mask&gt;</code>	The IP subnet to use with limited local proxy ARP, in dotted decimal format (A.B.C.D/M). To specify a single IP address, use a 32-bit mask.

**Default** No subnets are specified for use with limited local proxy ARP.

**Mode** Global Configuration

**Example** To specify limited local proxy ARP for the address 172.22.0.3, use the following commands:

```
awplus# configure terminal
awplus(config)# local-proxy-arp 172.22.0.3/32
```

**Related Commands** [ip limited-local-proxy-arp](#)

# optimistic-nd

**Overview** Use this command to enable the optimistic neighbor discovery feature for both IPv4 and IPv6.

Use the **no** variant of this command to disable the optimistic neighbor discovery feature.

**Syntax** `optimistic-nd`  
`no optimistic-nd`

**Default** The optimistic neighbor discovery feature is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** The optimistic neighbor discovery feature allows the device, after learning an IPv4 or IPv6 neighbor, to refresh the neighbor before the neighbor is deleted from the hardware L3 switching table. The neighbor is put into the “stale” state in the software switching table if it is not refreshed, then the ‘stale’ neighbors are deleted from the hardware L3 switching table.

The optimistic neighbor discovery feature enables the device to sustain L3 traffic switching to a neighbor without interruption. Without the optimistic neighbor discovery feature enabled L3 traffic is interrupted when a neighbor is “stale” and is then deleted from the L3 switching table.

If a neighbor receiving optimistic neighbor solicitations does not answer optimistic neighbor solicitations with neighbor advertisements, then the neighbor will be put into the “stale” state, and subsequently deleted from both the software and the hardware L3 switching tables.

**Examples** To enable the optimistic neighbor discovery feature on vlan100, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan100
awplus(config-if)# optimistic-nd
```

To disable the optimistic neighbor discovery feature on vlan100, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan100
awplus(config-if)# no optimistic-nd
```

**Related Commands** [show running-config](#)

# ping

**Overview** This command sends a query to another IPv4 host (send Echo Request messages).

**Syntax** ping [ip] <host> [broadcast] [df-bit {yes|no}] [interval <0-128>] [pattern <hex-data-pattern>] [repeat {<1-2147483647>|continuous}] [size <36-18024>] [source <ip-addr>] [timeout <1-65535>] [tos <0-255>]

**Syntax (VRF-lite)** ping [vrf <vrf-name>] [ip] <host> [broadcast] [df-bit {yes|no}] [interval <0-128>] [pattern <hex-data-pattern>] [repeat {<1-2147483647>|continuous}] [size <36-18024>] [source <ip-addr>] [timeout <1-65535>] [tos <0-255>]

Parameter	Description
<host>	The destination IP address or hostname.
broadcast	Allow pinging of a broadcast address.
df-bit	Enable or disable the do-not-fragment bit in the IP header.
interval <0-128>	Specify the time interval in seconds between sending ping packets. The default is 1. You can use decimal places to specify fractions of a second. For example, to ping every millisecond, set the interval to 0.001.
pattern <hex-data-pattern>	Specify the hex data pattern.
repeat	Specify the number of ping packets to send.
<1-2147483647>	Specify repeat count. The default is 5.
continuous	Continuous ping
size <36-18024>	The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).
source <ip-addr>	The IP address of a configured IP interface to use as the source in the IP header of the ping packet.
timeout <1-65535>	The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.
tos <0-255>	The value of the type of service in the IP header.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode** User Exec and Privileged Exec

**Example** To ping the IP address 10.10.0.5 use the following command:

```
awplus# ping 10.10.0.5
```

**Example (VRF-lite)** To ping the IP address 10.10.0.5 from VRF instance 'red', use the following command:

```
awplus# ping vrf red 10.10.0.5
```

**NOTE:** *Unless a cross-domain static or leaked route exists to the destination IP address, you must run this command from within the same routing domain as the address being pinged.*

# router ip irdp

**Overview** This command globally enables ICMP Router Discovery (IRDP) advertisements on your device. However, your device does not send or process IRDP messages until at least one interface is configured to use IP and has had IRDP enabled on the interface with the `ip irdp` command.

The **no** variant of this command globally disables IRDP advertisements on the device. All interfaces immediately stop transmitting and processing Router Discovery messages.

**Syntax** `router ip irdp`  
`no router ip irdp`

**Mode** Global Configuration

**Examples** To enable Router Discovery advertisements on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# router ip irdp
```

To disable Router Discovery advertisements on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# no router ip irdp
```

**Related Commands** `ip irdp`  
`show ip irdp`

# show arp

**Overview** Use this command to display entries in the ARP routing and forwarding table—the ARP cache contains mappings of IP addresses to physical addresses for hosts. To have a dynamic entry in the ARP cache, a host must have used the ARP protocol to access another host.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show arp [security [interface [<interface-list>]]`  
`show arp [statistics [detail][interface [<interface-list>]]`

**Syntax (VRF-lite)** `show arp [global|security|vrf <vrf-name>]`

Parameter	Description
<code>security</code>	Specify the DHCP Snooping ARP security output option.
<code>interface</code>	Specify an interface list for DHCP Snooping ARP security output.
<code>&lt;interface-list&gt;</code>	Specify a single Layer 3 interface name, or a range of interfaces.
<code>statistics</code>	Specify brief DHCP Snooping ARP security statistics.
<code>detail</code>	Specify detailed DHCP Snooping ARP security statistics.
<code>global</code>	When VRF-lite is configured, apply this command to the global routing and forwarding table
<code>vrf</code>	Apply this command to the specified VRF instance.
<code>&lt;vrf-name&gt;</code>	The VRF instance name

**Mode** User Exec and Privileged Exec

**Usage** Running this command with no additional parameters will display all entries in the ARP routing and forwarding table.

With VRF-lite configured, and no additional parameters entered, the command output displays all entries, listed by their VRF instance. By adding either a specific VRF instance or global parameter entry, you can selectively list ARP entries by their membership of a specific VRF instance.

**Example** To display all ARP entries in the ARP cache, use the following command:

```
awplus# show arp
```

**Output** Figure 20-3: Example output from the **show arp** command

```
awplus#show arp

IP Address      MAC Address      Interface      Port           Type
192.168.10.2    0015.77ad.fad8  vlan1          port1.1.1      dynamic
192.168.20.2    0015.77ad.fa48  vlan2          port1.1.2      dynamic
192.168.1.100   00d0.6b04.2a42  vlan2          port1.1.3      static
...
```

**Example (VRF-lite)** To display the dynamic ARP entries in the global routing instance, use the command:

```
awplus# show arp global
```

**Output** Figure 20-4: Example output from the **show arp global** command

```
awplus#show arp global

IP Address      MAC Address      Interface      Port           Type
192.168.10.2    0015.77ad.fad8  vlan1          port1.1.1      dynamic
192.168.20.2    0015.77ad.fa48  vlan2          port1.1.2      dynamic
192.168.1.100   00d0.6b04.2a42  vlan2          port1.1.3      static
...
```

**Example (VRF-lite)** To display the dynamic ARP entries for a VRF instance 'red', use the command:

```
awplus# show arp vrf red
```

**Output** Figure 20-5: Example output from the **show arp vrf red** command

```
awplus# show arp vrf red

[VRF: red]
IP Address      MAC Address      Interface      Port           Type
192.168.10.2    0015.77ad.fad8  vlan1          port1.1.1      dynamic
```

**Table 21:** Parameters in the output of the **show arp** command

Parameter	Meaning
IP Address	IP address of the network device this entry maps to.
MAC Address	Hardware address of the network device.
Interface	Interface over which the network device is accessed.
Port	Physical port that the network device is attached to.

**Table 21:** Parameters in the output of the **show arp** command (cont.)

Parameter	Meaning
Type	Whether the entry is a static or dynamic entry. Static entries are added using the <a href="#">arp</a> command. Dynamic entries are learned from ARP request/reply message exchanges.
VRF	The name of the VRF instance. The VRF-lite components only display when VRF-lite is configured.

Commands**    [arp](#)  
                  [clear arp-cache](#)

# show debugging ip packet

**Overview** Use this command to show the IP interface debugging status. IP interface debugging is set using the **debug ip packet interface** command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging ip packet

**Mode** User Exec and Privileged Exec

**Example** To display the IP interface debugging status when the terminal monitor off, use the command:

```
awplus# terminal no monitor
awplus# show debug ip packet
```

**Output** Figure 20-6: Example output from the **show debugging ip packet** command with **terminal monitor** off

```
awplus#terminal no monitor

awplus#show debug ip packet

IP debugging status:

interface all tcp (stopped)

interface vlan1 arp verbose (stopped)
```

**Example** To display the IP interface debugging status when the terminal monitor is on, use the command:

```
awplus# terminal monitor
awplus# show debug ip packet
```

**Output** Figure 20-7: Example output from the **show debugging ip packet** command with **terminal monitor** on

```
awplus#terminal monitor

awplus#show debug ip packet

IP debugging status:

interface all tcp (running)

interface vlan1 arp verbose (running)
```

**Related  
Commands** [debug ip packet interface](#)  
[terminal monitor](#)

# show ip flooding-nextops

**Overview** Use this command to display the static and dynamic ARP entries in the ARP cache that flood packets to multiple ports.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ip flooding-nextops`

**Syntax (VRF-lite)** `show ip flooding-nextops [vrf <vrf-name>|global]`

Parameter	Description
<code>vrf &lt;vrf-name&gt;</code>	VRF instance
<code>global</code>	Global Routing/Forwarding table

**Mode** User Exec and Privileged Exec

**Usage** To display the flooding nexthop entries associated with a VRF instance, use the **show ip flooding-nextops vrf** command in User Exec and Privileged Exec mode.

To display the entries in the global ARP table only, use the **show ip flooding-nextop global** command.

**Example** To display all of the flooding nexthop entries in the ARP cache, use the command:

```
awplus# show ip flooding-nextops
```

**Output** Figure 20-8: Example output from **show ip flooding-nextops**

```
awplus#show ip flooding-nextops
IP Address      MAC Address      Interface      Flooding Mode      Type
11.11.11.10     0300.0000.0011  vlan1          port-group          static
[VRF: test]
IP Address      MAC Address      Interface      Flooding Mode      Type
10.10.10.10     0100.0000.0000  vlan2          port-group          static
```

**Related Commands** [show arp](#)

**Command changes** Version 5.4.8-2.1: command added

# show ip interface

**Overview** Use this command to display information about interfaces and the IP addresses assigned to them. To display information about a specific interface, specify the interface name with the command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip interface [<interface-list>] [brief]`

Parameter	Description
<code>&lt;interface-list&gt;</code>	The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• an interface, e.g. <code>vlan2</code></li><li>• a continuous range of interfaces separated by a hyphen, e.g. <code>vlan2-8</code> or <code>vlan2-vlan5</code></li><li>• a comma-separated list of interfaces or interface ranges, e.g. <code>vlan2, vlan5, vlan8-10</code></li></ul> The specified interfaces must exist.

**Mode** User Exec and Privileged Exec

**Examples** To show brief information for the assigned IP address for interface `port1.1.2` use the command:

```
awplus# show ip interface port1.1.2 brief
```

To show the IP addresses assigned to `vlan2` and `vlan3`, use the command:

```
awplus# show ip interface vlan2-3 brief
```

**Output** Figure 20-9: Example output from the **show ip interface brief** command

Interface	IP-Address	Status	Protocol
<code>port1.1.2</code>	<code>unassigned</code>	<code>admin up</code>	<code>down</code>
<code>vlan1</code>	<code>192.168.1.1</code>	<code>admin up</code>	<code>running</code>
<code>vlan2</code>	<code>192.168.2.1</code>	<code>admin up</code>	<code>running</code>
<code>vlan3</code>	<code>192.168.3.1</code>	<code>admin up</code>	<code>running</code>
<code>vlan8</code>	<code>unassigned</code>	<code>admin up</code>	<code>down</code>

# show ip interface vrf

**Overview** Use this command to display protocol and status information about configured interfaces and their assigned IP addresses in VRF instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip interface [vrf <vrf-name>|global]`

Parameter	Description
vrf	A VRF instance.
<vrf-name>	The name of a specific VRF instance.
global	The global routing and forwarding table.

**Mode** User Exec and Privileged Exec

**Examples** To display all interfaces and IP addresses associated with a VRF instance ‘red’, use the command:

```
awplus# show ip interface vrf red
```

**Output** Figure 20-10: Example output from **show ip interface vrf red**

Interface	IP-Address	Status	Protocol
lol	unassigned	admin up	running
vlan1	192.168.10.1/24	admin up	running

**Example** To display all interfaces and IP addresses associated with all VRF instances, use the command:

```
awplus# show ip interface
```

**Output** Figure 20-11: Example output from the **show ip interface** with VRF-lite configured

Interface	IP-Address	Status	Protocol
eth0	unassigned	admin up	down
lo	unassigned	admin up	running
vlan1	192.168.1.1/24	admin up	running
vlan4	172.30.4.43/24	admin up	down
[VRF: red]			
Interface	IP-Address	Status	Protocol
lo1	unassigned	admin up	running
[VRF: blue]			
Interface	IP-Address	Status	Protocol
lo2	unassigned	admin up	running

# show ip irdp

**Overview** This command displays whether IRDP is globally enabled on your device, and the status of the debugging modes.

If the **debug ip irdp** command has been set with the **detail** parameter then the **both** parameter is also set and the output will show “packet debugging mode is all”.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip irdp

**Mode** User Exec and Privileged Exec

**Example** To display global IRDP configuration, use the command:

```
awplus# show ip irdp
```

**Output** Figure 20-12: Example output from the **show ip irdp** command

```
IRDP is enabled
event debugging is disabled
nsm debugging is disabled
packet debugging mode is disabled
```

Figure 20-13: Example output from the **show ip irdp** command with **debug ip irdp detail** set

```
IRDP is enabled
event debugging is disabled
nsm debugging is disabled
packet debugging mode is all
```

Figure 20-14: Example output from the **show ip irdp** command with **debug ip irdp both** set

```
IRDP is enabled
event debugging is disabled
nsm debugging is disabled
packet debugging mode is both
```

**Related Commands** [debug ip irdp](#)  
[router ip irdp](#)

# show ip irdp interface

**Overview** This command displays the configuration of IRDP on all interfaces, or for a specified interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip irdp interface [<interface-name>]`

Parameter	Description
<interface-name>	Displays the interface status and configuration details of the specified interface.

**Mode** User Exec and Privileged Exec

**Example** To display the IRDP configuration for `vlan4`, use the command:

```
awplus# show ip irdp interface vlan4
```

**Output** Figure 20-15: Example output from the **show ip irdp interface** command

```
vlan13 is up, line protocol is up
ICMP Router Discovery Protocol
  Sending mode          multicast
  Router Lifetime       1350 seconds
  Default Preference    0
  Min Adv Interval      450 seconds
  Max Adv Interval      600 seconds
  Next advertisement in 551 seconds
  Non default prefix preferences
    192.168.1.1         preference    25000

  In packets            0                Out packets        3
  In bad packets        0                Out bad packets    0
  In good packets       0                Out good packets   3
  In ignored packets    0
```

**Table 22:** Parameters in the output of the **show ip irdp interface** command

Parameter	Description
Sending mode	Whether this interface is sending broadcast or multicast router advertisements. This means the destination IP address of router advertisements will be either the multicast address 224.0.0.1, or the broadcast address 255.255.255.255.
Router Lifetime	The lifetime value set for router advertisements sent from this interface. This is the maximum time that other devices should treat the advertised address as valid.
Default Preference	The preference value for IP addresses as default router addresses, relative to other router addresses on the same subnet. This preference value is used for all IP addresses on this interface, except for those listed under the heading "non default prefix preferences".
Min Adv Interval	Minimum time allowed between sending router advertisements from this interface.
Max Adv Interval	Maximum time allowed between sending router advertisements from this interface.
Non default prefix preferences	List of the IP addresses on this interface that have been set with a specific router preference value. These addresses use the preference value listed beside them, rather than the interface's default preference value.
In packets	The total number of packets received by IRDP on this interface. IRDP processes all ICMP packets received on this interface.
Out packets	The number of packets sent by IRDP on this interface.
In bad packets	The number of packets received by IRDP that it has discarded because they do not conform or corrupted.
Out bad packets	The number of packets that IRDP generated but failed to send to the network layer.
In good packets	The number of packets received and processed by IRDP.
Out good packets	The number of packets generated and successfully sent by IRDP.
In ignored packets	The number of incoming packets ignored, like ICMP packets other than IRDP.

**Related Commands** [ip irdp](#)  
[show ip irdp](#)

# show ip sockets

**Overview** Use this command to display information about the IP or TCP sockets that are present on the device. It includes TCP and UDP listen sockets, and displays the associated IP address and port.

The information displayed for established TCP sessions includes the remote IP address, port, and session state. Raw IP protocol listen socket information is also displayed for protocols such as VRRP and ICMP6, which are configured to receive IP packets with the associated protocol number.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip sockets

**Mode** Privileged Exec

**Usage** Use this command to verify that the socket being used is opening correctly. If there is a local and remote endpoint, a connection is established with the ports indicated.

Note that this command does not display sockets that are used internally for exchanging data between the various processes that exist on the device and are involved in its operation and management. It only displays sockets that are present for the purposes of communicating with other external devices.

**Example** To display IP sockets currently present on the device, use the command:

```
awplus# show ip sockets
```

**Output** Figure 20-16: Example output from **show ip sockets**

```
Socket information

Not showing 40 local connections
Not showing 7 local listening ports
```

Typ	Local Address	Remote Address	State
tcp	0.0.0.0:111	0.0.0.0:*	LISTEN
tcp	0.0.0.0:80	0.0.0.0:*	LISTEN
tcp	0.0.0.0:23	0.0.0.0:*	LISTEN
tcp	0.0.0.0:443	0.0.0.0:*	LISTEN
tcp	0.0.0.0:4743	0.0.0.0:*	LISTEN
tcp	0.0.0.0:873	0.0.0.0:*	LISTEN
tcp	:::23	:::*	LISTEN
udp	0.0.0.0:111	0.0.0.0:*	
udp	226.94.1.1:5405	0.0.0.0:*	
udp	0.0.0.0:161	0.0.0.0:*	
udp	:::161	:::*	
raw	0.0.0.0:112	0.0.0.0:*	112
raw	:::58	:::*	58
raw	:::112	:::*	112

Table 20-1: Parameters in the output from **show ip sockets**

Parameter	Description
Not showing <number> local connections	This field refers to established sessions between processes internal to the device, that are used in its operation and management. These sessions are not displayed as they are not useful to the user. <number> is some positive integer.
Not showing <number> local listening ports	This field refers to listening sockets belonging to processes internal to the device, that are used in its operation and management. They are not available to receive data from other devices. These sessions are not displayed as they are not useful to the user. <number> is some positive integer.
Typ	This column displays the type of the socket. Possible values for this column are: tcp : IP Protocol 6 udp : IP Protocol 17 raw : Indicates that socket is for a non port-orientated protocol (i.e. a protocol other than TCP or UDP) where all packets of a specified IP protocol type are accepted. For raw socket entries the protocol type is indicated in subsequent columns.
Local Address	For TCP and UDP listening sockets this shows the destination IP address (either IPv4 or IPv6) and destination TCP or UDP port number for which the socket will receive packets. The address and port are separated by ':'. If the socket will accept packets addressed to any of the device's IP addresses, the IP address will be 0.0.0.0 for IPv4 or :: for IPv6. For active TCP sessions the IP address will display which of the devices addresses the session was established with. For raw sockets this displays the IP address and IP protocol for which the socket will accept IP packets. The address and protocol are separated by ':'. If the socket will accept packets addressed to any of the device's IP addresses, the IP address will be 0.0.0.0 for IPv4 and :: for IPv6. IP Protocol assignments are described at: <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a>

Table 20-1: Parameters in the output from **show ip sockets** (cont.)

Parameter	Description
Remote Address	For TCP and UDP listening sockets this shows the source IP address (either IPv4 or IPv6) and source TCP or UDP port number for which the socket will accept packets. The address and port are separated by ':'. If the socket will accept packets addressed from any IP address, the IP address will be 0.0.0.0 for IPv4 or :: for IPv6. This is the usual case for a listening socket. Normally for a listen socket any source port will be accepted. This is indicated by ". For active TCP sessions the IP address will display the remote address and port the session was established with. For raw sockets the entry in this column will be 0.0.0.0: or ::: for IPv4 and IPv6, respectively.
State	This column shows the state of the socket. For TCP sockets this shows the state of the TCP state machine. For UDP sockets this column is blank. For raw sockets it contains the IP protocol number. The possible TCP states are: LISTEN SYN-SENT SYN-RECEIVED ESTABLISHED FIN-WAIT-1 FIN-WAIT-2 CLOSE-WAIT CLOSING LAST-ACK TIME-WAIT CLOSED RFC793 contains the TCP state machine diagram with Section 3.2 describing each of the states.

# show ip traffic

**Overview** Use this command to display statistics regarding IP traffic sent and received by all interfaces on the device, showing totals for IP and IPv6 and then broken down into sub-categories such as TCP, UDP, ICMP and their IPv6 equivalents when appropriate.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip traffic

**Mode** Privileged Exec

**Example** To display IP traffic statistics, use the command:

```
awplus# show ip traffic
```

**Output** Figure 20-17: Example output from the **show ip traffic** command

```
IP:
    261998 packets received
    261998 delivered
    261998 sent
    69721 multicast packets received
    69721 multicast packets sent
    23202841 bytes received
    23202841 bytes sent
    7669296 multicast bytes received
    7669296 multicast bytes sent
IPv6:
    28 packets discarded on transmit due to no route
ICMP6:
UDP6:
UDPLite6:
TCP:
    0 remote connections established
    40 local connections established
    7 remote listening ports
    7 local listening ports
    261 active connection openings
    247 passive connection openings
    14 connection attempts failed
    122535 segments received
    122535 segments transmitted
    14 resets transmitted
    227 TCP sockets finished time wait in fast timer
```

```
155 delayed acks sent
21187 headers predicted
736 pure ACKs
80497 pure ACKs predicted
UDP:
139468 datagrams received
139468 datagrams sent
UDPLite:
```

# tcpdump

**Overview** Use this command to start a tcpdump, which gives the same output as the Unix-like **tcpdump** command to display TCP/IP traffic. Press <ctrl> + c to stop a running tcpdump.

**Syntax** tcpdump <line>

**Syntax (VRF-lite)** tcpdump [vrf <vrf-name>] <line>

Parameter	Description
<line>	Specify the dump options. For more information on the options for this placeholder see <a href="http://www.tcpdump.org/tcpdump_man.html">http://www.tcpdump.org/tcpdump_man.html</a>
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode** Privileged Exec

**Example** To start a tcpdump running to capture IP packets, enter the command:

```
awplus# tcpdump ip
```

**Example (VRF-lite)** To start a tcpdump on interface vlan2 associated with a VRF instance red, enter the command:

```
awplus# tcpdump vrf red vlan2
```

**Output** Figure 20-18: Example output from the **tcpdump** command

```
03:40:33.221337 IP 192.168.1.1 > 224.0.0.13: PIMv2, Hello,  
length: 34  
1 packets captured  
2 packets received by filter  
0 packets dropped by kernel
```

**Related Commands** [debug ip packet interface](#)

# traceroute

**Overview** Use this command to trace the route to the specified IPv4 host.

**Syntax** `traceroute {<ip-addr>|<hostname>}`

**Syntax (VRF-lite)** `traceroute [vrf <vrf-name>] {<ip-addr>|<hostname>}`

Parameter	Description
<code>&lt;ip-addr&gt;</code>	The destination IPv4 address. The IPv4 address uses the format A.B.C.D.
<code>&lt;hostname&gt;</code>	The destination hostname.
<code>vrf</code>	Apply the command to the specified VRF instance.
<code>&lt;vrf-name&gt;</code>	The name of the VRF instance.

**Mode** User Exec and Privileged Exec

**Example** `awplus# traceroute 10.10.0.5`

**Example (VRF-lite)** `awplus# traceroute vrf red 192.168.0.1`

# undebbug ip packet interface

**Overview** This command applies the functionality of the no `debug ip packet interface` command.

# undebug ip irdp

**Overview** This command applies the functionality of the no `debug ip irdp` command.

# 21

# Domain Name Service (DNS) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Domain Name Service (DNS) features, including the following:

- DNS client
- DNS forwarding (DNS relay)

For more information about DNS for Switches, see the [Domain Name System \(DNS\) for AlliedWare Plus Switches Feature Overview and Configuration Guide](#)

- Command List**
- “clear ip dns forwarding cache” on page 882
  - “debug ip dns forwarding” on page 883
  - “ip dns forwarding” on page 884
  - “ip dns forwarding cache” on page 885
  - “ip dns forwarding dead-time” on page 887
  - “ip dns forwarding retry” on page 888
  - “ip dns forwarding source-interface” on page 889
  - “ip dns forwarding timeout” on page 890
  - “ip domain-list” on page 891
  - “ip domain-lookup” on page 892
  - “ip domain-name” on page 894
  - “ip name-server” on page 895
  - “show debugging ip dns forwarding” on page 897
  - “show hosts” on page 898
  - “show ip dns forwarding” on page 899
  - “show ip dns forwarding cache” on page 900

- [“show ip dns forwarding server”](#) on page 902
- [“show ip domain-list”](#) on page 904
- [“show ip domain-name”](#) on page 905
- [“show ip name-server”](#) on page 906

# clear ip dns forwarding cache

**Overview** Use this command to clear the DNS Relay name resolver cache.

When using VRF-lite, use this command to clear the DNS Relay name resolver cache for either the whole device or for a specific VRF instance.

**Syntax** `clear ip dns forwarding cache`

**Syntax (VRF-lite)** `clear ip dns [vrf <name>|global] forwarding cache`

Parameter	Description
vrf	Apply this command to the specified VRF instance.
<name>	The name of the specific VRF instance
global	When VRF-lite is configured, apply this command to the global routing and forwarding table.

**Mode** Privileged Exec

**Examples** To clear all cached data, use the command:

```
awplus# clear ip dns forwarding cache
```

**Example (VRF-lite)** To clear the cached data for VRF instance red, use the command:

```
awplus# clear ip dns vrf red forwarding cache
```

To clear the cached data for the default global VRF instance only, use the command:

```
awplus# clear ip dns global forwarding cache
```

**Related Commands** [ip dns forwarding cache](#)

# debug ip dns forwarding

**Overview** Use this command to enable DNS Relay debugging.  
Use the **no** variant of this command to disable DNS Relay debugging.

**Syntax** `debug ip dns forwarding`  
`no debug ip dns forwarding`

**Default** DNS Relay debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable DNS forwarding debugging, use the commands:

```
awplus# debug ip dns forwarding
```

To disable DNS forwarding debugging, use the commands:

```
awplus# no debug ip dns forwarding
```

**Related Commands** [ip dns forwarding](#)  
[show debugging ip dns forwarding](#)

# ip dns forwarding

**Overview** Use this command to enable DNS Relay, the forwarding of incoming DNS queries for IP hostname-to-address translation.

Use the **no** variant of this command to disable the forwarding of incoming DNS queries for IP hostname-to-address translation.

**Syntax** `ip dns forwarding`  
`no ip dns forwarding`

**Default** The forwarding of incoming DNS query packets is disabled by default.

**Mode** Global Configuration

**Usage** DNS Relay is independent of the configuration of [ip domain-lookup](#) (which is enabled by default). If [ip domain-lookup](#) is disabled, but DNS Relay is enabled, the router will continue to forward DNS queries by hosts in the network to its configured name-servers.

See the [ip dns forwarding dead-time](#) command used with this command.

**NOTE:** *When running VRF-lite, the DNS Relay functions will apply separately within each VRF instance.*

**Examples** To enable the forwarding of incoming DNS query packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding
```

To disable the forwarding of incoming DNS query packets, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding
```

# ip dns forwarding cache

**Overview** Use this command to set the DNS Relay name resolver cache size and cache entry lifetime period. The DNS Relay name resolver cache stores the mappings between domain names and IP addresses.

Use the **no** variant of this command to set the default DNS Relay name resolver cache size and cache entry lifetime period.

Note that the lifetime period of the cache entry can be overwritten by the time-out period of the DNS reply from the DNS server if the time-out period of the DNS reply from the DNS server is smaller than the configured time-out period. The time-out period of the cache entry will only be used when the time-out period of the DNS reply from the DNS server is bigger than the time-out period configured on the device.

**Syntax** `ip dns forwarding cache [size <0-10000>] [timeout <60-3600>]`  
`no ip dns forwarding cache [size|timeout]`

Parameter	Description
<0-10000>	Number of entries in the DNS Relay name resolver cache.
<60-3600>	Timeout value in seconds. Note that when running VRF-lite the number of entries configured will apply to each VRF instance.

**Default** The default cache size is 0 (no entries) and the default lifetime is 1800 seconds.

**Mode** Global Configuration

**Examples** To set the cache size to 10 entries and the lifetime to 500 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding cache size 10 time 500
```

To set the cache size to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding cache size
```

**Related Commands**

- [clear ip dns forwarding cache](#)
- [debug ip dns forwarding](#)
- [ip dns forwarding](#)
- [show ip dns forwarding](#)
- [show ip dns forwarding cache](#)

**Command changes** Version 5.4.8-1.1: maximum cache limit increased to 10000

# ip dns forwarding dead-time

**Overview** Use this command to set the time period in seconds when the device stops sending any DNS requests to an unresponsive server and all retries set using `ip dns forwarding retry` are used. This time period is the DNS forwarding dead-time. The device stops sending DNS requests at the DNS forwarding dead-time configured and when all of the retries are used.

Use the **no** variant of this command to restore the default DNS forwarding dead-time value of 3600 seconds.

**Syntax** `ip dns forwarding dead-time <60-43200>`  
`no ip dns forwarding retry`

Parameter	Description
<code>&lt;60-43200&gt;</code>	Set the DNS forwarding dead-time in seconds. At the dead-time set, the switch stops sending DNS requests to an unresponsive server.

**Default** The default time to stop sending DNS requests to an unresponsive server is 3600 seconds.

**Mode** Global Configuration

**Usage** See the `ip dns forwarding retry` command used with this command.

**Examples** To set the DNS forwarding retry count to 50 and to set the DNS forwarding dead-time to 1800 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding dead-time 1800
awplus(config)# ip dns forwarding retry 50
```

To reset the DNS retry count to the default of 2 and the DNS forwarding dead-time to the default of 3600, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding dead-time
awplus(config)# no ip dns forwarding retry
```

**Related Commands**

- `debug ip dns forwarding`
- `ip dns forwarding`
- `ip dns forwarding retry`
- `show ip dns forwarding`
- `show ip dns forwarding server`

# ip dns forwarding retry

**Overview** Use this command to set the number of times DNS Relay will retry to forward DNS queries. The device stops sending DNS requests to an unresponsive server at the time set using the [ip dns forwarding dead-time](#) command and when all of the retries are used.

Use the **no** variant of this command to set the number of retries to the default of 2.

**Syntax** `ip dns forwarding retry <0-100>`  
`no ip dns forwarding retry`

Parameter	Description
<0-100>	Set the number of times DNS Relay will retry to forward a DNS query.

**Default** The default number of retries is 2 DNS requests to an unresponsive server.

**Mode** Global Configuration

**Usage** See the [ip dns forwarding dead-time](#) command used with this command.

**Examples** To set the DNS forwarding retry count to 50 and to set the DNS forwarding dead-time to 1800 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding retry 50
awplus(config)# ip dns forwarding dead-time 1800
```

To reset the DNS retry count to the default of 2 and the DNS forwarding dead-time to the default of 3600 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding retry
awplus(config)# no ip dns forwarding dead-time
```

**Related Commands**

- [debug ip dns forwarding](#)
- [ip dns forwarding](#)
- [ip dns forwarding dead-time](#)
- [show ip dns forwarding](#)

# ip dns forwarding source-interface

**Overview** Use this command to set the interface to use for forwarding and receiving DNS queries.

Use the **no** variant of this command to unset the interface used for forwarding and receiving DNS queries.

**Syntax** `ip dns forwarding source-interface <interface-name>`  
`no ip dns forwarding source-interface`

Parameter	Description
<code>&lt;interface-name&gt;</code>	An alphanumeric string that is the interface name.

**Default** The default is that no interface is set and the device selects the appropriate source IP address automatically.

**Mode** Global Configuration

**Examples** To set `vlan1` as the source interface for relayed DNS queries, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding source-interface vlan1
```

To clear the source interface for relayed DNS queries, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding source-interface
```

**Related Commands** [debug ip dns forwarding](#)  
[ip dns forwarding](#)  
[show ip dns forwarding](#)

# ip dns forwarding timeout

**Overview** Use this command to set the time period for the DNS Relay to wait for a DNS response.

Use the **no** variant of this command to set the time period to wait for a DNS response to the default of 3 seconds.

**Syntax** `ip dns forwarding timeout <0-3600>`  
`no ip dns forwarding timeout`

Parameter	Description
<0-3600>	Timeout value in seconds.

**Default** The default timeout value is 3 seconds.

**Mode** Global Configuration

**Examples** To set the timeout value to 12 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding timeout 12
```

To set the timeout value to the default of 3 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding timeout
```

**Related Commands** [debug ip dns forwarding](#)  
[ip dns forwarding](#)  
[show ip dns forwarding](#)

# ip domain-list

**Overview** This command adds a domain to the DNS list. Domains are appended to incomplete host names in DNS requests. Each domain in this list is tried in turn in DNS lookups. This list is ordered so that the first entry you create is checked first.

The **no** variant of this command deletes a domain from the list.

**Syntax** `ip domain-list <domain-name>`  
`no ip domain-list <domain-name>`

Parameter	Description
<code>&lt;domain-name&gt;</code>	Domain string, for example "company.com".

**Mode** Global Configuration

**Usage** If there are no domains in the DNS list, then your device uses the domain specified with the `ip domain-name` command. If any domain exists in the DNS list, then the device does not use the domain set using the **ip domain-name** command.

**Example** To add the domain `example.net` to the DNS list, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-list example.net
```

**Related Commands** `ip domain-lookup`  
`ip domain-name`  
`show ip domain-list`

# ip domain-lookup

**Overview** This command enables the DNS client on your device. This allows you to use domain names instead of IP addresses in commands. The DNS client resolves the domain name into an IP address by sending a DNS inquiry to a DNS server, specified with the `ip name-server` command.

It is possible to configure the DNS client to use the DNS relay to resolve domain lookups originating from the device itself. This configuration may be preferred, as the DNS relay provides additional functionality that is not available in the DNS client, such as caching, a configurable timeout length, and other options.

The **no** variant of this command disables the DNS client. The client will not attempt to resolve domain names. You must use IP addresses to specify hosts in commands.

**Syntax** `ip domain-lookup [via-relay]`  
`no ip domain-lookup`

Parameter	Description
<code>via-relay</code>	Perform resolution via DNS relay

**Mode** Global Configuration

**Usage** The client is enabled by default. However, it does not attempt DNS inquiries unless there is a DNS server configured.

**Examples** To enable the DNS client on your device, use the following commands:

```
awplus# configure terminal  
awplus(config)# ip domain-lookup
```

To configure the DNS client to perform resolution via the DNS relay, use the following commands:

```
awplus# configure terminal  
awplus(config)# ip domain-lookup via-relay  
awplus(config)# ip dns forwarding
```

To disable the DNS client on your device, use the following commands:

```
awplus# configure terminal  
awplus(config)# no ip domain-lookup
```

**Related  
Commands** ip domain-list  
ip domain-name  
ip name-server  
show hosts  
show ip name-server

**Command  
changes** Version 5.4.8-1.1: via-relay parameter added

# ip domain-name

**Overview** This command sets a default domain for the DNS. The DNS client appends this domain to incomplete host-names in DNS requests.

The **no** variant of this command removes the domain-name previously set by this command.

**Syntax** `ip domain-name <domain-name>`  
`no ip domain-name <domain-name>`

Parameter	Description
<code>&lt;domain-name&gt;</code>	Domain string, for example "company.com".

**Mode** Global Configuration

**Usage** If there are no domains in the DNS list (created using the [ip domain-list](#) command) then your device uses the domain specified with this command. If any domain exists in the DNS list, then the device does not use the domain configured with this command.

When your device is using its DHCP client for an interface, it can receive Option 15 from the DHCP server. This option replaces the domain name set with this command.

**Example** To configure the domain name, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-name company.com
```

**Related Commands** [ip domain-list](#)  
[show ip domain-list](#)  
[show ip domain-name](#)

# ip name-server

**Overview** This command adds IPv4 or IPv6 DNS server addresses. The DNS client on your device sends DNS queries to IP addresses in this list when trying to resolve a host name. Host names cannot be resolved until you have added at least one server to this list. A maximum of three name servers can be added to this list.

If you are running VRF-lite, you can add IPv4 or IPv6 DNS server addresses for either the global VRF instance or for a specific VRF instance. Host names cannot be resolved from within a VRF instance until you have added at least one name-server to that VRF instance.

The **no** variant of this command removes the specified DNS name-server address.

**Syntax** `ip name-server <ip-addr>`  
`no ip name-server <ip-addr>`

**Syntax (VRF-lite)** `ip name-server [vrf <name>] <ip-addr>`  
`no ip name-server [vrf <name>] <ip-addr>`

Parameter	Description
<code>&lt;ip-addr&gt;</code>	The IP address of the DNS server that is being added to the name server list. The address is entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address.
<code>vrf</code>	Apply this command to the specified VRF instance.
<code>&lt;name&gt;</code>	The name of the specific VRF instance

**Mode** Global Configuration

**Usage** To allow the device to operate as a DNS proxy, your device must have learned about a DNS name-server to forward requests to. Name-servers can be learned through the following means:

- Manual configuration, using the **ip name-server** command
- Learned from DHCP server with Option 6

This command is used to statically configure a DNS name-server for the device to use.

**Examples** To allow a device to send DNS queries to a DNS server with the IPv4 address 10.10.10.5, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server 10.10.10.5
```

To enable your device to send DNS queries to a DNS server with the IPv6 address 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server 2001:0db8:010d::1
```

**Example (VRF-lite)** To enable your switch to send DNS queries (on VRF instance RED) to a DNS server with the IPv4 address 10.10.10.5 use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server vrf RED 10.10.10.5
```

[show ip name-server](#)

# show debugging ip dns forwarding

**Overview** Use this command to display the DNS Relay debugging status. DNS Relay debugging is set using the **debug ip dns forwarding** command.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show debugging ip dns forwarding`

**Mode** User Exec and Privileged Exec

**Example** To display the DNS Relay debugging status, use the command:

```
awplus# show debugging ip dns forwarding
```

**Output** Figure 21-1: Example output from the **show debugging ip dns forwarding** command

```
awplus#show debugging ip dns forwarding

DNS Relay debugging status:
debugging is on
```

**Related Commands** [debug ip dns forwarding](#)

# show hosts

**Overview** This command shows the default domain, domain list, and name servers configured on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show hosts`

**Mode** User Exec and Privileged Exec

**Example** To display the default domain, use the command:

```
awplus# show hosts
```

**Output** Figure 21-2: Example output from the **show hosts** command when **no ip domain-lookup** is configured

```
awplus#show hosts

Default domain is not set
Name/address lookup is disabled
```

Figure 21-3: Example output from the **show hosts** command when **ip domain-lookup** is configured

```
awplus#show hosts

Default domain is mycompany.com
Domain list: company.com
Name/address lookup uses domain service
Name servers are 10.10.0.2 10.10.0.88
```

Figure 21-4: Example output from the **show hosts** command when **ip domain-lookup via-relay** is configured

```
awplus#show hosts

Default domain is mycompany.com
Domain list: company.com
Name/address lookup uses domain relay service
Name servers are 10.10.0.2 10.10.0.88
```

# show ip dns forwarding

**Overview** Use this command to display the DNS Relay status.

**Syntax** show ip dns forwarding

**Mode** User Exec and Privileged Exec

**Examples** To display the DNS Relay status, use the command:

```
awplus# show ip dns forwarding
```

**Output** Figure 21-5: Example output from the **show ip dns forwarding** command

```
awplus#show ip dns forwarding

Max-Retry      : 2
Timeout        : 3 second(s)
Dead-Time      : 3600 second(s)
Source-Interface: not specified
DNS Cache      : disabled
```

**Related Commands** [ip dns forwarding](#)

# show ip dns forwarding cache

**Overview** Use this command to display the DNS Relay name resolver cache.

**Syntax** show ip dns forwarding cache

**Syntax (VRF-lite)** show ip dns [vrf <name>|global] forwarding cache

Parameter	Description
vrf	Apply this command to the specified VRF instance.
<name>	The name of the specific VRF instance
global	When VRF-lite is configured, apply this command to the global routing and forwarding table.

**Mode** User Exec and Privileged Exec

**Example** To display the DNS Relay name resolver cache, use the command:

```
awplus# show ip dns forwarding cache
```

**Output** Figure 21-6: Example output from the **show ip dns forwarding cache** command

```
awplus#show ip dns forwarding cache
IPv4 addresses in cache:    3
IPv6 addresses in cache:    0
Cache size: 1000
Host                        Address                Expires  Flags
www.example.com            172.16.1.1.            180
mail.example.com           www.example.com        180 CNAME
www.example.com            172.16.1.1.            180 REVERSE
mail.example.com           172.16.1.5.            180
```

**Example (VRF-lite)** To display the DNS Relay name resolver cache with output for VRF instance RED, use the command:

```
awplus# show ip dns vrf RED forwarding cache
```

**Output** Figure 21-7: Example output from the **show ip dns forwarding cache** command that includes output for VRF instance RED.

```
awplus#show ip dns vrf RED forwarding cache
IPv4 addresses in cache: 3
IPv6 addresses in cache: 0
Cache size: 1000
Host                Address                Expires  Flags
www.example.com     172.16.1.1.            180
mail.example.com    www.example.com        180 CNAME
www.example.com     172.16.1.1.            180 REVERSE
mail.example.com    172.16.1.5.            180

[VRF: RED]
www.example2.com    10.25.1.1.             180
mail.example2.com   www.example2.com       180 CNAME
www.example2.com    10.25.1.1.             180 REVERSE
mail.example2.com   10.25.1.6.             180
```

**Related Commands** [ip dns forwarding cache](#)  
[ip name-server](#)

# show ip dns forwarding server

**Overview** Use this command to display the status of DNS forwarding name servers.

If you are running VRF, you can also use this command to display the status for DNS forwarding name servers operating on a specific VRF instance.

**Syntax** `show ip dns forwarding server`

**Syntax (VRF-lite)** `show ip dns [vrf <name>|global] forwarding server`

Parameter	Description
vrf	Apply this command to the specified VRF instance.
<name>	The name of the specific VRF instance
global	When VRF-lite is configured, apply this command to the global routing and forwarding table.
forwarding server	Display information about the DNS forwarding name servers for either the switch (when not using VRF-lite) or for a specific VRF instance (when using VRF-lite).

**Mode** User Exec and Privileged Exec

**Examples** To display the status of DNS Relay name servers, use the command:

```
awplus# show ip dns forwarding server
```

**Output** Figure 21-8: Example output from the **show ip dns forwarding server** command

```
awplus#show ip dns forwarding server

Servers          Forwards    Fails      Dead-Time
172.16.1.1       12          0          active
172.16.1.2       6           3          3900
```

**Example (VRF-lite)** To display the status of DNS Relay name-servers for VRF-lite instance red, use the command:

```
awplus# show ip dns vrf red forwarding server
```

**Output** Figure 21-9: Example output from the **show ip dns forwarding server** command

```
awplus#show ip dns forwarding server

[VRF: red]
Servers          Forwards    Fails      Dead-Time
172.16.1.1       12          0          active
172.16.1.2       6           3          3900
```

**Related  
Commands** [ip dns forwarding](#)  
[ip dns forwarding dead-time](#)

# show ip domain-list

**Overview** This command shows the domains configured in the domain list. The DNS client uses the domains in this list to append incomplete hostnames when sending a DNS inquiry to a DNS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip domain-list`

**Mode** User Exec and Privileged Exec

**Example** To display the list of domains in the domain list, use the command:

```
awplus# show ip domain-list
```

**Output** Figure 21-10: Example output from the **show ip domain-list** command

```
awplus#show ip domain-list
alliedtelesis.com
mycompany.com
```

**Related Commands** [ip domain-list](#)  
[ip domain-lookup](#)

# show ip domain-name

**Overview** This command shows the default domain configured on your device. When there are no entries in the DNS list, the DNS client appends this domain to incomplete hostnames when sending a DNS inquiry to a DNS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip domain-name`

**Mode** User Exec and Privileged Exec

**Example** To display the default domain configured on your device, use the command:

```
awplus# show ip domain-name
```

**Output** Figure 21-11: Example output from the **show ip domain-name** command

```
awplus#show ip domain-name  
alliedtelesis.com
```

**Related Commands** [ip domain-name](#)  
[ip domain-lookup](#)

# show ip name-server

**Overview** This command displays a list of IPv4 and IPv6 DNS server addresses that your device will send DNS requests to. This is a static list configured using the `ip name-server` command.

When running VRF-lite, this command displays a list of IPv4 and IPv6 addresses of DNS servers that your device will send DNS requests to for either the global VRF instance or a selected VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip name-server`

**Syntax (VRF-lite)** `show ip name-server [vrf <name>|global]`

Parameter	Description
vrf	A VRF instance
<name>	The name of the specific VRF instance
global	The global VRF instance

**Mode** User Exec and Privileged Exec

**Example** To display the list of DNS servers that your device sends DNS requests to, use the command:

```
awplus# show ip name-server
```

**Output** Figure 21-12: Example output from the `show ip name-server` command

```
awplus# show ip name-server
10.10.0.123
10.10.0.124
2001:0db8:010d::1
```

**Output (VRF-lite)** Figure 21-13: Example output from the `show ip name-server` command for the VRF instance “red”

```
awplus# show ip name-server vrf red

[VRF: red]
10.10.0.123
10.10.0.124
2001:0db8:010d::1
```

- [“show ipv6 route summary”](#) on page 944
- [“traceroute ipv6”](#) on page 945

# clear ipv6 neighbors

**Overview** Use this command to clear all dynamic IPv6 neighbor entries.

**Syntax** `clear ipv6 neighbors`

**Mode** Privileged Exec

**Example** `awplus# clear ipv6 neighbors`

# ipv6 address

**Overview** Use this command to set the IPv6 address of an interface. The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

To stop the device from processing prefix information (routes and addresses from the received Router Advertisements) use the command **no ipv6 nd accept-ra-pinfo**.

To remove the EUI-64 link-local address, use the command **no ipv6 eui64-linklocal**.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

**Syntax** `ipv6 address <ipv6-addr/prefix-length>`  
`no ipv6 address <ipv6-addr/prefix-length>`

Parameter	Description
<code>&lt;ipv6-addr/prefix-length&gt;</code>	Specifies the IPv6 address to be set. The IPv6 address uses the format X:X::X/Prefix-Length. The prefix-length is usually set between 0 and 64.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Note that link-local addresses are retained in the system until they are negated by using the **no** variant of the command that established them. See the [ipv6 enable](#) command for more information.

Also note that the link-local address is retained in the system if the global address is removed using another command, which was not used to establish the link-local address. For example, if a link local address is established with the [ipv6 enable](#) command then it will not be removed using a **no ipv6 address** command.

**Examples** To assign the IPv6 address 2001:0db8::a2/64 to the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address 2001:0db8::a2/64 from the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

**Related  
Commands**

- ipv6 address autoconfig
- ipv6 address dhcp
- ipv6 dhcp server
- ipv6 enable
- ipv6 eui64-linklocal
- show running-config
- show ipv6 interface brief
- show ipv6 route

# ipv6 address autoconfig

**Overview** Use this command to enable IPv6 stateless address autoconfiguration (SLAAC) for an interface. This configures an IPv6 address on an interface derived from the MAC address on the interface.

Use the **no** variant of this command to disable IPv6 SLAAC on an interface. Note that if no global addresses are left after removing all IPv6 autoconfigured addresses then IPv6 is disabled.

**Syntax** `ipv6 address autoconfig`  
`no ipv6 address autoconfig`

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command enables automatic configuration of IPv6 addresses using stateless autoconfiguration on an interface and enables IPv6.

IPv6 hosts can configure themselves when connected to an IPv6 network using ICMPv6 (Internet Control Message Protocol version 6) router discovery messages. Configured routers respond with a Router Advertisement (RA) containing configuration parameters for IPv6 hosts.

The SLAAC process derives the interface identifier of the IPv6 address from the MAC address of the interface. When applying SLAAC to an interface, note that the MAC address of the default VLAN is applied to the interface if the interface does not have its own MAC address.

If SLAAC is not suitable then a network can use stateful configuration with DHCPv6 (Dynamic Host Configuration Protocol version 6) Relay, or hosts can be configured statically. See [ip dhcp-relay server-address](#) for the DHCPv6 Relay server command description and examples. See the [IP Feature Overview and Configuration Guide](#) for more information about DNS Relay.

Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them. See the [ipv6 enable](#) command for more information.

Also note that the link-local address is retained in the system if the global address is removed using another command that was not used to establish the link-local address. For example, if a link local address is established with the [ipv6 enable](#) command then it will not be removed using a **no ipv6 address** command.

**Examples** To enable SLAAC on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address autoconfig
```

To disable SLAAC on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address autoconfig
```

[show running-config](#)

# ipv6 address suffix

**Overview** Use this command to configure the suffix to use when generating an address from prefix information. Any addresses that were created with the EUI-64 suffix will be removed, and new addresses will be added after the next Router Advertisement.

Use the **no** variant of this command to set it back to the default of disabled or set to `::` for the same result as the **no** variant.

**Syntax** `ipv6 address suffix <ipv6-addr-suffix>`  
`no ipv6 address suffix`

Parameter	Description
<code>&lt;ipv6-addr-suffix&gt;</code>	In the format of <code>::X:X:X</code> , for example <code>::a2d8:0fd8</code>

**Default** Disabled

**Mode** Interface Configuration

**Example** To configure the suffix to use when generating an address from prefix information on `vlan2`, use the command:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address suffix ::a2d8:0fd8
```

**Related Commands** [ipv6 nd accept-ra-pinfo](#)  
[show running-config interface](#)

**Command changes** Version 5.4.8-2.1: command added

# ipv6 enable

**Overview** Use this command to enable automatic configuration of a link-local IPv6 address on an interface using Stateless Automatic Address Configuration (SLAAC). By default, the EUI-64 method is used to generate the link-local address.

Use the **no** variant of this command to disable IPv6 on an interface without a global address. Note, to stop EUI-64 from generating the automatic link-local address, use the command **no ipv6 eui64-linklocal**.

**Syntax** `ipv6 enable`  
`no ipv6 enable`

**Mode** Interface Configuration for a VLAN interface.

**Usage** The **ipv6 enable** command automatically configures an IPv6 link-local address on the interface and enables the interface for IPv6 processing.

A link-local address is an IP (Internet Protocol) address that is only used for communications in the local network, or for a point-to-point connection. Routing does not forward packets with link-local addresses. IPv6 requires that a link-local address is assigned to each interface that has the IPv6 protocol enabled, and when addresses are assigned to interfaces for routing IPv6 packets.

Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them.

Also note that the link-local address is retained in the system if the global address is removed using another command that was not used to establish the link-local address. For example, if a link local address is established with the **ipv6 enable** command then it will not be removed using a **no ipv6 address** command.

**Default** All interfaces default to IPv6-down with no address.

**Examples** To enable IPv6 with only a link-local IPv6 address on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
```

To disable IPv6 with only a link-local IPv6 address on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 enable
```

**Related

# ipv6 eui64-linklocal

**Overview** When IPv6 is enabled on an interface, an EUI link-local address is generated and installed on the interface. In other words, **ipv6 eui64-linklocal** is enabled by default on any IPv6 enabled interface.

Use the **no** variant of this command to disallow the automatic generation of the EUI-64 link-local address on an IPv6 enabled interface.

**Syntax** `ipv6 eui64-linklocal`  
`no ipv6 eui64-linklocal`

**Default** The command **ipv6 eui64-linklocal** is enabled by default on any IPv6 enabled interface.

**Mode** Interface

**Example** To enable IPv6 on the interface vlan1, and use the link-local address of fe80::1/10 instead of the EUI-64 link-local that is automatically generated, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# no ipv6 eui64-linklocal
awplus(config-if)# ipv6 address fe80::1/10
```

**Related Commands** [ipv6 address](#)  
[ipv6 address autoconfig](#)  
[ipv6 enable](#)

**Command changes** Version 5.4.7-0.1: command added

# ipv6 forwarding

**Overview** Use this command to turn on IPv6 unicast routing for IPv6 packet forwarding.

Execute this command globally on your device prior to issuing `ipv6 enable` on individual interfaces.

Use this **no** variant of this command to turn off IPv6 unicast routing. Note IPv6 unicast routing is disabled by default.

**NOTE:** Use this command to enable IPv6 unicast routing before configuring either RIPng or OSPFv3 IPv6 routing protocols and static or multicast IPv6 routing.

IPv6 must be enabled on an interface with the `ipv6 enable` command, IPv6 forwarding must be enabled globally for routing IPv6 with the `ipv6 forwarding` command, and IPv6 multicasting must be enabled globally with the `ipv6 multicast-routing` command before using PIM-SMv6 commands.

**Syntax** `ipv6 forwarding`  
`no ipv6 forwarding`

**Mode** Global Configuration

**Default** IPv6 unicast forwarding is disabled by default.

**Usage** Enable IPv6 unicast forwarding globally for all interface on your device with this command. Use the **no** variant of this command to disable IPv6 unicast forwarding globally for all interfaces on your device.

IPv6 unicast forwarding allows devices to communicate with devices that are more than one hop away, providing that there is a route to the destination address. If IPv6 forwarding is not enabled then pings to addresses on devices that are more than one hop away will fail, even if there is a route to the destination address.

**Examples** To enable IPv6 unicast routing, use this command as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
```

To disable IPv6 unicast routing, use the no variant of this command as shown below:

```
awplus# configure terminal
awplus(config)# no ipv6 forwarding
```

**Related Commands** [ipv6 enable](#)  
[ipv6 multicast-routing](#)

# ipv6 multicast forward-slow-path-packet

**Overview** Use this command to enable multicast packets to be forwarded to the CPU. Enabling this command will ensure that the layer L3 MTU is set correctly for each IP multicast group and will apply the value of the smallest MTU among the outgoing interfaces for the multicast group.

It will also ensure that a received packet that is larger than the MTU value will result in the generation of an ICMP Too Big message.

Use the **no** variant of this command to disable the above functionality.

**Syntax** `ipv6 multicast forward-slow-path-packet`  
`no ipv6 multicast forward-slow-path-packet`

**Default** Disabled.

**Mode** Privileged Exec

**Example** To enable the ipv6 multicast forward-slow-path-packet function, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-slow-path-packet
```

**Related Commands** [show ipv6 forwarding](#)

# ipv6 nd accept-ra-pinfo

**Overview** Use this command to allow the processing of the prefix information included in a received RA (Router Advertisement) on an IPv6 enabled interface.

Use the **no** variant of this command to disable an IPv6 interface from using the prefix information within a received RA.

**Syntax** `ipv6 nd accept-ra-pinfo`  
`no ipv6 nd accept-ra-pinfo`

**Default** The command **ipv6 nd accept-ra-pinfo** is enabled by default on any IPv6 interface.

**Mode** Interface

**Usage** By default, when IPv6 is enabled on an interface, SLAAC is also enabled. SLAAC addressing along with the EUI-64 process, uses the prefix information included in a received RA to generate an automatic link-local address on the IPv6 interface.

Note: an AlliedWare Plus device will, by default, add a prefix for the connected interface IPv6 address(es) to the RA it transmits. However, this behavior can be changed by using the command **no ipv6 nd prefix auto-advertise**, so there is no guarantee that an RA will contain a prefix.

**Example** To enable IPv6 on vlan1 without installing a SLAAC address on the interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# no ipv6 nd accept-ra-pinfo
```

**Related Commands** [ipv6 address](#)  
[ipv6 address autoconfig](#)  
[ipv6 enable](#)

**Command changes** Version 5.4.7-0.1: command added

# ipv6 nd current-hoplimit

**Overview** Use this command to specify the advertised current hop limit used between IPv6 Routers.

Use the **no** variant of this command to reset the current advertised hop limit to its default "0".

**Syntax** `ipv6 nd current-hoplimit <hoplimit>`  
`no ipv6 nd current-hoplimit`

Parameter	Description
<code>&lt;hoplimit&gt;</code>	Specifies the advertised current hop limit value. Valid values are from 0 to 255 hops.

**Default** 0 (No advertised current hop limit specified)

**Mode** Interface Configuration for a VLAN interface.

**Examples** To set the advertised current hop limit to 2 between IPv6 Routers on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd current-hoplimit 2
```

To reset the advertised current hop limit to the default 0 on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd current-hoplimit
```

**Related Commands** [ipv6 nd managed-config-flag](#)  
[ipv6 nd prefix](#)  
[ipv6 nd suppress-ra](#)

# ipv6 nd managed-config-flag

**Overview** Use this command to set the managed address configuration flag, contained within the router advertisement field.

Setting this flag indicates the operation of a stateful autoconfiguration protocol such as DHCPv6 for address autoconfiguration, and that address information (i.e. the network prefix) and other (non-address) information can be requested from the device.

An unset flag enables hosts receiving the advertisements to use a stateless autoconfiguration mechanism to establish their IPv6 addresses. The default is flag unset.

Use the **no** variant of this command to reset this command to its default of, flag unset.

**Syntax** `ipv6 nd managed-config-flag`  
`no ipv6 nd managed-config-flag`

**Default** Unset

**Mode** Interface Configuration for a VLAN interface.

**Usage** Advertisement flags will not be transmitted unless you have applied the [ipv6 nd suppress-ra](#) command. This step is included in the example below.

**Example** To set the managed address configuration flag on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd managed-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related Commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)  
[ipv6 nd other-config-flag](#)

# ipv6 nd minimum-ra-interval

**Overview** Use this command in Interface Configuration mode to set a minimum Router Advertisement (RA) interval for a VLAN interface.

Use the **no** variant of this command in Interface Configuration mode to remove the minimum RA interval for a VLAN interface.

**Syntax** `ipv6 nd minimum-ra-interval <seconds>`  
`no ipv6 nd minimum-ra-interval`

Parameter	Description
<code>&lt;seconds&gt;</code>	Specifies the number of seconds between IPv6 Router Advertisements (RAs). Valid values are from 3 to 1350 seconds.

**Default** The RA interval for a VLAN interface is unset by default.

**Mode** Interface Configuration for a VLAN interface.

**Examples** To set the minimum RA interval for the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd minimum-ra-interval 60
```

To remove the minimum RA interval for the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd minimum-ra-interval
```

**Related Commands**

- [ipv6 nd suppress-ra](#)
- [ipv6 nd prefix](#)
- [ipv6 nd other-config-flag](#)

# ipv6 nd other-config-flag

**Overview** Use this command to set the **other** stateful configuration flag (contained within the router advertisement field) to be used for IPv6 address auto-configuration. This flag is used to request the router to provide information in addition to providing addresses.

Setting the `ipv6 nd managed-config-flag` command implies that the `ipv6 nd other-config-flag` will also be set.

Use **no** variant of this command to reset the value to the default.

**Syntax** `ipv6 nd other-config-flag`  
`no ipv6 nd other-config-flag`

**Default** Unset

**Mode** Interface Configuration for a VLAN interface.

**Usage** Advertisement flags will not be transmitted unless you have applied the `ipv6 nd suppress-ra` command. This step is included in the example below.

**Example** To set the IPv6 other-config-flag on the VLAN interface vlan4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd other-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related Commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)  
[ipv6 nd managed-config-flag](#)

# ipv6 nd prefix

**Overview** Use this command in Interface Configuration mode for a VLAN interface to specify the IPv6 prefix information that is advertised by the router advertisement for IPv6 address auto-configuration.

Use the **no** parameter with this command to reset the IPv6 prefix for a VLAN interface in Interface Configuration mode.

**Syntax**

```

ipv6 nd prefix <ipv6-prefix/length>
ipv6 nd prefix <ipv6-prefix/length> [<valid-lifetime>]
ipv6 nd prefix <ipv6-prefix/length>
<valid-lifetime><preferred-lifetime> [no-autoconfig]
ipv6 nd prefix <ipv6-prefix/length>
<valid-lifetime><preferred-lifetime> off-link [no-autoconfig]
no ipv6 nd prefix [<ipv6-addr/prefix-length>|all]

```

Parameter	Description
<ipv6-prefix/length>	The prefix to be advertised by the router advertisement message. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. The default is X:X::/64.
<valid-lifetime>	The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 0 and 4294967295 seconds. The default is 2592000 (30 days). Note that this period should be set to a value greater than that set for the prefix preferred-lifetime.
<preferred-lifetime>	Specifies the IPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered a current (undeprecated) value. After this period, the command is still valid but should not be used in new communications. Set to a value between 0 and 4294967295 seconds. The default is 604800 seconds (7 days). Note that this period should be set to a value less than that set for the prefix valid-lifetime.
off-link	Specify the IPv6 prefix off-link flag. The default is flag set.
no-autoconfig	Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration. The default is flag set.
all	Specify all IPv6 prefixes associated with the VLAN interface.

**Default** Valid-lifetime default is 2592000 seconds (30 days). Preferred-lifetime default is 604800 seconds (7 days).

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

**Examples** To configure the device to issue router advertisements on vlan4, and advertise the address prefix of 2001:0db8::/64, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64
```

To configure the device to issue router advertisements on vlan4, and advertise the address prefix of 2001:0db8::/64 with a valid lifetime of 10 days and a preferred lifetime of 5 days, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64 864000 432000
```

To configure the device to issue router advertisements on vlan4, and advertise the address prefix of 2001:0db8::/64 with a valid lifetime of 10 days, a preferred lifetime of 5 days, and no prefix used for autoconfiguration, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64 864000 432000
no-autoconfig
```

To reset router advertisements on vlan4, so the address prefix of 2001:0db8::/64 is not advertised from the device, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/64
```

To reset all router advertisements on vlan4, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd prefix all
```

**Related Commands** [ipv6 nd suppress-ra](#)

# ipv6 nd ra-interval

**Overview** Use this command to specify the interval between IPv6 Router Advertisements (RA) transmissions.

Use **no** parameter with this command to reset the value to the default value (600 seconds).

**Syntax** `ipv6 nd ra-interval <seconds>`  
`no ipv6 nd ra-interval`

Parameter	Description
<code>&lt;seconds&gt;</code>	Specifies the number of seconds between IPv6 Router Advertisements (RAs). Valid values are from 4 to 1800 seconds.

**Default** 600 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Advertisement flags will not be transmitted unless you have applied the `ipv6 nd suppress-ra` command as shown in the example below.

**Example** To set the advertisements interval on vlan4 to be 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd ra-interval 60
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related Commands** [ipv6 nd minimum-ra-interval](#)  
[ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)

# ipv6 nd ra-lifetime

**Overview** Use this command to specify the time period that this router can usefully act as a default gateway for the network. Each router advertisement resets this time period.

Use **no** parameter with this command to reset the value to default.

**Syntax** `ipv6 nd ra-lifetime <seconds>`  
`no ipv6 nd ra-lifetime`

Parameter	Description
<code>&lt;seconds&gt;</code>	Time period in seconds. Valid values are from 0 to 9000. Note that you should set this time period to a value greater than the value you have set using the <a href="#">ipv6 nd ra-interval</a> command.

**Default** 1800 seconds

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command specifies the lifetime of the current router to be announced in IPv6 Router Advertisements.

Advertisement flags will not be transmitted unless you have applied the [ipv6 nd suppress-ra](#) command. This instruction is included in the example shown below.

**Examples** To set the advertisement lifetime of 8000 seconds on the VLAN interface vlan4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd ra-lifetime 8000
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related Commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)

# ipv6 nd rguard

**Overview** Use this command to apply the Router Advertisements (RA) Guard feature from the Interface Configuration mode for a device port. This blocks all RA messages received on a device port.

For more information about RA Guard, see the [IPv6 Feature Overview and Configuration Guide](#).

Use the **no** parameter with this command to disable RA Guard for a specified device port.

**Syntax** `ipv6 nd rguard`  
`no ipv6 nd rguard`

**Default** RA Guard is not disabled by default.

**Mode** Interface Configuration for a port.

**Usage** Router Advertisements (RAs) are used by Routers to announce themselves on the link. Applying RA Guard to a device port disallows Router Advertisements and redirect messages. RA Guard blocks RAs from untrusted hosts. Blocking RAs stops untrusted hosts from flooding malicious RAs and stops any misconfigured hosts from disrupting traffic on the local network.

Enabling RA Guard on a port blocks RAs from a connected host and indicates the port and host are untrusted. Disabling RA Guard on a port allows RAs from a connected host and indicates the port and host are trusted. Ports and hosts are trusted by default to allow RAs.

**Example** To enable RA Guard on port1.1.1-port1.1.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1-port1.1.4
awplus(config-if)# ipv6 nd rguard
```

To verify RA Guard is enabled on port1.1.1, use the command:

```
awplus# show running-config interface port1.1.1
```

To disable RA Guard on port1.1.1-port1.1.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1-port1.1.4
awplus(config-if)# no ipv6 nd rguard
```

When RA Guard is disabled on a port it is not displayed in **show running-config** output.

**Output** Example output from using **show running-config interface port1.1.1** to verify RA Guard:

```
!  
interface port1.1.1  
  switchport mode access  
  
  ipv6 nd raguard  
!
```

**Related  
Commands** [show running-config interface](#)

# ipv6 nd reachable-time

**Overview** Use this command to specify the reachable time in the router advertisement to be used for detecting reachability of the IPv6 neighbor.

Use the **no** variant of this command to reset the value to default.

**Syntax** `ipv6 nd reachable-time <milliseconds>`  
`no ipv6 nd reachable-time`

Parameter	Description
<code>&lt;milliseconds&gt;</code>	Time period in milliseconds. Valid values are from 1000 to 3600000. Setting this value to 0 indicates an unspecified reachable-time.

**Default** 0 milliseconds

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command specifies the reachable time of the current router to be announced in IPv6 Router Advertisements.

Advertisement flags will not be transmitted unless you have applied the [ipv6 nd suppress-ra](#) command. This instruction is included in the example shown below.

**Example** To set the reachable-time in router advertisements on the VLAN interface vlan4 to be 1800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd reachable-time 1800000
awplus(config-if)# no ipv6 nd suppress-ra
```

To reset the reachable-time in router advertisements on the VLAN interface vlan4 to an unspecified reachable-time (0 milliseconds), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd reachable-time
```

**Related Commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)

# ipv6 nd retransmission-time

**Overview** Use this command to specify the advertised retransmission interval for Neighbor Solicitation in milliseconds between IPv6 Routers.

Use the **no** variant of this command to reset the retransmission time to the default (1 second).

**Syntax** `ipv6 nd retransmission-time <milliseconds>`  
`no ipv6 nd retransmission-time`

Parameter	Description
<code>&lt;milliseconds&gt;</code>	Time period in milliseconds. Valid values are from 1000 to 3600000.

**Default** 1000 milliseconds (1 second)

**Mode** Interface Configuration for a VLAN interface.

**Examples** To set the retransmission-time of Neighbor Solicitation on the VLAN interface `vlan2` to be 800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd retransmission-time 800000
```

To reset the retransmission-time of Neighbor Solicitation on the VLAN interface `vlan2` to the default 1000 milliseconds (1 second), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd retransmission-time
```

**Related Commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)

# ipv6 nd suppress-ra

**Overview** Use this command to inhibit IPv6 Router Advertisement (RA) transmission for the current interface. Router advertisements are used when applying IPv6 stateless auto-configuration.

Use **no** parameter with this command to enable Router Advertisement transmission.

**Syntax** `ipv6 nd suppress-ra`  
`no ipv6 nd suppress-ra`

**Default** Router Advertisement (RA) transmission is suppressed by default.

**Mode** Interface Configuration for a VLAN interface.

**Example** To enable the transmission of router advertisements from vlan4 on the device, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related  
Commands** [ipv6 nd ra-interval](#)  
[ipv6 nd prefix](#)

# ipv6 neighbor

**Overview** Use this command to add a static IPv6 neighbor entry.  
Use the **no** variant of this command to remove a specific IPv6 neighbor entry.

**Syntax** `ipv6 neighbor <ipv6-address> <vlan-name> <mac-address>  
<port-list>`  
`no ipv6 neighbor <ipv6-address> <vlan-name> <port-list>`

Parameter	Description
<code>&lt;ipv6-address&gt;</code>	Specify the neighbor's IPv6 address in the format X:X::X:X.
<code>&lt;vlan-name&gt;</code>	Specify the neighbor's VLAN name.
<code>&lt;mac-address&gt;</code>	Specify the MAC hardware address in hexadecimal notation in the format HHHH . HHHH . HHHH.
<code>&lt;port-list&gt;</code>	Specify the port number, or port range.

**Mode** Global Configuration

**Usage** Use this command to clear a specific IPv6 neighbor entry. To clear all dynamic address entries, use the [clear ipv6 neighbors](#) command.

**Example** To create a static neighbor entry for IPv6 address 2001:0db8::a2, on vlan 4, with MAC address 0000.cd28.0880, on port 1.1.1, use the command:

```
awplus# configure terminal
awplus(config)# ipv6 neighbor 2001:0db8::a2 vlan4
0000.cd28.0880 port1.1.1
```

**Related Commands** [clear ipv6 neighbors](#)

# ipv6 opportunistic-nd

**Overview** Use this command to enable opportunistic neighbor discovery for the global IPv6 ND cache. Opportunistic neighbor discovery changes the behavior for unsolicited ICMPv6 ND packet forwarding on the device.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global IPv6 ND cache.

**Syntax** `ipv6 opportunistic-nd`  
`no ipv6 opportunistic-nd`

**Default** Opportunistic neighbor discovery is disabled by default.

**Mode** Global Configuration

**Usage** When opportunistic neighbor discovery is enabled, the device will reply to any received unsolicited ICMPv6 ND packets. The source MAC address for the unsolicited ICMPv6 ND packet is added to the IPv6 ND cache, so the device forwards the ICMPv6 ND packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ICMPv6 packet is not added to the IPv6 ND cache, so the ICMPv6 ND packet is not forwarded by the device.

**Examples** To enable opportunistic neighbor discovery for the IPv6 ND cache, enter:

```
awplus# configure terminal
awplus(config)# ipv6 opportunistic-nd
```

To disable opportunistic neighbor discovery for the IPv6 ND cache, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 opportunistic-nd
```

**Related Commands** [arp opportunistic-nd](#)  
[show ipv6 neighbors](#)  
[show running-config interface](#)

# ipv6 route

**Overview** This command adds a static IPv6 route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

The **no** variant of this command removes the static route.

**Syntax** `ipv6 route <dest-prefix> <dest-prefix/length> {<gateway-ip>|<gateway-name>} [<distvalue>]`  
`no ipv6 route <dest-prefix> <dest-prefix/length> {<gateway-ip>|<gateway-name>} [<distvalue>]`

Parameter	Description
<code>&lt;dest-prefix/length&gt;</code>	Specifies the IP destination prefix. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<code>&lt;gateway-ip&gt;</code>	Specifies the IP gateway (or next hop) address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<code>&lt;gateway-name&gt;</code>	Specifies the name of the gateway (or next hop) interface.
<code>&lt;distvalue&gt;</code>	Specifies the administrative distance for the route. Valid values are from 1 to 255.

**Mode** Global Configuration

**Usage** Administrative distance can be modified so static routes do not take priority over other routes.

**Example** `awplus# configure terminal`  
`awplus(config)# ipv6 route 2001:0db8::1/128 vlan2 32`

**Validation Commands** `show running-config`  
`show ipv6 route`

# ipv6 unreachable

**Overview** Use this command to enable ICMPv6 (Internet Control Message Protocol version 6) type 1, destination unreachable, messages.

Use the **no** variant of this command to disable destination unreachable messages. This prevents an attacker from using these messages to discover the topology of a network.

**Syntax** `ipv6 unreachable`  
`no ipv6 unreachable`

**Default** Destination unreachable messages are enabled by default.

**Mode** Global Configuration

**Usage** When a device receives a packet for a destination that is unreachable it returns an ICMPv6 type 1 message. This message includes a reason code, as per the table below. An attacker can use these messages to obtain information regarding the topology of a network. Disabling destination unreachable messages, using the **no ipv6 unreachable** command, secures your network against this type of probing.

**NOTE:** *Disabling ICMPv6 destination unreachable messages breaks applications such as traceroute, which depend on these messages to operate correctly.*

Table 22-1: ICMPv6 type 1 reason codes and description

Code	Description [RFC]
0	No route to destination [RFC4443]
1	Communication with destination administratively prohibited [RFC4443]
2	Beyond scope of source address [RFC4443]
3	Address unreachable [RF4443]
4	Port unreachable [RFC4443]
5	Source address failed ingress/egress policy [RFC4443]
6	Reject route to destination [RFC4443]
7	Error in Source Routing Header [RFC6554]

**Example** To disable destination unreachable messages, use the commands

```
awplus# configure terminal
awplus(config)# no ipv6 unreachable
```

To enable destination unreachable messages, use the commands

```
awplus# configure terminal
awplus(config)# ipv6 unreachable
```

# ping ipv6

**Overview** This command sends a query to another IPv6 host (send Echo Request messages).

**Syntax** ping ipv6 {<host>|<ipv6-address>} [repeat {<1-2147483647>|continuous}] [size <10-1452>] [interface <interface-list>] [timeout <1-65535>]

Parameter	Description
<ipv6-addr>	The destination IPv6 address. The IPv6 address uses the format X:X::X:X.
<hostname>	The destination hostname.
repeat	Specify the number of ping packets to send.
<1-2147483647>	Specify repeat count. The default is 5.
size <10-1452>	The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).
interface <interface-list>	The interface or range of configured IP interfaces to use as the source in the IP header of the ping packet. You can only specify the interface when pinging a link local address.
timeout <1-65535>	The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.
repeat	Specify the number of ping packets to send.
<1-2147483647>	Specify repeat count. The default is 5.
continuous	Continuous ping.
size <10-1452>	The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).
timeout <1-65535>	The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.

**Mode** User Exec and Privileged Exec

**Example** awplus# ping ipv6 2001:0db8::a2

**Related Commands** [traceroute ipv6](#)

# show ipv6 forwarding

**Overview** Use this command to display IPv6 forwarding status.

**Syntax** `show ipv6 forwarding`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 forwarding`

**Output** Figure 22-1: Example output from the **show ipv6 forwarding** command

```
ipv6 forwarding is on
```

# show ipv6 interface brief

**Overview** Use this command to display brief information about interfaces and the IPv6 address assigned to them.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 interface [brief]`

Parameter	Description
brief	Specify this optional parameter to display brief IPv6 interface information.

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ipv6 interface brief`

**Output** Figure 22-2: Example output from the **show ipv6 interface brief** command

```
awplus#show ipv6 interface brief
Interface      IPv6-Address          Status      Protocol
lo             unassigned           admin up    running
vlan1         2001:db8::1/48       admin up    down
              fe80::215:77ff:fee9:5c50/64
```

**Related Commands** [show interface brief](#)

# show ipv6 neighbors

**Overview** Use this command to display all IPv6 neighbors.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 neighbors`

**Mode** User Exec and Privileged Exec

# show ipv6 route

**Overview** Use this command to display the IPv6 routing table for a protocol or from a particular table.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 route`  
`[connected|database|ospf|rip|static|summary|<ipv6-address>|<ipv6-addr/prefix-length>]`

Parameter	Description
connected	Displays only the routes learned from connected interfaces.
database	Displays only the IPv6 routing information extracted from the database.
ospf	Displays only the routes learned from IPv6 Open Shortest Path First (OSPFv3).
rip	Displays only the routes learned from IPv6 Routing Information Protocol (RIPng).
static	Displays only the IPv6 static routes you have configured.
summary	Displays summary information from the IPv6 routing table.
<ipv6-address>	Displays the routes for the specified address in the IP routing table. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<ipv6-prefix/length>	Displays only the routes for the specified IP prefix.

**Mode** User Exec and Privileged Exec

**Example 1** To display an IP route with all parameters turned on, use the following command:

```
awplus# show ipv6 route
```

**Output** Figure 22-3: Example output of the **show ipv6 route** command

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
S   ::/0 [1/0] via 2001::a:0:0:c0a8:a6, vlan10
C   2001:db8::a:0:0:0/64 via ::, vlan10
C   2001:db8::14:0:0:0/64 via ::, vlan20
C   2001:db8::0:0:0:0/64 via ::, vlan30
C   2001:db8::28:0:0:0/64 via ::, vlan40
C   2001:db8::fa:0:0:0/64 via ::, vlan250
C   2001:db8::/64 via ::, vlan250
C   2001:db8::/64 via ::, vlan40
C   2001:db8::/64 via ::, vlan20
C   2001:db8::/64 via ::, vlan10
```

**Example 2** To display all database entries for an IP route, use the following command:

```
awplus# show ipv6 route database
```

**Output** Figure 22-4: Example output of the **show ipv6 route database** command

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
> - selected route, * - FIB route, p - stale info
Timers: Uptime

S   ::/0 [1/0] via 2001::a:0:0:c0a8:a01 inactive, 6d22h12m
      [1/0] via 2001::fa:0:0:c0a8:fa01 inactive, 6d22h12m
```

# show ipv6 route summary

**Overview** Use this command to display the summary of the current NSM RIB entries.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 route summary`

**Mode** User Exec and Privileged Exec

**Example** To display IP route summary, use the following command:

```
awplus# show ipv6 route summary
```

**Output** Figure 22-5: Example output from the **show ipv6 route summary** command

```
IPv6 routing table name is Default-IPv6-Routing-Table(0)
IPv6 routing table maximum-paths is 4
RouteSource      Networks
connected        4
rip              5
Total            9
FIB              5
```

**Related Commands** [show ip route database](#)

# traceroute ipv6

**Overview** Use this command to trace the route to the specified IPv6 host.

**Syntax** `traceroute ipv6 {<ipv6-addr>|<hostname>}`

Parameter	Description
<code>&lt;ipv6-addr&gt;</code>	The destination IPv6 address. The IPv6 address uses the format X:X::X:X.
<code>&lt;hostname&gt;</code>	The destination hostname.

**Mode** User Exec and Privileged Exec

**Example** To run a traceroute for the IPv6 address 2001:0db8::a2, use the following command:

```
awplus# traceroute ipv6 2001:0db8::a2
```

**Related Commands** [ping ipv6](#)

# 23

# Routing Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of routing commands that are common across the routing IP protocols. For more information, see the [Route Selection Feature Overview and Configuration Guide](#).

- Command List**
- “ip route” on page 947
  - “ipv6 route” on page 950
  - “max-fib-routes” on page 951
  - “max-static-routes” on page 953
  - “maximum-paths” on page 954
  - “show ip route” on page 955
  - “show ip route database” on page 958
  - “show ip route summary” on page 961
  - “show ipv6 route” on page 963
  - “show ipv6 route summary” on page 965

# ip route

**Overview** This command adds a static route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

When using VRF (Virtual Routing and Forwarding), you can use this command to configure a static inter-VRF route to a destination network that is reachable by a remote gateway located in a different VRF instance. Note that to apply the command in this way, the `ip route static inter-vrf` command must be enabled (its default condition). For more information about VRF, see the [VRF Feature Overview and Configuration Guide](#) and the [VRF-lite Commands](#) chapter.

The **no** variant of this command removes the static route from the RIB and FIB.

**Syntax** `ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]`  
`no ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]`

**Syntax (VRF-lite)** `ip route [vrf <vrf-name>] <subnet&mask> [<gateway-ip>] [<interface>] [<distance>]`  
`no ip route [vrf <vrf-name>] <subnet&mask> [<gateway-ip>] [<interface>] [<distance>]`

Parameter	Description
<code>&lt;subnet&amp;mask&gt;</code>	The IPv4 address of the destination subnet defined using either a prefix length or a separate mask specified in one of the following formats: <ul style="list-style-type: none"> <li>The IPv4 subnet address in dotted decimal notation followed by the subnet mask, also in dotted decimal notation.</li> <li>The IPv4 subnet address in dotted decimal notation, followed by a forward slash, then the prefix length</li> </ul>
<code>&lt;gateway-ip&gt;</code>	The IPv4 address of the gateway device.
<code>&lt;interface&gt;</code>	The interface that connects your device to the network. Enter the name of the VLAN or its VID. You can also enter 'null' as an interface. Specify a 'null' interface to add a null or blackhole route to the switch. The gateway IP address or the interface is required if VRF-lite is not configured. If VRF-lite is configured: When adding a static intra-VRF route, you must specify either the gateway IP address or the interface. When adding a static inter-VRF route, you must specify both the gateway IP address and the interface.
<code>&lt;distance&gt;</code>	The administrative distance for the static route in the range <1-255>. Static routes by default have an administrative distance of 1.

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance to enter IPv4 Address-Family mode for.

**Mode** Global Configuration

**Default** The default administrative distance for a static route is 1 for priority over non-static routes.

**Usage** Administrative distance can be modified so that static routes do not take priority over other routes.

Specify a 'Null' interface to add a null or blackhole route to the switch. A null or blackhole route is a routing table entry that does not forward packets, so any packets sent to it are dropped.

**Examples** To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To remove the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# no ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To specify a null or blackhole route 192.168.4.0/24, so packets forwarded to this route are dropped, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.4.0/24 null
```

To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with an administrative distance of 128, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
128
```

**Examples (VRF-lite)** To create a static route from source VRF instance red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6, use the following commands for static intra-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
```

To remove a static route from source VRF red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6, use the following commands for static intra-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# no ip route vrf red 192.168.50.0/24
192.168.20.6
```

To create a static route from source VRF red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6 via vlan10, use the following commands for static inter-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
vlan10
```

**Related  
Commands** [show ip route](#)  
[show ip route database](#)

# ipv6 route

**Overview** This command adds a static IPv6 route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

The **no** variant of this command removes the static route.

**Syntax** `ipv6 route <dest-prefix> <dest-prefix/length> {<gateway-ip>|<gateway-name>} [<distvalue>]`  
`no ipv6 route <dest-prefix> <dest-prefix/length> {<gateway-ip>|<gateway-name>} [<distvalue>]`

Parameter	Description
<code>&lt;dest-prefix/length&gt;</code>	Specifies the IP destination prefix. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<code>&lt;gateway-ip&gt;</code>	Specifies the IP gateway (or next hop) address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<code>&lt;gateway-name&gt;</code>	Specifies the name of the gateway (or next hop) interface.
<code>&lt;distvalue&gt;</code>	Specifies the administrative distance for the route. Valid values are from 1 to 255.

**Mode** Global Configuration

**Usage** Administrative distance can be modified so static routes do not take priority over other routes.

**Example** `awplus# configure terminal`  
`awplus(config)# ipv6 route 2001:0db8::1/128 vlan2 32`

**Validation Commands** `show running-config`  
`show ipv6 route`

# max-fib-routes

**Overview** This command enables you to control the maximum number of FIB routes configured. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds.

**NOTE:** When using VRF-lite, this command applies to the Global VRF instance; to set the max-fib-routes for a user-defined VRF instance use the *max-fib-routes (VRF)* command. For static routes use the *max-static-routes* command for the Global VRF instance and the *max-static-routes (VRF)* command for a user-defined VRF instance.

Use the **no** variant of this command to set the maximum number of FIB routes to the default of 4294967294 FIB routes.

**Syntax** `max-fib-routes <1-4294967294> [<1-100>|warning-only]`  
`no max-fib-routes`

Parameter	Description
max-fib-routes	This is the maximum number of routes that can be stored in the device's Forwarding Information dataBase. In practice, other practical system limits would prevent this maximum being reached.
<1-4294967294>	The allowable configurable range for setting the maximum number of FIB-routes.
<1-100>	This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached.
warning-only	This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value is reached. Routes can continue to be added until your device reaches either the maximum capacity value of 4294967294, or a practical system limit.

**Default** The default number of FIB routes is the maximum number of FIB routes (4294967294).

**Mode** Global Configuration

**Examples** To set the maximum number of dynamic routes to 2000 and warning threshold of 75%, use the following commands:

```
awplus# config terminal
awplus(config)# max-fib-routes 2000 75
```

**Related  
Commands** [max-fib-routes \(VRF\)](#)

# max-static-routes

**Overview** Use this command to set the maximum number of static routes, excluding FIB (Forwarding Information Base) routes.

**NOTE:** When using VRF-lite, this command applies to the Global VRF instance; to set the max-static-routes for a user-defined VRF instance use the [max-static-routes \(VRF\)](#) command. For FIB routes use the [max-fib-routes](#) command for the Global VRF instance and the [max-fib-routes \(VRF\)](#) command for a user-defined VRF instance.

Use the **no** variant of this command to set the maximum number of static routes to the default of 1000 static routes.

**Syntax** max-static-routes <1-1000>  
no max-static-routes

**Default** The default number of static routes is the maximum number of static routes (1000).

**Mode** Global Configuration

**Example** To reset the maximum number of static routes to the default maximum, use the command:

```
awplus# configure terminal
awplus(config)# no max-static-routes
```

**NOTE:** Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

**Related Commands** [max-fib-routes](#)

# maximum-paths

**Overview** This command enables ECMP on your device, and sets the maximum number of paths that each route has in the Forwarding Information Base (FIB). ECMP is enabled by default.

The **no** variant of this command sets the maximum paths to the default of 4.

**Syntax** `maximum-paths <1-8>`  
`no maximum-paths`

Parameter	Description
<1-8>	The maximum number of paths that a route can have in the FIB.

**Default** By default the maximum number of paths is 4.

**Mode** Global Configuration

**Examples** To set the maximum number of paths for each route in the FIB to 5, use the command:

```
awplus# configure terminal
awplus(config)# maximum-paths 5
```

To set the maximum paths for a route to the default of 4, use the command:

```
awplus# configure terminal
awplus(config)# no maximum-paths
```

# show ip route

**Overview** Use this command to display routing entries in the FIB (Forwarding Information Base). The FIB contains the best routes to a destination, and your device uses these routes when forwarding traffic. You can display a subset of the entries in the FIB based on protocol.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**VRF-lite** If VRF-lite is configured, you can display routing entries in the FIB associated with either the global routing domain or a named VRF.

**Syntax** `show ip route [bgp|connected|ospf|rip|static|  
<ip-addr>|<ip-addr/prefix-length>]`

**Syntax (VRF-lite)** `show ip route {vrf <vrf-name>|global}  
[bgp|connected|ospf|rip|static]`

Parameter	Description
global	If VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
bgp	Displays only the routes learned from BGP.
connected	Displays only the routes learned from connected interfaces.
ospf	Displays only the routes learned from OSPF.
rip	Displays only the routes learned from RIP.
static	Displays only the static routes you have configured.
<ip-addr>	Displays the routes for the specified address. Enter an IPv4 address.
<ip-addr/prefix-length>	Displays the routes for the specified network. Enter an IPv4 address and prefix length.

**Mode** User Exec and Privileged Exec

**Example** To display the static routes in the FIB, use the command:

```
awplus# show ip route static
```

To display the OSPF routes in the FIB, use the command:

```
awplus# show ip route ospf
```

**Example (VRF-lite)** To display all routing entries in the FIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red
```

**Output** Each entry in the output from this command has a code preceding it, indicating the source of the routing entry. For example, O indicates OSPF as the origin of the route. The first few lines of the output list the possible codes that may be seen with the route entries.

Typically, route entries are composed of the following elements:

- code
- a second label indicating the sub-type of the route
- network or host IP address
- administrative distance and metric
- next hop IP address
- outgoing interface name
- time since route entry was added

Figure 23-1: Example output from the **show ip route** command

```
Codes: C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
* - candidate default

O      10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
C      3.3.3.0/24 is directly connected, vlan1
C      10.10.31.0/24 is directly connected, vlan2
C      10.70.0.0/24 is directly connected, vlan4
O E2   14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
C      33.33.33.33/32 is directly connected, lo
```

**Connected Route** The connected route entry consists of:

```
C      10.10.31.0/24 is directly connected, vlan2
```

This route entry denotes:

- Route entries for network `10.10.31.0/24` are derived from the IP address of local interface `vlan2`.
- These routes are marked as Connected routes (C) and always preferred over routes for the same network learned from other routing protocols.

**OSPF Route** The OSPF route entry consists of:

```
O      10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
```

This route entry denotes:

- This route in the network `10.10.37.0/24` was added by OSPF.
- This route has an administrative distance of 110 and metric/cost of 11.
- This route is reachable via next hop `10.10.31.16`.
- The outgoing local interface for this route is `vlan2`.
- This route was added 20 minutes and 54 seconds ago.

### OSPF External Route

The OSPF external route entry consists of:

```
O E2 14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
```

This route entry denotes that this route is the same as the other OSPF route explained above; the main difference is that it is a Type 2 External OSPF route.

### Related Commands

[ip route](#)  
[maximum-paths](#)  
[show ip route database](#)

# show ip route database

**Overview** This command displays the routing entries in the RIB (Routing Information Base).

When multiple entries are available for the same prefix, RIB uses the routes' administrative distances to choose the best route. All best routes are entered into the FIB (Forwarding Information Base). To view the routes in the FIB, use the [show ip route](#) command.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**Syntax** `show ip route database [bgp|connected|ospf|rip|static]`

**Syntax (VRF-lite)** `show ip route [vrf <vrf-name>|global] database [bgp|connected|ospf|rip|static]`

Parameter	Description
global	If VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
bgp	Displays only the routes learned from BGP.
connected	Displays only the routes learned from connected interfaces.
ospf	Displays only the routes learned from OSPF.
rip	Displays only the routes learned from RIP.
static	Displays only the static routes you have configured.

**Mode** User Exec and Privileged Exec

**Example** To display the static routes in the RIB, use the command:

```
awplus# show ip route database static
```

**Output** Figure 23-2: Example output from the **show ip route database** command

```
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       > - selected route, * - FIB route, p - stale info

O    *> 9.9.9.9/32 [110/31] via 10.10.31.16, vlan2, 00:19:21
O    10.10.31.0/24 [110/1] is directly connected, vlan2, 00:28:20
C    *> 10.10.31.0/24 is directly connected, vlan2
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O    10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
O    *> 10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:21:19
C    *> 10.30.0.0/24 is directly connected, vlan6
S    *> 11.22.11.0/24 [1/0] via 10.10.31.16, vlan2
O E2 *> 14.5.1.0/24 [110/20] via 10.10.31.16,vlan2, 00:19:21
O    16.16.16.16/32 [110/11] via 10.10.31.16, vlan2, 00:21:19
S    *> 16.16.16.16/32 [1/0] via 10.10.31.16, vlan2
O    *> 17.17.17.17/32 [110/31] via 10.10.31.16, vlan2, 00:21:19
C    *> 45.45.45.45/32 is directly connected, lo
O    *> 55.55.55.55/32 [110/21] via 10.10.31.16, vlan2, 00:21:19
C    *> 127.0.0.0/8 is directly connected, lo
```

**Example (VRF-lite)** To display all routing entries in the RIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red database
```

**Output** Figure 23-3: Example output from the **show ip route vrf red database** command

```
[VRF: red]
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       > - selected route, * - FIB route, p - stale info

O    192.168.10.0/24 [110/1] is directly connected, vlan1, 06:45:51
C    *> 192.168.10.0/24 is directly connected, vlan1
B    > 192.168.33.0/24 [20/0] via 192.168.30.3, 06:45:52
O E2 *> 192.168.110.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
O E2 *> 192.168.111.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
```

The routes added to the FIB are marked with a \*. When multiple routes are available for the same prefix, the best route is indicated with the > symbol. All unselected routes have neither the \* nor the > symbol.

```
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O    10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
```

These route entries denote:

- The same prefix was learned from OSPF and from static route configuration.

- Since this static route has a lower administrative distance than the OSPF route (110), the static route (1) is selected and installed in the FIB.

If the static route becomes unavailable, then the device automatically selects the OSPF route and installs it in the FIB.

**Related  
Commands** [maximum-paths](#)  
[show ip route](#)

# show ip route summary

**Overview** This command displays a summary of the current RIB (Routing Information Base) entries.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**Syntax** show ip route summary

**Syntax (VRF-lite)** show ip route summary [vrf <vrf-name>|global]

Parameter	Description
vrf	Specific VRF instance.
<vrf-name>	The name of the VRF instance.
global	The global routing and forwarding table.

**Mode** User Exec and Privileged Exec

**Example** To display a summary of the current RIB entries, use the command:

```
awplus# show ip route summary
```

**Output** Figure 23-4: Example output from the **show ip route summary** command

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source      Networks
connected         5
ospf               2
Total             8
```

**Example (VRF-lite)** To display a summary of the current RIB entries associated with a VRF instance red, use the command:

```
awplus# show ip route summary vrf red
```

**Output** Figure 23-5: Example output from the **show ip route summary vrf red** command

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source      Networks
connected         1
Total             1
FIB               0

[VRF: red]
Route Source      Networks
connected         1
ospf              2
Total             3
```

**Related Commands** [show ip route](#)  
[show ip route database](#)

# show ipv6 route

**Overview** Use this command to display the IPv6 routing table for a protocol or from a particular table.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 route`  
`[connected|database|ospf|rip|static|summary|<ipv6-address>|<ipv6-addr/prefix-length>]`

Parameter	Description
connected	Displays only the routes learned from connected interfaces.
database	Displays only the IPv6 routing information extracted from the database.
ospf	Displays only the routes learned from IPv6 Open Shortest Path First (OSPFv3).
rip	Displays only the routes learned from IPv6 Routing Information Protocol (RIPng).
static	Displays only the IPv6 static routes you have configured.
summary	Displays summary information from the IPv6 routing table.
<ipv6-address>	Displays the routes for the specified address in the IP routing table. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<ipv6-prefix/length>	Displays only the routes for the specified IP prefix.

**Mode** User Exec and Privileged Exec

**Example 1** To display an IP route with all parameters turned on, use the following command:

```
awplus# show ipv6 route
```

**Output** Figure 23-6: Example output of the **show ipv6 route** command

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
S   ::/0 [1/0] via 2001::a:0:0:c0a8:a6, vlan10
C   2001:db8::a:0:0:0/64 via ::, vlan10
C   2001:db8::14:0:0:0/64 via ::, vlan20
C   2001:db8::0:0:0:0/64 via ::, vlan30
C   2001:db8::28:0:0:0/64 via ::, vlan40
C   2001:db8::fa:0:0:0/64 via ::, vlan250
C   2001:db8::/64 via ::, vlan250
C   2001:db8::/64 via ::, vlan40
C   2001:db8::/64 via ::, vlan20
C   2001:db8::/64 via ::, vlan10
```

**Example 2** To display all database entries for an IP route, use the following command:

```
awplus# show ipv6 route database
```

**Output** Figure 23-7: Example output of the **show ipv6 route database** command

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
> - selected route, * - FIB route, p - stale info
Timers: Uptime

S   ::/0 [1/0] via 2001::a:0:0:c0a8:a01 inactive, 6d22h12m
      [1/0] via 2001::fa:0:0:c0a8:fa01 inactive, 6d22h12m
```

# show ipv6 route summary

**Overview** Use this command to display the summary of the current NSM RIB entries.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 route summary`

**Mode** User Exec and Privileged Exec

**Example** To display IP route summary, use the following command:

```
awplus# show ipv6 route summary
```

**Output** Figure 23-8: Example output from the **show ipv6 route summary** command

```
IPv6 routing table name is Default-IPv6-Routing-Table(0)
IPv6 routing table maximum-paths is 4
RouteSource      Networks
connected        4
rip              5
Total            9
FIB              5
```

# accept-lifetime

**Overview** Use this command to specify the time period during which the authentication key on a key chain is received as valid.

Use the **no** variant of this command to remove a specified time period for an authentication key on a key chain as set previously with the **accept-lifetime** command.

**Syntax** `accept-lifetime <start-date> {<end-date>|  
duration <seconds>|infinite}`  
`no accept-lifetime`

Parameter	Description
<code>&lt;start-date&gt;</code>	Specifies the start time and date in the format: <code>&lt;hh:mm:ss&gt; &lt;day&gt; &lt;month&gt; &lt;year&gt;</code> or <code>&lt;hh:mm:ss&gt; &lt;month&gt; &lt;day&gt; &lt;year&gt;</code> , where:
<code>&lt;hh:mm:ss&gt;</code>	The time of the day, in hours, minutes and seconds
<code>&lt;day&gt;</code>	<1-31> The day of the month
<code>&lt;month&gt;</code>	The month of the year (the first three letters of the month, for example, Jan)
<code>&lt;year&gt;</code>	<1993-2035> The year
<code>&lt;end-date&gt;</code>	Specifies the end time and date in the format: <code>&lt;hh:mm:ss&gt; &lt;day&gt; &lt;month&gt; &lt;year&gt;</code> or <code>&lt;hh:mm:ss&gt; &lt;month&gt; &lt;day&gt; &lt;year&gt;</code> , where:
<code>&lt;hh:mm:ss&gt;</code>	The time of the day, in hours, minutes and seconds
<code>&lt;day&gt;</code>	<1-31> The day of the month
<code>&lt;month&gt;</code>	The month of the year (the first three letters of the month, for example, Jan)
<code>&lt;year&gt;</code>	<1993-2035> The year
<code>&lt;seconds&gt;</code>	<1-2147483646> Duration of the key in seconds.
<code>infinite</code>	Never expires.

**Mode** Keychain-key Configuration

**Examples** The following examples show the setting of accept-lifetime for key 1 on the key chain named "mychain".

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# accept-lifetime 03:03:01 Sep 3
2016 04:04:02 Oct 6 2016
```

or:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# accept-lifetime 03:03:01 3 Sep
2016 04:04:02 6 Oct 2016
```

**Related  
Commands**

[send-lifetime](#)

# address-family ipv4 (RIP)

**Overview** This command enters the IPv4 address-family command mode. In this mode you can configure address-family specific parameters for a specific VRF (RIP) instance.

**Syntax** `address-family ipv4 vrf <vrf-name>`  
`no address-family ipv4 vrf <vrf-name>`

Parameter	Description
<code>ipv4</code>	Configure parameters relating to the RIP exchange of IPv4 prefixes.
<code>vrf</code>	Apply this command to a VRF instance.
<code>&lt;vrf-name&gt;</code>	The name of the VRF instance.

**Mode** Router Configuration

**Usage** To leave Address Family mode and return to Router Configuration mode, use the [exit-address-family](#) command.

**Example** In this example the address family "green" is entered, and then exited by using the [exit-address-family](#) command.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Related Commands** [exit-address-family](#)

# alliedware-behavior

**Overview** This command configures your device to exhibit AlliedWare behavior when sending RIPv1 response/update messages. Configuring for this behavior may be necessary if you are replacing an AlliedWare device with an AlliedWare Plus device and wish to ensure consistent RIPv1 behavior.

Use the no variant of this command to implement AlliedWare Plus behavior.

This command has no impact on devices running RIPv2. Reception and transmission can be independently altered to conform to AlliedWare standard.

**Syntax** alliedware-behavior {rip1-send|rip1-recv}  
no alliedware-behavior {rip1-send|rip1-recv}

Parameter	Description
rip1-send	Configures the router to behave in AlliedWare mode when <b>sending</b> update messages.
rip1-recv	Configures the router to behave in AlliedWare mode when <b>receiving</b> update messages.

**Default** By default when sending out RIPv1 updates on an interface, if the prefix (learned through RIPv2 or otherwise redistributed into RIP) being advertised does not match the subnetting used on the outgoing RIPv1 interface it will be filtered. The **alliedware-behavior** command returns your router's RIPv1 behavior to the AlliedWare format, where the prefix will be advertised as-is.

For example, if a RIPv1 update is being sent over interface 192.168.1.4/26, by default the prefix 192.168.1.64/26 will be advertised, but the prefix 192.168.1.144/28 will be filtered because the mask /28 does not match the interface's mask of /26. If **alliedware-behavior rip1-send** is configured, the prefix 192.168.1.144 would be sent as-is.

**Mode** Router Configuration

**Examples** To configure your device for **alliedware-behavior** when sending and receiving RIPv1 update messages, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# alliedware-behavior rip1-send
awplus(config-router)# alliedware-behavior rip1-recv
```

To return your device to **AlliedWare Plus**-like behavior when sending and receiving RIPv1 update messages, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no alliedware-behavior rip1-send
awplus(config-router)# no alliedware-behavior rip1-recv
```

**Validation  
Commands**    [show ip protocols rip](#)  
                  [show running-config](#)

**Related  
Commands**    [fullupdate \(RIP\)](#)

# cisco-metric-behavior (RIP)

**Overview** Use this command to enable or disable the RIP routing metric update to conform to Cisco's implementation. This command is provided to allow inter-operation with older Cisco devices that do not conform to the RFC standard for RIP route metrics.

Use the **no** variant of this command to disable this feature.

**Syntax** `cisco-metric-behavior {enable|disable}`  
`no cisco-metric-behavior`

Parameter	Description
enable	Enables updating the metric consistent with Cisco.
disable	Disables updating the metric consistent with Cisco.

**Default** By default, the Cisco metric-behavior is disabled.

**Mode** Router Configuration

**Examples** To enable the routing metric update to behave as per the Cisco implementation, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# cisco-metric-behavior enable
```

To disable the routing metric update to behave as per the default setting, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no cisco-metric-behavior
```

**Validation Commands** `show running-config`

# clear ip rip route

**Overview** Use this command to clear specific data from the RIP routing table.

**Syntax** `clear ip rip route <ip-dest-network/prefix-length>`  
`clear ip rip route`  
{static|connected|rip|ospf|bgp|invalid-routes|all}

**Syntax (VRF-lite)** `clear ip rip [vrf <vrf-name>] route`  
`<ip-dest-network/prefix-length>`  
`clear ip rip [vrf <vrf-name>] route`  
{static|connected|rip|ospf|bgp|invalid-routes|all}

Parameter	Description
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
<ip-dest-network/ prefix-length>	Removes entries which exactly match this destination address from RIP routing table. Enter the IP address and prefix length of the destination network.
static	Removes static entries from the RIP routing table.
connected	Removes entries for connected routes from the RIP routing table.
rip	Removes only RIP routes from the RIP routing table.
ospf	Removes only OSPF routes from the RIP routing table.
bgp	Removes only BGP routes from the RIP routing table.
invalid-routes	Removes routes with metric 16 immediately. Otherwise, these routes are not removed until RIP times out the route after 2 minutes.
all	Clears the entire RIP routing table.

**Mode** Privileged Exec

**Usage** Using this command with the **all** parameter clears the RIP table of all the routes.

**Examples** To clear the route 10.0.0.0/8 from the RIP routing table, use the following command:

```
awplus# clear ip rip route 10.0.0.0/8
```

**Examples (VRF-lite)** To clear RIP routes associated with the VRF instance 'red' for OSPF routes, use the following command:

```
awplus# clear ip rip vrf red route ospf
```

To clear the route 10.0.0.0/8 from the RIP routing table for the VRF instance 'red', use the following command:

```
awplus# clear ip rip vrf red route 10.0.0.0/8
```

# debug rip

**Overview** Use this command to specify the options for the displayed debugging information for RIP events and RIP packets.

Use the **no** variant of this command to disable the specified debug option.

**Syntax** `debug rip {events|nsm|<packet>|all}`  
`no debug rip {events|nsm|<packet>|all}`

Parameter	Description
events	RIP events debug information is displayed.
nsm	RIP and NSM communication is displayed.
<packet>	packet [recv send] [detail] Specifies RIP packets only.
recv	Specifies that information for received packets be displayed.
send	Specifies that information for sent packets be displayed.
detail	Displays detailed information for the sent or received packet.
all	Displays all RIP debug information.

**Default** Disabled

**Mode** Privileged Exec and Global Configuration

**Example** The following example displays information about the RIP packets that are received and sent out from the device.

```
awplus# debug rip packet
```

**Related Commands** [undebug rip](#)

# default-information originate (RIP)

**Overview** Use this command to generate a default route into the Routing Information Protocol (RIP).

Use the **no** variant of this command to disable this feature.

**Syntax** `default-information originate`  
`no default-information originate`

**Default** Disabled

**Mode** Router Configuration

**Usage** If routes are being redistributed into RIP and the router's route table contains a default route, within one of the route categories that are being redistributed, the RIP protocol will advertise this default route, irrespective of whether the **default-information originate** command has been configured or not. However, if the router has not redistributed any default route into RIP, but you want RIP to advertise a default route anyway, then use this command.

This will cause RIP to create a default route entry in the RIP database. The entry will be of type RS (Rip Static). Unless actively filtered out, this default route will be advertised out every interface that is sending RIP. Split horizon does not apply to this route, as it is internally generated. This operates quite similarly to the OSPF **default-information originate always** command.

**Example** `awplus# configure terminal`  
`awplus(config)# router rip`  
`awplus(config-router)# default-information originate`

# default-metric (RIP)

**Overview** Use this command to specify the metrics to be assigned to redistributed RIP routes. Use the **no** variant of this command to reset the RIP metric back to its default (1).

**Syntax** `default-metric <metric>`  
`no default-metric [<metric>]`

Parameter	Description
<code>&lt;metric&gt;</code>	<1-16> Specifies the value of the default metric.

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** This command is used with the [redistribute \(RIP\)](#) command to make the routing protocol use the specified metric value for all redistributed routes, regardless of the original protocol that the route has been redistributed from.

**Examples** This example assigns the cost of 10 to the routes that are redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-metric 10
awplus(config-router)# redistribute ospf
awplus(config-router)# redistribute connected
```

**Example (VRF-lite)** This example assigns the cost of 10 to the routes which are redistributed into RIP for the VRF instance blue.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 vrf blue
awplus(config-router-af)# default-metric 10
awplus(config-router-af)# redistribute ospf
awplus(config-router-af)# redistribute connected
```

**Related Commands** [redistribute \(RIP\)](#)

# distance (RIP)

**Overview** This command sets the administrative distance for RIP routes. Your device uses this value to select between two or more routes to the same destination obtained from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). For more information, see the [Route Selection Feature Overview and Configuration Guide](#).

The **no** variant of this command sets the administrative distance for the RIP route to the default of 120.

**Syntax** `distance <1-255> [<ip-addr/prefix-length> [<access-list>]]`  
`no distance [<1-255>] [<ip-addr/prefix-length> [<access-list>]]`

Parameter	Description
<1-255>	The administrative distance value you are setting for this RIP route.
<ip-addr/prefix-length>	The network IP address and prefix-length that you are changing the administrative distance for.
<access-list>	Specifies the access-list name. This access list specifies which routes within the specified network this command applies to.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Examples** To set the administrative distance to 8 for the RIP routes within the 10.0.0.0/8 network that match the access-list "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distance 8 10.0.0.0/8 mylist
```

To set the administrative distance to the default of 120 for the RIP routes within the 10.0.0.0/8 network that match the access-list "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no distance 8 10.0.0.0/8 mylist
```

**Example (VRF-lite)** This example assigns a cost of 10 to the routes for the VRF instance blue, when redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 blue
awplus(config-router-af)# distance 10
```

# distribute-list (RIP)

**Overview** Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list.

When running VRF-lite, this command can be applied to a specific VRF instance.

Use the **no** variant of this command to disable this feature.

**Syntax** `distribute-list {<access-list> | prefix <prefix-list>} {in|out} [<interface>]`

`no distribute-list {<access-list> | prefix <prefix-list>} {in|out} [<interface>]`

Parameter	Description
<code>prefix</code>	Filter prefixes in routing updates.
<code>&lt;access-list&gt;</code>	Specifies the IPv4 access-list number or name to use.
<code>&lt;prefix-list&gt;</code>	Specifies the name of the IPv4 prefix-list to use.
<code>in</code>	Filter incoming routing updates.
<code>out</code>	Filter outgoing routing updates.
<code>&lt;interface&gt;</code>	The interface on which distribute-list applies. For instance: <code>vlan2</code>

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** Filter out incoming or outgoing route updates using access-list or prefix-list. If you do not specify the name of the interface, the filter will be applied to all interfaces.

**Examples** In this example the following commands are used to apply an access list called `myfilter` to filter incoming routing updates in `vlan2`

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list prefix myfilter in vlan2
```

**Example (VRF-lite)** This example applies the commands of the previous example, but to a specific VRF named `blue`:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# distribute-list prefix myfilter in
vlan2
```

**Related  
Commands**    access-list extended (named)  
                  ip prefix-list

# fullupdate (RIP)

**Overview** Use this command to specify which routes RIP should advertise when performing a triggered update. By default, when a triggered update is sent, RIP will only advertise those routes that have changed since the last update. When **fullupdate** is configured, the device advertises the full RIP route table in outgoing triggered updates, including routes that have not changed. This enables faster convergence times, or allows inter-operation with legacy network equipment, but at the expense of larger update messages.

Use the **no** variant of this command to disable this feature.

**Syntax** fullupdate  
no fullupdate

**Default** By default this feature is disabled.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage (VRF-lite)** If VRF-lite is configured, you can apply this command for either the global routing environment, or to a specific VRF instance.

**Example** To enable the fullupdate (RIP) function, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# fullupdate
```

**Example (VRF-lite)** To enable the full update (RIP) function on the VRF instance named 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# fullupdate
```

# ip summary-address rip

**Overview** Use this command to configure a summary IP address on a RIPv2 interface. Use the **no** variant of this command to remove a summary IP address from a selected RIPv2 interface.

**Syntax** `ip summary-address rip {<ip-address/prefix-length>}`  
`no ip summary-address rip {<ip-address/prefix-length>}`

Parameter	Description
<code>&lt;ip-address/prefix-length&gt;</code>	The summary IPv4 address to be advertised

**Usage** Route summarization is a technique that helps network administrators in reducing the size of the routing tables by advertising a single super-network that covers a range of subnets.

You statically configure an IP summary address on a router interface. The router then advertises the summary address downstream through this interface. This means that:

- all the routers that are downstream from the configured interface will receive only the summary route, and none of the child routes via the RIP advertisement.
- As long as any of the child routes is valid, the router will propagate the summary route. But when the last child that is part of the summarized range disappears, then the router will stop advertising the summary route through the interface.

This command will be rejected if there is no IP address configured on the interface.

**NOTE:** *Manual route summarization is not supported when the interface/router is running in RIPv1.*

**Example** The subnets: 10.4.1.0/24, 10.4.2.128/25, 10.4.3.0/24 can be summarized and advertised as 10.4.0.0/16 on vlan1 using the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip summary-address rip 10.4.0.0/16
```

**Related Commands** [show ip rip database](#)  
[show ip protocols rip](#)

**Command changes** Version 5.4.8-0.2 command added

# ip prefix-list

**Overview** Use this command to create an entry for an IPv4 prefix list.

Use the **no** variant of this command to delete the IPv4 prefix-list entry.

**Syntax**

```
ip prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ip-prefix>} [ge <0-32>] [le <0-32>]

ip prefix-list <list-name> description <text>

ip prefix-list sequence-number

no ip prefix-list <list-name> [seq <1-429496725>]

no ip prefix-list <list-name> [description <text>]

no ip prefix-list sequence-number
```

Parameter	Description
<list-name>	Specifies the name of a prefix list.
seq <1-429496725>	Sequence number of the prefix list entry.
deny	Specifies that the prefixes are excluded from the list.
permit	Specifies that the prefixes are included in the list.
<ip-prefix>	Specifies the IPv4 address and length of the network mask in dotted decimal in the format A.B.C.D/M.
any	Any prefix match. Same as <b>0.0.0.0 le 32</b> .
ge<0-32>	Specifies the minimum prefix length to be matched.
le<0-32>	Specifies the maximum prefix length to be matched.
<text>	Text description of the prefix list.
sequence-number	Specify sequence numbers included or excluded in prefix list.

**Mode** Global Configuration

**Usage** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. When setting these parameters, set the **le** value to be less than 32, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** In the following sample configuration, the last **ip prefix-list** command in the below list matches all, and the first **ip prefix-list** command denies the IP network 76.2.2.0:

```
awplus(config)# router bgp 100
awplus(config-router)# network 172.1.1.0
awplus(config-router)# network 172.1.2.0
awplus(config-router)# neighbor 10.6.5.3 remote-as 300
awplus(config-router)# neighbor 10.6.5.3 prefix-list mylist out
awplus(config-router)# exit
awplus(config)# ip prefix-list mylist seq 5 deny 76.2.2.0/24
awplus(config)# ip prefix-list mylist seq 100 permit any
```

To deny the IP addresses between 10.0.0.0/14 (10.0.0.0 255.252.0.0) and 10.0.0.0/22 (10.0.0.0 255.255.252.0) within the 10.0.0.0/8 (10.0.0.0 255.0.0.0) addressing range, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip prefix-list mylist seq 12345 deny 10.0.0.0/8
ge 14 le 22
```

**Related Commands**

# ip rip authentication key-chain

**Overview** Use this command to enable RIPv2 authentication on an interface and specify the name of the key chain to be used.

Use the **no** variant of this command to disable this function.

**Syntax** `ip rip authentication key-chain <key-chain-name>`  
`no ip rip authentication key-chain`

Parameter	Description
<code>&lt;key-chain-name&gt;</code>	Specify the name of the key chain. This is an alpha-numeric string, but it cannot include spaces.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command can only be used on VLAN interfaces.

Use this command to perform authentication on the interface. Not configuring the key chain results in no authentication at all.

The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use the [ip rip authentication string](#) command for single key authentication. Use the [ip rip authentication key-chain](#) command for multiple keys authentication. See the [RIP Feature Overview and Configuration Guide](#) for illustrated RIP configuration examples.

For multiple key authentication, use the following steps to configure a route to enable RIPv2 authentication using multiple keys at different times:

1) Define a key chain with a key chain name, using the following commands:

```
awplus# configure terminal
awplus(config)# key chain <key-chain-name>
```

2) Define a key on this key chain, using the following command:

```
awplus(config-keychain)# key <keyid>
```

3) Define the password used by the key, using the following command:

```
awplus(config-keychain-key)# key-string <key-password>
```

4) Enable authentication on the desired interface and specify the key chain to be used, using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication key-chain
<key-chain-name>
```

- 5) Specify the mode of authentication for the given interface (text or MD5), using the following command:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example** In the following example of a configuration for multiple keys authentication, a password “toyota” is set for key 1 in key chain “cars”. Authentication is enabled on vlan2 and the authentication mode is set to MD5:

```
awplus# configure terminal
awplus(config)# key chain cars
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string toyota
awplus(config-keychain-key)# accept-lifetime 10:00:00 Oct 08
2016 duration 43200
awplus(config-keychain-key)# send-lifetime 10:00:00 Oct 08 2016
duration 43200
awplus(config-keychain-key)# exit
awplus(config-keychain)# exit
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication key-chain cars
awplus(config-if)# ip rip authentication mode md5
```

**Example** In the following example, the VLAN interface vlan23 is configured to use key-chain authentication with the keychain “mykey”. See the [key](#) command for a description of how a key chain is created.

```
awplus# configure terminal
awplus(config)# interface vlan23
awplus(config-if)# ip rip authentication key-chain mykey
```

**Related  
Commands**

[send-lifetime](#)  
[ip rip authentication mode](#)  
[ip rip authentication string](#)  
[key](#)  
[key chain](#)

# ip rip authentication mode

**Overview** Use this command to specify the type of authentication mode used for RIP v2 packets.

Use the **no** variant of this command to restore clear text authentication.

**Syntax** `ip rip authentication mode {md5|text}`  
`no ip rip authentication mode`

Parameter	Description
md5	Uses the keyed MD5 authentication algorithm.
text	Specifies clear text or simple password authentication.

**Default** Text authentication is enabled

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command can only be used on VLAN interfaces.

The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use the [ip rip authentication string](#) command for single key authentication. Use the [ip rip authentication key-chain](#) command for multiple keys authentication. See the [RIP Feature Overview and Configuration Guide](#) for illustrated RIP configuration examples.

**Usage: single key** Use the following steps to configure a route to enable RIPv2 authentication using a single key or password:

- 1) Define the authentication string or password used by the key for the desired interface, using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication string <auth-string>
```

- 2) Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Usage: multiple key** For multiple keys authentication, use the following steps to configure a route to enable RIPv2 authentication using multiple keys at different times:

- 1) Define a key chain with a key chain name, using the following commands:

```
awplus# configure terminal
awplus(config)# key chain <key-chain-name>
```

- 2) Define a key on this key chain using the following command:

```
awplus(config-keychain)# key <keyid>
```

- 3) Define the password used by the key, using the following command:

```
awplus(config-keychain-key)# key-string <key-password>
```

- 4) Enable authentication on the desired interface and specify the key chain to be used, using the following commands:

```
awplus(config-if)# ip rip authentication key-chain
<key-chain-name>
```

- 5) Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example 1** In the following example of a configuration for multiple keys authentication, a password of "toyota" is set for key 1 in key chain "cars". Authentication is enabled on vlan2 and the authentication mode is set to MD5:

```
awplus# configure terminal
awplus(config)# key chain cars
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string toyota
awplus(config-keychain-key)# accept-lifetime 10:00:00 Oct 08
2016 duration 43200
awplus(config-keychain-key)# send-lifetime 10:00:00 Oct 08 2016
duration 43200
awplus(config-keychain-key)# exit
awplus(config-keychain)# exit
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication key-chain cars
awplus(config-if)# ip rip authentication mode md5
```

**Example 2** The following example shows MD5 authentication configured on VLAN interface vlan2, ensuring authentication of RIP packets received on this interface.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication mode md5
```

**Example 3** The following example specifies "mykey" as the authentication string with MD5 authentication, for the VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string mykey
awplus(config-if)# ip rip authentication mode md5
```

**Related Commands** [ip rip authentication string](#)  
[ip rip authentication key-chain](#)

# ip rip authentication string

**Overview** Use this command to specify the authentication string or password used by a key. Use the **no** variant of this command to remove the authentication string.

**Syntax** `ip rip authentication string <auth-string>`  
`no ip rip authentication string`

Parameter	Description
<code>&lt;auth-string&gt;</code>	The authentication string or password used by a key. It is an alphanumeric string and can include spaces.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command can only be used on VLAN interfaces.

The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use this command to specify the password for a single key on an interface. Use the [ip rip authentication key-chain](#) command for multiple keys authentication. For information about configuring RIP, see the [RIP Feature Overview and Configuration Guide](#).

Use the following steps to configure a route to enable RIPv2 authentication using a single key or password:

- 1) Define the authentication string or password used by the key for the desired interface, using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
```

- 2) Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus# configure terminal
awplus(config-if)# ip rip authentication string <auth-string>
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example** See the example below to specify `mykey` as the authentication string with MD5 authentication for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string mykey
awplus(config-if)# ip rip authentication mode md5
```

**Example** In the following example, the VLAN interface `vlan2` is configured to have an authentication string as `guest`. Any received RIP packet in that interface should have the same string as password.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string guest
```

**Related commands** [ip rip authentication key-chain](#)  
[ip rip authentication mode](#)

# ip rip receive-packet

**Overview** Use this command to configure the interface to enable the reception of RIP packets.

Use the **no** variant of this command to disable this feature.

**Syntax** `ip rip receive-packet`  
`no ip rip receive-packet`

**Default** Receive-packet is enabled

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command can only be configured on VLAN interfaces.

**Example** This example shows packet receiving being turned on for the VLAN interface `vlan3`:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip rip receive-packet
```

**Related Commands** [ip rip send-packet](#)

# ip rip receive version

**Overview** Use this command to specify the version of RIP packets accepted on an interface and override the setting of the version command.

Use the **no** variant of this command to use the setting specified by the [version \(RIP\)](#) command.

**Syntax** `ip rip receive version {[1][2]}`  
`no ip rip receive version`

Parameter	Description
1	Specifies acceptance of RIP version 1 packets on the interface.
2	Specifies acceptance of RIP version 2 packets on the interface.

**Default** Version 2

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command can only be used on VLAN interfaces.

This command applies to a specific VLAN interface and overrides any the version specified by the [version \(RIP\)](#) command.

RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

**Example** In the following example, the VLAN interface `vlan3` is configured to receive both RIP version 1 and 2 packets:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip rip receive version 1 2
```

**Related Commands** [version \(RIP\)](#)

# ip rip send-packet

**Overview** Use this command to enable sending RIP packets through the current interface. Use the **no** variant of this command to disable this feature.

**Syntax** `ip rip send-packet`  
`no ip rip send-packet`

**Default** Send packet is enabled

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command can only be configured on VLAN interfaces.

**Example** This example shows packet sending being turned on for the VLAN interface `vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send-packet
```

**Related Commands** [ip rip receive-packet](#)

# ip rip send version

**Overview** Use this command in Interface Configuration mode to specify the version of RIP packets sent on an interface and override the setting of the [version \(RIP\)](#) command. This mechanism causes RIP version 2 interfaces to send multicast packets instead of broadcasting packets.

Use the **no** variant of this command to use the setting specified by the [version \(RIP\)](#) command.

**Syntax** `ip rip send version {1|2|1 2|2 1}`  
`no ip rip send version`

Parameter	Description
1	Specifies the sending of RIP version 1 packets out of an interface.
2	Specifies the sending of RIP version 2 packets out of an interface.
12	Specifies the sending of both RIP version 1 and RIP version 2 packets out of an interface.
21	Specifies the sending of both RIP version 2 and RIP version 1 packets out of an interface.

**Default** RIP version 2 is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to a specific interface and overrides the version specified by the [version \(RIP\)](#) command.

RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces. Selecting version parameters 1 2 or 2 1 sends RIP version 1 and 2 packets.

Use the [ip rip send version 1-compatible](#) command in an environment where you cannot send multicast packets. For example, in environments where multicast is not enabled and where hosts do not listen to multicast.

**Examples** In the following example, the VLAN interface `vlan4` is configured to send both RIP version 1 and 2 packets.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 1 2
```

In the following example, the VLAN interface `vlan4` is configured to send both RIP version 2 and 1 packets.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 2 1
```

In the following example, the VLAN interface `vlan4` is configured to send RIP version 1 packets only.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 1
```

In the following example, the VLAN interface `vlan4` is configured to send RIP version 2 packets only.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 2
```

In the following example, the VLAN interface `vlan3` is configured to use the RIP version specified by the [version \(RIP\)](#) command.

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# no ip rip send version
```

**Related Commands** [ip rip send version 1-compatible](#)  
[version \(RIP\)](#)

# ip rip send version 1-compatible

**Overview** Use this command in Interface Configuration mode to send RIP version 1 compatible packets from a RIP version 2 interfaces to other RIP Interfaces. This mechanism causes RIP version 2 interfaces to send broadcast packets instead of multicasting packets, and is used in environments where multicast is not enabled or where hosts do not listen to multicast.

Use the **no** variant of this command to use the setting specified by the [version \(RIP\)](#) command, and disable the broadcast of RIP version 2 packets that are sent as broadcast packets.

**Syntax** `ip rip send version 1-compatible`  
`no ip rip send version`

Parameter	Description
1-compatible	Specify this parameter to send RIP version 1 compatible packets from a version 2 RIP interface to other RIP interfaces. This mechanism causes version 2 RIP interfaces to broadcast packets instead of multicasting packets.

**Default** RIP version 2 is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to a specific interface and overrides the version specified by the [version \(RIP\)](#) command.

RIP can be run in version 1 compatible mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Use the [ip rip send version](#) command in an environment where you can send multicast packets. For example, in environments where multicast is enabled and where hosts listen to multicast.

**Examples** In the following example, the VLAN interface `vlan2` is configured to send RIP version 1-compatible packets.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip send version 1-compatible
```

In the following example, the VLAN interface `vlan3` is configured to use the RIP version specified by the [version \(RIP\)](#) command.

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# no ip rip send version
```

**Related  
Commands** [ip rip send version](#)  
[version \(RIP\)](#)

# ip rip split-horizon

**Overview** Use this command to turn on the split-horizon mechanism on the interface. Use the **no** variant of this command to disable this mechanism.

**Syntax** `ip rip split-horizon [poisoned]`  
`no ip rip split-horizon`

Parameter	Description
poisoned	Performs split-horizon with poison-reverse. See "Usage" below for more information.

**Default** Split horizon poisoned

**Mode** Interface Configuration for a VLAN interface.

**Usage** Use this command to avoid including routes in updates sent to the same gateway from which they were learned. Without the **poisoned** parameter, using this command causes routes learned from a neighbor to be omitted from updates sent to that neighbor. With the **poisoned** parameter, using this command causes such routes to be included in updates, but sets their metrics to infinity. This advertises that these routes are not reachable.

**Example** To turn on split horizon poisoned on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip split-horizon poisoned
```

# key

**Overview** Use this command to manage, add and delete authentication keys in a key-chain. Use the **no** variant of this command to delete the authentication key.

**Syntax** `key <keyid>`  
`no key <keyid>`

Parameter	Description
<keyid>	<0-2147483647> Key identifier number.

**Mode** Keychain Configuration

**Usage** This command allows you to enter the keychain-key mode where a password can be set for the key.

**Example** The following example configures a key number 1 and shows the change into a **keychain- key** command mode prompt.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)#
```

**Related Commands** [key chain](#)  
[key-string](#)  
[accept-lifetime](#)  
[send-lifetime](#)

# key chain

**Overview** Use this command to enter the key chain management mode and to configure a key chain with a key chain name.

Use the **no** variant of this command to remove the key chain and all configured keys.

**Syntax** `key chain <key-chain-name>`  
`no key chain <key-chain-name>`

Parameter	Description
<code>&lt;key-chain-name&gt;</code>	Specify the name of the key chain to manage.

**Mode** Global Configuration

**Usage** This command allows you to enter the keychain mode from which you can specify keys on this key chain.

**Example** The following example shows the creation of a key chain named `mychain` and the change into **keychain** mode prompt.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)#
```

**Related  
Commands**

[key](#)  
[key-string](#)  
[accept-lifetime](#)  
[send-lifetime](#)

# key-string

**Overview** Use this command to define the password to be used by a key.

Use the **no** variant of this command to remove a password.

**Syntax** `key-string <key-password>`  
`no key-string`

Parameter	Description
<code>&lt;key-password&gt;</code>	A string of characters to be used as a password by the key.

**Mode** Keychain-key Configuration

**Usage** Use this command to specify passwords for different keys.

**Examples** In the following example, the password for `key1` in the key chain named `mychain` is set to password **prime**:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string prime
```

In the following example, the password for `key1` in the key chain named `mychain` is removed:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# no key-string
```

**Related Commands**

- [key](#)
- [key chain](#)
- [accept-lifetime](#)
- [send-lifetime](#)

# maximum-prefix

**Overview** Use this command to configure the maximum number of RIP routes stored in the routing table.

Use the **no** variant of this command to disable all limiting of the number of RIP routes stored in the routing table.

**Syntax** `maximum-prefix <maxprefix> [<threshold>]`  
`no maximum-prefix`

Parameter	Description
<code>&lt;maxprefix&gt;</code>	<code>&lt;1-65535&gt;</code> The maximum number of RIP routes allowed.
<code>&lt;threshold&gt;</code>	<code>&lt;1-100&gt;</code> Percentage of maximum routes to generate a warning. The default threshold is 75%.

**Mode** Router Configuration

**Example** To configure the maximum number of RIP routes to 150, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# maximum-prefix 150
```

# neighbor (RIP)

**Overview** Use this command to specify a neighbor router. It is used for each router to which you wish to send unicast RIP updates.

Use the **no** variant of this command to stop sending unicast updates to the specific router.

**Syntax** `neighbor <ip-address>`  
`no neighbor <ip-address>`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The IP address of a neighboring router with which the routing information will be exchanged.

**Default** Disabled

**Mode** Router Configuration

**Usage** Use this command to exchange nonbroadcast routing information. It can be used multiple times for additional neighbors.

The [passive-interface \(RIP\)](#) command disables sending routing updates on an interface. Use the `neighbor` command in conjunction with the [passive-interface \(RIP\)](#) to send routing updates to specific neighbors.

**Example** To specify the neighbor router to 1.1.1.1, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan1
awplus(config-router)# neighbor 1.1.1.1
```

**Related Commands** [passive-interface \(RIP\)](#)

# network (RIP)

**Overview** Use this command to activate the transmission of RIP routing information on the defined network.

Use the **no** variant of this command to remove the specified network or VLAN as one that runs RIP.

**Syntax** `network {<network-address>[/<subnet-mask>] | <vlan-name>}`  
`no network {<network-address>[/<subnet-mask>] | <vlan-name>}`

Parameter	Description
<code>&lt;network-address&gt;</code> <code>[/&lt;subnet-mask&gt;]</code>	Specifies the network address to run RIP. Entering a subnet mask (or prefix length) for the network address is optional. Where no mask is entered, the device will attempt to apply a mask that is appropriate to the class (A, B, or C) of the address entered, e.g. an IP address of 10.0.0.0 will have a prefix length of 8 applied to it.
<code>&lt;vlan-name&gt;</code>	Specify a VLAN name with up to 32 alphanumeric characters to run RIP.

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** Use this command to specify networks, or VLANs, to which routing updates will be sent and received. The connected routes corresponding to the specified network, or VLANs, will be automatically advertised in RIP updates. RIP updates will be sent and received within the specified network or VLAN.

When running VRF-lite, this command can be applied to a VRF instance.

**Example** Use the following commands to activate RIP routing updates on network 172.16.20.0/24:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# network 172.16.20.0/24
```

**Example (VRF-lite)** To activate RIP routing updates on vlan3 for VRF instance 'blue'.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# network vlan3
```

**Related  
Commands** show ip rip  
show running-config  
clear ip rip route

# offset-list (RIP)

**Overview** Use this command to add an offset to the **in** and **out** metrics of routes learned through RIP.

Use the **no** variant of this command to remove the offset list.

**Syntax** `offset-list <access-list> {in|out} <offset> [<interface>]`  
`no offset-list <access-list> {in|out} <offset> [<interface>]`

Parameter	Description
<code>&lt;access-list&gt;</code>	Specifies the access-list number or names to apply.
<code>in</code>	Indicates the access list will be used for metrics of incoming advertised routes.
<code>out</code>	Indicates the access list will be used for metrics of outgoing advertised routes.
<code>&lt;offset&gt;</code>	<code>&lt;0-16&gt;</code> Specifies that the offset is used for metrics of networks matching the access list.
<code>&lt;interface&gt;</code>	An alphanumeric string that specifies the interface to match.

**Default** The default offset value is the metric value of the interface over which the updates are being exchanged.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** Use this command to specify the offset value that is added to the routing metric. When the networks match the access list the offset is applied to the metrics. No change occurs if the offset value is zero.

**Examples** In this example the router examines the RIP updates being sent out from interface vlan2 and adds 5 hops to the routes matching the ip addresses specified in the access list 8.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# offset-list 8 in 5 vlan2
```

To apply this same command within the specific VRF instance named 'blue', use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# offset-list 8 in 5 vlan2
```

**Related  
Commands** [access-list \(extended numbered\)](#)

# passive-interface (RIP)

**Overview** Use this command to block RIP broadcasts on the interface.  
Use the **no** variant of this command to disable this function.

**Syntax** `passive-interface <interface>`  
`no passive-interface <interface>`

Parameter	Description
<code>&lt;interface&gt;</code>	Specifies the interface name.

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Example** Use the following commands to block RIP broadcasts on vlan20:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan20
```

**Example (VRF-lite)** To apply this above example to a specific VRF instance named 'green', use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# passive-interface vlan20
```

**Related Commands** [show ip rip](#)

# recv-buffer-size (RIP)

**Overview** Use this command to run-time configure the RIP UDP (User Datagram Protocol) receive-buffer size to improve UDP reliability by avoiding UDP receive buffer overrun.

Use the **no** variant of this command to reset the configured RIP UDP receive-buffer size to the system default (196608 bits).

**Syntax** `recv-buffer-size <8192-2147483647>`  
`no recv-buffer-size [<8192-2147483647>]`

Parameter	Description
<code>&lt;8192-2147483647&gt;</code>	Specify the RIP UDP (User Datagram Protocol) buffer size value in bits.

**Default** 196608 bits is the system default when reset using the **no** variant of this command.

**Mode** Router Configuration

**Examples** To run-time configure the RIP UDP, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# recv-buffer-size 23456789
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no recv-buffer-size 23456789
```

# redistribute (RIP)

**Overview** Use this command to redistribute information from other routing protocols into RIP.

When using VRF-lite, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **route-map** may be used with the **no** variant, but have no effect.

**Syntax** `redistribute {connected|static|ospf|bgp} [metric <0-16>]  
[route-map <route-map>]`  
`no redistribute {connected|static|ospf|bgp} [metric] [route-map]`

Parameter	Description
route-map	Optional. Specifies route-map that controls how routes are redistributed.
<route-map>	Optional. The name of the route map.
connected	Redistribute from connected routes.
static	Redistribute from static routes.
ospf	Redistribute from Open Shortest Path First (OSPF).
bgp	Redistribute from Border Gateway Protocol (BGP).
metric <0-16>	Optional. Sets the value of the metric that will be applied to routes redistributed into RIP from other protocols. If a value is not specified, and no value is specified using the <a href="#">default-metric (RIP)</a> command, the default is one.

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Example** To apply the metric value 15 to static routes being redistributed into RIP, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# redistribute static metric 15
```

**Example (VRF-lite)** To apply the metric value 15 to static routes in address-family ipv4 VRF instance blue being redistributed into RIP, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute static metric 15
```

**Related Commands** [default-metric \(RIP\)](#)

# restart rip graceful

**Overview** Use this command to force the RIP process to restart, and optionally set the grace-period.

**Syntax** `restart rip graceful [grace-period <1-65535>]`

**Mode** Privileged Exec

**Default** The default RIP grace-period is 60 seconds.

**Usage** After this command is executed, the RIP process immediately shuts down. It notifies the system that RIP has performed a graceful shutdown. Routes that have been installed into the route table by RIP are preserved until the specified grace-period expires.

When a **restart rip graceful** command is issued, the RIP configuration is reloaded from the last saved configuration. Ensure you first enter the command `copy running-config startup-config`.

When a master failover happens on a VCStack, the RIP grace-period will apply the larger value of either the setting's configured value, or its default of 60 seconds.

**Example** To apply a restart rip graceful setting, grace-period to 100 seconds use the following commands:

```
awplus# copy running-config startup-config
awplus# restart rip graceful grace-period 100
```

# rip restart grace-period

**Overview** Use this command to change the grace period of RIP graceful restart.  
Use the **no** variant of this command to disable this function.

**Syntax** `rip restart grace-period <1-65535>`  
`no rip restart grace-period <1-65535>`

**Mode** Global Configuration

**Default** The default RIP grace-period is 60 seconds.

**Usage** Use this command to enable the **Graceful Restart** feature on the RIP process.  
Entering this command configures a grace period for RIP.

When a master failover happens on a VCStack, the RIP grace-period will be the longest period between the default value (60 seconds is the default RIP grace-period) and the configured RIP grace-period value from this command. So the configured RIP grace-period value will not be used for a VCStack master failover if it is shorter than the default RIP grace-period value.

**Example** `awplus# configure terminal`  
`awplus(config)# rip restart grace-period 200`

# route (RIP)

**Overview** Use this command to add a static RIP route.  
Use the **no** variant of this command to remove a static RIP route.

**Syntax** `route <ip-addr/prefix-length>`  
`no route <ip-addr/prefix-length>`

Parameter	Description
<code>&lt;ip-addr/prefix-length&gt;</code>	The IPv4 address and prefix length.

**Default** No static RIP route is added by default.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** Use this command to add a static RIP route. After adding the RIP route, the route can be checked in the RIP routing table.

**Example** To create a static RIP route to IP subnet 192.168.1.0/24, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# route 192.168.1.0/24
```

**Example (VRF-lite)** To create a static RIP route to IP subnet 192.168.1.0/24, for the VRF instance red, use the following commands

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# route 192.168.1.0/24
```

**Related Commands** [show ip rip](#)  
[clear ip rip route](#)

# router rip

**Overview** Use this global command to enter Router Configuration mode to enable the RIP routing process.

Use the **no** variant of this command to disable the RIP routing process.

**Syntax** `router rip`  
`no router rip`

**Mode** Global Configuration

**Example** This command is used to begin the RIP routing process:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
awplus(config-router)# network 10.10.10.0/24
awplus(config-router)# network 10.10.11.0/24
awplus(config-router)# neighbor 10.10.10.10
```

**Related  
Commands** [network \(RIP\)](#)  
[version \(RIP\)](#)

# send-lifetime

**Overview** Use this command to specify the time period during which the authentication key on a key chain can be sent.

**Syntax** `send-lifetime <start-date> {<end-date>|  
duration <seconds>|infinite}`  
`no send-lifetime`

Parameter	Description
<code>&lt;start-date&gt;</code>	Specifies the start time and date in the format: <code>&lt;hh:mm:ss&gt; &lt;day&gt; &lt;month&gt; &lt;year&gt;</code> or <code>&lt;hh:mm:ss&gt; &lt;month&gt; &lt;day&gt; &lt;year&gt;</code> , where:
<code>&lt;hh:mm:ss&gt;</code>	The time of the day, in hours, minutes and seconds
<code>&lt;day&gt;</code>	<1-31> The day of the month
<code>&lt;month&gt;</code>	The month of the year (the first three letters of the month, for example, Jan)
<code>&lt;year&gt;</code>	<1993-2035> The year
<code>&lt;end-date&gt;</code>	Specifies the end time and date in the format: <code>&lt;hh:mm:ss&gt; &lt;day&gt; &lt;month&gt; &lt;year&gt;</code> or <code>&lt;hh:mm:ss&gt; &lt;month&gt; &lt;day&gt; &lt;year&gt;</code> , where:
<code>&lt;hh:mm:ss&gt;</code>	The time of the day, in hours, minutes and seconds
<code>&lt;day&gt;</code>	<1-31> The day of the month
<code>&lt;month&gt;</code>	The month of the year (the first three letters of the month, for example, Jan)
<code>&lt;year&gt;</code>	<1993-2035> The year
<code>&lt;seconds&gt;</code>	<1-2147483646> Duration of the key in seconds.
<code>infinite</code>	Never expires.

**Mode** Keychain-key Configuration

**Example** The following example shows the setting of send-lifetime for key 1 on the key chain named "mychain".

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# send-lifetime 03:03:01 Jan 3 2016
04:04:02 Dec 6 2016
```

**Related  
Commands** [key](#)  
[key-string](#)  
[key chain](#)  
[accept-lifetime](#)

# show debugging rip

**Overview** Use this command to display the RIP debugging status for these debugging options: nsm debugging, RIP event debugging, RIP packet debugging and RIP nsm debugging.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show debugging rip`

**Mode** User Exec and Privileged Exec

**Usage** Use this command to display the debug status of RIP.

**Example** `awplus# show debugging rip`

# show ip prefix-list

**Overview** Use this command to display the IPv4 prefix-list entries.  
Note that this command is valid for RIP and BGP routing protocols only.

**Syntax** `show ip prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of a prefix list in this placeholder.
detail	Specify this parameter to show detailed output for all IPv4 prefix lists.
summary	Specify this parameter to show summary output for all IPv4 prefix lists.

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip prefix-list
awplus# show ip prefix-list 10.10.0.98/8
awplus# show ip prefix-list detail
```

**Related Commands** [ip prefix-list](#)

# show ip protocols rip

**Overview** Use this command to display RIP process parameters and statistics.  
For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ip protocols rip`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip protocols rip`

**Output** Figure 24-1: Example output from the **show ip protocols rip** command

```
Routing Protocol is "rip"
Sending updates every 30 seconds with +/-50%, next due in 12
seconds
Timeout after 180 seconds, garbage collect after 120 seconds
Outgoing update filter list for all interface is not set
Incoming update filter list for all interface is not set
Default redistribution metric is 1
Redistributing: connected static
Default version control: send version 2, receive version 2
Interface          Send  Recv  Key-chain
   vlan25           2    2
Routing for Networks:
  10.10.0.0/24
Routing Information Sources:
  Gateway          BadPackets BadRoutes  Distance Last Update
Distance: (default is 120
```

# show ip rip

**Overview** Use this command to show RIP routes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip rip`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip rip`

**Output** Figure 24-2: Example output from the **show ip rip** command

```
awplus#show ip rip
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
       C - Connected, S - Static, O - OSPF, B - BGP
Network      Next Hop Metric From If    Time
C 10.0.1.0/24          1      vlan20
S 10.10.10.0/24       1      vlan20
C 10.10.11.0/24       1      vlan20
S 192.168.101.0/24    1      vlan20
R 192.192.192.0/24    1      --
```

**Related** [route \(RIP\)](#)

**Commands** [network \(RIP\)](#)

[clear ip rip route](#)

[show ip rip vrf interface](#)

# show ip rip database

**Overview** Use this command to display information about the RIP database.  
For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ip rip database [full]`

Parameter	Description
full	Specify the full RIP database including sub-optimal RIP routes.

**Mode** User Exec and Privileged Exec

**Example**  
`awplus# show ip rip database`  
`awplus# show ip rip database full`

**Related Commands** [show ip rip](#)

# show ip rip interface

**Overview** Use this command to display information about the RIP interfaces. You can specify an interface name to display information about a specific interface.

**Syntax** `show ip rip interface [<interface>]`

Parameter	Description
<interface>	The interface to display information about. For instance: <code>vlan2</code> .

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip rip interface`

# show ip rip vrf database

**Overview** Use this command to display information about the RIP database that is associated with a specific VRF instance.

Entering this command with the **full** option included, will display information about the full RIP database (including sub-optimal routes) associated with a specific VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip rip {vrf <vrf-name>|global} database [full]`

Parameter	Description
vrf	Specific VRF instance.
<vrf-name>	The name of the VRF instance.
global	The global routing and forwarding table.
full	Specify the full RIP database including sub-optimal RIP routes.

**Mode** User Exec and Privileged Exec

**Example** To display information about the RIP database associated with a VRF instance 'blue', use the command:

```
awplus# show ip rip vrf blue database
```

**Output** Figure 24-3: Example output from the **show ip rip vrf blue database** command

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
       C - Connected, S - Static, O - OSPF, B - BGP
```

Network	Next Hop	Metric	From	If	Time
Rc 192.168.30.0/24		1		vlan3	
R 192.168.45.0/24	192.168.30.1	2	192.168.30.1	vlan3	02:46

**Related Commands** [show ip rip](#)

# show ip rip vrf interface

**Overview** Use this command to display information about the RIP interfaces that are associated with a specific VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip rip {vrf <vrf-name>|global} interface [<interface-name>]`

Parameter	Description
vrf	Specific VRF instance.
<vrf-name>	The name of the VRF instance.
global	The global routing and forwarding table.
<interface-name>	The IP RIP interface (VLAN).

**Mode** User Exec and Privileged Exec

**Example** To display information about the RIP database associated with a VRF instance 'blue', use the command:

```
awplus# show ip rip vrf blue interface
```

**Output** Figure 24-4: Example output from **show ip rip vrf blue interface vlan3**

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
       C - Connected, S - Static, O - OSPF, B - BGP
```

Network	Next Hop	Metric	From	If	Time
Rc 192.168.30.0/24		1		vlan3	
R 192.168.45.0/24	192.168.30.1	2	192.168.30.1	vlan3	02:46

**NOTE:** The Time parameter operates as follows:

- RIP updates occur approximately every 30 seconds.
- Each update resets a count-down timer to 180 seconds (3 minutes).
- The Time parameter displays the count-down from the last reset.

**Related Commands** [show ip rip](#)

# timers (RIP)

**Overview** Use this command to adjust routing network timers.  
Use the **no** variant of this command to restore the defaults.

**Syntax** `timers basic <update> <timeout> <garbage>`  
`no timers basic`

Parameter	Description
<code>&lt;update&gt;</code>	<code>&lt;5-2147483647&gt;</code> Specifies the period at which RIP route update packets are transmitted. The default is 30 seconds.
<code>&lt;timeout&gt;</code>	<code>&lt;5-2147483647&gt;</code> Specifies the routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid.
<code>&lt;garbage&gt;</code>	<code>&lt;5-2147483647&gt;</code> Specifies the routing garbage collection timer in seconds. The default is 120 seconds.

**Default** Enabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** This command adjusts the RIP timing parameters.

The update timer is the time between sending out updates, that contain the complete routing table, to every neighboring router.

If an update for a given route has not been seen for the time specified by the timeout parameter, that route is no longer valid. However, it is retained in the routing table for a short time, with metric 16, so that neighbors are notified that the route has been dropped.

When the time specified by the garbage parameter expires the metric 16 route is finally removed from the routing table. Until the garbage time expires, the route is included in all updates sent by the router.

All the routers in the network must have the same timers to ensure the smooth operation of RIP throughout the network.

**Examples** To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# timers basic 30 180 120
```

To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120 with VRF, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# timers basic 30 180 120
```

# undebug rip

**Overview** Use this command to disable the options set for debugging information of RIP events, packets and communication between RIP and NSM.

This command has the same effect as the **no debug rip** command.

**Syntax** undebug rip {all|events|nsm|<packet>}

Parameter	Description
all	Disables all RIP debugging.
events	Disables the logging of RIP events.
nsm	Disables the logging of RIP and NSM communication.
<packet>	packet [recv send] [detail] Disables the debugging of RIP packets.
recv	Disables the logging of received packet information.
send	Disables the logging of sent packet information.
detail	Disables the logging of sent or received RIP packets.

**Mode** Privileged Exec

**Example** To disable the options set for debugging RIP information events, use the following command:

```
awplus# undebug rip packet
```

**Related Commands** [debug rip](#)

# version (RIP)

**Overview** Use this command to specify a RIP version used globally by the router. If VRF-lite is configured, you can specify a RIP version either globally, or for a particular VRF instance. Use the **no** variant of this command to restore the default version.

**Syntax** `version {1|2}`  
`no version`

Parameter	Description
1 2	Specifies the version of RIP processing.

**Default** Version 2

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Setting the version command has no impact on receiving updates, only on sending them. The `ip rip send version` command overrides the value set by the `version (RIP)` command on an interface-specific basis. The `ip rip receive version` command allows you to configure a specific interface to accept only packets of the specified RIP version. The `ip rip receive version` command and the `ip rip send version` command override the value set by this command.

**Examples** To specify a RIP version, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
```

To specify a RIP version with VRF, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue

# RIPng for IPv6 Commands

## Introduction

**Overview** This chapter contains RIPng commands. RIPng (Routing Information Protocol next generation) is an extension of RIPv2 to support IPv6. RFC 2080 specifies RIPng. The differences between RIPv2 and RIPng are:

- RIPng does not support RIP updates authentication
- RIPng does not allow the attachment of arbitrary tags to routes
- RIPng requires the encoding of the next-hop for a set of routes

For more information, see the [RIPng Feature Overview and Configuration Guide](#).

# aggregate-address (IPv6 RIPng)

**Overview** Use this command to add an aggregate route to RIPng.  
Use the **no** variant of this command to remove the aggregate route from RIPng.

**Syntax** `aggregate-address <ipv6-addr/prefix-length>`  
`no aggregate-address <ipv6-addr/prefix-length>`

Parameter	Description
<code>&lt;ipv6-addr/prefix-length&gt;</code>	Specify the IPv6 Address in the format <code>X:X::X:/Prefix-Length</code> . The prefix-length is a decimal integer between 1 and 128.

**Mode** Router Configuration

**Usage** The route will not be added to the RIPng database unless the database contains at least one route which is contained within the address range covered by the aggregate route. As soon as there are any such component routes in the RIPng database, then the following occurs:

- the aggregate route is added to the RIPng database
- all the component routes that are within the address range covered by the aggregate route are retained in the RIPng database, but are marked as suppressed routes. The aggregate route will be advertised in RIPng updates, and the component route will no longer be advertised.

Note that simply having a component route in the IPv6 route database is not a sufficient condition for the aggregate route to be included into the RIPng database. The component route(s) must be in the RIPng database before the aggregate route will be included in the RIPng database. There is no restriction on the method by which the component routes have arrived into the RIPng database, it can be by being connected RIP interfaces, by redistribution or by direct inclusion using the **route** command in router IPv6 RIP configuration mode.

**Example**

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# aggregate-address 2001:db8::/32
```

# clear ipv6 rip route

**Overview** Use this command to clear specific data from the RIPng routing table.

**Syntax** `clear ipv6 rip route`  
{<ipv6-addr/prefix-length>|all|connected|rip|static|ospf}

Parameter	Description
<ipv6-addr/ prefix-length>	Specify the IPv6 Address in format X:X::X:Prefix-Length. The prefix-length is a decimal integer between 1 and 128. Removes entries which exactly match this destination address from the RIPng routing table.
connected	Removes redistributed connected entries from RIPng routing table.
static	Removes redistributed static entries from the RIPng routing table.
rip	Removes RIPng routes from the RIPng routing table.
ospf	Removes redistributed OSPFv3 routes from the RIPng routing table.
all	Clears the entire RIPng routing table.

**Mode** Privileged Exec

**Example** `awplus# clear ipv6 rip route all`  
`awplus# clear ipv6 rip route 2001:db8::/32`

# debug ipv6 rip

**Overview** Use this command to enable RIPng debugging and specify debugging for RIPng events, RIPng packets, or RIPng communication with NSM processes.

Use the **no** variant of this command to disable RIPng debugging.

**Syntax** `debug ipv6 rip [all|events|nsm|packet [detail]|recv [detail]|send [detail]]`  
`no debug ipv6 rip [all|events|nsm|packet [detail]|recv [detail]|send [detail]]`

Parameter	Description
all	Displays all RIPng debugging showing RIPng events debug information, RIPng received packets information, and RIPng sent packets information.
events	Displays RIPng events debug information.
nsm	Displays RIPng and NSM communication.
packet	Displays RIPng packets only.
recv	Displays information for received packets.
send	Displays information for sent packets.
detail	Displays detailed information for the sent or received packet.

**Default** RIPng debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# debug ipv6 rip events`  
`awplus# debug ipv6 rip packet send detail`  
`awplus# debug ipv6 rip nsm`

**Related Commands** [undebug ipv6 rip](#)

# default-information originate (IPv6 RIPng)

**Overview** Use this command to generate a default route into RIPng.  
Use the **no** variant of this command to disable this feature.

**Syntax** default-information originate  
no default-information originate

**Default** Disabled

**Mode** Router Configuration

**Example** awplus# configure terminal  
awplus(config)# router ipv6 rip  
awplus(config-router)# default-information originate

# default-metric (IPv6 RIPng)

**Overview** Use this command to specify the metrics to be assigned to redistributed RIPng routes.

Use the **no** variant of this command to reset the RIPng metric back to its default (1).

**Syntax** `default-metric <1-16>`  
`no default-metric [<1-16>]`

Parameter	Description
<1-16>	Metric value.

**Default** By default, the RIPng metric value is set to 1.

**Mode** Router Configuration

**Usage** This command is used with the [redistribute \(IPv6 RIPng\)](#) command to make the routing protocol use the specified metric value for all redistributed RIPng routes, regardless of the original protocol that the route has been redistributed from.

Note, this metric is not applied to routes that are brought into RIPng by using the **route** command in router IPv6 RIP configuration mode. This metric is, though, applied to any RIPng aggregate routes that have been brought into the RIPng database due to the presence of a component route that was redistributed into RIPng.

Also note that the default-metric is applied to routes redistributed into RIPng with no metric assignment in the routemap associated with redistribution.

**Example**

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# default-metric 8
```

**Related Commands** [ipv6 rip metric-offset](#)  
[redistribute \(IPv6 RIPng\)](#)

# distribute-list (IPv6 RIPng)

**Overview** Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
distribute-list [<access-list>|prefix <prefix-list-name>]  
[in|out] [<interface>]  
  
no distribute-list [<access-list>|prefix <prefix-list-name>]  
[in|out] [<interface>]  
  
no distribute-list [prefix <prefix-list-name>] [in|out]  
[<interface>]
```

Parameter	Description
<access-list>	Specifies the IPv6 access-list number or name to use.
<prefix-list-name>	Filter prefixes in routing updates. Specify the name of the IPv6 prefix-list to use.
<interface>	The interface for which distribute-list applies. For instance: vlan2.
in	Filter incoming routing updates.
out	Filter outgoing routing updates.

**Default** Disabled

**Mode** Router Configuration

**Usage** Filter out incoming or outgoing route updates using the access-list or the prefix-list. If you do not specify the name of the interface, the filter is applied to all the interfaces.

**Example** To filter incoming or outgoing route updates, use the following commands:

```
awplus# configure terminal  
awplus(config)# router ipv6 rip  
awplus(config-router)# distribute-list prefix myfilter in vlan2
```

**Related Commands** [ipv6 access-list extended \(named\)](#)  
[ipv6 nd prefix](#)

# ipv6 prefix-list

**Overview** Use this command to create an IPv6 prefix list or an entry in an existing prefix list.

Use the **no** variant of this command to delete a whole prefix list, a prefix list entry, or a description.

**Syntax**

```

  ipv6 prefix-list <list-name> [seq <1-429496725>] {deny|permit}
  {any|<ipv6-prefix>} [ge <0-128>] [le <0-128>]
  ipv6 prefix-list <list-name> description <text>
  no ipv6 prefix-list <list-name> [seq <1-429496725>]
  no ipv6 prefix-list <list-name> [description <text>]
  
```

Parameter	Description
<list-name>	Specifies the name of a prefix list.
seq <1-429496725>	Sequence number of the prefix list entry.
deny	Specifies that the prefixes are excluded from the list.
permit	Specifies that the prefixes are included in the list.
<ipv6-prefix>	Specifies the IPv6 prefix and prefix length in hexadecimal in the format X:X::X:X/M.
any	Any prefix match. Same as ::0/0 le 128.
ge <0-128>	Specifies the minimum prefix length to be matched.
le <0-128>	Specifies the maximum prefix length to be matched.
description	Prefix list specific description.
<text>	Up to 80 characters of text description of the prefix list.

**Mode** Global Configuration

**Usage** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. The parameters **ge** and **le** are only used if an ip-prefix is stated. When setting these parameters, set the **le** value to be less than 128, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** To check the first 32 bits of the prefix 2001:db8:: and that the subnet mask must be greater than or equal to 34 and less than or equal to 40, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list mylist seq 12345 permit
2001:db8::/32 ge 34 le 40
```

**Related Commands**

- [match ipv6 address](#)
- [show ipv6 prefix-list](#)
- [show running-config ipv6 prefix-list](#)

# ipv6 rip metric-offset

**Overview** Use this command to increment the metric value on incoming routes for a specified interface. This command can be used to artificially inflate the metric value for routes learned on the specified interface. Routes learned on the specified interface are only used if the routes to the same destination with a lower metric value in the routing table are down.

Use the **no** variant of this command to reset the metric value on incoming routes to the default value (1). You can set the metric value for redistributed routes with [default-metric \(IPv6 RIPng\)](#) and [redistribute \(IPv6 RIPng\)](#) commands in Router Configuration mode.

**Syntax** `ipv6 rip metric-offset <1-16>`  
`no ipv6 rip metric-offset <1-16>`

Parameter	Description
<1-16>	Specify an increment to the metric value on an incoming route. The metric value for RIPng routes is the hop count for the route.

**Default** The default RIPng metric value is 1.

**Mode** Interface Configuration for a VLAN interface only.

**Usage** When a RIPng route is received on a VLAN interface, the metric value for the interface set by this command is added to the metric value of the route in the routing table. Note this command only increments the metric for incoming routes on a specified interface. Increasing the metric value for a VLAN interface increases the metric value of routes received on that VLAN interface. This changes the route selected from the routing table.

The RIPng metric is the hop count. At regular intervals of the routing update timer (which has a default value of 30 seconds), and at the time of change in the topology, the RIPng router sends update messages to other routers. The listening routers update their route table with the new route, and increase the metric value of the path by one (referred to as a hop count). The router recognizes the IPv6 address advertising router as the next hop, then sends the routing updates to other routers. A maximum allowable hop count is 15. If a router reaches a metric value of 16 or more, the destination is identified as unreachable.

For information about how AlliedWare Plus adds routes, see the [“Route Selection” Feature Overview and Configuration Guide](#). See also the [default-metric \(IPv6 RIPng\)](#) and [redistribute \(IPv6 RIPng\)](#) commands to specify the metric for redistributed RIPng routes.

**Examples** To increment the metric-offset on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 rip metric-offset 1
```

To reset the metric-offset on the VLAN interface `vlan2` to the default value, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 rip metric-offset 1
```

**Validation  
Commands** [show running-config](#)

**Related  
Commands** [default-metric \(IPv6 RIPng\)](#)

# ipv6 rip split-horizon

**Overview** Use this command to perform the split-horizon action on the interface. The default is split-horizon with poisoned reverse.

Use the **no** variant of this command to disable this function.

**Syntax** `ipv6 rip split-horizon [poisoned]`  
`no ipv6 rip split-horizon`

Parameter	Description
<code>split-horizon</code>	Perform split-horizon without poisoned reverse
<code>poisoned</code>	Performs split-horizon with poisoned reverse.

**Default** Split-horizon with poisoned reverse is the default.

**Mode** Interface Configuration for a VLAN interface only.

**Usage** Use this command to avoid including routes in updates sent to the same gateway from which they were learned. Using the **split horizon** command omits routes learned from one neighbor, in updates sent to that neighbor. Using the **poisoned** parameter with this command includes such routes in updates, but sets their metrics to infinity. Thus, advertising that these routes are not reachable.

**Examples** To perform split-horizon with poisoned reverse on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 rip split-horizon poisoned
```

To disable split-horizon on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 rip split-horizon
```

**Validation Commands** `show running-config`

# ipv6 router rip

**Overview** Use this command to enable RIPng routing on an interface.  
Use the **no** variant of this command to disable RIPng routing on an interface.

**Syntax** `ipv6 router rip`  
`no ipv6 router rip`

**Default** RIPng routing is disabled by default.

**Mode** Interface Configuration for a VLAN interface only.

**Usage** This command can only be configured on VLAN interfaces.

**Examples** To enable RIPng routing on the VLAN interface vlan2, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 router rip
```

To disable RIPng routing on the VLAN interface vlan2, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 router rip
```

# neighbor (IPv6 RIPng)

**Overview** Use this command to specify a neighbor router.  
Use the **no** variant of this command to disable the specific router.

**Syntax** `neighbor <ipv6-link-local-addr> <interface>`  
`no neighbor <ipv6-link-local-addr> <interface>`

Parameter	Description
<code>&lt;ipv6-link-local-addr&gt;</code>	Specify the link-local IPv6 address (in the format X:X::X:X) of a neighboring router to exchange routing information with.
<code>&lt;interface&gt;</code>	The interface. For instance: <code>vlan2</code> .

**Mode** Router Configuration

**Usage** Use this command to exchange non broadcast routing information. It can be used multiple times for additional neighbors.

The [passive-interface \(IPv6 RIPng\)](#) command disables sending routing updates on an interface. Use the `neighbor` command in conjunction with the [passive-interface \(IPv6 RIPng\)](#) command to send routing updates to specific neighbors.

**Examples**

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# neighbor 2001:db8:1::1 vlan2
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no neighbor 2001:db8:1::1 vlan2
```

**Related Commands** [passive-interface \(IPv6 RIPng\)](#)

# offset-list (IPv6 RIPng)

**Overview** Use this command to add an offset to in and out metrics to routes learned through RIPng.

Use the **no** variant of this command to remove an offset list.

**Syntax** `offset-list {<access-list-number>|<access-list-name>} {in|out} <offset> [<interface>]`  
`no offset-list {<access-list-number>|<access-list-name>} {in|out} <offset> [<interface>]`

Parameter	Description
<code>&lt;access-list-number&gt;</code>	Specify an access-list number to apply to an offset-list.
<code>&lt;access-list-name&gt;</code>	Specify and access-list name to apply to an offset-list.
<code>in</code>	Indicates the access-list will be used for metrics of incoming advertised routes
<code>out</code>	Indicates the access-list will be used for metrics of outgoing advertised routes
<code>&lt;offset&gt;</code>	<code>&lt;0-16&gt;</code> Specifies that the offset is used for metrics of networks matching the access-list
<code>&lt;interface&gt;</code>	The interface to match. For instance: <code>vlan2</code> .

**Default** The default offset value is the metric value of the interface over which the updates are being exchanged.

**Mode** Router Configuration

**Usage** Use this command to specify the offset value that is added to the routing metric. When the networks match the access list the offset is applied to the metrics. No change occurs if the offset value is zero.

**Example** In this example the router examines the RIPng updates being sent out from interface `vlan2` and adds 8 hops to the routes matching the ip addresses specified in the access list 2.

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# offset-list mylist in 8 vlan2
```

## passive-interface (IPv6 RIPng)

**Overview** Use this command to enable suppression of routing updates on an interface. Use the **no** variant of this command to disable this function.

**Syntax** `passive-interface <interface>`  
`no passive-interface <interface>`

Parameter	Description
<code>&lt;interface&gt;</code>	The interface. For instance: <code>vlan2</code> .

**Default** Disabled

**Mode** Router Configuration

**Examples** To enable suppression of routing updates, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# passive-interface vlan2
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no passive-interface vlan2
```

## recv-buffer-size (IPv6 RIPng)

**Overview** Use this command to configure the RIPng UDP (User Datagram Protocol) receive-buffer size. This should improve UDP reliability by avoiding UDP receive buffer overruns.

Use the **no** variant of this command to unset the configured RIPng UDP receive-buffer size and set it back to the system default of 196608 bits.

**Syntax** `recv-buffer-size <8192-2147483647>`  
`no recv-buffer-size [<8192-2147483647>]`

**Default** The RIPng UDP receive-buffer-size is 196608 bits by default, and is reset to the default using the **no** variant of this command.

**Mode** Router Configuration

**Examples** To configure the RIPng UPD, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# recv-buffer-size 23456789
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no recv-buffer-size 23456789
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no recv-buffer-size
```

# redistribute (IPv6 RIPng)

**Overview** Use this command to redistribute information from other routing protocols into RIPng.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **route-map** may be used on this command, but have no effect.

**Syntax** redistribute {connected|static|ospf} [metric <0-16>] [route-map <route-map>]  
no redistribute {connected|static|ospf} [metric <0-16>] [route-map <route-map>]

Parameter	Description
<0-16>	Optional. Specifies the metric value to be used when redistributing information. If a value is not specified, and no value is specified using the <a href="#">default-metric (IPv6 RIPng)</a> command, the default is one.
<route-map>	Optional. Specifies route-map to be used to redistribute information.
connected	Redistribute from connected routes.
static	Redistribute from static routes.
ospf	Redistribute from Open Shortest Path First (OSPF).

**Default** By default, the RIPng metric value is set to 1.

**Mode** Router Configuration

**Example** To redistribute information from other routing protocols into RIPng, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# redistribute static route-map mymap
awplus(config-router)# redistribute static metric 8
```

**Related Commands** [default-metric \(IPv6 RIPng\)](#)

# route (IPv6 RIPng)

**Overview** Use this command to configure static RIPng routes.  
Use the **no** variant of this command to disable this function.

**Syntax** `route <ipv6-addr/prefix-length>`  
`no route <ipv6-addr/prefix-length>`

Parameter	Description
<code>&lt;ipv6-addr/prefix-length&gt;</code>	Specify the IPv6 Address in format <code>X:X::X:Prefix-Length</code> . The prefix-length is a decimal integer between 1 and 128.

**Mode** Router Configuration

**Usage** Use this command to add a static RIPng route. After adding the RIPng route, the route can be checked in the RIPng routing table.

**Example** To configure static RIPng routes, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# route 2001:db8::1/64
```

**Related Commands** [show ipv6 rip](#)  
[clear ipv6 rip route](#)

# router ipv6 rip

**Overview** Use this global command to enter Router Configuration mode to enable a RIPng routing process.

Use the **no** variant of this command to disable the RIPng routing process.

**Syntax** `router ipv6 rip`  
`no router ipv6 rip`

**Mode** Global Configuration

**Example** To enable a RIPng routing process, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)#
```

# show debugging ipv6 rip

**Overview** Use this command to display the RIPng debugging status for the debugging options of: nsm debugging, RIPng event debugging, RIPng packet debugging, and RIPng nsm debugging.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show debugging ipv6 rip`

**Mode** User Exec and Privileged Exec

**Usage** Use this command to display the debug status of RIPng.

**Example** To display the RIPng debugging status, use the following command:

```
awplus# show debugging ipv6 rip
```

# show ipv6 prefix-list

**Overview** Use this command to display the prefix-list entries.

Note that this command is valid for RIPng and BGP4+ routing protocols only.

**Syntax** `show ipv6 prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of an individual IPv6 prefix list.
detail	Specify this parameter to show detailed output for all IPv6 prefix lists.
summary	Specify this parameter to show summary output for all IPv6 prefix lists.

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

**Related Commands** [ipv6 prefix-list](#)

# show ipv6 protocols rip

**Overview** Use this command to display RIPng process parameters and statistics.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 protocols rip`

**Mode** User Exec and Privileged Exec

**Example** To display RIPng process parameters and statistics, use the following command:

```
awplus# show ipv6 protocols rip
```

## Output

```
awplus#show ipv6 protocols rip
Routing Protocol is "RIPng"
  Sending updates every 30 seconds with +/-5 seconds, next due
in 6 seconds
  Timeout after 180 seconds, garbage collect after 120 seconds
  Outgoing update filter list for all interface is not set
  Incoming update filter list for all interface is not set
  Default redistribute metric is 1
  Redistributing:
  Interface
    vlan3
  Routing for Networks:
    fe80::200:cdff:fe27:c086 vlan1
```

# show ipv6 rip

**Overview** Use this command to show RIPng routes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 rip`

**Mode** User Exec and Privileged Exec

**Example** To display RIPng routes, use the following command:

```
awplus# show ipv6 rip
```

## Output

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, Ra - RIP
aggregated, Rcx - RIP connect suppressed, Rsx - RIP static
suppressed, C - Connected, S - Static, O - OSPF, B - BGP
```

	Network	Next Hop	If	Met	Tag	Time
R	2001:db8:1::/48	2001:db8:2::/48	vlan3	3	0	02:28
C	2001:db8:3::/48	::	vlan2	1	0	
Ra	2001:db8:4::/48		--	1	0	
Rs	2001:db8:5::/48	2001:db8:1::/48	vlan3	3	0	02:32
Cs	2001:db8:6::/48	::	vlan3	1	0	

**Related Commands** [show ipv6 rip database](#)

# show ipv6 rip database

**Overview** Use this command to display information about the RIPng database.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 rip database [full]`

Parameter	Description
full	Display all IPv6 RIPng full database entries including sub-optimal routes.

**Mode** User Exec and Privileged Exec

**Example** To display information about the RIPng database, use the following command:

```
awplus# show ipv6 rip database
```

## Output

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, Ra- RIP
aggregated, Rcx - RIP connect suppressed, Rsx - RIP static

**Related Commands** [show ipv6 rip](#)

# show ipv6 rip interface

**Overview** Use this command to display information about the RIPng interfaces. You can specify an interface name to display information about a specific interface.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 rip interface [<interface>]`

Parameter	Description
<interface>	The interface to display information about. For instance: <code>vlan2</code> .

**Mode** User Exec and Privileged Exec

**Example** To display RIPng interface information, use the following command:

```
awplus# show ipv6 rip interface
```

## Output

```
lo is up, line protocol is up
RIPng is not enabled on this interface
vlan1 is up, line protocol is up
RIPng is not enabled on this interface
vlan2 is down, line protocol is down
RIPng is not enabled on this interface
vlan3 is up, line protocol is up
Routing Protocol: RIPng
Passive interface: Disabled
Split horizon: Enabled with Poisoned Reversed
IP interface address:
2001:db8:1::1/64
2001:db8:1::2/64
```

# timers (IPv6 RIPng)

**Overview** Use this command to adjust the RIPng routing network timers.

Use the **no** variant of this command to restore the defaults.

**Syntax** `timers basic <update> <timeout> <garbage>`  
`no timers basic`

Parameter	Description
<code>&lt;update&gt;</code>	<code>&lt;5-2147483647&gt;</code> Specifies the RIPng routing table update timer in seconds. The default is 30 seconds.
<code>&lt;timeout&gt;</code>	<code>&lt;5-2147483647&gt;</code> Specifies the RIPng routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid.
<code>&lt;garbage&gt;</code>	<code>&lt;5-2147483647&gt;</code> Specifies the RIPng routing garbage collection timer in seconds. The default is 120 seconds.

**Default** The default RIPng routing table update timer default is 30 seconds, the default RIPng routing information timeout timer is 180 seconds, and the default RIPng routing garbage collection timer is 120 seconds. The **no** variant of this command restores the default RIPng routing timers.

**Mode** Router Configuration

**Example** To adjust the RIPng routing network timers, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# timers basic 30 180 120
```

# undebg ipv6 rip

**Overview** Use this command to disable debugging options of RIPng events, RIPng packets, and communication between RIPng and NSM processes.

**Syntax** `undebg ipv6 rip [all|events|nsm|packet [recv|send][detail]]`

Parameter	Description
all	Disables all RIPng debugging.
events	Disable the display of RIPng events information.
nsm	Disable the display of RIPng and NSM communication.
packet	Disable debugging of specified RIPng packets only.
recv	Disable the display of information for received packets.
send	Disable the display of information for sent packets.
detail	Disable the display of detailed information for sent or received packets.

**Mode** Privileged Exec and Global Configuration

**Example** To disable debugging options, use the following command:

```
awplus# undebg ipv6 rip events
awplus# undebg ipv6 rip all
awplus# undebg ipv6 rip packet send
awplus# undebg ipv6 rip packet recv detail
```

# area default-cost

**Overview** This command specifies a cost for the default summary route sent into a stub or NSSA area.

The **no** variant of this command removes the assigned default-route cost.

**Syntax** `area <area-id> default-cost <0-16777215>`  
`no area <area-id> default-cost`

Parameter	Description
<code>&lt;area-id&gt;</code>	The OSPF area that you are specifying the default summary route cost for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.
<code>&lt;ip-addr&gt;</code>	OSPF Area ID expressed in IPv4 address format A.B.C.D.
<code>&lt;0-4294967295&gt;</code>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.
<code>default-cost</code>	Indicates the cost for the default summary route used for a stub or NSSA area. Default: <b>1</b>

**Mode** Router Configuration

**Usage** The default-cost option provides the metric for the summary default route, generated by the area border router, into the NSSA or stub area. Use this option only on an area border router that is attached to the NSSA or stub area. Refer to the RFC 3101 for information on NSSA.

**Example** To set the default cost to 10 in area 1 for the OSPF instance 100, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 default-cost 10
```

**Related Commands** [area nssa](#)  
[area stub](#)

# area authentication

**Overview** Use this command to enable authentication for an OSPF area. Specifying the area authentication sets the authentication to Type 1 authentication or the Simple Text password authentication (details in RFC 2328).

The **no** variant of this command removes the authentication specification for an area.

**Syntax** `area <area-id> authentication [message-digest]`  
`no area <area-id> authentication`

Parameter	Description
<code>&lt;area-id&gt;</code>	The OSPF area that you are enabling authentication for. This can be entered in either dotted decimal format or normal decimal format.
<code>&lt;ip-addr&gt;</code>	OSPF Area ID expressed in IPv4 address, entered in the form A.B.C.D.
<code>&lt;0-4294967295&gt;</code>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area OSPF Area ID.
<code>message-digest</code>	Enables MD5 authentication in the OSPF area.

**Default** By default, no authentication occurs.

**Mode** Router Configuration

**Usage** All OSPF packets transmitted in this **area** must have the same password in their OSPF header. This ensures that only routers that have the correct password may join the routing domain.

Give all routers that are to communicate with each other through OSPF the same authentication password.

Use the [ip ospf authentication-key](#) command to specify a Simple Text password. Use the [ip ospf message-digest-key](#) command to specify MD5 password.

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 authentication
```

**Related Commands** [ip ospf authentication](#)  
[ip ospf message-digest-key](#)

# area filter-list

**Overview** This command configures filters to advertise summary routes on Area Border Routers (ABR).

This command is used to suppress particular intra-area routes from/to an area to/from the other areas. You can use this command in conjunction with either the access-list or the prefix-list command.

The **no** variant of this command removes the filter configuration.

**Syntax**

```
area <area-id> filter-list access <access-list> {in|out}
area <area-id> filter-list prefix <prefix-list> {in|out}
no area <area-id> filter-list access <access-list> {in|out}
no area <area-id> filter-list prefix <prefix-list> {in|out}
```

Parameter	Description
<area-id>	The OSPF area that you are configuring the filter for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.
<ip-addr>	OSPF Area ID expressed in IPv4 address format A.B.C.D.
<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.
access	Use access-list to filter summary.
<access-list>	Name of an access-list.
prefix	Use prefix-list to filter summary.
<prefix-list>	Name of a prefix-list.
in	Filter routes from the other areas to this area.
out	Filter routes from this area to the other areas.

**Mode** Router Configuration

**Example** To configure filters to advertise summary routes, use the following commands:

```
awplus# configure terminal
awplus(config)# access-list 1 deny 172.22.0.0
awplus(config)# router ospf 100
awplus(config-router)# area 1 filter-list access 1 in
```

## area nssa

**Overview** This command sets an area as a Not-So-Stubby-Area (NSSA). By default, no NSSA area is defined.

Use this command to simplify administration if you are connecting a central site using OSPF to a remote site that is using a different routing protocol. You can extend OSPF to cover the remote connection by defining the area between the central router and the remote router as an NSSA.

There are no external routes in an OSPF stub area, so you cannot redistribute from another protocol into a stub area. A NSSA allows external routes to be flooded within the area. These routes are then leaked into other areas. Although, the external routes from other areas still do not enter the NSSA. You can either configure an area to be a stub area or an NSSA, not both.

The **no** variant of this command removes this designation.

**Syntax**

```
area <area-id> nssa [default-information-originate <metric> |
no-redistribution | no-summary | translator-role <role> ]
no area <area-id> nssa [default-information-originate |
no-redistribution | no-summary | translator-role ]
```

Parameter	Description				
<area-id>	The OSPF area that you are configuring as an NSSA. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.  <table border="1"> <tr> <td>&lt;ip-addr&gt;</td> <td>OSPF Area ID expressed in IPv4 address format A.B.C.D.</td> </tr> <tr> <td>&lt;0-4294967295&gt;</td> <td>OSPF Area ID expressed as a decimal number within the range shown.</td> </tr> </table> For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	<ip-addr>	OSPF Area ID expressed in IPv4 address format A.B.C.D.	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
<ip-addr>	OSPF Area ID expressed in IPv4 address format A.B.C.D.				
<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.				
default-information-originate	Originate Type-7 default LSA into NSSA.				
<metric>	The external or internal metric. Specify the following:  <table border="1"> <tr> <td>metric&lt;0-16777214&gt;</td> <td>The metric value.</td> </tr> <tr> <td>metric-type&lt;1-2&gt;</td> <td>External metric type.</td> </tr> </table>	metric<0-16777214>	The metric value.	metric-type<1-2>	External metric type.
metric<0-16777214>	The metric value.				
metric-type<1-2>	External metric type.				
no-redistribution	Do not redistribute external route into NSSA.				
no-summary	Do not inject inter-area route into NSSA.				
translator-role	Specify NSSA-ABR translator-role.				

Parameter	Description
<code>&lt;role&gt;</code>	The role type. Specify one of the following keywords:
<code>always</code>	Router always translate NSSA-LSA to Type-5 LSA.
<code>candidate</code>	Router may translate NSSA-LSA to Type-5 LSA if it is elected.
<code>never</code>	Router never translate NSSA-LSA.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 0.0.0.51 nssa
awplus(config-router)# area 3 nssa translator-role candidate
no-redistribution default-information-originate metric 34
metric-type 2
```

**Related Commands** [area default-cost](#)

# area range

**Overview** Use this command to summarize OSPF routes at an area boundary, configuring an IPv4 address range which consolidates OSPF routes. By default, this feature is not enabled.

A summary route created by this command is then advertised to other areas by the Area Border Routers (ABRs). In this way, routing information is condensed at area boundaries and outside the area so that routes are exchanged between areas in an efficient manner.

If the network numbers in an area are arranged into sets of contiguous routes, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

The **no** variant of this command disables this function and restores default behavior.

**Syntax** `area <area-id> range <ip-addr/prefix-length> [advertise|not-advertise]`  
`no area <area-id> range <ip-addr/prefix-length>`

Parameter	Description
<code>&lt;area-id&gt;</code>	The OSPF area that you summarizing the routes for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.
<code>&lt;ip-addr&gt;</code>	OSPF Area ID expressed in IPv4 address format A.B.C.D.
<code>&lt;0-4294967295&gt;</code>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.
<code>&lt;ip-addr/prefix-length&gt;</code>	The area range prefix and length.
<code>advertise</code>	Advertise this range as a summary route into other areas.
<code>not-advertise</code>	Does not advertise this range.

**Default** The area range is not configured by default. The area range is advertised if it is configured.

**Mode** Router Configuration

**Usage** You can configure multiple ranges on a single area with multiple instances of this command, so OSPF summarizes addresses for different sets of IPv4 address ranges.

Ensure OSPF IPv4 routes exist in the area range for advertisement before using this command.

**Example** awplus# configure terminal  
awplus(config)# router ospf 100  
awplus(config-router)# area 1 range 192.16.0.0/16  
awplus(config-router)# area 1 range 203.18.0.0/16

# area stub

**Overview** This command defines an OSPF area as a stub area. By default, no stub area is defined.

Use this command when routers in the area do not require learning about summary LSAs from other areas. You can define the area as a totally stubby area by configuring the Area Border Router of that area using the **area stub no-summary** command.

There are two stub area router configuration commands: the **area stub** and **area default-cost** commands. In all routers attached to the stub area, configure the area by using the **area stub** command. For an area border router (ABR) attached to the stub area, also use the **area default-cost** command.

The **no** variant of this command removes this definition.

**Syntax** `area <area-id> stub [no-summary]`  
`no area <area-id> stub [no-summary]`

Parameter	Description
<code>&lt;area-id&gt;</code>	The OSPF area that you are configuring as a stub area. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.
<code>&lt;ip-addr&gt;</code>	OSPF Area ID expressed in IPv4 address in the format A.B.C.D.
<code>&lt;0-4294967295&gt;</code>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.
<code>no-summary</code>	Stops an ABR from sending summary link advertisements into the stub area.

**Mode** Router Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# router ospf 100`  
`awplus(config-router)# area 1 stub`

**Related Commands** [area default-cost](#)

# area virtual-link

**Overview** This command configures a link between two backbone areas that are physically separated through other non-backbone areas.

In OSPF, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection.

The **no** variant of this command removes the virtual link.

**Syntax**

```

area <area-id> virtual-link <ip-addr> [<auth-key>|<msg-key>]
no area <area-id> virtual-link <ip-addr> [<auth-key>|<msg-key>]
area <area-id> virtual-link <ip-addr> authentication
[message-digest|null] [<auth-key>|<msg-key>]
no area <area-id> virtual-link <ip-addr> authentication
[message-digest|null] [<auth-key>|<msg-key>]
area <area-id> virtual-link <ip-addr> [authentication]
[dead-interval <1-65535>] [hello-interval <1-65535>]
[retransmit-interval <1-3600>] [transmit-delay <1-3600>]
no area <area-id> virtual-link <ip-addr> [authentication]
[dead-interval] [hello-interval] [retransmit-interval]
[transmit-delay]

```

Parameter	Description
<area-id>	The area ID of the transit area that the virtual link passes through. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.
<ip-addr>	OSPF Area ID expressed in IPv4 address format A.B.C.D.
<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.
<ip-address>	The OSPF router ID of the virtual link neighbor.
<auth-key>	Specifies the password used for this virtual link. Use the format: <b>authentication-key</b> <pswd-short>
<pswd-short>	An 8 character password.
<msg-key>	Specifies a message digest key using the MD5 encryption algorithm. Use the following format: <b>message-digest-key</b> <1-255> md5 <pswd-long>
<1-255>	The key ID.
<pswd-long>	Authentication password of 16 characters.
authentication	Enables authentication on this virtual link.

Parameter	Description
message-digest	Use message-digest authentication.
null	Use null authentication to override password or message digest.
dead-interval	If no packets are received from a particular neighbor for dead-interval seconds, the router considers that neighboring router as being off-line. Default: 40 seconds
	<1-65535> The number of seconds in the interval.
hello-interval	The interval the router waits before it sends a hello packet. Default: 10 seconds
	<1-65535> The number of seconds in the interval.
retransmit-interval	The interval the router waits before it retransmits a packet. Default: 5 seconds
	<1-3600> The number of seconds in the interval.
transmit-delay	The interval the router waits before it transmits a packet. Default: 1 seconds
	<1-3600> The number of seconds in the interval.

**Mode** Router Configuration

**Usage** You can configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these two routers, joined by a virtual link, as if they were connected by an unnumbered point-to-point network. To configure a virtual link, you require:

- The transit area ID, i.e. the area ID of the non backbone area that the two backbone routers are both connected to.
- The corresponding virtual link neighbor's router ID. To see the router ID use the [show ip ospf](#) command.

Configure the **hello-interval** to be the same for all routers attached to a common network. A short **hello-interval** results in the router detecting topological changes faster but also an increase in the routing traffic.

The **retransmit-interval** is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The **transmit-delay** is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet, are incremented by this amount. Set the **transmit-delay** to be greater than zero. Also, take into account the transmission and propagation delays for the interface.

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 virtual-link 10.10.11.50 hello 5
dead 10
```

**Related  
Commands**    area authentication  
                  show ip ospf  
                  show ip ospf virtual-links

# auto-cost reference bandwidth

**Overview** This command controls how OSPF calculates default metrics for the interface. Use the **no** variant of this command to assign cost based only on the interface bandwidth.

**Syntax** `auto-cost reference-bandwidth <1-4294967>`  
`no auto-cost reference-bandwidth`

Parameter	Description
<code>&lt;1-4294967&gt;</code>	The reference bandwidth in terms of Mbits per second (Mbps).

**Default** 1000 Mbps

**Usage** By default, OSPF calculates the OSPF metric for an interface by dividing the reference bandwidth by the interface bandwidth. The default for the reference bandwidth is 1000 Mbps. As a result, if this default is used, there is very little difference between the metrics applied to interfaces of increasing bandwidth beyond 1000 Mbps.

The auto-cost command is used to alter this reference bandwidth in order to give a real difference between the metrics of high bandwidth links of differing bandwidths. In a network that has multiple links with high bandwidths, specify a larger reference bandwidth value to differentiate the costs on those links.

Cost is calculated by dividing the reference bandwidth (Mbps) by the layer 3 interface (Switched Virtual Interface (SVI), Loopback or Ethernet interface) bandwidth. Interface bandwidth may be altered by using the [bandwidth](#) command as the SVI does not auto detect the bandwidth based on the speed of associated switch ports.

When the reference bandwidth calculation results in a cost integer greater than 1 but contains a fractional value (value after the decimal point), the result rounds down to the nearest integer. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 7 Mbps.

Calculation =  $1000/7$

Calculation result = 142.85 (integer of 142, fractional value of 0.85)

Result after rounding down to the nearest integer = 142 (Interface cost is 142)

When the reference bandwidth calculation results in a cost less than 1, it is rounded up to the nearest integer which is 1. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 10000 Mbps.

Calculation =  $1000/10000$

Calculation result = 0.1

Result after rounding up to the nearest integer = 1 (Interface cost is 1)

The auto-cost reference bandwidth value should be consistent across all OSPF routers in the OSPF process.

Note that using the [ip ospf cost](#) command on a layer 3 interface will override the cost calculated by this command.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# auto-cost reference-bandwidth 1000
```

**Related  
Commands** [ip ospf cost](#)

# bandwidth

**Overview** Use this command to specify the maximum bandwidth to be used for each VLAN interface. The bandwidth value is in bits per second. OSPF uses this to calculate metrics for the VLAN interface.

The **no** variant of this command removes any applied bandwidth value and replaces it with a value equal to the lowest port speed within that VLAN.

**Syntax** `bandwidth <bandwidth-setting>`  
`no bandwidth`

Parameter	Description
<code>&lt;bandwidth-setting&gt;</code>	Sets the bandwidth for the interface. Enter a value in the range 1 to 10000000000 bits per second. Note that to avoid entering many zeros, you can add k, m, or g to internally add 3, 6 or 9 zeros to the number entered. For example entering 1k is the same as entering 1000.

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the bandwidth on VLAN2 to be 1 Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# bandwidth 1000000
```

Or

```
awplus(config-if)# bandwidth 1m
```

**Related Commands** `show running-config access-list`  
`show interface`

# capability opaque

**Overview** This command enables opaque-LSAs. Opaque-LSAs are Type 9, 10 and 11 LSAs that deliver information used by external applications.

Use the **no** variant of this command to disable opaque-LSAs.

**Syntax** `capability opaque`  
`no capability opaque`

**Default** By default, opaque-LSAs are enabled.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no capability opaque
```

# capability restart

**Overview** This command enables OSPF Graceful Restart or restart signaling features. By default, this is enabled.

Use the **no** variant of this command to disable OSPF Graceful Restart and restart signaling features.

**Syntax** `capability restart [graceful|signaling]`  
`no capability restart`

Parameter	Description
<code>graceful</code>	Enable graceful OSPF restart.
<code>signaling</code>	Enable OSPF restart signaling.

**Default** Graceful restart

**Mode** Router Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# router ospf 100`  
`awplus(config-router)# capability restart graceful`

# clear ip ospf process

**Overview** This command clears and restarts the OSPF routing process. Specify the Process ID to clear one particular OSPF process. When no Process ID is specified, this command clears all running OSPF processes.

**Syntax** `clear ip ospf [<0-65535>] process`

Parameter	Description
<0-65535>	The Routing Process ID.

**Mode** Privileged Exec

**Example** `awplus# clear ip ospf process`

# compatible rfc1583

**Overview** This command changes the method used to calculate summary route to the that specified in RFC 1583. By default, OSPF uses the method specified in RFC 2328.

RFC 1583 specifies a method for calculating the metric for summary routes based on the minimum metric of the component paths available. RFC 2328 specifies a method for calculating metrics based on maximum cost.

It is possible that some ABRs in an area might conform to RFC 1583 and others support RFC 2328, which could lead to incompatibility in their interoperation. This command addresses this issue by allowing you to selectively disable compatibility with RFC 2328.

Use the **no** variant of this command to disable RFC 1583 compatibility.

**Syntax** compatible rfc1583  
no compatible rfc1583

**Mode** Router Configuration

**Example** awplus# configure terminal  
awplus(config)# router ospf 100  
awplus(config-router)# compatible rfc1583

# debug ospf events

**Overview** This command enables OSPF debugging for OSPF event troubleshooting.

To enable all debugging options, specify **debug ospf event** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF debugging. Use this command without parameters to disable all the options.

**Syntax**

```
debug ospf events [abr] [asbr] [lsa] [nssa] [os] [router] [vlink]
no debug ospf events [abr] [asbr] [lsa] [nssa] [os] [router] [vlink]
```

Parameter	Description
abr	Shows ABR events.
asbr	Shows ASBR events.
lsa	Shows LSA events.
nssa	Shows NSSA events.
os	Shows OS interaction events.
router	Shows other router events.
vlink	Shows virtual link events.

**Mode** Privileged Exec and Global Configuration

**Example** awplus# debug ospf events asbr lsa

**Related Commands** [terminal monitor](#)  
[undebug ospf events](#)

# debug ospf ifsm

**Overview** This command specifies debugging options for OSPF Interface Finite State Machine (IFSM) troubleshooting.

To enable all debugging options, specify **debug ospf ifsm** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF IFSM debugging. Use this command without parameters to disable all the options.

**Syntax** `debug ospf ifsm [status] [events] [timers]`  
`no debug ospf ifsm [status] [events] [timers]`

Parameter	Description
events	Displays IFSM event information.
status	Displays IFSM status information.
timers	Displays IFSM timer information.

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# no debug ospf ifsm events status`  
`awplus# debug ospf ifsm status`  
`awplus# debug ospf ifsm timers`

**Related Commands** [terminal monitor](#)  
[undebug ospf ifsm](#)

# debug ospf lsa

**Overview** This command enables debugging options for OSPF Link State Advertisements (LSA) troubleshooting. This displays information related to internal operations of LSAs.

To enable all debugging options, specify **debug ospf lsa** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF LSA debugging. Use this command without parameters to disable all the options.

**Syntax**

```
debug ospf lsa [flooding] [generate] [install] [maxage] [refresh]
no debug ospf lsa [flooding] [generate] [install] [maxage] [refresh]
```

Parameter	Description
flooding	Displays LSA flooding.
generate	Displays LSA generation.
install	Show LSA installation.
maxage	Shows maximum age of the LSA in seconds.
refresh	Displays LSA refresh.

**Mode** Privileged Exec and Global Configuration

**Examples** awplus# undebug ospf lsa refresh

**Output** Figure 26-1: Example output from the **debug ospf lsa** command

```
2002/05/09 14:08:11 OSPF: LSA[10.10.10.10:10.10.10.70]: instance(0x8139cd0)
created with Link State Update
2002/05/09 14:08:11 OSPF: RECV[LS-Upd]: From 10.10.10.70 via vlan5:10.10.10.50
(10.10.10.10 -> 224.0.0.5)
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: Begin send queue
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: # of LSAs 1, destination 224.0.0.5
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: End send queue
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: To 224.0.0.5 via vlan5:10.10.10.50
```

**Related Commands** [terminal monitor](#)  
[undebug ospf lsa](#)

# debug ospf nfsm

**Overview** This command enables debugging options for OSPF Neighbor Finite State Machines (NFSMs).

To enable all debugging options, specify **debug ospf nfsm** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF NFSM debugging. Use this command without parameters to disable all the options.

**Syntax** `debug ospf nfsm [events] [status] [timers]`  
`no debug ospf nfsm [events] [status] [timers]`

Parameter	Description
events	Displays NFSM event information.
status	Displays NFSM status information.
timers	Displays NFSM timer information.

**Mode** Privileged Exec and Global Configuration

**Examples** `awplus# debug ospf nfsm events`  
`awplus# no debug ospf nfsm timers`  
`awplus# undebug ospf nfsm events`

**Related Commands** [terminal monitor](#)  
[undebug ospf nfsm](#)

# debug ospf nsm

**Overview** This command enables debugging options for the OSPF Network Service Module. To enable both debugging options, specify **debug ospf nsm** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF NSM debugging. Use this command without parameters to disable both options.

**Syntax** `debug ospf nsm [interface] [redistribute]`  
`no debug ospf nsm [interface] [redistribute]`

Parameter	Description
interface	Specify NSM interface information.
redistribute	Specify NSM redistribute information.

**Mode** Privileged Exec and Global Configuration

**Examples** `awplus# debug ospf nsm interface`  
`awplus# no debug ospf nsm redistribute`  
`awplus# undebug ospf nsm interface`

**Related Commands** [terminal monitor](#)  
[undebug ospf nsm](#)

# debug ospf packet

**Overview** This command enables debugging options for OSPF packets.

To enable all debugging options, specify **debug ospf packet** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF packet debugging. Use this command without parameters to disable all options.

**Syntax** `debug ospf packet [dd] [detail] [hello] [ls-ack] [ls-request] [ls-update] [recv] [send]`  
`no debug ospf packet [dd] [detail] [hello] [ls-ack] [ls-request] [ls-update] [recv] [send]`

Parameter	Description
dd	Specifies debugging for OSPF database descriptions.
detail	Sets the debug option to detailed information.
hello	Specifies debugging for OSPF hello packets.
ls-ack	Specifies debugging for OSPF link state acknowledgments.
ls-request	Specifies debugging for OSPF link state requests.
ls-update	Specifies debugging for OSPF link state updates.
recv	Specifies the debug option set for received packets.
send	Specifies the debug option set for sent packets.

**Mode** Privileged Exec and Global Configuration

**Examples** `awplus# debug ospf packet detail`  
`awplus# debug ospf packet dd send detail`  
`awplus# no debug ospf packet ls-request recv detail`  
`awplus# undebug ospf packet ls-request recv detail`

**Related Commands** [terminal monitor](#)  
[undebug ospf packet](#)

# debug ospf route

**Overview** This command enables debugging of route calculation. Use this command without parameters to turn on all the options.

To enable all debugging options, specify **debug ospf route** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF route debugging. Use this command without parameters to disable all options.

**Syntax** `debug ospf route [ase] [ia] [install] [spf]`  
`no debug ospf route [ase] [ia] [install] [spf]`

Parameter	Description
ia	Specifies the debugging of Inter-Area route calculation.
ase	Specifies the debugging of external route calculation.
install	Specifies the debugging of route installation.
spf	Specifies the debugging of SPF calculation.

**Mode** Privileged Exec and Global Configuration

**Examples** `awplus# debug ospf route`  
`awplus# no debug ospf route ia`  
`awplus# debug ospf route install`  
`awplus# undebug ospf route install`

**Related Commands** [terminal monitor](#)  
[undebug ospf route](#)

# default-information originate

**Overview** This command creates a default external route into an OSPF routing domain.

When you use the **default-information originate** command to redistribute routes into an OSPF routing domain, then the system acts like an Autonomous System Boundary Router (ASBR). By default, an ASBR does not generate a default route into the OSPF routing domain.

When using this command, also specify the **route-map** *<route-map>* option to avoid a dependency on the default network in the routing table.

The **metric-type** is an external link type associated with the default route advertised into the OSPF routing domain. The value of the external route could be either Type 1 or 2. The default is Type 2.

The **no** variant of this command disables this feature.

**Syntax**

```
default-information originate [always] [metric <metric>]
[metric-type <1-2>] [route-map <route-map>]

no default-information originate [always] [metric]
[metric-type] [route-map]
```

Parameter	Description
always	Used to advertise the default route regardless of whether there is a default route.
<metric>	The metric value used in creating the default route. Enter a value in the range 0 to 16777214. The default metric value is 10. The value used is specific to the protocol.
<1-2>	External metric type for default routes, either OSPF External Type 1 or Type 2 metrics. Enter the value 1 or 2.
route-map	Specifies to use a specific route-map.
<route-map>	The route-map name. It is a string comprised of any characters, numbers or symbols.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# default-information originate always
metric 23 metric-type 2 route-map myinfo
```

**Related Commands** [route-map](#)

# default-metric (OSPF)

**Overview** This command sets default metric values for the OSPF routing protocol. The **no** variant of this command returns OSPF to using built-in, automatic metric translations, as appropriate for each routing protocol.

**Syntax** `default-metric <1-16777214>`  
`no default-metric [<1-16777214>]`

Parameter	Description
<code>&lt;1-16777214&gt;</code>	Default metric value appropriate for the specified routing protocol.

**Mode** Router Configuration

**Usage** A default metric facilitates redistributing routes even with incompatible metrics. If the metrics do not convert, the default metric provides an alternative and enables the redistribution to continue. The effect of this command is that OSPF will use the same metric value for **all** redistributed routes. Use this command in conjunction with the [redistribute \(OSPF\)](#) command.

**Examples**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# default-metric 100
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no default-metric
```

**Related commands** [redistribute \(OSPF\)](#)

# distance (OSPF)

**Overview** This command sets the administrative distance for OSPF routes based on the route type. Your device uses this value to select between two or more routes to the same destination from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). See the [Route\\_Selection Feature Overview and Configuration Guide](#) for more information.

Use the command **distance ospf** to set the distance for an entire category of OSPF routes, rather than the specific routes that pass an access list.

Use the command **distance <1-255>**, with no other parameter, to set the same distance for all OSPF route types.

The **no** variant of this command sets the administrative distance for all OSPF routes to the default of 110.

**Syntax**

```
distance <1-255>  
distance ospf {external <1-255>|inter-area <1-255>|intra-area <1-255>}  
no distance {ospf|<1-255>}
```

Parameter	Description
<1-255>	Specify the Administrative Distance value for OSPF routes.
external	Sets the distance for routes from other routing domains, learned by redistribution. Specify an OSPF external distance in the range <1-255>.
inter-area	Sets the distance for all routes from one area to another area. Specify an OSPF inter-area distance in the range <1-255>.
intra-area	Sets the distance for all routes within an area. Specify an OSPF intra-area distance in the range <1-255>.

**Default** The default OSPF administrative distance is 110. The default Administrative Distance for each type of route (intra, inter, or external) is 110.

**Mode** Router Configuration

**Usage** The administrative distance rates the trustworthiness of a routing information source. The distance could be any integer from 0 to 255. A higher distance value indicates a lower trust rating. For example, an administrative distance of 255 indicates that the routing information source cannot be trusted and should be ignored.

Use this command to set the distance for an entire group of routes, rather than a specific route that passes an access list.

**Examples** To set the following administrative distances for route types in OSPF 100:

- 20 for inter-area routes

- 10 for intra-area routes
- 40 for external routes

use the commands:

```
awplus(config)# router ospf 100  
awplus(config-router)# distance ospf inter-area 20 intra-area  
10 external 40
```

To set the administrative distance for all routes in OSPF 100 back to the default of 110, use the commands:

```
awplus(config)# router ospf 100  
awplus(config-router)# no distance ospf
```

# distribute-list (OSPF)

**Overview** Use this command to apply filtering to the transfer of routing information between OSPF and the IP route table. You can apply filtering in either direction, from OSPF to the IP route table using an **in** distribute-list, or from the IP route table to OSPF using an **out** distribute-list.

The effect of an **in** filter is that some route information that OSPF has learned from LSA updates will not be installed into the IP route table. The effect of an **out** filter is that some route information that could be redistributed to OSPF will not be redistributed to OSPF. See the **Usage** section below for the distinction between the **in** and **out** distribute-lists.

The entities that are used to perform filtering are ACLs or route-maps, which match on certain attributes in the routes that are being transferred.

For information about ACLs and route maps, see the [ACL Feature Overview and Configuration Guide](#) and the [Routemaps Feature Overview and Configuration Guide](#).

The **no** variant of this command removes the configured distribute-list command entry.

**Syntax**

```
distribute-list {<access-list-name>|route-map
<route-map-name>} in

distribute-list <access-list-name> out
{bgp|connected|rip|static}

no distribute-list <access-list-name> in

no distribute-list <access-list-name> out
{bgp|connected|rip|static}
```

Parameter	Description
<access-list-name>	Specifies the name of the access list. The access list defines which networks are received and which are suppressed.
in	Indicates that this applies to incoming advertised routes.
out	Indicates that this applies to outgoing advertised routes.
<route-map-name>	The name of the route-map that the distribute-list applies. This defines which networks are installed in the IP route table and which networks are filtered from the IP route table.
bgp	Specify the redistribution of BGP routes.
connected	Specify the redistribution of connected routes.
rip	Specify the redistribution of RIP routes.
static	Specify the redistribution of static routes.

**Mode** Router Configuration

**Usage** There are **in** and **out** distribute-lists, which carry out different route filtering activities:

- The **in** distribute list is applied to the process of installing OSPF routes into the IP route table. The SPF calculation generate a set of routes calculated from the LSA database. By default, all of these routes become OSPF's candidate routes for inclusion into the IP route table.
- An **in** distribute-list can be used to control whether or not certain routes generated by the SPF calculation are included into the set of candidates for inclusion into the IP route table. Those routes that match **deny** entries in the distribute-list will not be considered for inclusion into the IP route table.
- The **out** distribute-list applies the process of redistributing non-OSPF routes into OSPF. If OSPF redistribution is configured, and an **out** distribute-list is also configured, then routes that match deny entries in the distribute-list will not be redistributed into OSPF.

**Examples** The following example shows the distribution of BGP routing updates into OSPF, based on the access list "myacl1" that is defined to permit network 172.10.0.0:

```
awplus# configure terminal
awplus(config)# access-list standard myacl1 permit
172.10.0.0/16
awplus(config)# router ospf 100
awplus(config-router)# distribute-list myacl1 out bgp
awplus(config-router)# redistribute bgp
```

The following example shows the installation of OSPF routes into the IP route table with route map "mymap1" applied, which will process routes that have been tagged 100:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# distribute-list route-map mymap1 in
```

Use the following commands to configure a route-map to specifically prevent OSPF from offering 192.168.1.0/24 as a candidate for inclusion into the IP route table:

```
awplus# configure terminal
awplus(config)# ip prefix-list 100 seq 5 permit 192.168.1.0/24
awplus(config)# route-map 100 deny 10
awplus(config-route-map)# match ip address prefix-list 100
awplus(config-route-map)# exit
awplus(config)# route-map 100 permit 20
awplus(config-router)# router ospf 1
awplus(config-router)# distribute-list route-map 100 in
```

**Related  
Commands** [match interface](#)  
[redistribute \(OSPF\)](#)  
[route-map](#)

# enable db-summary-opt

**Overview** This command enables OSPF database summary list optimization.  
The **no** variant of this command disables database summary list optimization.

**Syntax** `enable db-summary-opt`  
`no enable db-summary-opt`

**Default** The default setting is disabled.

**Mode** Router Configuration

**Usage** When this feature is enabled, the database exchange process is optimized by removing the LSA from the database summary list for the neighbor, if the LSA instance in the database summary list is the same as, or less recent than, the listed LSA in the database description packet received from the neighbor.

**Examples** To enable OSPF database summary list optimization, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf
awplus(config-router)# enable db-summary-opt
```

To disable OSPF database summary list optimization, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf
awplus(config-router)# no enable db-summary-opt
```

**Validation  
Commands** `show running-config`

# host area

**Overview** This command configures a stub host entry belonging to a particular area. You can use this command to advertise specific host routes in the router-LSA as stub link. Since stub host belongs to the specified router, specifying cost is optional.

The **no** variant of this command removes the host area configuration.

**Syntax** `host <ip-address> area <area-id> [cost <0-65535>]`  
`no host <ip-address> area <area-id> [cost <0-65535>]`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The IPv4 address of the host, in dotted decimal notation.
<code>&lt;area-id&gt;</code>	The OSPF area ID of the transit area that configuring the stub host entry for. Use one of the following formats: <ul style="list-style-type: none"><li>dotted decimal format, e.g. 0.0.1.2.</li><li>normal decimal format in the range &lt;0-4294967295&gt;, e.g. 258.</li></ul>
<code>cost &lt;0-65535&gt;</code>	The cost for the stub host entry.

**Default** By default, no host entry is configured.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# host 172.16.10.100 area 1
awplus(config-router)# host 172.16.10.101 area 2 cost 10
```

# ip ospf authentication

**Overview** This command sets the authentication method used when sending and receiving OSPF packets on the current VLAN interface. The default is to use no authentication. If no authentication method is specified in this command, then plain text authentication will be used.

The **no** variant of this command disables the authentication.

**Syntax** `ip ospf [<ip-address>] authentication [message-digest|null]`  
`no ip ospf [<ip-address>] authentication`

Parameter	Description
<ip-address>	The IP address of the interface.
message-digest	Use the message digest authentication.
null	Use no authentication. It overrides password or message-digest authentication of the interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Use the [ip ospf authentication](#) command to specify a Simple Text password. Use the [ip ospf message-digest-key](#) command to specify MD5 password.

**Example** In this example, VLAN interface `vlan2` is configured to have no authentication. This will override any text or MD5 authentication configured on this interface.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf authentication null
```

**Related Commands** [ip ospf authentication-key](#)  
[area authentication](#)  
[ip ospf message-digest-key](#)

# ip ospf authentication-key

**Overview** This command specifies an OSPF authentication password for the neighboring routers.

The **no** variant of this command removes the OSPF authentication password.

**Syntax** `ip ospf [<ip-address>] authentication-key <pswd-long>`  
`no ip ospf [<ip-address>] authentication-key`

Parameter	Description
<ip-address>	The IPv4 address of the interface, in dotted decimal notation.
<pswd-long>	Specifies the authentication password. The string by the end of line will be used.

**Default** By default, an authentication password is not specified.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command creates a password (key) that is inserted into the OSPF header when AlliedWare Plus™ software originates routing protocol packets. Assign a separate password to each network for different VLAN interfaces. All neighboring routers on the same network with the same password exchange OSPF routing data.

The key can be used only when authentication is enabled for an area. Use the **area authentication** command to enable authentication.

Simple password authentication allows a password to be configured for each area. Configure the routers in the same routing domain with the same password.

**Example** In the following example, an authentication key test is created on VLAN interface `vlan2` in area 0. Note that first authentication is enabled for area 0.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# network 10.10.10.0/24 area 0
awplus(config-router)# area 0 authentication
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ip ospf 3.3.3.3 authentication-key test
```

**Related Commands** [area authentication](#)  
[ip ospf authentication](#)

# ip ospf cost

**Overview** This command explicitly specifies the cost of the link-state metric in a router-LSA. The **no** variant of this command resets the VLAN interface cost to the default.

**Syntax** `ip ospf [<ip-address>] cost <1-65535>`  
`no ip ospf [<ip-address>] cost`

Parameter	Description
<ip-address>	The IPv4 address of the interface, in dotted decimal notation.
<1-65535>	The link-state metric.

**Default** By default there is no static value set and the OSPF cost is automatically calculated by using the [auto-cost reference bandwidth](#) command.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command explicitly sets a user specified cost of sending packets out the interface. Using this command overrides the cost value calculated automatically with the auto-cost reference bandwidth feature.

The interface cost indicates the overhead required to send packets across a certain VLAN interface. This cost is stated in the Router-LSA's link. Typically, the cost is inversely proportional to the bandwidth of an interface. By default, the cost of a VLAN interface is calculated according to the following formula:

$$\text{reference bandwidth} / \text{interface bandwidth}$$

To set the VLAN interface cost manually, use this command.

**Example** The following example shows setting ospf cost to 10 on VLAN interface `vlan25` for IP address 10.10.10.50

```
awplus# configure terminal
awplus(config)# interface vlan25
awplus(config-if)# ip ospf 10.10.10.50 cost 10
```

**Related Commands** [show ip ospf interface](#)  
[auto-cost reference bandwidth](#)

# ip ospf database-filter

**Overview** This command turns on the LSA database-filter for a particular VLAN interface. The **no** variant of this command turns off the LSA database-filter.

**Syntax** `ip ospf [<ip-address>] database-filter all out`  
`no ip ospf [<ip-address>] database-filter`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The IPv4 address of the interface, in dotted decimal notation.

**Default** By default, all outgoing LSAs are flooded to the interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage** OSPF floods new LSAs over all interfaces in an area, except the interface on which the LSA arrives. This redundancy ensures robust flooding. However, too much redundancy can waste bandwidth and might lead to excessive link and CPU usage in certain topologies, resulting in destabilizing the network. To avoid this, use the **ip ospf database-filter** command to block flooding of LSAs over specified interfaces.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan1`  
`awplus(config-if# ip ospf database-filter all out`

# ip ospf dead-interval

**Overview** This command sets the interval during which no hello packets are received and after which a neighbor is declared dead.

The dead-interval is the amount of time that OSPF waits to receive an OSPF hello packet from the neighbor before declaring the neighbor is down. This value is advertised in the router's hello packets. It must be a multiple of the hello-interval and be the same for all routers on a specific network.

The **no** variant of this command returns the interval to the default of 40 seconds. If you have configured this command specifying the IP address of the interface and want to remove the configuration, specify the IP address ( **no ip ospf**<ip-address> **dead-interval**).

**Syntax** ip ospf [<ip-address>] dead-interval <1-65535>  
no ip ospf [<ip-address>] dead-interval

Parameter	Description
<ip-address>	The IPv4 address of the interface, in dotted decimal notation.
<1-65545>	The interval in seconds. Default: 40

**Mode** Interface Configuration for a VLAN interface.

**Example** The following example shows configuring the dead-interval to 10 seconds on the VLAN interface vlan2.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf dead-interval 10
```

**Related Commands** [ip ospf hello-interval](#)  
[show ip ospf interface](#)

# ip ospf disable all

**Overview** This command completely disables OSPF packet processing on a VLAN interface. It overrides the [network area](#) command and disables the processing of packets on the specific interface.

Use the **no** variant of this command to restore OSPF packet processing on a selected interface.

**Syntax** `ip ospf disable all`  
`no ip ospf disable all`

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip ospf disable all`

# ip ospf hello-interval

**Overview** This command specifies the interval between hello packets.

The hello-interval is advertised in the hello packets. Configure the same hello-interval for all routers on a specific network. A shorter hello interval ensures faster detection of topological changes, but results in more routing traffic.

The **no** variant of this command returns the interval to the default of 10 seconds.

**Syntax** `ip ospf [<ip-address>] hello-interval <1-65535>`  
`no ip ospf [<ip-address>] hello-interval`

Parameter	Description
<ip-address>	The IP address of the interface, in dotted decimal notation.
<1-65535>	The interval in seconds. Default: 10

**Default** The default interval is 10 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Example** The following example shows setting the hello-interval to 3 seconds on VLAN interface vlan2.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf hello-interval 3
```

**Related Commands** [ip ospf dead-interval](#)  
[show ip ospf interface](#)

# ip ospf message-digest-key

**Overview** This command registers an MD5 key for OSPF MD5 authentication.

Message Digest Authentication is a cryptographic authentication. A key (password) and key-id are configured on each router. The router uses an algorithm based on the OSPF packet, the key, and the key-id to generate a message digest that gets appended to the packet.

The **no** variant of this command removes the MD5 key.

**Syntax**

```
ip ospf [<ip-address>] message-digest-key <key-id> md5  
<pswd-long>  
  
no ip ospf [<ip-address>] message-digest-key <key-id>
```

Parameter	Description
<ip-address>	The IPv4 address of the interface, in dotted decimal notation.
<key-id>	A key ID number specified as an integer between 1 and 255.
md5	Use the MD5 algorithm.
<pswd-long>	The OSPF password. This is a string of 1 to 16 characters including spaces.

**Default** By default, there is no MD5 key registered.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Use this command for uninterrupted transitions between passwords. It allows you to add a new key without having to delete the existing key. While multiple keys exist, all OSPF packets will be transmitted in duplicate; one copy of the packet will be transmitted for each of the current keys. This is helpful for administrators who want to change the OSPF password without disrupting communication. The system begins a rollover process until all the neighbors have adopted the new password. This allows neighboring routers to continue communication while the network administrator is updating them with a new password. The router will stop sending duplicate packets once it detects that all of its neighbors have adopted the new password.

Maintain only one password per interface, removing the old password whenever you add a new one. This will prevent the local system from continuing to communicate with the system that is using the old password. Removing the old password also reduces overhead during rollover. All neighboring routers on the same network must have the same password value to enable exchange of OSPF routing data.

**Examples** The following example shows OSPF authentication on the VLAN interface vlan5 when IP address has not been specified.

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip ospf authentication message-digest
awplus(config-if)# ip ospf message-digest-key 1 md5 yourpass
```

The following example shows configuring OSPF authentication on the VLAN interface vlan2 for the IP address 1.1.1.1. (If the interface has two IP addresses assigned-- 1.1.1.1 & 2.2.2.2, OSPF authentication will be enabled only for the IP address 1.1.1.1).

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf 1.1.1.1 authentication
message-digest
awplus(config-if)# ip ospf 1.1.1.1 message-digest-key 2 md5
yourpass
```

# ip ospf mtu

**Overview** This command sets the MTU size for OSPF. Whenever OSPF constructs packets, it uses the interface MTU size as Maximum IP packet size. This command forces OSPF to use the specified value, instead of the actual interface MTU size.

Use the **no** variant of this command to return the MTU size to the default.

**Syntax** `ip ospf mtu <576-65535>`  
`no ip ospf mtu`

**Default** By default, OSPF uses interface MTU derived from the interface.

**Mode** Interface Configuration for VLANs

**Usage** This command allows an administrator to configure the MTU size recognized by the OSPF protocol. It does not configure the MTU settings on the interface.

This command can be useful to ensure the OSPF neighbor relationship can fully establish via a network link, where the neighboring devices may have mismatched interface MTUs.

**Example** To change the OSPF MTU to 1446 on VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf mtu 1446
```

# ip ospf mtu-ignore

**Overview** Use this command to configure OSPF so that OSPF does not check the MTU size during DD (Database Description) exchange.

Use the **no** variant of this command to make sure that OSPF checks the MTU size during DD exchange.

**Syntax** `ip ospf [<ip-address>] mtu-ignore`  
`no ip ospf [<ip-address>] mtu-ignore`

Parameter	Description
<code>&lt;ip-address&gt;</code>	IPv4 address of the interface, in dotted decimal notation.

**Mode** Interface Configuration for a VLAN interface.

**Usage** By default, during the DD exchange process, OSPF checks the MTU size described in the DD packets received from the neighbor. If the MTU size does not match the interface MTU, the neighbor adjacency is not established. Using this command makes OSPF ignore this check and allows establishing of adjacency regardless of MTU size in the DD packet.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip ospf mtu-ignore`

# ip ospf network

**Overview** This command configures the OSPF network type to a type different from the default for the particular VLAN interface.

The **no** variant of this command returns the network type to the default for the particular VLAN interface.

**Syntax** `ip ospf network [broadcast|non-broadcast|point-to-point|point-to-multipoint]`  
`no ip ospf network`

Parameter	Description
<code>broadcast</code>	Sets the network type to broadcast.
<code>non-broadcast</code>	Sets the network type to NBMA.
<code>point-to-multipoint</code>	Sets the network type to point-to-multipoint.
<code>point-to-point</code>	Sets the network type to point-to-point.

**Default** The default is the `broadcast` OSPF network type for a VLAN interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command forces the interface network type to the specified type. Depending on the network type, OSPF changes the behavior of the packet transmission and the link description in LSAs.

**Example** The following example shows setting the network type to `point-to-point` on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf network point-to-point
```

# ip ospf priority

**Overview** This command sets the router priority, which is a parameter used in the election of the designated router for the network.

The **no** variant of this command returns the router priority to the default of 1.

**Syntax** `ip ospf [<ip-address>] priority <priority>`  
`no ip ospf [<ip-address>] priority`

Parameter	Description
<ip-address>	The IP address of the interface.
<priority>	<0-255> Specifies the Router Priority of the interface.

**Default** The router priority for an interface is set to 1 by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Set the priority to help determine the OSPF Designated Router (DR) for a network. If two routers attempt to become the DR, the router with the higher router priority becomes the DR. If the router priority is the same for two routers, the router with the higher router ID takes precedence.

Only routers with nonzero router priority values are eligible to become the designated or backup designated router.

Configure router priority for multi-access networks only and not for point-to-point networks.

**Example** The following example shows setting the OSPF priority value to 3 on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf priority 3
```

**Related Commands** [ip ospf network](#)

# ip ospf resync-timeout

**Overview** Use this command to set the interval after which adjacency is reset if out-of-band resynchronization has not occurred. The interval period starts from the time a restart signal is received from a neighbor.

Use the **no** variant of this command to return to the default.

**Syntax** `ip ospf [<ip-address>] resync-timeout <1-65535>`  
`no ip ospf [<ip-address>] resync-timeout`

Parameter	Description
<ip-address>	The IP address of the interface.
<1-65535>	Specifies the resynchronization timeout value of the interface in seconds.

**Mode** Interface Configuration for a VLAN interface.

**Example** The following example shows setting the OSPF resynchronization timeout value to 65 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf resync-timeout 65
```

# ip ospf retransmit-interval

**Overview** Use this command to specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface.

Use the **no** variant of this command to return to the default of 5 seconds.

**Syntax** `ip ospf [<ip-address>] retransmit-interval <1-65535>`  
`no ip ospf [<ip-address>] retransmit-interval`

Parameter	Description
<ip-address>	The IP address of the interface.
<1-65535>	Specifies the interval in seconds.

**Default** The default interval is 5 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage** After sending an LSA to a neighbor, the router keeps the LSA until it receives an acknowledgment. In case the router does not receive an acknowledgment during the set time (the retransmit interval value) it retransmits the LSA. Set the retransmission interval value conservatively to avoid needless retransmission. The interval should be greater than the expected round-trip delay between two routers.

**Example** The following example shows setting the `ospf retransmit interval` to 6 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf retransmit-interval 6
```

# ip ospf transmit-delay

**Overview** Use this command to set the estimated time it takes to transmit a link-state-update packet on the VLAN interface.

Use the **no** variant of this command to return to the default of 1 second.

**Syntax** `ip ospf [<ip-address>] transmit-delay <1-65535>`  
`no ip ospf [<ip-address>] transmit-delay`

Parameter	Description
<ip-address>	The IP address of the VLAN interface.
<1-65535>	Specifies the time, in seconds, to transmit a link-state update.

**Default** The default interval is 1 second.

**Mode** Interface Configuration for a VLAN interface.

**Usage** The transmit delay value adds a specified time to the age field of an update. If the delay is not added, the time in which the LSA transmits over the link is not considered. This command is especially useful for low speed links. Add transmission and propagation delays when setting the transmit delay value.

**Example** The following example shows setting the OSPF transmit delay time to 3 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf transmit-delay 3
```

# max-concurrent-dd

**Overview** Use this command to set the limit for the number of Database Descriptors (DD) that can be processed concurrently.

Use the **no** variant of this command to reset the limit for the number of Database Descriptors (DD) that can be processed concurrently.

**Syntax** `max-concurrent-dd <1-65535>`  
`no max-concurrent-dd`

Parameter	Description
<1-65535>	Specify the number of DD processes.

**Mode** Router Configuration

**Usage** This command is useful when a router's performance is affected from simultaneously bringing up several OSPF adjacencies. This command limits the maximum number of DD exchanges that can occur concurrently per OSPF instance, thus allowing for all of the adjacencies to come up.

**Example** The following example sets the max-concurrent-dd value to 4, so that only 4 DD exchanges will be processed at a time.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# max-concurrent-dd 4
```

# maximum-area

**Overview** Use this command to set the maximum number of OSPF areas.  
Use the **no** variant of this command to set the maximum number of OSPF areas to the default.

**Syntax** `maximum-area <1-4294967294>`  
`no maximum-area`

Parameter	Description
<code>&lt;1-4294967294&gt;</code>	Specify the maximum number of OSPF areas.

**Default** The default for the maximum number of OSPF areas is 4294967294.

**Mode** Router Configuration

**Usage** Use this command in router OSPF mode to specify the maximum number of OSPF areas.

**Examples** The following example sets the maximum number of OSPF areas to 2:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# maximum-area 2
```

The following example removes the maximum number of OSPF areas and resets to default:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no maximum-area
```

# neighbor (OSPF)

**Overview** Use this command to inform the router of other neighboring routers that are connected to the same NBMA network.

Use the **no** variant of this command to remove a configuration.

**Syntax** `neighbor <ip-address> [<cost>]{<priority>|<poll-interval>}`  
`no neighbor <ip-address> [<cost>]{<priority>|<poll-interval>}`

Parameter	Description
<code>&lt;ip-address&gt;</code>	Specifies the interface IP address of the neighbor.
<code>&lt;priority&gt;</code>	<code>priority &lt;0-255&gt;</code> Specifies the router priority value of the non-broadcast neighbor associated with the specified IP address. The default is 0. This keyword does not apply to point-to-multipoint interfaces.
<code>&lt;poll-interval&gt;</code>	<code>poll-interval &lt;1-2147483647&gt;</code> Dead neighbor polling interval in seconds. It is recommended to set this value much higher than the hello interval. The default is 120 seconds.
<code>&lt;cost&gt;</code>	<code>cost &lt;1-65535&gt;</code> Specifies the link-state metric to this neighbor.

**Mode** Router Configuration

**Usage** To configure a neighbor on an NBMA network manually, use the `neighbor` command and include one neighbor entry for each known nonbroadcast network neighbor. The IP address used in this command is the neighbor's primary IP address on the interface where that neighbor connects to the NBMA network.

The poll interval is the reduced rate at which routers continue to send hello packets, when a neighboring router has become inactive. Set the poll interval to be much larger than hello interval.

**Examples** This example shows a neighbor configured with a priority value, poll interval time, and cost.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# neighbor 1.2.3.4 priority 1
poll-interval 90
awplus(config-router)# neighbor 1.2.3.4 cost 15
```

# network area

**Overview** Use this command to enable OSPF routing with a specified Area ID on any interfaces with IP addresses that match the specified network address.

Use the **no** variant of this command to disable OSPF routing on the interfaces.

**Syntax** `network <network-address> area <area-id>`  
`no network <network-address> area <area-id>`

Parameter	Description
<network-address>	{<ip-network/m> <ip-addr> <reverse-mask>}
<ip-network/m>	IP address of the network, entered in the form A.B.C.D/M. Dotted decimal notation followed by a forward slash, and then the subnet mask length.
<ip-addr> <reverse-mask>	IPv4 network address, entered in the form A.B.C.D, followed by the mask. Enter the mask as a wildcard, or reverse, mask (e.g. 0.0.0.255). Note that the device displays the mask as a subnet mask in the running configuration.
<area-id>	{<ip-addr> <0-4294967295>}
<ip-addr>	OSPF Area ID in IPv4 address format, in the form A.B.C.D.
<0-4294967295>	OSPF Area ID as 4 octets unsigned integer value.

**Default** No **network area** is configured by default.

**Mode** Router Configuration

**Usage** OSPF routing can be enabled per IPv4 subnet. The network address can be defined using either the prefix length or a wild card mask. A wild card mask is comprised of consecutive 0's as network bits and consecutive 1's as host bits.

**Examples** The following commands show the use of the **network area** command with OSPF multiple instance support disabled:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# network 10.0.0.0/8 area 3
awplus(config-router)# network 10.0.0.0/8 area 1.1.1.1
```

The following commands disable OSPF routing with Area ID 3 on all interfaces:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no network 10.0.0.0/8 area3
```

# ospf abr-type

**Overview** Use this command to set an OSPF Area Border Router (ABR) type.

Use the **no** variant of this command to revert the ABR type to the default setting (Cisco).

**Syntax** `ospf abr-type {cisco|ibm|standard}`  
`no ospf abr-type {cisco|ibm|standard}`

Parameter	Description
cisco	Specifies an alternative ABR using Cisco implementation (RFC 3509). This is the default ABR type.
ibm	Specifies an alternative ABR using IBM implementation (RFC 3509).
standard	Specifies a standard behavior ABR (RFC 2328).

**Default** ABR type `Cisco`

**Mode** Router Configuration

**Usage** Specifying the ABR type allows better interoperability between different implementations. This command is especially useful in a multi-vendor environment. The different ABR types are:

- Cisco ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached to it.

**Example** `awplus# configure terminal`  
`awplus(config)# router ospf 100`  
`awplus(config-router)# ospf abr-type ibm`

# ospf restart grace-period

**Overview** Use this command to configure the grace-period for restarting OSPF routing. Use the **no** variant of this command to revert to the default grace-period.

**Syntax** ospf restart grace-period <1-1800>  
no ospf restart grace-period

Parameter	Description
<1-1800>	Specifies the grace period in seconds.

**Default** In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

**Mode** Global Configuration

**Usage** Use this command to enable the OSPF Graceful Restart feature and set the restart grace-period. Changes from the default restart grace-period are displayed in the running- config. The restart grace-period is not displayed in the running-config if it has been reset to the default using the **no** variant of this command.

When a master failover happens on a VCStack, the grace-period will be the longer of the default value (180 seconds) and the configured value from this command. Therefore, the configured grace-period value will only be used in a master failover if it is longer than 180 seconds.

**Example** To set the OSPF restart grace-period to 250 seconds, use the commands:

```
awplus# configure terminal  
awplus(config)# ospf restart grace-period 250
```

To reset the OSPF restart grace-period to the default (180 seconds), use the commands:

```
awplus# configure terminal  
awplus(config)# no ospf restart grace-period
```

**Validation Commands** [show running-config](#)

**Related Commands** [ospf restart helper](#)  
[restart ospf graceful](#)

# ospf restart helper

**Overview** Use this command to configure the **helper** behavior for the OSPF Graceful Restart feature.

Use the **no** variant of this command to revert to the default grace-period.

**Syntax**

```
ospf restart helper {max-grace-period  
<grace-period>|only-reload|only-upgrade}  
ospf restart helper {never router-id <router-id>}  
no ospf restart helper [max-grace-period]
```

Parameter	Description
max-grace-period	Specify help if received grace-period is less than a specified value.
<grace-period>	Maximum grace period accepted in seconds in range <1-1800>.
never	Specify the local policy to never to act as a helper for this feature.
only-reload	Specify help only on software reloads not software upgrades.
only-upgrade	Specify help only on software upgrades not software reloads.
router-id	Enter the router-id keyword to specify the OSPF Router ID that is never to act as a helper for the OSPF Graceful Restart feature.
<router-id>	<A.B.C.D> Specify the OSPF Router ID in dotted decimal format A.B.C.D

**Default** In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

**Mode** Global Configuration

**Usage** The **ospf restart helper** command requires at least one parameter, but you may use more than one in the same command (excluding parameter **never**).

The **no** version of this command turns off the OSPF restart helper, while the **no ospf restart helper max-grace-period** command resets the max-grace-period, rather than the helper policy itself.

**Example**

```
awplus# configure terminal  
awplus(config)# ospf restart helper only-reload  
awplus# configure terminal  
awplus(config)# ospf restart helper never router-id 10.10.10.1  
awplus# configure terminal  
awplus(config)# no ospf restart helper max-grace-period
```

**Related  
Commands** ospf restart grace-period  
restart ospf graceful

# ospf router-id

**Overview** Use this command to specify a router ID for the OSPF process.  
Use the **no** variant of this command to disable this function.

**Syntax** ospf router-id *<ip-address>*  
no ospf router-id

Parameter	Description
<i>&lt;ip-address&gt;</i>	Specifies the router ID in IPv4 address format.

**Mode** Router Configuration

**Usage** Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id takes effect at the next reload or when you restart OSPF manually.

**Example** The following example shows a specified router ID 2.3.4.5.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# ospf router-id 2.3.4.5
```

**Related Commands** [show ip ospf](#)

# overflow database

**Overview** Use this command to limit the maximum number of Link State Advertisements (LSAs) that can be supported by the current OSPF instance.

Use the **no** variant of this command to have no limit on the maximum number of LSAs.

**Syntax** `overflow database <0-4294967294> {hard|soft}`  
`no overflow database`

Parameter	Description
<0-4294967294>	The maximum number of LSAs.
hard	Shutdown occurs if the number of LSAs exceeds the specified value.
soft	Warning message appears if the number of LSAs exceeds the specified value.

**Mode** Router Configuration

**Usage** Use **hard** with this command if a shutdown is required if the number of LSAs exceeds the specified number. Use **soft** with this command if a shutdown is not required, but a warning message is required, if the number of LSAs exceeds the specified number.

**Example** The following example shows setting the database overflow to 500, and a shutdown to occur, if the number of LSAs exceeds 500.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# overflow database 500 hard
```

# overflow database external

**Overview** Use this command to configure the size of the external database and the time the router waits before it tries to exit the overflow state.

Use the **no** variant of this command to revert to default.

**Syntax** `overflow database external <max-lsas> <recover-time>`  
`no overflow database external`

Parameter	Description
<code>&lt;max-lsas&gt;</code>	<code>&lt;0-2147483647&gt;</code> The maximum number of Link State Advertisements (LSAs). Note that this value should be the same on all routers in the AS.
<code>&lt;recover-time&gt;</code>	<code>&lt;0-65535&gt;</code> the number of seconds the router waits before trying to exit the database overflow state. If this parameter is 0, router exits the overflow state only after an explicit administrator command.

**Mode** Router Configuration

**Usage** Use this command to limit the number of AS-external-LSAs a router can receive, once it is in the wait state. It takes the number of seconds specified as the `<recover-time>` to recover from this state.

**Example** The following example shows setting the maximum number of LSAs to 5 and the time to recover from overflow state to be 3:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# overflow database external 50 3
```

# passive-interface (OSPF)

**Overview** Use this command to suppress the sending of Hello packets on all interfaces, or on a specified interface. If you use the **passive-interface** command without the optional parameters then **all** interfaces are put into passive mode.

Use the **no** variant of this command to allow the sending of Hello packets on all interfaces, or on the specified interface. If you use the **no** variant of this command without the optional parameters then **all** interfaces are removed from passive mode.

**Syntax** `passive-interface [<interface>] [<ip-address>]`  
`no passive-interface [<interface>] [<ip-address>]`

Parameter	Description
<interface>	The name of the interface.
<ip-address>	IP address of the interface, entered in the form A.B.C.D.

**Mode** Router Configuration

**Usage** Configure an interface to be passive if you wish its connected route to be treated as an OSPF route (rather than an AS-external route), but do not wish to actually exchange any OSPF packets via this interface.

**Examples** To configure passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ospf 100  
awplus(config-router)# passive-interface
```

To remove passive interface mode on interface vlan2, enter the following commands:

```
awplus(config)# router ospf 100  
awplus(config-router)# no passive-interface vlan2
```

To remove passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ospf 100  
awplus(config-router)# no passive-interface
```

# redistribute (OSPF)

**Overview** Use this command to redistribute routes from other routing protocols, static routes and connected routes into an OSPF routing table.

Use the **no** variant of this command to disable this function.

**Syntax**

```
redistribute {bgp|connected|rip|static} {metric  
<0-16777214>|metric-type {1|2}|route-map <name>|tag  
<0-4294967295>}  
  
no redistribute {bgp|connected|rip|static} {metric  
<0-16777214>|metric-type {1|2}|route-map <name>|tag  
<0-4294967295>}
```

Parameter	Description
bgp	Specifies that this applies to the redistribution of BGP routes.
connected	Specifies that this applies to the redistribution of connected routes.
rip	Specifies that this applies to the redistribution of RIP routes.
static	Specifies that this applies to the redistribution of static routes.
metric	Specifies the external metric.
metric-type	Specifies the external metric-type.
route-map	Specifies name of the route-map.
tag	Specifies the external route tag.

**Default** The default metric value for routes redistributed into OSPF is 20. The metric can also be defined using the [set metric](#) command for a route map. Note that a metric defined using the [set metric](#) command for a route map overrides a metric defined with this command.

**Mode** Router Configuration

**Usage** You use this command to inject routes, learned from other routing protocols, into the OSPF domain to generate AS-external-LSAs. If a route-map is configured by this command, then that route-map is used to control which routes are redistributed and can set metric and tag values on particular routes.

The metric, metric-type, and tag values specified on this command are applied to any redistributed routes that are not explicitly given a different metric, metric-type, or tag value by the route map.

See the [OSPF Feature Overview and Configuration Guide](#) for more information about metrics, and about behavior when configured in route maps.

Note that this command does not redistribute the default route. To redistribute the default route, use the [default-information originate](#) command.

**Example** The following example shows redistribution of BGP routes into OSPF routing table 100, with metric 12.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp metric 12
```

The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command, so routes learned via interface `vlan1` can be redistributed as type-1 external LSAs:

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp rip route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which routes are distributed from another routing protocol (such as RIP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

- [match interface](#)
- [route-map](#)
- [show ip ospf database external](#)

# restart ospf graceful

**Overview** Use this command to force the OSPF process to restart, and optionally set the grace-period.

**Syntax** `restart ospf graceful [grace-period <1-1800>]`

Parameter	Description
<code>grace-period</code>	Specify the grace period.
<code>&lt;1-1800&gt;</code>	The grace period in seconds.

**Default** In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

**Mode** Privileged Exec

**Usage** After this command is executed, the OSPF process immediately shuts down. It notifies the system that OSPF has performed a graceful shutdown. Routes installed by OSPF are preserved until the grace-period expires.

When a **restart ospf graceful** command is issued, the OSPF configuration is reloaded from the last saved configuration. Ensure you first enter the command [copy running-config startup-config](#).

When a master failover happens on a VCStack, the grace-period will be the longer of the default value (180 seconds) and the configured value from this command. Therefore, the configured grace-period value will only be used in a master failover if it is longer than 180 seconds.

**Example**

```
awplus# copy running-config startup-config
awplus# restart ospf graceful grace-period 200
```

**Related Commands** [ospf restart grace-period](#)  
[ospf restart helper](#)

# router ospf

**Overview** Use this command to enter Router Configuration mode to configure an OSPF routing process. You must specify the process ID with this command for multiple OSPF routing processes on the device.

Use the **no** variant of this command to terminate an OSPF routing process.

Use the **no** parameter with the **process-id** parameter, to terminate and delete a specific OSPF routing process. If no **process-id** is specified on the **no** variant of this command, then all OSPF routing processes are terminated, and all OSPF configuration is removed.

**Syntax** `router ospf [<process-id>]`  
`no router ospf [<process-id>]`

**Syntax (VRF-lite)** `router ospf [<process-id>] [<vrf-instance>]`  
`no router ospf [<process-id>]`

Parameter	Description
<code>&lt;process-id&gt;</code>	A positive number from 1 to 65535, that is used to define a routing process.
<code>&lt;vrf-instance&gt;</code>	The VRF instance to be associated with the OSPF routing process.

**Default** No routing process is defined by default.

**Mode** Global Configuration

**Usage** The process ID of OSPF is an optional parameter for the **no** variant of this command only. When removing all instances of OSPF, you do not need to specify each Process ID, but when removing particular instances of OSPF you must specify each Process ID to be removed.

When using VRF-lite, this command can be used to associate a process-id with a VRF instance that has been created using the [ip vrf](#) command.

**Example** To enter Router Configuration mode to configure an existing OSPF routing process 100, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)#
```

**Example (VRF-lite)** To enter Router Configuration mode to configure an existing OSPF routing process 100 for VRF instance `red`, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100 red
awplus(config-router)#
```

# router-id

**Overview** Use this command to specify a router ID for the OSPF process.  
Use the **no** variant of this command to force OSPF to use the previous OSPF router-id behavior.

**Syntax** `router-id <ip-address>`  
`no router-id`

Parameter	Description
<code>&lt;ip-address&gt;</code>	Specifies the router ID in IPv4 address format.

**Mode** Router Configuration

**Usage** Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id is used at the next reload or when you restart OSPF manually.

**Example** The following example shows a fixed router ID 10.10.10.60

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# router-id 10.10.10.60
```

**Related Commands** [show ip ospf](#)

# show debugging ospf

**Overview** Use this command to display which OSPF debugging options are currently enabled.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show debugging ospf`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show debugging ospf`

**Output** Figure 26-2: Example output from the **show debugging ospf** command

```
OSPF debugging status:
OSPF packet Link State Update debugging is on
OSPF all events debugging is on
```

# show ip ospf

**Overview** Use this command to display general information about all OSPF routing processes. Include the process ID parameter with this command to display information about specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf`  
`show ip ospf <process-id>`

Parameter	Description
<code>&lt;process-id&gt;</code>	<code>&lt;0-65535&gt;</code> The ID of the router process for which information will be displayed. If this parameter is included, only the information for the specified routing process is displayed.

**Mode** User Exec and Privileged Exec

**Examples** To display general information about all OSPF routing processes, use the command:

```
awplus# show ip ospf
```

To display general information about OSPF routing process 100, use the command:

```
awplus# show ip ospf 100
```

**Table 1:** Example output from the **show ip ospf** command

```
Route Licence: Route : Limit=0, Allocated=0, Visible=0, Internal=0
Route Licence: Breach: Current=0, Watermark=0
Routing Process "ospf 10" with ID 192.168.1.1
Process uptime is 10 hours 24 minutes
Process bound to VRF default
Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Graceful Restart
SPF schedule delay min 0.500 secs, SPF schedule delay max 50.0 secs
Refresh timer 10 secs
Number of incoming current DD exchange neighbors 0/5
Number of outgoing current DD exchange neighbors 0/5
Number of external LSA 0. Checksum 0x000000
Number of opaque AS LSA 0. Checksum 0x000000
Number of non-default external LSA 0
```

**Table 1:** Example output from the **show ip ospf** command (cont.)

```
External LSA database is unlimited.
Number of LSA originated 0
Number of LSA received 0
Number of areas attached to this router: 2
  Area 0 (BACKBONE) (Inactive)
    Number of interfaces in this area is 0(0)
    Number of fully adjacent neighbors in this area is 0
    Area has no authentication
    SPF algorithm executed 0 times
    Number of LSA 0. Checksum 0x000000

  Area 1 (Inactive)
    Number of interfaces in this area is 0(0)
    Number of fully adjacent neighbors in this area is 0
    Number of fully adjacent virtual neighbors through this area is 0
    Area has no authentication
    SPF algorithm executed 0 times
    Number of LSA 0. Checksum 0x000000
```

**Table 2:** Example output from the **show ip ospf <process-id>** command

```
Routing Process "ospf 100" with ID 10.10.11.146
Process uptime is 0 minute
Conforms to RFC2328, and RFC1583Compatibility flag is disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Refresh timer 10 secs
Number of external LSA 0. Checksum Sum 0x0
Number of non-default external LSA 0
External LSA database is unlimited.
Number of areas attached to this router: 1
  Area 1
    Number of interfaces in this area is 1(1)
    Number of fully adjacent neighbors in this area is 0
    Number of fully adjacent virtual neighbors through this area is 0
    Area has no authentication
    SPF algorithm executed 0 times
    Number of LSA 1. Checksum Sum 0x00e3e2
```

**Table 3:** Parameters in the output of the **show ip ospf** command

Output Parameter		Meaning
Route Licence: Route:	Limit	The maximum number of OSPF routes which may be used for forwarding.
	Allocated	The current total number of OSPF routes allocated in the OSPF module.
	Visible	The current number of OSPF routes which may be used for forwarding.
	Internal	The number of OSPF internal routes used for calculating paths to ASBRs.
Number of external LSA		The number of external link-state advertisements
Number of opaque AS LSA		Number of opaque link-state advertisements

**Related Commands** [router ospf](#)

# show ip ospf border-routers

**Overview** Use this command to display the ABRs and ASBRs for all OSPF instances. Include the process ID parameter with this command to view data about specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf border-routers`  
`show ip ospf <process-id> border-routers`

Parameter	Description
<code>&lt;process-id&gt;</code>	<code>&lt;0-65535&gt;</code> The ID of the router process for which information will be displayed.

**Mode** User Exec and Privileged Exec

**Output** Figure 26-3: Example output from the **show ip ospf border-routers** command

```
OSPF process 1 internal Routing Table
Codes: i - Intra-area route, I - Inter-area route
i 10.15.0.1 [10] via 10.10.0.1, vlan2, ASBR, Area 0.0.0.0
i 172.16.10.1 [10] via 10.10.11.50, vlan3, ABR, ASBR, Area
0.0.0.0
```

# show ip ospf database

**Overview** Use this command to display a database summary for OSPF information. Include the process ID parameter with this command to display information about specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf [<process-id>] database  
[self-originate|max-age|adv router <adv-router-id>]`

Parameter	Description
<process-id>	<0-65535> The ID of the router process for which information will be displayed.
self-originate	Displays self-originated link states.
max-age	Displays LSAs in MaxAge list. It maintains the list of the all LSAs in the database which have reached the max-age which is 3600 seconds.
adv-router	Advertising Router LSA.
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.

**Mode** User Exec and Privileged Exec

**Examples** To display the ABRs and ASBRs for all OSPF instances, use the command:

```
awplus# show ip ospf border-routers
```

To display the ABRs and ASBRs for the specific OSPF instance 721, use the command:

```
awplus# show ip ospf 721 border-routers
```

**Output** Figure 26-4: Example output from the **show ip ospf database** command

```

      OSPF Router process 1 with ID (10.10.11.60)

# show ip ospf database asbr-summary

**Overview** Use this command to display information about the Autonomous System Boundary Router (ASBR) summary LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus”\\_Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database asbr-summary [<ip-addr>]  
[self-originate|adv-router <advrouter-ip-addr>]`

Parameter	Description
<ip-addr>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.
adv-router <advrouter-ip-addr>	Displays all the LSAs of the specified router.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database asbr-summary 1.2.3.4  
self-originate  
  
awplus# show ip ospf database asbr-summary self-originate  
  
awplus# show ip ospf database asbr-summary 1.2.3.4 adv-router  
2.3.4.5
```

# show ip ospf database external

**Overview** Use this command to display information about the external LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database external adv-router[<adv-router-id>]  
[self-originate|adv-router<adv-router-id>]`

Parameter	Description
adv-router	Displays all the LSAs of the specified router.
self-originate	Displays self-originated link states.
<adv-router- id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database external 1.2.3.4 self-originate
awplus# show ip ospf database external self-originate
awplus# show ip ospf database external 1.2.3.4 adv-router
2.3.4.5
```

**Output** Figure 26-6: Example output from the **show ip ospf database external self-originate** command

```
OSPF Router process 100 with ID (10.10.11.50)
AS External Link States
LS age: 298

# show ip ospf database network

**Overview** Use this command to display information about the network LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database network [<adv-router-id>]  
[self-originate|<adv-router-id>]`

Parameter	Description
<adv-router-id>	The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address.
self-originate	Displays self-originated link states.
adv-router	Displays all the LSAs of the specified router.

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf database network 1.2.3.4 self-originate`  
`awplus# show ip ospf database network self-originate`  
`awplus# show ip ospf database network 1.2.3.4 adv-router 2.3.4.5`

**Output** Figure 26-8: Example output from the **show ip ospf database network** command

```
OSPF Router process 200 with ID (192.30.30.2)
  Net Link States (Area 0.0.0.0)

...
```

# show ip ospf database nssa-external

**Overview** Use this command to display information about the NSSA external LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database nssa-external [<ip-address>]  
[self-originate|<advrouter>]`

Parameter	Description
<advrouter>	adv-router <ip-address>
adv-router	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database nssa-external 1.2.3.4  
self-originate  
  
awplus# show ip ospf database nssa-external self-originate  
  
awplus# show ip ospf database nssa-external 1.2.3.4 adv-router  
2.3.4.5
```

**Output** Figure 26-9: Example output from the **show ip ospf database nssa-external adv-router** command

```

  External Route Tag: 0
  NSSA-external Link States (Area 0.0.0.1 [NSSA])
```

# show ip ospf database opaque-area

**Overview** Use this command to display information about the area-local (link state type 10) scope LSAs. Type-10 Opaque LSAs are not flooded beyond the borders of their associated area.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database opaque-area [<ip-address>]  
[self-originate|<advrouter>]`

Parameter	Description
<advrouter>	adv-router <ip-address>
adv-router	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database opaque-area 1.2.3.4  
self-originate  
  
awplus# show ip ospf database opaque-area self-originate  
  
awplus# show ip ospf database opaque-area 1.2.3.4 adv-router  
2.3.4.5
```

**Output** Figure 26-10: Example output from the **show ip ospf database opaque-area** command

```
OSPF Router process 100 with ID (10.10.11.50)  
Area-Local Opaque-LSA (Area 0.0.0.0)  
LS age: 262  
Options: 0x2 (*|---|---|E|---)  
LS Type: Area-Local Opaque-LSA  
Link State ID: 10.0.25.176 (Area-Local Opaque-Type/ID)  
Opaque Type: 10  
Opaque ID: 6576  
Advertising Router: 10.10.11.50  
LS Seq Number: 80000001  
Checksum: 0xb413  
Length: 26
```

# show ip ospf database opaque-as

**Overview** Use this command to display information about the link-state type 11 LSAs. This type of link-state denotes that the LSA is flooded throughout the Autonomous System (AS).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database opaque-as [<ip-address>]  
[self-originate|<advrouter>]`

Parameter	Description
<advrouter>	adv-router <ip-address>
adv-router	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database opaque-as 1.2.3.4 self-originate
awplus# show ip ospf database opaque-as self-originate
awplus# show ip ospf database opaque-as 1.2.3.4 adv-router
2.3.4.5
```

**Output** Figure 26-11: Example output from the **show ip ospf database opaque-as** command

```
OSPF Router process 100 with ID (10.10.11.50)
AS-Global Opaque-LSA
LS age: 325
Options: 0x2 (*|-|-|-|-|E|-)
LS Type: AS-external Opaque-LSA
Link State ID: 11.10.9.23 (AS-external Opaque-Type/ID)
Opaque Type: 11
Opaque ID: 657687
Advertising Router: 10.10.11.50
LS Seq Number: 80000001
Checksum: 0xb018
Length: 25
```

# show ip ospf database opaque-link

**Overview** Use this command to display information about the link-state type 9 LSAs. This type denotes a link-local scope. The LSAs are not flooded beyond the local network.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database opaque-link [<ip-address>]  
[self-originate|<advrouter>]`

Parameter	Description
<advrouter>	adv-router <ip-address>
adv-router	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database opaque-link 1.2.3.4  
self-originate  
  
awplus# show ip ospf database opaque-link self-originate  
  
awplus# show ip ospf database opaque-link 1.2.3.4 adv-router  
2.3.4.5
```

**Output** Figure 26-12: Example output from the **show ip ospf database opaque-link** command

```
OSPF Router process 100 with ID (10.10.11.50)
      Link-Local Opaque-LSA (Link hme0:10.10.10.50)
LS age: 276
Options: 0x2 (*|-|-|-|-|E|-)
LS Type: Link-Local Opaque-LSA
Link State ID: 10.0.220.247 (Link-Local Opaque-Type/ID)
Opaque Type: 10
Opaque ID: 56567
Advertising Router: 10.10.11.50
LS Seq Number: 80000001
Checksum: 0x744e
Length: 26
      Link-Local Opaque-LSA (Link hme1:10.10.11.50)
```

# show ip ospf database router

**Overview** Use this command to display information only about the router LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database router [<adv-router-id>  
self-originate|<adv-router-id>]`

Parameter	Description
<code>adv-router</code>	Displays all the LSAs of the specified router.
<code>self-originate</code>	Displays self-originated link states.
<code>&lt;adv-router- id&gt;</code>	The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database router 1.2.3.4 self-originate
awplus# show ip ospf database router self-originate
awplus# show ip ospf database router 1.2.3.4 adv-router 2.3.4.5
```

**Output** Figure 26-13: Example output from the **show ip ospf database router** command

```
OSPF Router process 100 with ID (10.10.11.50)
  Router Link States (Area 0.0.0.0)
LS age: 878
Options: 0x2 (*|-|-|-|-|E|-)
Flags: 0x3 : ABR ASBR
LS Type: router-LSA

```

# show ip ospf database summary

**Overview** Use this command to display information about the summary LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database summary [<ip-address>]  
[self-originate|<advrouter>]`

Parameter	Description
<advrouter>	adv-router <ip-address>
adv-router	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf database summary 1.2.3.4 self-originate`  
`awplus# show ip ospf database summary self-originate`  
`awplus# show ip ospf database summary 1.2.3.4 adv-router 2.3.4.5`

**Output** Figure 26-14: Example output from the **show ip ospf database summary** command

# show ip ospf interface

**Overview** Use this command to display interface information for OSPF.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ip ospf interface [<interface-name>]`

Parameter	Description
<interface-name>	The VLAN name, for example vlan3.

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf interface vlan2`

**Output** Figure 26-17: Example output from the **show ip ospf interface** command

```
vlan2 is up, line protocol is up
Internet Address 1.1.1.1/24, Area 0.0.0.0, MTU 1500
Process ID 0, Router ID 33.33.33.33, Network Type BROADCAST, Cost: 10
Transmit Delay is 1 sec, State Waiting, Priority 1, TE Metric 0
No designated router on this network
No backup designated router on this network
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  Hello due in 00:00:02
Neighbor Count is 0, Adjacent neighbor count is 0
Crypt Sequence Number is 1106347721
Hello received 0 sent 1, DD received 0 sent 0
LS-Req received 0 sent 0, LS-Upd received 0 sent 0
LS-Ack received 0 sent 0, Discarded 0
```

# show ip ospf neighbor

**Overview** Use this command to display information on OSPF neighbors. Include the **ospf-id** parameter with this command to display information about specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf [<ospf-id>] neighbor <neighbor-ip-addr> [detail]`  
`show ip ospf [<ospf-id>] neighbor detail [all]`  
`show ip ospf [<ospf-id>] neighbor [all]`  
`show ip ospf [<ospf-id>] neighbor interface <ip-addr>`

Parameter	Description
<ospf-id>	<0-65535> The ID of the router process for which information will be displayed.
<neighbor-ip-addr>	The Neighbor ID, entered as an IP address.
all	Include downstatus neighbor.
detail	Detail of all neighbors.
<ip-addr>	IP address of the interface.

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf neighbor detail`  
`awplus# show ip ospf neighbor 1.2.3.4`  
`awplus# show ip ospf neighbor interface 10.10.10.50 detail all`

**Output** Note that before a device enters OSPF Graceful Restart it first informs its OSPF neighbors. In the **show** output, the \* symbol beside the **Dead Time** parameter indicates that the device has been notified of a neighbor entering the graceful restart state, as shown in the figures below.

Figure 26-18: Example output from the **show ip ospf neighbor** command

```
OSPF process 1:
Neighbor ID    Pri   State           Dead Time   Address      Interface
10.10.10.50    1     Full/DR         00:00:38   10.10.10.50  vlan1
OSPF process 100:
Neighbor ID    Pri   State           Dead Time   Address      Interface
10.10.11.50    1     Full/Backup     00:00:31   10.10.11.50  vlan2
awplus#show ip ospf 1 neighbor
OSPF process 1:
Neighbor ID    Pri   State           Dead Time   Address      Interface
10.10.10.50    1     Full/DR         00:00:38*   10.10.10.50  vlan1
```

Figure 26-19: Example output from the **show ip ospf <ospf-id> neighbor** command

```
OSPF process 100:
```

Neighbor ID	Pri	State	Dead Time	Address	Interface
192.168.0.3	50	2-Way/DROther	00:01:59*	192.168.200.3	vlan200

Figure 26-20: Example output from the **show ip ospf neighbor detail** command

```
Neighbor 10.10.10.50, interface address 10.10.10.50
  In the area 0.0.0.0 via interface vlan5
  Neighbor priority is 1, State is Full, 5 state changes
  DR is 10.10.10.50, BDR is 10.10.10.10
  Options is 0x42 (*|O|---|E|)
  Dead timer due in 00:00:38
  Neighbor is up for 00:53:07
  Database Summary List 0
  Link State Request List 0
  Link State Retransmission List 0
  Crypt Sequence Number is 0
  Thread Inactivity Timer on
  Thread Database Description Retransmission off
  Thread Link State Request Retransmission off
  Thread Link State Update Retransmission on
Neighbor 10.10.11.50, interface address 10.10.11.50
  In the area 0.0.0.0 via interface vlan2
  Neighbor priority is 1, State is Full, 5 state changes
  DR is 10.10.11.10, BDR is 10.10.11.50
  Options is 0x42 (*|O|---|E|)
  Dead timer due in 00:00:31
  Neighbor is up for 00:26:50
  Database Summary List 0
  Link State Request List 0
  Link State Retransmission List 0
  Crypt Sequence Number is 0
  Thread Inactivity Timer on
  Thread Database Description Retransmission off
  Thread Link State Request Retransmission off
  Thread Link State Update Retransmission on
```

# show ip ospf route

**Overview** Use this command to display the OSPF routing table. Include the **ospf-id** parameter with this command to display the OSPF routing table for specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf [<ospf-id>] route`

Parameter	Description
<ospf-id>	<0-65535> The ID of the router process for which information will be displayed. If this parameter is included, only the information for this specified routing process is displayed.

**Mode** User Exec and Privileged Exec

**Examples** To display the OSPF routing table, use the command:

```
awplus# show ip ospf route
```

**Output** Figure 26-21: Example output from the **show ip ospf route** command for a specific process

```
OSPF process 1:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
O 10.10.0.0/24 [10] is directly connected, vlan1, Area 0.0.0.0
O 10.10.11.0/24 [10] is directly connected, vlan2, Area 0.0.0.0
O 10.10.11.100/32 [10] is directly connected, lo, Area 0.0.0.0
E2 10.15.0.0/24 [10/50] via 10.10.0.1, vlan1
IA 172.16.10.0/24 [30] via 10.10.11.50, vlan2, Area 0.0.0.0
E2 192.168.0.0/16 [10/20] via 10.10.11.50, vlan2
```

# show ip ospf virtual-links

**Overview** Use this command to display virtual link information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf virtual-links`

**Mode** User Exec and Privileged Exec

**Examples** To display virtual link information, use the command:

```
awplus# show ip ospf virtual-links
```

**Output** Figure 26-22: Example output from the **show ip ospf virtual-links** command

```
Virtual Link VLINK0 to router 10.10.0.9 is up
  Transit area 0.0.0.1 via interface vlan5
  Transmit Delay is 1 sec, State Point-To-Point,
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
  Retransmit 5
    Hello due in 00:00:02
    Adjacency state Full
Virtual Link VLINK1 to router 10.10.0.123 is down
  Transit area 0.0.0.1 via interface *
  Transmit Delay is 1 sec, State Down,
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
  Retransmit 5
    Hello due in inactive
    Adjacency state Down
```

# show ip protocols ospf

**Overview** Use this command to display OSPF process parameters and statistics.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip protocols ospf`

**Mode** User Exec and Privileged Exec

**Examples** To display OSPF process parameters and statistics, use the command:

```
awplus# show ip protocols ospf
```

**Output** Figure 26-23: Example output from the **show ip protocols ospf** command

```
Routing Protocol is "ospf 200"
  Invalid after 0 seconds, hold down 0, flushed after 0
  Outgoing update filter list for all interfaces is
    Redistributed kernel filtered by filter1
  Incoming update filter list for all interfaces is
  Redistributing: kernel
  Routing for Networks:
    192.30.30.0/24
    192.40.40.0/24
  Routing Information Sources:
    Gateway          Distance          Last Update
  Distance: (default is 110)
  Address           Mask              Distance List
```

# summary-address

**Overview** Use this command to summarize, or possibly suppress, external routes that have the specified address range.

Use the **no** variant of this command to stop summarizing, or suppressing, external routes that have the specified address range.

**Syntax** `summary-address <ip-addr/prefix-length> [not-advertise] [tag <0-4294967295>]`  
`no summary-address <ip-addr/prefix-length> [not-advertise] [tag <0-4294967295>]`

Parameter	Description
<code>&lt;ip-addr/prefix-length&gt;</code>	Specifies the base IP address of the summary address. The range of addresses given as IPv4 starting address and a prefix length.
<code>not-advertise</code>	Set the <b>not-advertise</b> option if you do not want OSPF to advertise either the summary address or the individual networks within the range of the summary address.
<code>tag &lt;0-4294967295&gt;</code>	The tag parameter specifies the tag value that OSPF places in the AS external LSAs created as a result of redistributing the summary route. The tag overrides tags set by the original route.

**Default** The default tag value for a summary address is 0.

**Mode** Router Configuration

**Usage** An address range is a pairing of an address and a mask that is almost the same as IP network number. For example, if the specified address range is 192.168.0.0/255.255.240.0, it matches: 192.168.1.0/24, 192.168.4.0/22, 192.168.8.128/25 and so on.

Redistributing routes from other protocols into OSPF requires the router to advertise each route individually in an external LSA. Use the **summary address** command to advertise one summary route for all redistributed routes covered by a specified network address and mask. This helps decrease the size of the OSPF link state database.

Ensure OSPF routes exist in the summary address range for advertisement before using this command.

**Example** The following example uses the **summary-address** command to aggregate external LSAs that match the network 172.16.0.0/16 and assign a Tag value of 3.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# summary-address 172.16.0.0/16 tag 3
```

# timers spf exp

**Overview** Use this command to adjust route calculation timers using exponential back-off delays.

Use **no** form of this command to return to the default exponential back-off timer values.

**Syntax** `timers spf exp <min-holdtime> <max-holdtime>`  
`no timers spf exp`

Parameter	Description
<code>&lt;min-holdtime&gt;</code>	<code>&lt;0-2147483647&gt;</code> Specifies the minimum delay between receiving a change to the SPF calculation in milliseconds. The default SPF min-holdtime value is 50 milliseconds.
<code>&lt;max-holdtime&gt;</code>	<code>&lt;0-2147483647&gt;</code> Specifies the maximum delay between receiving a change to the SPF calculation in milliseconds. The default SPF max-holdtime value is 50 seconds.

**Mode** Router Configuration

**Default** The default SPF min-holdtime is 50 milliseconds. The default SPF max-holdtime is 40 seconds.

**Usage** This command configures the minimum and maximum delay time between the receipt of a topology change and the calculation of the Shortest Path First (SPF).

**Examples** To set the minimum delay time to 5 milliseconds and maximum delay time to 10 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# timers spf exp 5 10
```

To reset the minimum and maximum delay times to the default values, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no timers spf exp
```

**Related Commands** [timers spf exp](#)

# undebbug ospf events

# abr-type

**Overview** Use this command to set an OSPF Area Border Router (ABR) type.

Use the **no** variant of this command to revert the ABR type to the default setting (cisco).

**Syntax** `abr-type {cisco|ibm|standard}`  
`no abr-type {cisco|ibm|standard}`

Parameter	Description
cisco	Specifies an alternative ABR using Cisco implementation (RFC 3509). This is the default ABR type.
ibm	Specifies an alternative ABR using IBM implementation (RFC 3509).
standard	Specifies a standard behavior ABR (RFC 2328).

**Default** ABR type cisco

**Mode** Router Configuration

**Usage** Specifying the ABR type allows better interoperability between different implementations. This command is especially useful in a multi-vendor environment. The different ABR types are:

- Cisco ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached to it.

**Example** To set the ABR type to "ibm" use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# abr-type ibm
```

# area authentication ipsec spi

**Overview** Use this command in Router Configuration mode to enable either MD5 (Message-Digest 5) or SHA1 (Secure Hash Algorithm 1) authentication for a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable the authentication configured for a specified OSPF area.

**Syntax** `area <area-id> authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}`  
`no area <area-id> authentication ipsec spi <256-4294967295>`

Parameter	Description
<area-id>	The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats:  <ip-addr> OSPF area-ID expressed in IPv4 address format A.B.C.D.  <0-4294967295> OSPF area-ID expressed as a decimal number within the range shown.  For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.
md5	Specify the MD5 (Message-Digest 5) hashing algorithm.
<MD5-key>	Enter an MD5 key containing up to 32 hexadecimal characters.
sha1	Specify the SHA-1 (Secure Hash Algorithm 1) hashing algorithm.
<SHA1-key>	Enter an SHA-1 key containing up to 40 hexadecimal characters.

**Mode** Router Configuration

**Usage** Use this command on an OSPFv3 area; use the [area virtual-link authentication ipsec spi](#) command on an OSPFv3 area virtual link. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**NOTE:** You can configure an authentication security policy (SPI) on an OSPFv3 area with this command, or on a VLAN interface with the [ipv6 ospf authentication spi](#) command.

When you configure authentication for an area, the security policy is applied to all VLAN interfaces in the area. However, we recommend a different authentication security policy is applied to each interface for higher security.

If you apply the **ipv6 ospf authentication null** command, this affects authentication configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area authentication, not being authenticated. So neighbors time out.

**Example** To enable MD5 authentication with a 32 hexadecimal character key for OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 40 hexadecimal character key for OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 authentication ipsec spi 1000
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 authentication ipsec spi 1000
```

**Related  
Commands**

[area encryption ipsec spi esp](#)  
[area virtual-link authentication ipsec spi](#)  
[area virtual-link encryption ipsec spi](#)  
[ipv6 ospf authentication spi](#)  
[ipv6 ospf encryption spi esp](#)  
[show ipv6 ospf](#)

# area default-cost (IPv6 OSPF)

**Overview** This command specifies a cost for the default summary route sent into a stub area. The **no** variant of this command removes the assigned default-route cost.

**Syntax** `area <area-id> default-cost <0-16777215>`  
`no area <area-id> default-cost`

Parameter	Description				
<area-id>	The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: <table border="1"><tbody><tr><td>&lt;ip-addr&gt;</td><td>OSPF area-ID expressed in IPv4 address format A.B.C.D.</td></tr><tr><td>&lt;0-4294967295&gt;</td><td>OSPF area-ID expressed as a decimal number within the range shown.</td></tr></tbody></table> For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.	<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.				
<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.				
default-cost	Indicates the cost for the default summary route used for a stub area. Default: <b>1</b>				

**Mode** Router Configuration

**Usage** The default-cost option provides the metric for the summary default route, generated by the area border router, into the stub area. Use this option only on an area border router that is attached to the stub area.

**Example** To set the default cost to 10 in area 1 for the OSPF process P2, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf P2
awplus(config-router)# area 1 default-cost 10
```

**Related Commands** [area stub \(IPv6 OSPF\)](#)

# area encryption ipsec spi esp

**Overview** Use this command in Router Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable the encryption configured for a specified OSPF area.

**Syntax**

```
area <area-id> encryption ipsec spi <256-4294967295> esp
{aes-cbc <AES-CBC-key>|3des <3DES-key>|null}{md5
<MD5-key>|sha1 <SHA1-key>}
no area <area-id> encryption ipsec spi <256-4294967295>
```

Parameter	Description
<area-id>	The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: <ip-addr> OSPF area-ID expressed in IPv4 address format A.B.C.D. <0-4294967295> OSPF area-ID expressed as a decimal number within the range shown. For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.
esp	Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption.
aes-cbc	Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption.
<AES-CBC-key>	Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters.
3des	Specify 3DES (Triple Data Encryption Standard) encryption.
<3DES-key>	Enter a 3DES key containing 48 hexadecimal characters.
null	Specify ESP without AES-CBC or 3DES encryption applied.
md5	Specify the MD5 (Message-Digest 5) encryption algorithm.
<MD5-key>	Enter an MD5 key containing 32 hexadecimal characters.
sha1	Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.
<SHA1-key>	Enter an SHA-1 key containing 40 hexadecimal characters.

**Mode** Router Configuration

**Usage** When you issue this command, authentication and encryption are both enabled.

Use this command on an OSPFv3 area, use the [area virtual-link encryption ipsec spi](#) command on an OSPFv3 area virtual link. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. The IPv6 ESP extension header is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers, so applying IPv6 ESP extension headers are required for integrity, authentication, and confidentiality.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**NOTE:** You can configure an encryption security policy (SPI) on an OSPFv3 area with this command, or on a VLAN interface with the [ipv6 ospf encryption spi esp](#) command.

When you configure encryption for an area, the security policy is applied to all VLAN interfaces in the area. However, we recommend a different encryption security policy is applied to each interface for higher security.

If you apply the [ipv6 ospf encryption null](#) command, this affects encryption configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area encryption, not being being encrypted. So neighbors time out.

**Example** To enable ESP encryption, but not apply an AES-CBC key or an 3DES key, and MD5 authentication with a 32 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp null
md5 1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or an 3DES key, and SHA-1 authentication with a 40 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp null
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 48 hexadecimal character 3DES key and a 32 hexadecimal character MD5 authentication for OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp 3des
1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF md5
1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption with a 32 hexadecimal character AES-CBC key, and a 40 hexadecimal character SHA-1 authentication key for OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp
aes-cbc 1234567890ABCDEF1234567890ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable ESP encryption for OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 encryption ipsec spi 1000
```

**Related  
Commands**

[show ipv6 ospf](#)

# area range (IPv6 OSPF)

**Overview** Use this command to summarize OSPFv3 routes at an area boundary, configuring an IPv6 address range which consolidates OSPFv3 routes. By default, this feature is not enabled.

A summary route created by this command is then advertised to other areas by the Area Border Routers (ABRs). In this way, routing information is condensed at area boundaries and outside the area so that routes are exchanged between areas in an efficient manner.

If the network numbers in an area are arranged into sets of contiguous routes, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

The **no** variant of this command disables this function and restores default behavior.

**Syntax** `area <area-id> range <ipv6address/prefix-length> [advertise|not-advertise]`  
`no area <area-id> range <ipv6address/prefix-length>`

Parameter	Description
<code>&lt;area-id&gt;</code>	The OSPFv3 area that you summarizing the routes for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.  <code>&lt;A.B.C.D&gt;</code> OSPF area-ID expressed in IPv4 address format A.B.C.D.  <code>&lt;0-4294967295&gt;</code> OSPF area-ID expressed as a decimal number within the range shown.  For example the values 0.0.1.2 and decimal 258 would both define the same area-ID.
<code>&lt;ip-addr/prefix-length&gt;</code>	The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<code>advertise</code>	Advertise this range as a summary route into other areas.
<code>not-advertise</code>	Do not advertise this range.

**Default** The area range is not configured by default. The area range is advertised if it is configured.

**Mode** Router Configuration

**Usage** You can configure multiple ranges on a single area with multiple instances of this command, so OSPFv3 summarizes addresses for different sets of IPv6 address ranges.

Ensure OSPFv3 IPv6 routes exist in the area range for advertisement before using this command.

**Example** awplus# configure terminal  
awplus(config)# router ipv6 ospf P2  
awplus(config-router)# area 1 range 2000::/3

# area stub (IPv6 OSPF)

**Overview** This command defines an OSPF area as a stub area. By default, no stub area is defined.

Use this command when routers in the area do not require learning about external LSAs. You can define the area as a totally stubby area by configuring the Area Border Router of that area using the **area stub no-summary** command.

The **no** variant of this command removes this definition.

**Syntax** `area <area-id> stub [no-summary]`  
`no area <area-id> stub [no-summary]`

Parameter	Description
<area-id>	The OSPF area that you are configuring as a stub area. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID.
<A.B.C.D>	OSPF area-ID, expressed in the IPv4 address format <A.B.C.D>.
<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID.
no-summary	Stops an ABR from sending summary link advertisements into the stub area.

**Mode** Router Configuration

**Usage** There are two stub area router configuration commands: the **area stub** and **area default-cost** commands. In all routers attached to the stub area, configure the area by using the **area stub** command. For an area border router (ABR) attached to the stub area, also use the **area default-cost** command.

**Example**

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# area 100 stub
```

**Related Commands** [area default-cost \(IPv6 OSPF\)](#)

# area virtual-link (IPv6 OSPF)

**Overview** This command configures a link between a non-backbone area and the backbone, through other non-backbone areas.

In OSPF, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection.

The **no** variant of this command removes the virtual link.

**Syntax**

```

area <area-id> virtual-link <router-id>
no area <area-id> virtual-link <router-id>
area <area-id> virtual-link <router-id>
no area <area-id> virtual-link <router-id>
area <area-id> virtual-link <router-id> [hello-interval
<1-65535>] [retransmit-interval <1-65535>] [transmit-delay
<1-65535>]
no area <area-id> virtual-link <router-id> [hello-interval]
[retransmit-interval] [transmit-delay]
```

Parameter	Description
<area-id>	The area-ID of the transit area that the virtual link passes through. This can be entered in either dotted decimal format or normal decimal format as shown below.
	<A.B.C.D> OSPF area-ID, expressed in the IPv4 address format <A.B.C.D>.
	<0-4294967295> OSPF area-ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID.
<router-id>	The OSPF router ID of the virtual link neighbor.
dead-interval	If no packets are received from a particular neighbor for dead-interval seconds, the router considers the neighbor router to be off-line. Default: 40 seconds
	<1-65535> The number of seconds in the interval.
hello-interval	The interval the router waits before it sends a hello packet. Default: 10 seconds
	<1-65535> The number of seconds in the interval.
retransmit-interval	The interval the router waits before it retransmits a packet. Default: 5 seconds
	<1-65535> The number of seconds in the interval.

Parameter	Description
transmit-delay	The interval the router waits before it transmits a packet. Default: 1 seconds
<1-65535>	The number of seconds in the interval.

**Mode** Router Configuration

**Usage** You can configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these two routers, joined by a virtual link, as if they were connected by an unnumbered point-to-point network. To configure a virtual link, you require:

- The transit area-ID, i.e. the area-ID of the non-backbone area that the two backbone routers are both connected to.
- The corresponding virtual link neighbor's router ID. To see the router ID use the [show ipv6 ospf](#) command.

Configure the **hello-interval** to be the same for all routers attached to a common network. A short **hello-interval** results in the router detecting topological changes faster but also an increase in the routing traffic.

The **retransmit-interval** is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The **transmit-delay** is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet, are incremented by this amount. Set the **transmit-delay** to be greater than zero. Also, take into account the transmission and propagation delays for the interface.

**Example** To configure a virtual link through area 1 to the router with router-ID 10.10.11.50, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# area 1 virtual-link 10.10.11.50 hello 5
dead 10
```

**Related Commands** [show ipv6 ospf](#)

# area virtual-link authentication ipsec spi

**Overview** Use this command in Router Configuration mode to enable authentication for virtual links in a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable authentication for virtual links in a specified OSPF area.

**Syntax** `area <area-id> virtual-link <router-ID> authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}`  
`no area <area-id> virtual-link <router-ID> authentication ipsec spi <256-4294967295>`

Parameter	Description				
<area-id>	The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: <table border="1" data-bbox="683 958 1422 1131"> <tr> <td>&lt;ip-addr&gt;</td> <td>OSPF area-ID expressed in IPv4 address format A.B.C.D.</td> </tr> <tr> <td>&lt;0-4294967295&gt;</td> <td>OSPF area-ID expressed as a decimal number within the range shown.</td> </tr> </table> For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.	<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.				
<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.				
virtual-link	Specify a virtual link and its parameters.				
<router-ID>	Enter a router ID associated with a virtual link neighbor in IPv4 address format A.B.C.D.				
authentication	Specify this keyword to enable authentication.				
ipsec	Specify this keyword to use IPsec authentication.				
spi	Specify this keyword to set the SPI (Security Parameters Index).				
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.				
md5	Specify the MD5 (Message-Digest 5) encryption algorithm.				
<MD5-key>	Enter an MD5 key containing 32 hexadecimal characters.				
sha1	Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.				
<SHA1-key>	Enter an SHA-1 key containing 40 hexadecimal characters.				

**Mode** Router Configuration

**Usage** Use this command on an OSPFv3 area virtual link, use the [area authentication ipsec spi](#) command on an OSPFv3 area. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by

link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

OSPFv3 areas are connected to a backbone area. Virtual links can be configured to repair lost connections to a backbone area for OSPFv3 areas. To configure an OSPFv3 virtual link, use a router ID instead of the IPv6 prefix of the router.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**Example** To enable MD5 authentication with a 32 hexadecimal character key for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 40 hexadecimal character key for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000 sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 virtual-link ipsec spi 1000
```

**Related Commands**

- [area authentication ipsec spi](#)
- [area encryption ipsec spi esp](#)
- [area virtual-link encryption ipsec spi](#)
- [show ipv6 ospf virtual-links](#)

# area virtual-link encryption ipsec spi

**Overview** Use this command in Router Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for virtual links in a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable encryption configured for virtual links in a specified OSPF area.

**Syntax**

```
area <area-id> virtual-link <router-ID> encryption ipsec spi
<256-4294967295> esp {aes-cbc <AES-CBC-key>|3des
<3DES-key>|null}{md5 <MD5-key>|sha1 <SHA1-key>}
no area <area-id> encryption ipsec spi <256-4294967295>
```

Parameter	Description				
<area-id>	The OSPF area that you are specifying the summary route default- cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: <table border="1" data-bbox="730 1025 1423 1279"> <tr> <td>&lt;ip-addr&gt;</td> <td>OSPF area-ID expressed in IPv4 address format A.B.C.D.</td> </tr> <tr> <td>&lt;0-4294967295&gt;</td> <td>OSPF area-ID expressed as a decimal number within the range shown.</td> </tr> </table> For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.	<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.				
<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.				
virtual-link	Specify a virtual link and its parameters.				
<router-ID>	Enter a router ID associated with a virtual link neighbor in IPv4 address format A.B.C.D.				
encryption	Specify this keyword to enable encryption.				
ipsec	Specify this keyword to use IPsec authentication.				
spi	Specify this keyword to set the SPI (Security Parameters Index).				
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.				
esp	Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption.				
aes-cbc	Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption.				
<AES-CBC-key>	Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters.				
3des	Specify 3DES (Triple Data Encryption Standard) encryption.				
<3DES-key>	Enter a 3DES key containing 48 hexadecimal characters.				

Parameter	Description
null	Specify ESP without AES-CBC or 3DES encryption applied.
md5	Specify the MD5 (Message-Digest 5) encryption algorithm.
<MD5-key>	Enter an MD5 key containing 32 hexadecimal characters.
sha1	Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.
<SHA1-key>	Enter an SHA-1 key containing 40 hexadecimal characters.

**Mode** Router Configuration

**Usage** When you issue this command, authentication and encryption are both enabled.

Use this command on an OSPFv3 area virtual link, use the [area encryption ipsec spi esp](#) command on an OSPFv3 area. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. ESP is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers. The IPv6 ESP extension header is required for integrity, authentication, and confidentiality.

Note that interface configuration takes priority over area configuration. If an interface configuration is removed then an area configuration is applied to an interface instead.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**Example** To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, and MD5 authentication with a 32 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp null md5 1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, and SHA-1 authentication with a 40 hexadecimal character key for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp null sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 32 hexadecimal character AES-CBC key and a 40 hexadecimal character SHA-1 authentication key for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp aes-cbc 1234567890ABCDEF1234567890ABCDEF
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 48 hexadecimal character 3DES key and a 40 hexadecimal character SHA-1 authentication key for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp 3des
1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000
```

[area encryption ipsec spi esp](#)  
[area virtual-link authentication ipsec spi](#)  
[show ipv6 ospf virtual-links](#)

# auto-cost reference bandwidth (IPv6 OSPF)

**Overview** This command controls how OSPF calculates default metrics for the interface. Use the **no** variant of this command to assign cost based only on the interface bandwidth.

**Syntax** `auto-cost reference-bandwidth <1-4294967>`  
`no auto-cost reference-bandwidth`

Parameter	Description
<code>&lt;1-4294967&gt;</code>	The reference bandwidth, measured in Mbits per second (Mbps).

**Default** 1000 Mbps

**Usage** By default, OSPF calculates the OSPF metric for an interface by dividing the reference bandwidth by the interface bandwidth. The default for the reference bandwidth is 1000 Mbps. As a result, if this default is used, there is very little difference between the metrics applied to interfaces of increasing bandwidth beyond 1000 Mbps.

The auto-cost command is used to alter this reference bandwidth in order to give a real difference between the metrics of high bandwidth links of differing bandwidths. In a network that has multiple links with high bandwidths, specify a larger reference bandwidth value to differentiate the costs on those links.

Cost is calculated by dividing the reference bandwidth (Mbps) by the layer 3 interface (Switched Virtual Interface (SVI), Loopback or Ethernet interface) bandwidth. Interface bandwidth may be altered by using the [bandwidth](#) command as the SVI does not auto-detect the bandwidth based on the speed of associated device ports.

When the reference bandwidth calculation results in a cost integer greater than 1 but contains a fractional value (the value after the decimal point), the result rounds down to the nearest integer. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 7 Mbps.

Calculation =  $1000/7$

Calculation result = 142.85 (integer of 142, fractional value of 0.85)

Result after rounding down to the nearest integer = 142 (Interface cost is 142)

When the reference bandwidth calculation results in a cost less than 1, it is rounded up to the nearest integer which is 1. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 10000 Mbps.

Calculation =  $1000/10000$

Calculation result = 0.1

Result after rounding up to the nearest integer = 1 (Interface cost is 1)

The auto-cost reference bandwidth value should be consistent across all OSPF routers in the OSPF process.

Note that using the `ipv6 ospf cost` command on a layer 3 interface will override the cost calculated by this command.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 20
awplus(config-router)# auto-cost reference-bandwidth 1000
```

**Related  
Commands** [ipv6 ospf cost](#)

# bandwidth

**Overview** Use this command to specify the maximum bandwidth to be used for each VLAN interface. The bandwidth value is in bits per second. OSPF uses this to calculate metrics for the VLAN interface.

The **no** variant of this command removes any applied bandwidth value and replaces it with a value equal to the lowest port speed within that VLAN.

**Syntax** `bandwidth <bandwidth-setting>`  
`no bandwidth`

Parameter	Description
<code>&lt;bandwidth-setting&gt;</code>	Sets the bandwidth for the interface. Enter a value in the range 1 to 10000000000 bits per second. Note that to avoid entering many zeros, you can add k, m, or g to internally add 3, 6 or 9 zeros to the number entered. For example entering 1k is the same as entering 1000.

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the bandwidth on VLAN2 to be 1 Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# bandwidth 1000000
```

Or

```
awplus(config-if)# bandwidth 1m
```

**Related Commands** `show running-config access-list`  
`show interface`

# clear ipv6 ospf process

**Overview** This command clears and restarts the IPv6 OSPF routing process. Specify the Process ID to clear one particular OSPF process. When no Process ID is specified, this command clears all running OSPF processes.

**Syntax** `clear ipv6 ospf [<0-65535>] process`

Parameter	Description
<0-65535>	The routing process ID.

**Mode** Privileged Exec

**Example** `awplus# clear ipv6 ospf process`

# debug ipv6 ospf events

**Overview** This command enables IPv6 OSPF debugging for event troubleshooting.

To enable all debugging options, specify **debug ipv6 ospf event** with no additional parameters.

The **no** and **undebug** variants of this command disable OSPF debugging. Using this command with no parameters entered, will disable debugging for all parameter options.

**Syntax** `debug ipv6 ospf events [abr] [asbr] [os][router] [vlink]`  
`no debug ipv6 ospf events [abr] [asbr] [os] [router] [vlink]`

Parameter	Description
abr	Shows ABR events.
asbr	Shows ASBR events.
router	Shows other router events.
os	Shows OS events.
vlink	Shows virtual link events.

**Mode** Privileged Exec and Global Configuration

**Example** To enable IPv6 event debugging and show ABR events, use the following command:

```
awplus# debug ipv6 ospf events asbr
```

# debug ipv6 ospf ifsm

**Overview** This command specifies debugging options for IPv6 OSPF Interface Finite State Machine (IFSM) troubleshooting.

To enable all debugging options, specify **debug ipv6 ospf ifsm** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF IFSM debugging. Use these commands without parameters to disable all the options.

**Syntax** `debug ipv6 ospf ifsm [events] [status] [timers]`  
`no debug ipv6 ospf ifsm [events] [status] [timers]`

Parameter	Description
events	Displays IFSM event information.
status	Displays IFSM status information.
timers	Displays IFSM timer information.

**Mode** Privileged Exec and Global Configuration

**Example** To specify IPv6 OSPF debugging options to display IPv6 OSPF IFSM events information, use the following commands:

```
awplus# debug ipv6 ospf ifsm events
```

**Related Commands** [terminal monitor](#)  
[undebug ipv6 ospf ifsm](#)

# debug ipv6 ospf lsa

**Overview** This command enables debugging options for IPv6 OSPF Link State Advertisements (LSA) troubleshooting. This displays information related to internal operations of LSAs.

To enable all debugging options, specify **debug ipv6 ospf lsa** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF LSA debugging. Use this command without parameters to disable all the options.

**Syntax**

```
debug ipv6 ospf lsa [flooding] [generate] [install] [maxage] [refresh]
no debug ipv6 ospf lsa [flooding] [generate] [install] [maxage] [refresh]
```

Parameter	Description
flooding	Displays LSA flooding.
generate	Displays LSA generation.
install	Show LSA installation.
maxage	Shows maximum age of the LSA in seconds.
refresh	Displays LSA refresh.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging for IPv6 OSPF refresh LSA, use the following commands:

```
awplus# debug ipv6 ospf lsa refresh
```

**Related Commands** [terminal monitor](#)  
[undebug ipv6 ospf lsa](#)

# debug ipv6 ospf nfsm

**Overview** This command enables debugging options for IPv6 OSPF Neighbor Finite State Machines (NFSMs).

To enable all debugging options, specify **debug ipv6 ospf nfsm** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF NFSM debugging. Use this command without parameters to disable all the options.

**Syntax** `debug ipv6 ospf nfsm [events] [status] [timers]`  
`no debug ipv6 ospf nfsm [events] [status] [timers]`

Parameter	Description
events	Displays NFSM event information.
status	Displays NFSM status information.
timers	Displays NFSM timer information.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable IPv6 debugging option to display timer information, use the following command:

```
awplus# debug ipv6 ospf nfsm timers
```

**Related Commands** [terminal monitor](#)  
[undebug ipv6 ospf nfsm](#)

# debug ipv6 ospf packet

**Overview** This command enables debugging options for IPv6 OSPF packets.

To enable all debugging options, specify **debug ipv6 ospf packet** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF packet debugging. Use this command without parameters to disable all options.

**Syntax**

```
debug ipv6 ospf packet [dd] [detail] [hello] [ls-ack]
[ls-request] [ls-update] [recv] [send]
no debug ipv6 ospf packet [dd] [detail] [hello] [ls-ack]
[ls-request] [ls-update] [recv] [send]
```

Parameter	Description
dd	Specifies debugging for IPv6 OSPF database descriptions.
detail	Sets the debug option to detailed information.
hello	Specifies debugging for IPv6 OSPF hello packets.
ls-ack	Specifies debugging for IPv6 OSPF link state acknowledgments.
ls-request	Specifies debugging for IPv6 OSPF link state requests.
ls-update	Specifies debugging for IPv6 OSPF link state updates.
recv	Specifies the debug option set for received packets.
send	Specifies the debug option set for sent packets.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging for hello packets, use the following command:

```
awplus# debug ipv6 ospf packet hello
```

**Related Commands** [terminal monitor](#)  
[undebug ipv6 ospf packet](#)

# debug ipv6 ospf route

**Overview** This command enables debugging of route calculation. Use this command without parameters to turn on all the options.

The **no** and **undebug** variants of this command disable IPv6 OSPF route debugging. Use this command without parameters to disable all options.

**Syntax** `debug ipv6 ospf route [ase] [ia] [install] [spf]`  
`no debug ipv6 ospf route [ase] [ia] [install] [spf]`

Parameter	Description
ase	Specifies the debugging of external route calculation.
ia	Specifies the debugging of inter-area route calculation.
install	Specifies the debugging of route installation.
spf	Specifies the debugging of SPF calculation.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable IPv6 route debugging of inter-area route calculations, use the following command:

```
awplus# debug ipv6 ospf route ia
```

**Related Commands** [terminal monitor](#)  
[undebug ipv6 ospf route](#)

# default-information originate

**Overview** This command creates a default external route into an OSPF routing domain.

When you use the **default-information originate** command to redistribute routes into an OSPF routing domain, then the system acts like an Autonomous System Boundary Router (ASBR). By default, an ASBR does not generate a default route into the OSPF routing domain.

When using this command, also specify the **route-map <route-map>** option to avoid a dependency on the default network in the routing table.

The **metric-type** is an external link type associated with the default route advertised into the OSPF routing domain. The value of the external route could be either Type 1 or 2. The default is Type 2.

The **no** variant of this command disables this feature.

**Syntax**

```
default-information originate [always] [metric <metric>]
[metric-type <1-2>] [route-map <route-map>]

no default-information originate [always] [metric]
[metric-type] [route-map]
```

Parameter	Description
always	Used to advertise the default route regardless of whether there is a default route.
<metric>	The metric value used in creating the default route. Enter a value in the range 0 to 16777214. The default metric value is 10. The value used is specific to the protocol.
<1-2>	External metric type for default routes, either OSPF External Type 1 or Type 2 metrics. Enter the value 1 or 2.
route-map	Specifies to use a specific route-map.
<route-map>	The route-map name. It is a string comprised of any characters, numbers or symbols.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# default-information originate always
metric 23 metric-type 2 route-map myinfo
```

**Related Commands** [route-map](#)

# default-metric (IPv6 OSPF)

**Overview** This command sets default metric value for routes redistributed into the IPv6 OSPF routing protocol.

The **no** variant of this command returns IPv6 OSPF to using built-in, automatic metric translations, as appropriate for each routing protocol.

**Syntax** `default-metric <0-16777214>`  
`no default-metric [<0-16777214>]`

Parameter	Description
<code>&lt;1-16777214&gt;</code>	Default metric value appropriate for the specified routing protocol.

**Mode** Router Configuration

**Usage** A default metric facilitates redistributing routes even with incompatible metrics. If the metrics do not convert, the default metric provides an alternative and enables the redistribution to continue. The effect of this command is that IPv6 OSPF will use the same metric value for **all** redistributed routes. Use this command in conjunction with the [redistribute \(IPv6 OSPF\)](#) command.

**Examples**

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# default-metric 100
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# no default-metric
```

**Related commands** [redistribute \(IPv6 OSPF\)](#)

# distance (IPv6 OSPF)

**Overview** This command sets the administrative distance for OSPFv3 routes based on the route type. Your device uses this value to select between two or more routes to the same destination from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information.

Use the command **distance ospfv3** to set the distance for an entire category of OSPFv3 routes, rather than the specific routes that pass an access list.

Use the command **distance <1-254>**, with no other parameter, to set the same distance for all OSPFv3 route types.

The **no** variant of this command sets the administrative distance for OSPFv3 routes to the default of 110.

**Syntax** `distance <1-254>`  
`distance ospfv3 {external <1-254>|inter-area <1-254>|intra-area <1-254>}`  
`no distance {ospfv3|<1-254>}`

Parameter	Description
<1-254>	Specify the Administrative Distance value for OSPFv3 routes.
external	Sets the distance for routes from other routing domains, learned by redistribution. Specify an OSPFv3 external distance in the range <1-254>.
inter-area	Sets the distance for all routes from one area to another area. Specify an OSPFv3 inter-area distance in the range <1-254>.
intra-area	Sets the distance for all routes within an area. Specify an OSPFv3 intra-area distance in the range <1-254>.

**Default** The default OSPFv3 administrative distance is 110. The default Administrative Distance for each type of route (intra, inter, or external) is 110.

**Mode** Router Configuration

**Usage** The administrative distance rates the trustworthiness of a routing information source. The distance could be any integer from 0 to 254. A higher distance value indicates a lower trust rating. For example, an administrative distance of 254 indicates that the routing information source cannot be trusted and should be ignored.

Use this command to set the distance for an entire group of routes, rather than a specific route that passes an access list.

**Examples** To set the following administrative distances for route types in OSPF 100:

- 20 for inter-area routes

- 10 for intra-area routes
- 40 for external routes

use the commands:

```
awplus(config)# router ipv6 ospf 100  
awplus(config-router)# distance ospfv3 inter-area 20 intra-area  
10 external 40
```

To set the administrative distance for all routes in OSPFv3 100 back to the default of 110, use the commands:

```
awplus(config)# router ipv6 ospf 100  
awplus(config-router)# no distance ospfv3
```

# distribute-list (IPv6 OSPF)

**Overview** Use this command to apply filtering to the transfer of routing information between OSPFv3 and the IPv6 route table.

The entities that are used to perform filtering are ACLs (Access Control Lists), which match on certain attributes in the routes that are being transferred. For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to disable this feature for networks as defined in an associated access-list.

**Syntax**

```
distribute-list <access-list> in
no distribute-list [<access-list>] in
distribute-list <access-list> out {connected|ospf
[<process-tag>]|rip|static}
no distribute-list <access-list> out {connected|ospf
[<process-tag>]|rip|static}
```

Parameter	Description
<access-list>	Specifies the IPv6 access-list number or name to use. The specified access list defines which networks are received and which are suppressed.
in	Indicates that this applies to incoming advertised routes.
out	Indicates that this applies to outgoing advertised routes.
connected	Specify the redistribution of connected routes.
ospf	Specify the redistribution of OSPFv3 routes.
<process-tag>	Optionally specify an OSPFv3 process tag for OSPFv3 routes.
rip	Specify the redistribution of RIPng routes.
static	Specify the redistribution of connected routes.

**Default** Disabled

**Mode** Router Configuration

**Usage** This command applies filtering to the transfer of routing information between OSPFv3 and the IPv6 route table. You can apply filtering in either direction, from OSPFv3 to the IPv6 route table using an **in** distribute-list, or from the IPv6 route table to OSPFv3 using an **out** distribute-list.

The effect of an **in** filter is that some route information that OSPFv3 has learned from LSA updates will not be installed into the IPv6 route table. The effect of an **out** filter is that some route information that could be redistributed to OSPFv3 will not be redistributed to OSPFv3.

There are **in** and **out** distribute-lists, which carry out different route filtering activities:

- The **in** distribute list is applied to the process of installing OSPFv3 routes into the IPv6 route table. The SPF calculation generate a set of routes calculated from the LSA database. By default, all of these routes become OSPFv3 candidate routes for inclusion into the IPv6 route table.
- An **in** distribute-list can be used to control whether or not certain routes generated by the SPF calculation are included into the set of candidates for inclusion into the IP route table. Those routes that match **deny** entries in the distribute-list will not be considered for inclusion into the IPv6 route table.
- The **out** distribute-list applies the process of redistributing non-OSPFv3 routes into OSPFv3. If OSPFv3 redistribution is configured, and an **out** distribute-list is also configured, then routes that match deny entries in the distribute-list will not be redistributed into OSPFv3.

**Example** The below commands redistribute incoming route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard myacl permit
2001:db8:1::/64
awplus(config)# router ipv6 ospf
awplus(config-router)# distribute-list myacl in
```

The below commands redistribute outgoing connected route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard myacl permit
2001:db8:1::/64
awplus(config)# router ipv6 ospf
awplus(config-router)# distribute-list myacl out connected
```

The below commands disable incoming route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no distribute-list myacl in
```

The below commands disable outgoing connected route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no distribute-list myacl out connected
```

**Related Commands** [ipv6 access-list extended \(named\)](#)  
[ipv6 access-list standard \(named\)](#)

# ipv6 ospf authentication spi

**Overview** Use this command in Interface Configuration mode to enable either MD5 (Message-Digest 5) or SHA1 (Secure Hash Algorithm 1) authentication for a specified interface.

Use the **no** variant of this command in Interface Configuration mode to disable the authentication configured for a specified interface.

**Syntax** `ipv6 ospf authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}`  
`ipv6 ospf authentication null`  
`no ipv6 ospf authentication ipsec spi <256-4294967295>`

Parameter	Description
authentication	Specify this keyword to enable authentication.
ipsec	Specify this keyword to use IPsec authentication.
spi	Specify this keyword to set the SPI (Security Parameters Index).
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.
md5	Specify the MD5 (Message-Digest 5) hashing algorithm.
<MD5-key>	Enter an MD5 key containing up to 32 hexadecimal characters.
sha1	Specify the SHA-1 (Secure Hash Algorithm 1) hashing algorithm.
<SHA1-key>	Enter an SHA-1 key containing up to 40 hexadecimal characters.
null	Specify no authentication is applied when no other parameters are applied after this keyword ( <code>ipv6 ospf authentication null</code> ). Note this overrides any existing area authentication configured.

**Mode** Interface Configuration

**Default** Authentication is not configured on an interface by default.

**Usage** Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

Use the **null** keyword to override existing area authentication. Apply the **null** keyword if area authentication is already configured to configure authentication on an interface.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**NOTE:** You can configure an authentication security policy (SPI) on a VLAN interface with this command, or an OSPFv3 area with the [area authentication ipsec spi](#) command.

When you configure authentication for an area, the security policy is applied to all VLAN interfaces in the area. Allied Telesis recommends a different authentication security policy is applied to each interface for higher security.

If you apply the **ipv6 ospf authentication null** command, this affects authentication configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area authentication, not being authenticated. So neighbors time out.

**Example** To enable MD5 authentication with a 32 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# area 1 authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 40 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf authentication ipsec spi 1000 sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To specify no authentication is applied to interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf authentication null
```

To disable authentication for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 ospf authentication ipsec spi 1000
```

**Related Commands**

- [area authentication ipsec spi](#)
- [area encryption ipsec spi esp](#)
- [ipv6 ospf encryption spi esp](#)
- [show ipv6 ospf interface](#)

# ipv6 ospf cost

**Overview** This command explicitly specifies the cost of the link-state metric in a router-LSA. The interface cost indicates the overhead required to send packets across a certain VLAN interface. Use this command to set the VLAN interface cost manually. The **no** variant of this command resets the VLAN interface cost to the default.

**Syntax** `ipv6 ospf cost <1-65535>`  
`no ipv6 ospf cost`

Parameter	Description
<1-65535>	The link-state metric.

**Default** By default there is no static value set and the OSPF cost is automatically calculated by using the command [auto-cost reference bandwidth \(IPv6 OSPF\)](#).

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command explicitly sets a user specified cost of sending packets out the interface. Using this command overrides the cost value calculated automatically with the auto-cost reference bandwidth (IPv6 OSPF) feature.

The link-state metric cost is stated in the Router-LSA's link. Typically, the cost is inversely proportional to the bandwidth of an interface. By default, the cost of a VLAN interface is calculated according to the following formula:

reference bandwidth / interface bandwidth

The reference bandwidth is set by default at 1000000 kbps (or 1000 Mbps), but can be changed by the command [auto-cost reference bandwidth \(IPv6 OSPF\)](#).

The interface bandwidth is set by default to 1000000 kbps (or 1000 Mbps), but can be changed by the [bandwidth](#) command.

**Example** To set the IPv6 OSPF cost to 10 on the VLAN interface `vlan25`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan25
awplus(config-if)# ipv6 ospf cost 10
```

**Related Commands** [show ipv6 ospf interface](#)  
[auto-cost reference bandwidth \(IPv6 OSPF\)](#)  
[bandwidth](#)

# ipv6 ospf dead-interval

**Overview** This command sets the interval during which no hello packets are received and after which a neighbor is declared dead.

The dead-interval is the amount of time that OSPF waits to receive an OSPF hello packet from the neighbor before declaring the neighbor is down. This value is advertised in the router's hello packets. It must be a multiple of the hello-interval and be the same for all routers on a specific network.

The **no** variant of this command returns the interval to the default of 40 seconds.

**Syntax** `ipv6 ospf dead-interval <1-65535> [<inst-id>]`  
`no ipv6 ospf dead-interval`

Parameter	Description
<1-65535>	The interval in seconds. Default: 40
<inst-id>	The instance ID Default: 0

**Mode** Interface Configuration for a VLAN interface.

**Example** The following example shows configuring the dead-interval to 10 seconds on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf dead-interval 10
```

**Related Commands** [ipv6 ospf hello-interval](#)  
[show ipv6 ospf interface](#)

# ipv6 ospf display route single-line

**Overview** Use this command to change the result of the **show ipv6 route** command to display each route entry on a single line.

**Syntax** `ipv6 ospf display route single-line`  
`no ipv6 ospf display route single-line`

**Mode** Global Configuration

**Example** To display each route entry on a single line.

```
awplus# configure terminal
awplus(config)# ipv6 ospf display route single-line
```

**Related Commands** [show ipv6 ospf route](#)

# ipv6 ospf encryption spi esp

**Overview** Use this command in Interface Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for a specified interface.

Use the **no** variant of this command in Interface Configuration mode to disable the encryption configured for a specified interface.

**Syntax**

```
ipv6 ospf encryption ipsec spi <256-4294967295> esp {aes-cbc  
<AES-CBC-key>|3des <3DES-key>|null}{md5 <MD5-key>|sha1  
<SHA1-key>}  
  
ipv6 ospf encryption null  
  
no ipv6 ospf encryption ipsec spi <256-4294967295>
```

Parameter	Description
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.
esp	Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption.
aes-cbc	Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption.
<AES-CBC-key>	Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters.
3des	Specify 3DES (Triple Data Encryption Standard) encryption.
<3DES-key>	Enter a 3DES key containing 48 hexadecimal characters.
null	Specify ESP without AES-CBC or 3DES encryption applied.
md5	Specify the MD5 (Message-Digest 5) encryption algorithm.
<MD5-key>	Enter an MD5 key containing 32 hexadecimal characters.
sha1	Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.
<SHA1-key>	Enter an SHA-1 key containing 40 hexadecimal characters.
null	Specify no encryption is applied when no other parameters are applied after this keyword ( <code>ipv6 ospf encryption null</code> ).

**Default** Authentication is not configured on an interface by default.

**Mode** Interface Configuration

**Usage** When you issue this command, authentication and encryption are both enabled. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. The IPv6 ESP extension header is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers, so applying IPv6 ESP extension headers are required for integrity, authentication, and confidentiality.

Use the **null** keyword to override existing area encryption. Apply the **null** keyword if area encryption is already configured to then configure encryption on an interface instead.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**NOTE:** You can configure an encryption security policy (SPI) on a VLAN interface with this command, or an OSPFv3 area with the [area encryption ipsec spi esp](#) command.

When you configure encryption for an area, the security policy is applied to all VLAN interfaces in the area. Allied Telesis recommends a different encryption security policy is applied for each interface for higher security.

If you apply the **ipv6 ospf encryption null** command this affects encryption configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area encryption, not being encrypted. So neighbors time out.

**Example** To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, for interface VLAN 2 and MD5 authentication with a 32 hexadecimal character key, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp null
md5 1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, for interface VLAN 2 and SHA-1 authentication with a 40 hexadecimal character key, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp null
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with an 3DES key with a 48 hexadecimal character key and MD5 authentication with a 32 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp 3des
1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF md5
1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption with an AES-CBC key with a 32 hexadecimal character key and SHA-1 authentication with a 40 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp
aes-cbc 1234567890ABCDEF1234567890ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To specify no ESP encryption is applied to interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption null
```

To disable ESP encryption for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 ospf encryption ipsec spi 1000
```

**Related  
Commands**

- [area authentication ipsec spi](#)
- [area encryption ipsec spi esp](#)
- [ipv6 ospf authentication spi](#)
- [show ipv6 ospf interface](#)

# ipv6 ospf hello-interval

**Overview** This command specifies the interval between hello packets.

The hello-interval is advertised in the hello packets. Configure the same hello-interval for all routers on a specific network. A shorter interval ensures faster detection of topological changes, but results in more routing traffic.

The **no** variant of this command returns the interval to the default of 10 seconds.

**Syntax** `ipv6 ospf hello-interval <1-65535>`  
`no ipv6 ospf hello-interval`

Parameter	Description
<1-65535>	The hello-interval in seconds. Default: 10

**Default** The default interval is 10 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Example** The following example shows setting the `hello-interval` to 3 seconds on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf hello-interval 3
```

**Related Commands** [ipv6 ospf dead-interval](#)  
[show ipv6 ospf interface](#)

# ipv6 ospf neighbor

**Overview** Use this command to configure static OSPFv3 IPv6 neighbors when using the OSPFv3 "non-broadcast" (NBMA) and "point-to-multipoint non-broadcast" (P2MP NBMA) network types. OSPFv3 messages exchanged between the neighbors are unicast only.

Use the **no** variant of this command to remove a configuration.

**Syntax** `ipv6 ospf neighbor <ipv6-address>`  
`[<cost>|<instance-id>|<poll-interval>|<priority>]`  
`no ipv6 ospf neighbor <ipv6-address>`  
`[<cost>|<instance-id>|<poll-interval>|<priority>]`

Parameter	Description
<code>&lt;ipv6-address&gt;</code>	Specifies the interface IPv6 address of the neighbor.
<code>&lt;cost&gt;</code>	<code>cost &lt;1-65535&gt;</code> OSPF cost for point-to-multipoint neighbor.
<code>&lt;instance-id&gt;</code>	<code>instance-id &lt;0-255&gt;</code> Interface instance ID.
<code>&lt;poll-interval&gt;</code>	<code>poll-interval &lt;0-4294967295&gt;</code> Dead neighbor polling interval in seconds. It is recommended to set this value much higher than the hello interval. The default is 120 seconds.
<code>&lt;priority&gt;</code>	<code>priority &lt;0-255&gt;</code> Specifies the router priority value of the non-broadcast neighbor associated with the specified IP address. The default is 0. This keyword does not apply to point-to-multipoint interfaces.

**Mode** Interface Configuration

**Usage** To configure a neighbor on an NBMA network manually, use the **ipv6 ospf neighbor** command and include one neighbor entry for each known non-broadcast network neighbor. The IPv6 address used in this command is the neighbor's primary IPv6 address on the interface where that neighbor connects to the NBMA network.

The poll interval is the reduced rate at which routers continue to send hello packets, when a neighboring router has become inactive. Set the poll interval to be much larger than hello interval.

You can use this command to configure static OSPFv3 IPv6 neighbors for Layer 3 interfaces, such as Ethernet or tunnel interfaces on routers or a VLAN interface on switches or routers.

**Examples** To configure a neighbor with a priority value, poll interval time, and cost, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf neighbor fe80::c:20:0:1 priority 1
poll-interval 90
awplus(config-router)# ipv6 ospf neighbor fe80::c:20:0:1 cost
15
```

**Related  
Commands** [show ipv6 ospf neighbor](#)

# ipv6 ospf network

**Overview** This command configures the OSPF network type to a type different from the default for the particular VLAN interface.

The **no** variant of this command returns the network type to the default for the particular VLAN interface.

**Syntax** `ipv6 ospf network [broadcast | non-broadcast | point-to-point | point-to-multipoint]`  
`no ipv6 ospf network`

Parameter	Description
<code>broadcast</code>	Sets the network type to broadcast.
<code>non-broadcast</code>	Sets the network type to NBMA.
<code>point-to-multipoint</code>	Sets the network type to point-to-multipoint.
<code>point-to-point</code>	Sets the network type to point-to-point.

**Default** The default is the `broadcast` OSPF network type for a VLAN interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command forces the interface network type to the specified type. Depending on the network type, OSPF changes the behavior of the packet transmission and the link description in LSAs.

**Example** The following example shows setting the network type to `point-to-point` on the VLAN interface `vlan1`:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 ospf network point-to-point
```

# ipv6 ospf priority

**Overview** This command sets the router priority, which is a parameter used in the election of the designated router for the link.

The **no** variant of this command returns the router priority to the default of 1.

**Syntax** `ipv6 ospf priority <priority>`  
`no ipv6 ospf priority`

Parameter	Description
<code>&lt;priority&gt;</code>	<code>&lt;0-255&gt;</code> Specifies the router priority of the interface. The larger the value, the greater the priority level. The value 0 defines that the device cannot become either the DR, or backup DR for the link.

**Default** The default priority is 1.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Set the priority to help determine the OSPF Designated Router (DR) for a link. If two routers attempt to become the DR, the router with the higher router priority becomes the DR. If the router priority is the same for two routers, the router with the higher router ID takes precedence.

Routers with zero router priority values cannot become the designated or backup designated router.

**Example** The following example shows setting the OSPFv3 priority value to 3 on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf priority 3
```

# ipv6 ospf retransmit-interval

**Overview** Use this command to specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface.

Use the **no** variant of this command to return to the default of 5 seconds.

**Syntax** `ipv6 ospf retransmit-interval <1-65535>`  
`no ipv6 ospf retransmit-interval`

Parameter	Description
<code>&lt;1-65535&gt;</code>	Specifies the interval in seconds.

**Default** The default interval is 5 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage** After sending an LSA to a neighbor, the router keeps the LSA until it receives an acknowledgment. In case the router does not receive an acknowledgment during the set time (the retransmit interval value) it retransmits the LSA. Set the retransmission interval value conservatively to avoid needless retransmission. The interval should be greater than the expected round-trip delay between two routers.

**Example** The following example shows setting the `ospf retransmit interval` to 6 seconds on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf retransmit-interval 6
```

# ipv6 ospf transmit-delay

**Overview** Use this command to set the estimated time it takes to transmit a link-state-update packet on the VLAN interface.

Use the **no** variant of this command to return to the default of 1 second.

**Syntax** `ipv6 ospf transmit-delay <1-65535>`  
`no ipv6 ospf transmit-delay`

Parameter	Description
<code>&lt;1-65535&gt;</code>	Specifies the time, in seconds, to transmit a link-state update.

**Default** The default interval is 1 second.

**Mode** Interface Configuration for a VLAN interface.

**Usage** The transmit delay value adds a specified time to the age field of an update. If the delay is not added, the time in which the LSA transmits over the link is not considered. This command is especially useful for low speed links. Add transmission and propagation delays when setting the transmit delay value.

**Example** To set the IPv6 OSPF transmit delay time to 3 seconds on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf transmit-delay 3
```

# ipv6 router ospf area

**Overview** Use this command to enable IPv6 OSPF routing on an interface.  
Use the **no** variant of this command to disable IPv6 OSPF routing on an interface.

**Syntax** `ipv6 router ospf area <area-id> [tag <process-id>] [instance <inst-id>]`  
`no ipv6 router ospf area <area-id>`

Parameter	Description
<code>&lt;area-id&gt;</code>	The ID of the IPv6 OSPF routing area. Can be entered as either an IPv4 A.B.C.D address format, or as an unsigned integer in the range, 0 to 4294967295. Use either of the following forms when entering an area-ID: <ul style="list-style-type: none"><li><code>area-id &lt;A.B.C.D&gt;</code> where A.B.C.D is a number entered in IPv4 address format.</li><li><code>area-id &lt;0 to 4294967295&gt;</code>.</li></ul>
<code>&lt;process-id&gt;</code>	The process tag denotes a separate router process. It can comprise any string of alphanumeric characters. Note that this tag is local to the router on which it is set and does not appear in any OSPF packets or LSA.
<code>&lt;instance-id&gt;</code>	The OSPF instance ID, entered as an integer between 0 and 255. This is the value that will appear in the instance field of the IPv6 OSPF hello packet.

**Defaults** IPv6 OSPF routing is disabled by default.

When enabling IPv6 OSPF routing:

- the process-tag will default to a null value if not set.
- the Instance ID defaults to 0 if not set.

**Mode** Interface Configuration for a VLAN interface.

**Usage** When enabling IPv6 OSPF routing on an interface, specifying the area-ID is mandatory, but the Process tag and Instance are optional.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**Examples** The following commands enable IPv6 OSPF on VLAN interface `vlan2`, OSPF area 1, tag PT2, and instance 2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 router ospf area 1 tag PT2 instance-id 2
```

The following commands disable IPv6 OSPF on VLAN interface `vlan2` and OSPF area 1:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 router ospf area 1
```

# max-concurrent-dd (IPv6 OSPF)

**Overview** Use this command to limit the number of neighbors that can be concurrently processed in the database exchange. The specified value limits the number of neighbors from all interfaces, not per interface.

Use the **no** variant of this command to have no limit on the maximum number of LSAs.

**Syntax** `max-concurrent-dd <max-neighbors>`  
`no max-concurrent-dd`

Parameter	Description
<code>&lt;max-neighbors&gt;</code>	<code>&lt;1-65535&gt;</code> The maximum number of neighbors.

**Mode** Router Configuration

**Usage** This command is useful where bringing up several adjacencies on a router is affecting performance. In this situation, you can often enhance the system performance by limiting the number of neighbors that can be processed concurrently.

**Example** The following example sets the max-concurrent-dd value to allow only 4 neighbors to be processed at a time.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# max-concurrent-dd 4
```

**Related Commands** [router ipv6 ospf](#)

# passive-interface (IPv6 OSPF)

**Overview** Use this command to suppress the sending of Hello packets on a specified interface. If you use the **passive-interface** command without the optional parameters then **all** interfaces are put into passive mode.

Use the **no** variant of this command to allow the sending of Hello packets on all interfaces, or on the specified interface. If you use the **no** variant of this command without the optional parameters then **all** interfaces are removed from passive mode.

**Syntax** `passive-interface [<interface>]`  
`no passive-interface [<interface>]`

Parameter	Description
<interface>	The name or the VID of the VLAN interface.

**Mode** Router Configuration

**Usage** Configure an interface to be passive if you wish its connected route to be treated as an OSPF route (rather than an AS-external route), but do not wish to actually exchange any OSPF packets via this interface.

**Examples** To configure passive interface mode on interface vlan2, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# passive-interface vlan2
```

To configure passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# passive-interface
```

To remove passive interface mode on interface vlan2, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# no passive-interface vlan2
```

To remove passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# no passive-interface
```

# redistribute (IPv6 OSPF)

**Overview** Use this command to redistribute routes from other routing protocols, static routes and connected routes into an IPv6 OSPF routing table.

Use the **no** variant of this command to disable this function.

**Syntax** `redistribute <protocol> [metric <0-16777214>] [metric-type {1|2}] [route-map <route-map-entry>]`  
`no redistribute <protocol>`

Parameter	Description						
<code>&lt;protocol&gt;</code>	The routing protocol to be redistributed, can be one of: <table border="1"><tr><td><code>connected</code></td><td>Connected routes</td></tr><tr><td><code>rip</code></td><td>Routing Internet Protocol</td></tr><tr><td><code>static</code></td><td>Static Routes</td></tr></table>	<code>connected</code>	Connected routes	<code>rip</code>	Routing Internet Protocol	<code>static</code>	Static Routes
<code>connected</code>	Connected routes						
<code>rip</code>	Routing Internet Protocol						
<code>static</code>	Static Routes						
<code>metric</code>	Specifies the external metric.						
<code>metric-type</code>	Specifies the external metric-type, either type 1 or type 2. <ul style="list-style-type: none"><li>• <b>For Metric Type 1:</b> The best route is based on the external redistributed path cost plus the internal path cost presented by the native routing protocol.</li><li>• <b>For Metric Type 2:</b> The best route is based only on the external redistributed path cost. The internal path cost is only used to break a "tie" situation between two identical external path costs.</li></ul>						
<code>route-map</code>	The name of the specific route-map.						

**Default** The default metric value for routes redistributed into OSPFv3 is 20. The metric can also be defined using the [set metric](#) command for a route map. Note that a metric defined using the [set metric](#) command for a route map overrides a metric defined with this command.

**Mode** Router Configuration

**Usage** You use this command to inject routes, learned from other routing protocols, into the OSPF domain to generate AS-external-LSAs. If a route-map is configured by this command, then that route-map is used to control which routes are redistributed and can set metric and tag values on particular routes.

The metric, metric-type, and tag values specified on this command are applied to any redistributed routes that are not explicitly given a different metric, metric-type, or tag value by the route map.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information about metrics, and about behavior when configured in route maps.

Note that this command does not redistribute the default route. To redistribute the default route, use the [default-information originate](#) command.

**Example** The following example shows the redistribution of RIP routes into the IPv6 OSPF routing table, with a metric of 10 and a metric type of 1.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# redistribute rip metric 10 metric-type 1
```

# restart ipv6 ospf graceful

**Overview** Use this command to force the OSPFv3 process to restart. You may optionally specify a grace-period value. If a grace-period is not specified then a default value of 120 seconds is applied.

You should specify a grace-period value of 120 seconds or more. Low grace-period values may cause the graceful restart process on neighboring routers to terminate with routes missing.

**Syntax** `restart ipv6 ospf graceful [grace-period <1-1800>]`

Parameter	Description
<code>grace-period</code>	Specify the grace period.
<code>&lt;1-1800&gt;</code>	The grace period in seconds.

**Default** The default OSPF grace-period is 120 seconds.

**Mode** Privileged Exec

**Usage** After this command is executed, the OSPFv3 process immediately shuts down. It notifies the system that OSPF has performed a graceful shutdown. Routes installed by OSPF are preserved until the grace-period expires.

When a **restart ospf graceful** command is issued, the OSPF configuration is reloaded from the last saved configuration. Ensure you first enter the [copy running-config startup-config](#) command.

**Example** To restart OSPFv3, use the following commands:

```
awplus# copy running-config startup-config  
awplus# restart ipv6 ospf graceful grace-period 200
```

To apply the default grace-period (120 seconds), use the following commands:

```
awplus# copy running-config startup-config  
awplus# restart ipv6 ospf graceful
```

# router ipv6 ospf

**Overview** Use this command to create or remove an IPv6 OSPF routing process, or to enter the Router Configuration mode to configure a specific IPv6 OSPF routing process. Use the **no** variant of this command to terminate an IPv6 OSPF routing process.

Use the **no** parameter with the **process-id** parameter, to terminate and delete a specific IPv6 OSPF routing process.

**Syntax** `router ipv6 ospf [<process-id>]`  
`no router ipv6 ospf [<process-id>]`

Parameter	Description
<code>&lt;process-id&gt;</code>	A character string that identifies a routing process. If you do not specify the process-id a "null" process ID will be applied. Note that this will appear in show output as *null*. However you cannot select the null process by using the character string *null* as command entry characters.

**Default** No routing process is defined by default.

**Mode** Global Configuration

**Usage** The process ID enables you to run more than one OSPF session within the same router, then configure each session to a different router port. Note that this function is internal to the router, and other routers (neighbors) have no knowledge of these different processes. The hello and LSAs issued from each process will appear as if coming from a separate physical router.

To a large extent the requirement for multiple processes has been replaced by the ability within IPv6 OSPF of running simultaneous router instances.

The process ID of IPv6 OSPF is an optional parameter for the **no** variant of this command only. When removing all IPv6 OSPF processes on the device, you do not need to specify each Process ID, but when removing particular IPv6 OSPF processes, you must specify each Process ID to be removed.

For a description of processes and instances and their configuration relationships, see the [OSPFv3 Feature Overview and Configuration Guide](#).

**Example** This example shows the use of this command to enter Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf P100
awplus(config-router)#
```

# router-id (IPv6 OSPF)

**Overview** Use this command to specify a router ID for the IPv6 OSPF process.  
Use the **no** variant of this command to disable this function.

**Syntax** `router-id <router-id>`  
`no router-id`

Parameter	Description
<code>&lt;router-id&gt;</code>	Specifies the router ID in IPv4 address format.

**Mode** Router Configuration

**Usage** Configure each router with a unique router-id. In an IPv6 OSPF router process that has active neighbors, a new router-id takes effect at the next reload or when you restart OSPF manually.

**Example** The following example shows a specified router ID 0.0.4.5.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# router-id 0.0.4.5
```

**Related Commands** [show ipv6 ospf](#)

# show debugging ipv6 ospf

**Overview** Use this command in User Exec or Privileged Exec modes to display which OSPFv3 debugging options are currently enabled.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show debugging ipv6 ospf`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show debugging ipv6 ospf`

**Output** Figure 27-1: Example output from the **show debugging ipv6 ospf** command

```
OSPFv3 debugging status:
OSPFv3 all packet detail debugging is on
OSPFv3 all IFSM debugging is on
OSPFv3 all NFSM debugging is on
OSPFv3 all LSA debugging is on
OSPFv3 all NSM debugging is on
OSPFv3 all route calculation debugging is on
OSPFv3 all event debugging is on
```

# show ipv6 ospf

**Overview** Use this command in User Exec or Privileged Exec modes to display general information about all IPv6 OSPF routing processes, including OSPFv3 Authentication configuration and status information.

Include the process ID parameter with this command to display information about specified processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf`  
`show ipv6 ospf <process-id>`

Parameter	Description
<process-id>	<0-65535> The ID of the router process for which information will be displayed. If this parameter is included, only the information for the specified routing process is displayed.

**Mode** User Exec and Privileged Exec

**Examples** To display general information about all IPv6 OSPF routing processes, use the command:

```
awplus# show ipv6 ospf
```

To display general information about IPv6 OSPF (OSPFv3) routing process P10, use the command:

```
awplus# show ipv6 ospf P10
```

**Output** Figure 27-2: Example output from the **show ipv6 ospf** command for process P10, showing OSPFv3 Authentication configuration information highlighted in bold

```
awplus#show ipv6 ospf
  Routing Process "OSPFv3 (10)" with ID 192.168.1.2
  Route Licence: Route : Limit=Unlimited, Allocated=0, Visible=0,
Internal=0
  Route Licence: Breach: Current=0, Watermark=0
  Process uptime is 6 minutes
  Current grace period is 120 secs (default)
  SPF schedule delay min 0.500 secs, SPF schedule delay max 50.0
secs
  Minimum LSA interval 5 secs, Minimum LSA arrival 1 secs
  Number of incoming current DD exchange neighbors 0/5
  Number of outgoing current DD exchange neighbors 0/5
  Number of external LSA 0. Checksum Sum 0x0000
  Number of AS-Scoped Unknown LSA 0
  Number of LSA originated 4
  Number of LSA received 10
  Number of areas in this router is 1
    Area BACKBONE(0)
      Number of interfaces in this area is 1(1)
      MD5 Authentication SPI 1000
      NULL Encryption SHA-1 Auth, SPI 1001
      SPF algorithm executed 9 times
      Number of LSA 3. Checksum Sum 0xF9CC
      Number of Unknown LSA 0
```

# show ipv6 ospf database

**Overview** Use this command in User Exec or Privileged Exec modes to display a database summary for IPv6 OSPF information. Include the process ID parameter with this command to display information about specified processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf <process-id> database  
[self-originate|max-age|adv router <adv-router-id>]`

Parameter	Description
<process-id>	<0-65535> The ID of the router process for which information will be displayed.
self-originate	Displays self-originated link states.
max-age	Displays LSAs in MaxAge list. It maintains the list of the all LSAs in the database which have reached the max-age which is 3600 seconds.
adv-router	Advertising Router LSA.
<adv-router- id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.

**Mode** User Exec and Privileged Exec

**Example** To display the database summary for IPv6 OSPF information on process P10, use the command:

```
awplus# show ipv6 ospf P10 database
```

**Output** Figure 27-3: Example output from the **show ipv6 ospf P10 database** command

```

# show ipv6 ospf database external

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the external LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf database external <adv-router-id>  
[self-originate|adv-router <adv-router-id>]`

Parameter	Description
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
self-originate	Self-originated link states.
adv-router	Displays all the LSAs of the specified router.

**Mode** User Exec and Privileged Exec

**Examples** To display information about the external LSAs, use the following command:

```
awplus# show ipv6 ospf database external adv-router 10.10.10.1
```

**Output** Figure 27-4: Example output from the **show ipv6 ospf database external** command

```
LS age: 1087
LS Type: AS-External-LSA
Link State ID: 0.0.0.13
Advertising Router: 0.0.1.1

  Prefix Options: 0 (-|-|-|-)
  Forwarding Address: 2003:1111::1
...
```

# show ipv6 ospf database grace

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the grace LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf database grace <adv-router-id>`  
`[self-originate|adv-router <adv-router-id>]`

Parameter	Description
<code>&lt;adv-router-id&gt;</code>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
<code>adv-router</code>	Displays all the LSAs of the specified router.
<code>self-originate</code>	Self-originated link states.

**Mode** User Exec and Privileged Exec

**Examples** To display information about the grace LSAs, use the following command:

```
awplus# show ipv6 ospf database grace adv-router 10.10.10.1
```

**Output** Figure 27-5: Example output from the **show ipv6 ospf database grace** command

```
LS age: 1087
LS Type: AS-External-LSA
Link State ID: 0.0.0.13
Advertising Router: 0.0.1.1
LS Seq Number: 0x8000000C
Checksum: 0xCE9D
Length: 52
  Metric Type: 2 (Larger than any link state path)
  Metric: 20
  Prefix: 2010:2222::/64
  Prefix Options: 0 (-|-|-|-)
  Forwarding Address: 2003:1111::1
```

# show ipv6 ospf database inter-prefix

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the inter-prefix LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf database inter-prefix <adv-router-id>  
[self-originate|adv-router <adv-router-id>]`

Parameter	Description
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
adv-router	Displays all the LSAs of the specified router.
self-originate	Self-originated link states.

**Mode** User Exec and Privileged Exec

**Examples** To display information about the inter-prefix LSAs, use the following command:

```
awplus# show ipv6 ospf database external adv-router 10.10.10.1
```

**Output** Figure 27-6: Example output from the **show ipv6 ospf database inter-prefix** command

```
LS age: 1087
LS Type: AS-External-LSA
Link State ID: 0.0.0.13
Advertising Router: 0.0.1.1
LS Seq Number: 0x8000000C
Checksum: 0xCE9D

...
```

# show ipv6 ospf database inter-router

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the inter-router LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf database inter-router <adv-router-id>`  
`[self-originate] adv-router <adv-router-id>]`

Parameter	Description
<code>&lt;adv-router-id&gt;</code>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
<code>adv-router</code>	Displays all the LSAs of the specified router.
<code>self-originate</code>	Self-originated link states.

**Mode** User Exec and Privileged Exec

**Examples** To display information about the inter-router LSAs, use the following command:

```
awplus# show ipv6 ospf database inter-router adv-router  
10.10.10.1
```

**Output** Figure 27-7: Example output from the **show ipv6 ospf database inter-router** command

```
LS age: 1087  
LS Type: AS-External-LSA  
Link State ID: 0.0.0.13

...
```

# show ipv6 ospf database intra-prefix

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the intra-prefix LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf database intra-prefix <adv-router-id>  
[self-originate|adv-router <adv-router-id>]`

Parameter	Description
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
adv-router	Displays all the LSAs of the specified router.
self-originate	Self-originated link states.

**Mode** User Exec and Privileged Exec

**Examples** To display information about the intra-prefix LSAs, use the following command:

```
awplus# show ipv6 ospf database intra-prefix adv-router  
10.10.10.1
```

**Output** Figure 27-8: Example output from the **show ipv6 ospf database intra-prefix** command

```
LS age: 1087  
LS Type: AS-External-LSA  
Link State ID: 0.0.0.13  
Advertising Router: 0.0.1.1  
LS Seq Number: 0x8000000C  
Checksum: 0xCE9D  
Length: 52  
Metric Type: 2 (Larger than any link state path)  
Metric: 20  
Prefix: 2010:2222::/64  
Prefix Options: 0 (-|-|-|-)  
Forwarding Address: 2003:1111::1  
...
```

# show ipv6 ospf database link

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the link LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf database link <adv-router-id>`  
`[self-originate|adv-router <adv-router-id>]`

Parameter	Description
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
adv-router	Displays all the LSAs of the specified router.
self-originate	Self-originated link states.

**Mode** User Exec and Privileged Exec

**Examples** To display information about the link LSAs, use the following command:

```
awplus# show ipv6 ospf database link adv-router 10.10.10.1
```

**Output** Figure 27-9: Example output from the **show ipv6 ospf database link** command

```
LS age: 1087
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.13
  Advertising Router: 0.0.1.1
  LS Seq Number: 0x8000000C
  Checksum: 0xCE9D
  Length: 52
    Metric Type: 2 (Larger than any link state path)
    Metric: 20
    Prefix: 2010:2222::/64
    Prefix Options: 0 (-|-|-)
    Forwarding Address: 2003:1111::1
  ...
```

# show ipv6 ospf database network

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the network LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf database network <adv-router-id>`  
`[self-originate|adv-router <adv-router-id>]`

Parameter	Description
<code>&lt;adv-router-id&gt;</code>	The router ID of the advertising router, in IPv4 address format. Note, however, that this no longer represents a real address.
<code>self-originate</code>	Self-originated link states.
<code>adv-router</code>	The advertising router selected.

**Mode** User Exec and Privileged Exec

**Examples** To display information about the OSPFv3 network LSAs, use the following command:

```
awplus# show ipv6 ospf database network
```

**Output** Figure 27-10: Example output from the **show ipv6 ospf database network** command

```

# show ipv6 ospf interface

**Overview** Use this command in User Exec or Privileged Exec modes to display interface information for OSPF for all interfaces or a specified interface, including OSPFv3 Authentication status for all interfaces or for a specified interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf interface [<interface-name>]`

Parameter	Description
<interface-name>	An alphanumeric string that is the interface name. Omit the optional interface to display OSPF

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ipv6 ospf interface vlan2`

**Output** Figure 27-12: Example output from the **show ipv6 ospf interface** command showing OSPFv3 Authentication configuration information highlighted in bold

```
awplus#show ipv6 ospf interface
vlan2 is up, line protocol is up
Interface ID 302
IPv6 Prefixes
  fe80::215:77ff:fead:f87e/64 (Link-Local Address)
Security Policy
  MD5 Authentication SPI 1000
  NULL Encryption SHA-1 Auth, SPI 1001

OSPFv3 Process (10), Area 0.0.0.0, Instance ID 0
Router ID 192.168.1.2, Network Type BROADCAST, Cost: 1
Transmit Delay is 1 sec, State Backup, Priority 1
Interface state Backup
Designated Router (ID) 192.168.1.1
  Interface Address fe80::21d:e5ff:fec9:cfbe
Backup Designated Router (ID) 192.168.1.2
  Interface Address fe80::215:77ff:fead:f87e
Timer interval configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
  Hello due in 00:00:07
Neighbor Count is 1, Adjacent neighbor count is 1
```

Figure 27-13: Example output from the **show ipv6 ospf interface** vlan3 command

```
awplus#show ipv6 ospf interface vlan3
vlan3 is up, line protocol is up
  Interface ID 203
  IPv6 Prefixes
    fe80::200:cdff:fe24:daae/64 (Link-Local Address)
    2003:1111::2/64
  OSPFv3 Process (P1), Area 0.0.0.0, Instance ID 0
  Router ID 0.0.1.1, Network Type BROADCAST, Cost: 1
  Transmit Delay is 1 sec, State DR, Priority 1
  Designated Router (ID) 0.0.1.1
    Interface Address fe80::200:cdff:fe24:daae
  No backup designated router on this link
  Timer interval configured, Hello 10, Dead 40, Wait 40,
  Retransmit 5
    Hello due in 00:00:02

# show ipv6 ospf neighbor

**Overview** Use this command in User Exec or Privileged Exec modes to display information on OSPF neighbors. Include the process ID parameter with this command to display information about specified processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf [<process-id>] neighbor <neighbor-id>`  
`show ipv6 ospf [<process-id>] neighbor detail`  
`show ipv6 ospf [<process-id>] neighbor <interface> [detail]`

Parameter	Description
<process-id>	<character string> The ID of the OSPF process for which information will be displayed.
<neighbor-id>	The Neighbor ID, entered in IP address (A.B.C.D) format.
detail	Detail of all neighbors.
<interface>	IP address of the interface.

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ipv6 ospf neighbor`

**Output** Figure 27-14: Example output from **show ipv6 ospf neighbor**

```
awplus#show ipv6 ospf P1 neighbor 2.2.2.2
OSPFv3 Process (P1)
Neighbor ID      Pri      State                Dead Time   Interface Instance ID
2.2.2.2          5        2-Way/DROther        00:00:33   vlan3         0
```

Figure 27-15: Example output from **show ipv6 ospf neighbor detail**

```
awplus#show ipv6 ospf neighbor detail
Neighbor 0.0.1.2, interface address fe80::215:77ff:fec9:7472
  In the area 0.0.0.0 via interface vlan2
  Neighbor priority is 1, State is Full, 6 state changes
  DR is 0.0.1.2      BDR is 0.0.1.1
  Options is 0x000013 (-|R|-|-|E|V6)
  Dead timer due in 00:00:33
  Database Summary List 0
  Link State Request List 0
  Link State Retransmission List 0
```

# show ipv6 ospf route

**Overview** Use this command in User Exec or Privileged Exec modes to display the OSPF routing table. Include the process ID parameter with this command to display the OSPF routing table for specified processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf [<process-id>] route`

Parameter	Description
<code>&lt;process-id&gt;</code>	A character string that specifies the router process. If this parameter is included, only the information for this specified routing process is displayed.

**Mode** User Exec and Privileged Exec

**Examples** To display the OSPF routing table, use the command:

```
awplus# show ipv6 ospf route
```

**Output** Figure 27-16: Example output from the **show ipv6 ospf P10 route** command for a specific process

```

```

# show ipv6 ospf virtual-links

**Overview** Use this command in User Exec or Privileged Exec modes to display virtual link information, including OSPFv3 Authentication status for virtual links.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf virtual-links`

**Mode** User Exec and Privileged Exec

**Usage** See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**Examples** To display virtual link information, use the command:

```
awplus# show ipv6 ospf virtual-links
```

**Output** Figure 27-17: Example output from the **show ipv6 ospf virtual-links** command showing OSPFv3 Authentication configuration information highlighted in bold

```
awplus#show ipv6 ospf virtual-links
Virtual Link VLINK1 to router 192.168.1.10 is down
  Transit area 0.0.0.1 via interface *, instance ID 0

[area virtual-link encryption ipsec spi](#)

# summary-address (IPv6 OSPF)

**Overview** Use this command in Router Configuration mode to summarize, or possibly suppress, external redistributed OSPFv3 routes within the specified address range.

Use the **no** variant of this command in Router Configuration mode to stop summarizing, or suppressing, external redistributed OSPFv3 routes within the specified address range.

**Syntax** `summary-address <ipv6-addr/prefix-length> [not-advertise] [tag <0-4294967295>]`

`no summary-address <ipv6-addr/prefix-length> [not-advertise] [tag <0-4294967295>]`

Parameter	Description
<code>&lt;ipv6-addr/prefix-length&gt;</code>	Specifies the base IPv6 address of the IPv6 summary address. The range of addresses given as IPv6 starting address and an IPv6 prefix length.
<code>not-advertise</code>	Set the <b>not-advertise</b> option if you do not want OSPFv3 to advertise either the summary address or the individual networks within the range of the summary address.
<code>tag &lt;0-4294967295&gt;</code>	The tag parameter specifies the tag value that OSPFv3 places in the AS external LSAs created as a result of redistributing the summary route. The tag overrides tags set by the original route.

**Default** The default tag value for a summary address is 0.

**Mode** Router Configuration

**Usage** An address range is a pairing of an address and a prefix length. Redistributing routes from other protocols into OSPFv3 requires the router to advertise each route individually in an external LSA. Use this command to advertise one summary route for all redistributed routes covered by a specified prefix to decrease the size of the OSPFv3 link state database.

For example, if the specified address range is 2001:0db8:44::/48, then summary-address functionality will match 2001:0db8:4400:0000::1/128 through 2001:0db8:44ff:ffff::1/128.

Ensure OSPFv3 routes exist in the summary address range for advertisement before using this command.

**Example** The following example uses the `summary-address` command to aggregate external LSAs that match the IPv6 prefix `2001:0db8::/32` and assigns a tag value of 3.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# summary-address 2001:0db8::/32 tag 3
```

The following example uses the `no summary-address` command to stop summarizing IPv6 addresses in the address range covered within the IPv6 prefix `2001:0db8::/32`.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no summary-address 2001:0db8::/32
```

## timers spf (IPv6 OSPF) (deprecated)

**Overview** This command has been deprecated because SPF timers have been replaced by exponential SPF timers. To configure the exponential timers, please use the [timers spf exp \(IPv6 OSPF\)](#) command instead.

# timers spf exp (IPv6 OSPF)

**Overview** Use this command to adjust route calculation timers using exponential back-off delays.

Use **no** form of this command to return to the default exponential back-off timer values.

**Syntax** `timers spf exp <min-holdtime> <max-holdtime>`  
`no timers spf exp <min-holdtime> <max-holdtime>`

Parameter	Description
<code>&lt;min-holdtime&gt;</code>	Specifies the minimum delay between receiving a change to the SPF calculation in milliseconds. The range is 0-2147483647. The default SPF min-holdtime value is 50 milliseconds.
<code>&lt;max-holdtime&gt;</code>	Specifies the maximum delay between receiving a change to the SPF calculation in milliseconds. The range is 0-2147483647. The default SPF max-holdtime value is 50 seconds.

**Mode** Router Configuration

**Usage** This command configures the minimum and maximum delay time between the receipt of a topology change and the calculation of the Shortest Path First (SPF). The time between SPF runs increases if a topology change occurs (and triggers a new SPF run) before the last SPF holdtimer has finished. The time between runs may increase up to the max-holdtime value. This increase in holdtime prevents too many SPF runs from occurring if multiple OSPF topology change events occur.

**Examples** To set the minimum delay time to 5 milliseconds and maximum delay time to 2 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# timers spf exp 5 2000
```

# address-family

**Overview** This command enters the IPv4 or IPv6 Address-Family Configuration command mode. In this mode you can configure address-family specific parameters.

When using VRF-lite, you can enter IPv4 Address Family Configuration mode for a specified VRF instance before configuring that instance.

**Syntax [BGP]** address-family ipv4 [unicast]  
no address-family ipv4 [unicast]

**Syntax (VRF-lite)** address-family ipv4 [unicast|vrf <vrf-name>]  
no address-family ipv4 [unicast|vrf <vrf-name>]

**Syntax [BGP4+]** address-family ipv6 [unicast]  
no address-family ipv6 [unicast]

Parameter	Description
ipv4	Configure parameters relating to the exchange of IPv4 prefixes.
ipv6	Configure parameters relating to the exchange of IPv6 prefixes.
unicast	Configure parameters relating to the exchange of routes to unicast destinations.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance to enter IPv4 Address-Family mode for.

**Mode [BGP]** Router Configuration

**Mode [BGP4+]** Router Configuration

**Usage** To leave the IPv4 or IPv6 Address Family Configuration mode, and return to the Router Configuration mode, use the [exit-address-family](#) command.

**Example [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 192.168.0.1 remote-as 100
awplus(config-router)# address-family ipv4 vrf
green
awplus(config-router-af)# neighbor 192.168.0.1 activate
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Example [BGP4+]** awplus# configure terminal  
awplus(config)# router bgp 100  
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 100  
awplus(config-router)# address-family ipv6  
awplus(config-router-af)# neighbor 2001:0db8:010d::1 activate  
awplus(config-router-af)# exit-address-family  
awplus(config-router)#

**Related  
Commands** [exit-address-family](#)

**Command  
changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# aggregate-address

**Overview** This command adds an aggregate route that can be advertised to BGP or BGP4+ neighbors. This command creates an aggregate entry in the BGP or BGP4+ routing table if the device learns, by any means, any routes that are within the range configured by the aggregate address/mask.

When this command is used with the **summary-only** option, the more-specific routes of the aggregate are suppressed to all neighbors. Use the [neighbor unsuppress-map](#) command instead to selectively leak more-specific routes to a particular neighbor.

The **no** variant of this command removes the aggregate configured by the **aggregate-address** command.

**Syntax [BGP]** `aggregate-address <ip-addr/m> {summary-only|as-set}`  
`no aggregate-address <ip-addr/m> {summary-only|as-set}`

**Syntax [BGP4+]** `aggregate-address <ipv6-addr/prefix-length>`  
`{summary-only|as-set}`  
`no aggregate-address <ipv6-addr/prefix-length>`  
`{summary-only|as-set}`

Parameter	Description
<code>&lt;ip-addr/m&gt;</code>	Specifies the aggregate IPv4 address and mask.
<code>&lt;ipv6-addr/prefix-length&gt;</code>	Specifies the aggregate IPv6 address. The IPv6 address uses the format X:X::X:Prefix-Length. The prefix-length is usually set between 0 and 64.
<code>summary-only</code>	Filters more specific routes from updates. Only the aggregate address/mask will be advertised, and none of the component addresses that fall within the range of the aggregate address/mask.
<code>as-set</code>	Generates AS set path information. The AS-path advertised with the aggregate is an unordered list of all the AS-numbers that appear in any of the AS-paths of the component routes, with each AS-number appearing just once in the list.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage [BGP]** If the `summary-only` parameter is specified, then only the aggregate address/mask will be advertised, and none of the component addresses that fall within the range of the aggregate address/mask. For example, if you configure:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# aggregate-address 172.0.0.0/8 summary-
only
```

then the device will advertise the prefix 172.0.0.0/8, but no component routes like 172.10.0.0/16

The `as-set` parameter controls the AS-path attribute that is advertised with the aggregate route. If the device has learned multiple routes that are within the range of the aggregate address/mask, and the AS-paths associated with those routes contain different sets of AS-numbers, then it is not possible to create a single AS-path that accurately represents the AS-paths of all those component routes. In this case, the device will, by default, advertise a NULL AS-path with the aggregate.

**Usage [BGP4+]** If the `summary-only` parameter is specified, then only the aggregate address/mask will be advertised, and none of the component addresses that fall within the range of the aggregate address/mask. For example, if you configure:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)#address-family ipv6
awplus(config-router-af)# aggregate-address 2001:0db8::/64
summary-only
```

then the device will advertise the prefix 2001:0db8::/64, but no component routes like 2001:0db8:010d::/128

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# aggregate-address 192.0.0.0/8 as-set
summary-only

awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no aggregate-address 192.0.0.0/8 as-set
summary-only
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address family ipv6
awplus(config-router-af)# aggregate-address 2001:0db8::/64
as-set summary-only
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address family ipv6
awplus(config-router-af)# no aggregate-address 2001:0db8::/64
as-set summary-only
```

# auto-summary (BGP only)

**Overview** Use this command to enable sending summarized routes by a BGP speaker to its peers in the Router Configuration mode or in the Address-Family Configuration mode. BGP uses auto-summary to advertise summarized routes.

Use the **no** variant of this command to disable BGP auto-summary.

**Syntax** auto-summary  
no auto-summary

**Default** The auto-summary function is disabled by default.

**Mode** Router Configuration and Address Family IPv4 mode

**Usage** If certain routes have already been advertised, enabling auto-summary results in non- summarized routes being withdrawn and only summarized routes are advertised. Summarized routes are advertised before non-summarized routes are withdrawn from all connected peers.

If certain routes have already been advertised, disabling auto-summary results in summarized routes being withdrawn and only non-summarized routes are advertised. Non-summarized routes are advertised before summarized routes are withdrawn from all connected peers.

**Examples** The following example enables auto-summary in Router Configuration mode:

```
awplus# configure
awplus(config)# router bgp 100
awplus(config-router)# auto-summary
```

The following example disables auto-summary in Router Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no auto-summary
```

The following example enables auto-summary in Address Family IPv4 mode:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv4
awplus(config-router-af)# auto-summary
```

The following example disables auto-summary in Address Family IPv4 mode:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no auto-summary
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp aggregate-next-hop-check

**Overview** This command affects the operation of the summary-only option on the aggregate-address command.

This command enables a mode whereby the summary-only option will only suppress the component routes if those component routes all have the same next hop. If the routes have different next hops, then they will continue to be advertised to peers even if the summary-only option is configured. By default this is disabled.

The **no** variant of this command disables this function.

**Syntax** `bgp aggregate-next-hop-check`  
`no bgp aggregate-next-hop-check`

**Default** Disabled by default.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# bgp aggregate-next-hop-check`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp always-compare-med

**Overview** This command enables BGP to compare the Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems.

Multi Exit Discriminator (MED) is used in best path selection by BGP. MED is compared after BGP attributes weight, local preference, AS-path and origin have been compared and are equal.

By default, MED comparison is done only among routes from the same autonomous system (AS). Use the **bgp always-compare-mode** command to allow comparison of MEDs from different ASs.

A path with a lower MED value is preferred. For example, if the bgp table contains the following entries, and the **bgp always-compare-med** command has been issued to enable this feature:

- Route1: as-path 400, med 300
- Route2: as-path 200, med 200
- Route3: as-path 400, med 250

Route1 is compared to Route2. Route2 is best of the two (lower MED). Next, Route2 is compared to Route3 and Route2 is chosen best path again (lower MED). If **always-compare-med** was disabled, MED is not taken into account when Route1 and Route2 are compared, because of different ASs and MED is compared for only Route1 and Route3. In this case, Route3 would be the best path. The selected route is also affected by the **bgp deterministic-med** command. See the [bgp deterministic-med](#) command for details.

If this command is used to compare MEDs for all paths, it should be configured on every BGP router in the AS.

The **no** variant of this command disallows the comparison.

**Syntax** `bgp always-compare-med`  
`no bgp always-compare-med`

**Default** By default this feature is disabled.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp always-compare-med
```

**Related Commands** [bgp bestpath med](#)  
[bgp bestpath as-path ignore](#)  
[bgp bestpath compare-routerid](#)  
[bgp deterministic-med](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp bestpath as-path ignore

**Overview** This command prevents the router from considering as-path as a factor in the algorithm for choosing a route.  
The **no** variant of this command allows the router to consider as-path in choosing a route.

**Syntax** `bgp bestpath as-path ignore`  
`no bgp bestpath as-path ignore`

**Mode** Router Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# router bgp 100`  
`awplus(config-router)# bgp bestpath as-path ignore`

**Related Commands** [bgp always-compare-med](#)

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp bestpath compare-confed-aspash

**Overview** This command specifies that the AS confederation path length must be used, when available, in the BGP best path decision process. It is effective only when [bgp bestpath as-path ignore](#) command has not been specified.

By default, if BGP receives routes with identical eBGP paths from eBGP peers, BGP does not continue to consider any AS confederation path length attributes that may be associated with the routes.

The **no** variant of this command returns the device to the default state, where the device ignores AS confederation path length in the BGP best path selection process.

**Syntax** `bgp bestpath compare-confed-aspash`  
`no bgp bestpath compare-confed-aspash`

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath compare-confed-aspash
```

**Related Commands** [bgp bestpath as-path ignore](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp bestpath compare-routerid

**Overview** By default, when comparing similar routes from peers, BGP does not consider the router ID of neighbors advertising the routes - BGP simply selects the first received route. Use this command to include router ID in the selection process; similar routes are compared and the route with the lowest router ID is selected.

The **no** variant of this command disables this feature, and returns the device to the default state, where the device ignores the router ID in the BGP best path selection process.

**Syntax** `bgp bestpath compare-routerid`  
`no bgp bestpath compare-routerid`

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath compare-routerid
```

**Related Commands** [show ip bgp \(BGP only\)](#)  
[show bgp ipv6 neighbors \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp bestpath med

**Overview** This command controls how the Multi Exit Discriminator (MED) attribute comparison is performed.

Use the **no** variant of this command to prevent BGP from considering the MED attribute when comparing paths.

**Syntax** `bgp bestpath med {[confed] [missing-as-worst]}`

Parameter	Description
<code>confed</code>	Compares MED among confederation paths.
<code>missing-as-worst</code>	Treats missing MED as the least preferred one.

**Mode** Router Configuration

**Usage** The **confed** parameter enables MED comparison among paths learned from confederation peers. The MED attributes are compared only if there is no external AS (Autonomous System), where an external AS is one that is not within the confederation. If there is an external AS in the path, then the MED comparison is not made.

For example, in the following paths the MED value is not compared with `Path3` since it is not in the confederation. MED is compared for `Path1` and `Path2` only.

- `Path1 = 32000 32004, med=4`
- `Path2 = 32001 32004, med=2`
- `Path3 = 32003 1, med=1`

The effect of the **missing-as-worst** parameter is to treat a missing MED attribute in a path as having a value of infinity, making the path without a MED value the least desirable path. If the **missing-as-worst** parameter is not configured, the missing MED attribute is assigned the value of 0, making the path with the missing MED attribute the best path.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med missing-as-worst
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med confed
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med confed missing-as-worst
```

**Related  
Commands** `bgp always-compare-med`  
`bgp bestpath as-path ignore`  
`bgp deterministic-med`

**Command  
changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp bestpath med remove-recv-med

**Overview** This command removes the Multi Exit Discriminator (MED) attribute from the update messages received by the BGP speaker from its peers. However, the local BGP speaker will send MED attributes in the update messages to its peers, unless specified not to by the **bgp bestpath med remove-send-med** command.

Use the **no** variant of this command to disable this feature.

**Syntax** `bgp bestpath med remove-recv-med`  
`no bgp bestpath med remove-recv-med`

**Mode** Router Configuration

**Example** To enable the **remove-recv-med** feature on the BGP speaker belonging to the Autonomous System (AS) 100, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med remove-recv-med
```

**Related Commands** [bgp bestpath med remove-send-med](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp bestpath med remove-send-med

**Overview** This command removes the Multi Exit Discriminator (MED) attribute from the update messages sent by the BGP speaker to its peers. However, the local BGP speaker will consider the MED attribute received from other peers during the decision and route selection process, unless specified not to by the **bgp bestpath med remove-recv-med** command.

Use the **no** variant of this command to disable this feature.

**Syntax** `bgp bestpath med remove-send-med`  
`no bgp bestpath med remove-send-med`

**Mode** Router Configuration

**Example** To enable the **remove-send-med** feature on the BGP speaker belonging to the Autonomous System (AS) 100, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med remove-send-med
```

**Related Commands** [bgp bestpath med remove-recv-med](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp client-to-client reflection

**Overview** This command restores route reflection from a BGP route reflector to clients, and is used to configure routers as route reflectors. Route reflectors are used when all Interior Border Gateway Protocol (iBGP) speakers are not fully meshed.

If the clients are fully meshed the route reflector is not required, use the **no** variant of this command to disable the client-to-client route reflection.

When a router is configured as a route reflector, client-to-client reflection is enabled by default.

The **no** variant of this command turns off client-to-client reflection.

**Syntax** `bgp client-to-client reflection`  
`no bgp client-to-client reflection`

**Default** This command is enabled by default.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp client-to-client reflection
```

**Related Commands** [bgp cluster-id](#)  
[neighbor route-reflector-client \(BGP only\)](#)  
[show bgp ipv6 \(BGP4+ only\)](#)  
[show ip bgp \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp cluster-id

**Overview** This command configures the cluster-id if the BGP cluster has more than one route reflector. A cluster includes one or more route reflectors and their clients. Usually, each cluster is identified by the router-id of its single route reflector. However, to increase redundancy, a cluster may sometimes have more than one route reflector. All router reflectors in such a cluster are then identified by a cluster-id.

The **bgp cluster-id** command is used to configure the 4 byte cluster ID for clusters with more than one route reflector.

The **no** variant of this command removes the cluster ID.

**Syntax** `bgp cluster-id {<ip-address>|<cluster-id>}`  
`no bgp cluster-id`

Parameter	Description
<code>&lt;cluster-id&gt;</code>	<code>&lt;1-4294967295&gt;</code> Route Reflector cluster-id as a 32 bit quantity.
<code>&lt;ip-address&gt;</code>	<code>A.B.C.D</code> Route Reflector Cluster-id in IP address format.

**Mode** Router Configuration

**Usage** The following configuration creates `cluster-id 5` including two `route-reflector-clients`.

```
awplus(config)# router bgp 200
awplus(config-router)# neighbor 2.2.2.2 remote-as 200
awplus(config-router)# neighbor 3.3.3.3 remote-as 200
awplus(config-router)# neighbor 3.3.3.3 route-reflector-client
awplus(config-router)# neighbor 5.5.5.5 remote-as 200
awplus(config-router)# neighbor 5.5.5.5 route-reflector-client
awplus(config-router)# neighbor 6.6.6.6 remote-as 200
awplus(config-router)# bgp cluster-id 5
```

**Examples** To add a **bgp cluster-id**, apply the example commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp cluster-id 10.10.1.1
```

To remove a bgp cluster-id apply the example commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp cluster-id 10.10.1.1
```

**Related  
Commands**

[neighbor route-reflector-client \(BGP only\)](#)  
[show bgp ipv6 \(BGP4+ only\)](#)  
[show ip bgp \(BGP only\)](#)

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp confederation identifier

**Overview** This command specifies a BGP confederation identifier.  
The **no** variant of this command removes all BGP confederation identifiers.

**Syntax** `bgp confederation identifier <1-4294967295>`  
`no bgp confederation identifier`

Parameter	Description
<code>&lt;1-4294967295&gt;</code>	Set routing domain confederation AS number.

**Mode** Router Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp confederation identifier 1
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp confederation identifier
```

**Related Commands** [bgp confederation peers](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1

- Version 5.4.7-2.4: BGP support added for IE300 series

# bgp confederation peers

**Overview** This command configures the Autonomous Systems (AS) that belong to the same confederation as the current device.

A confederation allows an AS to be divided into several sub-ASs. The overall AS is given a confederation identifier. External routers view only the whole confederation as one AS, whose AS number is the confederation identifier. Each sub-AS is fully meshed within itself and is visible internally to the confederation.

Use the **bgp confederation peer** command to define the list of AS numbers of the sub-ASs in the confederation containing the current device.

The **no** variant of this command removes an autonomous system from the confederation.

**Syntax** `bgp confederation peers <1-4294967295>`  
`no bgp confederation peers <1-4294967295>`

Parameter	Description
<code>&lt;1-4294967295&gt;</code>	AS numbers of eBGP peers that are under same confederation but in a different sub-AS.

**Mode** Router Configuration

**Usage** In the following configuration of **Router 1** the neighbor 172.210.30.2 and 172.210.20.1 have iBGP connection within AS 100. The neighbor 173.213.30.1 has an BGP connection, but it is within AS 200, which is part of the same confederation. The neighbor 6.6.6.6 has an eBGP connection to external AS 500.

In the configuration of **Router 2**, neighbor 5.5.5.4 has an eBGP connection to confederation 300. Router2 does not know about the ASs 100 and 200, it only knows about confederation 300.

## Router 1

```
awplus(config)# router bgp 100
awplus(config-router)# bgp confederation identifier 300
awplus(config-router)# bgp confederation peers 200
awplus(config-router)# neighbor 172.210.30.2 remote-as 100
awplus(config-router)# neighbor 172.210.20.1 remote-as 100
awplus(config-router)# neighbor 173.213.30.1 remote-as 200
awplus(config-router)# neighbor 6.6.6.6 remote-as 300
```

## Router 2

```
awplus(config)# router bgp 500
awplus(config-router)# neighbor 5.5.5.4 remote-as 300
```

**Example** awplus# configure terminal  
awplus(config)# router bgp 100  
awplus(config-router)# bgp confederation peers 1234

**Related  
Commands** [bgp confederation identifier](#)

**Command  
changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp config-type

**Overview** Use this command to set the BGP configuration type to either **standard** or **enhanced** types. When you configure the **enhanced** type, then BGP and BGP4+ communities are allowed to be sent and received by default. The **enhanced** type is configured by default.

Use the **no** variant of this command to restore the default BGP configuration type (**enhanced**).

**Syntax** `bgp config-type {standard|enhanced}`  
`no bgp config-type`

Parameter	Description
standard	Specifies the industry standard style configuration. After setting the configuration to standard, make sure to use the <a href="#">neighbor send-community</a> command to send out BGP community attributes. The <a href="#">synchronization</a> command is enabled in the Global Configuration mode and is shown in the configuration.
enhanced	Specifies the enhanced style configuration. The enhanced configuration type requires no specific configuration for sending out BGP standard community and extended community attributes. The <a href="#">synchronization</a> command is enabled by default in the Global Configuration mode and is not shown in configuration output.

**Default** By default, the BGP configuration type is **enhanced**.

**Mode** Global Configuration

**Usage** Note that the **enhanced** type default configuration may cause issues in some networks if unauthorized BGP peers are advertising BGP communities to adjust routing decisions.

Changing modes requires you to **reload** your device for the change to take effect:

```
awplus(config)#bgp config-type standard
awplus(config)#exit
awplus#reload
reboot system? (y/n): y
```

When your device reloads, it will load with the standard BGP settings commonly used by most vendors. Apply the **standard** type configuration if you have interoperability issues.

**Examples** To specify the standard BGP configuration type, enter the following commands:

```
awplus# configure terminal
awplus(config)# bgp config-type standard
```

To specify the enhanced BGP configuration type, enter the following commands:

```
awplus# configure terminal  
awplus(config)# bgp config-type enhanced
```

To restore the default BGP configuration type (enhanced), enter the following commands:

```
awplus# configure terminal  
awplus(config)# no bgp config-type
```

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp dampening

**Overview** This command enables BGP and BGP4+ dampening and sets BGP and BGP4+ dampening parameters. BGP4+ dampening is available from the IPv6 Address Family Configuration mode. BGP dampening is available from the Router Configuration mode.

The **no** variant of this command disables BGP dampening or unsets the BGP dampening parameters.

**Syntax**

```
bgp dampening
no bgp dampening
bgp dampening <reachtime>
no bgp dampening <reachtime>
bgp dampening <reachtime> <reuse> <suppress> <maxsuppress>
<unreachtime>
no bgp dampening <reachtime> <reuse> <suppress> <maxsuppress>
<unreachtime>
bgp dampening route-map <routemap-name>
no bgp dampening route-map <routemap-name>
```

Parameter	Description
<reachtime>	<1-45> Specifies the reachability half-life time in minutes. The time for the penalty to decrease to one-half of its current value. The default is 15 minutes.
<reuse>	<1-20000> Specifies the reuse limit value. When the penalty for a suppressed route decays below the reuse value, the routes become unsuppressed. The default reuse limit is 750
<suppress>	<1-20000> Specifies the suppress limit value. When the penalty for a route exceeds the suppress value, the route is suppressed. The default suppress limit is 2000.
<maxsuppress>	<1-255> Specifies the max-suppress-time. Maximum time that a dampened route is suppressed. The default max-suppress value is 4 times the half-life time (60 minutes).
<unreachtime>	<1-45> Specifies the un-reachability half-life time for penalty, in minutes.
route-map	Route-map to specify criteria for dampening.
<routemap-name>	Specify the name of the route-map.

**Mode [BGP]** Router Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Route dampening minimizes the instability caused by route flapping. A penalty is added for every flap in a flapping route. As soon as the total penalty reaches the **suppress** limit the advertisement of the route is suppressed. This penalty is decayed according to the configured **half time** value. Once the penalty is lower than the **reuse** limit, the route advertisement is un-suppressed.

The dampening information is purged from the router once the penalty becomes less than half of the **reuse** limit.

**Example [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# bgp dampening 20 800 2500 80 25
```

**Example [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv6
awplus(config-router-af)# bgp dampening 20 800 2500 80 25
```

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1

- Version 5.4.7-2.4: BGP support added for IE300 series

# bgp damp-peer-oscillation (BGP only)

**Overview** Use this command to enable BGP peer oscillating connection damping. Use the **no** variant of this command to disable BGP peer oscillating connection damping.

**Syntax** `bgp damp-peer-oscillations`  
`no bgp damp-peer-oscillations`

**Default** By default, this functionality is enabled and will not appear in the **show running-config** command output.

**Mode** Router Configuration

**Usage** BGP peers in AlliedWare Plus will automatically attempt to form connections with configured neighbors. Due to misconfiguration these connections may fail and continue to fail until such time as the misconfiguration is detected and fixed. During this time, BGP can quickly cycle through the state machine from Idle through the various Connect states, which can result in large numbers of TCP sessions being opened in a short period of time.

This command instead adds a delay after a peer enters the Idle state before it can progress to the later states. The default delay is 0 second, increasing by 1 second for each unsuccessful connection attempt, to a maximum of 5 seconds. After a successful BGP route update has been received over a connection, the delay will be reset to 0. This command implements the DampPeerOscillations FSM behavior described in section 8.1 of RFC 4271.

The command is enabled by default. When disabled, peers will transition out of the Idle state immediately. The command applies globally to all currently configured BGP peers and all future peers to be created.

**Example** To disable peer connection damping, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 1
awplus(config-router)# no bgp damp-peer-oscillations
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp default ipv4-unicast

**Overview** This command configures BGP defaults and activates IPv4-unicast for a peer by default. This affects BGP global configuration. By default, BGP exchanges IPv4 prefixes with a peer.

The **no** variant of this command disables this function. The BGP routing process will no longer exchange IPv4 addressing information with BGP neighbor routers. Note that disabling the exchange of IPv4 prefixes will also enable an IPv6 only BGP4+ network.

**Syntax** `bgp default ipv4-unicast`  
`no bgp default ipv4-unicast`

**Default** This is enabled by default.

**Mode** Router Configuration

**Usage** Use the negated form of this command to enable an IPv6 only BGP4+ network.

**Examples** `awplus# configure terminal`  
`awplus(config)# router bgp 100`  
`awplus(config-router)# bgp default ipv4-unicast`  
`awplus# configure terminal`  
`awplus(config)# router bgp 100`  
`awplus(config-router)# no bgp default ipv4-unicast`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp default local-preference (BGP only)

**Overview** This command changes the default local preference value.

The local preference indicates the preferred path when there are multiple paths to the same destination. The path with the higher preference is preferred.

Use this command to define the default local preference value that the device will advertise for the routes it sends. The preference is sent to all routers and access servers in the local autonomous system.

The **no** variant of this command reverts to the default local preference value of 100.

**Syntax** `bgp default local-preference <pref-value>`  
`no bgp default local-preference [<pref-value>]`

Parameter	Description
<code>&lt;pref-value&gt;</code>	<code>&lt;0-4294967295&gt;</code> Configure default local preference value. The default local preference value is 100.

**Default** By default the local-preference value is 100.

**Mode** Router Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp default local-preference 2345555
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp default local-preference
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp deterministic-med

**Overview** Use this command to allow or disallow the device to compare the Multi Exit Discriminator (MED) variable when choosing among routes advertised by different peers in the same autonomous system (AS).

Use the **bgp deterministic-med** command to enable this feature to allow the comparison of MED variables when choosing among routes advertised by different peers in the same AS.

Use the **no** variant of this command to disable this feature to disallow the comparison of the MED variable when choosing among routes advertised by different peers in the same AS.

**Syntax** `bgp deterministic-med`  
`no bgp deterministic-med`

**Default** Disabled

**Mode** Router Configuration

**Usage** When the **bgp deterministic-med** command is enabled, routes from the same AS are grouped together and ordered according to their MED values, and the best routes of each group are compared.

The main benefit of this is that the choice of best route then does not depend on the order in which the routes happened to be received, which is rather random and arbitrary.

To see how this works, consider the following set of bgp table entries, all for the same route:

```
1: ASPATH 234, MED 120, internal, IGP metric to NEXT_HOP 40
2: ASPATH 389, MED 190, internal, IGP metric to NEXT_HOP 35
3: ASPATH 234, MED 245, external
```

If **bgp deterministic-med** is not enabled, then entry 3 will be chosen, because it is an external route.

But if BGP deterministic-MED is enabled, the entries will be grouped as follows:

```
Group 1: 1: ASPATH 234, MED 120, internal, IGP metric to NEXT_HOP 40
          3: ASPATH 234, MED 245, external
Group 2: 2: ASPATH 389, MED 190, internal, IGP metric to NEXT_HOP 35
```

**NOTE:** Routes from the same AS are grouped together and ordered by MED.

Entry 1 is chosen as the best route from Group 1, since this route has the lowest MED value. Entry 2 has to be the best route in Group 2, since this is the only route in that group. These two group winners are compared against each other, and

Entry 2 is chosen as the best route because Entry 2 has the lower metric to next-hop.

All routers in an AS should have the same setting for BGP deterministic-MED. All routers in an AS should have BGP deterministic-MED enabled with **bgp deterministic-med**, or all routers in an AS should have BGP deterministic-MED disabled with **no bgp-deterministic-med**.

In the example above, the MED values were not considered when comparing the winners of the two groups (the best routes from the different ASs). To use MED in the comparison of routes from different ASs, use the [bgp always-compare-med](#) command.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp deterministic-med
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp deterministic-med
```

## bgp enforce-first-as

**Overview** Use this command to enforce the denying of eBGP updates in which the neighbor's AS number is not the first AS in the AS-path attribute.

Use the **no** variant of this command to disable this feature.

**Syntax** `bgp enforce-first-as`  
`no bgp enforce-first-as`

**Mode** Router Configuration

**Usage** This command specifies that any updates received from an external neighbor that do not have the neighbor's configured Autonomous System (AS) at the beginning of the AS\_PATH in the received update must be denied. Enabling this feature adds to the security of the BGP network by not allowing traffic from unauthorized systems.

**Example**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp enforce-first-as
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp fast-external-failover

**Overview** Use this command to reset a BGP session immediately if the interface used for BGP connection goes down.

Use the **no** variant of this command to disable this feature.

**Syntax** `bgp fast-external-failover`  
`no bgp fast-external-failover`

**Default** Enabled

**Mode** Router Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# router bgp 100`  
`awplus(config-router)# bgp fast-external-failover`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp graceful-restart

**Overview** Use this command to enable BGP and BGP4+ graceful-restart capabilities for restart and stalepath times.

Use the **no** variant of this command to restore restart timers to their default settings.

**Syntax** `bgp graceful-restart [restart-time <delay-value>|  
stalepath-time <delay-value>]`  
`no bgp graceful-restart [restart-time|stalepath-time]`

Parameter	Description
<code>restart-time</code>	The maximum time needed for neighbors to restart, in seconds. The default restart-time is 120 seconds.
<code>stalepath-time</code>	The maximum time to retain stale paths from restarting neighbors, in seconds. The default stalepath-time is 120 seconds.
<code>&lt;delay-value&gt;</code>	<1-3600> Maximum time in seconds.

**Default** Graceful restart is disabled by default. If you enable it and do not specify the restart-time and stalepath-time, they default to 120 seconds.

**Mode** Router Configuration

**Usage** The **restart-time** parameter is used for setting the maximum time that a graceful-restart neighbor waits to come back up after a restart. This **restart-time** value is applied to neighbors unless you explicitly override it by configuring the corresponding value on the neighbor.

The **stalepath-time** parameter is used to set the maximum time to preserve stale paths from a gracefully restarted neighbor. All stalepaths, unless reinstated by the neighbor after a re-establishment, will be deleted when time, as specified by the **stalepath-time** parameter, expires.

**Examples** To enable graceful restart, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# bgp graceful-restart
```

To disable graceful restart, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no bgp graceful-restart
```

To enable graceful restart and set the restart time to 150 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# bgp graceful-restart restart-time 150
```

To return the restart-time to its default of 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no bgp graceful-restart restart-time
```

**Related Commands** [bgp graceful-restart graceful-reset restart bgp graceful \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp graceful-restart graceful-reset

**Overview** This command enables BGP and BGP4+ graceful-restart when a configuration change forces a peer restart.

Use the **no** variant of this command to restore the device to its default state.

**Syntax** `bgp graceful-restart graceful-reset`  
`no bgp graceful-restart graceful-reset`

**Default** Disabled

**Mode** Router Configuration

**Usage** The `bgp graceful-restart` command must be enabled before this command is enabled. All events that cause BGP peer reset, including all session reset commands, can trigger graceful-restart.

**Example** To enable the graceful-restart graceful-reset feature on the BGP or BGP4+ peer belonging to Autonomous System (AS) 10, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# bgp graceful-restart graceful-reset
```

To disable the graceful-restart graceful-reset feature on the BGP or BGP4+ peer belonging to Autonomous System (AS) 10, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no bgp graceful-restart graceful-reset
```

**Related Commands** [bgp graceful-restart](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp log-neighbor-changes

**Overview** Use this command to enable logging of status change messages without turning on **debug bgp** commands.

Use the **no** variant of this command to disable this feature.

**Syntax** `bgp log-neighbor-changes`  
`no bgp log-neighbor-changes`

**Default** Disabled

**Mode** Router Configuration

**Usage** AlliedWare Plus™ provides other kinds of logging services for neighbor status, for example, **debug bgp fsm** and **debug bgp events**.

However, these commands create a significant hit in the logging performance. If you need to log neighbor status changes only, we recommend turning off all the debug commands, and then use this command.

To see BGP neighbor changes in the log you must also set the log level to informational using the **log buffered** command.

A sample output of this log is:

```
%Protocol-Severity-Events: Message-text
```

A sample output of the log for an interface down event is:

```
%BGP-5-ADJCHANGE: neighbor 10.10.0.24 Down Interface flap
```

The **bgp log-neighbor-changes** command logs the following events:

- BGP Notification Received
- Erroneous BGP Update Received
- User reset request
- Peer time-out
- Peer Closing down the session
- Interface flap
- Router ID changed
- Neighbor deleted
- Member added to peer group
- Administrative shutdown

- Remote AS changed
- RR client configuration modification
- Soft reconfiguration modification

**Example** To enable the logging of BGP status changes without using the debug bgp command:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp log-neighbor-changes
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp memory maxallocation

**Overview** This command allocates a maximum percentage of the RAM (Random Access Memory) available on the device for BGP processes.

When this percentage is exceeded, BGP peering terminates and an **out of resources** error displays. The default setting for **bgp memory maxallocation** is 100% memory allocation.

Use the **no** variant of this command to reset memory allocation to the default.

**Syntax** `bgp memory maxallocation <1-100>`  
`no bgp memory maxallocation`

Parameter	Description
<1-100>	Percentage of device memory allocated to BGP processes. Note this is RAM (Random Access Memory), not device flash memory.

**Default** BGP processes are allocated the maximum percentage of 100% of the device's available RAM memory by default. Note only non-default BGP memory allocation values are shown in the running or startup configuration files:

```
awplus#show running-config
!
bgp memory maxallocation 50
!
```

**Mode** Global Configuration

**Examples** To limit the maximum amount of memory used by BGP processes to 65% of the total RAM memory available on the device, use the commands:

```
awplus# configure terminal
awplus(config)# bgp memory maxallocation 65
```

To return to the default 100% maximum RAM memory allocation available on the device for BGP processes, use the commands:

```
awplus# configure terminal
awplus(config)# no bgp memory maxallocation
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp nexthop-trigger-count

**Overview** Use this command to configure the display of BGP next hop tracking status.  
Use the **no** variant of this command to disable this function.

**Syntax** `bgp nexthop-trigger-count <0-127>`  
`no bgp nexthop-trigger-count`

Parameter	Description
<0-127>	BGP next hop tracking status.

**Mode** Router Configuration

**Example** To enable next-hop-tracking status on the BGP peer belonging to the Autonomous System (AS) 100, enter the following commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp nexthop-trigger-count 10
```

To disable next-hop-tracking status, enter the following commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp nexthop-trigger-count
```

**Related Commands** [bgp nexthop-trigger delay](#)  
[bgp nexthop-trigger enable](#)  
[show bgp nexthop-tracking \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp nexthop-trigger delay

**Overview** Use this command to set the delay interval for next hop address tracking.  
Use the **no** variant of this command to reset the timer value to the default.

**Syntax** `bgp nexthop-trigger delay <1-100>`  
`no bgp nexthop-trigger delay`

Parameter	Description
<1-100>	Next hop trigger delay interval in seconds.

**Default** The default next hop delay interval is 5 seconds.

**Mode** Global Configuration

**Usage** This command configures the delay interval between routing table waits for next hop delay tracking. The delay interval determines how long BGP waits after it receives the trigger from the system about one or more next hop changes before it walks the full BGP table to determine which prefixes are affected by the next hop changes.

**Example** To set the next hop delay interval to 6 seconds, enter the command:

```
awplus# configure terminal  
awplus(config)# bgp nexthop-trigger delay 6
```

**Related Commands** [bgp nexthop-trigger-count](#)  
[bgp nexthop-trigger enable](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp nexthop-trigger enable

**Overview** Use this command to enable next hop address tracking. If next hop address tracking is enabled and a next hop trigger delay interval has not been explicitly set with the [bgp nexthop-trigger delay](#) command, the default delay interval of 5 seconds is used.

Use the **no** variant of this command to disable this feature.

**Syntax** `bgp nexthop-trigger enable`  
`no bgp nexthop-trigger enable`

**Default** Disabled.

**Mode** Global Configuration

**Usage** Next hop address tracking is an event driven notification system that monitors the status of routes installed in the Routing Information Base (RIB) and reports next hop changes that affect internal BGP (iBGP) or external BGP (eBGP) prefixes directly to the BGP process. This improves the overall BGP convergence time, by allowing BGP to respond rapidly to next hop changes for routes installed in the RIB.

If next hop tracking is enabled after certain routes are learned, the registration of all the next hops of selected BGP routes are done immediately after the next hop tracking feature is enabled.

If next hop tracking is disabled, and if there are still some selected BGP routes, BGP deregisters the next hops of all of the selected BGP routes from the system.

If next hop tracking is disabled when next hop tracking is in the process of execution, an error appears, and next hop tracking is not disabled. However, if the next hop tracking timer is running at the time of negation, the next hop tracking timer is stopped, and next hop tracking is disabled.

**Example** To enable next hop address tracking, enter the command:

```
awplus# configure terminal
awplus(config)# bgp nexthop-trigger enable
```

**Related Commands** [bgp nexthop-trigger-count](#)  
[bgp nexthop-trigger delay](#)  
[show bgp nexthop-tracking \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp rfc1771-path-select (BGP only)

**Overview** Use this command to set the RFC1771 compatible path selection mechanism.

Use the **no** variant of this command to revert this setting.

**Syntax** `bgp rfc1771-path-select`  
`no bgp rfc1771-path-select`

**Default** Industry standard compatible path selection mechanism.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# bgp rfc1771-path-select`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

## bgp rfc1771-strict (BGP only)

**Overview** Use this command to set the Strict RFC1771 setting.  
Use the **no** variant of this command to revert this setting.

**Syntax** `bgp rfc1771-strict`  
`no bgp rfc1771-strict`

**Default** Disabled

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# bgp rfc1771-strict`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp router-id

**Overview** Use this command to configure the router identifier. The IPv4 address specified in this command does not have to be an IPv4 address that is configured on any of the interfaces on the device. Note that you must specify an IPv4 address with this when used for BGP4+.

Use the **no** variant of this command to return the router-id to its default value (as described in Default below).

**Syntax** `bgp router-id <routerid>`  
`no bgp router-id [<routerid>]`

Parameter	Description
<code>&lt;routerid&gt;</code>	Specify the IPv4 address without mask for a manually configured router ID, in the format A . B . C . D.

**Default** If the BGP router ID is not specified, the IPv4 address of the loopback interface is used. When there is no address on the loopback interface, the highest IP address among the VLAN interfaces is used. Note that devices that have an Ethernet management interface will not use that eth interface's IP address as a router ID.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** Use the **bgp router-id** command to manually configure a fixed router ID as a BGP or BGP4+ router identifier. This router ID takes precedence over all other possible router ID sources. The order of precedence is:

- 1) router ID configured with this command
- 2) IP address of the loopback interface
- 3) highest IP address from the VLAN interfaces

**Examples** To configure a router ID with an IPv4 address for a BGP or BGP4+ router identifier, enter the commands listed below:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp router-id 1.1.2.3
```

To disable the router ID for a BGP or BGP4+ router identifier enter the commands listed below:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp router-id
```

- Command changes**
- Added to AlliedWare Plus prior to 5.4.6-1
  - Version 5.4.7-2.1: BGP support added for IEx510, x550 series
  - Version 5.4.7-2.4: BGP support added for IE300 series

# bgp scan-time (BGP only)

**Overview** Use this command to set the interval for BGP route next-hop scanning.  
Use the **no** variant of this command to disable this function.

**Syntax** `bgp scan-time <time>`  
`no bgp scan-time [<time>]`

Parameter	Description
<time>	<0-60> Scanning interval in seconds.

**Default** The default scanning interval is 60 seconds.

**Mode** Router Configuration

**Usage** Use this command to configure scanning intervals of BGP routers. This interval is the period after which router checks the validity of the routes in its database.

To disable BGP scanning, set the scan time interval to 0 seconds.

**Example** `awplus# configure terminal`  
`awplus(config)# router bgp 100`  
`awplus(config-router)# bgp scan-time 10`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# bgp update-delay

**Overview** Use this command to specify the update-delay value for a graceful-restart capable router.

Use the **no** variant of this command to revert to the default update-delay value.

**Syntax** `bgp update-delay <1-3600>`  
`no bgp update-delay [<1-3600>]`

Parameter	Description
<1-3600>	Delay value in seconds.

**Default** The default update-delay value is 120 seconds.

**Mode** Router Configuration

**Usage** The update-delay value is the maximum time a graceful-restart capable router which is restarting will defer route-selection and advertisements to all its graceful-restart capable neighbors. This maximum time starts from the instance the first neighbor attains established state after restart. The restarting router prematurely terminates this timer when end-of-rib markers are received from all its graceful-restart capable neighbors.

**Example**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# bgp update-delay 345
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp \*

**Overview** Use this command to reset the BGP and BGP4+ connections for all peers.

**Syntax** `clear bgp *`  
`clear bgp * in [prefix-filter]`  
`clear bgp * out`  
`clear bgp * soft [in|out]`

Parameter	Description
*	Clears all BGP and BGP4+ peers.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

**Mode** Privileged Exec

**Examples** `awplus# clear bgp * soft in`  
`awplus# clear bgp * in prefix-filter`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp (IPv4 or IPv6 address)

**Overview** Use this command to reset the BGP and BGP4+ connections for specified peers.

When VRF-lite is configured, you can apply this command to a specific VRF instance. This command resets all BGP connections from any address family (from either IPv4 or IPv6 Address Families).

**Syntax [BGP]**

```
clear bgp <ip-addr>  
clear bgp <ip-addr> in [prefix-filter]  
clear bgp <ip-addr> out  
clear bgp <ip-addr> soft [in|out]
```

**Syntax (VRF-lite)** `clear ip bgp <ip-addr> [vrf <vrf-name>] [in|out|soft [in|out]]`

**Syntax [BGP4+]**

```
clear bgp <ipv6-addr>  
clear bgp <ipv6-addr> in [prefix-filter]  
clear bgp <ipv6-addr> out  
clear bgp <ipv6-addr> soft [in|out]
```

Parameter	Description
<ip-addr>	Specifies the IPv4 address of the neighbor whose connection is to be reset, entered in the form A.B.C.D.
<ipv6-addr>	Specifies the IPv6 address of the neighbor whose connection is to be reset, entered in hexadecimal in the format X:X::X:X.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode** Privileged Exec

**Examples [BGP]** awplus# clear bgp 3.3.3.3 soft in prefix-filter  
awplus# clear bgp 2.2.2.2 out

**Example (VRF-lite)** To apply the above example to clear the BGP connection to peer at IP address 192.0.2.11 for the VRF instance blue, use the following commands:

```
awplus# clear bgp 192.0.2.11 vrf blue in
```

**Examples [BGP4+]** awplus# clear bgp 2001:0db8:010d::1 soft in prefix-filter  
awplus# clear bgp 2001:0db8:010d::1 out

**Related Commands** [clear bgp \(IPv4 or IPv6 address\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp (ASN)

**Overview** Use this command to reset the BGP and BGP4+ connections for peers in the specified Autonomous System Number (ASN).

**Syntax** `clear bgp <asn> [in [prefix-filter]|out|soft [in|out]]`

Parameter	Description
<asn>	<1-4294967295> The AS Number for which all routes will be cleared.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

**Mode** Privileged Exec

**Examples**

```
awplus# clear bgp 300 soft in prefix-filter
awplus# clear bgp 500 soft out
awplus# clear bgp 300 soft in
awplus# clear bgp 1 in prefix-filter
```

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp external

**Overview** Use this command to reset the BGP and BGP4+ connections for all external peers.

**Syntax** `clear bgp external [in [prefix-filter]|out|soft [in|out]]`

Parameter	Description
external	Clears all external peers.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

**Mode** Privileged Exec

**Examples**  
`awplus# clear bgp external soft in`  
`awplus# clear bgp external in prefix-filter`

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp peer-group

**Overview** Use this command to reset the BGP and BGP4+ connections for all members of a peer group.

**Syntax** `clear bgp peer-group <peer-group> [in [prefix-filter]|out|soft [in|out]]`

Parameter	Description
peer-group	Clears all members of a peer group.
<peer-group>	Name of the BGP peer group
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

**Mode** Privileged Exec

**Examples** `awplus# clear bgp peer-group P1 soft in`  
`awplus# clear bgp peer-group P2 in`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp ipv6 (ipv6 address) (BGP4+ only)

**Overview** Use this command to reset the IPv6 BGP4+ connection to the peer specified by the IP address.

**Syntax** `clear bgp ipv6 <ipv6-addr> [in [prefix-filter]|out|soft [in|out]]`

Parameter	Description
<ipv6-addr>	Specifies the IPv6 address of the neighbor whose connection is to be reset, entered in hexadecimal in the format X:X::X:X.
ipv6	Clears all IPv6 address family peers. Configure parameters relating to the BGP4+ exchange of IPv6 prefixes.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

**Mode** Privileged Exec

**Examples** Use the following command to clear the BGP4+ connection to peer at IPv6 address 2001:0db8:010d::1, and clearing all incoming routes.

```
awplus# clear ip bgp 2001:0db8:010d::1 in
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp ipv6 dampening (BGP4+ only)

**Overview** Use this command to clear route dampening information and unsuppress routes that have been suppressed routes.

**Syntax** `clear bgp ipv6 dampening`  
`[<ipv6-addr>|<ipv6-addr/prefix-length>]`

Parameter	Description
<code>&lt;ipv6-addr&gt;</code>	Specifies the IPv6 address for which BGP4+ dampening is to be cleared, entered in hexadecimal in the format X:X::X:X.
<code>&lt;ipv6-addr/prefix-length&gt;</code>	Specifies the IPv6 address and prefix-length for which BGP4+ dampening is to be cleared. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

**Mode** Privileged Exec

**Examples** `awplus# clear bgp ipv6 dampening 2001:0db8:010d::1`  
`awplus# clear bgp ipv6 dampening 2001:0db8::/64`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp ipv6 flap-statistics (BGP4+ only)

**Overview** Use this command to clear the flap count and history duration for the specified prefixes.

**Syntax** `clear bgp ipv6 flap-statistics`  
`[<ipv6-addr>|<ipv6-addr/prefix-length>]`

Parameter	Description
<code>&lt;ipv6-addr&gt;</code>	Specifies the IPv6 address for which BGP4+ flap count and history duration are to be cleared, entered in hexadecimal in the format X:X::X:X.
<code>&lt;ipv6-addr/prefix-length&gt;</code>	Specifies the IPv6 address with prefix length for which BGP4+ flap count and history duration are to be cleared. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

**Mode** Privileged Exec

**Examples** `awplus# clear bgp ipv6 flap-statistics 2001:0db8:010d::1`  
`awplus# clear bgp ipv6 flap-statistics 2001:0db8::/64`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp ipv6 (ASN) (BGP4+ only)

**Overview** Use this command to reset the BGP4+ connections to all peers in a specified Autonomous System Number (ASN).

**Syntax**

```
clear bgp ipv6 <asn> [in [prefix-filter]|out|soft [in|out]]
clear bgp ipv6 <asn>
clear bgp ipv6 <asn> in [prefix-filter]
clear bgp ipv6 <asn> out
clear bgp ipv6 <asn> soft [in|out]
```

Parameter	Description
<asn>	<1-4294967295> Specifies the ASN for which all routes will be cleared.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

**Mode** Privileged Exec

**Examples**

```
awplus# clear bgp ipv6 100
awplus# clear bgp ipv6 100 in
awplus# clear bgp ipv6 100 in prefix-filter
awplus# clear bgp ipv6 100 out
awplus# clear bgp ipv6 100 soft out
awplus# clear bgp ipv6 100 soft in
```

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp ipv6 external (BGP4+ only)

**Overview** Use this command to reset the BGP4+ connections to all external peers.

**Syntax**

```
clear bgp ipv6 external [in [prefix-filter]|out|soft [in|out]]
clear bgp ipv6 external
clear bgp ipv6 external in [prefix-filter]
clear bgp ipv6 external out
clear bgp ipv6 external soft [in|out]
```

Parameter	Description
external	Clears all external peers.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

**Mode** Privileged Exec

**Examples**

```
awplus# clear bgp ipv6 external in
awplus# clear bgp ipv6 external in prefix
awplus# clear bgp ipv6 external out
awplus# clear bgp ipv6 external soft out
awplus# clear bgp ipv6 external soft in
```

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp ipv6 peer-group (BGP4+ only)

**Overview** Use this command to reset the BGP4+ connections to all members of a peer group.

**Syntax**

```
clear bgp ipv6 peer-group <peer-name>  
clear bgp ipv6 peer-group <peer-name> in [prefix-filter]  
clear bgp ipv6 peer-group <peer-name> out  
clear bgp ipv6 peer-group <peer-name> soft [in|out]
```

Parameter	Description
peer-group	Clears all members of a peer group.
<peer-name>	Specifies the name of the peer group for which all members will be cleared.
ipv6	Clears all IPv6 address family peers. Configure parameters relating to the BGP4+ exchange of IPv6 prefixes.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

**Mode** Privileged Exec

**Example** awplus# clear bgp ipv6 peer-group Peer1 out

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

## clear ip bgp \* (BGP only)

**Overview** Use this command to reset all BGP connections, either by fully resetting sessions or by performing soft resets.

If VRF-lite is configured, you can reset BGP connections for all VRF instances or for a specified VRF instance.

**Syntax**

```
clear ip bgp *  
clear ip bgp * in  
clear ip bgp * out  
clear ip bgp * soft [in|out]  
clear ip bgp * in [prefix-filter]
```

**Syntax (VRF-lite)**

```
clear ip bgp * [vrf <vrf-name>]  
clear ip bgp * [vrf <vrf-name>] in  
clear ip bgp * [vrf <vrf-name>] out  
clear ip bgp * [vrf <vrf-name>] soft [in|out]  
clear ip bgp * in [prefix-filter]
```

Parameter	Description
*	Clears all BGP peers.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode** Privileged Exec

**Examples** To clear all BGP peers, use the command:

```
awplus# clear ip bgp *
```

**Example (VRF-lite)** To clear all BGP peers in VRF instance red, use the command:

```
awplus# clear ip bgp * vrf red
```

To clear all outbound BGP peers in VRF instance red, use the command:

```
awplus# clear ip bgp * out vrf red
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp (IPv4) (BGP only)

**Overview** Use this command to reset the IPv4 BGP connection to the peer specified by the IP address. When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax [BGP]** `clear ip bgp <ipv4-addr> [in [prefix-filter]|out|soft [in|out]]`

**Syntax (VRF-lite)** `clear ip bgp <ipv4-address> [vrf <vrf-name>] [in|out|soft [in|out]]`

Parameter	Description
<ipv4-addr>	Specifies the IPv4 address of the neighbor whose connection is to be reset, entered in the form A.B.C.D.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode [BGP]** Privileged Exec

**Examples [BGP]** To clear the BGP connection to the peer at IPv4 address 192.168.1.1 and clear all incoming routes, use the following command:

```
awplus# clear ip bgp 192.168.1.1 in
```

To apply the above example to clear the BGP connection to the peer at IP address 192.0.2.11 for the VRF instance blue, use the following commands:

```
awplus# clear ip bgp 192.0.2.11 vrf blue in
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp dampening (BGP only)

**Overview** Use this command to clear route dampening information and unsuppress routes that have been suppressed.

**Syntax** `clear ip bgp dampening [<ip-address>|<ip-address/m>]`

Parameter	Description
<code>&lt;ip-address&gt;</code>	Specifies the IPv4 address for which BGP dampening is to be cleared, in dotted decimal format.
<code>&lt;ip-address/m&gt;</code>	Specifies the IPv4 address with mask for which BGP dampening is to be cleared, entered in the form A.B.C.D/M. Where M is the subnet mask
<code>ipv4</code>	Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes.

**Mode** Privileged Exec

**Examples** `awplus# clear ip bgp dampening 10.10.0.121`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

## clear ip bgp flap-statistics (BGP only)

**Overview** Use this command to clear the flap count and history duration for the specified prefixes.

**Syntax** `clear ip bgp flap-statistics [<ip-address>|<ip-address/m>]`

Parameter	Description
<code>&lt;ip-address&gt;</code>	Specifies the IPv4 address for which BGP flap count and history duration are to be cleared.
<code>&lt;ip-address/m&gt;</code>	Specifies the IPv4 address with mask for which BGP flap count and history duration are to be cleared.
<code>ipv4</code>	Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes.

**Mode** Privileged Exec

**Examples** `awplus# clear ip bgp flap-statistics 10.10.0.121`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp (ASN) (BGP only)

**Overview** Use this command to reset the BGP connections to all peers in a specified Autonomous System Number (ASN).

**Syntax**

```
clear ip bgp <asn> [in [prefix-filter]|out|soft [in|out]]
clear ip bgp <asn> ipv4
clear ip bgp <asn> ipv4 in [prefix-filter]
clear ip bgp <asn> ipv4 out
clear ip bgp <asn> ipv4 soft [in|out]
```

Parameter	Description
<asn>	<1-4294967295> Specifies the ASN for which all routes will be cleared.
ipv4	Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

**Mode** Privileged Exec

**Examples** awplus# clear ip bgp 100

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp external (BGP only)

**Overview** Use this command to reset the BGP connections to all external peers.

**Syntax**

```
clear ip bgp external [in [prefix-filter]|out|soft [in|out]]
clear ip bgp external
clear ip bgp external in [prefix-filter]
clear ip bgp external out
clear ip bgp external soft [in|out]
```

Parameter	Description
external	Clears all external peers.
ipv4	Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

**Mode** Privileged Exec

**Examples** awplus# clear ip bgp external out

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp peer-group (BGP only)

**Overview** Use this command to reset the BGP connections to all members of a peer group.

**Syntax**

```
clear ip bgp peer-group <peer-name>
clear ip bgp peer-group <peer-name> in [prefix-filter]
clear ip bgp peer-group <peer-name> out
clear ip bgp peer-group <peer-name> soft [in|out]
clear ip bgp peer-group <peer-name> out
clear ip bgp peer-group <peer-name> soft [in|out]
```

Parameter	Description
peer-group	Clears all members of a peer group.
<peer-name>	Specifies the name of the peer group for which all members will be cleared.
ipv4	Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

**Mode** Privileged Exec

**Examples** awplus# clear ip bgp peer-group Peer1 out

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip prefix-list

**Overview** Use this command to reset the hit count to zero in the prefix-list entries.

**Syntax** `clear ip prefix-list [<list-name>] [<ip-address>/<mask>]`

Parameter	Description
<list-name>	The name of the prefix-list.
<ip-address>/<mask>	The IP prefix and length.

**Mode** Privileged Exec

**Example** To clear a prefix-list named List1:

```
awplus# clear ip prefix-list List1
```

# debug bgp (BGP only)

**Overview** Use this command to turn on one or more BGP debug options.

Use the **no** variant of this command to disable one or more BGP debug options.

**Syntax**

```
debug bgp  
[all|dampening|events|filters|fsm|keepalives|nht|nsm|updates  
[in|out]]  
  
no debug all bgp  
  
no debug bgp  
[all|dampening|events|filters|fsm|keepalives|nht|nsm|updates  
[in|out]]
```

Parameter	Description
all	Turns on all debugging for BGP.
dampening	Specifies debugging for BGP dampening.
events	Specifies debugging for BGP events.
filters	Specifies debugging for BGP filters.
fsm	Specifies debugging for BGP Finite State Machine (FSM).
keepalives	Specifies debugging for BGP keepalives.
nht	Specifies debugging for BGP NHT (Next Hop Tracking) messages.
nsm	Specifies debugging for NSM messages.
updates	[in out] Specifies debugging for BGP updates.
in	Inbound updates.
out	Outbound updates.

**Mode** Privileged Exec and Global Configuration

**Usage** If the command is entered with no parameters, then all debug options are enabled.

**Examples**

```
awplus# debug bgp  
awplus# debug bgp events  
awplus# debug bgp nht  
awplus# debug bgp updates in
```

**Related Commands** [show debugging bgp \(BGP only\)](#)  
[undebug bgp \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# distance (BGP and BGP4+)

**Overview** This command sets the administrative distance for BGP and BGP4+ routes. The device uses this value to select between two or more routes to the same destination from two different routing protocols. Set the administrative distance for BGP routes in the Router Configuration mode, and for BGP4+ routes in IPv6 Address Family Configuration mode.

The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). For more information, see the [Route Selection Feature Overview and Configuration Guide](#), which is available from the above link at [alliedtelesis.com](#).

The **no** variant of this command sets the administrative distance for the route to the default for the route type.

**Syntax**

```
distance <1-255> <ip-address/m> [<listname>]
distance bgp <ebgp> <ibgp> <local>
no distance <1-255> <ip-address/m> [<listname>]
no distance bgp <ebgp> <ibgp> <local>
```

Parameter	Description
<1-255>	The administrative distance value you are setting for the route.
<ip-address/m>	The IP source prefix that you are changing the administrative distance for, entered in the form A . B . C . D / M. This is an IPv4 address in dotted decimal notation followed by a forward slash, and then the prefix length.
<listname>	The name of the access list to be applied to the administrative distance to selected routes.
<ebgp>	Specifies the administrative distance of external BGP (eBGP) routes. These are routes learned from a neighbor out of the AS. Specify the distance as a number between 1 and 255. Default: <b>20</b>
<ibgp>	Specifies the administrative distance of internal BGP (iBGP) routes. These are routes learned from a neighbor within the same AS. Specify the distance as a number between 1 and 255. Default: <b>200</b>
<local>	Specifies the administrative distance of local BGP routes. These are routes redistributed from another protocol within your device. Specify the distance as a number between 1 and 255. Default: <b>200</b>

**Mode [BGP]** Router Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** You can use this command to set the administrative distance:

- for each BGP route type by specifying:

```
awplus(config-router)# distance <ebgp> <igbp> <local>
```

- for a specific route by specifying:

```
awplus(config-router)# distance <1-255> <ip-address/m>  
[<listname>]
```

If the administrative distance is changed, it could create inconsistency in the routing table and obstruct routing.

**Examples [BGP]** For BGP IPv4, to set the administrative distance to 34 for the route 10.10.0.0/24 in BGP 100, and use the access list "mylist" to filter the routes, use the commands:

```
awplus# configure terminal  
awplus(config)# router bgp 100  
awplus(config-router)# distance 34 10.10.0.0/24 mylist
```

For BGP IPv4, to set BGP 100's administrative distances for eBGP routes to 34, iBGP routes to 23, and local BGP routes to 15, use the commands:

```
awplus# configure terminal  
awplus(config)# router bgp 100  
awplus(config-router)# distance bgp 34 23 15
```

**Example [BGP4+]** For BGP4+ IPv6, to set BGP 100's administrative distances for eBGP routes to 34, iBGP routes to 23, and local BGP routes to 15, use the commands:

```
awplus# configure terminal  
awplus(config)# router bgp 100  
awplus(config-router)# address-family ipv6  
awplus(config-router-af)# distance bgp 34 23 15
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# exit-address-family

**Overview** Use this command to exit either the IPv4 or the IPv6 Address Family Configuration mode.

**Syntax** `exit-address-family`

**Mode [BGP]** IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Examples [BGP]** To enter and then exit IPv4 Address Family Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv4
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Example (VRF-lite)** To enter and then exit IPv4 Address Family Configuration mode for VRF instance red, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Example [BGP4+]** To enter and then exit IPv6 Address Family Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Related Commands** [address-family](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# ip as-path access-list

**Overview** This command defines a BGP and BGP4+ Autonomous System (AS) path access list.

The named AS path list is a filter based on regular expressions. If the regular expression matches the AS path in a BGP update message, then the permit or deny condition applies to that update. Use this command to define the BGP access list globally, then use neighbor configuration commands to apply the list to a particular neighbor.

The **no** variant of this command disables the use of the access list.

**Syntax** `ip as-path access-list <listname> {deny|permit} <reg-exp>`  
`no ip as-path access-list <listname> {deny|permit} <reg-exp>`

Parameter	Description
<listname>	Specifies the name of the access list.
deny	Denies access to matching conditions.
permit	Permits access to matching conditions.
<reg-exp>	Specifies a regular expression to match the BGP AS paths.

Regular expressions listed below can be used with the **ip as-path-access-list** command:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[ ]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# ip as-path access-list mylist deny ^65535\$

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# ip community-list

**Overview** Use this command to add an entry to a standard or extended BGP community-list filter.

Use the **no** variant of this command to delete a standard or extended community list entry.

**Syntax** `ip community-list <listname> {deny|permit} .<community>`  
`no ip community-list <listname> {deny|permit} .<community>`

Parameter	Description
<listname>	Specifies the community listname.
deny	Specifies the community to reject.
permit	Specifies the community to accept.
.<community>	{<AS:VAL> local-AS no-advertise no-export}
<AS:VAL>	Specifies the valid value for the community number. This format represents the 32 bit communities value, where AS is the high order 16 bits and VAL is the low order 16 bits in digit format.
local-AS	Specifies routes not to be advertised to external BGP peers.
no-advertise	Specifies routes not to be advertised to other BGP peers.
no-export	Specifies routes not to be advertised outside of Autonomous System boundary.

**Mode** Global Configuration

**Usage** A community-list can be used as a filter to BGP updates. Use this command to define the community access list globally, then use neighbor configuration commands to apply the list to a particular neighbor.

There are two kinds of community-lists: expanded and standard. A standard community-list defines the community attributes explicitly and not via a regular expression. An expanded community-list defines the communities attributes with regular expressions.

The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value that does not match the standard community value is automatically treated as expanded.

**Example**

```
awplus# configure terminal
awplus(config)# ip community-list mylist permit 7675:80 7675:90
```

**Related  
Commands** [ip community-list standard](#)  
[ip community-list expanded](#)  
[show ip community-list](#)

**Command  
changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# ip community-list expanded

**Overview** Use this command to add an entry to an expanded BGP community-list filter.

Use the **no** variant of this command to delete the community list entry.

**Syntax**

```
ip community-list <100-199> {deny|permit} .<line>  
no ip community-list <100-199> {deny|permit} .<line>  
ip community-list expanded <expanded-listname> {deny|permit}  
.<line>  
no ip community-list expanded <expanded-listname> {deny|permit}  
.<line>
```

Parameter	Description
<100-199>	Expanded community list number.
expanded	Specifies an expanded community list.
<expanded-listname>	Expanded community list entry.
deny	Specifies community to reject.
permit	Specifies community to accept.
.<line>	Specifies community attributes with regular expressions.

Regular expressions listed below can be used with the **ip community-list expanded** command:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[ ]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

**Mode** Global Configuration

**Usage** A `community-list` can be used as a filter to BGP updates. Use this command to define the community access list globally, then use **neighbor** configuration commands to apply the list to a particular neighbor.

There are two kinds of community-lists: expanded and standard. A standard community-list defines the community attributes explicitly and not via a regular expression. An expanded community-list defines the communities attributes with regular expressions.

The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value that does not match the standard community value is automatically treated as expanded.

**Examples**

```
awplus# configure terminal
awplus(config)# ip community-list 125 permit 6789906
awplus(config)# ip community-list expanded CLIST permit .*
```

**Related Commands**

# ip community-list standard

**Overview** Use this command to add an entry to a standard BGP community-list filter.  
Use the **no** variant of this command to delete the standard community-list entry.

**Syntax**

```
ip community-list <1-99> {deny|permit} [.<community>]  
no ip community-list <1-99> {deny|permit} [.<community>]  
ip community-list standard <standard-listname> {deny|permit}  
[.<community>]  
no ip community-list standard <standard-listname> {deny|permit}  
[.<community>]
```

Parameter	Description
<1-99>	Standard community list number.
standard	Specifies a standard community list.
<standard-listname>	Standard community list entry.
deny	Specifies community to reject.
permit	Specifies community to accept.
<community>	{<AS:VAL>   local-AS   no-advertise   no-export}
<AS:VAL>	Specifies the valid value for the community number. This format represents the 32 bit communities value, where AS is the high order 16 bits and VAL is the low order 16 bits in digit format.
local-AS	Specifies routes not to be advertised to external BGP peers.
no-advertise	Specifies routes not to be advertised to other BGP peers.
no-export	Specifies routes not to be advertised outside of the Autonomous System boundary.

**Mode** Global Configuration

**Usage** A community-list can be used as a filter to BGP updates. Use this command to define the community access list globally, then use neighbor configuration commands to apply the list to a particular neighbor.

There are two kinds of community-lists: expanded and standard. The standard community-list defines the community attributes as explicit values, without regular expressions. The expanded community-list defines the communities attributes with regular expressions.

The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value

that does not match the standard community value is automatically treated as expanded.

**Examples**

```
awplus# configure terminal
awplus(config)# ip community-list standard CLIST permit 7675:80
7675:90 no-export
awplus(config)# ip community-list 34 permit 5675:50
no-advertise
```

# ip extcommunity-list expanded

**Overview** Use this command to create or delete an expanded extended community list.

Use the **no** variant of this command to delete the expanded extended community-list entry.

**Syntax**

```
ip extcommunity-list <100-199> {deny|permit}
{.<line>|.<AS:NN>|.<ip-address>}

no ip extcommunity-list <100-199> {deny|permit}
{.<line>|.<AS:NN>|.<ip-address>}

ip extcommunity-list expanded <expanded-listname> {deny|permit}
{.<line>|.<AS:NN>|.<ip-address>}

no ip extcommunity-list expanded <expanded-listname>
{deny|permit} {.<line>|.<AS:NN>|.<ip-address>}

no ip extcommunity-list <100-199>

no ip extcommunity-list expanded <expanded-listname>
```

Parameter	Description
<100-199>	Expanded extcommunity list number.
expanded	Specifies an expanded extcommunity list.
<expanded-listname>	Expanded extcommunity list entry.
deny	Specifies the extcommunity to reject.
permit	Specifies the extcommunity to accept.
.<line>	Specifies extcommunity attributes with regular expression.
<AS:NN>	Specifies the valid value for an extcommunity number. This format represents the 32 bit extcommunities value, where AA is the high order 16 bits and NN is the low order 16 bits in digit format.
<ip-address>	Specifies the IP address to deny or permit.

Regular expressions listed below are used with the **ip extcommunity-list expanded** command:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.

Symbol	Character	Meaning
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[ ]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

**Mode** Global Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# ip extcommunity-list 125 permit 4567335
awplus(config)# ip extcommunity-list expanded CLIST permit .*
```

**Related Commands** [ip extcommunity-list standard](#)

<community-number>]

no ip extcommunity-list standard <standard-listname>
[{{deny|permit} {rt|soo} <community-number>}]
```

Parameter	Description
<1-99>	Standard extcommunity list number.
standard	Specifies a standard extended community list.
<standard-listname>	Standard extended community list entry.
deny	Specifies the extended community to reject.
permit	Specifies the extended community to accept.
rt	Specifies the route target of the extended community.
soo	Specifies the site of origin of the extended community.
<community-number>	Specifies the valid value for an extended community number. This can be one of two formats: <ul style="list-style-type: none"><li>• &lt;ASN:NN&gt; where ASN is an AS (Autonomous System) number and NN is a value chosen by the ASN administrator</li><li>• &lt;A.B.C.D:NN&gt; where A.B.C.D is an IPv4 address, and NN is a value chosen by the ASN administrator.</li></ul> Note that ASN and NN are both integers from 1 to 4294967295. AS numbers are assigned to the regional registries by IANA ( <a href="http://www.iana.org">www.iana.org</a> ) and must be obtained in your region.

**Mode** Global Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# ip extcommunity-list 36 permit rt 5675:50
awplus(config)# ip extcommunity-list standard CLIST permit soo
7645:70
awplus# configure terminal
awplus(config)# ip extcommunity-list 36 deny rt 192.168.1.1:70
awplus(config)# ip extcommunity-list standard CLIST deny soo
10.10.1.1:50
```

**Related  
Commands**

# ip prefix-list

**Overview** Use this command to create an entry for an IPv4 prefix list.

Use the **no** variant of this command to delete the IPv4 prefix-list entry.

**Syntax**

```
ip prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ip-prefix>} [ge <0-32>] [le <0-32>]

ip prefix-list <list-name> description <text>

ip prefix-list sequence-number

no ip prefix-list <list-name> [seq <1-429496725>]

no ip prefix-list <list-name> [description <text>]

no ip prefix-list sequence-number
```

Parameter	Description
<list-name>	Specifies the name of a prefix list.
seq <1-429496725>	Sequence number of the prefix list entry.
deny	Specifies that the prefixes are excluded from the list.
permit	Specifies that the prefixes are included in the list.
<ip-prefix>	Specifies the IPv4 address and length of the network mask in dotted decimal in the format A.B.C.D/M.
any	Any prefix match. Same as <b>0.0.0.0 le 32</b> .
ge<0-32>	Specifies the minimum prefix length to be matched.
le<0-32>	Specifies the maximum prefix length to be matched.
<text>	Text description of the prefix list.
sequence-number	Specify sequence numbers included or excluded in prefix list.

**Mode** Global Configuration

**Usage** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. When setting these parameters, set the **le** value to be less than 32, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** In the following sample configuration, the last **ip prefix-list** command in the below list matches all, and the first **ip prefix-list** command denies the IP network 76.2.2.0:

```
awplus(config)# router bgp 100
awplus(config-router)# network 172.1.1.0
awplus(config-router)# network 172.1.2.0
awplus(config-router)# neighbor 10.6.5.3 remote-as 300
awplus(config-router)# neighbor 10.6.5.3 prefix-list mylist out
awplus(config-router)# exit
awplus(config)# ip prefix-list mylist seq 5 deny 76.2.2.0/24
awplus(config)# ip prefix-list mylist seq 100 permit any
```

To deny the IP addresses between 10.0.0.0/14 (10.0.0.0 255.252.0.0) and 10.0.0.0/22 (10.0.0.0 255.255.252.0) within the 10.0.0.0/8 (10.0.0.0 255.0.0.0) addressing range, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip prefix-list mylist seq 12345 deny 10.0.0.0/8
ge 14 le 22
```

**Related Commands**

- [match ip address](#)
- [neighbor prefix-list](#)
- [area filter-list](#)
- [clear ip prefix-list](#)
- [match route-type](#)
- [show ip prefix-list](#)

# ipv6 prefix-list

**Overview** Use this command to create an IPv6 prefix list or an entry in an existing prefix list.

Use the **no** variant of this command to delete a whole prefix list, a prefix list entry, or a description.

**Syntax**

```
ipv6 prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ipv6-prefix>} [ge <0-128>] [le <0-128>]
ipv6 prefix-list <list-name> description <text>
no ipv6 prefix-list <list-name> [seq <1-429496725>]
no ipv6 prefix-list <list-name> [description <text>]
```

Parameter	Description
<list-name>	Specifies the name of a prefix list.
seq <1-429496725>	Sequence number of the prefix list entry.
deny	Specifies that the prefixes are excluded from the list.
permit	Specifies that the prefixes are included in the list.
<ipv6-prefix>	Specifies the IPv6 prefix and prefix length in hexadecimal in the format X:X::X:X/M.
any	Any prefix match. Same as ::0/0 le 128.
ge <0-128>	Specifies the minimum prefix length to be matched.
le <0-128>	Specifies the maximum prefix length to be matched.
description	Prefix list specific description.
<text>	Up to 80 characters of text description of the prefix list.

**Mode** Global Configuration

**Usage** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. The parameters **ge** and **le** are only used if an ip-prefix is stated. When setting these parameters, set the **le** value to be less than 128, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** To check the first 32 bits of the prefix 2001:db8:: and that the subnet mask must be greater than or equal to 34 and less than or equal to 40, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list mylist seq 12345 permit
2001:db8::/32 ge 34 le 40
```

**Related Commands**

- match ipv6 address
- show ipv6 prefix-list
- show running-config ipv6 prefix-list

# match as-path

**Overview** Use this command to add an autonomous system (AS) path match clause to a route map entry. Specify the AS path attribute value or values to match by specifying the name of an AS path access list. To create the AS path access list, enter Global Configuration mode and use the [ip as-path access-list](#) command.

A BGP update message matches the route map if its attributes include AS path values that match the AS path access list.

Each entry of a route map can only match against one AS path access list in one AS path match clause. If the route map entry already has an AS path match clause, entering this command replaces that match clause with the new clause.

Note that AS path access lists and route map entries both specify an action of deny or permit. The action in the AS path access list determines whether the route map checks update messages for a given AS path value. The route map action and its **set** clauses determine what the route map does with update messages that contain that AS path value.

Use the **no** variant of this command to remove the AS path match clause from a route map entry.

**Syntax** `match as-path <as-path-listname>`  
`no match as-path [<as-path-listname>]`

Parameter	Description
<code>&lt;as-path-listname&gt;</code>	Specifies an AS path access list name.

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To add entry 34 to the route map called `myroute`, which will discard update messages if they contain the AS path values that are included in `myaccesslist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match as-path myaccesslist
```

**Related Commands** [ip as-path access-list](#)  
[route-map](#)  
[set as-path](#)  
[show route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# match community

**Overview** Use this command to add a community match clause to a route map entry. Specify the community value or values to match by specifying a community list. To create the community list, enter Global Configuration mode and use the [ip community-list](#) command.

A BGP update message matches the route map if its attributes include community values that match the community list.

Each entry of a route map can only match against one community list in one community match clause. If the route map entry already has a community match clause, entering this command replaces that match clause with the new clause.

Note that community lists and route map entries both specify an action of deny or permit. The action in the community list determines whether the route map checks update messages for a given community value. The route map action and its **set** clauses determine what the route map does with update messages that contain that community value.

Use the **no** variant of this command to remove the community match clause from a route map.

**Syntax**

```
match community  
{<community-listname>|<1-99>|<100-199>} [exact-match]  
  
no match community  
[<community-listname>|<1-99>|<100-199>|exact-match]
```

Parameter	Description
<community-listname>	The community list name or number.
<1-99>	Community list number (standard range).
<100-199>	Community list number (expanded range).
exact-match	Exact matching of communities.

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes.

**Example** To add entry 3 to the route map called `myroute`, which will process update messages if they contain the community values that are included in `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match community mylist
```

**Related  
Commands**

- Version 5.4.7-2.4: BGP support added for IE300 series

# max-paths

**Overview** Use this command to set the number of equal-cost multi-path (ECMP) routes for eBGP or iBGP. You can install multiple BGP paths to the same destination to balance the load on the forwarding path.

Use the **no** variant of this command to disable this feature.

**Syntax** `max-paths {ebgp|ibgp} <2-64>`  
`no max-paths ebgp [<2-64>]`  
`no max-paths ibgp [<2-64>]`

Parameter	Description
ebgp	eBGP ECMP session.
ibgp	iBGP ECMP session.
<2-64>	Specifies the number of routes.

**Mode** Global Configuration

**Usage** This command is available for the default BGP instance and for IPV4 and IPV6 unicast addresses.

**Example** `awplus# configure terminal`  
`awplus(config)# router bgp 64501`  
`awplus(config-router)# max-paths ebgp 2`

**Related commands** [show ip route summary](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor activate

**Overview** Use this command to enable the exchange of BGP IPv4 and BGP4+ IPv6 routes with a neighboring router, and also within either an IPv4 or an IPv6 specific address-family.

Use the **no** variant of this command to disable the exchange of information with a BGP or BGP4+ neighbor, in the Router Configuration or the Address Family Configuration mode.

**Syntax** neighbor <neighborid> activate  
no neighbor <neighborid> activate

Parameter	Description
<neighborid>	{ <ip-address>   <ipv6-addr>   <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage [BGP]** Use this command to enable the exchange of information to a neighbor. To exchange IPv4 or IPv6 prefixes with a BGP or a BGP4+ peer, you must configure this command for the peer or the peer group. This command only enables the exchange of information. You can establish peering without this command, but no prefixes and other information is sent until you apply this command to the neighbor.

This command triggers the device to start a BGP or BGP4+ peering relationship with the specified BGP or BGP4+ neighbor and start exchanging routes with that neighbor.

The command is required for neighbors configured in Address-Family Configuration mode, but it is not required in Router Configuration mode (that is, it does not affect the device's behavior).

**Examples [BGP]** To enable an exchange of routes with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 activate
```

To disable an exchange of routes with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 activate
```

To enable an exchange of routes in Address Family Configuration mode with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 activate
```

To disable an exchange of routes in Address Family Configuration mode with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 activate
```

To enable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.63 remote-as 10
awplus(config-router)# neighbor 10.10.0.63 peer-group group1
awplus(config-router)# neighbor group1 activate
```

To disable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 activate
```

**Examples** To enable an exchange of routes in IPv6 Address Family Configuration mode with a neighboring router with the IPv6 address 2001:0db8:010d::1, enter the commands as shown below:

**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 activate
```

To disable an exchange of routes in IPv6 Address Family Configuration mode with a neighboring router with the IPv6 address 2001:0db8:010d::1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
activate
```

To enable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 activate
```

To disable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 activate
```

**Related Commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor advertisement-interval

**Overview** Use this command to set the minimum interval between sending iBGP or eBGP routing updates for a given route. This command reduces the flapping of individual routes.

Use the **no** variant of this command to set the interval time to the default values (30 seconds for eBGP peers and 5 seconds for iBGP peers) for a given route.

**Syntax** `neighbor <neighborid> advertisement-interval <time>`  
`no neighbor <neighborid> advertisement-interval [<time>]`

Parameter	Description
<neighborid>	{<ip-address>   <ipv6-addr>   <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. Note that if you apply an advertisement-interval value to a peer group it will apply to all members in the peer group.
<time>	<0-600> Advertisement -interval value in seconds.

**Default** The default interval between sending routing updates for a given route to eBGP peers is 30 seconds, and the default interval for a given route to iBGP peers is 5 seconds.

**Mode** Router Configuration

**Usage** Use this command to set the minimum interval between sending iBGP or eBGP routing updates for a given route. To reduce the flapping of routes to the internet, set a minimum advertisement interval, so iBGP or eBGP routing updates are sent per interval seconds.

BGP dampening can also be used to control the effects of flapping routes. See the [bgp dampening](#) command in this chapter, and the [Routing\\_Protocol Guide](#) for more information.

The advertisement-interval time value is the minimum time between the advertisement of Update messages sent from a BGP speaker to report changes to

eBGP or iBGP peers. This is the minimum time between two Update messages sent to iBGP or eBGP peers.

See the [neighbor as-origination-interval](#) command to set the interval time between messages to iBGP peers, which have prefixes within the local AS. Use this command instead of the [neighbor as-origination-interval](#) command for eBGP peers with prefixes not in the same AS and updates not in a local AS.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.3
advertisement-interval 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.3
advertisement-interval
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.3 remote-as 10
awplus(config-router)# neighbor 10.10.0.3 peer-group group1
awplus(config-router)# neighbor group1 advertisement-interval
45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1
advertisement-interval
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
advertisement-interval 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
advertisement-interval
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1
advertisement-interval 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1
advertisement-interval
```

# neighbor allowas-in

**Overview** Use this command to accept an AS\_PATH with the specified Autonomous System (AS) number from inbound updates for both BGP and BGP4+ routes.

This command allows BGP and BGP4+ to accept prefixes with the same ASN in the AS\_PATH attribute. This command allows BGP and BGP4+ to accept up to 10 instances, configured by the *<occurrences>* placeholder, of its own AN in the AS\_PATH for a prefix.

Use the **no** variant of this command to revert to default functionality (disabled by default).

**Syntax** `neighbor <neighborid> allowas-in <occurrences>`  
`no neighbor <neighborid> allowas-in`

Parameter	Description
<i>&lt;neighborid&gt;</i>	{ <i>&lt;ip-address&gt;</i>   <i>&lt;ipv6-addr&gt;</i>   <i>&lt;peer-group&gt;</i> }
<i>&lt;ip-address&gt;</i>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<i>&lt;ipv6-addr&gt;</i>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<i>&lt;peer-group&gt;</i>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<i>&lt;occurrences&gt;</i>	<i>&lt;1-10&gt;</i> Specifies the number of occurrences of the AS number.

**Default** Disabled

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use this command to configure PE (Provider Edge) routers to allow re-advertisement of all prefixes containing duplicate Autonomous System Numbers (ASNs). In a hub and spoke configuration, a PE router re-advertises all prefixes containing duplicate ASNs. Specify the remote-as or peer-group first using the related commands. The command allows a receiving peer to accept prefixes with its own AN in the AS\_PATH, up the maximum number of instances, as configured by the *<occurrences>* placeholder.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.1 allowas-in 3
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.1 allowas-in 3
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.1 allowas-in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.1 allowas-in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.1 remote-as 10
awplus(config-router)# neighbor 10.10.0.1 peer-group group1
awplus(config-router)# neighbor group1 allowas-in 3
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor group1 allowas-in 3
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
allowas-in 3
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6

# neighbor as-origination-interval

**Overview** Use this command to adjust the sending of AS (Autonomous System) origination routing updates to a specified iBGP peer. This command adjusts the rate at which updates are sent to a specified iBGP peer (15 seconds by default). You must set a rate when you enable it.

The as-origination-interval is the minimum time set between the advertisement of Update messages sent from a BGP speaker to an iBGP peer to report changes within the local AS.

Use the **no** variant of this command to reset the timer to the default value of 15 seconds.

**Syntax [BGP]** neighbor <neighbor\_address> as-origination-interval <time>  
no neighbor <neighbor\_address> as-origination-interval [<time>]

**Syntax [BGP4+]** neighbor <ipv6-addr> as-origination-interval <time>  
no neighbor <ipv6-addr> as-origination-interval [<time>]

Parameter	Description
<neighbor_address>	Specify a neighbor IPv4 address, in dotted decimal in the format A.B.C.D.
<ipv6-addr>	Specify an address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<time>	<1-600> Time in seconds.

**Default** The default interval between sending routing updates to iBGP peers, which include a prefix that originates from the local AS, is 15 seconds by default.

**Mode** Router Configuration

**Usage** This command is used to change the minimum interval between sending AS-origination routing updates. The update interval for iBGP peers can be set from 1 to 600 seconds.

For interoperability with other vendors' devices, we recommend using the default value. The AS origination interval timer may not be available to adjust on other vendors' devices. Applying the default of 15 seconds across the AS maintains a common timer policy.

AlliedWare Plus devices use the default 15 second AS Origination Interval timer as per RFC 4271, a 30 second keepalive timer, a 90 second hold timer, a 120 second connect timer, a 5 second iBGP peer route advertisement interval, and a 30 second eBGP peer route advertisement interval.

Cisco devices use a 60 second keepalive timer, a 180 second hold timer, and no iBGP peer route interval timer (0). Juniper devices use a 10 second AS Origination Interval timer.

The as-origination-interval time value is the minimum amount of time between the advertisement of Update messages sent from a BGP speaker to report changes within the local AS. This is the minimum time between two Update messages to iBGP peers, which contain a prefix that originates from the same AS. See the [neighbor advertisement-interval](#) command to set time between messages to eBGP peers.

Use this command instead of the [neighbor advertisement-interval](#) command for iBGP peers with prefixes in the same AS for updates only within a local AS.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 10.10.0.1
as-origination-interval 10
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 10.10.0.1
as-origination-interval
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1
as-origination-interval 10
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 2001:0db8:010d::1
as-origination-interval
```

# neighbor attribute-unchanged

**Overview** Use this command to advertise unchanged BGP or BGP4+ attributes to the specified BGP or BGP4+ neighbor.

Use the **no** variant of this command to disable this function.

**Syntax** `neighbor <neighborid> attribute-unchanged  
{as-path|next-hop|med}`  
`no neighbor <neighborid> attribute-unchanged  
{as-path|next-hop|med}`

Parameter	Description
<neighborid>	{<ip-address>   ipv6-addr>   <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
as-path	AS path attribute.
next-hop	Next hop attribute.
med	Multi Exit Discriminator.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Note that specifying this command with the optional **as-path** parameter has the same effect as invoking the [neighbor transparent-as](#) command.

Note this specifying this command with the optional **next-hop** parameter has the same effect as invoking the [neighbor transparent-next-hop](#) command.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.75 attribute-unchanged
as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.75
attribute-unchanged as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.75
attribute-unchanged as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.75
attribute-unchanged as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.75 remote-as 10
awplus(config-router)# neighbor 10.10.0.75 peer-group group1
awplus(config-router)# neighbor group1 attribute-unchanged
as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 attribute-unchanged
as-path med
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
attribute-unchanged as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
attribute-unchanged as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 attribute-unchanged
as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1
attribute-unchanged as-path med
```

**Related**

# neighbor capability graceful-restart

**Overview** Use this command to configure the device to advertise the Graceful Restart Capability to BGP and BGP4+ neighbors.

Use the **no** variant of this command to configure the device so it does not advertise the Graceful Restart Capability to its neighbor.

**Syntax** `neighbor <neighborid> capability graceful-restart`  
`no neighbor <neighborid> capability graceful-restart`

Parameter	Description
<neighborid>	{ <ip-address>   <ipv6-addr>   <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Default** Disabled

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use the **neighbor capability graceful-restart** command to advertise to the BGP or BGP4+ neighbor routers the capability of graceful restart. First specify the BGP or BGP4+ neighbor's **remote-as** identification number as assigned by the neighbor router.

The graceful restart capability is advertised only when the graceful restart capability has been enabled using the [bgp graceful-restart](#) command.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.50 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.50 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.50 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.50 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.50 remote-as 10
awplus(config-router)# neighbor 10.10.10.50 peer-group group1
awplus(config-router)# neighbor group1 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability
graceful-restart
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
capability graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
capability graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 capability
graceful-restart
```

**Related**  
**Commands**

- [bgp graceful-restart](#)
- [neighbor peer-group \(add a neighbor\)](#)
- [neighbor route-map](#)
- [restart bgp graceful \(BGP only\)](#)

**Command**  
**changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor capability orf prefix-list

**Overview** Use this command to advertise ORF (Outbound Route Filters) capability to neighbors. Use this command to dynamically filter updates. The BGP speaker can advertise a prefix list with prefixes it wishes the peer to prune or filter from outgoing updates.

Use the **no** variant of this command to disable this function.

**Syntax** `neighbor <neighborid> capability orf prefix-list  
{both|receive|send}`  
`no neighbor <neighborid> capability orf prefix-list  
{both|receive|send}`

Parameter	Description
<neighborid>	{<ip-address>   <ipv6-addr>   <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
orf	Advertises ORF capability to its neighbors.
both	Indicates that the local router can send ORF entries to its peer as well as receive ORF entries from its peer.
receive	Indicates that the local router is willing to receive ORF entries from its peer.
send	Indicates that the local router is willing to send ORF entries to its peer.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Default** Disabled

**Usage** Outbound Route Filters (ORFs) send and receive capabilities to lessen the number of updates exchanged between neighbors. By filtering updates, this option minimizes generating and processing of updates. The local router advertises the ORF capability in `send` mode and the remote router receives the ORF capability in

**receive** mode applying the filter as outbound policy. The two routers exchange updates to maintain the ORF for each router. Only an individual router or a peer-group can be configured to be in **receive** or **send** mode. A peer-group member cannot be configured in **receive** or **send** mode.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.5 capability orf
prefix-list both
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.5 capability orf
prefix-list both
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# neighbor 10.10.0.5 capability orf
prefix-list both
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# no neighbor 10.10.0.5 capability orf
prefix-list both
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.5 remote-as 10
awplus(config-router)# neighbor 10.10.0.5 peer-group group1
awplus(config-router)# neighbor group1 capability orf
prefix-list both
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability orf
prefix-list both
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router)# neighbor 2001:0db8:010d::1 capability
orf prefix-list both

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router)# no neighbor 2001:0db8:010d::1 capability
orf prefix-list both

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 capability orf
prefix-list both

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 capability orf
prefix-list both
```

**Related**  
**Commands**

- [neighbor capability orf prefix-list](#)
- [neighbor peer-group \(add a neighbor\)](#)
- [neighbor route-map](#)

**Command**  
**changes**

- Added to AlliedWare Plus prior to 5.4.6-1

# neighbor capability route-refresh

**Overview** Use this command to advertise route-refresh capability to the specified BGP and BGP4+ neighbors.

Use the **no** variant of this command to disable this function

**Syntax** `neighbor <neighborid> capability route-refresh`  
`no neighbor <neighborid> capability route-refresh`

Parameter	Description
<neighborid>	{ <ip-address>   ipv6-addr>   <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode** Router Configuration

**Default** Enabled

**Usage** Use this command to advertise to peer about route refresh capability support. If route refresh capability is supported, then router can dynamically request that the peer readvertises its Adj-RIB-Out.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 capability
route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 capability
route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.1.1 remote-as 10
awplus(config-router)# neighbor 10.10.1.1 peer-group group1
awplus(config-router)# neighbor group1 capability route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability
route-refresh
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 capability
route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 capability
route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 capability route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability
route-refresh
```

**Related  
Commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command  
changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor collide-established

**Overview** Use this command to specify including a BGP or BGP4+ neighbor, already in an 'established' state, for conflict resolution when a TCP connection collision is detected.

Use the **no** variant of this command to remove a BGP or BGP4+ neighbor, already in an 'established' state, for conflict resolution when a TCP connection collision is detected.

**Syntax** `neighbor <neighborid> collide-established`  
`no neighbor <neighborid> collide-established`

Parameter	Description
<neighborid>	{<ip-address> <ipv6-addr> <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode** Router Configuration

**Usage** This command must be used only when specially required. It is not required in most network deployments.

The associated functionality of including an 'established' neighbor into TCP connection collision conflict resolution is automatically enabled when neighbor is configured for BGP graceful-restart.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1
collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 collide-established
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 collide-established
```

# neighbor default-originate

**Overview** Use this command to allow a BGP or BGP4+ local router to send the default route to a neighbor.

Use the **no** variant of this command to send no route as a default route.

**Syntax** `neighbor {<neighborid>} default-originate [route-map <routemap-name>]`  
`no neighbor {<neighborid>} default-originate [route-map <routemap-name>]`

Parameter	Description
<code>&lt;neighborid&gt;</code>	<code>{&lt;ip-address&gt;   &lt;ipv6-addr&gt;   &lt;peer-group&gt;}</code>
<code>&lt;ip-address&gt;</code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code>&lt;ipv6-addr&gt;</code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code>&lt;peer-group&gt;</code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<code>route-map</code>	If a route-map is specified, then the route table must contain at least one route that matches the permit criteria of the route map before the default route will be advertised to the specified neighbor.
<code>&lt;routemap-name&gt;</code>	Enter the route-map name.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 default-originate
route-map myroute

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 default-originate
route-map myroute

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1
default-originate route-map myroute

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1
default-originate route-map myroute

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 default-originate
route-map myroute

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 default-originate
route-map myroute
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
default-originate route-map myroute
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
default-originate route-map myroute
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 default-originate
route-map myroute
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 default-originate
route-map myroute
```

# neighbor description

**Overview** Use this command to associate a description with a BGP or a BGP4+ neighbor. We recommend adding descriptions to defined neighbors, so any network administrators or network engineers can see a description of connected BGP or BGP4+ peers on the device.

Use the **no** variant of this command to remove the description from a BGP or a BGP4+ neighbor.

**Syntax** `neighbor <neighborid> description <description>`  
`no neighbor <neighborid> description [<description>]`

Parameter	Description
<code>&lt;neighborid&gt;</code>	{ <code>&lt;ip-address&gt;</code>   <code>&lt;ipv6-addr&gt;</code>   <code>&lt;peer-group&gt;</code> }
<code>&lt;ip-address&gt;</code> >	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code>&lt;ipv6-addr&gt;</code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code>&lt;peer-group&gt;</code> >	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<code>&lt;description&gt;</code>	Enter up to 80 characters of text describing the neighbor.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 description Backup
router for sales

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 description

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 description Backup
router for sales

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 description Backup
router for sales.
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 description
Backup router for sales

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
description

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 description Backup
router for sales

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 description Backup
router for sales
```

**Related Commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

# neighbor disallow-infinite-holdtime

**Overview** Use this command to disallow the configuration of infinite holdtime for BGP and BGP4+.

Use the **no** variant of this command to allow the configuration of infinite holdtime for BGP or BGP4+.

**Syntax [BGP]** neighbor {<ip-address>} disallow-infinite-holdtime  
no neighbor {<ip-address>} disallow-infinite-holdtime

**Syntax [BGP4+]** neighbor {<ipv6-addr>} disallow-infinite-holdtime  
no neighbor {<ipv6-addr>} disallow-infinite-holdtime

Parameter	Description
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.

**Mode** Router Configuration

**Usage** This command enables the local BGP or BGP4+ speaker to reject holdtime "0" seconds from the peer during exchange of open messages or the user during configuration.

The **no** variant of this command allows the BGP speaker to accept "0" holdtime from the peer or during configuration.

**Examples [BGP]** To enable the **disallow-infinite-holdtime** feature on the BGP speaker with the IP address of 10.10.10.1, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1
disallow-infinite-holdtime
```

To disable the **disallow-infinite-holdtime** feature on the BGP speaker with the IP address of 10.10.10.10, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1
disallow-infinite-holdtime
```

**Examples** To enable the **disallow-infinite-holdtime** feature on the BGP4+ speaker with the IPv6 address of 2001:0db8:010d::1, enter the commands:

**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor
disallow-infinite-holdtime2001:0db8:010d::1
```

To disable the **disallow-infinite-holdtime** feature on the BGP4+ speaker with the IPv6 address of 2001:0db8:010d::1, enter the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor
disallow-infinite-holdtime2001:0db8:010d::1
```

**Related Commands** [neighbor timers](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor distribute-list

**Overview** This command filters route updates from a particular BGP or BGP4+ neighbor using an access control list.

You can add one incoming and one outgoing distribute-list for each BGP or BGP4+ neighbor.

The **no** variant of this command removes a previously configured BGP or BGP4+ distribute-list.

**Syntax** `neighbor <neighborid> distribute-list <access-list> {in|out}`  
`no neighbor <neighborid> distribute-list <access-list> {in|out}`

Parameter	Description
<neighborid>	Specify an identification method for the BGP or BGP4+ peer. Use one of the following formats:
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> and <a href="#">neighbor route-map</a> commands. When this parameter is used with this command, the command applies on all peers in the specified group.
<access-list>	The specific access-list used to filter routes. Specify one of the following types of access-lists:
<WORD>	The name of IP access-list.
<1-199>	The ID number of a standard IP access-list.
<1300-2699>	The ID number of an extended IP access-list.
in	Indicates that incoming advertised routes will be filtered.
out	Indicates that outgoing advertised routes will be filtered.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 distribute-list
mylist out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 distribute-list
mylist out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 distribute-list
mylist out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1
distribute-list mylist out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor 10.10.10.1 distribute-list
mylist out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 distribute-list
mylist out
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
distribute-list mylist out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
distribute-list mylist out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor 2001:0db8:010d::1
distribute-list mylist out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
distribute-list mylist out
```

# neighbor dont-capability-negotiate

**Overview** Use this command to disable capability negotiation for BGP and BGP4+.

The capability negotiation is performed by default. This command is used to allow compatibility with older BGP versions that have no capability parameters used in open messages between peers.

Use the **no** variant of this command to enable capability negotiation.

**Syntax** `neighbor <neighborid> dont-capability-negotiate`  
`no neighbor <neighborid> dont-capability-negotiate`

Parameter	Description
<code>&lt;neighborid&gt;</code>	<code>{&lt;ip-address&gt;   &lt;ipv6-addr&gt;   &lt;peer-group&gt;}</code>
<code>&lt;ip-address&gt;</code>	Specify the IPv4 address of the BGP neighbor in dotted decimal, in the format A.B.C.D.
<code>&lt;ipv6-addr&gt;</code>	Specify the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code>&lt;peer-group&gt;</code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> and <a href="#">neighbor route-map</a> commands. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 100
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1
dont-capability-negotiate
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1
dont-capability-negotiate
```

**Related  
Commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command  
changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor ebgp-multihop

**Overview** Use this command to accept and attempt BGP or BGP4+ connections to external peers on indirectly connected networks.

Effectively, this command sets the TTL value in the BGP or BGP4+ packets that the router sends to the neighbor, so that the packets may traverse the network route to the neighbor.

The device will not establish a connection to a multihop neighbor, if the only route to the multihop peer is a default route.

Use the **no** variant of this command to return to the default.

**Syntax** `neighbor <neighborid> ebgp-multihop [<count>]`  
`no neighbor <neighborid> ebgp-multihop [<count>]`

Parameter	Description
<code>&lt;neighborid&gt;</code>	{ <code>&lt;ip-address   ipv6-addr   &lt;peer-group&gt;</code> }
<code>&lt;ip-addr&gt;</code>	Specify the address of an IPv4 BGP neighbor, entered in dotted decimal notation A.B.C.D.
<code>&lt;ipv6-addr&gt;</code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code>&lt;peer-group&gt;</code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<code>&lt;count&gt;</code>	<code>&lt;1-255&gt;</code> The Maximum hop count, that is set in the TTL field of the BGP packets. If this optional parameter is not specified with the command, then the Maximum hop count is set to 255.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.34 ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 ebgp-multihop 5
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# neighbor 2001:0db8:010d::1
ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1

# neighbor enforce-multihop

**Overview** Use this command to enforce the requirement that BGP and BGP4+ neighbors form multihop connections.

Use the **no** variant of this command to turn off this feature.

**Syntax** `neighbor <neighborid> enforce-multihop`  
`no neighbor <neighborid> enforce-multihop`

Parameter	Description
<neighborid>	{<ip-address> <ipv6-addr> <peer-group>}
<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	The address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34 remote-as 10

# neighbor filter-list

**Overview** This command creates a BGP or BGP4+ filter using an AS (Autonomous System) path list. This command specifies an AS path list, which it then applies to filter updates to and from a BGP or a BGP4+ neighbor

The **no** variant of this command removes the previously specified BGP or BGP4+ filter using access control lists.

**Syntax** `neighbor <neighborid> filter-list <listname> {in|out}`  
`no neighbor <neighborid> filter-list <listname> {in|out}`

Parameter	Description
<code>&lt;neighborid&gt;</code>	Specify the identification method for the BGP or BGP4+ peer. Use one of the following formats: <ul style="list-style-type: none"><li><code>&lt;ip-address&gt;</code> Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.</li><li><code>&lt;ipv6-addr&gt;</code> Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.</li><li><code>&lt;peer-group&gt;</code> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.</li></ul>
<code>&lt;listname&gt;</code>	Specify the name of an AS (Autonomous System) path list.
<code>in</code>	Indicates that incoming advertised routes will be filtered.
<code>out</code>	Indicates that outgoing advertised routes will be filtered.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** This command specifies a filter for updates based on a BGP AS (Autonomous System) path list.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34 filter-list list1
out

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34 filter-list list1
out

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.34 filter-list list1
out

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.34 filter-list
list1 out

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 filter-list list1 out
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
filter-list list1 out

awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 filter-list list1
out
```

**Related**  
**Commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command**  
**changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor interface

**Overview** Use this command to configure the interface name of a BGP4+ speaking neighbor. Use the **no** variant of this command to disable this function.

**Syntax [BGP4+]** neighbor {<ipv6-addr>|<ipaddress>} interface <interface>  
no neighbor {<ipv6-addr>|<ipaddress>} interface <interface>

Parameter	Description
<ipaddress>	Specifies the IPv4 address of the BGP neighbor - entered in dotted decimal notation in the format A.B.C.D.
<ipv6-addr>	Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<interface>	Specifies the interface name of BGP neighbor, e.g. vlan2.

**Mode [BGP4+]** Router Configuration

**Usage [BGP4+]** This command is for use with BGP4+ peering. Use this command for BGP peering with IPv6 link local addresses.

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 interface vlan2
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 interface vlan2
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 interface
vlan2
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 interface
vlan2
```

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor local-as

**Overview** Use this command to configure a local AS number for the specified BGP or BGP4+ neighbor. This overrides the local AS number specified by the [router bgp](#) command.

Use the **no** variant of this command to remove the local AS number for the specified BGP or BGP4+ neighbor.

**Syntax** `neighbor <neighborid> local-as <as-number>`  
`no neighbor <neighborid> local-as <as-number>`

Parameter	Description
<code>&lt;neighborid&gt;</code>	{ <code>&lt;ip-address&gt;</code>   <code>&lt;ipv6-addr&gt;</code>   <code>&lt;peer-group&gt;</code> }
<code>&lt;ip-address&gt;</code>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code>&lt;ipv6-addr&gt;</code>	The address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code>&lt;peer-group&gt;</code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> and <a href="#">neighbor route-map</a> commands. When this parameter is used with this command, the command applies on all peers in the specified group.
<code>&lt;as-number&gt;</code>	<code>&lt;1-4294967295&gt;</code> Neighbor's Autonomous System (AS) number.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

When VRF-lite is configured, this command allows internal BGP loopback connections between named VRFs and the default global routing instance to be configured to act as eBGP connections, instead of only iBGP.

**Usage [BGP4+]** When BGP4+ is configured, this command prepends the ASN as defined by the [router bgp](#) command, and adds the ASN as defined by the [neighbor local-as](#) command in front of the actual ASN as defined by the [router bgp](#) command. This makes the peer believe it is peering with the ASN as defined by the [neighbor local-as](#) command.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 local-as 1
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 local-as 1
```

# neighbor maximum-prefix

**Overview** Use this command to control the number of prefixes that can be received from a BGP or a BGP4+ neighbor.

Use the **no** variant of this command to disable this function. Do not specify threshold to apply the default threshold of 75% for the maximum number of prefixes before this is applied.

**Syntax** `neighbor <neighborid> maximum-prefix <maximum>`  
`no neighbor <neighborid> maximum-prefix [<maximum>]`

Parameter	Description
<code>&lt;neighborid&gt;</code>	{ <code>&lt;ip-address&gt;</code>   <code>&lt;ipv6-addr&gt;</code>   <code>&lt;peer-group&gt;</code> }
<code>&lt;ip-address&gt;</code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code>&lt;ipv6-addr&gt;</code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code>&lt;peer-group&gt;</code>	Name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<code>&lt;maximum&gt;</code>	<code>&lt;maxprefix&gt;</code> [ <code>&lt;threshold&gt;</code> ] [ <code>warning-only</code> ]
<code>&lt;maxprefix&gt;</code>	<code>&lt;1-4294967295&gt;</code> Specifies the maximum number of prefixes permitted.
<code>&lt;threshold&gt;</code>	<code>&lt;1-100&gt;</code> Specifies the threshold value, 1 to 100 percent. 75% by default.
<code>warning-only</code>	Only gives a warning message when the limit is exceeded.

**Default** The default threshold value is 75%. If the threshold value is not specified this default is applied.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** The **neighbor maximum-prefix** command allows the configuration of a specified number of prefixes that a BGP or a BGP4+ router is allowed to receive from a neighbor. When the `warning-only` option is not used, if any extra prefixes are received, the router ends the peering. A terminated peer, stays down until the **clear ip bgp** command is used.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 maximum-prefix 1244
warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 maximum-prefix
1244 warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 maximum-prefix 1244
warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 maximum-prefix 1244
warning-only
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
maximum-prefix 1244 warning-only
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
maximum-prefix 1244 warning-only
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 maximum-prefix 1244
warning-only
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 maximum-prefix
1244 warning-only
```

**Related** [neighbor peer-group \(add a neighbor\)](#)  
**Commands** [neighbor route-map](#)

**Command** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor next-hop-self

**Overview** Use this command to configure the BGP or BGP4+ router as the next hop for a BGP or BGP4+ speaking neighbor or peer group.

Use the **no** variant of this command to disable this feature.

**Syntax** `neighbor <neighborid> next-hop-self`  
`no neighbor <neighborid> next-hop-self`

Parameter	Description
<neighborid>	{ <ip-address>   <ipv6-addr>   <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** This command allows a BGP or BGP4+ router to change the next hop information that is sent to the iBGP peer. The next hop information is set to the IP address of the interface used to communicate with the neighbor.

This command can be run for a specific VRF instance.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 next-hop-self
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 next-hop-self
```

# neighbor override-capability

**Overview** Use this command to override a capability negotiation result for BGP and BGP4+. Use the **no** variant of with this command to disable this function.

**Syntax** `neighbor <neighborid> override-capability`  
`no neighbor <neighborid> override-capability`

Parameter	Description
<neighborid>	{<ip-address>   <ipv6-addr>   <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 override-capability
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
override-capability
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 override-capability
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 override-capability
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 2001:0db8:010d::1
override-capability
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 2001:0db8:010d::1
override-capability
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 override-capability
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 override-capability
```

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor passive

**Overview** Use this command to configure the local BGP or BGP4+ router to be passive with regard to the specified BGP or BGP4+ neighbor. This has the effect that the BGP or BGP4+ router will not attempt to initiate connections to this BGP or BGP4+ neighbor, but will accept incoming connection attempts from the BGP or BGP4+ neighbor.

Use the **no** variant of this command to disable this function.

**Syntax** `neighbor <neighborid> passive`  
`no neighbor <neighborid> passive`

Parameter	Description
<neighborid>	{<ip-address>   <ipv6-addr>   <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 passive
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 passive
```

**Related Commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series

## Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor password

**Overview** Use this command to enable MD5 authentication on a TCP connection between BGP and BGP4+ neighbors. No authentication is applied by default. To setup authentication for the session, you must first apply authentication on each connected peer for the session.

Use the **no** variant of this command to disable this function.

**Syntax [BGP]** `neighbor {<ip-address>|<peer-group-name>} password <password>`  
`no neighbor {<ip-address>|<peer-group-name>} password`  
`[<password>]`

**Syntax [BGP4+]** `neighbor {<ipv6-addr>|<peer-group-name>} password <password>`  
`no neighbor {<ipv6-addr>|<peer-group-name>} password`  
`[<password>]`

Parameter	Description
<code>&lt;ip-address&gt;</code>	Specifies the IP address of the BGP neighbor, in A.B.C.D format.
<code>&lt;ipv6-addr&gt;</code>	Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code>&lt;peer-group-name&gt;</code>	Name of an existing peer-group. When this parameter is used with this command, the command applies on all peers in the specified group.
<code>&lt;password&gt;</code>	An alphanumeric string of characters to be used as password.

**Default** No authentication is applied by default.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** When using the `<peer-group-name>` parameter with this command (to apply this command to all peers in the group), see the related commands [neighbor peer-group \(add a neighbor\)](#) and [neighbor route-map](#) for information about how to create peer groups first.

**Examples [BGP]** This example specifies the encryption type and the password 'manager' for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 password manager
```

This example removes the password set for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 password
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

**Examples  
(VRF-lite)**

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor 10.10.10.1 password manager
```

This example removes the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# no neighbor 10.10.10.1 password
manager
```

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor group1 password manager
```

**Examples [BGP4+]** This example specifies the encryption type and the password 'manager' for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor password manager
2001:0db8:010d::1
```

This example removes the password set for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor password 2001:0db8:010d::1
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor remote-as 102001:0db8:010d::1
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor peer-group group1
2001:0db8:010d::1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

**Related Commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

- Command changes**
- Added to AlliedWare Plus prior to 5.4.6-1
  - Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
  - Version 5.4.7-2.1: BGP support added for IEx510, x550 series
  - Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor peer-group (add a neighbor)

**Overview** Use this command to add a BGP or a BGP4+ neighbor to an existing peer-group. Use the **no** variant of this command to disable this function.

**Syntax [BGP]** `neighbor <ip-address> peer-group <peer-group>`  
`no neighbor <ip-address> peer-group <peer-group>`

**Syntax [BGP4+]** `neighbor <ipv6-addr> peer-group <peer-group>`  
`no neighbor <ipv6-addr> peer-group <peer-group>`

Parameter	Description
<code>&lt;ip-address&gt;</code>	Specify the IPv4 address of the BGP neighbor, entered in the format A.B.C.D.
<code>&lt;ipv6-addr&gt;</code>	Specify the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code>&lt;peer-group&gt;</code>	Enter the name of the peer-group. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use this command to add neighbors with the same update policies to a peer group. This facilitates the updates of various policies, such as, distribute and filter lists. The peer-group is then configured easily with many of the neighbor commands. Any changes made to the peer group affect all members.

To create a peer-group use the [neighbor port](#) command and then use this command to add neighbors to the group.

**Examples [BGP]** This example shows a new peer-group `group1` and the addition of a neighbor `10.10.0.63` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.63 peer-group group1
```

This example shows a new peer-group `group1` and the removal of a neighbor `10.10.0.63` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# no neighbor 10.10.0.63 peer-group group1
```

**Examples [BGP4+]** This example shows a new peer-group `group1` and the addition of a neighbor `2001:0db8:010d::1` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor peer-group
group12001:0db8:010d::1
```

This example shows a new peer-group `group1` and the removal of a neighbor `2001:0db8:010d::1` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor peer-group
group12001:0db8:010d::1
```

**Related Commands** [neighbor peer-group \(create a peer-group\)](#)

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor peer-group (create a peer-group)

**Overview** Use this command to create a peer-group for BGP and BGP4+. Use the **no** variant of this command to disable this function.

**Syntax** neighbor <peer-group> peer-group  
no neighbor <peer-group> peer-group

Parameter	Description
<peer-group>	Enter the name of the peer-group.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** Neighbors with the same update policies are grouped into peer groups. This facilitates the updates of various policies, such as, distribute and filter lists.

The peer-group is then configured easily with many of the neighbor commands. Any changes made to the peer group affect all members.

Use this command to create a peer-group, then use the [neighbor peer-group \(add a neighbor\)](#) command to add neighbors to the group.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 peer-group
```

**Related Commands** [neighbor peer-group \(add a neighbor\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor port

**Overview** Use this command to specify the TCP port to which packets are sent to on a BGP or a BGP4+ neighbor. TCP port 179 is the default port used to connect BGP and BGP4+ peers. You can specify a different destination port for the TCP session with this command.

Use the **no** variant of this command to reset the port number back to the default value (TCP port 179).

**Syntax [BGP]** `neighbor <neighborid> port <portnum>`  
`no neighbor <neighborid> port [<portnum>]`

Parameter	Description
<code>&lt;neighborid&gt;</code>	<code>{&lt;ip-address&gt;   ipv6-addr   &lt;peer-group&gt;}</code>
<code>&lt;ip-address&gt;</code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code>&lt;ipv6-addr&gt;</code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code>&lt;peer-group&gt;</code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<code>&lt;portnum&gt;</code>	<code>&lt;0-65535&gt;</code> Specifies the TCP port number.

**Default** TCP port 179 is the default port used to connect BGP and BGP4+ peers.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 10.10.10.10 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 10.10.10.10 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 port 643
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor port 6432001:0db8:010d::1
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor port 6432001:0db8:010d::1
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(awplus-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 port 643
```

**Related Commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series

## Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor prefix-list

**Overview** Use this command to distribute BGP and BGP4+ neighbor information as specified in a prefix list.

Use the **no** variant of this command to remove an entry.

**Syntax** `neighbor <neighborid> prefix-list <listname> {in|out}`  
`no neighbor <neighborid> prefix-list <listname> {in|out}`

Parameter	Description
<neighborid>	<ip-address> <ipv6-addr> <peer-group>
	<ip-address> Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr> Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<listname>	The name of an IP prefix list.
in	Specifies that the IP prefix list applies to incoming advertisements.
out	Specifies that the IP prefix list applies to outgoing advertisements.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use this command to specify a prefix list for filtering BGP or BGP4+ advertisements. Filtering by prefix list matches the prefixes of routes with those listed in the prefix list. If there is a match, the route is used. An empty prefix list permits all prefixes. If a given prefix does not match any entries of a prefix list, the route is denied access.

The router begins the search at the top of the prefix list, with the sequence number 1. Once a match or deny occurs, the router does not need to go through the rest of the prefix list. For efficiency the most common matches or denies are listed at the top.

The **neighbor distribute-list** command is an alternative to the **neighbor prefix-list** command and only one of them can be used for filtering to the same neighbor in any direction.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 prefix-list list1
in
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 prefix-list list1
in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 prefix-list
list1 in
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 prefix-list list1 in
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list list1 deny
2001:0db8:010d::1/128

awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:: prefix-list
list1 in

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:: prefix-list
list1 in

awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 2001:0db8:010d::1/128
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 prefix-list list1
in
```

# neighbor remote-as

**Overview** Use this command to configure an internal or external BGP or BGP4+ (iBGP or eBGP) peering relationship with another router.

Use the **no** variant of this command to remove a previously configured BGP or BGP4+ peering relationship.

**Syntax** `neighbor <neighborid> remote-as <as-number>`  
`no neighbor <neighborid> remote-as <as-number>`

**Syntax (VRF- lite)** `neighbor <neighborid> remote-as <as-number> [global|vrf <vrf-name>]`  
`no neighbor <neighborid> remote-as <as-number>`

Parameter	Description
<neighborid>	{<ip-address>   ipv6-addr   <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<as-number>	<1-4294967295> Neighbor's Autonomous System (AS) number.
global	Specify that the remote neighbor exists locally within the device, in the global routing domain
vrf	Specify that the remote neighbor exists locally within the device, in the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** This command is used to configure iBGP and eBGP peering relationships with other BGP or BGP4+ neighbors. A peer-group support of this command is configured only after creating a specific peer-group. Use the **no** variant of this command to remove a previously configured BGP peering relationship.

The **vrf** and **global** parameters are used to create internal 'loopback' BGP connections within the device between two VRF instances. This is used to leak BGP routes between a named VRF instance and the global routing instance. This requires BGP neighbors to be configured in both the global routing instance and in the named VRF instance.

**Examples [BGP]** To configure a BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 from another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 remote-as 10
```

To configure a BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Examples [BGP4+]** To configure a BGP4+ peering relationship with another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 345
```

To remove a configured BGP4+ peering relationship from another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# no neighbor 2001:0db8:010d::1 remote-as 345
```

To configure a BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor remove-private-AS (BGP only)

**Overview** Use this command to remove the private Autonomous System (AS) number from external outbound updates. Use the **no** variant of this command to revert to the default (disabled).

**Syntax** `neighbor <neighborid> remove-private-AS`  
`no neighbor <neighborid> remove-private-AS`

Parameter	Description
<neighborid>	{ <ip-address>   <tag> }
<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<tag>	Name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor remote-as</a> command. When this parameter is used with a command, the command applies on all peers in the specified group.

**Default** This command is disabled by default.

**Mode** Router Configuration or IPv4 Address Family Configuration

**Usage** The private AS numbers range from <64512-65535>. Private AS numbers are not advertised to the Internet. This command is used with external BGP peers only. The router removes the AS numbers only if the update includes private AS numbers. If the update includes both private and public AS numbers, the system treats it as an error.

This command removes private AS numbers for BGP in Router Configuration mode. This command is not supported for BGP4+ in IPv6 Address Family Configuration mode. This command removes a private AS number and makes an update packet with a public AS number as the AS path attribute. So only public AS numbers are entered in Internet BGP routing tables, and private AS numbers are not entered in Internet BGP tables.

For the filtering to apply, both peering devices must be set to use either 2-byte or extended 4- byte ASN (with the same ASN type set on both peers). For example, if a device (which defaults to use a 4-byte ASN), is peered with a device that defaults to a 2-byte ASN, then the device using a 2-byte ASN device also needs to be configured with the command **bgp extended-asn-cap** for the filtering to apply.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.63 remove-private-AS
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.63 remove-private-AS
```

**Related  
Commands** [show ip bgp \(BGP only\)](#)

**Command  
changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor restart-time

**Overview** Use this command to set a different restart-time other than the global restart-time configured using the **bgp graceful-restart** command for BGP and BGP4+.

Use the **no** variant of this command to restore the device to its default state (see the default value of the **bgp graceful-restart** command).

**Syntax** `neighbor <neighborid> restart-time <delay-value>`  
`no neighbor <neighborid> restart-time <delay-value>`

Parameter	Description
<code>&lt;neighborid&gt;</code>	{ <code>&lt;ip-address&gt;</code>   <code>&lt;ipv6-addr&gt;</code>   <code>&lt;peer-group&gt;</code> }
<code>&lt;ip-address&gt;</code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code>&lt;ipv6-addr&gt;</code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code>&lt;peer-group&gt;</code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<code>&lt;delay-value&gt;</code>	<code>&lt;1-3600&gt;</code> Delay value in seconds.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** This command takes precedence over the restart-time value specified using the **bgp graceful-restart** command.

The restart-time value is the maximum time that a graceful-restart neighbor waits to come back up after a restart. The default is 120 seconds.

Make sure that the restart time specified using this command does not exceed the stalepath-time specified in the Router Configuration mode.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 restart-time 45
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 restart-time 45
```

# neighbor route-map

**Overview** Use this command to apply a route map to incoming or outgoing routes for BGP or BGP4+.

Use the **no** variant of this command to remove a route map from a BGP or BGP4+ route.

**Syntax** `neighbor <neighborid> route-map <mapname> {in|out}`  
`no neighbor <neighborid> route-map <mapname> {in|out}`

Parameter	Description
<neighborid>	{<ip-address>   ipv6-addr>   <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<mapname>	Specifies name of the route-map.
in	Specifies that the access list applies to incoming advertisements.
out	Specifies that the access list applies to outgoing advertisements.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use the **neighbor route-map** command to filter updates and modify attributes. A route map is applied to inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates.

**Examples [BGP]** The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 route-map rmap2 in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 route-map rmap2
in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the IPv4 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 route-map rmap2
in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the IPv4 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 route-map
rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 route-map rmap2 in
```

The following example shows the removal the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 route-map rmap2 in
```

**Examples**  
**[BGP4+]**

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv6 address 2001:0db8:010d::1 in the IPv6 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 route-map
rmap2 in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv6 address 2001:0db8:010d::1 in the IPv6 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
route-map rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 route-map rmap2 in
```

The following example shows the removal the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 route-map rmap2 in
```

**Related  
Commands**

[address-family](#)  
[neighbor peer-group \(add a neighbor\)](#)  
[route-map](#)

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor route-reflector-client (BGP only)

**Overview** Use this command to configure the router as a BGP route reflector and configure the specified neighbor as its client.

Use the **no** variant of this command to indicate that the neighbor is not a client.

**Syntax** `neighbor <neighborid> route-reflector-client`  
`no neighbor <neighborid> route-reflector-client`

Parameter	Description
<neighborid>	{ <ip-address>   <peer-group> }
<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode** Router Configuration or IPv4 Address Family Configuration

**Usage** Route reflectors are a solution for the explosion of iBGP peering within an autonomous system. By route reflection the number of iBGP peers within an AS is reduced. Use the **neighbor route-reflector-client** command to configure the local router as the route reflector and specify neighbors as its client.

An AS can have more than one route reflector. One route reflector treats the other route reflector as another iBGP speaker.

In the following configuration, Router1 is the route reflector for clients 3.3.3.3 and 2.2.2.2; it also has a non-client peer 6.6.6.6:

```
Router1#  
router bgp 200  
neighbor 3.3.3.3 remote-as 200  
neighbor 3.3.3.3 route-reflector-client  
neighbor 2.2.2.2 remote-as 200  
neighbor 2.2.2.2 route-reflector-client  
neighbor 6.6.6.6 remote-as 200
```

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72
route-reflector-client

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
route-reflector-client
```

# neighbor route-server-client (BGP only)

**Overview** Use this command to specify the peer as route server client.  
Use the **no** variant of this command to disable this function.

**Syntax** neighbor <neighborid> route-server-client  
no neighbor <neighborid> route-server-client

Parameter	Description
<neighborid>	{<ip-address> <peer-group>}
<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode** Router Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 route-server-client
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
route-server-client
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor send-community

**Overview** Use this command to specify that a community attribute should be sent to a BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove the entry for the community attribute.

**Syntax** `neighbor <neighborid> send-community {both|extended|standard}`  
`no neighbor <neighborid> send-community {both|extended|standard}`

Parameter	Description
<neighborid>	{<ip-address>   <ipv6-addr>   <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
both	Sends Standard and Extended Community attributes. Specifying this parameter with the <b>no</b> variant of this command results in no standard or extended community attributes being sent.
extended	Sends Extended Community attributes. Specifying this parameter with the <b>no</b> variant of this command results in no extended community attributes being sent.
standard	Sends Standard Community attributes. Specifying this parameter with the <b>no</b> variant of this command results in no standard community attributes being sent.

**Default** Both **standard** and **extended** community attributes are sent to a neighbor.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration and IPv6 Address Family Configuration

**Usage** This command is used to specify a community attribute to be sent to a neighbor. The community attribute groups destinations in a certain community and applies routing decisions according to those communities. On receiving community attributes the router reannounces them to the neighbor. Only when the **no**

parameter is used with this command the community attributes are not reannounced to the neighbor.

By default, both **standard** and **extended** community attributes are sent to a neighbor.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 send-community extended
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 send-community
extended
```

# neighbor shutdown

**Overview** Use this command to disable a peering relationship with a BGP or BGP4+ neighbor. Use the **no** variant of this command to re-enable the BGP or BGP4+ neighbor.

**Syntax** neighbor <neighborid> shutdown  
no neighbor <neighborid> shutdown

Parameter	Description
<neighborid>	{ <ip-address>   <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** This command shuts down any active session for the specified BGP or BGP4+ neighbor and clears all related routing data.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 shutdown
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 shutdown
```

**Related** [neighbor peer-group \(add a neighbor\)](#)  
**Commands** [neighbor route-map](#)

**Command** Added to AlliedWare Plus prior to 5.4.6-1  
**changes** Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor soft-reconfiguration inbound

**Overview** Use this command to configure the device to start storing all updates from the BGP or BGP4+ neighbor, without any consideration of any inward route filtering policy that might be applied to the connection with this BGP or BGP4+ neighbor. This is so that the full set of the neighbor's updates are available locally to be used in a soft-reconfiguration event.

You may need to apply this older method of clearing routes if the peer does not support route refresh.

Use the **no** variant of this command to disable this function for a BGP or BGP4+ neighbor.

**Syntax** `neighbor <neighborid> soft-reconfiguration inbound`  
`no neighbor <neighborid> soft-reconfiguration inbound`

Parameter	Description
<neighborid>	{<ip-address>   <ipv6-addr>   <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use this command to store updates for inbound soft reconfiguration. Soft-reconfiguration may be used in lieu of BGP route refresh capability. Using this command enables local storage of all the received routes and their attributes. This requires additional memory. When a soft reset (inbound) is done on this neighbor, the locally stored routes are re-processed according to the inbound policy. The BGP neighbor connection is not affected.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 10.10.10.10
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 10.10.10.10
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4
awplus(config-router-
af)# neighbor 10.10.10.10 soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4
awplus(config-router-
af)# no neighbor 10.10.10.10 soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 soft-reconfiguration
inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 soft-reconfiguration
inbound
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 soft-reconfiguration
inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-
af)# no neighbor group1 soft-reconfiguration inbound
```

**Related**  
**Commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command**  
**changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor timers

**Overview** Use this command to set the keepalive, holdtime, and connect timers for a specific BGP or BGP4+ neighbor.

Use the **no** variant of this command to clear the timers for a specific BGP or BGP4+ neighbor.

**Syntax** `neighbor <neighborid> timers {<keepalive> <holdtime>|connect <connect>}`

`no neighbor <neighborid> timers [connect]`

Parameter	Description
<neighborid>	{<ip-address>   <ipv6-addr>   <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<keepalive>	<0-65535> Frequency (in seconds) at which a router sends keepalive messages to its neighbor.
<holdtime>	<0-65535> Interval (in seconds) after which, on not receiving a keepalive message, the router declares a neighbor dead.
<connect>	<code>connect &lt;1-65535&gt;</code> Specifies the connect timer in seconds. The default connect timer value is 120 seconds as per RFC 4271. Modify this value as needed for interoperability.

**Default** The keepalive timer default is 60 seconds, the holdtime timer default is 90 seconds, and the connect timer default is 120 seconds as per RFC 4271. Holdtime is keepalive \* 3.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** Keepalive messages are sent by a router to inform another router that the BGP connection between the two is still active. The keepalive interval is the period of time between each keepalive message sent by the router. The holdtime interval is the time the router waits to receive a keepalive message and if it does not receive

a message for this period it declares the neighbor dead. The holdtime value must be 3 times the value of the keepalive value.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 timers
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 timers
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 timers
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 timers
```

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor transparent-as

**Overview** Use this command to specify not to append your AS path number even if the BGP or BGP4+ peer is an eBGP peer.

Note this command has the same effect as invoking [neighbor attribute-unchanged](#) and specifying the optional **as-path** parameter.

**Syntax** `neighbor <neighborid> transparent-as`

Parameter	Description
<neighborid>	{<ip-address>   <ipv6-addr>   <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 transparent-as
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 transparent-as
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
transparent-as
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 transparent-as
```

**Related**

# neighbor transparent-nextthop

**Overview** Use this command to keep the next hop value of the route even if the BGP or BGP4+ peer is an eBGP peer.

Note this command has the same effect as invoking [neighbor attribute-unchanged](#) and specifying the optional **next-hop** parameter.

**Syntax** `neighbor <neighborid> transparent-nextthop`

Parameter	Description
<neighborid>	{<ip-address>   <ipv6-addr>   <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 transparent-nextthop
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 transparent-nextthop
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
transparent-nexthop
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 transparent-nexthop
```

**Related**  
**Commands**

- [neighbor attribute-unchanged](#)
- [neighbor peer-group \(add a neighbor\)](#)
- [neighbor route-map](#)
- [neighbor transparent-as](#)

**Command**  
**changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor unsuppress-map

**Overview** Use this command to selectively leak more specific routes to a particular BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove selectively leaked specific routes to a particular BGP or BGP4+ neighbor.

**Syntax** `neighbor <neighborid> unsuppress-map <route-map-name>`  
`no neighbor <neighborid> unsuppress-map <route-map-name>`

Parameter	Description
<neighborid>	{ <ip-address>   <ipv6-addr>   <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<route-map-name>	The name of the route-map used to select routes to be unsuppressed.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** When the [aggregate-address](#) command is used with the **summary-only** option, the more-specific routes of the aggregate are suppressed to all neighbors. Use this command instead to selectively leak more-specific routes to a particular neighbor.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 unsuppress-map mymap
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# neighbor 10.10.0.70 unsuppress-map
mymap
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 unsuppress-map
mymap
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# no neighbor 10.10.0.70 unsuppress-map
mymap
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 unsuppress-map mymap
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 unsuppress-map mymap
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# neighbor 2001:0db8:010d::1
unsuppress-map mymap
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
unsuppress-map mymap
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 unsuppress-map mymap
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 unsuppress-map
mymap
```

**Related**  
**Commands**

- [aggregate-address](#)
- [neighbor peer-group \(add a neighbor\)](#)
- [neighbor route-map](#)

**Command**  
**changes**

- Added to AlliedWare Plus prior to 5.4.6-1

- Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor update-source

**Overview** Use this command to specify the source IPv4 or IPv6 address of BGP or BGP4+ packets, which are sent to the neighbor for routing updates, as the IPv4 or IPv6 address configured on the specified interface. The specified interface is usually the local loopback (lo) interface to allow internal BGP or BGP4+ connections to stay up regardless of which interface is used to reach a neighbor.

Use the **no** variant of this command to remove the IPv4 or IPv6 address from the interface as the source IPv4 or IPv6 address of BGP or BGP4+ packets sent to the neighbor, and restores the interface assignment to the closest interface, which is also called the best local address.

**Syntax** `neighbor <neighborid> update-source <interface>`  
`no neighbor <neighborid> update-source`

Parameter	Description
<code>&lt;neighborid&gt;</code>	{ <code>&lt;ip-address&gt;</code>   <code>&lt;ipv6-addr&gt;</code>   <code>&lt;peer-group&gt;</code> }
<code>&lt;ip-address&gt;</code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code>&lt;ipv6-addr&gt;</code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code>&lt;peer-group&gt;</code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<code>&lt;interface&gt;</code>	Specifies the local loopback interface (lo).

**Default** Use of this command sets a default value of 2 for the maximum hop count.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** Use this command in conjunction with any specified interface on the router. The local loopback interface is the interface that is most commonly used with this command. The use of local loopback interface eliminates a dependency and BGP or BGP4+ does not have to rely on the availability of a particular interface for making BGP or BGP4+ peer relationships.

**Examples [BGP]** To source BGP connections for neighbor 10.10.0.72 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.0.73/24
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# network 10.10.0.0
awplus(config-router)# neighbor 10.10.0.72 remote-as 110
awplus(config-router)# neighbor 10.10.0.72 update-source lo
```

To remove BGP connections for neighbor 10.10.0.72 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 10.10.0.72 update-source
```

To source BGP connections for neighbor group1 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.0.73/24
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# network 10.10.0.0
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.72 remote-as 100
awplus(config-router)# neighbor 10.10.0.72 peer-group group1
awplus(config-router)# neighbor group1 update-source lo
```

To remove BGP connections for neighbor group1 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 update-source lo
```

**Examples** To source BGP connections for neighbor 2001:0db8:010d::1 with the IPv6 address  
**[BGP4+]** of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ipv6 address 2001:0db8:010d::1/128
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 110
awplus(config-router)# neighbor 2001:0db8:010d::1
update-source lo
```

To remove BGP connections for neighbor 2001:0db8:010d::1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 2001:0db8:010d::1
update-source
```

To source BGP connections for neighbor group1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ipv6 address 2001:0db8:010d::1/128
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 100
awplus(config-router)# address-family ipv6
awplus(config-router-
af)# neighbor 2001:0db8:010d::1 peer-group group1
awplus(config-router-
af)# exit
awplus(config-router)# neighbor group1 update-source lo
```

To remove BGP connections for neighbor group1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 update-source lo
```

**Related** [neighbor peer-group \(add a neighbor\)](#)  
**Commands** [neighbor route-map](#)

**Command** Added to AlliedWare Plus prior to 5.4.6-1  
**changes** Version 5.4.7-2.1: BGP support added for IEx510, x550 series

## Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor version (BGP only)

**Overview** Use this command to configure the device to accept only a particular BGP version. Use the **no** variant of this command to use the default BGP version (version 4).

**Syntax** `neighbor <neighborid> version <version>`  
`no neighbor <neighborid> version`

Parameter	Description
<code>&lt;neighborid&gt;</code>	<code>{ &lt;ip-address&gt;   &lt;peer-group&gt; }</code>
	<code>&lt;ip-address&gt;</code> The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<code>&lt;peer-group&gt;</code> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<code>&lt;version&gt;</code>	<code>{4}</code> Specifies the BGP version number.

**Mode** Router Configuration or IPv4 Address Family Configuration

**Usage** By default, the system uses BGP version 4 and on request dynamically negotiates down to version 2. Using this command disables the router's version-negotiation capability and forces the router to use only a specified version with the neighbor.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 version 4
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 version 4
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 version
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 version
```

**Related Commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor weight

**Overview** Use this command to set default weights for routes from this BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove a weight assignment.

**Syntax** `neighbor <neighborid> weight <weight>`  
`no neighbor <neighborid> weight [<weight>]`

Parameter	Description
<code>&lt;neighborid&gt;</code>	<code>{&lt;ip-address&gt; &lt;ipv6-addr&gt; &lt;peer-group&gt;}</code>
<code>&lt;ip-address&gt;</code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code>&lt;ipv6-addr&gt;</code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code>&lt;peer-group&gt;</code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<code>&lt;weight&gt;</code>	<code>&lt;0-65535&gt;</code> Specifies the weight this command assigns to the route.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use this command to specify a weight value to all routes learned from a BGP or BGP4+ neighbor. The route with the highest weight gets preference when there are other routes on the network.

Unlike the local-preference attribute, the weight attribute is relevant only to the local router.

The weights assigned using the **set weight** command overrides the weights assigned using this command.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 weight
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 weight
```

**Related**  
**Commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command**  
**changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# network (BGP and BGP4+)

**Overview** Use this command to specify particular routes to be advertised into the BGP or BGP4+ routing process. A unicast network address without a mask is accepted if it falls into the natural boundary of its class. A class-boundary mask is derived if the address matches its natural class-boundary.

Note that you can specify a prefix length for the prefix being added, and you can also specify a classful network without a prefix length and an appropriate prefix length is added. Note that specifying a non-classful prefix without a prefix length results in a /32 prefix length on an IPv4 route.

Use the **no** variant of this command to remove a network route entry.

**Syntax [BGP]** `network {<ip-prefix/length>|<ip-network-addr>} [mask <network-mask>] [route-map <route-map-name>] [backdoor]`  
`no network {<ip-prefix/length>|<ip-network-addr>} [mask <network-mask>] [route-map <route-map-name>] [backdoor]`

**Syntax [BGP4+]** `network {<ipv6-prefix/length>|<ipv6-network-addr>} [route-map <route-map-name>]`  
`no network {<ipv6-prefix/length>|<ipv6-network-addr>} [route-map <route-map-name>]`

Parameter	Description
<code>&lt;ip-prefix/length&gt;</code>	IP network prefix and prefix length entered in dotted decimal format for the IP network prefix, then slash notation for the prefix length in the format A.B.C.D/M, e.g. 192.168.1.224/27
<code>&lt;ip-network-addr&gt;</code>	IP network prefix entered in dotted decimal format A.B.C.D, e.g. 192.168.1.224
<code>&lt;network-mask&gt;</code>	Specify a network mask in the format A.B.C.D, e.g. 255.255.255.224.
<code>&lt;ipv6-prefix/length&gt;</code>	IPv6 network prefix and prefix length entered in dotted decimal format for the IPv6 network prefix, then slash notation for the IPv6 prefix length in the format X:X::X/X/M, e.g. 2001:db8::/64
<code>&lt;ipv6-network-addr&gt;</code>	IP network prefix entered in dotted decimal format A.B.C.D, e.g. 192.168.1.224
<code>&lt;route-map-name&gt;</code>	Specify the name of the route map.
<code>backdoor</code>	Specify a BGP backdoor route that is not advertised.

**Mode [BGP]** Router Configuration and IPv4 Address Family [ipv4 unicast] mode

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** It does not matter how the route is arranged in the IP or IPv6 routing table. The route can arrive in the IP routing table by a static route, or the route can be learned from OSPF or OSPFv3 or RIP or RIPng routing.

If you configure a route-map, then that route-map will be used in filtering the network, or the route-map will be used to modify the attributes that are advertised with the route.

**Example [BGP]** The following example illustrates a Class-A address configured as a network route. The natural Class-A network prefix mask length of 8 will be internally derived, that is, 2.0.0.0/8.

```
awplus(config)# router bgp 100
awplus(config-router)# network 2.0.0.0
```

**Output [BGP]** Figure 28-1: Example output from the **show running-config** command after entering **network 2.0.0.0**

```
awplus#show running-config

router bgp 100
network 2.0.0.0/8
```

**Example [BGP]** The following example illustrates a network address which does not fall into its natural class boundary, and hence, is perceived as a host route, that is, 192.0.2.224/27.

```
awplus(config)# router bgp 100
awplus(config-router)# network 192.0.2.224 mask 255.255.255.224
```

**Output [BGP]** Figure 28-2: Example output from the **show running-config** command after entering **network 192.0.2.224 mask 255.255.255.224**

```
awplus#show running-config

router bgp 100
network 192.0.2.224/27
```

**Example [BGP]** The following example is the same as the previous example for host route 192.0.2.224/27, but is entered in prefix/length format using slash notation (instead of prefix plus mask in dotted decimal format using the **mask** keyword before the network mask in dotted decimal format):

```
awplus(config)# router bgp 100
awplus(config-router)# network 192.0.2.224/27
```

**Example [BGP4+]** The following example is the same as the previous example for host route 2001:db8::/32:

```
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# network 2001:db8::/32
```

**Output [BGP4+]** Figure 28-3: Example output from the **show running-config** command after entering **network 2001:db8::/32**

```
awplus#show running-config

router bgp 100
 network 2001:db8::/32
```

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1

# network synchronization

**Overview** Use this command to ensure the exact same static network prefix, specified through any of the **network** commands, is local or has IGP reachability before introduction to BGP or BGP4+.

Use the **no** variant of this command to disable this function.

**Syntax** `network synchronization`  
`no network synchronization`

**Default** Network synchronization is disabled by default.

**Mode [BGP]** Router Configuration and IPv4 Address Family [ipv4 unicast] Configuration

**Mode [BGP4+]** IPv6 Address Family [ipv6 unicast] Configuration

**Examples [BGP]** The following example enables IGP synchronization of BGP static network routes in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# network synchronization
```

The following example enables IGP synchronization of BGP static network routes in the IPv4-Unicast address family.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# network synchronization
```

**Example [BGP4+]** The following example enables IGP synchronization of BGP4+ static network routes in the IPv6-Unicast address family.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# network synchronization
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# redistribute (into BGP or BGP4+)

**Overview** Use this command to inject routes from one routing process into a BGP or BGP4+ routing table.

Use the **no** variant of this command to disable this function.

**Syntax** redistribute {ospf|rip|connected|static} [route-map  
<route-map-entry-pointer>]  
  
no redistribute {ospf|rip|connected|static} [route-map  
<route-map-entry-pointer>]

Parameter	Description
connected	Specifies the redistribution of connected routes for both BGP and BGP4+.
ospf	Specifies the redistribution of OSPF information for BGP or OSPFv3 information for BGP4+.
rip	Specifies the redistribution of RIP information for BGP or RIPng information for BGP4+.
static	Specifies the redistribution of Static routes for both BGP and BGP4+.
route-map	Route map reference for both BGP and BGP4+.
<route-map-entry-pointer>	Pointer to route-map entries.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration or IPv6 Address Family Configuration

**Usage** Redistribution is used by routing protocols to advertise routes that are learned by some other means, such as by another routing protocol or by static routes. Since all internal routes are dumped into BGP, careful filtering is applied to make sure that only routes to be advertised reach the internet, not everything. This command allows redistribution by injecting prefixes from one routing protocol into another routing protocol.

**Examples [BGP/ BGP+]** The following example shows the configuration of a route-map named `rmap1`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 1
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 12
awplus(config-router)# redistribute ospf route-map rmap1
```

To apply the above example to a specific VRF instance named `blue`, use the following commands:

```
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute ospf route-map rmap1
```

The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp route-map rmap2
```

Note that configuring a route-map and applying it with the `redistribute route-map` command allows you to filter which routes are distributed from another routing protocol (such as OSPF with BGP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# restart bgp graceful (BGP only)

**Overview** Use this command to force the device to perform a graceful BGP restart.

**Syntax** `restart bgp graceful`

**Mode** Privileged Exec

**Usage** Before using this command, BGP graceful-restart capabilities must be enabled within the router BGP ([bgp graceful-restart](#) command), and each neighbor configured on the device should be set to advertise its graceful-restart capability ([bgp graceful-restart graceful-reset](#) command). The neighbor devices also need to have BGP graceful-restart capabilities enabled ([bgp graceful-restart](#) command).

This command stops the whole BGP process and makes the device retain the BGP routes and mark them as stale. Receiving BGP speakers, retain and mark as stale all BGP routes received from the restarting speaker for all the address families received in the Graceful Restart Capability exchange.

When a **restart bgp graceful** command is issued, the BGP configuration is reloaded from the last saved configuration. Ensure you first issue a **copy running-config startup-config**.

**Example** `awplus# restart bgp graceful`

**Related Commands** [bgp graceful-restart](#)  
[bgp graceful-restart graceful-reset](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# router bgp

**Overview** Use this command to configure a BGP routing process, specifying the 32-bit Autonomous System (AS) number.

Use the **no** variant of this command to disable a BGP routing process, specifying the 32-bit AS number.

**Syntax** `router bgp <asn>`  
`no router bgp <asn>`

Parameter	Description
<asn>	<1-4294967295> Specifies the 32-bit Autonomous System (AS) number.

**Mode** Global Configuration

**Usage** The **router bgp** command enables a BGP routing process:

```
router bgp 1
  neighbor 10.0.0.1 remote-as 1
  neighbor 10.0.0.2 remote-as 1
  !
router bgp 2
  neighbor 10.0.0.3 remote-as 2
  neighbor 10.0.0.4 remote-as 2
```

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)#
awplus# configure terminal
awplus(config)# no router bgp 12
awplus(config)#
```

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# route-map

**Overview** Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes and BGP update messages.

The device uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes or update messages match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes or update messages.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

**Syntax**

```
route-map <mapname> {deny|permit} <seq>  
no route-map <mapname>  
no route-map <mapname> {deny|permit} <seq>
```

Parameter	Description
<mapname>	A name to identify the route map.
deny	The route map causes a routing process to discard matching routes or BGP update messages.
permit	The route map causes a routing process to use matching routes or BGP update messages.
<seq>	<1-65535> The sequence number of the entry. You can use this parameter to control the order of entries in this route map.

**Mode** Global Configuration

**Usage** Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- processes BGP update messages that it has received from a peer
- prepares BGP update messages to send to peers
- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols
- uses BGP route flap dampening

When a routing protocol passes a route or update message through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route or update message. This means that route maps end with an implicit deny entry. To permit all non-matching routes or update messages, end your route map with an entry that has an action of **permit** and no match clause.

**Examples** To enter route-map mode for entry 1 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 1
awplus(config-route-map)# match as-path 60
awplus(config-route-map)# set weight 70
```

To enter route-map mode for entry 2 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface vlan2
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

**Related  
Commands**

- [show route-map](#)
- [bgp dampening](#)
- [neighbor default-originate](#)
- [neighbor route-map](#)
- [neighbor unsuppress-map](#)
- [network \(BGP and BGP4+\)](#)
- [redistribute \(into BGP or BGP4+\)](#)
- [show ip bgp route-map \(BGP only\)](#)

For OSPF:

- [distribute-list \(OSPF\)](#)
- [default-information originate](#)
- [redistribute \(OSPF\)](#)

For RIP:  
`redistribute (RIP)`

# set as-path

**Overview** Use this command to add an AS path set clause to a route map entry.

When a BGP update message matches the route map entry, the device prepends the specified Autonomous System Number (ASN) or ASNs to the update's AS path attribute.

The AS path attribute is a list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its ASN to the beginning of the list. This means that the AS path attribute can be used to make routing decisions.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set as-path prepend <1-65535> [<1-65535>]...`  
`no set as-path prepend [<1-65535> [<1-65535>]...]`

Parameter	Description
<code>prepend</code>	Prepends the autonomous system path.
<code>&lt;1-65535&gt;</code>	The number to prepend to the AS path. If you specify multiple ASNs, separate them with spaces.

**Mode** Route-map mode

**Usage** Use the **set as-path** command to specify an autonomous system path. By specifying the length of the AS-Path, the device influences the best path selection by a neighbor. Use the `prepend` parameter with this command to prepend an AS path string to routes increasing the AS path length.

This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `myroute` to prepend ASN 8 and 24 to the AS path of matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set as-path prepend 8 24
```

**Related Commands** [match as-path](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# set community

**Overview** Use this command to add a community set clause to a route map entry.

When a BGP update message matches the route map entry, the device takes one of the following actions:

- changes the update's community attribute to the specified value or values, or
- adds the specified community value or values to the update's community attribute, if you specify the **additive** parameter after specifying another parameter. or
- removes the community attribute from the update, if you specify the **none** parameter

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set community {[<1-65535>][AA:NN] [internet] [local-AS]
[no-advertise] [no-export] [additive]}
no set community {[AA:NN] [internet] [local-AS] [no-advertise]
[no-export] [additive]}
set community none
no set community none
```

Parameter	Description
<1-65535>	The AS number of the community as an integer not in AA:NN format.
AA:NN	The Autonomous System (AS) number of the community, in AA:NN format. AS numbers are assigned to the regional registries by the IANA ( <a href="http://www.iana.org">www.iana.org</a> ) and can be obtained from the registry in your region. AA and NN are both integers from 1 to 65535. AA is the AS number; NN is a value chosen by the ASN administrator.
local-AS	The community of routes that must not be advertised to external BGP peers (this includes peers in other members' Autonomous Systems inside a BGP confederation).
internet	The community of routes that can be advertised to all BGP peers.
no-advertise	The community of routes that must not be advertised to other BGP peers.
no-export	The community of routes that must not be advertised outside a BGP confederation boundary (a standalone Autonomous System that is not part of a confederation should be considered a confederation itself).

Parameter	Description
none	The device removes the community attribute from matching update messages.
additive	The device adds the specified community value to the update message's community attribute, instead of replacing the existing attribute. By default this parameter is not included, so the device replaces the existing attribute.

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Examples** To use entry 3 of the route map called `rmap1` to put matching routes into the no-advertise community, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community no-advertise
```

To use entry 3 of the route map called `rmap1` to put matching routes into several communities, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 10:01 23:34 12:14
no-export
```

To use entry 3 of the route map called `rmap1` to put matching routes into a single AS community numbered 16384, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 16384 no-export
```

# show bgp ipv6 community (BGP4+ only)

**Overview** Use this command to display routes that match specified communities within an IPv6 environment. Use the [show ip bgp community \(BGP only\)](#) command within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

You may use any combination and repetition of parameters listed in the *<type>* placeholder.

**Syntax** `show bgp ipv6 community [<type>] [exact-match]`

Parameter	Description
<i>&lt;type&gt;</i>	{[AA:NN] [local-AS] [no-advertise] [no-export]}
AA:NN	Specifies the Autonomous System (AS) community number, in AA:NN format.
local-AS	Do not send outside local Autonomous Systems (well-known community).
no-advertise	Do not advertise to any peer (well-known community).
no-export	Do not export to next AS (well-known community).
exact-match	Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated.

**Mode** User Exec and Privileged Exec

**Examples** Note that the AS numbers shown are examples only.

```
awplus# show bgp ipv6 community 64497:64499 exact-match
awplus# show bgp ipv6 community 64497:64499 64500:64501
exact-match
awplus# show bgp ipv6 community 64497:64499 64500:64501
64510:64511no-advertise
awplus# show bgp ipv6 community no-advertise
no-advertiseno-advertise exact-match
awplus# show bgp ipv6 community no-export 64510:64511
no-advertise local-AS no-export
awplus# show bgp ipv6 community no-export 64510:64511
no-advertise 64497:64499 64500:64501 no-export
awplus# show bgp ipv6 community no-export 64497:64499
no-advertise local-AS no-export
```

**Related  
Commands** [show ip bgp community \(BGP only\)](#)

**Command  
changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series

# show bgp ipv6 dampening (BGP4+ only)

**Overview** Use this command to show dampened routes from a BGP4+ instance within an IPv6 environment. Use the [show ip bgp dampening \(BGP only\)](#) command to show dampened routes from a BGP instance within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 dampening  
{dampened-paths|flap-statistics|parameters}`

Parameter	Description
dampened-paths	Display paths suppressed due to dampening.
flap-statistics	Display flap statistics of routes.
parameters	Display details of configured dampening parameters.

**Mode** User Exec and Privileged Exec

**Usage** Enable BGP4+ dampening to maintain dampened-path information in memory.

**Examples**

```
awplus# show bgp ipv6 dampening dampened-path  
awplus# show bgp ipv6 dampening flap-statistics  
awplus# show bgp ipv6 dampening parameter
```

**Related Commands** [show ip bgp dampening \(BGP only\)](#)

# show bgp ipv6 inconsistent-as (BGP4+ only)

**Overview** Use this command to display routes with inconsistent AS Paths within an IPv6 environment. Use the [show ip bgp inconsistent-as \(BGP only\)](#) command to display routes with inconsistent AS paths within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 inconsistent-as`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 inconsistent-as`

**Related Commands** [show ip bgp inconsistent-as \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 longer-prefixes (BGP4+ only)

**Overview** Use this command to display the route of the local BGP4+ routing table for a specific prefix with a specific mask or for any prefix having a longer mask than the one specified.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 <ipv6-addr/prefix-length> longer-prefixes`

Parameter	Description
<code>&lt;ipv6-addr/prefix-length&gt;</code>	Specifies the IPv6 address with prefix length. The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 2001:0db8::/64 longer-prefixes`

**Related Commands** [show bgp ipv6 \(BGP4+ only\)](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 neighbors (BGP4+ only)

**Overview** Use this command to display detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment.

Use the [show ip bgp neighbors \(BGP only\)](#) command to display detailed information on peering connections to all BGP neighbors within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 neighbors [<ipv6-addr> [advertised-routes | received prefix-filter | received-routes | routes]]`

Parameter	Description
<ipv6-addr>	Specifies the IPv6 address, entered in hexadecimal in the format X:X::X:X.
advertised-routes	Displays the routes advertised to a BGP4+ neighbor.
received prefix-filter	Displays received prefix-list filters.
received-routes	Displays the received routes from the neighbor. To display all the received routes from the neighbor, configure the BGP4+ soft reconfigure first.
routes	Displays all accepted routes learned from neighbors.

**Mode** User Exec and Privileged Exec

**Examples [BGP4+]**

```
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 advertised-routes
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 received prefix-filter
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 received-routes
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 routes
```

**Output** Figure 28-4: Example output from **show bgp ipv6 neighbors 2001:db8:b::1**

```
awplus#show bgp ipv6 neighbors 2001:db8:b::1
BGP neighbor is 2001:db8:b::1, remote AS 200, local AS 100, external link
  BGP version 4, remote router ID 2.2.2.1
  BGP state = Established, up for 01:03:26
  Last read 01:03:26, hold time is 90, keepalive interval is 30 seconds

If available the following is shown:

- Session information
  - Neighbor address, ASN information and if the link is external or internal
  - BGP version and status
  - Neighbor capabilities for the BGP session
  - Number of messages transmitted and received
- IPv6 unicast address family information
  - BGP4+ table version
  - IPv6 Address Family dependent capabilities
  - IPv6 Communities
  - IPv6 Route filters for ingress and egress updates
  - Number of announced and accepted IPv6 prefixes
- Connection information
  - Connection counters
  - Graceful restart timer
  - Hop count to the peer
  - Next hop information
  - Local and external port numbers

**Related Commands** [show ip bgp neighbors \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

## show bgp ipv6 paths (BGP4+ only)

**Overview** Use this command to display BGP4+ path information within an IPv6 environment. Use the [show ip bgp paths \(BGP only\)](#) command to display BGP path information within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 paths`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 paths`

**Related Commands** [show ip bgp paths \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 prefix-list (BGP4+ only)

**Overview** Use this command to display routes matching the prefix-list within an IPv6 environment. Use the [show ip bgp prefix-list \(BGP only\)](#) command to display routes matching the prefix-list within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 prefix-list <list>`

Parameter	Description
<list>	Specifies the name of the IPv6 prefix list.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 prefix-list mylist`

**Related Commands** [show ip bgp prefix-list \(BGP only\)](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 quote-regexp (BGP4+ only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv6 environment. Use the [show ip bgp quote-regexp \(BGP only\)](#) command to display routes matching the AS path regular expression within an IPv4 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[ ]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 quote-regexp <expression>`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 quote-regexp myexpression`

**Related Commands** [show ip bgp quote-regexp \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 regexp (BGP4+ only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv6 environment. Use the [show ip bgp regexp \(BGP only\)](#) command to display routes matching the AS path regular expression within an IPv4 environment.

Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[ ]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 regexp <expression>`

Parameter	Description
<i>&lt;expression&gt;</i>	Specifies a regular-expression to match the BGP4+ AS paths.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 regexp myexpression`

**Related Commands** [show ip bgp regexp \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series

## Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 route-map (BGP4+ only)

**Overview** Use this command to display BGP4+ routes that match the specified route-map within an IPv6 environment. Use the [show ip bgp route-map \(BGP only\)](#) command to display BGP routes that match the specified route-map within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 route-map <route-map>`

Parameter	Description
<code>&lt;route-map&gt;</code>	Specifies a route-map that is matched.

**Mode** User Exec and Privileged Exec

**Example** To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show bgp ipv6 route-map myRouteMap
```

**Related Commands** [show ip bgp route-map \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 summary (BGP4+ only)

**Overview** Use this command to display a summary of a BGP4+ neighbor status within an IPv6 environment. Use the [show ip bgp summary \(BGP only\)](#) command to display a summary of a BGP neighbor status within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show bgp ipv6 summary

**Mode** User Exec and Privileged Exec

**Example** awplus# show bgp ipv6 summary

**Output** Figure 28-5: Example output from the **show ip bgp summary** command

```
awplus>show ip bgp summary

BGP router identifier 1.0.0.1, local AS number 65541
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries

Neighbor          V      AS   MsgRc  MsgSnt  TblVer  InOutQ  Up/Down  State/PfxRcd
2001:0db8:cccc::1 4     65544    20     24     11 0/0   00:07:19      1
2001:0db8:dddd::1 4     65545     0      0      0 0/0   never         Active
2001:0db8:eeee::1 4     65542    34     40      0 0/0   00:00:04     Active
2001:0db8:ffff::1 4     65543    29     32     11 0/0   00:07:03     13

Number of neighbors 4
```

The Up/Down column in this output is a timer that shows:

- "never" if the peer session has never been established
- The up time, if the peer session is currently up
- The down time, if the peer session is currently down.

In the example above, the session with 2001:0db8:eeee::1 has been down for 4 seconds, and the session with 2001:0db8:dddd::1 has never been established.

**Related Commands** [show ip bgp summary \(BGP only\)](#)

# show bgp memory maxallocation (BGP only)

**Overview** This command displays the maximum percentage of total memory that is allocated to BGP processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp memory maxallocation`

**Mode** User Exec and Privileged Exec

**Example** To display the maximum amount of memory allocated for BGP processes, use the command:

```
awplus# show bgp memory maxallocation
```

**Output** Figure 28-6: Example output from the **show bgp memory maxallocation** command

```
BGP maximum RAM allocation is 100%
```

**Command changes**

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp cidr-only (BGP only)

**Overview** Use this command to display routes with non-natural network masks.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp cidr-only`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] cidr-only`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode** User Exec and Privileged Exec

**Example**  
`awplus# show ip bgp cidr-only`  
`awplus# show ip bgp vrf red cidr-only`

**Output** Figure 28-10: Example output from the **show ip bgp cidr-only** command

```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp community (BGP only)

**Overview** Use this command to display routes that match specified communities from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

You may use any combination and repetition of parameters listed in the `<type>` placeholder.

**Syntax** `show ip bgp community [<type>] [exact-match]`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] community [<type>] [exact-match]`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<type>	{[AA:NN] [local-AS] [no-advertise] [no-export] }
AA:NN	Specifies the Autonomous System (AS) community number, in AA:NN format.
local-AS	Do not send outside local Autonomous Systems (well-known community).
no-advertise	Do not advertise to any peer (well-known community).
no-export	Do not export to next AS (well-known community).
exact-match	Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated.

**Mode** User Exec and Privileged Exec

**Examples** Note that the AS numbers shown are examples only.

```
awplus# show ip bgp community 64497:64499 exact-match
awplus# show ip bgp community 64497:64499 64500:64501
exact-match
awplus# show ip bgp community 64497:64499 64500:64501
64510:64511no-advertise
awplus# show ip bgp community no-advertise
no-advertiseno-advertise exact-match
awplus# show ip bgp community no-export 64510:64511
no-advertise local-AS no-export

# show ip bgp community-list (BGP only)

**Overview** Use this command to display routes that match the given community-list from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community-list \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp community-list <listname> [exact-match]`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] community-list <listname> [exact-match]`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<listname>	Specifies the community list name.
exact-match	Displays only routes that have exactly the same specified communities.

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp community-list mylist exact-match
awplus# show ip bgp vrf red community-list myCommunity
awplus# show ip bgp global community-list myExactCommunity
exact-match
```

**Related Commands** [show bgp ipv6 community-list \(BGP4+ only\)](#)

# show ip bgp dampening (BGP only)

**Overview** Use this command to show dampened routes from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 dampening \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp dampening  
{dampened-paths|flap-statistics|parameters}`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] dampening  
{dampened-paths|flap-statistics|parameters}`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
dampened-paths	Display paths suppressed due to dampening.
flap-statistics	Display flap statistics of routes.
parameters	Display details of configured dampening parameters.

**Mode** User Exec and Privileged Exec

**Usage** Enable BGP dampening to maintain dampened-path information in memory.

**Examples** `awplus# show ip bgp dampening dampened-paths  
awplus# show ip bgp vrf red dampening dampened-paths  
awplus# show ip bgp global dampening flap-statistics`

**Output** Figure 28-11: Example output from the **show ip bgp dampening** command

```
dampening 15 750 2000 60 15
  Reachability Half-Life time      : 15 min
  Reuse penalty                    : 750
  Suppress penalty                 : 2000
  Max suppress time                : 60 min
  Un-reachability Half-Life time  : 15 min
  Max penalty (ceil)               : 11999
  Min penalty (floor)              : 375
```

The following example output shows that the internal route (i), has flapped 3 times and is now categorized as history (h).

Figure 28-12: Example output from the **show ip bgp dampening flap-statistics** command

```
awplus# show ip bgp dampening flap-statistics
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S

# show ip bgp filter-list (BGP only)

**Overview** Use this command to display routes conforming to the filter-list within an IPv4 environment. Use the [show bgp ipv6 filter-list \(BGP4+ only\)](#) command to display routes conforming to the filter-list within an IPv6 environment

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp filter-list <listname>`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] filter-list <listname>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<listname>	Specifies the regular-expression access list name.

**Mode** User Exec and Privileged Exec

**Example**  
`awplus# show ip bgp filter-list mylist`  
`awplus# show ip bgp vrf red filter-list mylist`

**Related Commands** [show bgp ipv6 filter-list \(BGP4+ only\)](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp inconsistent-as (BGP only)

**Overview** Use this command to display routes with inconsistent AS Paths within an IPv4 environment. Use the [show bgp ipv6 inconsistent-as \(BGP4+ only\)](#) command to display routes with inconsistent AS paths within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp inconsistent-as`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] inconsistent-as`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode** User Exec and Privileged Exec

**Example**  
`awplus# show ip bgp inconsistent-as`  
`awplus# show ip bgp global inconsistent-as`

**Related Commands** [show bgp ipv6 inconsistent-as \(BGP4+ only\)](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp longer-prefixes (BGP only)

**Overview** Use this command to display the route of the local BGP routing table for a specific prefix with a specific mask, or for any prefix having a longer mask than the one specified.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp <ip-address/m> longer-prefixes`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] <ip-address/m> longer-prefixes`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<ip-address/m>	Neighbor's IP address and subnet mask, entered in the form A.B.C.D/M, where M is the subnet mask length.

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp 10.10.0.10/24 longer-prefixes
awplus# show ip bgp vrf red 172.16.4.0/24
awplus# show ip bgp global 172.16.0.0/16 longer-prefixes
```

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors (BGP only)

**Overview** Use this command to display detailed information on peering connections to all BGP neighbors within an IPv4 environment.

Use the [show bgp ipv6 neighbors \(BGP4+ only\)](#) command to display detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax [BGP]** `show ip bgp neighbors [<ipv4-addr> [advertised-routes|received prefix-filter|received-routes|routes]]`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] neighbors [<ipv4-addr> routes]`

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
advertised-routes	Displays the routes advertised to a BGP neighbor.
received prefix-filter	Displays the received prefix-list filters.
received-routes	Displays the received routes from the neighbor. To display all the received routes from the neighbor, configure the BGP soft reconfigure first.
routes	Displays all accepted routes learned from neighbors.
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode [BGP]** User Exec and Privileged Exec

**Examples [BGP]**

```
awplus# show ip bgp neighbors 10.10.10.72 advertised-routes
awplus# show ip bgp neighbors 10.10.10.72 received
prefix-filter
awplus# show ip bgp neighbors 10.10.10.72 received-routes
awplus# show ip bgp neighbors 10.10.10.72 routes
```

**Output** Figure 28-14: Example output from **show ip bgp neighbors 10.10.10.72**

```
awplus#show ip bgp neighbors 10.10.10.72
BGP neighbor is 10.10.10.72, remote AS 100, local AS 100, internal
link
Member of peer-group group1 for session parameters
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Active
  Last read          , hold time is 90, keepalive interval is 30 seconds
  Received 0 messages, 0 notifications, 0 in queue
  Sent 0 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
For address family: IPv4 Unicast
  BGP table version 1, neighbor version 0
  Index 1, Offset 0, Mask 0x2
  group1 peer-group member
  NEXT_HOP is always this router
  0 accepted prefixes
  0 announced prefixes

Connections established 0; dropped 0
Next connect timer due in 33 seconds
```

If available the following is shown:

- Session information
  - Neighbor address, ASN information and if the link is external or internal
  - BGP version and status
  - Neighbor capabilities for the BGP session
  - Number of messages transmitted and received
- IPv4 unicast address family information
  - BGP table version
  - IPv4 Address Family dependent capabilities
  - IPv4 Communities
  - IPv4 Route filters for ingress and egress updates
  - Number of announced and accepted IPv4 prefixes
- Connection information
  - Connection counters
  - Graceful restart timer
  - Hop count to the peer
  - Next hop information
  - Local and external port numbers

**Related Commands** [show bgp ipv6 neighbors \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors connection-retrytime (BGP only)

**Overview** Use this command to display the configured connection-retrytime value of the peer at the session establishment time with the neighbor.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> connection-retrytime`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 connection-retrytime`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors hold-time (BGP only)

**Overview** Use this command to display the configured holdtime value of the peer at the session establishment time with the neighbor.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> hold-time`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

**Default** The holdtime timer default is 90 seconds as per RFC 4271. Holdtime is `keepalive * 3`.

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip bgp neighbors 10.11.4.26 hold-time`

**Related Commands** [neighbor timers](#)  
[show ip bgp neighbors keepalive-interval \(BGP only\)](#)  
[timers \(BGP\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors keepalive (BGP only)

**Overview** Use this command to display the number of keepalive messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> keepalive`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip bgp neighbors 10.11.4.26 keepalive`

**Related Commands** [show ip bgp neighbors keepalive-interval \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors keepalive-interval (BGP only)

**Overview** Use this command to display the configured keepalive-interval value of the peer at the session establishment time with the neighbor.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> keepalive-interval`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

**Default** The keepalive timer default is 60 seconds as per RFC 4271. Keepalive is holdtime / 3.

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip bgp neighbors 10.11.4.26 keepalive-interval`

**Related Commands** [neighbor timers](#)  
`show ip bgp neighbors hold-time (BGP only)`  
`timers (BGP)`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors notification (BGP only)

**Overview** Use this command to display the number of notification messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> notification`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 notification`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors open (BGP only)

**Overview** Use this command to display the number of open messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> open`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 open`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors rcvd-msgs (BGP only)

**Overview** Use this command to display the number of messages received by the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> rcvd-msgs`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 rcvd-msgs`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors sent-msgs (BGP only)

**Overview** Use this command to display the number of messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> sent-msgs`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 sent-msgs`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors update (BGP only)

**Overview** Use this command to display the number of update messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> update`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 update`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp paths (BGP only)

**Overview** Use this command to display BGP4 path information within an IPv4 environment. Use the [show bgp ipv6 paths \(BGP4+ only\)](#) command to display BGP4+ path information within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp paths`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp paths`

**Related Commands** [show bgp ipv6 paths \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp prefix-list (BGP only)

**Overview** Use this command to display routes matching the prefix-list within an IPv4 environment. Use the [show bgp ipv6 prefix-list \(BGP4+ only\)](#) command to display routes matching the prefix-list within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp prefix-list <list>`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] prefix-list <list>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<list>	Specifies the name of the IP prefix list.

**Mode** User Exec and Privileged Exec

**Examples**  
`awplus# show ip bgp prefix-list mylist`  
`awplus# show ip bgp vrf red prefix-list myPrefixes`

**Related Commands** [show bgp ipv6 prefix-list \(BGP4+ only\)](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp quote-regexp (BGP only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 quote-regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[ ]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp quote-regexp <expression>`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] quote-regexp <expression>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<expression>	Specifies a regular-expression to match the BGP AS paths.

**Mode** User Exec and Privileged Exec

**Examples** awplus# show ip bgp quote-regexp myexpression  
awplus# show ip bgp global quote-regexp 65550 65555

**Related Commands** [show bgp ipv6 quote-regexp \(BGP4+ only\)](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

## show ip bgp regexp (BGP only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[ ]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp regexp <expression>`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] regexp <expression>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<expression>	Specifies a regular-expression to match the BGP AS paths.

**Mode** User Exec and Privileged Exec

**Examples** awplus# show ip bgp regexp myexpression  
awplus# show ip bgp vrf red regexp 65550 65555

**Related  
Commands** [show bgp ipv6 regexp \(BGP4+ only\)](#)

**Command  
changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp route-map (BGP only)

**Overview** Use this command to display BGP routes that match the specified route-map within an IPv4 environment. Use the [show bgp ipv6 route-map \(BGP4+ only\)](#) command to display BGP4+ routes that match the specified route-map within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp route-map <route-map>`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] route-map <route-map>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<route-map>	Specifies a route-map that is matched.

**Mode** User Exec and Privileged Exec

**Examples** To show routes that match the route-map `myRouteMap` for the global routing instance, use the command:

```
awplus# show ip bgp global route-map myRouteMap
```

To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show ip bgp route-map myRouteMap
```

**Related Commands** [show bgp ipv6 route-map \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp scan (BGP only)

**Overview** Use this command to display BGP scan status.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp scan`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp scan`

**Output** Figure 28-15: Example output from the **show ip bgp scan** command

```
BGP scan is running
BGP scan interval is 60
BGP instance : AS is 11,DEFAULT
Current BGP nexthop cache:
BGP connected route:
 10.10.10.0/24
 10.10.11.0/24
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp summary (BGP only)

**Overview** Use this command to display a summary of a BGP neighbor status within an IPv4 environment. Use the [show bgp ipv6 summary \(BGP4+ only\)](#) command to display a summary of BGP4+ neighbors.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp summary`

**Syntax [VRF]** `show ip bgp [global|vrf <vrf-name>] summary`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode** User Exec and Privileged Exec

**Examples**  
`awplus# show ip bgp summary`  
`awplus# show ip bgp vrf red summary`

**Output** Figure 28-16: Example output from the **show ip bgp summary** command

```
awplus>show ip bgp summary

BGP router identifier 1.0.0.1, local AS number 65541
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries

Neighbor      V      AS      MsgRc  MsgSnt  TblVer  InOutQ  Up/Down      State/PfxRcd
192.168.3.2   4      65544   20     24     11 0/0   00:07:19     1
192.168.4.2   4      65545    0      0      0 0/0   never         Active
192.168.11.2  4      65542   34     40      0 0/0   00:00:04     Active
192.168.21.2  4      65543   29     32     11 0/0   00:07:03     13

Number of neighbors 4
```

The Up/Down column in this output is a timer that shows:

- "never" if the peer session has never been established
- The up time, if the peer session is currently up
- The down time, if the peer session is currently down.

In the example above, the session with 192.168.11.2 has been down for 4 seconds, and the session with 192.168.4.2 has never been established.

**Related Commands** [show bgp ipv6 summary \(BGP4+ only\)](#)

# show ip community-list

**Overview** Use this command to display routes that match a specified community-list name or number.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip community-list [<listnumber>|<listname>]`

Parameter	Description
<code>&lt;listnumber&gt;</code>	Specifies the community list number in the range <1-199> as specified by a previously issued <b>ip community-list</b> command.
<code>&lt;listname&gt;</code>	Specifies the community list name as specified by a previously issued <b>ip community-list</b> command.

**Mode** User Exec and Privileged Exec

**Examples**  
`awplus# show ip community-list mylist`  
`awplus# show ip community-list 99`

**Related Commands**  
[ip community-list](#)  
[ip community-list expanded](#)  
[ip community-list standard](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip extcommunity-list

**Overview** Use this command to display a configured extcommunity-list.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip extcommunity-list [<1-199>|<extcommunity-listname>]`

Parameter	Description
<1-199>	Extcommunity-list number
<extcommunity-listname>	Extcommunity-list name

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip extcommunity-list 33`

**Related Commands** [ip extcommunity-list expanded](#)  
[ip extcommunity-list standard](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip prefix-list

**Overview** Use this command to display the IPv4 prefix-list entries.  
Note that this command is valid for RIP and BGP routing protocols only.

**Syntax** `show ip prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of a prefix list in this placeholder.
detail	Specify this parameter to show detailed output for all IPv4 prefix lists.
summary	Specify this parameter to show summary output for all IPv4 prefix lists.

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip prefix-list
awplus# show ip prefix-list 10.10.0.98/8
awplus# show ip prefix-list detail
```

**Related Commands** [ip prefix-list](#)

# show ipv6 prefix-list

**Overview** Use this command to display the prefix-list entries.

Note that this command is valid for RIPng and BGP4+ routing protocols only.

**Syntax** `show ipv6 prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of an individual IPv6 prefix list.
detail	Specify this parameter to show detailed output for all IPv6 prefix lists.
summary	Specify this parameter to show summary output for all IPv6 prefix lists.

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

**Related Commands** [ipv6 prefix-list](#)

# show ip protocols bgp (BGP only)

**Overview** Use this command to display BGP process parameters and statistics.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip protocols bgp`

**Mode** User Exec and Privileged Exec

**Example** To display BGP process parameters and statistics, use the command:

```
awplus# show ip protocols bgp
```

**Output** Figure 28-17: Example output from the **show ip protocols bgp** command

```
Routing Protocol is "bgp 100"
  IGP synchronization is disabled
  Automatic route summarization is disabled
  Default local-preference applied to incoming route is 100
  Redistributing:
  Neighbor(s):
  Address AddressFamily FiltIn FiltOut DistIn DistOut RouteMapIn RouteMapOut
  Weight
  10.10.10.1                unicast
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show route-map

**Overview** Use this command to display information about one or all route maps.

**Syntax** `show route-map <map-name>`

Parameter	Description
<code>&lt;map-name&gt;</code>	A name to identify the route map.

**Mode** User Exec and Privileged Exec

**Example** To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

**Output** Figure 28-18: Example output from the **show route-map** command

```
route-map example-map, permit, sequence 1
  Match clauses:
    ip address prefix-list example-pref
  Set clauses:
    metric 100
route-map example-map, permit, sequence 200
  Match clauses:
  Set clauses:
```

**Related Commands** [route-map](#)

# synchronization

**Overview** Use this command in Router Configuration mode or in Address Family Configuration mode to ensure BGP does not advertise router learned from iBGP peers until they are learned locally, or are propagated throughout the AS via an IGP.

Use the **no** variant of this command to disable this function.

**Syntax** `synchronization`  
`no synchronization`

**Default** Disabled.

**Mode** Router Configuration and Address Family Configuration mode

**Usage** Synchronization is used when a BGP router should not advertise routes learned from iBGP neighbors, unless those routes are also present in an IGP (for example, OSPF). These routes must be in the RIB (Routing Information Base) learned locally or via an IGP.

Synchronization may be enabled when all the routers in an autonomous system do not speak BGP, and the autonomous system is a transit for other autonomous systems.

Use the **no synchronization** command when BGP router can advertise routes learned from iBGP neighbors, without waiting for IGP reachability, when routes are in the RIB.

**Example** The following example enables IGP synchronization of iBGP routes in Router Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# synchronization
```

The following example enables IGP synchronization of iBGP routes in IPv4 unicast Address Family Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config)# address-family ipv4 unicast
awplus(config-af)# synchronization
```

The following example enables IGP synchronization of iBGP routes in the IPv6 unicast Address Family Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config)# address-family ipv6 unicast
awplus(config-af)# synchronization
```

- Command changes**
- Added to AlliedWare Plus prior to 5.4.6-1
  - Version 5.4.7-2.1: BGP support added for IEx510, x550 series
  - Version 5.4.7-2.4: BGP support added for IE300 series

# timers (BGP)

**Overview** Use this command sets the BGP keepalive timer and holdtime timer values.  
Use the **no** variant of this command to reset timers to the default.

**Syntax** `timers bgp <keepalive> <holdtime>`  
`no timers bgp [<keepalive> <holdtime>]`

Parameter	Description
<code>&lt;keepalive&gt;</code>	<code>&lt;0-65535&gt;</code> The frequency with which the keepalive messages are sent to the neighbors. The default is 30 seconds as per RFC 4271. Cisco IOS uses a 60 second keepalive timer default value. Adjust keepalive timers for interoperability as required. Maintain the keepalive value at the holdtime value / 3.
<code>&lt;holdtime&gt;</code>	<code>&lt;0-65535&gt;</code> The interval after which the neighbor is considered dead if keepalive messages are not received. The default holdtime value is 90 seconds as per RFC 4271. Cisco IOS uses a 180 second holdtime timer default value. Adjust holdtime timers for interoperability as required. Maintain the holdtime value at the keepalive value * 3.

**Default** The keepalive timer default is 60 seconds, the holdtime timer default is 90 seconds, and the connect timer default is 120 seconds as per RFC 4271. Holdtime is `keepalive * 3`.

**Mode** Router Configuration

**Usage** This command is used globally to set or unset the keepalive and holdtime values for all the neighbors.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# timers bgp 40 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no timers bgp 30 90
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no timers bgp
```

# undebug bgp (BGP only)

**Overview** Use this command to disable BGP debugging functions.

**Syntax** undebug bgp  
[all|dampening|events|filters|fsm|keepalives|nht|nsm|updates]  
undebug all bgp

Parameter	Description
all	Disable all debugging for BGP.
dampening	Disable debugging for BGP dampening.
events	Disable debugging for BGP events.
filters	Disable debugging for BGP filters.
fsm	Disable debugging for BGP Finite State Machine (FSM).
keepalives	Disable debugging for BGP keepalives.
nht	Disable debugging for BGP NHT (Next Hop Tracking) messages.
nsm	Disable debugging for NSM messages.
updates	Disable debugging for BGP updates.

**Mode** Privileged Exec and Global Configuration

**Example** awplus# undebug bgp events  
awplus# undebug bgp nht  
awplus# undebug bgp updates

# Route Map Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for route map commands. For more information, see the [Routemaps Feature Overview and Configuration Guide](#). These commands can be divided into the following categories:

- the [route-map](#) command, which is used to create a route map and/or route map entry, and to put you into route map mode
- **match** commands, used to determine which routes or BGP update messages the route map applies to
- **set** commands, used to modify matching routes or BGP update messages

- Command List**
- ["match as-path"](#) on page 1570
  - ["match community"](#) on page 1572
  - ["match interface"](#) on page 1574
  - ["match ip address"](#) on page 1575
  - ["match ip next-hop"](#) on page 1577
  - ["match ipv6 address"](#) on page 1579
  - ["match ipv6 next-hop"](#) on page 1581
  - ["match metric"](#) on page 1582
  - ["match origin"](#) on page 1583
  - ["match route-type"](#) on page 1585
  - ["match tag"](#) on page 1586
  - ["route-map"](#) on page 1587
  - ["set aggregator"](#) on page 1590
  - ["set as-path"](#) on page 1591
  - ["set atomic-aggregate"](#) on page 1592

- [“set comm-list delete”](#) on page 1593
- [“set community”](#) on page 1594
- [“set dampening”](#) on page 1596
- [“set extcommunity”](#) on page 1598
- [“set ip next-hop \(route map\)”](#) on page 1600
- [“set ipv6 next-hop”](#) on page 1601
- [“set local-preference”](#) on page 1602
- [“set metric”](#) on page 1603
- [“set metric-type”](#) on page 1605
- [“set origin”](#) on page 1606
- [“set originator-id”](#) on page 1607
- [“set tag”](#) on page 1608
- [“set weight”](#) on page 1609
- [“show route-map”](#) on page 1610

# match as-path

**Overview** Use this command to add an autonomous system (AS) path match clause to a route map entry. Specify the AS path attribute value or values to match by specifying the name of an AS path access list. To create the AS path access list, enter Global Configuration mode and use the [ip as-path access-list](#) command.

A BGP update message matches the route map if its attributes include AS path values that match the AS path access list.

Each entry of a route map can only match against one AS path access list in one AS path match clause. If the route map entry already has an AS path match clause, entering this command replaces that match clause with the new clause.

Note that AS path access lists and route map entries both specify an action of deny or permit. The action in the AS path access list determines whether the route map checks update messages for a given AS path value. The route map action and its **set** clauses determine what the route map does with update messages that contain that AS path value.

Use the **no** variant of this command to remove the AS path match clause from a route map entry.

**Syntax** `match as-path <as-path-listname>`  
`no match as-path [<as-path-listname>]`

Parameter	Description
<code>&lt;as-path-listname&gt;</code>	Specifies an AS path access list name.

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To add entry 34 to the route map called `myroute`, which will discard update messages if they contain the AS path values that are included in `myaccesslist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match as-path myaccesslist
```

**Related Commands** [ip as-path access-list](#)  
[route-map](#)  
[set as-path](#)  
[show route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# match community

**Overview** Use this command to add a community match clause to a route map entry. Specify the community value or values to match by specifying a community list. To create the community list, enter Global Configuration mode and use the [ip community-list](#) command.

A BGP update message matches the route map if its attributes include community values that match the community list.

Each entry of a route map can only match against one community list in one community match clause. If the route map entry already has a community match clause, entering this command replaces that match clause with the new clause.

Note that community lists and route map entries both specify an action of deny or permit. The action in the community list determines whether the route map checks update messages for a given community value. The route map action and its **set** clauses determine what the route map does with update messages that contain that community value.

Use the **no** variant of this command to remove the community match clause from a route map.

**Syntax**

```
match community  
{<community-listname>|<1-99>|<100-199>} [exact-match]  
  
no match community  
[<community-listname>|<1-99>|<100-199>|exact-match]
```

Parameter	Description
<community-listname>	The community list name or number.
<1-99>	Community list number (standard range).
<100-199>	Community list number (expanded range).
exact-match	Exact matching of communities.

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes.

**Example** To add entry 3 to the route map called `myroute`, which will process update messages if they contain the community values that are included in `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match community mylist
```

**Related Commands**

- [ip community-list](#)
- [route-map](#)
- [set comm-list delete](#)
- [set community](#)
- [show route-map](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# match interface

**Overview** Use this command to add an interface match clause to a route map entry. Specify the interface name to match.

A route matches the route map if its interface matches the interface name.

Each entry of a route map can only match against one interface in one interface match clause. If the route map entry already has an interface match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the interface match clause from the route map entry. Use the **no** variant of this command without a specified interface to remove all interfaces.

**Syntax** `match interface <interface>`  
`no match interface [<interface>]`

Parameter	Description
<interface>	The VLAN to match, e.g. vlan2.

**Mode** Route-map Configuration

**Usage** This command is valid for RIP and OSPF routes only.

**Example** To add entry 10 to the route map called `mymap1`, which will process routes if they use the interface `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match interface vlan1
```

To remove all interfaces from the route map called `mymap1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# no match interface
```

**Related Commands**

- [match ip address](#)
- [match ip next-hop](#)
- [match route-type](#)
- [match tag](#)
- [route-map](#)
- [show route-map](#)

# match ip address

**Overview** Use this command to add an IP address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map entry if the route's prefix matches the access list or prefix list.

Use the **no** variant of this command to remove the IP address match clause from a route map entry. To remove a prefix list-based match clause you must also specify the **prefix-list** parameter.

**Syntax**

```
match ip address <access-list-id>
match ip address prefix-list <prefix-listname>
no match ip address
no match ip address <access-list-id>
no match ip address prefix-list <prefix-listname>
```

Parameter	Description
<access-list-id>	{<access-list-name> <1-199> <1300-2699>} The IP access list name or number.
<access-list-name>	The IP access list name.
<1-199>	The IP access list number.
<1300-2699>	The IP access list number (expanded range).
prefix-list	Use an IP prefix list to specify which prefixes to match.
<prefix-listname>	The prefix list name.

**Mode** Route-map Configuration

**Usage** Each entry of a route map can have at most one access list-based IP address match clause and one prefix list-based IP address match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given prefix. The action in the route map, and the map's **set** clauses, determine what the device does with update messages or routes that contain that prefix.

If the **match ip address** command results in a match against the specified IP address, then the outcome is:

- If **permit** is specified, then the route is redistributed or controlled, as specified by the set action.
- If **deny** is specified, then the route is not redistributed or controlled.

If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Examples** To add entry 3 to the route map called "myroute", which will process routes that match the ACL called "List1", use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match ip address List1
```

To add entry 3 to the route map called "rmap1", which will process routes that match the prefix list called "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip address prefix-list mylist
```

**Related  
Commands**

[access-list \(extended numbered\)](#)

[access-list \(standard numbered\)](#)

[ip prefix-list](#)

[route-map](#)

[show ip access-list](#)

[show route-map](#)

# match ip next-hop

**Overview** Use this command to add a next-hop match clause to a route map entry. You can specify the next hop to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map if the route's next hop matches the access list or prefix list.

Each entry of a route map can have at most one access list-based next-hop match clause and one prefix list-based next-hop match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given next-hop value. The route map action and its **set** clauses determine what the route map does with update messages and routes that contain that next hop.

Use the **no** variant of this command to remove the next-hop match clause from a route map entry. To remove a prefix list-based match clause you must also specify the prefix-list parameter.

**Syntax**

```
match ip next-hop {<access-list-id>|prefix-list
<prefix-listname>}
no match ip next-hop [<access-list-id>]
no match ip next-hop prefix-list [<prefix-listname>]
```

Parameter	Description
<access-list-id>	{<access-list-name> <1-199> <1300-2699>} The IP access list name or number.
<access-list-name>	The IP access list name.
<1-199>	The IP access list number.
<1300-2699>	The IP access list number (expanded range).
prefix-list	Use an IP prefix list to specify which next hop to match.
<prefix-listname>	The prefix list name.

**Mode** Route-map Configuration

**Usage** This command is valid for:

- OSPF routes

- routes in BGP update messages
- RIP routes.

**Examples** To add entry 3 to the route map called "rmap1", which will process routes whose next hop matches the ACL called "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip next-hop mylist
```

To add entry 3 to the route map called "mymap", which will process routes whose next hop matches the prefix list called "list1", use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# match ip next-hop prefix-list list1
```

**Related Commands**

- [access-list \(extended numbered\)](#)
- [access-list \(standard numbered\)](#)
- [ip prefix-list](#)
- [route-map](#)
- [show ip access-list](#)
- [show ip prefix-list](#)
- [show route-map](#)

# match ipv6 address

**Overview** Use this command to add an IPv6 address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ipv6 prefix-list** command.

A route matches the route map entry if the route's prefix matches the access list or prefix list.

Use the **no** variant of this command to remove the IPv6 address match clause from a route map entry.

**Syntax**

```
match ipv6 address <access-list-id>
match ipv6 address prefix-list <prefix-listname>
no match ipv6 address
no match ipv6 address <access-list-id>
no match ipv6 address prefix-list <prefix-listname>
```

Parameter	Description
<access-list-id>	{<access-list-name> <1-199> <1300-2699>} The IP access list name or number.
<access-list-name>	The IP access list name.
<1-199>	The IP access list number.
<1300-2699>	The IP access list number (expanded range).
prefix-list	Use an IP prefix list to specify which prefixes to match.
<prefix-listname>	The prefix list name.

**Mode** Route-map Configuration

**Usage** Each entry of a route map can have at most one access list-based IPv6 address match clause and one prefix list-based IPv6 address match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given prefix. The action in the route map, and the map's **set** clauses, determine what the device does with update messages or routes that contain that prefix.

If the **match ipv6 address** command results in a match against the specified IPv6 address, then the outcome is:

- If **permit** is specified, then the route is redistributed or controlled, as specified by the set action.
- If **deny** is specified, then the route is not redistributed or controlled.

If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Examples** To avoid processing the routes specified by the ACL named “acl1”, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 deny 1
awplus(config-route-map)# match ipv6 address acl1
```

To match traffic according to the prefix list named “mylist”, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 address prefix-list mylist
```

# match ipv6 next-hop

**Overview** Use this command to specify a next-hop address to be matched by the route-map. Use the **no** variant of this command to disable this function.

**Syntax**

```
match ipv6 next-hop <access-list-name>
match ipv6 next-hop <ipv6-addr>
match ipv6 next-hop prefix-list <prefix-listname>
no match ipv6 next-hop [<access-list-name>]
match ipv6 next-hop [<ipv6-addr>]
match ipv6 next-hop [prefix-list <prefix-listname>]
```

Parameter	Description
<access-list-name>	The name of the IPv6 access list that specifies criteria for the addresses to match.
<ipv6-addr>	The IPv6 address of the next hop. The IPv6 address uses the format X:X::X:X.
<prefix-listname>	The name of the IPv6 prefix list that specifies criteria for the addresses to be matched.

**Mode** Route-map Configuration

**Usage** The **match ipv6 next-hop** command specifies the next-hop address to be matched. If there is a match for the specified next-hop address, and permit is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and deny is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of permit or deny specifications.

**NOTE:** This command is valid only for BGP.

**Example**

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 next-hop 2001:0db8::/32
```

# match metric

**Overview** Use this command to add a metric match clause to a route map entry. Specify the metric value to match.

A route matches the route map if its metric matches the route map's metric.

A BGP update message matches the route map if its MED attribute value matches the route map's metric.

Each entry of a route map can only match against one metric value in one metric match clause. If the route map entry already has a metric match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the metric match clause from the route map entry.

**Syntax** `match metric <metric>`  
`no match metric [<metric>]`

Parameter	Description
<metric>	<0-4294967295> Specifies the metric value.

**Mode** Route-map Configuration

**Usage** This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Example** To stop entry 3 of the route map called "myroute" from processing routes with a metric of 888999, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no match metric 888999
```

**Related Commands** [route-map](#)  
[set metric](#)  
[show route-map](#)

# match origin

**Overview** Use this command to add an origin match clause to a route map entry. Specify the origin attribute value to match.

A BGP update message matches the route map if its origin attribute value matches the route map's origin value.

Each entry of a route map can only match against one origin in one origin match clause. If the route map entry already has an origin match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the origin match clause from the route map entry.

**Syntax** `match origin {egp|igp|incomplete}`  
`no match origin [egp|igp|incomplete]`

Parameter	Description
egp	Learned from an exterior gateway protocol.
igp	Learned from a local interior gateway protocol.
incomplete	Of unknown heritage, for example a static route.

**Mode** Route-map Configuration

**Usage** The origin attribute defines the origin of the path information. The **egp** parameter is indicated as an **e** in the routing table, and it indicates that the origin of the information is learned via Exterior Gateway Protocol. The **igp** parameter is indicated as an **i** in the routing table, and it indicates the origin of the path information is interior to the originating AS. The **incomplete** parameter is indicated as a **?** in the routing table, and indicates that the origin of the path information is unknown or learned through other means. If a static route is redistributed into BGP, the origin of the route is incomplete.

The **match origin** command specifies the origin to be matched. If there is a match for the specified origin, and **permit** is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and **deny** is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for BGP update messages only.

**Example** To add entry 34 to the route map called "rmap1", which will drop externally-originated routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match origin egp
```

**Related  
Commands** route-map  
set origin  
show route-map

# match route-type

**Overview** Use this command to add an external route-type match clause to a route map entry. Specify whether to match OSPF type-1 external routes or OSPF type-2 external routes.

An OSPF route matches the route map if its route type matches the route map's route type.

Each entry of a route map can only match against one route type in one match clause. If the route map entry already has a route type match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the route type match clause from the route map entry.

**Syntax** `match route-type external {type-1|type-2}`  
`no match route-type external [type-1|type-2]`

Parameter	Description
type-1	OSPF type-1 external routes.
type-2	OSPF type-2 external routes.

**Mode** Route-map Configuration

**Usage** Use the **match route-type external** command to match specific external route types. AS- external LSA is either Type-1 or Type-2. **external type-1** matches only Type 1 external routes, and **external type-2** matches only Type 2 external routes. This command is valid for OSPF routes only.

**Example** To add entry 10 to the route map called `mymap1`, which will process type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match route-type external type-1
```

**Related Commands**

- [match interface](#)
- [match ip address](#)
- [match ip next-hop](#)
- [match tag](#)
- [route-map](#)
- [set metric-type](#)
- [show route-map](#)

# match tag

**Overview** Use this command to add a tag match clause to a route map entry. Specify the route tag value to match.

An OSPF route matches the route map if it has been tagged with the route map's tag value. Routes can be tagged through OSPF commands or through another route map's set clause.

Each entry of a route map can only match against one tag in one match clause. If the route map entry already has a tag match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the tag match clause from the route map entry.

**Syntax** `match tag <0-4294967295>`  
`no match tag [<0-4294967295>]`

**Mode** Route-map Configuration

**Usage** This command is valid for OSPF routes only.

**Example** To add entry 10 to the route map called `mymap1`, which will process routes that are tagged 100, use the following commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
```

**Related Commands**

- [set tag](#)
- [show route-map](#)

# route-map

**Overview** Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes and BGP update messages.

The device uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes or update messages match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes or update messages.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

**Syntax**

```
route-map <mapname> {deny|permit} <seq>  
no route-map <mapname>  
no route-map <mapname> {deny|permit} <seq>
```

Parameter	Description
<mapname>	A name to identify the route map.
deny	The route map causes a routing process to discard matching routes or BGP update messages.
permit	The route map causes a routing process to use matching routes or BGP update messages.
<seq>	<1-65535> The sequence number of the entry. You can use this parameter to control the order of entries in this route map.

**Mode** Global Configuration

**Usage** Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- processes BGP update messages that it has received from a peer
- prepares BGP update messages to send to peers
- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols
- uses BGP route flap dampening

When a routing protocol passes a route or update message through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route or update message. This means that route maps end with an implicit deny entry. To permit all non-matching routes or update messages, end your route map with an entry that has an action of **permit** and no match clause.

**Examples** To enter route-map mode for entry 1 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 1
awplus(config-route-map)# match as-path 60
awplus(config-route-map)# set weight 70
```

To enter route-map mode for entry 2 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface vlan2
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

**Related  
Commands**

For BGP:

- show route-map
- bgp dampening
- neighbor default-originate
- neighbor route-map
- neighbor unsuppress-map
- network (BGP and BGP4+)
- redistribute (into BGP or BGP4+)
- show ip bgp route-map (BGP only)

For OSPF:

- distribute-list (OSPF)
- default-information originate
- redistribute (OSPF)

For RIP:  
`redistribute (RIP)`

# set aggregator

**Overview** Use this command to add an aggregator set clause to a route map entry.

When a BGP update message matches the route map entry, the device sets the update's aggregator attribute. The aggregator attribute specifies the AS and IP address of the device that performed the aggregation.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set aggregator as <asnum> <ip-address>`  
`no set aggregator as`

Parameter	Description
<asnum>	The AS number of the aggregator.
<ip-address>	The IP address of the aggregator.

**Mode** Route-map Configuration

**Usage** An Autonomous System (AS) is a collection of networks under a common administration sharing a common routing strategy. It is subdivided by areas, and is assigned a unique 16-bit number. Use the **set aggregator** command to assign an AS number for the aggregator.

This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `myroute` to set the aggregator attribute to 43 10.10.0.3 in matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set aggregator as 43 10.10.0.3
```

To remove all aggregator attributes for entry 3 of the route map called `myroute`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no set aggregator as
```

**Related Commands** [route-map](#)  
[show route-map](#)

# set as-path

**Overview** Use this command to add an AS path set clause to a route map entry.

When a BGP update message matches the route map entry, the device prepends the specified Autonomous System Number (ASN) or ASNs to the update's AS path attribute.

The AS path attribute is a list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its ASN to the beginning of the list. This means that the AS path attribute can be used to make routing decisions.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set as-path prepend <1-65535> [<1-65535>]...`  
`no set as-path prepend [<1-65535> [<1-65535>]...]`

Parameter	Description
<code>prepend</code>	Prepends the autonomous system path.
<code>&lt;1-65535&gt;</code>	The number to prepend to the AS path. If you specify multiple ASNs, separate them with spaces.

**Mode** Route-map mode

**Usage** Use the **set as-path** command to specify an autonomous system path. By specifying the length of the AS-Path, the device influences the best path selection by a neighbor. Use the `prepend` parameter with this command to prepend an AS path string to routes increasing the AS path length.

This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `myroute` to prepend ASN 8 and 24 to the AS path of matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set as-path prepend 8 24
```

**Related Commands** [match as-path](#)  
[route-map](#)  
[show route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

# set atomic-aggregate

**Overview** Use this command to add an atomic aggregate set clause to a route map entry. When a BGP update message matches the route map entry, the device adds the atomic aggregate attribute to the update. Use the **no** variant of this command to remove the set clause.

**Syntax** `set atomic-aggregate`  
`no set atomic-aggregate`

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `rmap1` to add the atomic aggregator attribute to matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set atomic-aggregate
```

**Related Commands** [route-map](#)  
[show route-map](#)

# set comm-list delete

**Overview** Use this command to delete one or more communities from the community attribute of a BGP update message. Specify the communities to delete by specifying a community list. To create the community list, enter Global Configuration mode and use the [ip community-list](#) command.

When a BGP update message matches the route map entry, the device deletes the specified communities from the update's community attribute.

Use the **no** variant of this command to stop deleting the communities.

**Syntax**

```
set comm-list {<1-199>|<100-199>|<word>} delete  
no set comm-list {<1-199>|<100-199>|<word>} delete
```

Parameter	Description
<1-99>	Standard community-list number.
<100-199>	Expanded community-list number.
<word>	Name of the Community-list.

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `myroute` to delete the communities in community list 34 from matching update messages, use the commands:

```
awplus# configure terminal  
awplus(config)# route-map myroute permit 3  
awplus(config-route-map)# set comm-list 34 delete
```

**Related Commands**

- [ip community-list](#)
- [match community](#)
- [route-map](#)
- [set community](#)
- [show route-map](#)

# set community

**Overview** Use this command to add a community set clause to a route map entry.

When a BGP update message matches the route map entry, the device takes one of the following actions:

- changes the update's community attribute to the specified value or values, or
- adds the specified community value or values to the update's community attribute, if you specify the **additive** parameter after specifying another parameter. or
- removes the community attribute from the update, if you specify the **none** parameter

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set community {[<1-65535>][AA:NN] [internet] [local-AS]
[no-advertise] [no-export] [additive]}
no set community {[AA:NN] [internet] [local-AS] [no-advertise]
[no-export] [additive]}
set community none
no set community none
```

Parameter	Description
<1-65535>	The AS number of the community as an integer not in AA:NN format.
AA:NN	The Autonomous System (AS) number of the community, in AA:NN format. AS numbers are assigned to the regional registries by the IANA ( <a href="http://www.iana.org">www.iana.org</a> ) and can be obtained from the registry in your region. AA and NN are both integers from 1 to 65535. AA is the AS number; NN is a value chosen by the ASN administrator.
local-AS	The community of routes that must not be advertised to external BGP peers (this includes peers in other members' Autonomous Systems inside a BGP confederation).
internet	The community of routes that can be advertised to all BGP peers.
no-advertise	The community of routes that must not be advertised to other BGP peers.
no-export	The community of routes that must not be advertised outside a BGP confederation boundary (a standalone Autonomous System that is not part of a confederation should be considered a confederation itself).

Parameter	Description
none	The device removes the community attribute from matching update messages.
additive	The device adds the specified community value to the update message's community attribute, instead of replacing the existing attribute. By default this parameter is not included, so the device replaces the existing attribute.

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Examples** To use entry 3 of the route map called `rmap1` to put matching routes into the no-advertise community, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community no-advertise
```

To use entry 3 of the route map called `rmap1` to put matching routes into several communities, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 10:01 23:34 12:14
no-export
```

To use entry 3 of the route map called `rmap1` to put matching routes into a single AS community numbered 16384, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 16384 no-export
```

**Related Commands** [match community](#)  
[route-map](#)

[set aggregator](#)  
[set comm-list delete](#)  
[set extcommunity](#)  
[show route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# set dampening

**Overview** Use this command to add a route flap dampening set clause to a route map entry.

Also use the route map by specifying it in the command [bgp dampening route-map](#).

When a route matches the route map entry, the device enables route flap dampening for that route. If the set clause includes dampening parameter values, the device uses those values when dampening the matching route.

Use the **no** variant of this command to remove the set clause. This disables dampening on matching routes.

**Syntax**

```
set dampening
set dampening [<reachtime>]
set dampening <reachtime> [<reuse> <suppress> <maxsuppress>]
[<unreachtime>]
no set dampening
no set dampening [<reachtime>]
no set dampening <reachtime> [<reuse> <suppress> <maxsuppress>]
[<unreachtime>]
```

Parameter	Description
<reachtime>	<1-45> The time it takes, in minutes, for the route's instability penalty to halve if the route remains stable. The instability penalty is called the Figure of Merit (FoM). For example, if reachtime is 15, the FoM of a stable route halves over a 15 minute period, quarters over a 30 minute period, and so on. The default is 15 minutes.
<reuse>	<1-20000> The value that the instability penalty (FoM) must reach for the device to use a suppressed route again. Once a route is suppressed, it remains suppressed until its FoM falls below this threshold. Reuse must not exceed suppress. The default is 750.
<suppress>	<1-20000> The instability penalty (FoM) at which the route is suppressed. Suppress must be greater than or equal to reuse. If suppress is less than 1000, a route is suppressed when it becomes unreachable for the first time. The default is 2000.

Parameter	Description
<code>&lt;maxsuppress&gt;</code>	<p><code>&lt;1-255&gt;</code></p> <p>A number that is multiplied by reachtime to give the maximum time in minutes for which a suppressed route must remain stable in order to become unsuppressed. The lowest maxsuppress value of 1 gives a maximum suppression time of 1 x reachtime, and the highest maxsuppress value of 255 gives a maximum suppression time of 255 x reachtime.</p> <p>For example, if reachtime is 15 and maxsuppress is 4, the route is unsuppressed after 60 minutes of stability even if its FoM still exceeds reuse. The default is 4.</p>
<code>&lt;unreachtime&gt;</code>	<p><code>&lt;1-45&gt;</code></p> <p>The time it takes, in minutes, for the route's instability penalty to halve if the route remains unstable. The default is 15 minutes.</p>

**Mode** Route-map Configuration

**Usage** The **suppress** value must be greater than or equal to the **reuse** value.

Set the unreachability half-life time to be equal to, or greater than, reachability half-life time. The suppress-limit value must be greater than or equal to the reuse limit value.

This command is valid for BGP routes only.

**Example** To use entry 24 of the route map called R1 to enable dampening of matching routes and set the dampening parameters, use the commands:

```
awplus# configure terminal
awplus(config)# route-map R1 permit 24
awplus(config-route-map)# set dampening 20 333 534 30
```

**Related Commands**

- [bgp dampening](#)
- [route-map](#)
- [show route-map](#)

# set extcommunity

**Overview** Use this command to add an extended community set clause to a route map entry. A route map entry can have a route target extended community set clause, a site-of-origin extended community set clause, or both.

When a BGP update message matches the route map entry, the device sets the update's extended community attribute to the specified value or values.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set extcommunity {rt|soo} <extcomm-number>`  
`no set extcommunity {rt|soo} [<extcomm-number>]`

Parameter	Description
rt	Configure a route target extended community. This consists of routers that will receive matching routes.
soo	Configure a site-of-origin extended community. This consists of routers that will inject matching routes into BGP.
<extcomm-number>	The extended community number, in the format AA:NN or IPADD:N.

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Examples** To use entry 3 of the route map called `rmap1` to set the route target extended community attribute to `06:01`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity rt 06:01
```

To instead specify the extended community number in dotted decimal notation, use the command:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity rt 0.0.0.6:01
```

To use entry 3 of the route map called `rmap1` to set the site-of-origin extended community attribute to `06:01`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity soo 06:01
```

To instead specify the extended community number in dotted decimal notation, use the command:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity soo 0.0.0.6:01
```

**Related  
Commands**

[match community](#)  
[route-map](#)  
[set comm-list delete](#)  
[set community](#)  
[show route-map](#)

# set ip next-hop (route map)

**Overview** Use this command to add a next-hop set clause to a route map entry.

When a route or BGP update message matches the route map entry, the device sets the route's next hop to the specified IP address.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set ip next-hop <ip-address>`  
`no set ip next-hop [<ip-address>]`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The IP address of the next hop, entered in the form A.B.C.D.

**Mode** Route-map Configuration

**Usage** Use this command to set the next-hop IP address to the routes.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Example** To use entry 3 of the route map called `mymap` to give matching routes a next hop of 10.10.0.67, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# set ip next-hop 10.10.0.67
```

**Related Commands** [match ip next-hop](#)  
[route-map](#)  
[show route-map](#)

# set ipv6 next-hop

**Overview** Use this command to set a next hop-address.

Use the **no** variant of this command to delete an entry.

**Syntax** `set ipv6 next-hop {<ipv6-addr-global>|local <ipv6-addr>}`  
`no set ipv6 next-hop [<ipv6-addr-global>|local [<ipv6-addr>]]`

Parameter	Description
<code>&lt;ipv6-addr-global&gt;</code>	The IPv6 global address of next hop. The IPv6 address uses the format X:X::X:X.
<code>local</code>	Specifies that the address is local.
<code>&lt;ipv6-addr&gt;</code>	The IPv6 local address of next hop. The IPv6 address uses the format X:X::X:X.

**Mode** Route-map Configuration

**Usage** Use this command to set the next-hop IPv6 address to the routes.

This command is valid only for BGP.

**Examples**

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set ipv6 next-hop local
fe80::203:47ff:fe97:66dc
awplus(config-route-map)# no set ipv6 next-hop
```

# set local-preference

**Overview** This command changes the default local preference value.

The local preference indicates the BGP local preference path attribute when there are multiple paths to the same destination. The path with the higher preference is chosen.

Use this command to define the preference of a particular path. The preference is sent to all routers and access servers in the local autonomous system.

The **no** variant of this command reverts to the default setting.

**Syntax** `set local-preference <pref-value>`  
`no set local-preference [<pref-value>]`

Parameter	Description
<code>&lt;pref-value&gt;</code>	<code>&lt;0-4294967295&gt;</code> Configure local preference value. The default local preference value is 100.

**Mode** Route-map Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set local-preference 2345555
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-route-map)# no set local-preference
```

**Related Commands** For related Route Map commands:

[route-map](#)

[show route-map](#)

For related BGP commands:

[bgp default local-preference \(BGP only\)](#)

[neighbor route-map](#)

# set metric

**Overview** Use this command to add a metric set clause to a route map entry.

When a route or BGP update message matches the route map entry, the device takes one of the following actions:

- changes the metric (or for BGP, the MED attribute value) to the specified value, or
- adds or subtracts the specified value from the metric or MED attribute, if you specify + or - before the value (for example, to increase the metric by 2, enter +2)

Use the **no** variant of this command to remove the set clause.

**Syntax** `set metric {+<metric-value>|-<metric-value>|<metric-value>}`  
`no set metric [+<metric-value>|-<metric-value>|<metric-value>]`

Parameter	Description
+	Increase the metric or MED attribute by the specified amount.
-	Decrease the metric or MED attribute by the specified amount.
<metric-value>	<0-4294967295> The new metric or MED attribute value, or the amount by which to increase or decrease the existing value.

**Default** The default metric value for routes redistributed into OSPF and OSPFv3 is 20.

**Mode** Route-map Configuration

**Usage** For BGP, if you want the device to compare MED values in update messages from peers in different ASes, also enter the command [bgp always-compare-med](#). You do not need to enter this command if you only want the device to compare MED values in update messages from peers in the same AS, because it always does.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

Note that defining the OSPF metric in a route map supersedes the metric defined using a [redistribute \(OSPF\)](#) or a [redistribute \(IPv6 OSPF\)](#) command. For more information, see the [OSPFv3 Feature Overview and Configuration Guide](#) and the [OSPF Feature Overview and Configuration Guide](#).

**Examples** To use entry 3 of the route map called "rmap1" to give matching routes a metric of 600, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric 600
```

To use entry 3 of the route map called "rmap1" to increase the metric of matching routes by 2, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric +2
```

**Related  
Commands** [match metric](#)  
[route-map](#)  
[show route-map](#)

# set metric-type

**Overview** Use this command to add a metric-type set clause to a route map entry.

When a route matches the route map entry, the device sets its route type to the specified value.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set metric-type {type-1|type-2}`  
`no set metric-type [type-1|type-2]`

Parameter	Description
type-1	Redistribute matching routes into OSPF as type-1 external routes.
type-2	Redistribute matching routes into OSPF as type-2 external routes.

**Mode** Route-map Configuration

**Usage** This command is valid for OSPF routes only.

**Example** To use entry 3 of the route map called `rmap1` to redistribute matching routes into OSPF as type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric-type 1
```

**Related Commands**

- [default-information originate](#)
- [redistribute \(OSPF\)](#)
- [match route-type](#)
- [route-map](#)
- [show route-map](#)

# set origin

**Overview** Use this command to add an origin set clause to a route map entry.

When a BGP update message matches the route map entry, the device sets its origin attribute to the specified value.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set origin {egp|igp|incomplete}`  
`no set origin [egp|igp|incomplete]`

Parameter	Description
egp	Learned from an exterior gateway protocol.
igp	Learned from a local interior gateway protocol.
incomplete	Of unknown heritage, for example a static route.

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `rmap1` to give matching update messages an origin of `egp`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set origin egp
```

**Related Commands** [match origin](#)  
[route-map](#)  
[show route-map](#)

# set originator-id

- Overview** Use this command to add an originator ID set clause to a route map entry.
- The originator ID is the router ID of the IBGP peer that first learned this route, either via an EBGP peer or by some other means such as importing it.
- When a BGP update message matches the route map entry, the device sets its originator ID attribute to the specified value.
- Use the **no** variant of this command to remove the set clause.

**Syntax** `set originator-id <ip-address>`  
`no set originator-id [<ip-address>]`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The IP address of the originator, entered in the form A.B.C.D.

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `rmap1` to give matching update messages an originator ID of `1.1.1.1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set originator-id 1.1.1.1
```

**Related Commands** [route-map](#)  
[show route-map](#)

# set tag

**Overview** Use this command to add a tag set clause to a route map entry.  
When a route matches the route map entry, the device sets its tag to the specified value when it redistributes the route into OSPF.  
Use the **no** variant of this command to remove the set clause.

**Syntax** `set tag <tag-value>`  
`no set tag [<tag-value>]`

Parameter	Description
<code>&lt;tag-value&gt;</code>	<code>&lt;0-4294967295&gt;</code> Value to tag matching routes with.

**Mode** Route-map Configuration

**Usage** This command is valid only when redistributing routes into OSPF.

**Example** To use entry 3 of the route map called `rmap1` to tag matching routes with the number 6, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set tag 6
```

**Related Commands** [default-information originate](#)  
[redistribute \(OSPF\)](#)  
[match tag](#)  
[route-map](#)  
[show route-map](#)

# set weight

**Overview** Use this command to add a weight set clause to a route map entry.

The weight value assists in best path selection of BGP routes. It is stored with the route in the BGP routing table, but is not advertised to peers. When there are multiple routes with a common destination, the device uses the route with the highest weight value.

When a route matches the route map entry, the device sets its weight to the specified value.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set weight <weight>`  
`no set weight [<weight>]`

Parameter	Description
<code>&lt;weight&gt;</code>	<code>&lt;0-4294967295&gt;</code> The weight value.

**Mode** Route-map Configuration

**Usage** This command is valid for BGP routes only.

**Example** To use entry 3 of the route map called `rmap1` to give matching routes a weight of 60, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set weight 60
```

**Related Commands** [route-map](#)  
[show route-map](#)

# show route-map

**Overview** Use this command to display information about one or all route maps.

**Syntax** `show route-map <map-name>`

Parameter	Description
<code>&lt;map-name&gt;</code>	A name to identify the route map.

**Mode** User Exec and Privileged Exec

**Example** To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

**Output** Figure 29-1: Example output from the **show route-map** command

```
route-map example-map, permit, sequence 1
  Match clauses:
    ip address prefix-list example-pref
  Set clauses:
    metric 100
route-map example-map, permit, sequence 200

# address-family

**Overview** This command enters the IPv4 or IPv6 Address-Family Configuration command mode. In this mode you can configure address-family specific parameters.

When using VRF-lite, you can enter IPv4 Address Family Configuration mode for a specified VRF instance before configuring that instance.

**Syntax [BGP]** address-family ipv4 [unicast]  
no address-family ipv4 [unicast]

**Syntax (VRF-lite)** address-family ipv4 [unicast|vrf <vrf-name>]  
no address-family ipv4 [unicast|vrf <vrf-name>]

**Syntax [BGP4+]** address-family ipv6 [unicast]  
no address-family ipv6 [unicast]

Parameter	Description
ipv4	Configure parameters relating to the exchange of IPv4 prefixes.
ipv6	Configure parameters relating to the exchange of IPv6 prefixes.
unicast	Configure parameters relating to the exchange of routes to unicast destinations.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance to enter IPv4 Address-Family mode for.

**Mode [BGP]** Router Configuration

**Mode [BGP4+]** Router Configuration

**Usage** To leave the IPv4 or IPv6 Address Family Configuration mode, and return to the Router Configuration mode, use the [exit-address-family](#) command.

**Example [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 192.168.0.1 remote-as 100
awplus(config-router)# address-family ipv4 vrf
green
awplus(config-router-af)# neighbor 192.168.0.1 activate
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Example [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 activate
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Related  
Commands** [exit-address-family](#)

**Command  
changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# address-family ipv4 (RIP)

**Overview** This command enters the IPv4 address-family command mode. In this mode you can configure address-family specific parameters for a specific VRF (RIP) instance.

**Syntax** `address-family ipv4 vrf <vrf-name>`  
`no address-family ipv4 vrf <vrf-name>`

Parameter	Description
<code>ipv4</code>	Configure parameters relating to the RIP exchange of IPv4 prefixes.
<code>vrf</code>	Apply this command to a VRF instance.
<code>&lt;vrf-name&gt;</code>	The name of the VRF instance.

**Mode** Router Configuration

**Usage** To leave Address Family mode and return to Router Configuration mode, use the [exit-address-family](#) command.

**Example** In this example the address family "green" is entered, and then exited by using the [exit-address-family](#) command.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Related Commands** [exit-address-family](#)

# arp

**Overview** This command adds a static ARP entry to the ARP cache. This is typically used to add entries for hosts that do not support ARP or to speed up the address resolution function for a host. The ARP entry must not already exist. Use the **alias** parameter to allow your device to respond to ARP requests for this IP address.

If VRF-lite is configured, you can add ARP entries to either the global cache or for a specific VRF instance.

The **no** variant of this command removes the static ARP entry. Use the [clear arp-cache](#) command to remove the dynamic ARP entries in the ARP cache.

**Syntax**

```
arp <ip-addr> <mac-address> [<port-number>] [alias]
arp <ip-addr> <multicast-mac-address> [<port-list>]
no arp <ip-addr>
```

**Syntax (VRF-lite)**

```
arp [vrf <vrf-name>] <ip-addr> <mac-address> [<port-number>]
[alias]
arp [vrf <vrf-name>] <ip-addr> <multicast-mac-address>
[<port-list>]
no arp [vrf <vrf-name>] <ip-addr>
```

Parameter	Description
<ip-addr>	The IPv4 address of the device you are adding as a static ARP entry.
<mac-address>	The MAC address of the device you are adding as a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.
<port-number>	The port number associated with the IP address. Specify this when the IP address is part of a VLAN.
<multicast-mac-address>	The multicast MAC address for which you are adding a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.
<port-list>	The list of port numbers associated with the IP address. You can only specify multiple egress ports when the MAC address is a multicast MAC address.
alias	Allows your device to respond to ARP requests for the IP address. Proxy ARP must be enabled on the interface before using this parameter.
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode** Global Configuration

**Usage** One use of this command is to limit packet flooding when using services like Microsoft Network Load Balancing (MS-NLB). With such services, packets destined for server cluster virtual address must be sent to all servers in the cluster. The server cluster can operate in multicast mode, in which it uses a multicast MAC address. To support this, this command allows you to create a static ARP entry with a multicast MAC address, and specify which ports the packets will be forwarded out.

Creating a static ARP entry enables the switch to correctly forward server cluster traffic. If you want the switch to also respond to pings from the server cluster, you need to also enable server cluster support, using the [arp-mac-disparity](#) command.

**Examples** To add the IP address 10.10.10.9 with the MAC address 0010.2533.4655 into the ARP cache, and have your device respond to ARP requests for this address, use the commands:

```
awplus# configure terminal
awplus(config)# arp 10.10.10.9 0010.2355.4566 alias
```

**Example (VRF-lite)** To apply the above example within a VRF instance called `red` use the following commands:

```
awplus# configure terminal
awplus(config)# arp vrf red 10.10.10.9 0010.2355.4566 alias
```

**Related Commands**

- [arp-mac-disparity](#)
- [clear arp-cache](#)
- [ip proxy-arp](#)
- [show arp](#)

# arp opportunistic-nd

**Overview** Use this command to enable opportunistic neighbor discovery for the global ARP cache. This command changes the behavior for unsolicited ARP packet forwarding on the device.

When using VRF-lite, you can use this command to enable opportunistic neighbor discovery for a named VRF instance.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global ARP cache.

**Syntax** `arp opportunistic-nd`  
`no arp opportunistic-nd`

**Syntax (VRF-lite)** `arp opportunistic-nd [vrf <vrf-name>]`  
`no arp opportunistic-nd [vrf <vrf-name>]`

Parameter	Description
<code>vrf</code>	Apply this command to a VRF instance.
<code>&lt;vrf-name&gt;</code>	The name of the VRF instance.

**Default** Opportunistic neighbor discovery is disabled by default.

**Mode** Global Configuration

**Usage** When opportunistic neighbor discovery is enabled, the device will reply to any received unsolicited ARP packets (but not gratuitous ARP packets). The source MAC address for the unsolicited ARP packet is added to the ARP cache, so the device forwards the ARP packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ARP packet is not added to the ARP cache, so the ARP packet is not forwarded by the device.

Note this command enables or disables opportunistic neighbor discovery for a VRF instance if the **vrf** parameter and an instance name are applied. If a VRF instance is not specified, then opportunistic neighbor discovery is enabled or disabled for device ports configured for IPv4.

**Examples** To enable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd
```

To disable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd
```

**Example (VRF-lite)** To enable opportunistic neighbor discovery for the VRF instance 'blue', enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd vrf blue
```

To disable opportunistic neighbor discovery for the VRF instance 'blue', enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd vrf blue
```

**Related Commands**

- [ipv6 opportunistic-nd](#)
- [show arp](#)
- [show running-config interface](#)

# clear arp-cache

**Overview** This command deletes dynamic ARP entries from the ARP cache. You can optionally specify the IPv4 address of an ARP entry to be cleared from the ARP cache.

When running VRF-lite, this command deletes dynamic ARP entries either from the ARP cache of a specific VRF instance, or from the ARP cache of the Global VRF instance. To delete all ARP entries from both the Global VRF instance and all VRF instances, use the command with no parameters. You can optionally specify the IPv4 address for the VRF instance to clear an ARP entry from the ARP cache.

**Syntax** `clear arp-cache [<ip-address>]`

**Syntax (VRF-lite)** `clear arp-cache [vrf <vrf-name>|global] [<ip-address>]`

Parameter	Description
<ip-address>	Specifies a specific IPv4 address for a VRF instance whose entries are to be cleared from the ARP cache.
global	When VRF-lite is configured, apply this command to the global routing and forwarding table.
vrf	Apply this command to the specified VRF instance.
<vrf-name>	The VRF instance name

**Mode** Privileged Exec

**Usage** To display the entries in the ARP cache, use the [show arp](#) command. To remove static ARP entries, use the no variant of the [arp](#) command.

**Example** To clear all dynamic ARP entries, use the command:

```
awplus# clear arp-cache
```

To clear all dynamic ARP entries associated with the IPv4 address 192.168.1.1, use the command:

```
awplus# clear arp-cache 192.168.1.1
```

**Example (VRF-lite)** To clear the dynamic ARP entries from the VRF instance named blue, use the commands:

```
awplus# clear arp-cache vrf blue
```

To clear the dynamic ARP entries from the VRF instance named blue with the IPv4 address 192.168.1.1, use the commands:

```
awplus# clear arp-cache vrf blue 192.168.1.1
```

When running VRF-lite, to clear the dynamic ARP entries from the global VRF-lite and all VRF instances, use the command:

```
awplus# clear arp-cache
```

**Related  
Commands**

- [arp-mac-disparity](#)
- [arp](#)
- [show arp](#)

# clear ip bgp \* (BGP only)

**Overview** Use this command to reset all BGP connections, either by fully resetting sessions or by performing soft resets.

If VRF-lite is configured, you can reset BGP connections for all VRF instances or for a specified VRF instance.

**Syntax**

```
clear ip bgp *  
clear ip bgp * in  
clear ip bgp * out  
clear ip bgp * soft [in|out]  
clear ip bgp * in [prefix-filter]
```

**Syntax (VRF-lite)**

```
clear ip bgp * [vrf <vrf-name>]  
clear ip bgp * [vrf <vrf-name>] in  
clear ip bgp * [vrf <vrf-name>] out  
clear ip bgp * [vrf <vrf-name>] soft [in|out]  
clear ip bgp * in [prefix-filter]
```

Parameter	Description
*	Clears all BGP peers.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode** Privileged Exec

**Examples** To clear all BGP peers, use the command:

```
awplus# clear ip bgp *
```

**Example (VRF-lite)** To clear all BGP peers in VRF instance red, use the command:

```
awplus# clear ip bgp * vrf red
```

To clear all outbound BGP peers in VRF instance red, use the command:

```
awplus# clear ip bgp * out vrf red
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp (IPv4) (BGP only)

**Overview** Use this command to reset the IPv4 BGP connection to the peer specified by the IP address. When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax [BGP]** `clear ip bgp <ipv4-addr> [in [prefix-filter]|out|soft [in|out]]`

**Syntax (VRF-lite)** `clear ip bgp <ipv4-address> [vrf <vrf-name>] [in|out|soft [in|out]]`

Parameter	Description
<ipv4-addr>	Specifies the IPv4 address of the neighbor whose connection is to be reset, entered in the form A.B.C.D.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode [BGP]** Privileged Exec

**Examples [BGP]** To clear the BGP connection to the peer at IPv4 address 192.168.1.1 and clear all incoming routes, use the following command:

```
awplus# clear ip bgp 192.168.1.1 in
```

To apply the above example to clear the BGP connection to the peer at IP address 192.0.2.11 for the VRF instance blue, use the following commands:

```
awplus# clear ip bgp 192.0.2.11 vrf blue in
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip rip route

**Overview** Use this command to clear specific data from the RIP routing table.

**Syntax** `clear ip rip route <ip-dest-network/prefix-length>`  
`clear ip rip route`  
{static|connected|rip|ospf|bgp|invalid-routes|all}

**Syntax (VRF-lite)** `clear ip rip [vrf <vrf-name>] route`  
`<ip-dest-network/prefix-length>`  
`clear ip rip [vrf <vrf-name>] route`  
{static|connected|rip|ospf|bgp|invalid-routes|all}

Parameter	Description
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
<ip-dest-network/prefix-length>	Removes entries which exactly match this destination address from RIP routing table. Enter the IP address and prefix length of the destination network.
static	Removes static entries from the RIP routing table.
connected	Removes entries for connected routes from the RIP routing table.
rip	Removes only RIP routes from the RIP routing table.
ospf	Removes only OSPF routes from the RIP routing table.
bgp	Removes only BGP routes from the RIP routing table.
invalid-routes	Removes routes with metric 16 immediately. Otherwise, these routes are not removed until RIP times out the route after 2 minutes.
all	Clears the entire RIP routing table.

**Mode** Privileged Exec

**Usage** Using this command with the **all** parameter clears the RIP table of all the routes.

**Examples** To clear the route 10.0.0.0/8 from the RIP routing table, use the following command:

```
awplus# clear ip rip route 10.0.0.0/8
```

**Examples (VRF-lite)** To clear RIP routes associated with the VRF instance 'red' for OSPF routes, use the following command:

```
awplus# clear ip rip vrf red route ospf
```

To clear the route 10.0.0.0/8 from the RIP routing table for the VRF instance 'red', use the following command:

```
awplus# clear ip rip vrf red route 10.0.0.0/8
```

# crypto key pubkey-chain knownhosts

**Overview** This command adds a public key of the specified SSH server to the known host database on your device. The SSH client on your device uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

**Syntax** `crypto key pubkey-chain knownhosts [ip|ipv6] <hostname> [rsa|dsa|rsa1]`  
`no crypto key pubkey-chain knownhosts <1-65535>`

**Syntax (VRF-lite)** `crypto key pubkey-chain knownhosts [vrf <vrf-name>] [ip|ipv6] <hostname> [rsa|dsa|rsa1]`  
`no crypto key pubkey-chain knownhosts [vrf <vrf-name>] <1-65535>`

Parameter	Description
vrf	Apply this command to the specified VRF instance.
<vrf-name>	The VRF instance name
ip	Keyword used prior to specifying an IPv4 address
ipv6	Keyword used prior to specifying an IPv6 address
<hostname>	IPv4/IPv6 address or hostname of a remote server in the format a.b.c.d for an IPv4 address, or in the format x:x::x:x for an IPv6 address.
rsa	Specify the RSA public key of the server to be added to the known host database.
dsa	Specify the DSA public key of the server to be added to the known host database.
rsa1	Specify the SSHv1 public key of the server to be added to the know host database.
<1-65535>	Specify a key identifier when removing a key using the <b>no</b> parameter.

**Default** If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

**Mode** Privilege Exec

**Usage** This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

**Examples** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

**Examples (VRF-lite)** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 in VRF red to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts vrf red 192.0.2.11
```

To delete the second entry in the known host database in VRF red, use the command:

```
awplus# no crypto key pubkey-chain knownhosts vrf red 2
```

**Validation Commands** `show crypto key pubkey-chain knownhosts`

# default-metric (RIP)

**Overview** Use this command to specify the metrics to be assigned to redistributed RIP routes. Use the **no** variant of this command to reset the RIP metric back to its default (1).

**Syntax** `default-metric <metric>`  
`no default-metric [<metric>]`

Parameter	Description
<metric>	<1-16> Specifies the value of the default metric.

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** This command is used with the [redistribute \(RIP\)](#) command to make the routing protocol use the specified metric value for all redistributed routes, regardless of the original protocol that the route has been redistributed from.

**Examples** This example assigns the cost of 10 to the routes that are redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-metric 10
awplus(config-router)# redistribute ospf
awplus(config-router)# redistribute connected
```

**Example (VRF-lite)** This example assigns the cost of 10 to the routes which are redistributed into RIP for the VRF instance blue.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 vrf blue
awplus(config-router-af)# default-metric 10
awplus(config-router-af)# redistribute ospf
awplus(config-router-af)# redistribute connected
```

**Related Commands** [redistribute \(RIP\)](#)

# description (VRF)

**Overview** Use this command to add text that describes a specific VRF instance. Descriptions can be up to 80 characters long.

The **no** variant of this command removes the description of the selected VRF instance.

**Syntax** `description <descriptive-text>`  
`no description`

Parameter	Description
<code>&lt;descriptive-text&gt;</code>	A string of up to 80 characters that describes the VRF instance.

**Mode** VRF Configuration

**Example** To add the description for a VRF instance named blue, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# description the text description of vrf
blue
```

**Related Commands** [show ip vrf](#)

# distance (RIP)

**Overview** This command sets the administrative distance for RIP routes. Your device uses this value to select between two or more routes to the same destination obtained from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). For more information, see the [Route Selection Feature Overview and Configuration Guide](#).

The **no** variant of this command sets the administrative distance for the RIP route to the default of 120.

**Syntax** `distance <1-255> [<ip-addr/prefix-length> [<access-list>]]`  
`no distance [<1-255>] [<ip-addr/prefix-length> [<access-list>]]`

Parameter	Description
<1-255>	The administrative distance value you are setting for this RIP route.
<ip-addr/prefix-length>	The network IP address and prefix-length that you are changing the administrative distance for.
<access-list>	Specifies the access-list name. This access list specifies which routes within the specified network this command applies to.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Examples** To set the administrative distance to 8 for the RIP routes within the 10.0.0.0/8 network that match the access-list "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distance 8 10.0.0.0/8 mylist
```

To set the administrative distance to the default of 120 for the RIP routes within the 10.0.0.0/8 network that match the access-list "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no distance 8 10.0.0.0/8 mylist
```

**Example (VRF-lite)** This example assigns a cost of 10 to the routes for the VRF instance blue, when redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 blue
awplus(config-router-af)# distance 10
```

# distribute-list (RIP)

**Overview** Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list.

When running VRF-lite, this command can be applied to a specific VRF instance.

Use the **no** variant of this command to disable this feature.

**Syntax** `distribute-list {<access-list> | prefix <prefix-list>} {in|out} [<interface>]`

`no distribute-list {<access-list> | prefix <prefix-list>} {in|out} [<interface>]`

Parameter	Description
<code>prefix</code>	Filter prefixes in routing updates.
<code>&lt;access-list&gt;</code>	Specifies the IPv4 access-list number or name to use.
<code>&lt;prefix-list&gt;</code>	Specifies the name of the IPv4 prefix-list to use.
<code>in</code>	Filter incoming routing updates.
<code>out</code>	Filter outgoing routing updates.
<code>&lt;interface&gt;</code>	The interface on which distribute-list applies. For instance: <code>vlan2</code>

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** Filter out incoming or outgoing route updates using access-list or prefix-list. If you do not specify the name of the interface, the filter will be applied to all interfaces.

**Examples** In this example the following commands are used to apply an access list called `myfilter` to filter incoming routing updates in `vlan2`

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list prefix myfilter in vlan2
```

**Example (VRF-lite)** This example applies the commands of the previous example, but to a specific VRF named `blue`:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# distribute-list prefix myfilter in
vlan2
```

**Related  
Commands**    access-list extended (named)  
                  ip prefix-list

# export map

**Overview** This command associates a route map with a specific VRF instance. It provides a finer control over the routes that are exported out of a VRF instance by the **route-target** command. Note, however, that this command does not replace the need for a route-target export in the VRF configuration.

The **no** variant of this command disables the capability to export route map entries for a specified VRF instance.

**Syntax** `export map <route-map>`  
`no export map`

Parameter	Description
<code>&lt;route-map&gt;</code>	The route-map name.

**Mode** VRF Configuration

**Usage** Use this command to export route-map entries in VRF configuration mode.

**Example** To export the route map named routemap2 for the VRF instance named blue, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# export map routemap2
```

**Related Commands** [import map](#)

# fullupdate (RIP)

**Overview** Use this command to specify which routes RIP should advertise when performing a triggered update. By default, when a triggered update is sent, RIP will only advertise those routes that have changed since the last update. When **fullupdate** is configured, the device advertises the full RIP route table in outgoing triggered updates, including routes that have not changed. This enables faster convergence times, or allows inter-operation with legacy network equipment, but at the expense of larger update messages.

Use the **no** variant of this command to disable this feature.

**Syntax** fullupdate  
no fullupdate

**Default** By default this feature is disabled.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage (VRF-lite)** If VRF-lite is configured, you can apply this command for either the global routing environment, or to a specific VRF instance.

**Example** To enable the fullupdate (RIP) function, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# fullupdate
```

**Example (VRF-lite)** To enable the full update (RIP) function on the VRF instance named 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# fullupdate
```

# import map

**Overview** The import map command associates a route map with a specific VRF instance. The import map command does not replace the need for a route-target import in the VRF configuration. It provides a finer control over the routes imported into a VRF instance by the **route-target** command.

The **no** variant of this command disables the capability to import route map entries for a specified VRF instance.

**Syntax** `import map <route-map>`  
`no import map`

Parameter	Description
<code>&lt;route-map&gt;</code>	The route-map name.

**Mode** VRF Configuration

**Usage** Use this command to import route-map entries into the specified VRF instance.

**Example** To import the route map named `routemap2` for the VRF instance named `blue`, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# import map routemap2
```

**Related Commands** [export map](#)

# ip route static inter-vrf

**Overview** Applying this command enables static inter-VRF routing. Note that static inter-VRF routing must be enabled before you can use the **ip route** command to create a static inter-VRF route.

The **no** variant of this command disables static inter-VRF routing.

**Syntax** `ip route static inter-vrf`  
`no ip route static inter-vrf`

**Mode** VRF Configuration

**Default** Static inter-VRF routing is enabled.

**Example** To enable static inter-VRF routing, use the following commands:

```
awplus# config terminal
awplus(config)# ip route static inter-vrf
```

**Related  
Commands** [ip route](#)  
[show ip route](#)

# ip route

**Overview** This command adds a static route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

When using VRF (Virtual Routing and Forwarding), you can use this command to configure a static inter-VRF route to a destination network that is reachable by a remote gateway located in a different VRF instance. Note that to apply the command in this way, the `ip route static inter-vrf` command must be enabled (its default condition). For more information about VRF, see the [VRF Feature Overview and Configuration Guide](#) and the [VRF-lite Commands](#) chapter.

The **no** variant of this command removes the static route from the RIB and FIB.

**Syntax** `ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]`  
`no ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]`

**Syntax (VRF-lite)** `ip route [vrf <vrf-name>] <subnet&mask> [<gateway-ip>] [<interface>] [<distance>]`  
`no ip route [vrf <vrf-name>] <subnet&mask> [<gateway-ip>] [<interface>] [<distance>]`

Parameter	Description
<code>&lt;subnet&amp;mask&gt;</code>	The IPv4 address of the destination subnet defined using either a prefix length or a separate mask specified in one of the following formats: <ul style="list-style-type: none"> <li>The IPv4 subnet address in dotted decimal notation followed by the subnet mask, also in dotted decimal notation.</li> <li>The IPv4 subnet address in dotted decimal notation, followed by a forward slash, then the prefix length</li> </ul>
<code>&lt;gateway-ip&gt;</code>	The IPv4 address of the gateway device.
<code>&lt;interface&gt;</code>	The interface that connects your device to the network. Enter the name of the VLAN or its VID. You can also enter 'null' as an interface. Specify a 'null' interface to add a null or blackhole route to the switch. The gateway IP address or the interface is required if VRF-lite is not configured. If VRF-lite is configured: When adding a static intra-VRF route, you must specify either the gateway IP address or the interface. When adding a static inter-VRF route, you must specify both the gateway IP address and the interface.
<code>&lt;distance&gt;</code>	The administrative distance for the static route in the range <1-255>. Static routes by default have an administrative distance of 1.

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance to enter IPv4 Address-Family mode for.

**Mode** Global Configuration

**Default** The default administrative distance for a static route is 1 for priority over non-static routes.

**Usage** Administrative distance can be modified so that static routes do not take priority over other routes.

Specify a 'Null' interface to add a null or blackhole route to the switch. A null or blackhole route is a routing table entry that does not forward packets, so any packets sent to it are dropped.

**Examples** To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To remove the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# no ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To specify a null or blackhole route 192.168.4.0/24, so packets forwarded to this route are dropped, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.4.0/24 null
```

To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with an administrative distance of 128, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
128
```

**Examples (VRF-lite)** To create a static route from source VRF instance red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6, use the following commands for static intra-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
```

To remove a static route from source VRF red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6, use the following commands for static intra-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# no ip route vrf red 192.168.50.0/24
192.168.20.6
```

To create a static route from source VRF red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6 via vlan10, use the following commands for static inter-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
vlan10
```

**Related  
Commands** [show ip route](#)  
[show ip route database](#)

## ip vrf

**Overview** This command creates a VRF instance and specifies its unique name. You can also optionally specify a VRF ID. If you do not specify the VRF ID, a unique ID will automatically be created and assigned to the VRF instance.

The **no** variant of this command removes a selected VRF instance. All interfaces previously belonging to the removed instance are then returned to the global routing and forwarding environment.

**Syntax** `ip vrf <vrf-name> [<vrf-inst-id>]`  
`no ip vrf <vrf-name> [<vrf-inst-id>]`

Parameter	Description
<code>&lt;vrf-name&gt;</code>	The name of the VRF instance.
<code>&lt;vrf-inst-id&gt;</code>	The ID of the VRF instance, a number in the range 1 to 8.

**Mode** Global Configuration

**Default** Static inter-VRF routing is enabled.

**Example** To create a VRF instance named `vrf blue` and assign it the ID number `2`, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue 2
```

# ip vrf forwarding

**Overview** This command associates a VRF instance with an interface.  
The **no** variant of this command disassociates the VRF instance from its interface.

**Syntax** `ip vrf forwarding <vrf-name>`  
`no ip vrf <vrf-name>`

Parameter	Description
<vrf-name>	The name of the VRF instance.

**Mode** Interface Configuration

**Default** The default for an interface is the global routing table.

**Examples** For LAN interfaces, to associate the VRF instance named `blue` with the VLAN interface `vlan-admin`, use the following commands:

```
awplus# config terminal
awplus(config)# interface vlan-admin
awplus(config-if)# ip vrf forwarding blue
```

**Related  
Commands** `show ip vrf`  
`show ip vrf detail`

# max-fib-routes (VRF)

**Overview** This command now enables you to control the maximum number of FIB routes configured for a VRF instance. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds.

**NOTE:** This command applies to a user-defined VRF instance; to set the max-fib-routes for the Global VRF instance use the [max-fib-routes](#) command. For static routes use the [max-static-routes](#) command for the Global VRF instance and the [max-static-routes \(VRF\)](#) command for a user-defined VRF instance.

Use the **no** variant of this command to set the maximum number of FIB routes to the default of 4294967294 FIB routes.

**Syntax** `max-fib-routes <1-4294967294> [<1-100>|warning-only]`  
`no max-fib-routes`

Parameter	Description
<code>max-fib-routes</code>	The maximum number of routes that can be stored in Forwarding Information dataBase for either the Global VRF or a VRF instance.
<code>&lt;1-4294967294&gt;</code>	The allowable configurable range for setting the maximum number of FIB-routes.
<code>&lt;1-100&gt;</code>	This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached.
<code>warning-only</code>	This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value configured. Routes can continue to be added until your switch reaches either the maximum capacity value of 4294967294, or a practical system limit.

**Mode** VRF Configuration

**Default** Sets the maximum number of dynamic routes to 4294967294 and no warning threshold.

**Examples** To set the maximum number of dynamic routes to 2000 and warning threshold of 75% on VRF instance blue, use the commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# max-fib-routes 2000 75
```

**Related  
Commands**    `max-fib-routes`  
                  `show ip route`

# max-static-routes (VRF)

**Overview** Use this command to set the maximum number of static routes (excluding FIB—Forwarding Information Base routes) for VRF instances. A limit of 1000 static routes can be assigned to each individual VRF instance. For example you can assign 800 static routes to the Global VRF, then also assign 600 static routes to VRF instance Blue, and a further 600 routes to VRF instance Green.

**NOTE:** This command applies to a user-defined VRF instance; to set the max-static-routes for the Global VRF instance use the [max-static-routes](#) command. For FIB routes use the [max-fib-routes](#) command for the Global VRF instance and the [max-fib-routes \(VRF\)](#) command for a user-defined VRF instance.

Use the **no** variant of this command to reset the maximum number of static routes to the default value of 1000.

**Syntax** max-static-routes <1-1000>  
no max-static-routes

**Default** The default number of static routes is the maximum number of static routes (1000).

**Mode** VRF Configuration

**Example** To assign 200 static routes to VRF instance Blue, use the following commands:

```
awplus# configure terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# max-static-routes 200
```

**NOTE:** Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

**Related Commands** [max-fib-routes \(VRF\)](#)

# neighbor next-hop-self

**Overview** Use this command to configure the BGP or BGP4+ router as the next hop for a BGP or BGP4+ speaking neighbor or peer group.

Use the **no** variant of this command to disable this feature.

**Syntax** `neighbor <neighborid> next-hop-self`  
`no neighbor <neighborid> next-hop-self`

Parameter	Description
<neighborid>	{ <ip-address>   <ipv6-addr>   <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** This command allows a BGP or BGP4+ router to change the next hop information that is sent to the iBGP peer. The next hop information is set to the IP address of the interface used to communicate with the neighbor.

This command can be run for a specific VRF instance.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 next-hop-self
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 next-hop-self
```

**Related**  
**Commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command**  
**changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor remote-as

**Overview** Use this command to configure an internal or external BGP or BGP4+ (iBGP or eBGP) peering relationship with another router.

Use the **no** variant of this command to remove a previously configured BGP or BGP4+ peering relationship.

**Syntax** `neighbor <neighborid> remote-as <as-number>`  
`no neighbor <neighborid> remote-as <as-number>`

**Syntax (VRF- lite)** `neighbor <neighborid> remote-as <as-number> [global|vrf <vrf-name>]`  
`no neighbor <neighborid> remote-as <as-number>`

Parameter	Description
<neighborid>	{<ip-address>   ipv6-addr   <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.
<as-number>	<1-4294967295> Neighbor's Autonomous System (AS) number.
global	Specify that the remote neighbor exists locally within the device, in the global routing domain
vrf	Specify that the remote neighbor exists locally within the device, in the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** This command is used to configure iBGP and eBGP peering relationships with other BGP or BGP4+ neighbors. A peer-group support of this command is configured only after creating a specific peer-group. Use the **no** variant of this command to remove a previously configured BGP peering relationship.

The **vrf** and **global** parameters are used to create internal 'loopback' BGP connections within the device between two VRF instances. This is used to leak BGP routes between a named VRF instance and the global routing instance. This requires BGP neighbors to be configured in both the global routing instance and in the named VRF instance.

**Examples [BGP]** To configure a BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 from another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 remote-as 10
```

To configure a BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Examples [BGP4+]** To configure a BGP4+ peering relationship with another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 345
```

To remove a configured BGP4+ peering relationship from another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# no neighbor 2001:0db8:010d::1 remote-as 345
```

To configure a BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor password

**Overview** Use this command to enable MD5 authentication on a TCP connection between BGP and BGP4+ neighbors. No authentication is applied by default. To setup authentication for the session, you must first apply authentication on each connected peer for the session.

Use the **no** variant of this command to disable this function.

**Syntax [BGP]** `neighbor {<ip-address>|<peer-group-name>} password <password>`  
`no neighbor {<ip-address>|<peer-group-name>} password`  
`[<password>]`

**Syntax [BGP4+]** `neighbor {<ipv6-addr>|<peer-group-name>} password <password>`  
`no neighbor {<ipv6-addr>|<peer-group-name>} password`  
`[<password>]`

Parameter	Description
<code>&lt;ip-address&gt;</code>	Specifies the IP address of the BGP neighbor, in A.B.C.D format.
<code>&lt;ipv6-addr&gt;</code>	Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code>&lt;peer-group-name&gt;</code>	Name of an existing peer-group. When this parameter is used with this command, the command applies on all peers in the specified group.
<code>&lt;password&gt;</code>	An alphanumeric string of characters to be used as password.

**Default** No authentication is applied by default.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** When using the `<peer-group-name>` parameter with this command (to apply this command to all peers in the group), see the related commands [neighbor peer-group \(add a neighbor\)](#) and [neighbor route-map](#) for information about how to create peer groups first.

**Examples [BGP]** This example specifies the encryption type and the password 'manager' for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 password manager
```

This example removes the password set for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 password
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

**Examples  
(VRF-lite)**

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor 10.10.10.1 password manager
```

This example removes the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# no neighbor 10.10.10.1 password
manager
```

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor group1 password manager
```

**Examples [BGP4+]** This example specifies the encryption type and the password 'manager' for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor password manager
2001:0db8:010d::1
```

This example removes the password set for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor password 2001:0db8:010d::1
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor remote-as 102001:0db8:010d::1
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor peer-group group1
2001:0db8:010d::1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

# network (RIP)

**Overview** Use this command to activate the transmission of RIP routing information on the defined network.

Use the **no** variant of this command to remove the specified network or VLAN as one that runs RIP.

**Syntax** `network {<network-address>[/<subnet-mask>] | <vlan-name>}`  
`no network {<network-address>[/<subnet-mask>] | <vlan-name>}`

Parameter	Description
<code>&lt;network-address&gt;</code> <code>[/&lt;subnet-mask&gt;]</code>	Specifies the network address to run RIP. Entering a subnet mask (or prefix length) for the network address is optional. Where no mask is entered, the device will attempt to apply a mask that is appropriate to the class (A, B, or C) of the address entered, e.g. an IP address of 10.0.0.0 will have a prefix length of 8 applied to it.
<code>&lt;vlan-name&gt;</code>	Specify a VLAN name with up to 32 alphanumeric characters to run RIP.

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** Use this command to specify networks, or VLANs, to which routing updates will be sent and received. The connected routes corresponding to the specified network, or VLANs, will be automatically advertised in RIP updates. RIP updates will be sent and received within the specified network or VLAN.

When running VRF-lite, this command can be applied to a VRF instance.

**Example** Use the following commands to activate RIP routing updates on network 172.16.20.0/24:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# network 172.16.20.0/24
```

**Example (VRF-lite)** To activate RIP routing updates on vlan3 for VRF instance 'blue'.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# network vlan3
```

**Related  
Commands** show ip rip  
show running-config  
clear ip rip route

# offset-list (RIP)

**Overview** Use this command to add an offset to the **in** and **out** metrics of routes learned through RIP.

Use the **no** variant of this command to remove the offset list.

**Syntax** `offset-list <access-list> {in|out} <offset> [<interface>]`  
`no offset-list <access-list> {in|out} <offset> [<interface>]`

Parameter	Description
<code>&lt;access-list&gt;</code>	Specifies the access-list number or names to apply.
<code>in</code>	Indicates the access list will be used for metrics of incoming advertised routes.
<code>out</code>	Indicates the access list will be used for metrics of outgoing advertised routes.
