You may use any combination and repetition of parameters listed in the `<type>` placeholder.

**Syntax** `show ip bgp community [<type>] [exact-match]`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] community [<type>] [exact-match]`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<type>	{[AA:NN][local-AS][no-advertise][no-export]}
AA:NN	Specifies the Autonomous System (AS) community number, in AA:NN format.
local-AS	Do not send outside local Autonomous Systems (well-known community).
no-advertise	Do not advertise to any peer (well-known community).
no-export	Do not export to next AS (well-known community).
exact-match	Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated.

**Mode** User Exec and Privileged Exec

**Examples** Note that the AS numbers shown are examples only.

```
awplus# show ip bgp community 64497:64499 exact-match
awplus# show ip bgp community 64497:64499 64500:64501
exact-match

awplus# show ip bgp community 64497:64499 64500:64501
64510:64511no-advertise

awplus# show ip bgp community no-advertise
no-advertiseno-advertise exact-match

awplus# show ip bgp community no-export 64510:64511
no-advertise local-AS no-export

awplus# show ip bgp community no-export 64510:64511
no-advertise 64497:64499 64500:64501 no-export

awplus# show ip bgp community no-export 64497:64499
no-advertise local-AS no-export

awplus# show ip bgp vrf red no-export
awplus# show ip bgp global 65500:2 65500:3 exact-match
```

**Related commands** [set community](#)  
[show bgp ipv6 community \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp community-list (BGP only)

**Overview** Use this command to display routes that match the given community-list from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community-list \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp community-list <listname> [exact-match]`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] community-list <listname> [exact-match]`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<listname>	Specifies the community list name.
exact-match	Displays only routes that have exactly the same specified communities.

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp community-list mylist exact-match
awplus# show ip bgp vrf red community-list myCommunity
awplus# show ip bgp global community-list myExactCommunity
exact-match
```

**Related commands** [show bgp ipv6 community-list \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp dampening (BGP only)

**Overview** Use this command to show dampened routes from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 dampening \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp dampening`  
`{dampened-paths | flap-statistics | parameters}`

**Syntax (VRF-lite)** `show ip bgp [global | vrf <vrf-name>] dampening`  
`{dampened-paths | flap-statistics | parameters}`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
dampened-paths	Display paths suppressed due to dampening.
flap-statistics	Display flap statistics of routes.
parameters	Display details of configured dampening parameters.

**Mode** User Exec and Privileged Exec

**Usage notes** Enable BGP dampening to maintain dampened-path information in memory.

**Examples** `awplus# show ip bgp dampening dampened-paths`  
`awplus# show ip bgp vrf red dampening dampened-paths`  
`awplus# show ip bgp global dampening flap-statistics`

**Output** Figure 35-6: Example output from the **show ip bgp dampening** command

```
dampening 15 750 2000 60 15
  Reachability Half-Life time      : 15 min
  Reuse penalty                    : 750
  Suppress penalty                 : 2000
  Max suppress time                : 60 min
  Un-reachability Half-Life time  : 15 min
  Max penalty (ceil)              : 11999
  Min penalty (floor)             : 375
```

The following example output shows that the internal route (i), has flapped 3 times and is now categorized as history (h).

Figure 35-7: Example output from the **show ip bgp dampening flap-statistics** command

```
awplus# show ip bgp dampening flap-statistics
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
  Network          From                Flaps  Duration  Reuse    Path

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp filter-list (BGP only)

**Overview** Use this command to display routes conforming to the filter-list within an IPv4 environment. Use the [show bgp ipv6 filter-list \(BGP4+ only\)](#) command to display routes conforming to the filter-list within an IPv6 environment

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp filter-list <listname>`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] filter-list <listname>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<listname>	Specifies the regular-expression access list name.

**Mode** User Exec and Privileged Exec

**Example**  
`awplus# show ip bgp filter-list mylist`  
`awplus# show ip bgp vrf red filter-list mylist`

**Related commands** [show bgp ipv6 filter-list \(BGP4+ only\)](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp inconsistent-as (BGP only)

**Overview** Use this command to display routes with inconsistent AS Paths within an IPv4 environment. Use the [show bgp ipv6 inconsistent-as \(BGP4+ only\)](#) command to display routes with inconsistent AS paths within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp inconsistent-as`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] inconsistent-as`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode** User Exec and Privileged Exec

**Example**  
`awplus# show ip bgp inconsistent-as`  
`awplus# show ip bgp global inconsistent-as`

**Related commands** [show bgp ipv6 inconsistent-as \(BGP4+ only\)](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp longer-prefixes (BGP only)

**Overview** Use this command to display the route of the local BGP routing table for a specific prefix with a specific mask, or for any prefix having a longer mask than the one specified.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp <ip-address/m> longer-prefixes`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] <ip-address/m> longer-prefixes`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<ip-address/m>	Neighbor's IP address and subnet mask, entered in the form A.B.C.D/M, where M is the subnet mask length.

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp 10.10.0.10/24 longer-prefixes
awplus# show ip bgp vrf red 172.16.4.0/24
awplus# show ip bgp global 172.16.0.0/16 longer-prefixes
```

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp prefix-list (BGP only)

**Overview** Use this command to display routes matching the prefix-list within an IPv4 environment. Use the [show bgp ipv6 prefix-list \(BGP4+ only\)](#) command to display routes matching the prefix-list within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp prefix-list <list>`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] prefix-list <list>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<list>	Specifies the name of the IP prefix list.

**Mode** User Exec and Privileged Exec

**Examples**  
`awplus# show ip bgp prefix-list mylist`  
`awplus# show ip bgp vrf red prefix-list myPrefixes`

**Related commands** [show bgp ipv6 prefix-list \(BGP4+ only\)](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp quote-regexp (BGP only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 quote-regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[ ]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp quote-regexp <expression>`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] quote-regexp <expression>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<expression>	Specifies a regular-expression to match the BGP AS paths.

**Mode** User Exec and Privileged Exec

**Examples** awplus# show ip bgp quote-regexp myexpression  
awplus# show ip bgp global quote-regexp 65550 65555

**Related commands** [show bgp ipv6 quote-regexp \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp regexp (BGP only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[ ]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp regexp <expression>`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] regexp <expression>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<expression>	Specifies a regular-expression to match the BGP AS paths.

**Mode** User Exec and Privileged Exec

**Examples** awplus# show ip bgp regexp myexpression  
awplus# show ip bgp vrf red regexp 65550 65555

**Related commands** [show bgp ipv6 regexp \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for IEx510, x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp route-map (BGP only)

**Overview** Use this command to display BGP routes that match the specified route-map within an IPv4 environment. Use the [show bgp ipv6 route-map \(BGP4+ only\)](#) command to display BGP4+ routes that match the specified route-map within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp route-map <route-map>`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] route-map <route-map>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<route-map>	Specifies a route-map that is matched.

**Mode** User Exec and Privileged Exec

**Examples** To show routes that match the route-map `myRouteMap` for the global routing instance, use the command:

```
awplus# show ip bgp global route-map myRouteMap
```

To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show ip bgp route-map myRouteMap
```

**Related commands** [show bgp ipv6 route-map \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp summary (BGP only)

**Overview** Use this command to display a summary of a BGP neighbor status within an IPv4 environment. Use the [show bgp ipv6 summary \(BGP4+ only\)](#) command to display a summary of BGP4+ neighbors.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp summary`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] summary`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode** User Exec and Privileged Exec

**Examples**  
`awplus# show ip bgp summary`  
`awplus# show ip bgp vrf red summary`

**Output** Figure 35-9: Example output from the **show ip bgp summary** command

```
awplus>show ip bgp summary

BGP router identifier 1.0.0.1, local AS number 65541
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries

Neighbor      V      AS      MsgRc  MsgSnt  TblVer  InOutQ  Up/Down      State/PfxRcd
192.168.3.2   4      65544    20     24     11 0/0    00:07:19    1
192.168.4.2   4      65545     0      0      0 0/0    never        Active
192.168.11.2  4      65542    34     40      0 0/0    00:00:04    Active
192.168.21.2  4      65543    29     32     11 0/0    00:07:03    13

Number of neighbors 4
```

The Up/Down column in this output is a timer that shows:

- "never" if the peer session has never been established
- The up time, if the peer session is currently up
- The down time, if the peer session is currently down.

In the example above, the session with 192.168.11.2 has been down for 4 seconds, and the session with 192.168.4.2 has never been established.

**Related commands** [show bgp ipv6 summary \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for IEx510, x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip interface vrf

**Overview** Use this command to display protocol and status information about configured interfaces and their assigned IP addresses in VRF instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip interface [vrf <vrf-name>|global]`

Parameter	Description
vrf	A VRF instance.
<vrf-name>	The name of a specific VRF instance.
global	The global routing and forwarding table.

**Mode** User Exec and Privileged Exec

**Examples** To display all interfaces and IP addresses associated with a VRF instance ‘red’, use the command:

```
awplus# show ip interface vrf red
```

**Output** Figure 35-10: Example output from **show ip interface vrf red**

Interface	IP-Address	Status	Protocol
lol	unassigned	admin up	running
vlan1	192.168.10.1/24	admin up	running

**Example** To display all interfaces and IP addresses associated with all VRF instances, use the command:

```
awplus# show ip interface
```

**Output** Figure 35-11: Example output from the **show ip interface** with VRF-lite configured

Interface	IP-Address	Status	Protocol
eth0	unassigned	admin up	down
lo	unassigned	admin up	running
vlan1	192.168.1.1/24	admin up	running
vlan4	172.30.4.43/24	admin up	down
[VRF: red]			
Interface	IP-Address	Status	Protocol
lo1	unassigned	admin up	running
[VRF: blue]			
Interface	IP-Address	Status	Protocol
lo2	unassigned	admin up	running

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip rip vrf database

**Overview** Use this command to display information about the RIP database that is associated with a specific VRF instance.

Entering this command with the **full** option included, will display information about the full RIP database (including sub-optimal routes) associated with a specific VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip rip {vrf <vrf-name>|global} database [full]`

Parameter	Description
vrf	Specific VRF instance.
<vrf-name>	The name of the VRF instance.
global	The global routing and forwarding table.
full	Specify the full RIP database including sub-optimal RIP routes.

**Mode** User Exec and Privileged Exec

**Example** To display information about the RIP database associated with a VRF instance 'blue', use the command:

```
awplus# show ip rip vrf blue database
```

**Output** Figure 35-12: Example output from the **show ip rip vrf blue database** command

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
       C - Connected, S - Static, O - OSPF, B - BGP
```

Network	Next Hop	Metric	From	If	Time
Rc 192.168.30.0/24		1		vlan3	
R 192.168.45.0/24	192.168.30.1	2	192.168.30.1	vlan3	02:46

**Related commands** [show ip rip](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip rip vrf interface

**Overview** Use this command to display information about the RIP interfaces that are associated with a specific VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip rip {vrf <vrf-name>|global} interface [<interface-name>]`

Parameter	Description
vrf	Specific VRF instance.
<vrf-name>	The name of the VRF instance.
global	The global routing and forwarding table.
<interface-name>	The IP RIP interface (VLAN).

**Mode** User Exec and Privileged Exec

**Example** To display information about the RIP database associated with a VRF instance 'blue', use the command:

```
awplus# show ip rip vrf blue interface
```

**Output** Figure 35-13: Example output from **show ip rip vrf blue interface vlan3**

Codes: R - RIP, Rc - RIP connected, Rs - RIP static C - Connected, S - Static, O - OSPF, B - BGP						
	Network	Next Hop	Metric	From	If	Time
Rc	192.168.30.0/24		1		vlan3	
R	192.168.45.0/24	192.168.30.1	2	192.168.30.1	vlan3	02:46

**NOTE:** The Time parameter operates as follows:

- RIP updates occur approximately every 30 seconds.
- Each update resets a count-down timer to 180 seconds (3 minutes).
- The Time parameter displays the count-down from the last reset.

**Related commands** [show ip rip](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip route

**Overview** Use this command to display routing entries in the FIB (Forwarding Information Base). The FIB contains the best routes to a destination, and your device uses these routes when forwarding traffic. You can display a subset of the entries in the FIB based on protocol.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**VRF-lite** If VRF-lite is configured, you can display routing entries in the FIB associated with either the global routing domain or a named VRF.

**Syntax** `show ip route [bgp|connected|ospf|rip|static|  
<ip-addr>|<ip-addr/prefix-length>]`

**Syntax (VRF-lite)** `show ip route {vrf <vrf-name>|global}  
[bgp|connected|ospf|rip|static]`

Parameter	Description
global	If VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
bgp	Displays only the routes learned from BGP.
connected	Displays only the routes learned from connected interfaces.
ospf	Displays only the routes learned from OSPF.
rip	Displays only the routes learned from RIP.
static	Displays only the static routes you have configured.
<ip-addr>	Displays the routes for the specified address. Enter an IPv4 address.
<ip-addr/prefix-length>	Displays the routes for the specified network. Enter an IPv4 address and prefix length.

**Mode** User Exec and Privileged Exec

**Examples** To display the static routes in the FIB, use the command:

```
awplus# show ip route static
```

To display the OSPF routes in the FIB, use the command:

```
awplus# show ip route ospf
```

**Example (VRF-lite)** To display all routing entries in the FIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red
```

**Output** Each entry in the output from this command has a code preceding it, indicating the source of the routing entry. For example, O indicates OSPF as the origin of the route. The first few lines of the output list the possible codes that may be seen with the route entries.

Typically, route entries are composed of the following elements:

- code
- a second label indicating the sub-type of the route
- network or host IP address
- administrative distance and metric
- next hop IP address
- outgoing interface name
- time since route entry was added

Figure 35-14: Example output from the **show ip route** command

```
Codes: C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
* - candidate default

O    10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
C    3.3.3.0/24 is directly connected, vlan1
C    10.10.31.0/24 is directly connected, vlan2
C    10.70.0.0/24 is directly connected, vlan4
O E2 14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
C    33.33.33.33/32 is directly connected, lo
```

**Connected Route** The connected route entry consists of:

```
C    10.10.31.0/24 is directly connected, vlan2
```

This route entry denotes:

- Route entries for network 10.10.31.0/24 are derived from the IP address of local interface `vlan2`.
- These routes are marked as Connected routes (C) and always preferred over routes for the same network learned from other routing protocols.

**OSPF Route** The OSPF route entry consists of:

```
O    10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
```

This route entry denotes:

- This route in the network 10.10.37.0/24 was added by OSPF.
- This route has an administrative distance of 110 and metric/cost of 11.
- This route is reachable via next hop 10.10.31.16.
- The outgoing local interface for this route is vlan2.
- This route was added 20 minutes and 54 seconds ago.

### **OSPF External Route**

The OSPF external route entry consists of:

```
O E2 14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
```

This route entry denotes that this route is the same as the other OSPF route explained above; the main difference is that it is a Type 2 External OSPF route.

### **Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# show ip route database

**Overview** This command displays the routing entries in the RIB (Routing Information Base).

When multiple entries are available for the same prefix, RIB uses the routes' administrative distances to choose the best route. All best routes are entered into the FIB (Forwarding Information Base). To view the routes in the FIB, use the [show ip route](#) command.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**Syntax** `show ip route database [bgp|connected|ospf|rip|static]`

**Syntax (VRF-lite)** `show ip route [vrf <vrf-name>|global] database [bgp|connected|ospf|rip|static]`

Parameter	Description
global	If VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
bgp	Displays only the routes learned from BGP.
connected	Displays only the routes learned from connected interfaces.
ospf	Displays only the routes learned from OSPF.
rip	Displays only the routes learned from RIP.
static	Displays only the static routes you have configured.

**Mode** User Exec and Privileged Exec

**Example** To display the static routes in the RIB, use the command:

```
awplus# show ip route database static
```

**Output** Figure 35-15: Example output from the **show ip route database** command

```
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       > - selected route, * - FIB route, p - stale info

O    *> 9.9.9.9/32 [110/31] via 10.10.31.16, vlan2, 00:19:21
O    10.10.31.0/24 [110/1] is directly connected, vlan2, 00:28:20
C    *> 10.10.31.0/24 is directly connected, vlan2
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O    10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
O    *> 10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:21:19
C    *> 10.30.0.0/24 is directly connected, vlan6
S    *> 11.22.11.0/24 [1/0] via 10.10.31.16, vlan2
O E2 *> 14.5.1.0/24 [110/20] via 10.10.31.16,vlan2, 00:19:21
O    16.16.16.16/32 [110/11] via 10.10.31.16, vlan2, 00:21:19
S    *> 16.16.16.16/32 [1/0] via 10.10.31.16, vlan2
O    *> 17.17.17.17/32 [110/31] via 10.10.31.16, vlan2, 00:21:19
C    *> 45.45.45.45/32 is directly connected, lo
O    *> 55.55.55.55/32 [110/21] via 10.10.31.16, vlan2, 00:21:19
C    *> 127.0.0.0/8 is directly connected, lo
```

**Example (VRF-lite)** To display all routing entries in the RIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red database
```

**Output** Figure 35-16: Example output from the **show ip route vrf red database** command

```
[VRF: red]
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       > - selected route, * - FIB route, p - stale info

O    192.168.10.0/24 [110/1] is directly connected, vlan1, 06:45:51
C    *> 192.168.10.0/24 is directly connected, vlan1
B    > 192.168.33.0/24 [20/0] via 192.168.30.3, 06:45:52
O E2 *> 192.168.110.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
O E2 *> 192.168.111.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
```

The routes added to the FIB are marked with a \*. When multiple routes are available for the same prefix, the best route is indicated with the > symbol. All unselected routes have neither the \* nor the > symbol.

```
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O    10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
```

These route entries denote:

- The same prefix was learned from OSPF and from static route configuration.

- Since this static route has a lower administrative distance than the OSPF route (110), the static route (1) is selected and installed in the FIB.

If the static route becomes unavailable, then the device automatically selects the OSPF route and installs it in the FIB.

[show ip route](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip route summary

**Overview** This command displays a summary of the current RIB (Routing Information Base) entries.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**Syntax** `show ip route summary`

**Syntax (VRF-lite)** `show ip route summary [vrf <vrf-name>|global]`

Parameter	Description
vrf	Specific VRF instance.
<vrf-name>	The name of the VRF instance.
global	The global routing and forwarding table.

**Mode** User Exec and Privileged Exec

**Example** To display a summary of the current RIB entries, use the command:

```
awplus# show ip route summary
```

**Output** Figure 35-17: Example output from the **show ip route summary** command

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source      Networks
connected         5
ospf               2
Total             8
```

**Example (VRF-lite)** To display a summary of the current RIB entries associated with a VRF instance red, use the command:

```
awplus# show ip route summary vrf red
```

**Output** Figure 35-18: Example output from the **show ip route summary vrf red** command

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source      Networks
connected         1
Total             1
FIB               0

# show ip vrf

**Overview** This command displays brief configurations for a specific VRF instance.

**Syntax** `show ip vrf <vrf-name>`

Parameter	Description
<code>&lt;vrf-name&gt;</code>	The name of the VRF instance.

**Mode** User Exec and Privileged Exec

**Example** To display brief information for the VRF instance red, use the command:

```
awplus# show ip vrf red
```

**Output** Figure 35-19: Example output from the show ip vrf red command

Name	Default RD	Interfaces
red	500:1	lo1, vlan1

# show ip vrf interface

**Overview** This command displays protocol, operational status, and address information, for interfaces existing within either a specified VRF instance, or all VRF instances.

**Syntax** `show ip vrf interface <vrf-name>`

Parameter	Description
<vrf-name>	The name of the VRF instance.

**Mode** User Exec and Privileged Exec

**Example** To display all interfaces and IP addresses associated with all VRF instances, use the command:

```
awplus# show ip vrf interface
```

**Output** Figure 35-21: Example output from the **show ip vrf interface** command

Interface	IP-Address	Status	Protocol	Vrf
lo1	unassigned	admin up	running	red
lo2	unassigned	admin up	running	green
vlan1	192.168.10.1/24	admin up	running	red
vlan2	192.168.20.1/24	admin up	running	green

**Example** To display all interfaces and IP addresses associated with the VRF instance `red`, use the command:

```
awplus# show ip vrf interface red
```

**Output** Figure 35-22: Example output from the **show ip vrf interface red** command

Interface	IP-Address	Status	Protocol	Vrf
lo1	unassigned	admin up	running	red
vlan1	192.168.10.1/24	admin up	running	red

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show running-config vrf

**Overview** This command displays the running system VRF-related configurations for all VRF instances.

**Syntax** `show running-config vrf`

**Mode** Privileged Exec

**Example** To display the running system VRF-related configurations, use the command:

```
awplus# show running-config vrf
```

**Output** Figure 35-23: Example output from the **show running config vrf** command

```
ip vrf red
rd 500:1
route-target export 500:1
route-target export 500:4
import map red 43
!
```

**Related commands** [show ip vrf](#)

# ssh

**Overview** Use this command to initiate a Secure Shell connection to a remote SSH server.

If the server requests a password to login, you need to type in the correct password at the "Password:" prompt.

An SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

**NOTE:** A hostname specified with SSH cannot begin with a hyphen (-) character.

**Syntax** `ssh [ip|ipv6] [user <username>|port <1-65535>|version {1|2}] <remote-device> [<command>]`

**Syntax (VRF-lite)** If the platform supports multicast for VRFs then specifying a VRF name the command will take effect on that VRF and not specifying a VRF will do it for the global VRF.

`ssh vrf <vrf-name> [ip|ipv6] [user <username>|port <1-65535>|version {1|2}] <remote-device> [<command>]`

Parameter	Description
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
ip	Specify IPv4 SSH.
ipv6	Specify IPv6 SSH.
user	Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.  <username> User name to login on the remote server.
port	SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Otherwise, the client port configured by "ssh client" command or the default TCP port (22) is used.  <1-65535> TCP port.
version	SSH client version. If version is specified, the SSH client supports only the specified SSH version. By default, SSH client uses SSHv2 first. If the server does not support SSHv2, it will try SSHv1. The default version can be configured by "ssh client" command.  1 Use SSH version 1. 2 Use SSH version 2.

Parameter	Description
<code>&lt;remote-device&gt;</code>	IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character.
<code>&lt;command&gt;</code>	A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.

**Mode** User Exec and Privileged Exec

**Examples** To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user "manager", use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening on TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server with "example\_host" using an IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

**Example (VRF-lite)** To login to the remote SSH server at 192.168.1.1 on VRF "red", use the command:

```
awplus# ssh vrf red 192.168.1.1
```

- Version 5.4.8-2.1: secure mode syntax added for x950, SBx908 GEN2.

# tcpdump

**Overview** Use this command to start a tcpdump, which gives the same output as the Unix-like **tcpdump** command to display TCP/IP traffic. Press <ctrl> + c to stop a running tcpdump.

**Syntax** `tcpdump <line>`

**Syntax (VRF-lite)** `tcpdump [vrf <vrf-name>] <line>`

Parameter	Description
<line>	Specify the dump options. For more information on the options for this placeholder see <a href="http://www.tcpdump.org/tcpdump_man.html">http://www.tcpdump.org/tcpdump_man.html</a>
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

**Mode** Privileged Exec

**Example** To start a tcpdump running to capture IP packets, enter the command:

```
awplus# tcpdump ip
```

**Example (VRF-lite)** To start a tcpdump on interface vlan2 associated with a VRF instance red, enter the command:

```
awplus# tcpdump vrf red vlan2
```

**Output** Figure 35-24: Example output from the **tcpdump** command

```
03:40:33.221337 IP 192.168.1.1 > 224.0.0.13: PIMv2, Hello,
length: 34
1 packets captured
2 packets received by filter
0 packets dropped by kernel
```

**Related commands** [debug ip packet interface](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# telnet

**Overview** Use this command to open a telnet session to a remote device.

**Syntax** `telnet {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [  
<port>]`

**Syntax (VRF-lite)** `telnet [vrf <vrf-name>] {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [  
<port>]`

Parameter	Description
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
<hostname>	The host name of the remote system.
ip	Keyword used to specify the IPv4 address or host name of a remote system.
<ipv4-addr>	An IPv4 address of the remote system.
ipv6	Keyword used to specify the IPv6 address of a remote system
<ipv6-addr>	Placeholder for an IPv6 address in the format x:x::x:x, for example, 2001:db8::8a2e:7334
<port>	Specify a TCP port number (well known ports are in the range 1-1023, registered ports are 1024-49151, and private ports are 49152-65535).

**Mode** User Exec and Privileged Exec

**Examples** To connect to TCP port 2602 on the device at 10.2.2.2, use the command:

```
awplus# telnet 10.2.2.2 2602
```

To connect to the telnet server `host.example`, use the command:

```
awplus# telnet host.example
```

To connect to the telnet server `host.example` on TCP port 100, use the command:

```
awplus# telnet host.example 100
```

**Example (VRF-lite)** To open a telnet session to a remote host `192.168.0.1` associated with VRF instance `red`, use the command:

```
awplus# telnet vrf red ip 192.168.0.1
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# timers (RIP)

**Overview** Use this command to adjust routing network timers.  
Use the **no** variant of this command to restore the defaults.

**Syntax** `timers basic <update> <timeout> <garbage>`  
`no timers basic`

Parameter	Description
<code>&lt;update&gt;</code>	<code>&lt;5-2147483647&gt;</code> Specifies the period at which RIP route update packets are transmitted. The default is 30 seconds.
<code>&lt;timeout&gt;</code>	<code>&lt;5-2147483647&gt;</code> Specifies the routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid.
<code>&lt;garbage&gt;</code>	<code>&lt;5-2147483647&gt;</code> Specifies the routing garbage collection timer in seconds. The default is 120 seconds.

**Default** Enabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** This command adjusts the RIP timing parameters.

The update timer is the time between sending out updates, that contain the complete routing table, to every neighboring router.

If an update for a given route has not been seen for the time specified by the timeout parameter, that route is no longer valid. However, it is retained in the routing table for a short time, with metric 16, so that neighbors are notified that the route has been dropped.

When the time specified by the garbage parameter expires the metric 16 route is finally removed from the routing table. Until the garbage time expires, the route is included in all updates sent by the router.

All the routers in the network must have the same timers to ensure the smooth operation of RIP throughout the network.

**Examples** To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# timers basic 30 180 120
```

To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120 with VRF, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# timers basic 30 180 120
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# traceroute

**Overview** Use this command to trace the route to the specified IPv4 host.

**Syntax** `traceroute {<ip-addr>|<hostname>}`

**Syntax (VRF-lite)** `traceroute [vrf <vrf-name>] {<ip-addr>|<hostname>}`

Parameter	Description
<code>&lt;ip-addr&gt;</code>	The destination IPv4 address. The IPv4 address uses the format A.B.C.D.
<code>&lt;hostname&gt;</code>	The destination hostname.
<code>vrf</code>	Apply the command to the specified VRF instance.
<code>&lt;vrf-name&gt;</code>	The name of the VRF instance.

**Mode** User Exec and Privileged Exec

**Example** `awplus# traceroute 10.10.0.5`

**Example (VRF-lite)** `awplus# traceroute vrf red 192.168.0.1`

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# version (RIP)

**Overview** Use this command to specify a RIP version used globally by the router. If VRF-lite is configured, you can specify a RIP version either globally, or for a particular VRF instance. Use the **no** variant of this command to restore the default version.

**Syntax** `version {1|2}`  
`no version`

Parameter	Description
1   2	Specifies the version of RIP processing.

**Default** Version 2

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Setting the version command has no impact on receiving updates, only on sending them. The `ip rip send version` command overrides the value set by the `version (RIP)` command on an interface-specific basis. The `ip rip receive version` command allows you to configure a specific interface to accept only packets of the specified RIP version. The `ip rip receive version` command and the `ip rip send version` command override the value set by this command.

**Examples** To specify a RIP version, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
```

To specify a RIP version with VRF, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# version 1
```

**Related commands** [ip rip receive version](#)  
[ip rip send version](#)  
[show running-config](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# application-decision

**Overview** Use this command to select which method is used for the application decision.

**Syntax** `application-decision {once-only|continuous}`

Parameter	Description
once-only	When a traffic flow reaches the PBR engine for the first time, whatever application has been set on that flow will be used to match against the PBR rules and a route selected. Subsequent updates to the flow's application will be ignored by the PBR engine.
continuous	Any time a traffic flow has its application updated by the DPI engine, the PBR engine will re-process the flow against all configured PBR rules, which may result in a new match and the traffic being directed over a different route than it was previously.

**Default** Application determination is set to **continuous**.

**Mode** Policy-based Routing Configuration

**Usage notes** When using a DPI engine, traffic flows through the device are periodically assigned an application by the DPI engine. The application assignment is then used when matching against PBR rules. The DPI engine may change its decision about a traffic flow over time, as more packets from the flow are analyzed. This command determines how the PBR engine utilizes the application decision made by DPI.

When set to **once-only**, only the initial application decision made by the DPI engine will be used when matching against PBR routes, and subsequent updates will be ignored.

When set to **continuous**, if the DPI engine re-classifies a traffic flow under a different application, the flow will be re-processed by the PBR engine, and may therefore match against a different PBR rule and take a different route than it was previously.

Once-only is intended for use with DPI learning enabled. Refer to the [SD-WAN Feature Overview and Configuration Guide](#) for examples.

**Example** To prevent the PBR engine from re-matching a traffic flow whenever the application decision is changed, use the following commands:

```
awplus(config)# policy-based-routing
awplus(config-pbr)# application-decision once-only
```

To allow the PBR engine to re-match traffic flows against PBR rules when the application decision changes, use the following commands:

```
awplus(config)# policy-based-routing
awplus(config-pbr)# application-decision continuous
```

**Related commands** `ip policy-route`  
`ipv6 policy-route`

**Command changes** Version 5.4.8-0.2: command added

# consecutive probe loss

**Overview** Use this command within a specific link performance profile to configure the allowable consecutive probe loss thresholds of probes that use that performance profile.

Use the **no** variant of this command to delete a consecutive probe loss threshold.

**Syntax** consecutive-probe-loss bad-when *<consecutive-probe-losses>*  
consecutive-probe-loss good-when *<consecutive-probe-successes>*  
consecutive-probe-loss unreachable-when  
*<consecutive-probe-losses>*  
no consecutive-probe-loss bad-when  
no consecutive-probe-loss good-when  
no consecutive-probe-loss unreachable-when

Parameter	Description
bad-when <i>&lt;consecutive-probe-losses&gt;</i>	The number of probes that must be lost consecutively, at which point the associated link is considered to be bad or unreachable, in a range of <1-100>.
good-when <i>&lt;consecutive-probe-successes&gt;</i>	The number of probes that must succeed consecutively, at which point the associated link is considered to be good, in a range of <1-100>.
unreachable-when <i>&lt;consecutive-probe-losses&gt;</i>	The number of probes that must be lost consecutively, at which point the associated link is considered to be bad or unreachable, in a range of <1-100>.

**Default** The performance profile is disabled.

**Mode** Linkmon Profile Configuration

**Usage notes** These setting are all optional.

The **bad-when** parameter is used to set the thresholds where if the number of probe replies that have been lost consecutively is equal to or above this value, then that nexthop is considered bad. If **bad-when** is not configured, this metric will never result in a nexthop being considered bad.

The **unreachable-when** parameter is used to set the thresholds where if the number of probe replies that have been lost consecutively is equal to or above this value, then that nexthop is considered unreachable or down. If **unreachable-when** is not configured, this metric will never result in a nexthop being considered unreachable.

The **good-when** parameter is used to state the thresholds where if the number of probe replies that have been successfully received consecutively is equal to or above this value, then that nexthop is considered good. If **good-when** is not

configured, then when a nexthop is considered bad or unreachable due to this metric, the first successful probe result will consider the nexthop as good.

**Example** To configure the point at or above which consecutive probe loss is unacceptable to be 10, the point at or above which consecutive probe success is acceptable to be 5, and the point at or above which consecutive probe loss indicates the destination is unreachable to be 15 for performance profile named "profile0", use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile0
awplus(config-linkmon-profile)# consecutive-probe-loss
bad-when 10
awplus(config-linkmon-profile)# consecutive-probe-loss
good-when 5
awplus(config-linkmon-profile)# consecutive-probe-loss
unreachable-when 15
```

To delete consecutive-probe-loss thresholds in performance profile "profile0", use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile0
awplus(config-linkmon-profile)# no consecutive-probe-loss
bad-when
awplus(config-linkmon-profile)# no consecutive-probe-loss
good-when
awplus(config-linkmon-profile)# no consecutive-probe-loss
unreachable-when
```

**Command changes** Version 5.4.8-1.1: command added

# debug linkmon

**Overview** Use this command to enable Link Health Monitoring debugging.  
Use the **no** variant of this command to disable Link Health Monitoring debugging.

**Syntax**

```
debug linkmon [probe|group|ip-address|interface|pbr-group]
no debug linkmon [probe|group|ip-address|interface|pbr-group]
debug linkmon probe name <name>
no debug linkmon probe name <name>
debug linkmon group name <name>
no debug linkmon group name <name>
```

Parameter	Description
probe	Link Health Monitoring probe.
group	Link Health Monitoring group.
ip-address	IP addresses that are of interest to Link Health Monitoring.
interface	Interfaces that are of interest to Link Health Monitoring.
pbr-group	This debug option will show debugging of policy-based-routing Link Health Monitoring groups. Policy based routing rules without an explicit Link Health Monitoring configuration will internally create Link Health Monitoring groups that are not visible from the Link Health Monitoring api/cli externally (apart from debug). The names for these groups are prefixed with 'pbr'. Their relationship to policy based routing rules can be seen with policy based routing debug enabled.
<name>	The name identifying a Link Health Monitoring probe or Link Health Monitoring group.

**Default** No debugging is enabled.

**Mode** Privileged Exec

**Usage notes**

If **probe** is specified, then debug related to all Link Health Monitoring probes is enabled.

If **probe name <name>** is specified, then debug related to the named Link Health Monitoring probe is enabled.

If **group** is specified, then debug related to all Link Health Monitoring groups is enabled.

If **group name <name>** is specified, then debug related to the named Link Health Monitoring group is enabled.

If **ip-address** is specified, then debug related to configuration of IP addresses that are of interest to Link Health Monitoring are enabled. These IP addresses could influence Link Health Monitoring group members being considered up/down.

If **interface** is specified, then debug related to up/down state of Link Health Monitoring is enabled.

**Example** To enable debugging on the Link Health Monitoring probe 'probe1', use the following command:

```
awplus# debug linkmon probe name probe1
```

To enable debugging on all Link Health Monitoring groups, use the following command:

```
awplus# debug linkmon group
```

To disable debugging on all Link Health Monitoring groups, use the following command:

```
awplus# no debug linkmon group
```

**Related commands** [show debugging linkmon](#)

**Command changes** Version 5.4.8-0.2: command added

# destination (linkmon-probe)

**Overview** Use this command to set the destination of a Link Health Monitoring probe. This is a required configuration option for probes.

Use the **no** variant of this command to remove the destination of a probe.

**Syntax** `destination {<ip-address>|ds-lite|<fqdn>}`  
`no destination`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The destination of the probe, an IPv4 or IPv6 IP address.
<code>ds-lite</code>	The destination of the probe, the DS-Lite AFTR address.
<code>&lt;fqdn&gt;</code>	The destination of the probe, an FQDN (fully qualified domain name). The IP address of the FQDN will be automatically resolved by the DNS on the device.

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the destination of a probe named 'probe1' to 192.168.2.200, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# destination 192.168.2.200
```

To set the destination of a probe named 'probe1' to 2001:db8:a0b:12f0::1, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# destination  
2001:db8:a0b:12f0::1
```

To set the destination of a probe named 'probe1' to the DS-Lite AFTR address, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# destination ds-lite
```

To set the destination of a probe named 'probe1' to the FQDN of "google.com", use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# destination google.com
```

To remove the destination of a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no destination
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added

# dscp (linkmon-probe)

**Overview** Use this command to set the DSCP value of packets used for Link Health Monitoring probes.

Use the **no** variant of this command to set it back to the default.

**Syntax** `dscp <dscp-value>`  
`no dscp`

Parameter	Description
<code>&lt;dscp-value&gt;</code>	The DSCP value for the probe packet in range <0-63>.

**Default** The default DSCP value is 0.

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the DSCP of a probe named 'probe1' to 10, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# dscp 10
```

To set the DSCP of a probe named 'probe1' back to default, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no dscp
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added

# egress interface (linkmon-probe)

**Overview** Use this command to force a Link Health Monitoring probe to egress out of a specific interface.

Use the **no** variant of this command to return interface selection back to the default behavior.

**Syntax** `egress interface <interface>`  
`no egress interface`

Parameter	Description
<code>&lt;interface&gt;</code>	The name of the egress interface for the probe. The specified egress interface needs to be locally configured and in an up and running state.

**Default** No egress interface is defined by default. The egress interface will be selected using standard routing behavior to reach the probe's destination.

**Mode** Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

**Example** To set the egress interface for a probe named 'probe1' to 'tunnel2', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# egress interface tunnel2
```

To set the egress interface for a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no egress interface
```

**Command changes** Version 5.4.8-1.1: command added

# enable (linkmon-probe)

**Overview** Use this command to enable individual Link Health Monitoring probes. When a probe is enabled, it will begin transmitting, processing, and storing results.

Use the **no** variant of this command to disable a probe.

**Syntax** enable  
no enable

**Default** Disabled

**Mode** Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

**Example** To enable a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# enable
```

To disable a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no enable
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added

# interval (linkmon-probe)

**Overview** Use this command to set the interval between Link Health Monitoring probe packets.

Use the **no** variant of this command to set the interval back to the default.

**Syntax** `interval <probe-interval>`  
`no interval`

Parameter	Description
<code>&lt;probe-interval&gt;</code>	The gap between probes being transmitted. For ICMP probes, this is a range of 100-10000 milliseconds. For HTTP probes, this is a range of 30000-3600000 milliseconds.

**Default** For ICMP probes, the default interval is 1000 milliseconds. For HTTP probes, the default interval is 60000 milliseconds.

**Mode** Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

**Example** To set the interval of a probe named 'probe1' to 100, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# interval 100
```

To set the interval of a probe named 'probe1' back to default, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no interval
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added

# ip policy-route

**Overview** Use this command to configure IP policy routes. These routes specify how the device will route traffic from specified applications and entities. You can specify the route's next-hop by specifying the egress interface, or by specifying the next-hop device's IP address (except on dynamic interfaces such as PPPoE). You can also list alternative next-hops to use if your first choice is down.

You can also specify the pseudo interface Null. Null should be the last nexthop specified, as this will drop packets when used as the nexthop.

Use the **no** variant of this command to remove a policy route.

**Syntax** `ip policy-route [<1-500>] [match <application-name>] [from <source-entity>] [to <destination-entity>] nexthop {<interface-list>|<ip-add-list>}`  
`no ip policy-route <1-500>`

Parameter	Description
<i>&lt;1-500&gt;</i>	The policy route ID number. If you do not specify an ID number, the device assigns the new policy route the next available number, in multiples of 10. For example, if the highest numbered policy route is 81, the next policy route would be given an ID of 90. Policy routes are checked in order of ID number, starting with the lowest ID number. The device applies the policy route as soon as it finds a matching route; it does not check the remaining policy routes.
<i>&lt;application-name&gt;</i>	An application name.
<i>&lt;source-entity&gt;</i>	A source entity name.
<i>&lt;destination-entity&gt;</i>	A destination entity name.
<i>&lt;interface-list&gt;</i>	The name of the egress interface or interfaces. You can list up to 8 interfaces per policy route; the device sends the traffic out the first interface in the list that is up.
<i>&lt;ip-add-list&gt;</i>	The IP address of the next-hop. You can list up to 8 next-hop addresses per policy route; the device sends the traffic to the first address in the list that is reachable. Do not use this when the next-hop is on a dynamic interface (e.g. PPPoE); specify the interface name instead.

**Default** No policy routes

**Mode** Policy-based Routing Configuration

**Usage notes** You must specify at least one of the **match**, **from** or **to** parameters. Packets will be routed to the specified next-hop if they match the application, come from the source entity, and are destined for the destination entity.

Before creating a policy route, you need to create the application and entities that specify the traffic you want to route. To create an application, use the [application](#) command. To create entities, use the [zone](#), [network \(zone\)](#), and [host \(network\)](#) commands. To see existing applications and entities, use the [show application](#) and [show entity](#) commands.

**Examples** To create a policy route to route traffic that matches an application called “voice”, comes from the entity called “inside”, and is destined for the entity called “outside”, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# policy-based-routing enable
awplus(config-pbr)# ip policy-route 10 match voice from inside
to outside nexthop 10.37.236.65
```

To delete the policy route created above, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# no ip policy-route 10
```

To route the above traffic via ppp0 if ppp0 is up, or ppp1 if ppp0 is down, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# policy-based-routing enable
awplus(config-pbr)# ip policy-route 20 match voice from inside
to outside nexthop ppp0 ppp1
```

To delete the policy route created above, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# no ip policy-route 20
```

**Related commands**

- [policy-based-routing](#)
- [policy-based-routing enable](#)
- [show application](#)
- [show entity](#)
- [show ip pbr route](#)

**Command changes** Version 5.4.8-0.2: number of routes increased, null interface added

# ip-version (linkmon-probe)

**Overview** Use this command to set the IP version for the Link Health Monitoring ICMP probe. Use the **no** variant of this command to set it back to the default.

**Syntax** `ip-version {4|6}`  
`no ip-version`

Parameter	Description
4	Internet Protocol (IPv4)
6	Internet Protocol version 6 (IPv6)

**Default** IPv4

**Mode** Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

**Example** To set the IP version as IPv6 for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# ip-version 6
```

To set the IP version back to the default for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no ip-version
```

**Command changes** Version 5.4.8-1.1: command added

# ipv6 policy-route

**Overview** Use this command to configure IPv6 policy routes. These routes specify how the device will route traffic from specified applications and entities. You can specify the route's next-hop by specifying the egress interface, or by specifying the next-hop device's IPv6 address (except on dynamic interfaces such as PPPoE). You can also list alternative next-hops to use if your first choice is down.

You can also specify the pseudo interface Null. Null should be the last nexthop specified, as this will drop packets when used as the nexthop.

Use the **no** variant of this command to remove a policy route.

**Syntax** `ipv6 policy-route [<1-500>] [match <application-name>] [from <source-entity>] [to <destination-entity>] nexthop {<interface-list>|<ipv6-add-list>}`  
`no ipv6 policy-route <1-500>`

Parameter	Description
<1-500>	The policy route ID number. If you do not specify an ID number, the device assigns the new policy route the next available number, in multiples of 10. For example, if the highest numbered policy route is 81, the next policy route would be given an ID of 90. Policy routes are checked in order of ID number, starting with the lowest ID number. The device applies the policy route as soon as it finds a matching route; it does not check the remaining policy routes.
<application-name>	An application name.
<source-entity>	A source entity name.
<destination-entity>	A destination entity name.
<interface-list>	The name of the egress interface or interfaces. You can list up to 8 interfaces per policy route; the device sends the traffic out the first interface in the list that is up.
<ipv6-add-list>	The IPv6 address of the next-hop, specified in the form X:X::X:X. You can list up to 8 next-hop addresses per policy route; the device sends the traffic to the first address in the list that is reachable. Do not use this when the next-hop is on a dynamic interface (e.g. PPPoE); specify the interface name instead.

**Default** No policy routes

**Mode** Policy-based Routing Configuration

**Usage notes** You must specify at least one of the **match**, **from** or **to** parameters. Packets will be routed to the specified next-hop if they match the application, come from the source entity, and are destined for the destination entity.

Before creating a policy route, you need to create the application and entities that specify the traffic you want to route. To create an application, use the [application](#) command. To create entities, use the [zone](#), [network \(zone\)](#), and [host \(network\)](#) commands. To see existing applications and entities, use the [show application](#) and [show entity](#) commands.

**Examples** To create a policy route to route traffic that matches an application called "voice", comes from the entity called "inside", and is destined for the entity called "outside", use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# policy-based-routing enable
awplus(config-pbr)# ipv6 policy-route 10 match voice from
inside to outside nexthop 2001:100::1
```

To delete the policy route created above, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# no ipv6 policy-route 10
```

To route the above traffic via ppp0 if ppp0 is up, or ppp1 if ppp0 is down, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# policy-based-routing enable
awplus(config-pbr)# ipv6 policy-route 20 match voice from
inside to outside nexthop ppp0 ppp1
```

To delete the policy route created above, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# no ipv6 policy-route 20
```

**Related commands**

- [policy-based-routing](#)
- [policy-based-routing enable](#)
- [show application](#)
- [show entity](#)
- [show ipv6 pbr route](#)

**Command changes** Version 5.4.8-0.2: number of routes increased, null interface added

# jitter

**Overview** Use this command to configure the thresholds for the jitter metric. This metric is used to judge whether probes associated with this performance profile are good or bad.

Use the **no** variant of this command to remove jitter bad-above and jitter good-below ranges.

**Syntax** jitter bad-above <unacceptable-jitter-point>  
jitter good-below <acceptable-jitter-point>  
no jitter bad-above  
no jitter good-below

Parameter	Description
bad-above <unacceptable-jitter-point>	The point above which jitter is unacceptable in range <1-1000> in milliseconds. When a probe associated with this profile has a jitter result greater than this value, the associated Link Health Monitoring member will be considered 'bad'.
good-below <acceptable-jitter-point>	The point at or below which jitter is acceptable in range <1-1000> in milliseconds. When a probe associated with this profile has a jitter result less than this value, the associated Link Health Monitoring member will be considered 'good'.

**Mode** Linkmon Profile Configuration

**Usage notes** If only **bad-above** is configured, then if the probe results indicate a nexthop is above this value, then that nexthop is considered bad. As soon as the results fall below this value, the nexthop will be immediately considered good.

The combination of these two parameters allow for hysteresis, which may prevent link-flapping behavior. For example, with a **bad-above** value of 100, and a **good-below** value of 90, if the jitter rises to 100 the link will be marked 'bad', but it will not be marked 'good' until it reaches or falls below 90.

If only **good-below** is configured, then probe results will not cause a nexthop to be considered bad.

**Example** To configure the point above which jitter is unacceptable to be 100ms and the point at or below which jitter is acceptable to be 90ms for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1  
awplus(config-linkmon-profile)# jitter bad-above 100  
awplus(config-linkmon-profile)# jitter good-below 90
```

To delete the jitter ranges for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1  
awplus(config-linkmon-profile)# no jitter bad-above  
awplus(config-linkmon-profile)# no jitter good-below
```

**Command  
changes**

Version 5.4.8-0.2: command added

# latency

**Overview** Use this command to configure the thresholds for the latency metric. This metric is used to judge whether probes associated with this performance profile are good or bad.

Use the **no** variant of this command to remove latency bad-above and latency good-below ranges.

**Syntax** `latency bad-above <unacceptable-latency-point>`  
`latency good-below <acceptable-latency-point>`  
`no latency bad-above`  
`no latency good-below`

Parameter	Description
<code>bad-above</code> <code>&lt;unacceptable-latency-point&gt;</code>	The point above which latency is unacceptable in range <code>&lt;1-2000&gt;</code> in milliseconds. When a probe associated with this profile has a latency result greater than this value, the associated Link Health Monitoring member will be considered 'bad'.
<code>good-below</code> <code>&lt;acceptable-latency-point&gt;</code>	The point at or below which latency is acceptable in range <code>&lt;1-2000&gt;</code> in milliseconds. When a probe associated with this profile has a latency result less than this value, the associated Link Health Monitoring member will be considered 'good'.

**Mode** Linkmon Profile Configuration

**Usage notes** If only **bad-above** is configured, then if the probe results indicate a nexthop is above this value, then that nexthop is considered bad. As soon as the results fall below this value, the nexthop will be immediately considered good.

The combination of these two parameters allow for hysteresis, which may prevent link-flapping behavior. For example, with a **bad-above** value of 100, and a **good-below** value of 90, if the latency rises to 100 the link will be marked 'bad', but it will not be marked 'good' until it reaches or falls below 90.

If only **good-below** is configured, then probe results will not cause a nexthop to be considered bad.

**Example** To configure the point above which latency is unacceptable to be 100ms and the point at or below which latency is acceptable to be 90ms for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# latency bad-above 100
awplus(config-linkmon-profile)# latency good-below 90
```

To delete the latency ranges for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1  
awplus(config-linkmon-profile)# no latency bad-above  
awplus(config-linkmon-profile)# no latency good-below
```

# linkmon group

**Overview** Use this command to create a Link Health Monitoring group and enter Linkmon Group Configuration mode where this group can be configured.

Use the **no** variant of this command to remove a configured group. All members previously belonging to the group are also removed.

**Syntax** `linkmon group <group-name>`  
`no linkmon group <group-name>`

Parameter	Description
<code>&lt;group-name&gt;</code>	The name of the link monitoring group.

**Mode** Global Configuration

**Example** To create a new link monitoring group named 'group1', use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon group group1
awplus(config-linkmon-group)#
```

To remove a link monitoring group named 'group1', use the following commands:

```
awplus# configure terminal
awplus(config)# no linkmon group group1
```

**Command changes** Version 5.4.8-1.1: command added

# linkmon probe-history

**Overview** Use this command to create a collection instance that records the metrics gathered by a Link Health Monitoring probe.

Use the **no** variant of this command to remove the specified collection instance.

**Syntax** `linkmon probe-history [<1-65535>] probe <probe-name> interval <1-2678400> buckets <1-65535>`  
`no linkmon probe-history <1-65535>`

Parameter	Description
<1-65535>	The ID of the collection instance. If this is not set on creation then it will be automatically allocated.
<probe-name>	The name of the probe to record metrics for.
<1-2678400>	The interval that metrics are collated, in seconds.
<1-65535>	The maximum number of metric history samples.

**Mode** Global Configuration

**Usage notes** Metrics are collated every **interval** seconds. Up to **buckets** samples of metrics are collated.

Different **interval** and **buckets** values can be used to record specific kinds of histories. For example, an **interval** value of 1 and a **buckets** value of 3600 would record per second metrics of a probe for an hour. An **interval** value of 3600 and a **buckets** value of 744 would record per hour metrics of a probe for 31 days.

Using the Web API, metric values for a sample are returned as a sum and a count. The sum can be divided by the count for an average. For example, if 10 probes have been sent during a history interval, then the metric counts would be 10 for a sample, and the sum would be the total of the metric values.

If a probe receives no reply then no metric is recorded.

Packet loss is not recorded exactly. Instead the probes sent and probe replies received is recorded.

**CAUTION:** *This configuration option can consume a large amount of RAM on the device, particularly if high numbers of buckets are configured. The memory will be increasingly consumed over time as the probe history is collected. Excessive use of this feature may result in a device configuration that appears stable for a period of hours or days, until the device eventually exhausts its available memory and reboots. It is recommended that this option only be enabled when required, and disabled after the necessary information has been collected.*

**Example** To create a Link Health Monitoring probe history collection instance with an ID of 10 for a probe named 'probe1' that collates metrics every second while keeping up to 300 samples, use the following command:

```
awplus# configure terminal
awplus(config)# linkmon probe-history 10 probe probe1 interval
1 buckets 300
```

To create a Link Health Monitoring probe history collection instance with an automatically allocated ID for a probe named 'probe1' that collates metrics every 60 seconds while keeping up to 3600 samples, use the following command:

```
awplus# configure terminal
awplus(config)# linkmon probe-history probe probe1 interval 60
buckets 3600
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-0.2: command added

# linkmon probe

**Overview** Use this command to create a Link Health Monitoring probe and enter the appropriate Link Health Monitoring Probe Configuration Mode where this probe can be configured.

Use the **no** variant of this command to delete the Link Health Monitoring probe.

**Syntax** `linkmon probe name <probe-name> [type {icmp-ping|http-get}]`  
`no linkmon probe name <probe-name>`

Parameter	Description
<code>&lt;probe-name&gt;</code>	The name of the probe.
<code>type</code>	The type of the probe. Indicates the packet type or protocol used by the probe, either of <b>icmp-ping</b> (ICMP) or <b>http-get</b> (HTTP). This parameter is optional. If not entered, a newly created probe's type defaults to <b>icmp-ping</b> .

**Default** The default probe type for a newly created probe is **icmp-ping**. The optional parameter **type** is only required to create a probe type other than the default. The **type** parameter is not required when editing an existing probe or deleting a probe.

**Mode** Global Configuration

**Usage notes** The optional probe **type** parameter represents the packet type or protocol used in the transmission of the probe. A probe of type **icmp-ping** will present some different configuration options to a probe of type **http-get**.

An **icmp-ping** Link Health Monitoring probe requires a destination, and must be enabled for probing to begin.

An **http-get** Link Health Monitoring probe requires a URL, and must be enabled for probing to begin.

**Example** To create a probe named 'probe1' using the default probe type and enter Link Health Monitoring ICMP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)#
```

To create a probe named 'probe1' using the default ICMP probe type and enter Link Health Monitoring ICMP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1 type icmp-ping
awplus(config-linkmon-icmp-probe)#
```

To create a probe named 'probe1' using the HTTP probe type and enter Link Health Monitoring HTTP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1 http-probe
awplus(config-linkmon-http-probe)#
```

To remove a probe named 'probe1', use the following commands:

```
awplus# configure terminal
awplus(config)# no linkmon probe name probe1
```

**Command  
changes**

Version 5.4.8-0.2: command added  
Version 5.4.8-1.1: now operates as a modal command, with the new type parameter used to determine whether to enter ICMP or HTTP probe mode

# linkmon profile

**Overview** Use this command to create a Link Health Monitoring performance profile and enter Linkmon Profile Configuration mode where this profile can be configured. Use the **no** variant of this command to remove a configured performance profile.

**Syntax** linkmon profile <profile-name>  
no linkmon profile <profile-name>

Parameter	Description
<profile-name>	The name of the performance profile.

**Mode** Global Configuration

**Example** To create a new performance profile named 'profile1', use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)#
```

To remove a performance profile named 'profile1', use the following commands:

```
awplus# configure terminal
awplus(config)# no linkmon profile profile1
```

**Command changes** Version 5.4.8-0.2: command added

# load-balancing

**Overview** Use this command to enable load-balancing for a Link Health Monitoring group.  
Use the **no** variant of this command to remove load-balancing from a Link Health Monitoring group.

**Syntax** `load-balancing`  
`no load-balancing`

**Default** Load-balancing is disabled.

**Mode** Linkmon Group Configuration

**Usage notes** When load-balancing is enabled, traffic will be load-balanced across all valid nexthops.

Load-balancing is achieved using a hashing algorithm on a per-flow basis for each application. For example, if two users visit YouTube, the session for user 1 may be sent over Tunnel 1, and the session for user 2 may be sent over Tunnel 2. Packets from each session will be sent entirely within one tunnel, until that session ends.

When a Link Health Monitoring group is configured for load-balancing, the preferred-metric used in any profile that is combined with the group in a PBR rule will be ignored when selecting 'good' links to send traffic over. This is because when load-balancing is enabled, all links that are 'good' are selected to send traffic over, so preferred metric is not required for tie-breaking. The preferred-metric is still used when all links within a group are considered 'bad' by a profile, in which case the least-bad link according to the preferred metric will be selected as the single link to send traffic over.

**Example** To enable load-balancing on the Link Health Monitoring group "BranchOffice", use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon group BranchOffice
awplus(config-linkmon-group)# load-balancing
```

To disable load-balancing on the Link Health Monitoring group "BranchOffice", use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon group BranchOffice
awplus(config-linkmon-group)# no load-balancing
```

**Related commands** [linkmon group](#)

**Command changes** Version 5.4.8-1.1: command added

# member (linkmon-group)

**Overview** Use this command to create a link monitoring group member and specify its nexthop destination and the probe to be used to gather metrics to judge the health of this member. A maximum of 8 members can be created per group.

Use the **no** variant of this command to remove a group member. The member ID is mandatory upon deletion.

**Syntax** member [*<member-id>*] destination *<ip-address>*/*<interface>* probe *<probe-name>*  
no member *<member-id>*

Parameter	Description
<i>&lt;member-id&gt;</i>	The ID of the link monitoring group member, a number in range <i>&lt;1-128&gt;</i> .
destination	The nexthop destination of the member that traffic will be directed to when this member is judged as the best available within the group, according the probe metric results and PBR rule profile.
<i>&lt;ip-address&gt;</i>	The IPv4 or IPv6 IP address of the next-hop. Do not use this when the next-hop is on a dynamic interface (e.g. PPPoE); specify the interface name instead.
<i>&lt;interface&gt;</i>	The name of the egress interface of the next-hop.
<i>&lt;probe-name&gt;</i>	The name of an existing probe.

**Mode** Linkmon Group Configuration

**Usage notes** Users can also optionally specify a group member ID. If no ID is specified, a unique ID will be automatically created and assigned to the group member.

The pseudo interface Null can be specified as a nexthop. This acts as an always up but bad interface. This is to be chosen as the best member when all other members are unavailable. No probe needs to be specified for this type of member.

**Example** To create a new group member in group 'group1' using probe 'probe1' with ID 10 and destination 'tunnel1', use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon group group1
awplus(config-linkmon-group)# member 10 destination tunnel1
probe probe1
```

To delete the group member with member ID '10' in group 'group1', use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon group group1
awplus(config-linkmon-group)# no member 10
```

**Command  
changes**

Version 5.4.8-0.2: command added

# pktloss

**Overview** Use this command to configure the thresholds for the packet loss metric. This metric is used to judge whether probes associated with this performance profile are good or bad.

Use the **no** variant of this command to remove packet loss rate bad-above and packet loss rate good-below ranges.

**Syntax** `pktloss bad-above <unacceptable-pktloss-point>`  
`pktloss good-below <acceptable-pktloss-point>`  
`no pktloss bad-above`  
`no pktloss good-below`

Parameter	Description
<code>&lt;unacceptable-pktloss-point&gt;</code>	The point above which packet loss rate is unacceptable in range <code>&lt;0.0-100.0&gt;</code> in percent to one decimal place. When a probe associated with this profile has a packet loss rate result greater than this value, the associated Link Health Monitoring member will be considered 'bad'.
<code>&lt;acceptable-pktloss-point&gt;</code>	The point at or below which packet loss rate is acceptable in range <code>&lt;0.0-100.0&gt;</code> in percent to one decimal place. When a probe associated with this profile has a packet loss rate result less than this value, the associated Link Health Monitoring member will be considered 'good'.

**Mode** Linkmon Profile Configuration

**Usage notes** If only **bad-above** is configured, then if the probe results indicate a nexthop is above this value, then that nexthop is considered bad. As soon as the results fall below this value, the nexthop will be immediately considered good.

The combination of these two parameters allow for hysteresis, which may prevent link-flapping behavior. For example, with a **bad-above** value of 5, and a **good-below** value of 3, if the packet loss rises to 5 the link will be marked 'bad', but it will not be marked 'good' until it reaches or falls below 3.

If only **good-below** is configured, then probe results will not cause a nexthop to be considered bad.

Packet loss also has a built-in threshold, where when it reaches 100% packet loss, the associated member is automatically considered unreachable / down, and will never be used as a nexthop for packets that match the PBR rule. If all members within a group are unreachable in this manner, then traffic will be routed via default routing behavior, rather than PBR. If the group has a member configured with a NULL destination, when all other members in the group are unreachable, traffic will be dropped (blackhole routed) instead.

**Example** To configure the point above which packet loss rate is unacceptable to be 5% and the point at or below which packet loss rate is acceptable to be 3.0% for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# pktloss bad-above 5.0
awplus(config-linkmon-profile)# pktloss good-below 3.0
```

To delete the packet loss rate ranges for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# no pktloss bad-above
awplus(config-linkmon-profile)# no pktloss good-below
```

- [preference](#)

**Command changes** Version 5.4.8-0.2: command added

# preference

**Overview** Use this command to configure the preferred metric of probes that use this Link Health Monitoring performance profile.

Use the **no** variant of this command to remove a preference.

**Syntax** `preference {latency|jitter|pktloss}`  
`no preference`

Parameter	Description
latency	Use latency as the tie-breaker metric.
jitter	Use jitter as the tie-breaker metric.
pktloss	Use packet loss rate as the tie-breaker metric.

**Default** No preference is applied.

**Mode** Linkmon Profile Configuration

**Usage notes** When two or more members within the same group have the same link-health judgment (good, bad), the metric nominated as the preferred one is used as a tie-break to select the best member amongst those that are tied. If the metric values for the preferred metric are identical, or preferred metric is not set in the profile, then the member with the lowest ID is selected as the best one.

**Example** To choose maximum allowable latency to be the preferred metric for a performance profile named 'profile1', use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# preference latency
```

To delete an existing preference for a performance profile named 'profile1', use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# no preference
```

# sample-size (linkmon-probe)

**Overview** Use this command to set the sample size used for calculating latency and jitter metrics for a Link Health Monitoring probe.

Use the **no** variant of this command to set the sample size back to the default value.

**Syntax** `sample-size <1-100>`  
`no sample-size`

Parameter	Description
<code>&lt;1-100&gt;</code>	The number of probe samples to use when calculating the latency and jitter metrics.

**Default** The default sample size is 5.

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the sample size a probe named 'probe1' to 10, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# sample-size 10
```

To set the sample size a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no sample-size
```

**Related commands** [linkmon probe](#)

Table 36-2: Parameters in the output from **show linkmon probe**

Parameter	Description
Name	The name of the probe.
Status	Whether the probe is enabled or disabled. If it is enabled, then the device will attempt to send probes if the link is up. If it is disabled, then no probes will be sent.
Type	The type of probe packet sent.
IP version	The IP version being used, IPv4 or IPv6.
Destination	The destination IP address that the probes are sent to.
Egress Interface	The interface that the probe packets should egress.
Source	The source IP address or interface.
DSCP	The DSCP value to use when sending the packet.
Packet Size	The size of a probe packet.
Interval	The number of milliseconds between sending out each probe.
Sample Size	The number of probe results to use when calculating the latency and jitter metrics.
Latency	The average latency based on the last <b>sample size</b> samples.
Jitter	The average jitter based on the last <b>sample size</b> samples.
Packet Loss	The percentage of packets lost based on the last 100 probes.

Table 36-2: Parameters in the output from **show linkmon probe** (cont.)

Parameter	Description
Probes Sent	The number of probe packets that have been sent.
Last Probe Sent	The time that the last probe packet was sent.
Last Probe Received	The time that the device last successfully received a probe packet.

			29785	29785	0.00

Table 36-3: Parameters in the output from **show linkmon probe-history**

Parameter	Description
ID	The ID of the Link Health Monitoring probe-history.
Probe	The name of the probe that this history is for.
Interval	The amount of time between each history sample (in seconds).
Buckets	The total number of samples that are stored.
Latency min	The minimum latency that is in the history.
Latency max	The maximum latency that is in the history.
Latency avg	The average latency of the samples stored in the history.
Jitter min	The minimum jitter that is in the history.
Jitter max	The maximum jitter that is in the history.
Jitter avg	The average jitter of the samples stored in the history.
Packets Tx	The total number of packets transmitted in this history.
Packets Rx	The total number of packets received in this history.
Packets Loss	The percentage of packets lost in the history.

# show pbr rules

**Overview** Use this command to display the configured IPv4 and IPv6 policy routes. It also shows the validity of the policy routes.

**Syntax** show pbr rules  
show pbr rules <rule-id>  
show pbr rules profile <profile-name>  
show pbr rules group <group-name>

Parameter	Description
<rule-id>	The policy route ID. If you specify a policy route ID, the output only lists configuration and status for this specified rule.
<profile-name>	The Link Health Monitoring profile name. If you specify an existing Link Health Monitoring performance profile name, the output only lists profile configuration for this specified profile.
<group-name>	The Link Health Monitoring group name. If you specify an existing Link Health Monitoring group name, the output only lists group configuration for this specified profile.

**Mode** User Exec and Privileged Exec

**Example** To show information about the policy routes, use the following command:

```
awplus# show pbr rules
```

To show information about the policy route rule with the rule ID of '1', use the following command:

```
awplus# show pbr rules 1
```

To show information about the Link Health Monitoring profile with the profile name of 'profile1', use the following command:

```
awplus# show pbr rules profile profile1
```

To show information about the Link Health Monitoring group with the profile name of 'group1', use the following command:

```
awplus# show pbr rules group group1
```

**Output** Figure 36-4: Example output from **show pbr rules**

Table 36-4: Parameters in the output from **show pbr rules**

Parameter	Description
Total number of configured PBR-rules	The number of PBR rules currently configured. This includes both conventional PBR policy-routes and Link Health Monitoring IP policy-routes, regardless of whether the rules are valid or not.
PBR-Rule	The PBR rule ID which the following statistics and configuration are associated with.
Active	Whether the rule is active or not.
Match	The name of an application. Packets will be routed to the specified next hop if they match this application, come from the source entity, and are destined for the destination entity.
From	The name of the source entity. Packets will be routed to the specified next hop if they match the application, come from this source entity, and are destined for the destination entity.
To	The name of the destination entity. Packets will be routed to the specified next hop if they match the application, come from the source entity, and are destined for this destination entity.
Profile	The name of the Link Health Monitoring profile associated with this Link Health Monitoring PBR policy-route.
bad above, good below	The configured threshold for this specific rule. There are fields for latency, jitter, and packet loss. If this field has a value of "-", then the threshold has not been configured.
Group	The name of the Link Health Monitoring group associated with this Link Health Monitoring PBR policy-route.

Table 36-4: Parameters in the output from **show pbr rules** (cont.)

Parameter	Description
Member	The ID of the Link Health Monitoring member associated with this Link Health Monitoring group.
Nexthop	The IPv4 or IPv6 address of the next-hop or the egress interface. There can be up to 8 next-hops per policy route.
probe	The Link Health Monitoring probe associated with the Link Health Monitoring group member.
latency	The latency of the probe associated with the Link Health Monitoring member.
jitter	The jitter of the probe associated with the Link Health Monitoring member.
packet loss	The packet loss of the probe associated with the Link Health Monitoring member.
Current Nexthop	The chosen nexthop for traffic matching the Link Health Monitoring PBR policy-route.
Previous Nexthop	The previously chosen nexthop prior to failover. If a failover hasn't occurred on this setup, there is no previous nexthop. This is indicated by "-".
Change Time	The time at which the current nexthop was chosen. This will change if a failover occurs, or at boot.
Causes	The event that caused the last failover.
Decision	The reason why the current nexthop was chosen.
Change Count	The number of times the chosen nexthop has changed. This counter will increment any time a link failover occurs.

# show pbr rules brief

**Overview** Use this command to show a summary of all PBR rules. It also indicates, by the presence or absence of the nexthop field, which nexthop to route to.

**Syntax** show pbr rules brief

**Mode** User Exec and Privileged Exec

**Example** To show information about the policy routes, use the following command:

```
awplus# show pbr rules brief
```

**Output** Figure 36-8: Example output from **show pbr rules brief**

```
awplus#show pbr rules brief
Policy based routing is enabled
Route table usage: 2/500
* - No route table available for the rule - see "show ip pbr
route"
Rule Match      From           To             Valid  Nexthop
-----
10  any          entities.any   entities.outside  Yes    10.10.20.2
20  udp          any           any               Yes    2001:100::2
```

Table 36-5: Parameters in the output from **show pbr rules brief**

Parameter	Description
Rule	The policy route ID number. Policy routes are checked in order of ID number, starting with the lowest ID number. The device applies the policy route as soon as it finds a matching route; it does not check the remaining policy routes.
Match	The name of an application. Packets will be routed to the specified next hop if they match this application, come from the source entity, and are destined for the destination entity.
From	The name of the source entity. Packets will be routed to the specified next hop if they match the application, come from this source entity, and are destined for the destination entity.
To	The name of the destination entity. Packets will be routed to the specified next hop if they match the application, come from the source entity, and are destined for this destination entity.

Table 36-5: Parameters in the output from **show pbr rules brief** (cont.)

Parameter	Description
Valid	Whether the application and entities are valid.
Nexthop	The IPv4 or IPv6 address of the next-hop or the egress interface. There can be up to 8 next-hops per policy route.

**Command changes** Version 5.4.8-0.2: command added  
Version 5.4.8-1.1: up to 500 route table entries supported

## size (linkmon-probe)

**Overview** Use this command to set the size of the packets used by a Link Health Monitoring probe.

Use the **no** variant of this command to set the size back to the default.

**Syntax** `size <64-1500>`  
`no size`

Parameter	Description
<code>&lt;64-1500&gt;</code>	The size of the probe packet in bytes.

**Default** The default packet size is 100 bytes.

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the size of a probe named 'probe1' to 1000, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# size 1000
```

To set the size of a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no size
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added

# source (linkmon-probe)

**Overview** Use this command to set the source IP address or interface for a Link Health Monitoring probe.

Use the **no** variant of this command to return it to the default.

**Syntax** `source {<interface>|<ip-address>}`  
`no source`

Parameter	Description
<code>&lt;interface&gt;</code>	The name of the interface that probes are sourcing from. The specified interface needs to be locally configured with at least one valid IPv4 address, and the interface is in up and running state.
<code>&lt;ip-address&gt;</code>	The source IPv4 address for this probe. The specified IP address needs to be locally configured on an interface that is in an up-and-running state.

**Default** No source IP address is defined by default. The source IP address will be selected using standard routing behavior to reach the probe's destination.

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the source interface as 'lo' for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# source lo
```

To set the source interface back to default for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no source
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added

# url (linkmon-probe)

**Overview** Use this command to set the destination URL of a Link Health Monitoring probe. This is a required configuration option for http-get probes.

Use the **no** variant of this command to remove the URL.

**Syntax** url <urlname>  
no url

Parameter	Description
<urlname>	The destination the probe is being sent to. The url must use ASCII characters and conform to the URL syntax in RFC 3986, with http or https protocol at the start and an optional port number on the end, such as :80, :443 or :8080.

**Mode** Linkmon HTTP Probe Configuration

**Example** To set the destination URL of a Link Health Monitoring probe named "test-probe", use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name test-probe type http
awplus(config-linkmon-http-probe)# url
http://www.alliedtelesis.co.nz/
```

Some other examples of supported URL formats:

```
awplus(config-linkmon-http-probe)# url
https://www.facebook.com/
awplus(config-linkmon-http-probe)# url
http://intranet.atlnz.lc:8080
```

To remove the URL, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name test-probe type http
awplus(config-linkmon-http-probe)# no url
```

**Related commands** [linkmon probe](#)

# Part 4: Multicast Applications

# 37

# IGMP and IGMP Snooping Commands

## Introduction

**Overview** Devices running AlliedWare Plus use IGMP (Internet Group Management Protocol) and MLD (Multicast Listener Discovery) to track which multicast groups their clients belong to. This enables them to send the correct multimedia streams to the correct destinations. IGMP is used for IPv4 multicasting, and MLD is used for IPv6 multicasting.

This chapter describes the commands to configure IGMP Querier behaviour and selection, IGMP Snooping and IGMP Proxy.

# clear ip igmp

**Overview** Use this command to clear all IGMP group membership records on all VLAN interfaces.

**Syntax** `clear ip igmp`

**Mode** Privileged Exec

**Example** `awplus# clear ip igmp`

**Related commands**

- `clear ip igmp group`
- `clear ip igmp interface`
- `show ip igmp interface`
- `show running-config`

**Command changes**

- Version 5.4.7-1.1: VRF-lite support added SBx8100.
- Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip igmp group

**Overview** Use this command to clear IGMP group membership records for a specific group on either all interfaces, a single interface, or for a range of interfaces.

**Syntax** `clear ip igmp group *`  
`clear ip igmp group <ip-address> <interface>`

Parameter	Description
*	Clears all groups on all interfaces. This has the same effect as the <b>clear ip igmp</b> command.
<ip-address>	Specifies the group whose membership records will be cleared from all interfaces, entered in the form A.B.C.D.
<interface>	Specifies the name of the interface; all groups learned on this interface are deleted.

**Mode** Privileged Exec

**Usage notes** This command applies to groups learned by IGMP or IGMP Snooping. In addition to the group, an interface can be specified. Specifying this will mean that only entries with the group learned on the interface will be deleted.

**Examples** To delete all group records, use the command:

```
awplus# clear ip igmp group *
```

To delete records for 224.1.1.1 on vlan1, use the command:

```
awplus# clear ip igmp group 224.1.1.1 vlan1
```

**Related commands** [clear ip igmp](#)  
[clear ip igmp interface](#)  
[show ip igmp interface](#)  
[show running-config](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip igmp interface

**Overview** Use this command to clear IGMP group membership records on a particular interface.

**Syntax** `clear ip igmp interface <interface>`

Parameter	Description
<interface>	Specifies the name of the interface. All groups learned on this interface are deleted.

**Mode** Privileged Exec

**Usage notes** This command applies to interfaces configured for IGMP or IGMP Snooping.

**Example** To delete records for vlan1, use the command:

```
awplus# clear ip igmp interface vlan1
```

**Related commands**

- [clear ip igmp](#)
- [clear ip igmp group](#)
- [show ip igmp interface](#)
- [show running-config](#)

**Command changes**

- Version 5.4.7-1.1: VRF-lite support added SBx8100.
- Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# debug igmp

**Overview** Use this command to enable debugging of either all IGMP or a specific component of IGMP.

Use the **no** variant of this command to disable all IGMP debugging, or debugging of a specific component of IGMP.

**Syntax** `debug igmp {all|decode|encode|events|fsm|tib}`  
`no debug igmp {all|decode|encode|events|fsm|tib}`

Parameter	Description
all	Enable or disable all debug options for IGMP
decode	Debug of IGMP packets that have been received
encode	Debug of IGMP packets that have been sent
events	Debug IGMP events
fsm	Debug IGMP Finite State Machine (FSM)
tib	Debug IGMP Tree Information Base (TIB)

**Modes** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug igmp all`

**Related commands** [show debugging igmp](#)  
[undebug igmp](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip igmp

**Overview** Use this command to enable IGMP on an interface. The command configures the device as an IGMP querier.

Use the **no** variant of this command to return all IGMP related configuration to the default on this interface.

**Syntax** ip igmp  
no ip igmp

**Default** Disabled

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage notes** An IP address must be assigned to the interface first, before this command will work.

**Example** To specify an interface as an IGMP querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp
```

**Validation  
Commands** show ip igmp interface  
show running-config

# ip igmp flood specific-query

**Overview** Use this command if you want IGMP to flood specific queries to all VLAN member ports, instead of only sending the queries to multicast group member ports.

Use the **no** variant of this command if you want IGMP to only send the queries to multicast group member ports.

**Syntax** `ip igmp flood specific-query`  
`no ip igmp flood specific-query`

**Default** By default, specific queries are flooded to all VLAN member ports.

**Mode** Global Configuration

**Usage** In an L2 switched network running IGMP, it is considered more robust to flood all specific queries. In most cases, the benefit of flooding specific queries to all VLAN member ports outweighs the disadvantages.

However, sometimes this is not the case. For example, if hosts with very low CPU capability receive specific queries for multicast groups they are not members of, their performance may degrade unacceptably. In this situation, it is desirable for IGMP to send specific queries to known member ports only. This minimizes the performance degradation of such hosts. In those circumstances, use this command to turn off flooding of specific queries.

**Example** To cause IGMP to flood specific queries only to multicast group member ports, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp flood specific-query
```

**Related commands** [show ip igmp interface](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip igmp last-member-query-count

**Overview** Use this command to set the last-member query-count value for an interface. Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ip igmp last-member-query-count <2-7>`  
`no ip igmp last-member-query-count`

Parameter	Description
<2-7>	Last member query count value.

**Default** The default last member query count value is 2.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage notes** This command applies to Eth interfaces configured for IGMP and VLAN interfaces configured for IGMP or IGMP Snooping.

**Example** To set the last-member query-count to 3 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-count 3
```

**Related commands** [ip igmp last-member-query-interval](#)  
[ip igmp startup-query-count](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp last-member-query-interval

**Overview** Use this command to configure the frequency at which the router sends IGMP group specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

**Syntax** `ip igmp last-member-query-interval <interval>`  
`no ip igmp last-member-query-interval`

Parameter	Description
<interval>	The frequency in milliseconds at which IGMP group-specific host query messages are sent, in the range 1000-25500.

**Default** 1000 milliseconds

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage notes** This command applies to Eth interfaces configured for IGMP and VLAN interfaces configured for IGMP or IGMP Snooping.

**Example** To change the IGMP group-specific host query message interval to 2 seconds (2000 milliseconds) on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-interval 2000
```

**Related commands** [ip igmp last-member-query-count](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp maximum-groups

**Overview** Use this command to set a limit, per switch port, on the number of IGMP groups clients can join. This stops a single client from using all the switch's available group-entry resources, and ensures that clients on all ports have a chance to join IGMP groups.

Use the **no** variant of this command to remove the limit.

**Syntax** `ip igmp maximum-groups <0-65535>`  
`no ip igmp maximum-groups`

Parameter	Description
<code>&lt;0-65535&gt;</code>	The maximum number of IGMP groups clients can join on this switch port. 0 means no limit.

**Default** The default is 0, which means no limit

**Mode** Interface mode for a switch port

**Usage notes** We recommend using this command with IGMP snooping fast leave on the relevant VLANs. To enable fast leave, use the command:

```
awplus(config-if)# ip igmp snooping fast-leave
```

The device keeps count of the number of groups learned by each port. This counter is incremented when group joins are received via IGMP reports. It is decremented when:

- Group memberships time out
- Group leaves are received via leave messages or reports

Also, the port's group counter is cleared when:

- The port goes down
- You run the command **clear ip igmp group \***
- The port is removed from a VLAN

You can see the current value of the group counter by using either of the commands:

```
awplus# show ip igmp snooping statistics interface <port-list>
```

```
awplus# show ip igmp interface <port>
```

**Example** To limit clients to 10 groups on port 1.0.1, which is in vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip igmp maximum-groups 10
awplus(config-if)# exit
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping fast-leave
```

**Related commands**

- clear ip igmp group
- ip igmp snooping fast-leave
- show ip igmp interface
- show ip igmp snooping statistics

# ip igmp mroute-proxy

**Overview** Use this command to enable IGMP mroute proxy on this downstream interface and associate it with the upstream proxy service interface.

Use the **no** variant of this command to remove the association with the proxy-service interface.

**Syntax** `ip igmp mroute-proxy <interface>`  
`no ip igmp mroute-proxy`

Parameter	Description
<interface>	The name of the interface.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage notes** This command applies to Eth interfaces and VLAN interfaces configured for IGMP Proxy.

You must also enable the IGMP proxy service on the upstream interface, using the [ip igmp proxy-service](#) command. You can associate one or more downstream mroute proxy interfaces on the device with a single upstream proxy service interface. This downstream mroute proxy interface listens for IGMP reports, and forwards them to the upstream IGMP proxy service interface.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

**Example** To configure vlan2 as the upstream proxy-service interface for the downstream vlan3 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp mroute-proxy vlan2
```

**Related commands** [ip igmp proxy-service](#)

# ip igmp proxy-service

**Overview** Use this command to enable the VLAN interface to be the upstream IGMP proxy-service interface for the device. All associated downstream IGMP mroute proxy interfaces on this device will have their memberships consolidated on this proxy service interface, according to IGMP host-side functionality.

Use the **no** variant of this command to remove the designation of the VLAN interface as an upstream proxy-service interface.

**Syntax** `ip igmp proxy-service`  
`no ip igmp proxy-service`

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage notes** This command applies to Eth interfaces and VLAN interfaces configured for IGMP Proxy.

This command is used with the [ip igmp mroute-proxy](#) command to enable forwarding of IGMP reports to a proxy service interface for all forwarding entries for this interface. You must also enable the downstream IGMP mroute proxy interfaces on this device using the command [ip igmp mroute-proxy](#).

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

From version 5.4.7-1.1 onwards, IGMP mroute proxy interfaces do not have to be configured with an IP address before they can operate. Instead, it is possible to have an address-less interface operate as an IGMP mroute proxy interface.

This feature is useful when IGMP Proxy needs to run on many downstream interfaces. For example, you may want to use it if your device has one subscriber (multicast receiver) per VLAN, and many receivers (many VLANs) connected to the device. In such a situation, assigning IP addresses to each VLAN may not be practicable.

Note that for such interface to be able to send queries to hosts directly attached to the interface, it is necessary to enable IGMP snooping querier on the interface, using the command [ip igmp snooping querier](#).

**Example** To designate VLAN1 as the upstream proxy-service interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp proxy-service
```

**Related commands** [ip igmp mroute-proxy](#)  
[ip igmp snooping querier](#)

**Command changes** Version 5.4.7-1.1: Address-less interface support added.  
Version 5.4.7-1.1: VRF-lite support added to SBx8100.

Version 5.4.8-1.1: VRF-lite support added to x930, SBx908 GEN2.

# ip igmp querier-timeout

**Overview** Use this command to configure the timeout period before the device takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

**Syntax** `ip igmp querier-timeout <timeout>`  
`no ip igmp querier-timeout`

Parameter	Description
<code>&lt;timeout&gt;</code>	IGMP querier timeout interval value in seconds, in the range 1-65535.

**Default** The default timeout interval is 255 seconds.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage notes** This command applies to Eth and VLAN interfaces configured for IGMP.

The timeout value should not be less than the current active querier's general query interval.

**Example** To configure the device to wait 130 seconds from the time it received the last query before it takes over as the querier for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp querier-timeout 130
```

**Related commands** `ip igmp query-interval`  
`show ip igmp interface`  
`show running-config`

# ip igmp query-holdtime

**Overview** This command sets the time that an IGMP Querier waits after receiving a query solicitation before it sends an IGMP Query. IGMP General Query messages will not be sent during the hold time interval.

Use the **no** variant of this command to return to the default query hold time period.

**Syntax** `ip igmp query-holdtime <interval>`  
`no ip igmp query-holdtime`

Parameter	Description
<interval>	Query interval value in milliseconds, in the range <100-5000>.

**Default** By default the delay before sending IGMP General Query messages is 500 milliseconds.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage notes** Use this command to configure a value for the IGMP query hold time in the current network. IGMP Queries can be generated after receiving Query Solicitation (QS) packets and there is a possibility of a DoS (Denial of Service) attack if a stream of Query Solicitation (QS) packets are sent to the IGMP Querier, eliciting a rapid stream of IGMP Queries. This command applies to interfaces on which the device is acting as an IGMP Querier.

Use the `ip igmp query-interval` command when a delay for IGMP general query messages is required and IGMP general query messages are required. The **ip igmp query-holdtime** command stops IGMP query messages during the configured holdtime interval, so the rate of IGMP Queries that can be sent out of an interface can be restricted.

See the [IGMP Feature Overview and Configuration Guide](#) for introductory information about the Query Solicitation feature.

**Examples** To set the IGMP query holdtime to 900 ms for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-holdtime 900
```

To reset the IGMP query holdtime to the default (500 ms) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-holdtime
```

**Related commands**

- ip igmp query-interval
- ip igmp snooping tcn query solicit
- show ip igmp interface
- show running-config

# ip igmp query-interval

**Overview** Use this command to configure the period for sending IGMP General Query messages.

The IGMP query interval specifies the time between IGMP General Query messages being sent.

Use the **no** variant of this command to return to the default query interval period.

**NOTE:** The IGMP query interval must be greater than IGMP query maximum response time.

**Syntax** `ip igmp query-interval <interval>`  
`no ip igmp query-interval`

Parameter	Description
<interval>	Query interval value in seconds, in the range <2-18000>.

**Default** The default IGMP query interval is 125 seconds.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage notes** This command applies to interfaces configured for IGMP. Note that the IGMP query interval is automatically set to a greater value than the IGMP query max response time.

For example, if you set the IGMP query max response time to 2 seconds using the [ip igmp query-max-response-time](#) command, and the IGMP query interval is currently less than 3 seconds, then the IGMP query interval period will be automatically reconfigured to be 3 seconds, so it is greater than the IGMP query maximum response time.

Use the **ip igmp query-interval** command when a non-default interval for IGMP General Query messages is required.

The [ip igmp query-holdtime](#) command can occasionally delay the sending of IGMP Queries.

**Examples** To set the period between IGMP host-query messages to 3 minutes (180 seconds) for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-interval 180
```

To reset the period between sending IGMP host-query messages to the default (125 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-interval
```

**Related  
commands**

```
ip igmp query-holdtime
ip igmp query-max-response-time
ip igmp startup-query-interval
show ip igmp interface
show running-config
```

# ip igmp query-max-response-time

**Overview** Use this command to configure the maximum response time advertised in IGMP Queries.

Use the **no** variant of this command to restore the default.

**NOTE:** The IGMP query maximum response time must be less than the IGMP query interval.

**Syntax** `ip igmp query-max-response-time <response-time>`  
`no ip igmp query-max-response-time`

Parameter	Description
<code>&lt;response-time&gt;</code>	Response time value in seconds, in the range 1-3180.

**Default** The default IGMP query maximum response time is 10 seconds.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage notes** This command applies to interfaces configured for IGMP.

Note that the IGMP query interval is automatically set to a greater value than the IGMP query maximum response time.

For example, if you set the IGMP query interval to 3 seconds using the `ip igmp query-interval` command, and the current IGMP query interval is less than 3 seconds, then the IGMP query maximum response time will be automatically reconfigured to be 2 seconds, so it is less than the IGMP query interval time.

To get the network to converge faster, use the **ip igmp query-max-response-time** command and set a low response time value, such as one or two seconds, so that the clients will respond immediately with a report as a response to the IGMP Queries.

**Examples** To set a maximum response time of 8 seconds for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-max-response-time 8
```

To reset the default maximum response time to the default (10 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-max-response-time
```

**Related commands** ip igmp query-interval  
show ip igmp interface  
show running-config

# ip igmp ra-option

**Overview** Use this command to enable strict Router Alert (RA) option validation. With strict RA option enabled, IGMP packets without RA options are ignored.

Use the **no** variant of this command to disable strict RA option validation.

**Syntax** `ip igmp ra-option`  
`no ip igmp ra-option`

**Default** The default state of RA validation is unset.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage notes** This command applies to interfaces configured for IGMP and IGMP Snooping.

**Examples** To enable strict Router Alert (RA) option validation on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp ra-option
```

# ip igmp robustness-variable

**Overview** Use this command to change the robustness variable value on an interface.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ip igmp robustness-variable <1-7>`  
`no ip igmp robustness-variable`

Parameter	Description
<1-7>	The robustness variable value.

**Default** The default robustness variable value is 2.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage notes** This command applies to interfaces configured for IGMP and IGMP Snooping.

**Examples** To set the robustness variable to 3 on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp robustness-variable 3
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping

**Overview** Use this command to enable IGMP Snooping. When this command is used in the Global Configuration mode, IGMP Snooping is enabled at the device level. When this command is used in Interface Configuration mode, IGMP Snooping is enabled for the specified VLANs.

Use the **no** variant of this command to either globally disable IGMP Snooping, or disable IGMP Snooping on a specified interface.

**NOTE:** *IGMP snooping cannot be disabled on an interface if IGMP snooping has already been disabled globally. IGMP snooping can be disabled on both an interface and globally if disabled on the interface first and then disabled globally.*

**Syntax** ip igmp snooping  
no ip igmp snooping

**Default** By default, IGMP Snooping is enabled both globally and on all VLANs.

**Mode** Global Configuration and Interface Configuration for a VLAN interface.

**Usage notes** For IGMP snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default.)

Both IGMP snooping and MLD snooping must be enabled globally on the device for IGMP snooping to operate. MLD snooping is also enabled by default. To enable it if it has been disabled, use the [ipv6 mld snooping](#) command in Global Configuration mode.

**Examples** To enable IGMP Snooping on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping
```

**Related commands** [ipv6 mld snooping](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping fast-leave

**Overview** Use this command to enable IGMP Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing. The IGMP group-membership entry is removed as soon as an IGMP leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

**Syntax** `ip igmp snooping fast-leave`  
`no ip igmp snooping fast-leave`

**Default** IGMP Snooping fast-leave processing is disabled.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This IGMP Snooping command can only be configured on VLAN interfaces.

**Example** To enable fast-leave processing on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping fast-leave
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping mrouter

**Overview** Use this command to statically configure the specified port as a multicast router port for IGMP Snooping for an interface. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to remove the static configuration of the port as a multicast router port.

**Syntax** `ip igmp snooping mrouter interface <port>`  
`no ip igmp snooping mrouter interface <port>`

Parameter	Description
<port>	The port may be a device port (e.g. port1.0.2), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).

**Mode** Interface Configuration for a VLAN interface.

**Example** To configure port1.0.2 statically as a multicast router interface for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping mrouter interface port1.0.2
```

**Related commands** [show ip igmp snooping mrouter](#)

# ip igmp snooping querier

**Overview** Use this command to enable IGMP querier operation when no multicast routing protocol is configured. When enabled, the IGMP Snooping querier sends out periodic IGMP queries for all interfaces. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to disable IGMP querier configuration.

**Syntax** `ip igmp snooping querier`  
`no ip igmp snooping querier`

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** The IGMP Snooping querier uses the 0 . 0 . 0 . 0 Source IP address because it only masquerades as a proxy IGMP querier for faster network convergence.

It does not start, or automatically cease, the IGMP Querier operation if it detects query message(s) from a multicast router.

If an IP address is assigned to a VLAN, which has IGMP querier enabled on it, then the IGMP Snooping querier uses the VLAN's IP address as the Source IP Address in IGMP queries.

The IGMP Snooping Querier will not stop sending IGMP Queries if there is another IGMP Snooping Querier in the network with a lower Source IP Address.

**NOTE:** Do not enable the IGMP Snooping Querier feature on a Layer 2 device when there is an operational IGMP Querier in the network.

**Example** To configure vlan2 as a Snooping querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping querier
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping report-suppression

**Overview** Use this command to enable report suppression for IGMP versions 1 and 2. This command applies to interfaces configured for IGMP Snooping.

Report suppression stops reports being sent to an upstream multicast router port when there are already downstream ports for this group on this interface.

Use the **no** variant of this command to disable report suppression.

**Syntax** `ip igmp snooping report-suppression`  
`no ip igmp snooping report-suppression`

**Default** Report suppression does not apply to IGMPv3, and is turned on by default for IGMPv1 and IGMPv2 reports.

**Mode** Interface Configuration for a VLAN interface.

**Example** To enable report suppression for IGMPv2 reports for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
awplus(config-if)# ip igmp snooping report-suppression
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping routermode

**Overview** Use this command to set the destination IP addresses as router multicast addresses.

Use the **no** variant of this command to set it to the default. You can also remove a specified IP address from a custom list of multicast addresses.

**Syntax** `ip igmp snooping routermode`  
`{all|default|ip|multicastrouter|address <ip-address>}`  
`no ip igmp snooping routermode [address <ip-address>]`

Parameter	Description
all	All reserved multicast addresses (224.0.0.x). Packets from all possible addresses in range 224.0.0.x are treated as coming from routers.
default	Default set of reserved multicast addresses. Packets from 224.0.0.1, 224.0.0.2, 224.0.0.4, 224.0.0.5, 224.0.0.6, 224.0.0.9, 224.0.0.13, 224.0.0.15 and 224.0.0.24 are treated as coming from routers.
ip	Custom reserved multicast addresses. Packets from custom IP address in the 224.0.0.x range are treated as coming from routers.
multicastrouter	Packets from DVMRP (224.0.0.4) and PIM (224.0.0.13) multicast addresses are treated as coming from routers.
address <ip-address>	Packets from the specified multicast address are treated as coming from routers. The address must be in the 224.0.0.x range.

**Default** The default routermode is **default** (not **all**) and shows the following reserved multicast addresses:

```
Router mode.....Def
Reserved multicast address
224.0.0.1
224.0.0.2
224.0.0.4
224.0.0.5
224.0.0.6
224.0.0.9
224.0.0.13
224.0.0.15
224.0.0.24
```

**Mode** Global Configuration

**Examples** To set **ip igmp snooping routermode** for all default reserved addresses enter:

```
awplus(config)# ip igmp snooping routermode default
```

To remove the multicast address 224.0.0.5 from the custom list of multicast addresses enter:

```
awplus(config)# no ip igmp snooping routermode address  
224.0.0.5
```

**Related commands** [ip igmp trusted](#)  
[show ip igmp snooping routermode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip igmp snooping source-timeout

**Overview** Use this command to set the global IGMP Snooping source time-out value (in seconds) on the switch.

Use the **no** variant of this command to set the source time-out value to be the same as the group membership timeout.

**Syntax** `ip igmp snooping source-timeout <timeout>`  
`no ip igmp snooping source-timeout <timeout>`

Parameter	Description
<code>&lt;timeout&gt;</code>	Time-out value in seconds <code>&lt;0-86400&gt;</code>

**Default** Global IGMP Snooping source-timeout is disabled by default, and unregistered multicast will be timed-out like normal entries.

Interface IGMP Snooping source timeout is disabled by default, and unregistered multicast will be timed-out like normal entries.

**Mode** Interface/Global Configuration

**Usage notes** The timeout determines how long unregistered multicast entries will be kept for. If the value '0' is specified, then effectively all unregistered multicast entries will never be timed out, and can only be cleared by using the command **clear ip igmp group**. The interface settings will always take precedence over the global setting.

**Example** To configure IGMP Snooping source timeout on 'vlan1', use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping source-timeout 200
```

**Related commands** [show ip igmp snooping source-timeout](#)

# ip igmp snooping tcn query solicit

**Overview** Use this command to enable IGMP (Internet Group Management Protocol) Snooping TCN (Topology Change Notification) Query Solicitation feature. When this command is used in the Global Configuration mode, Query Solicitation is enabled.

Use the **no** variant of this command to disable IGMP Snooping TCN Query Solicitation. When the **no** variant of this command is used in Interface Configuration mode, this overrides the Global Configuration mode setting and Query Solicitation is disabled.

**Syntax** `ip igmp snooping tcn query solicit`  
`no ip igmp snooping tcn query solicit`

**Default** IGMP Snooping TCN Query Solicitation is disabled by default on the device, unless the device is the Master Node in an EPSR ring, or is the Root Bridge in a Spanning Tree.

When the device is the Master Node in an EPSR ring, or the device is the Root Bridge in a Spanning Tree, then IGMP Snooping TCN Query Solicitation is enabled by default and cannot be disabled using the Global Configuration mode command. However, Query Solicitation can be disabled for specified interfaces using the **no** variant of this command from the Interface Configuration mode.

**Mode** Global Configuration, and Interface Configuration for a VLAN interface.

**Usage notes** Once enabled, if the device is not an IGMP Querier, on detecting a topology change, the device generates IGMP Query Solicit messages that are sent to all the ports of the vlan configured for IGMP Snooping on the device.

On a device that is not the Master Node in an EPSR ring or the Root Bridge in a Spanning Tree, Query Solicitation can be disabled using the **no** variant of this command after being enabled.

If the device that detects a topology change is an IGMP Querier then the device will generate an IGMP Query message.

Note that the **no** variant of this command when issued in Global Configuration mode has no effect on a device that is the Master Node in an EPSR ring or on a device that is a Root Bridge in a Spanning Tree. Query Solicitation is not disabled for the device these instances. However, Query Solicitation can be disabled on a per-vlan basis from the Interface Configuration mode.

See the following state table that shows when Query Solicit messages are sent in these instances:

Command issued from Global Configuration	Command issued from Interface Configuration	Device is STP Root Bridge or the EPSR Master Node	IGMP Query Solicit message sent on VLAN
No	Yes	Yes	Yes
Yes	No	Yes	No
Yes	Yes	Yes	Yes

See the [IGMP Feature Overview and Configuration Guide](#) for introductory information about the Query Solicitation feature.

**Examples** To enable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp snooping tcn query solicit
```

To enable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp snooping tcn query solicit
```

**Related commands** [ip igmp query-holdtime](#)  
[show ip igmp interface](#)  
[show running-config](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
 Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip igmp source-address-check

**Overview** This command enables the checking of the Source Address for an IGMP Report, rejecting any IGMP Reports originating on devices outside of the local subnet.

Use the **no** variant of this command to disable the checking of the Source Address for an IGMP Report, which allows IGMP Reports from devices outside of the local subnet.

**Syntax** `ip igmp source-address-check`  
`no ip igmp source-address-check`

**Default** Source address checking for IGMP Reports is enabled by default.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Usage notes** This is a security feature, and should be enabled unless IGMP Reports from outside the local subnet are expected, for example, if Multicast VLAN Registration is active in the network.

The no variant of this command is required to disable the IGMP Report source address checking feature in networks that use Multicast VLAN Registration to allow IGMP Reports from devices outside of the local subnet.

**Examples** To deny IGMP Reports from outside the current subnet for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp source-address-check
```

To allow IGMP Reports from outside the current subnet for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp source-address-check
```

**Validation Commands** `show ip igmp interface`  
`show running-config`

# ip igmp startup-query-count

**Overview** Use this command to configure the IGMP startup query count for an interface. The IGMP startup query count is the number of IGMP General Query messages sent by a querier at startup. The default IGMP startup query count is 2.

Use the **no** variant of this command to return an interface's configured IGMP startup query count to the default.

**Syntax** `ip igmp startup-query-count <startup-query-count>`  
`no ip igmp startup-query-count`

Parameter	Description
<code>&lt;startup-query-count&gt;</code>	Specify the IGMP startup query count, in the range 2-10.

**Default** The default IGMP startup query count is 2.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Example** To set the IGMP startup query count to 4 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp startup-query-count 4
```

**Related commands** [ip igmp last-member-query-count](#)  
[ip igmp startup-query-interval](#)

# ip igmp startup-query-interval

**Overview** Use this command to configure the IGMP startup query interval for an interface. The IGMP startup query interval is the amount of time in seconds between successive IGMP General Query messages sent by a querier during startup. The default IGMP startup query interval is one quarter of the IGMP query interval value.

Use the **no** variant of this command to return an interface's configured IGMP startup query interval to the default.

**Syntax** `ip igmp startup-query-interval <startup-query-interval>`  
`no ip igmp startup-query-interval`

Parameter	Description
<code>&lt;startup-query-interval&gt;</code>	Specify the IGMP startup query interval, in the range of 2-1800 seconds. The value must be one quarter of the IGMP query interval value.

**Default** The default IGMP startup query interval is one quarter of the IGMP query interval value.

**NOTE:** *The IGMP startup query interval must be one quarter of the IGMP query interval.*

**Mode** Interface Configuration for a VLAN or Eth interface.

**Example** To set the IGMP startup query interval to 15 seconds for vlan2, which is one quarter of the IGMP query interval of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp query-interval 60
awplus(config-if)# ip igmp startup-query-interval 15
```

**Related commands** [ip igmp last-member-query-interval](#)  
[ip igmp query-interval](#)  
[ip igmp startup-query-count](#)

# ip igmp trusted

**Overview** Use this command to allow IGMP to process packets received on certain trusted ports only.

Use the **no** variant of this command to stop IGMP from processing specified packets if the packets are received on the specified ports or aggregator.

**Syntax** `ip igmp trusted {all|query|report|routermode}`  
`no ip igmp trusted {all|query|report|routermode}`

Parameter	Description
all	Specifies whether or not the interface is allowed to receive all IGMP and other routermode packets
query	Specifies whether or not the interface is allowed to receive IGMP queries
report	Specifies whether or not the interface is allowed to receive IGMP membership reports
routermode	Specifies whether or not the interface is allowed to receive routermode packets

**Default** By default, all ports and aggregators are trusted interfaces, so IGMP is allowed to process all IGMP query, report, and router mode packets arriving on all interfaces.

**Mode** Interface mode for one or more switch ports or aggregators

**Usage** Because all ports are trusted by default, use this command in its **no** variant to stop IGMP processing packets on ports you do not trust.

For example, you can use this command to make sure that only ports attached to approved IGMP routers are treated as router ports.

**Example** To stop ports port1.0.3-port1.0.6 from being treated as router ports by IGMP, use the commands:

```
awplus(config)# interface port1.0.3-port1.0.6  
awplus(config-if)# no ip igmp trusted routermode
```

**Related commands** [ip igmp snooping routermode](#)

# ip igmp version

**Overview** Use this command to set the current IGMP version (IGMP version 1, 2 or 3) on an interface.

Use the **no** variant of this command to return to the default version.

**Syntax** `ip igmp version <1-3>`  
`no ip igmp version`

Parameter	Description
<code>version &lt;1-3&gt;</code>	IGMP protocol version number

**Default** The default IGMP version is 3.

**Mode** Interface Configuration for a VLAN or Eth interface.

**Example** To set the IGMP version to 2 for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
```

**Related commands** [show ip igmp interface](#)

# show debugging igmp

**Overview** Use this command to see what debugging is turned on for IGMP.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging igmp`

**Mode** User Exec and Privileged Exec

**Example** To display the IGMP debugging options set, enter the command:

```
awplus# show debugging igmp
```

**Output** Figure 37-1: Example output from the **show debugging igmp** command

```
IGMP Debugging status:
IGMP Decoder debugging is on
IGMP Encoder debugging is on
IGMP Events debugging is on
IGMP FSM debugging is on
IGMP Tree-Info-Base (TIB) debugging is on
```

**Related commands** [debug igmp](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp groups

**Overview** Use this command to display the multicast groups with receivers directly connected to the router, and learned through IGMP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp groups [<ip-address>|<interface> detail | brief]`

Parameter	Description
<ip-address>	Address of the multicast group, entered in the form A.B.C.D.
<interface>	Interface name for which to display local information.
brief	Brief display of all interfaces

**Mode** User Exec and Privileged Exec

**Example** The following command displays local-membership information for all ports in all interfaces:

```
awplus# show ip igmp groups
```

**Output** Figure 37-2: Example output from **show ip igmp groups**

IGMP Connected Group Membership				
Group Address	Interface	Uptime	Expires	Last Reporter
224.0.1.1	port1.0.1	00:00:09	00:04:17	10.10.0.82
224.0.1.24	port1.0.2	00:00:06	00:04:14	10.10.0.84
...				

Table 37-1: Parameters in the output of **show ip igmp groups**

Parameter	Description
Group Address	Address of the multicast group.
Interface	Port through which the group is reachable.
Uptime	The time in weeks, days, hours, minutes, and seconds that this multicast group has been known to the device.
Expires	Time (in hours, minutes, and seconds) until the entry expires.
Last Reporter	Last host to report being a member of the multicast group.

- Command changes**
- Version 5.4.7-1.1: VRF-lite support added SBx8100.
  - Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.
  - Version 5.4.8-2.3: **brief** parameter added.

# show ip igmp interface

**Overview** Use this command to display the state of IGMP, IGMP Proxy service, and IGMP Snooping for a specified VLAN, or all VLANs. IGMP is shown as Active or Disabled in the show output. You can also display the number of groups a switch port belongs to.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp interface [<interface>]`

Parameter	Description
<code>&lt;interface&gt;</code>	The name of the interface. If you specify a switch port number, the output displays the number of groups the port belongs to, and the port’s group membership limit, if a limit has been set (with the command <code>ip igmp maximum-groups</code> ).

**Mode** User Exec and Privileged Exec

**Output** The following output shows IGMP interface status for vlan2 with IGMP Snooping enabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
  IGMP Disabled, Inactive, Version 3 (default)
  IGMP interface has 0 group-record states
  IGMP activity: 0 joins, 0 leaves
  IGMP robustness variable is 2
  IGMP last member query count is 2
  IGMP query interval is 125 seconds
  IGMP query holdtime is 500 milliseconds
  IGMP querier timeout is 255 seconds
  IGMP max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  Strict IGMPv3 ToS checking is disabled on this interface
  Source Address checking is enabled
  IGMP Snooping is globally enabled
  IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
  IGMP Snooping is enabled on this interface
  IGMP Snooping fast-leave is not enabled
  IGMP Snooping querier is not enabled
  IGMP Snooping report suppression is enabled
```

The following output shows IGMP interface status for vlan2 with IGMP Snooping disabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
  IGMP Disabled, Inactive, Version 3 (default)
  IGMP interface has 0 group-record states
  IGMP activity: 0 joins, 0 leaves
  IGMP robustness variable is 2
  IGMP last member query count is 2
  IGMP query interval is 125 seconds
  IGMP query holdtime is 500 milliseconds
  IGMP querier timeout is 255 seconds
  IGMP max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  Strict IGMPv3 ToS checking is disabled on this interface
  Source Address checking is enabled
  IGMP Snooping is globally enabled
  IGMP Snooping query solicitation is globally disabled
    Num. query-solicit packets: 57 sent, 0 recvd
  IGMP Snooping is not enabled on this interface
  IGMP Snooping fast-leave is not enabled
  IGMP Snooping querier is not enabled
  IGMP Snooping report suppression is enabled
```

The following output displays membership information for port1.0.1:

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
  Maximum groups limit set: 10
  Number of groups port belongs to: 0
```

**Command  
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp proxy

**Overview** Use this command to display the state of IGMP Proxy services for a specified interface or for all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp proxy`

**Mode** User Exec and Privileged Exec

**Example** To display the state of IGMP Proxy services for all interfaces, enter the command:

```
awplus# show ip igmp proxy
```

**Output** Figure 37-3: Example output from **show ip igmp proxy**

```
awplus#show ip igmp proxy
Interface vlan40 (Index 340)
Administrative status: enabled
Operational status: up
Upstream interface is vlan30
Number of multicast groups: 1
```

**Related commands** [ip igmp proxy-service](#)

# show ip igmp proxy groups

**Overview** Use this command to display multicast groups with receivers directly connected to the router, learned through IGMP, which use a proxy service. You can also use a filter to specify a multicast group IP address and /or interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax**

```
show ip igmp proxy groups [detail]
show ip igmp proxy groups <multicast-group> [detail]
show ip igmp proxy groups <vlan> [detail]
show ip igmp proxy groups <vlan> <multicast-group> [detail]
```

Parameter	Description
groups	Specify IGMP proxy group membership information.
detail	Specify detailed IGMPv3 source information.
<vlan>	Specify the name of a single VLAN interface, for example <b>vlan1</b> .
<multicast-group>	Specify the IPv4 address in of the multicast group, in the format A.B.C.D.

**Mode** User Exec

**Example** To display local membership information for IGMP proxy service interfaces, use the command:

```
awplus# show ip igmp proxy groups
```

**Output** Figure 37-4: Example output from **show ip igmp proxy groups**

```
awplus#show ip igmp proxy groups
IGMP Connected Proxy Group Membership
Group Address      Interface          Member state
224.9.10.11       vlan10            Delay
```

**Example** To display local membership information for IGMP proxy service interfaces, use the command:

```
awplus# show ip igmp proxy groups detail
```

**Output** Figure 37-5: Example output from **show ip igmp proxy groups detail**

```
awplus#show ip igmp proxy groups detail
Interface:      vlan10
Group:          224.9.10.11
Group mode:     Exclude
Member state:   Delay
Source list is empty

Summary :
IGMP Connected Proxy Group Membership
Group Address   Interface      Member state
224.9.10.11    vlan10         DelayDetail :
Interface:      vlan10
Group:          224.9.10.11
Group mode:     Exclude
Member state:   Delay
Source list is empty
```

Table 37-2: Parameters in the output of **show ip igmp proxy groups**

Parameter	Description
Interface	The interface that received the IGMP report.
Group	The multicast group address that has been requested by the IGMP report.
Group mode	<b>Include</b> mode indicates that the multicast receiver has sent an IGMPv3 report for a group with a list of addresses that it wants to receive traffic from. <b>Exclude</b> mode indicates that the multicast receiver has sent an IGMPv3 report for a group with a list of addresses that it does not want to receive traffic from.
Member state	<b>Delay</b> indicates that no group or source query timers are running for the specified group, otherwise the member state is shown as <b>Idle</b> .

**Related commands** [show ip igmp proxy](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping mrouter

**Overview** Use this command to display the multicast router ports, both static and dynamic, in a VLAN.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp snooping mrouter [interface <interface>]`

Parameter	Description
interface	A specific interface.
<interface>	The name of the VLAN interface.

**Mode** User Exec and Privileged Exec

**Example** To show all multicast router interfaces, use the command:

```
awplus# show ip igmp snooping mrouter
```

To show the multicast router interfaces in `vlan1`, use the command:

```
awplus# show ip igmp snooping mrouter interface vlan1
```

**Output** Figure 37-6: Example output from **show ip igmp snooping mrouter**

VLAN	Interface	Static/Dynamic
1	port1.0.1	Statically configured
200	port1.0.2	Statically configured

Figure 37-7: Example output from **show ip igmp snooping mrouter interface vlan1**

VLAN	Interface	Static/Dynamic
1	port1.0.1	Statically configured

**Related commands** [ip igmp snooping mrouter](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping routermode

**Overview** Use this command to display the current router mode and the list of IP addresses set as router multicast addresses from the [ip igmp snooping routermode](#) command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip igmp snooping routermode

**Mode** User Exec and Privileged Exec

**Example** To show the router mode and the list of router multicast addresses, use the command:

```
awplus# show ip igmp snooping routermode
```

**Output** Figure 37-8: Example output from **show ip igmp snooping routermode**

```
awplus#show ip igmp snooping routermode
Router mode.....Def
Reserved multicast address

      224.0.0.1
      224.0.0.2
      224.0.0.4
      224.0.0.5
      224.0.0.6
      224.0.0.9
      224.0.0.13
      224.0.0.15
      224.0.0.24
```

**Related commands** [ip igmp snooping routermode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping source-timeout

**Overview** Use this command to display the configured IGMP snooping source timeouts for a specified VLAN or VLAN range.

**Syntax** `show ip igmp snooping source-timeout [interface|  
<interface-range>]`

Parameter	Description
<interface-range>	The name of the VLAN interface or VLAN range

**Mode** Privileged Exec

**Example** To display the configured IGMP snooping source timeouts for all VLANs, use the command:

```
awplus# show ip igmp snooping source-timeout
```

**Output** Figure 37-9: Example output from **show ip igmp snooping source-timeout**

```
awplus#show ip igmp snooping source-timeout
Global IGMP snooping source-timeout is enabled (60 secs)

vlan1          enabled (300 secs)
vlan2          inherits global setting
vlan1000       inherits global settingawplus#show ip igmp
snooping source-timeout int vlan1
Global IGMP snooping source-timeout is enabled (60 secs)vlan1
enabled (300 secs)
```

**Related commands** [ip igmp snooping source-timeout](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping statistics

**Overview** Use this command to display IGMP Snooping statistics data.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp snooping statistics interface <interface-range> [group [<ip-address>]]`

Parameter	Description
<ip-address>	Optionally specify the address of the multicast group, entered in the form A.B.C.D.
<interface>	Specify the name of the interface or interface range. If you specify a port number, the output displays the number of groups the port belongs to, and the port’s group membership limit, if a limit has been set (with the command <code>ip igmp maximum-groups</code> )

**Mode** Privileged Exec

**Example** To display IGMP statistical information for **vlan1** and **vlan2**, use the command:

```
awplus# show ip igmp snooping statistics interface vlan1-vlan2
```

**Output** Figure 37-10: Example output from the **show ip igmp snooping statistics** command for VLANs

```
awplus#show ip igmp interface vlan1-vlan2
IGMP Snooping statistics for vlan1
Interface:      port1.0.1
Group:         224.1.1.1
Uptime:        00:00:09
Group mode:    Exclude (Expires: 00:04:10)
Last reporter: 10.4.4.5
Source list is empty
IGMP Snooping statistics for vlan2
Interface:      port1.0.2
Group:         224.1.1.2
Uptime:        00:00:19
Group mode:    Exclude (Expires: 00:05:10)
Last reporter: 10.4.4.6
Source list is empty
```

Figure 37-11: Example output from the **show ip igmp snooping statistics** command for a switch port

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
  Maximum groups limit set: 10
  Number of groups port belongs to: 0
```

**Command  
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# undebug igmp

**Overview** This command applies the functionality of the no `debug igmp` command.

# 38

# MLD and MLD Snooping Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of configuration, clear, and show commands related to MLD and MLD Snooping.

The Multicast Listener Discovery (MLD) module includes the MLD Proxy service and MLD Snooping functionality. Some of the following commands may have commonalities and restrictions; these are described under the Usage section for each command.

MLD and MLD Snooping commands only apply to switch ports, not Ethernet interfaces.

Before using PIM-SMv6:

- IPv6 must be enabled on an interface ([ipv6 enable](#)),
- IPv6 forwarding must be enabled globally for routing IPv6 ([ipv6 forwarding](#)), and
- IPv6 multicasting must be enabled globally ([ipv6 multicast-routing](#)).

- Command List**
- [“clear ipv6 mld”](#) on page 1842
  - [“clear ipv6 mld group”](#) on page 1843
  - [“clear ipv6 mld interface”](#) on page 1844
  - [“debug mld”](#) on page 1845
  - [“ipv6 mld”](#) on page 1846
  - [“ipv6 mld last-member-query-count”](#) on page 1847
  - [“ipv6 mld last-member-query-interval”](#) on page 1848
  - [“ipv6 mld querier-timeout”](#) on page 1849
  - [“ipv6 mld query-interval”](#) on page 1850
  - [“ipv6 mld query-max-response-time”](#) on page 1851
  - [“ipv6 mld robustness-variable”](#) on page 1852

- [“ipv6 mld snooping”](#) on page 1853
- [“ipv6 mld snooping fast-leave”](#) on page 1855
- [“ipv6 mld snooping mrouter”](#) on page 1856
- [“ipv6 mld snooping querier”](#) on page 1858

- [“show ipv6 mld snooping statistics”](#) on page 1869

# clear ipv6 mld

**Overview** Use this command to clear all MLD local memberships on all interfaces.

**Syntax** `clear ipv6 mld`

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

**Example** `awplus# clear ipv6 mld`

**Related commands** `clear ipv6 mld group`  
`clear ipv6 mld interface`

# clear ipv6 mld group

**Overview** Use this command to clear MLD specific local-membership(s) on all interfaces, for a particular group.

**Syntax** `clear ipv6 mld group {*|<ipv6-address>}`

Parameter	Description
*	Clears all groups on all interfaces. This is an alias to the <a href="#">clear ipv6 mld</a> command.
<ipv6-address>	Specify the group address for which MLD local-memberships are to be cleared from all interfaces. Specify the IPv6 multicast group address in the format in the format X:X::X:X.

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

**Example** `awplus# clear ipv6 mld group *`

**Related commands** [clear ipv6 mld](#)  
[clear ipv6 mld interface](#)

# clear ipv6 mld interface

**Overview** Use this command to clear MLD interface entries.

**Syntax** `clear ipv6 mld interface <interface>`

Parameter	Description
<interface>	Specifies name of the interface; all groups learned from this interface are deleted.

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

**Example** `awplus# clear ipv6 mld interface vlan2`

**Related commands** [clear ipv6 mld](#)  
[clear ipv6 mld group](#)

# debug mld

**Overview** Use this command to enable all MLD debugging modes, or a specific MLD debugging mode.

Use the **no** variant of this command to disable all MLD debugging modes, or a specific MLD debugging mode.

**Syntax** `debug mld {all|decode|encode|events|fsm|tib}`  
`no debug mld {all|decode|encode|events|fsm|tib}`

Parameter	Description
all	Debug all MLD.
decode	Debug MLD decoding.
encode	Debug MLD encoding.
events	Debug MLD events.
fsm	Debug MLD Finite State Machine (FSM).
tib	Debug MLD Tree Information Base (TIB).

**Mode** Privileged Exec and Global Configuration

**Usage notes** This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

**Examples**

```
awplus# configure terminal
awplus(config)# debug mld all
awplus# configure terminal
awplus(config)# debug mld decode
awplus# configure terminal
awplus(config)# debug mld encode
awplus# configure terminal
awplus(config)# debug mld events
```

**Related commands** [show debugging mld](#)

# ipv6 mld

**Overview** Use this command to enable the MLD protocol operation on an interface. This command enables MLD protocol operation in stand-alone mode, and can be used to learn local-membership information prior to enabling a multicast routing protocol on the interface.

Use the **no** variant of this command to return all MLD related configuration to the default (including MLD Snooping).

**Syntax** `ipv6 mld`  
`no ipv6 mld`

**Default** MLD is disabled by default.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld
```

# ipv6 mld last-member-query-count

**Overview** Use this command to set the last-member query-count value.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ipv6 mld last-member-query-count <value>`  
`no ipv6 mld last-member-query-count`

Parameter	Description
<value>	Count value. Valid values are from 2 to 7.

**Default** The default last-member query-count value is 2.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-count 3
```

# ipv6 mld last-member-query-interval

**Overview** Use this command to configure the interval at which the router sends MLD group-specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

**Syntax** `ipv6 mld last-member-query-interval <milliseconds>`  
`no ipv6 mld last-member-query-interval`

Parameter	Description
<code>&lt;milliseconds&gt;</code>	The time delay between successive query messages (in milliseconds). Valid values are from 1000 to 25500 milliseconds.

**Default** 1000 milliseconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-interval 2000
```

# ipv6 mld querier-timeout

**Overview** Use this command to configure the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

**Syntax** `ipv6 mld querier-timeout <seconds>`  
`no ipv6 mld querier-timeout`

Parameter	Description
<code>&lt;seconds&gt;</code>	Number of seconds that the router waits after the previous querier has stopped querying before it takes over as the querier. Valid values are from 2 to 65535 seconds.

**Default** 255 seconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** This command applies to interfaces configured for MLD Layer-3 multicast protocols.

**Example** The following example configures the router to wait 120 seconds from the time it received the last query before it takes over as the querier for the interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld querier-timeout 120
```

**Related commands** [ipv6 mld query-interval](#)

# ipv6 mld query-interval

**Overview** Use this command to configure the frequency of sending MLD host query messages.

Use the **no** variant of this command to return to the default frequency.

**Syntax** `ipv6 mld query-interval <seconds>`  
`no ipv6 mld query-interval`

Parameter	Description
<code>&lt;seconds&gt;</code>	Variable that specifies the time delay between successive MLD host query messages (in seconds). Valid values are from 1 to 18000 seconds.

**Default** The default query interval is 125 seconds.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols.

**Example** The following example changes the frequency of sending MLD host-query messages to 2 minutes:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-interval 120
```

**Related commands** [ipv6 mld querier-timeout](#)

# ipv6 mld query-max-response-time

**Overview** Use this command to configure the maximum response time advertised in MLD queries.

Use the **no** variant of with this command to restore the default.

**Syntax** `ipv6 mld query-max-response-time <seconds>`  
`no ipv6 mld query-max-response-time`

Parameter	Description
<code>&lt;seconds&gt;</code>	Maximum response time (in seconds) advertised in MLD queries. Valid values are from 1 to 240 seconds.

**Default** 10 seconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols.

**Example** The following example configures a maximum response time of 8 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-max-response-time 8
```

# ipv6 mld robustness-variable

**Overview** Use this command to change the robustness variable value on an interface.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ipv6 mld robustness-variable <value>`  
`no ipv6 mld robustness-variable`

**Default** The default robustness variable value is 2.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld robustness-variable 3
```

# ipv6 mld snooping

**Overview** Use this command to enable MLD Snooping. When this command is issued in the Global Configuration mode, MLD Snooping is enabled globally for the device. When this command is issued in Interface mode for a VLAN then MLD Snooping is enabled for the specified VLAN. Note that MLD Snooping is enabled on the VLAN only if it is enabled globally and on the VLAN.

Use the **no** variant of this command to globally disable MLD Snooping in Global Configuration mode, or for the specified VLAN interface in Interface mode.

**Syntax** `ipv6 mld snooping`  
`no ipv6 mld snooping`

**Default** By default, MLD Snooping is enabled both globally and on all VLANs.

**Mode** Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** For MLD Snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default).

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

**Examples** To configure MLD Snooping on the VLAN interfaces `vlan2-vlan4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interfaces `vlan2-vlan4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config)# no ipv6 mld snooping
```

To configure MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal  
awplus(config)# ipv6 mld snooping
```

To disable MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal  
awplus(config)# no ipv6 mld snooping
```

# ipv6 mld snooping fast-leave

**Overview** Use this command to enable MLD Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing; the MLD group-membership is removed as soon as an MLD leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

**Syntax** `ipv6 mld snooping fast-leave`  
`no ipv6 mld snooping fast-leave`

**Default** MLD Snooping fast-leave processing is disabled.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** This MLD Snooping command can only be configured on VLAN interfaces.

**Examples** This example shows how to enable fast-leave processing on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping fast-leave
```

This example shows how to enable fast-leave processing on the VLAN interface `vlan2-vlan4`.

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping fast-leave
```

# ipv6 mld snooping mrouter

**Overview** Use this command to statically configure the specified port as a Multicast Router interface for MLD Snooping within the specified VLAN.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to remove the static configuration of the interface as a Multicast Router interface.

**Syntax** `ipv6 mld snooping mrouter interface <port>`  
`no ipv6 mld snooping mrouter interface <port>`

Parameter	Description
<port>	Specify the name of the port.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** This MLD Snooping command statically configures a switch port as a Multicast Router interface.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if port1.0.1 and port1.0.6 are ports on an EPSR data VLAN vlan101, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

Figure 38-1: Example **ipv6 mld snooping mrouter** commands when static IPv6 multicast routing is being used and the destination VLAN is an EPSR data VLAN:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.6
```

**Examples** This example shows how to specify the next-hop interface to the multicast router for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping mrrouter interface
port1.0.5
```

This example shows how to specify the next-hop interface to the multicast router for VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping mrrouter interface
port1.0.5
```

**Related commands** [ipv6 multicast route](#)

# ipv6 mld snooping querier

**Overview** Use this command to enable MLD querier operation on a subnet (VLAN) when no multicast routing protocol is configured in the subnet (VLAN). When enabled, the MLD Snooping querier sends out periodic MLD queries for all interfaces on that VLAN.

Use the **no** variant of this command to disable MLD querier configuration.

**Syntax** `ipv6 mld snooping querier`  
`no ipv6 mld snooping querier`

**Mode** Interface Configuration for a specified VLAN interface.

**Usage** This command can only be configured on a single VLAN interface - not on multiple VLANs.

The MLD Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as an MLD querier for faster network convergence.

The MLD Snooping querier does not start, or automatically cease, the MLD Querier operation if it detects query message(s) from a multicast router. It restarts as an MLD Snooping querier if no queries are seen within the other querier interval.

Do not enable MLD Snooping querier if you have already enabled MLD on your device.

Do not enable MLD Snooping querier on your device and then enable MLD afterwards.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ipv6 mld snooping querier`

# ipv6 mld snooping report-suppression

**Overview** Use this command to enable report suppression from hosts for Multicast Listener Discovery version 1 (MLDv1) on a VLAN in Interface Configuration mode.

Use the **no** variant of this command to disable report suppression on a VLAN in Interface Configuration mode.

**Syntax** `ipv6 mld snooping report-suppression`  
`no ipv6 mld snooping report-suppression`

**Default** Report suppression does not apply to MLDv2, and is turned on by default for MLDv1 reports.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This MLD Snooping command can only be configured on VLAN interfaces. MLDv1 Snooping maybe configured to suppress reports from hosts. When a querier sends a query, only the first report for particular set of group(s) from a host will be forwarded to the querier by the MLD Snooping device. Similar reports (to the same set of groups) from other hosts, which would not change group memberships in the querier, will be suppressed by the MLD Snooping device to prevent 'flooding' of query responses.

**Examples** This example shows how to enable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 mld snooping report-suppression
```

This example shows how to enable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ipv6 mld snooping report-suppression
```

# ipv6 mld ssm-map enable

**Overview** Use this command to enable the Source Specific Multicast (SSM) mapping feature on the device.

Use the **no** variant of this command to disable the SSM mapping feature on the device.

**Syntax** `ipv6 mld ssm-map enable`  
`no ipv6 mld ssm-map enable`

**Mode** Global Configuration

**Usage notes** This command enables the SSM mapping feature for group members in the defined SSM range.

**Example** This example shows how to enable the MLD SSM mapping feature on the device.

```
awplus# configure terminal
awplus(config)# ipv6 mld ssm-map enable
```

# ipv6 mld static-group

**Overview** Use this command to statically configure IPv6 group membership entries on an interface. To statically add only a group membership, do not specify any parameters.

Use the **no** variant of this command to delete static group membership entries.

**Syntax** `ipv6 mld static-group <ipv6-group-address> [source <ipv6-source-address>] [interface <port>]`  
`no ipv6 mld static-group <ipv6-group-address> [source <ipv6-source-address>] [interface <port>]`

Parameter	Description
<code>&lt;ipv6-group-address&gt;</code>	Specify a standard IPv6 Multicast group address to be configured as a static group member. The IPv6 address uses the format X:X::X:X.
<code>&lt;ipv6-source-address&gt;</code>	Optional. Specify a standard IPv6 source address to be configured as a static source from where multicast packets originate. The IPv6 address uses the format X:X::X:X.
<code>&lt;port&gt;</code>	Optional. Physical interface. This parameter specifies a physical port. If this parameter is used, the static configuration is applied to just to that physical interface. If this parameter is not used, the static configuration is applied on all ports in the VLAN.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to MLD Snooping on a VLAN interface to statically add groups and/or source records.

**Examples** To add a static group record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10
```

To add a static group and source record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
fe80::2fd:6cff:fe1c:b
```

To add a static group record on a specific port on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 interface
port1.0.4
```

# ipv6 mld version

**Overview** Use this command to set the current MLD protocol version on an interface.  
Use the **no** variant of this command to return to the default version on an interface.

**Syntax** `ipv6 mld version <version>`  
`no ipv6 mld version`

Parameter	Description
<code>&lt;version&gt;</code>	MLD protocol version number. Valid version numbers are 1 and 2

**Default** The default MLD protocol version number is 2.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to interfaces configured for MLD Layer-3 multicast protocols and MLD Snooping. Note this command is intended for use where there is another querier (when there is another device with MLD enabled) on the same link that can only operate with MLD version 1. Otherwise, the default MLD version 2 is recommended for performance.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld version 1
```

# show debugging mld

**Overview** Use this command to see what debugging is turned on for MLD. MLD debugging modes are enabled with the [debug mld](#) command.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** show debugging mld

**Mode** Privileged Exec

**Example** awplus# show debugging mld

## Output

```
show debugging mld
MLD Debugging status:
  MLD Decoder debugging is on
  MLD Encoder debugging is on
  MLD Events debugging is on
  MLD FSM debugging is on
  MLD Tree-Info-Base (TIB) debugging is on
```

**Related commands** [debug mld](#)

# show ipv6 mld groups

**Overview** Use this command to display the multicast groups that have receivers directly connected to the router and learned through MLD.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 mld groups [<ipv6-address>|<interface>] [detail]`

Parameter	Description
<ipv6-address>	Optional. Specify Address of the multicast group in format X:X::X:X.
<interface>	Optional. Specify the Interface name for which to display local information.

**Mode** User Exec and Privileged Exec

**Examples** The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups
```

**Output** Figure 38-2: Example output for **show ipv6 mld groups**

```
awplus#show ipv6 mld groups
MLD Connected Group Membership
Group Address                Interface                Uptime    Expires
                               Last Reporter
ff08::1                      vlan10 (port1.0.1)      00:07:27 00:03:10
                               fe80::200:1ff:fe20:b5ac
```

The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups detail
```

# show ipv6 mld interface

**Overview** Use this command to display the state of MLD and MLD Snooping for a specified interface, or all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 mld interface [<interface>]`

Parameter	Description
<interface>	Interface name.

**Mode** User Exec and Privileged Exec

**Example** The following command displays MLD interface status on all interfaces enabled for MLD:

```
awplus# show ipv6 mld interface
```

## Output

```
awplus#show ipv6 mld interface
Interface vlan1 (Index 301)
  MLD Enabled, Active, Querier, Version 2 (default)
  Internet address is fe80::215:77ff:fec9:7468
  MLD interface has 0 group-record states
  MLD activity: 0 joins, 0 leaves
  MLD robustness variable is 2
  MLD last member query count is 2
  MLD query interval is 125 seconds
  MLD querier timeout is 255 seconds
  MLD max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  MLD Snooping is globally enabled
  MLD Snooping is enabled on this interface
  MLD Snooping fast-leave is not enabled
  MLD Snooping querier is enabled
  MLD Snooping report suppression is enabled
```

# show ipv6 mld snooping mrouter

**Overview** Use this command to display the multicast router interfaces, both configured and learned, in a VLAN. If you do not specify a VLAN interface then all the VLAN interfaces are displayed.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 mld snooping mrouter [<interface>]`

Parameter	Description
<interface>	Optional. Specify the name of the VLAN interface. Note: If you do not specify a single VLAN interface, then all VLAN interfaces are shown.

**Mode** User Exec and Privileged Exec

**Examples** The following command displays the multicast router interfaces in `vlan2`:

```
awplus# show ipv6 mld snooping mrouter vlan2
```

## Output

```
awplus#show ipv6 mld snooping mrouter vlan2
VLAN    Interface    Static/Dynamic
2       port1.0.2    Dynamically Learned
2       port1.0.3    Dynamically Learned
```

The following command displays the multicast router interfaces for all VLAN interfaces:

```
awplus# show ipv6 mld snooping mrouter
```

## Output

```
awplus#show ipv6 mld snooping mrouter
VLAN    Interface    Static/Dynamic
2       port1.0.2    Dynamically Learned
2       port1.0.3    Dynamically Learned
3       port1.0.4    Statically Assigned
3       port1.0.5    Statically Assigned
```

# show ipv6 mld snooping statistics

**Overview** Use this command to display MLD Snooping statistics data.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus”\\_Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 mld snooping statistics interface <interface>`

Parameter	Description
<interface>	The name of the VLAN interface.

**Mode** User Exec and Privileged Exec

**Example** The following command displays MLDv2 statistical information for vlan1:

```
awplus# show ipv6 mld snooping statistics interface vlan1
```

## Output

```
awplus#show ipv6 mld snooping statistics interface vlan1
MLD Snooping statistics for vlan1
Interface:      port1.0.1
Group:         ff08::1
Uptime:        00:02:18
Group mode:    Include ( )
Last reporter: fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
  Source Address      Uptime      v2 Exp      Fwd  Flags
  2001:db8::1         00:02:18    00:02:02  Yes  R
  2001:db8::3         00:02:18    00:02:02  Yes  R
```

# 39

# Multicast Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of multicast commands for configuring:

- IPv4 and IPv6 multicast forwarding
- IPv4 and IPv6 static multicast routes
- mroutes (routes back to a multicast source)

For commands for other multicast protocols, see:

- [IGMP and IGMP Snooping Commands](#)
- [MLD and MLD Snooping Commands](#)
- [PIM-SM Commands](#)
- [PIM-SMv6 Commands](#)

**NOTE:** Before using PIM-SMv6 commands, IPv6 must be enabled on an interface with the *ipv6 enable* command, IPv6 forwarding must be enabled globally for routing IPv6 with the *ipv6 forwarding* command, and IPv6 multicasting must be enabled globally with the *ipv6 multicast-routing* command.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the *clear ipv6 mroute* command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

- Command List**
- “clear ip mroute” on page 1872
  - “clear ip mroute statistics” on page 1873
  - “clear ipv6 mroute” on page 1874
  - “clear ipv6 mroute statistics” on page 1875
  - “debug nsm” on page 1876
  - “debug nsm mcast” on page 1877
  - “debug nsm mcast6” on page 1878
  - “ip mroute” on page 1879
  - “ip multicast route” on page 1881
  - “ip multicast route-limit” on page 1883
  - “ip multicast wrong-vif-suppression” on page 1884
  - “ip multicast-routing” on page 1885
  - “ipv6 mroute” on page 1886
  - “ipv6 multicast route” on page 1888
  - “ipv6 multicast route-limit” on page 1890
  - “ipv6 multicast-routing” on page 1891
  - “multicast” on page 1892
  - “platform multicast-ratelimit” on page 1893
  - “show debugging nsm mcast” on page 1894
  - “show ip mroute” on page 1895
  - “show ip mvif” on page 1898
  - “show ip rpf” on page 1899
  - “show ipv6 mroute” on page 1900
  - “show ipv6 multicast forwarding” on page 1902
  - “show ipv6 mif” on page 1903

# clear ip mroute

**Overview** Use this command to delete entries from the IPv4 multicast routing table.

**NOTE:** If you use this command, you should also use the [clear ip igmp group](#) command to clear IGMP group membership records.

**Syntax** `clear ip mroute {*|<ipv4-group-address>  
[<ipv4-source-address>]} [pim sparse-mode]`

Parameter	Description
*	Deletes all multicast routes.
<ipv4-group-address>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-source-address>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
pim sparse-mode	Clear specified IPv4 multicast route(s) for PIM Sparse Mode only.

**Mode** Privileged Exec

**Usage notes** When this command is used, the Multicast Routing Information Base (MRIB) clears the IPv4 multicast route entries in its IPv4 multicast route table, and removes the entries from the multicast forwarder. The MRIB sends a "clear" message to the multicast protocols. Each multicast protocol has its own "clear" multicast route command. The protocol-specific "clear" command clears multicast routes from PIM Sparse Mode, and also clears the routes from the MRIB.

**Examples** `awplus# clear ip mroute 225.1.1.1 192.168.3.3`  
`awplus# clear ip mroute *`

**Related commands** [ip multicast route](#)  
[show ip mroute](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip mroute statistics

**Overview** Use this command to delete multicast route statistics entries from the IP multicast routing table.

**Syntax** `clear ip mroute statistics {*|<ipv4-group-addr>  
[<ipv4-source-addr>]}`

Parameter	Description
*	All multicast route entries.
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.

**Mode** Privileged Exec

**Example** `awplus# clear ip mroute statistics 225.1.1.2 192.168.4.4`  
`awplus# clear ip mroute statistics *`

# clear ipv6 mroute

**Overview** Use this command to delete one or more dynamically-added route entries from the IPv6 multicast routing table.

You need to do this, for example, if you want to create a static route instead of an existing dynamic route.

**Syntax** `clear ipv6 mroute {*|<ipv6-group-address> [ <ipv6-source-address> ] }`

Parameter	Description
*	Deletes all dynamically-learned IPv6 multicast routes.
<ipv6-group-address>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<ipv6-source-address>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.

**Mode** Privileged Exec

**Usage notes** When this command is used, the Multicast Routing Information Base (MRIB) clears the relevant IPv6 multicast route entries in its IPv6 multicast route table, and removes the entries from the multicast forwarder. The MRIB sends a “clear” message to the multicast protocols. Each multicast protocol has its own “clear” multicast route command.

This command does not remove static routes from the routing table or the configuration. To remove static routes, use the **no** parameter of the command [ipv6 multicast route](#).

**Example** `awplus# clear ipv6 mroute 2001::2 ff08::1`

**Related commands** [ipv6 multicast route](#)  
[show ipv6 mroute](#)

# clear ipv6 mroute statistics

**Overview** Use this command to delete multicast route statistics entries from the IPv6 multicast routing table.

**NOTE:** *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the `clear ipv6 mroute` command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

**Syntax** `clear ipv6 mroute statistics {*|<ipv6-group-address> [<ipv6-source-address>]}`

Parameter	Description
*	All multicast route entries.
<ipv6-group-addr>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<ipv6-source-addr>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.

**Mode** Privileged Exec

**Examples**

```
awplus# clear ipv6 mroute statistics 2001::2 ff08::1  
awplus# clear ipv6 mroute statistics *
```

# debug nsm

**Overview** This command specifies a set of debug options for use by Allied Telesis authorized service personnel only.

Use the **no** variant of this command to remove debug options.

**Syntax** `debug nsm [all|events|ha|kernel]`  
`no debug nsm [all|events|ha|kernel]`

Parameter	Description
all	Enables all the nsm debugging options
events	Enables the nsm events debugging options
ha	Enables the nsm high availability debugging options
kernel	Enables the nsm kernel debugging options

**Mode** Global Configuration, Privileged Exec

**Usage notes** This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

**Related commands** [show debugging nsm mcast](#)

**Command changes** Version 5.4.7-2.1 command added.

# debug nsm mcast

**Overview** Use this command to debug IPv4 events in the Multicast Routing Information Base (MRIB).

This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

**Syntax** debug nsm mcast  
{all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}

Parameter	Description
all	All IPv4 multicast debugging.
fib-msg	Forwarding Information Base (FIB) messages.
mrt	Multicast routes.
mtrace	Multicast traceroute.
mtrace-detail	Multicast traceroute detailed debugging.
register	Multicast PIM register messages.
stats	Multicast statistics.
vif	Multicast interface.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging of all multicast route events, use the commands:

```
awplus# configure terminal  
awplus(config)# debug nsm mcast all
```

To enable debugging of PIM register entries, use the commands:

```
awplus# configure terminal  
awplus(config)# debug nsm mcast register
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# debug nsm mcast6

**Overview** Use this command to debug IPv6 events in the Multicast Routing Information Base (MRIB).

This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

**Syntax** `debug nsm mcast6 {all|fib-msg|mrt|register|stats|vif}`  
`no debug nsm mcast6 {all|fib-msg|mrt|register|stats|vif}`

Parameter	Description
all	All IPv6 multicast route debugging.
fib-msg	Forwarding Information Base (FIB) messages.
mrt	Multicast routes.
register	Multicast PIM register messages.
stats	Multicast statistics.
vif	Multicast interfaces.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging of all multicast route events, use the commands:

```
awplus# configure terminal  
awplus(config)# debug nsm mcast6 all
```

To enable debugging of PIM register entries, use the commands:

```
awplus# configure terminal  
awplus(config)# debug nsm mcast6 register
```

# ip mroute

**Overview** Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv4 multicast source.

Use the **no** variant of this command to delete a route to an IPv4 multicast source.

**Syntax** `ip mroute <ipv4-source-address/mask-length>  
[bgp|ospf|rip|static] <rpf-address> [<admin-distance>]`  
`no ip mroute <ipv4-source-address/mask-length>  
[bgp|ospf|rip|static]`

Parameter	Description
<code>&lt;ipv4-source-address/mask-length&gt;</code>	A multicast source IPv4 address and mask length, in dotted decimal notation in the format A.B.C.D/M.
<code>bgp</code>	BGP unicast routing protocol.
<code>ospf</code>	OSPF unicast routing protocol.
<code>rip</code>	RIP unicast routing protocol.
<code>static</code>	Specifies a static route.
<code>&lt;rpf-address&gt;</code>	A.B.C.D The closest known address on the multicast route back to the specified source. This host IPv4 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the next hop address on the path to this host.
<code>&lt;admin-distance&gt;</code>	The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is 0 and the range available is 0-255.

**Mode** Global Configuration

**Usage notes** Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to an IPv4 multicast source, it uses the unicast route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the device with "multicast routes" back to given sources. When performing the RPF check on a stream from a given IPv4 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest

administrative distance - whether a static "multicast route" or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term "multicast route" does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

**Examples** The following example creates a static multicast IPv4 route back to the sources in the 10.10.3.0/24 subnet. The multicast route is via the host 192.168.2.3, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ip mroute 10.10.3.0/24 static 2 192.168.2.3 2
```

The following example creates a static multicast IPv4 route back to the sources in the 192.168.3.0/24 subnet. The multicast route is via the host 10.10.10.50. The administrative distance on this route has the default value of 0:

```
awplus# configure terminal
awplus(config)# ip mroute 192.168.3.0/24 10.10.10.50
```

**Validation  
Commands** `show ip rpf`

# ip multicast route

**Overview** Use this command to add an IPv4 static multicast route for a specific multicast source and group IPv4 address to the multicast Routing Information Base (RIB). This IPv4 multicast route is used to forward multicast traffic from a specific source and group ingressing on an upstream VLAN to a single or range of downstream VLANs.

Use the **no** variant of this command to either remove an IPv4 static multicast route set with this command or to remove a specific downstream VLAN interface from an IPv4 static multicast route for a specific multicast source and group IPv4 address.

**Syntax**

```
ip multicast route <ipv4-source-addr> <ipv4-group-addr>
<upstream-vlan-id> [<downstream-vlan-id>]

no ip multicast route <ipv4-source-addr> <ipv4-group-addr>
[<upstream-vlan-id> <downstream-vlan-id>]
```

Parameter	Description
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<upstream-vlan-id>	Upstream VLAN interface on which the multicast packets ingress.
<downstream-vlan-id>	Downstream VLAN interface or range of VLAN interfaces to which the multicast packets are sent.

**Default** By default, this feature is disabled.

**Mode** Global Configuration

**Usage notes** Only one multicast route entry per IPv4 address and multicast group can be specified. Therefore, if one entry for a static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists you cannot create a static multicast route with same source IPv4 address, group IPv4 address, upstream VLAN and downstream VLANs. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to timeout or clear the dynamic multicast route with the [clear ip mroute](#) command.

To update an existing static multicast route entry with more or a new set of downstream VLANs, you must firstly remove the existing static multicast route and then add the new static multicast route with all downstream VLANs specified. If you attempt to update an existing static multicast route entry with an additional VLAN or VLANs an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream VLAN are dropped rather than

forwarded, do not specify the optional *<downstream-vlan-id>* parameter when entering this command.

To remove a specific downstream VLAN from an existing static multicast route entry, specify the VLAN you want to remove with the *<downstream-vlan-id>* parameter when entering the **no** variant of this command.

**Examples** To create a static multicast route for the multicast source IPv4 address 2.2.2.2 and group IPv4 address 224.9.10.11, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN interface as `vlan20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20
```

To create a blackhole route for the multicast source IPv4 address 2.2.2.2 and group IPv4 address 224.9.10.11, specifying the upstream VLAN interface as `vlan10`, use the following commands:

To create an IPv4 static multicast route for the multicast source IPv4 address 2.2.2.2 and group IP address 224.9.10.11, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN range as `vlan20-25`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20-25
```

To remove the downstream VLAN 23 from the IPv4 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
vlan10 vlan23
```

To delete an IPv4 static multicast route for the multicast source IP address 2.2.2.2 and group IP address 224.9.10.11, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
```

**Related commands** [clear ip mroute](#)  
[show ip mroute](#)

# ip multicast route-limit

**Overview** Use this command to limit the number of multicast routes that can be added to an IPv4 multicast routing table.

Use the **no** variant of this command to return the IPv4 route limit to the default.

**Syntax** `ip multicast route-limit <limit> [<threshold>]`  
`no ip multicast route-limit`

Parameter	Description
<code>&lt;limit&gt;</code>	<code>&lt;1-2147483647&gt;</code> Number of routes.
<code>&lt;threshold&gt;</code>	<code>&lt;1-2147483647&gt;</code> Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit.

**Default** The default limit and threshold value is 2147483647.

**Mode** Global Configuration

**Usage notes** This command limits the number of multicast IPv4 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

**Examples**

```
awplus# configure terminal
awplus(config)# ip multicast route-limit 34 24
awplus# configure terminal
awplus(config)# no ip multicast route-limit
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip multicast wrong-vif-suppression

**Overview** Use this command to prevent unwanted multicast packets received on an unexpected VLAN being trapped to the CPU.

Use the no variant of this command to disable wrong VIF suppression.

**Syntax** `ip ip multicast wrong-vif-suppression`  
`no ip multicast wrong-vif-suppression`

**Default** By default, this feature is disabled.

**Mode** Global Configuration

**Usage notes** Use this command if there is excessive CPU load and multicast traffic is enabled. To confirm that VIF messages are being sent to the CPU use the `debug nsm mcast6` command.

**Examples** To enable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast wrong-vif-suppression
```

To disable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast wrong-vif-suppression
```

# ip multicast-routing

**Overview** Use this command to turn on/off IPv4 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv4 multicast routing after enabling it. Note the default stated below.

**Syntax** `ip multicast-routing`  
`no ip multicast-routing`

**Default** By default, IPv4 multicast routing is off.

**Mode** Global Configuration

**Usage notes** When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), stops IGMP operation, and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

**Example** `awplus# configure terminal`  
`awplus(config)# ip multicast-routing`

**Validation Commands** `show running-config`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ipv6 mroute

**Overview** Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv6 multicast source.

Use the **no** variant of this command to delete a route to an IPv6 multicast source.

**Syntax** `ipv6 mroute <ipv6-source-address/mask-length> [rip|static] <rpf-address> [<admin-distance>]`

`no ipv6 mroute <ipv6-source-address/mask-length> [rip|static]`

Parameter	Description
<code>&lt;ipv6-source-address/mask-length&gt;</code>	A multicast source IPv6 address and mask length, in hexadecimal notation in the format X.X::X.X/M.
<code>rip</code>	RIPng IPv6 unicast routing protocol.
<code>static</code>	Specifies a static route.
<code>&lt;rpf-address&gt;</code>	X.X::X:X The closest known address on the IPv6 multicast route back to the specified source. This host IPv6 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the nexthop address on the path to this host.
<code>&lt;admin-distance&gt;</code>	The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is 0 and the range available is 0–255.

**Mode** Global Configuration

**Usage notes** Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to a multicast source, it uses the unicast IPv6 route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the switch with “multicast routes” back to given sources. When performing the RPF check on a stream from a given IPv6 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest administrative distance - whether a static “multicast route” or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term “multicast route” does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

**Examples** The following example creates a static multicast route back to the sources in the 2001::1/64 subnet. The multicast route is via the host 2002::2, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ipv6 mroute 2001::1/64 static 2 2002::2
```

The following example creates a static multicast route back to the sources in the 2002::2/64 subnet. The multicast route is via the host 2001::1. The administrative distance on this route has the default value of 0:

```
awplus# configure terminal
awplus(config)# ipv6 mroute 2002::2/64 2001::1
```

**Validation  
Commands** `show ipv6 mroute`

# ipv6 multicast route

**Overview** Use this command to add an IPv6 static multicast route for a specific multicast source and group IPv6 address to the multicast Routing Information Base (RIB). This IPv6 multicast route is used to forward IPv6 multicast traffic from a specific source and group ingressing on an upstream VLAN to a single or range of downstream VLANs.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to either remove an IPv6 static multicast route set with this command or to remove a specific downstream VLAN interface from an IPv6 static multicast route for a specific IPv6 multicast source and group address.

**Syntax** `ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr> <upstream-vlan-id> [<downstream-vlan-id>]`  
`no ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr> [<upstream-vlan-id> <downstream-vlan-id>]`

Parameter	Description
<code>&lt;ipv6-group-addr&gt;</code>	Source IPv6 address, in dotted decimal notation in the format X.X::X.X.
<code>&lt;ipv6-group-addr&gt;</code>	Group IP address, in dotted decimal notation in the format X.X::X.X.
<code>&lt;upstream-vlan-id&gt;</code>	Upstream VLAN interface on which the multicast packets ingress.
<code>&lt;downstream-vlan-id&gt;</code>	Downstream VLAN interface or range of VLAN interfaces to which the multicast packets are sent.

**Default** By default, no static routes exist.

**Mode** Global Configuration

**Usage notes** Only one multicast route entry per IPv6 address and multicast group can be specified. Therefore, if one entry for an IPv6 static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists, you cannot create a static multicast route with the same source IPv6 address and group IPv6 address. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to time out or clear the dynamic multicast route with the [clear ipv6 mroute](#) command.

To update an existing IPv6 static multicast route entry with new or additional downstream VLANs, you must firstly remove the existing static multicast route and then add the new static multicast route with all downstream VLANs specified. If

you attempt to update an existing static multicast route entry with an additional VLAN or VLANs an error message is displayed and logged.

To remove a specific downstream VLAN from an existing static multicast route entry, specify the VLAN you want to remove with the `<downstream-vlan-id>` parameter when entering the **no** variant of this command.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

See [ipv6 mld snooping mrouter](#) for a command description and command examples.

**Examples** To create an IPv6 static multicast route for the multicast source IPv6 address `2001::1` and group IPv6 address `ff08::1`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN interface as `vlan20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20
```

To create a blackhole route for the IPv6 multicast source IP address `2001::1` and group IP address `ff08::1`, specifying the upstream VLAN interface as `vlan10`, use the following commands:

To create an IPv6 static multicast route for the multicast source IPv6 address `2001::1` and group IPv6 address `ff08::1`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN range as `vlan20-25`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20-25
```

To remove the downstream VLAN 23 from the IPv6 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1 vlan10
vlan23
```

To delete an IPv6 static multicast route for the multicast source IPv6 address `2001::1` and group IPv6 address `ff08::1`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1
```

**Related commands**

- [clear ipv6 mroute](#)
- [ipv6 mld snooping mrouter](#)
- [show ipv6 mroute](#)

# ipv6 multicast route-limit

**Overview** Use this command to limit the number of multicast routes that can be added to an IPv6 multicast routing table.

Use the no variant of this command to return the IPv6 route limit to the default.

**Syntax** `ipv6 multicast route-limit <limit> [<threshold>]`  
`no ipv6 multicast route-limit`

Parameter	Description
<code>&lt;limit&gt;</code>	<code>&lt;1-2147483647&gt;</code> Number of routes.
<code>&lt;threshold&gt;</code>	<code>&lt;1-2147483647&gt;</code> Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit.

**Default** The default limit and threshold value is 2147483647.

**Mode** Global Configuration

**Usage notes** This command limits the number of multicast IPv6 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 multicast route-limit 34 24
awplus# configure terminal
awplus(config)# no ipv6 multicast route-limit
```

# ipv6 multicast-routing

**Overview** Use this command to turn on/off IPv6 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv6 multicast routing after enabling it. Note the default stated below.

**Syntax** `ipv6 multicast-routing`  
`no ipv6 multicast-routing`

**Default** By default, IPv6 multicast routing is off.

**Mode** Global Configuration

**Usage** When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

**Examples** `awplus# configure terminal`  
`awplus(config)# ipv6 multicast-routing`  
`awplus# configure terminal`  
`awplus(config)# no ipv6 multicast-routing`

**Validation Commands** `show running-config`

# multicast

**Overview** Use this command to enable a device port to route multicast packets that ingress the port.

Use the **no** variant of this command to stop the device port from routing multicast packets that ingress the port. Note that this does not affect Layer 2 forwarding of multicast packets. If you enter **no multicast** on a port, multicast packets received on that port will not be forwarded to other VLANs, but ports in the same VLANs as the receiving port will still receive the multicast packets.

**CAUTION:** *We do not recommend disabling multicast routing in a live network. Some non-multicast protocols use multicast packets and will not function correctly if you disable it.*

**Syntax** multicast  
no multicast

**Default** By default, all device ports route multicast packets.

**Mode** Interface Configuration

**Examples** To disable routing of multicast packets on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no multicast
```

To re-enable routing of multicast packets on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# multicast
```

**Validation Commands** `show running-config`

# platform multicast-ratelimit

**Overview** Use this command to set the maximum number of multicast packets to be forwarded to the CPU (in packets per second). Setting the value to zero disables rate limiting.

This command should be used with care. Increasing or removing the limit could make the device less responsive under heavy multicast load.

Use the **no** variant of this command to return the limit to its default.

**Syntax** `platform multicast-ratelimit <0-100>`  
`no platform multicast-ratelimit`

**Default** 10 packets per second (pps)

**Mode** Global Configuration

**Usage notes** If you find that the CPU load on your device from multicast traffic is higher than desired, reducing this rate may reduce the CPU load.

If you need the device to process a large amount of multicast traffic, increasing this rate may improve performance.

**Example** To set the rate to 30pps, use the commands:

```
awplus# configure terminal
awplus(config)# platform multicast-ratelimit 30
```

**Command changes** Version 5.4.8-1.1: default changed to 100pps on SBx908 GEN2, SBx8100, and x930 Series switches.

# show debugging nsm mcast

**Overview** Use this command to show the status of the NSM multicast debugging.

**Syntax** show debugging nsm mcast

Parameter	Description
<vrf-name>	VRF instance name

**Mode** Privileged Exec

**Usage notes** This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

**Example** To show debugging for NSM multicast, use the following command:

```
awplus# show debug nsm mcast
```

**Output** Figure 39-1: Example output from **show debug nsm mcast**

```
awplus# show debugging nsm mcast
Debugging status:
NSM multicast vif debugging is on
NSM multicast route debugging is on
NSM multicast route statistics debugging is on
NSM multicast FIB message debugging is on
NSM multicast PIM Register message debugging is on
NSM multicast traceroute debugging is on
NSM multicast traceroute detailed debugging is on
```

**Related commands** [debug nsm mcast](#)

**Command changes** Version 5.4.7-2.1: command added  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2

# show ip mroute

**Overview** Use this command to display the contents of the IPv4 multicast routing (mroute) table.

**Syntax** `show ip mroute [<ipv4-group-addr>] [<ipv4-source-addr>]  
[dense|sparse] [count|summary]`

Parameter	Description
<code>&lt;ipv4-group-addr&gt;</code>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<code>&lt;ipv4-source-addr&gt;</code>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
<code>dense</code>	Display dense IPv4 multicast routes.
<code>sparse</code>	Display sparse IPv4 multicast routes.
<code>count</code>	Display the route and packet count from the IPv4 multicast routing (mroute) table.
<code>summary</code>	Display the contents of the IPv4 multicast routing (mroute) table in an abbreviated form.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip mroute 10.10.3.34 224.1.1.4.3  
awplus# show ip mroute 10.10.5.24 225.2.2.2 count  
awplus# show ip mroute 10.10.1.34 summary
```

**Output** The following is a sample output of this command displaying the IPv4 multicast routing table, with and without specifying the group and source IPv4 address:

Figure 39-2: Example output from the **show ip mroute** command

```
awplus# show ip mroute  
IP Multicast Routing Table  
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder  
installed  
Timers: Uptime/Stat Expiry  
Interface State: Interface (TTL)  
  
(10.10.1.52, 224.0.1.3), uptime 00:00:31, stat expires 00:02:59  
Owner PIM-SM, Flags: TF  
  Incoming interface: vlan2  
  Outgoing interface list:  
    vlan3 (1)
```

Figure 39-3: Example output from the **show ip mroute** command with the source and group IPv4 address specified

```
awplus# show ip mroute 10.10.1.52 224.0.1.3

IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.1.3), uptime 00:03:24, stat expires 00:01:28
Owner PIM-SM, Flags: TF
  Incoming interface: vlan2
  Outgoing interface list:
    vlan3 (1)
```

The following is a sample output of this command displaying the packet count from the IPv4 multicast routing table:

Figure 39-4: Example output from the **show ip mroute count** command

```
awplus# show ip mroute count
IP Multicast Statistics
Total 1 routes using 132 bytes memory
Route limit/Route threshold: 2147483647/2147483647
Total NOCACHE/WRONGVIF/WHOLEPKT rcv from fwd: 1/0/0
Total NOCACHE/WRONGVIF/WHOLEPKT sent to clients: 1/0/0
Immediate/Timed stat updates sent to clients: 0/0

Client msg counts: WRONGVIF/WHOLEPKT/Imm Stat/Timed Stat sent
Reg pkt counts: Reg ACK rcv/Reg NACK rcv/Reg pkt sent

(10.10.1.52, 224.0.1.3), Forwarding: 2/19456, Other: 0
  Fwd msg: 0/0, Client msg: 0/0/0/0, Reg: 0/0/0
```

The following is a sample output for this command displaying the IPv4 multicast routing table in an abbreviated form:

Figure 39-5: Example output from the **show ip mroute summary** command

```
awplus# show ip mroute summary

IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.1.3), 00:01:32/00:03:20, PIM-SM, Flags: TF
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip mvif

**Overview** Use this command to display the contents of the IPv4 Multicast Routing Information Base (MRIB) VIF table.

**Syntax** `show ip mvif <interface>`

Parameter	Description
<interface>	The interface to display information about.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip mvif vlan2`

**Output** Figure 39-6: Example output from the **show ip mvif** command

Interface	Vif Idx	Owner Module	TTL	Local Address	Remote Address	Uptime
vlan2	0	PIM-SM	1	192.168.1.53	0.0.0.0	00:04:26
Register	1		1	192.168.1.53	0.0.0.0	00:04:26
vlan3	2	PIM-SM	1	192.168.10.53	0.0.0.0	00:04:25

Figure 39-7: Example output from the **show ip mvif** command with the interface parameter **vlan2** specified

Interface	Vif Idx	Owner Module	TTL	Local Address	Remote Address	Uptime
vlan2	0	PIM-SM	1	192.168.1.53	0.0.0.0	00:05:17

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip rpf

**Overview** Use this command to display Reverse Path Forwarding (RPF) information for the specified IPv4 source address.

**Syntax** `show ip rpf <source-addr>`

Parameter	Description
<code>&lt;source-addr&gt;</code>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip rpf 10.10.10.50`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ipv6 mroute

**Overview** Use this command to display the contents of the IPv6 multicast routing (mroute) table.

**Syntax** `show ipv6 mroute [<ipv6-group-addr>] [<ipv6-source-addr>]  
[ {count | summary} ]`

Parameter	Description
<code>&lt;ipv6-group-addr&gt;</code>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<code>&lt;ipv6-source-addr&gt;</code>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.
<code>count</code>	Display the route and packet count from the IPv6 multicast routing (mroute) table.
<code>summary</code>	Display the contents of the IPv6 multicast routing (mroute) table in an abbreviated form.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ipv6 mroute
awplus# show ipv6 mroute count
awplus# show ipv6 mroute summary
awplus# show ipv6 mroute 2001::2 ff08::1 count
awplus# show ipv6 mroute 2001::2 ff08::1
awplus# show ipv6 mroute 2001::2 summary
```

**Output** The following is a sample output of this command displaying the IPv6 multicast routing table for a single static IPv6 Multicast route:

Figure 39-8: Example output from the **show ipv6 mroute** command

```
awplus#show ipv6 mroute
IPv6 Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface
(2001::2, ff08::1), uptime 03:18:38
Owner IMI, Flags: F
  Incoming interface: vlan2
  Outgoing interface list:
    vlan3
```

The following is a sample output of this command displaying the IPv6 multicast routing count table for a single static IPv6 Multicast route:

Figure 39-9: Example output from the **show ipv6 mroute count** command

```
awplus#show ipv6 mroute count

IPv6 Multicast Statistics
Total 1 routes using 152 bytes memory
Route limit/Route threshold: 1024/1024
Total NOCACHE/WRONGmif/WHOLEPKT rcv from fwd: 6/0/0
Total NOCACHE/WRONGmif/WHOLEPKT sent to clients: 6/0/0
Immediate/Timed stat updates sent to clients: 0/0
Reg ACK rcv/Reg NACK rcv/Reg pkt sent: 0/0/0
Next stats poll: 00:01:14

Forwarding Counts: Pkt count/Byte count, Other Counts: Wrong If
pkts
Fwd msg counts: WRONGmif/WHOLEPKT rcv
Client msg counts: WRONGmif/WHOLEPKT/Imm Stat/Timed Stat sent
Reg pkt counts: Reg ACK rcv/Reg NACK rcv/Reg pkt sent

(2001::2, ff08::1), Forwarding: 0/0, Other: 0
  Fwd msg: 0/0, Client msg: 0/0/0/0, Reg: 0/0/0
```

The following is a sample output of this command displaying the IPv6 multicast routing summary table for a single static IPv6 Multicast route:

Figure 39-10: Example output from the **show ipv6 mroute summary** command

```
awplus#show ipv6 mroute summary

(2001::2, ff08::1), 03:20:28/-, IMI, Flags: F
```

# show ipv6 multicast forwarding

**Overview** Use this command to view the status of multicast forwarding slow-path-packet setting.

**Syntax** `show ipv6 multicast forwarding`

**Mode** User Exec

**Example** To show the status of the multicast forwarding, slow-path-packet setting, use the following command:

```
awplus# show ipv6 multicast forwarding
```

**Output** Figure 39-11: Example output from the **show ipv6 multicast forwarding** command:

```
ipv6 multicast forwarding is disabled
```

**Related commands** [ipv6 multicast forward-slow-path-packet](#)

# show ipv6 mif

**Overview** Use this command to display the contents of the IPv6 Multicast Routing Information Base (MRIB) MIF table.

**Syntax** `show ipv6 mif [<interface>]`

Parameter	Description
<interface>	The interface to display information about.

**Mode** User Exec and Privileged Exec

**Example**  
`awplus# show ipv6 mif`  
`awplus# show ipv6 mif vlan2`

**Output** Figure 39-12: Example output from the **show ipv6 mif** command

```
awplus#show ipv6 mif
Interface  Mif  Owner          Uptime
          Idx  Module
vlan3      0    MLD/MLD Proxy-Service 03:28:48
vlan2      1    MLD/MLD Proxy-Service 03:28:48
vlan1      2    MLD/MLD Proxy-Service 03:28:48
```

Figure 39-13: Example output from the **show ipv6 mif** command with the interface parameter **vlan2** specified

Interface	Mif Idx	Owner Module	TTL	Remote Address	Uptime
vlan2	0	PIM-SMv6	1	0.0.0.0	00:05:17

# PIM-SM Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of PIM-SM commands. For commands common to PIM-SM and PIM-DM, see the [Multicast Commands](#) chapter.

- Command List**
- “clear ip pim sparse-mode bsr rp-set \*” on page 1906
  - “clear ip pim sparse-mode packet statistics” on page 1907
  - “clear ip mroute pim sparse-mode” on page 1908
  - “debug pim sparse-mode” on page 1909
  - “debug pim sparse-mode timer” on page 1910
  - “ip pim anycast-rp” on page 1912
  - “ip pim bsr-border” on page 1913
  - “ip pim bsr-candidate” on page 1914
  - “ip pim cisco-register-checksum” on page 1915
  - “ip pim crp-cisco-prefix” on page 1916
  - “ip pim dr-priority” on page 1917
  - “ip pim exclude-genid” on page 1918
  - “ip pim ext-srcs-directly-connected” on page 1919
  - “ip pim hello-holdtime (PIM-SM)” on page 1920
  - “ip pim hello-interval (PIM-SM)” on page 1921
  - “ip pim ignore-rp-set-priority” on page 1922
  - “ip pim jp-timer” on page 1923
  - “ip pim register-rate-limit” on page 1924
  - “ip pim register-rp-reachability” on page 1925

- [“ip pim register-source”](#) on page 1926
- [“ip pim register-suppression”](#) on page 1927
- [“ip pim rp-address”](#) on page 1928
- [“ip pim rp-candidate”](#) on page 1930
- [“ip pim rp-register-kat”](#) on page 1931
- [“ip pim sparse-mode”](#) on page 1932
- [“ip pim sparse-mode join-prune-batching”](#) on page 1933
- [“ip pim sparse-mode passive”](#) on page 1935
- [“ip pim sparse-mode wrong-vif-suppression”](#) on page 1936
- [“ip pim spt-threshold”](#) on page 1938
- [“ip pim ssm”](#) on page 1939
- [“service pim”](#) on page 1940
- [“show debugging pim sparse-mode”](#) on page 1941
- [“show ip pim sparse-mode bsr-router”](#) on page 1942
- [“show ip pim sparse-mode interface”](#) on page 1943
- [“show ip pim sparse-mode interface detail”](#) on page 1945
- [“show ip pim sparse-mode local-members”](#) on page 1946
- [“show ip pim sparse-mode mroute”](#) on page 1947
- [“show ip pim sparse-mode mroute detail”](#) on page 1949
- [“show ip pim sparse-mode neighbor”](#) on page 1951
- [“show ip pim sparse-mode nexthop”](#) on page 1952
- [“show ip pim sparse-mode packet statistics”](#) on page 1953
- [“show ip pim sparse-mode rp-hash”](#) on page 1954
- [“show ip pim sparse-mode rp mapping”](#) on page 1955
- [“undebug all pim sparse-mode”](#) on page 1956

# clear ip pim sparse-mode bsr rp-set \*

**Overview** Use this command to clear all Rendezvous Point (RP) sets learned through the PIMv2 Bootstrap Router (BSR).

**Syntax** `clear ip pim sparse-mode bsr rp-set *`

Parameter	Description
*	Clears all RP sets.

**Mode** Privileged Exec

**Usage notes** For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

**Example** `awplus# clear ip pim sparse-mode bsr rp-set *`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip pim sparse-mode packet statistics

**Overview** Use this command to clear the PIM sparse mode packet statistics counter.

**Syntax** `clear ip pim sparse-mode packet statistics`

**Mode** Privileged Exec

**Example** The following command clears the current packet receive counts for PIM sparse-mode:

```
awplus# configure terminal
awplus(config)# clear ip pim sparse-mode statistics
```

**Output** Figure 40-1: Example output from **clear ip pim sparse-mode statistics**

```
awplus(config)#clear ip pim sparse-mode statistics
PIM-SM Receive Packet Statistics :
All PIM-SM      : Total : 0 Valid : 0
Hello          : Total : 0 Valid : 0
Register       : Total : 0 Valid : 0
Register Stop  : Total : 0 Valid : 0
Join/Prune     : Total : 0 Valid : 0
Bootstrap      : Total : 0 Valid : 0
Assert         : Total : 0 Valid : 0
Candidate-RP   : Total : 0 Valid : 0
```

**Related commands** [show ip pim sparse-mode packet statistics](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip mroute pim sparse-mode

**Overview** Use this command to clear all multicast route table entries learned through PIM-SM for a specified multicast group address, and optionally a specified multicast source address.

**Syntax** `clear ip mroute <Group-IP-address> pim sparse-mode`  
`clear ip mroute <Group-IP-address> <Source-IP-address> pim sparse-mode`

Parameter	Description
<code>&lt;Group-IP-address&gt;</code>	Specify a multicast group IPv6 address, entered in the form A.B.C.D.
<code>&lt;Source-IP-address&gt;</code>	Specify a source group IP address, entered in the form A.B.C.D.

**Mode** Privileged Exec

**Example** `awplus# clear ip mroute pim sparse-mode 224.0.0.0`  
`awplus# clear ip mroute 192.168.7.1 pim sparse-mode 224.0.0.0`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# debug pim sparse-mode

**Overview** Use this command to turn on some or all PIM-SM debugging.

Use the **no** variant of this command to turn off some or all PIM-SM debugging.

**Syntax** `debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`

`no debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`

Parameter	Description
all	Activates/deactivates all PIM-SM debugging.
events	Activates debug printing of events.
mfc	Activates debug printing of MFC (Multicast Forwarding Cache in kernel) add/delete/updates.
mib	Activates debug printing of PIM-SM MIBs.
nexthop	Activates debug printing of PIM-SM next hop communications.
nsm	Activates debugging of PIM-SM Network Services Module communications.
packet	Activates debug printing of incoming and/or outgoing packets.
state	Activates debug printing of state transition on all PIM-SM FSMs.
mtrace	Activates debug printing of multicast traceroute.

**Mode** Privileged Exec and Global Configuration

**Example**  
`awplus# configure terminal`  
`awplus(config)# debug pim sparse-mode all`

**Related commands** [show debugging pim sparse-mode](#)

**Command changes**  
Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# debug pim sparse-mode timer

**Overview** Use this command to enable debugging for the specified PIM-SM timers. Use the **no** variants of this command to disable debugging for the specified PIM-SM timers.

**Syntax**

```
debug pim sparse-mode timer assert [at]
no debug pim sparse-mode timer assert [at]
debug pim sparse-mode timer bsr [bst|crp]
no debug pim sparse-mode timer bsr [bst|crp]
debug pim sparse-mode timer hello [ht|nlt|tht]
no debug pim sparse-mode timer hello [ht|nlt|tht]
debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
debug pim sparse-mode timer register [rst]
no debug pim sparse-mode timer register [rst]
```

Parameter	Description
assert	Enable or disable debugging for the Assert timers.
at	Enable or disable debugging for the Assert Timer.
bsr	Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers.
bst	Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.
crp	Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.
hello	Enable or disable debugging for the specified Hello timer, or all Hello timers.
ht	Enable or disable debugging for the Hello timer: Hello Timer.
nlt	Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.
tht	Enable or disable debugging for the Hello timer: Triggered Hello Timer.
joinprune	Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.
jt	Enable or disable debugging for the JoinPrune timer: upstream Join Timer.
et	Enable or disable debugging for the JoinPrune timer: Expiry Timer.
ppt	Enable or disable debugging for the JoinPrune timer: PrunePending Timer.

Parameter	Description
kat	Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.
ot	Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.
register	Enable or disable debugging for the Register timers.
rst	Enable or disable debugging for the Register timer: Register Stop Timer.

**Default** By default, all debugging is disabled.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging for the PIM-SM Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SM Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SM Joinprune expiry timer, use the command:

```
awplus# debug pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SM Register timer, use the command:

```
awplus# no debug pim sparse-mode timer register
```

**Related commands** [show debugging pim sparse-mode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim anycast-rp

**Overview** Use this command to configure Anycast RP (Rendezvous Point) in a RP set.  
Use the **no** variant of this command to remove the configuration.

**Syntax** `ip pim anycast-rp <anycast-rp-address> <member-rp-address>`  
`no ip pim anycast-rp <anycast-rp-address> [<member-rp-address>]`

Parameter	Description
<code>&lt;anycast-rp-address&gt;</code>	<A.B.C.D> Specify an anycast IP address to configure an Anycast RP (Rendezvous Point) in a RP set.
<code>&lt;member-rp-address&gt;</code>	<A.B.C.D> Specify an Anycast RP (Rendezvous Point) address to configure an Anycast RP in a RP set.

**Mode** Global Configuration

**Usage notes** Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IP address range from many sources, resulting in packets address to destination addresses in this range being routed to the nearest source announcing the given destination IP address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

**Examples** The following example shows how to configure the Anycast RP address with **ip pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ip pim anycast-rp 1.1.1.1 10.10.10.10
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ip pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ip pim anycast-rp 1.1.1.1
```

# ip pim bsr-border

**Overview** Use the **ip pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through a VLAN interface. The BSR border is the border of the PIM domain.

Use the **no** variant of this command to disable the configuration set with **ip pim bsr-border**.

**Syntax** `ip pim bsr-border`  
`no ip pim bsr-border`

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage notes** When this command is configured on a VLAN interface, no PIM version 2 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM domain with this command to avoid BSR messages from being exchanged between the two PIM domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM protocol from working as intended.

**Examples** The following example configures the VLAN interface `vlan2` to be the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim bsr-border
```

The following example removes the VLAN interface `vlan2` from the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim bsr-border
```

The following example configures the PPP interface `ppp0` to be the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim bsr-border
```

The following example removes the PPP interface `ppp0` from the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim bsr-border
```

# ip pim bsr-candidate

**Overview** Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IP address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

**Syntax** `ip pim bsr-candidate <interface> [<hash>] [<priority>]`  
`no ip pim bsr-candidate [<interface>]`

Parameter	Description
<interface>	The interface. For instance, <code>vlan2</code> .
<hash>	<0-32> configure hash mask length for RP selection. The default hash value if you do not configure this parameter is 10.
<priority>	<0-255> configure priority for a BSR candidate. Note that you must also specify the <hash> (mask length) when specifying the <priority>. The default priority if you do not configure this parameter is 64.

**Mode** Global Configuration

**Default** The default hash parameter value is 10 and the default priority parameter value is 64.

**Examples** To set the BSR candidate to the VLAN interface `vlan2`, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan2 20 30
```

To withdraw the address of `vlan2` from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ip pim bsr-candidate vlan2
```

To set the BSR candidate to the PPP interface `ppp0`, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate ppp0 20 30
```

To withdraw the address of `ppp0` from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ip pim bsr-candidate ppp0
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim cisco-register-checksum

**Overview** Use this command to configure the option to calculate the Register checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

**Syntax** `ip pim cisco-register-checksum`  
`no ip pim cisco-register-checksum`

**Default** This command is disabled by default. By default, Register Checksum is calculated only over the header.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim cisco-register-checksum`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim crp-cisco-prefix

**Overview** Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0. RP advertisements for the default IPv4 multicast group range 224/4 are sent with a prefix of 1.

Use the **no** variant of this command to revert to the default settings.

**Syntax** `ip pim crp-cisco-prefix`  
`no ip pim crp-cisco-prefix`

**Mode** Global Configuration

**Usage notes** Cisco's BSR code does not conform to the latest BSR draft. It does not accept candidate RPs with a group prefix number of zero. To make the candidate RP work with a Cisco BSR, use the **ip pim crp-cisco-prefix** command when interoperating with older versions of Cisco IOS.

**Example**

```
awplus# configure terminal
awplus(config)# ip pim crp-cisco-prefix
awplus# configure terminal
awplus(config)# no ip pim crp-cisco-prefix
```

**Related commands** [ip pim rp-candidate](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim dr-priority

**Overview** Use this command to set the Designated Router priority value.  
Use the **no** variant of this command to disable this function.

**Syntax** `ip pim dr-priority <priority>`  
`no ip pim dr-priority [<priority>]`

Parameter	Description
<priority>	<0-4294967294> The Designated Router priority value. A higher value has a higher preference.

**Default** The default is 1. The negated form of this command restores the value to the default.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples** To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim dr-priority
```

To set the Designated Router priority value to 11234 for the PPP interface ppp0, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim dr-priority 11234
```

To disable the Designated Router priority value for the PPP interface ppp0, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim dr-priority
```

**Related commands** [ip pim ignore-rp-set-priority](#)

# ip pim exclude-genid

**Overview** Use this command to exclude the GenID option from Hello packets sent out by the PIM module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

**Syntax** `ip pim exclude-genid`  
`no ip pim exclude-genid`

**Default** By default, this command is disabled; the GenID option is included.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Example**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim exclude-genid
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim exclude-genid
```

# ip pim ext-srcs-directly-connected

**Overview** Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

**Syntax** `ip pim ext-srcs-directly-connected`  
`no ip pim ext-srcs-directly-connected`

**Default** The **no** variant of this command is the default behavior.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Example** To configure PIM to treat all sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

To configure PIM to treat all sources as directly connected for PPP interface `ppp0`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for PPP interface `ppp0`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

# ip pim hello-holdtime (PIM-SM)

**Overview** This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 \* the current hello-interval.

**Syntax** `ip pim hello-holdtime <holdtime>`  
`no ip pim hello-holdtime`

Parameter	Description
<code>&lt;holdtime&gt;</code>	<code>&lt;1-65535&gt;</code> The holdtime value in seconds (no fractional seconds are accepted).

**Default** The default hello-holdtime value is 3.5 \* the current hello-interval. The default hello- holdtime is restored using the negated form of this command.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** Each time the hello interval is updated, the hello holdtime is also updated, according to the following rules:

If the hello holdtime is not configured; or if the hello holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 \* hello interval). Otherwise, it retains the configured value.

**Example**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-holdtime 123
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim hello-holdtime 123
```

# ip pim hello-interval (PIM-SM)

**Overview** This command configures a hello-interval value.  
Use the **no** variant of this command to reset the hello-interval to the default.

**Syntax** `ip pim hello-interval <interval>`  
`no ip pim hello-interval`

Parameter	Description
<interval>	<1-65535> The value in seconds (no fractional seconds accepted).

**Default** The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** When the hello interval is configured, and the hello holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 \* hello interval). Otherwise, the hello-holdtime value is the configured value.

**Example**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim hello-interval 123
```

# ip pim ignore-rp-set-priority

**Overview** Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this setting.

**Syntax** `ip pim ignore-rp-set-priority`  
`no ip pim ignore-rp-set-priority`

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim ignore-rp-set-priority`

# ip pim jp-timer

**Overview** Use this command to set the PIM-SM join/prune timer. Note that the value the device puts into the holdtime field of the join/prune packets it sends to its neighbors is 3.5 times the join/prune timer value set using this command.

Use the **no** variant of this command to return the PIM-SM join/prune timer to its default value of 60 seconds, which corresponds to a join/prune packet holdtime of 210 seconds.

**Syntax** `ip pim jp-timer <1-65535>`  
`no ip pim jp-timer [<1-65535>]`

Parameter	Description
<1-65535>	Specifies the join/prune timer value. The default value is 60 seconds.

**Default** The default join/prune timer value is 60 seconds.

**Mode** Global Configuration

**Example** To set the join/prune timer value to 300 seconds, use the commands:

```
awplus# configure terminal  
awplus(config)# ip pim jp-timer 300
```

To return the join/prune timer to its default value of 60 seconds, use the commands:

```
awplus# configure terminal  
awplus(config)# no ip pim jp-timer
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim register-rate-limit

**Overview** Use this command to configure the rate of register packets sent by this DR, in units of packets per second.

Use the **no** variant of this command to remove the limit.

**Syntax** `ip pim register-rate-limit <1-65535>`  
`no ip pim register-rate-limit`

Parameter	Description
<1-65535>	Specifies the maximum number of packets that can be sent per second.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-rate-limit 3444`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim register-rp-reachability

**Overview** Use this command to enable the RP reachability check for PIM Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

**Syntax** `ip pim register-rp-reachability`  
`no ip pim register-rp-reachability`

**Default** This command is disabled; by default, there is no checking for RP-reachability.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-rp-reachability`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim register-source

**Overview** Use this command to configure the source address of register packets sent by this DR, overriding the default source address, which is the address of the RPF interface toward the source host.

Use the **no** variant of this command to un-configure the source address of Register packets sent by this DR, reverting back to use the default source address that is the address of the RPF interface toward the source host.

**Syntax** `ip pim register-source [<source-address>|<interface>]`  
`no ip pim register-source`

Parameter	Description
<code>&lt;source-address&gt;</code>	The IP address, entered in the form A.B.C.D, to be used as the source of the register packets.
<code>&lt;interface&gt;</code>	The name of the interface to be used as the source of the register packets.

**Usage notes** The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback interface address, but can also be a physical address. This address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM enabled.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-source 10.10.1.3`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim register-suppression

**Overview** Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds. Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the [ip pim rp-register-kat](#) command is not used.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

**Syntax** `ip pim register-suppression <1-65535>`  
`no ip pim register-suppression`

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-suppression 192`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim rp-address

**Overview** Use this command to statically configure the RP (Rendezvous Point) address for multicast groups.

Use the **no** variant of this command to remove a statically configured RP address for multicast groups.

**Syntax** `ip pim rp-address <ip-address> group-list <group-prefix> [override]`  
`no ip pim rp-address <ip-address> group-list <group-prefix> [override]`

Parameter	Description
<ip-address>	IP address of RP, entered in the form A . B . C . D.
<group-prefix>	Multicast group IP prefix address of RP, entered in the form A . B . C . D / M
override	Enables statically defined RPs to override dynamically learned RPs.

**Mode** Global Configuration

**Usage notes** The AlliedWare Plus PIM-SM implementation supports multiple static RPs. It also supports usage of static RP and the BSR (Bootstrap Router) mechanism simultaneously. The **ip pim rp-address** command is used to statically configure the RP address for multicast groups.

You need to understand the following information before using this command.

If the RP address configured by the BSR, and the statically configured RP address are both available for a group range, then the RP address configured through the BSR is chosen over the statically configured RP address, unless the 'override' parameter is specified, in which case, the static RP will be chosen.

After configuration, the RP address is inserted into a static RP group tree based on the configured group ranges. For each group range, multiple static RPs are maintained in a linked list. This list is sorted in a descending order of IP addresses. When selecting static RPs for a group range, the first element (which is the static RP with highest IP address) is chosen.

RP address deletion is handled by removing the static RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

**NOTE:** A unique RP address may only be specified once as a static RP.

**Example**

```
awplus# configure terminal
awplus(config)# ip pim rp-address 192.0.2.10 group-list
233.252.0.0/24 override
```

Figure 40-2: Output from the **show ip pim sparse-mode rp mapping** command

```
awplus#show ip pim sp rp mapping
PIM Group-to-RP Mappings
Group(s): 233.252.0.0/24, Static
RP: 192.0.2.10
Uptime: 00:00:17
```

**Related  
commands**

[ip pim rp-register-kat](#)

[show ip pim sparse-mode rp mapping](#)

**Command  
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-0.5: Replaced <acl> parameter with <group-list> parameter.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim rp-candidate

**Overview** Use this command to make the router an RP (Rendezvous Point) candidate, using the IP address of the specified interface.

Use the **no** variant of this command to remove the RP status set using the **ip pim rp-candidate** command.

**Syntax** `ip pim rp-candidate <interface> [priority <priority> | interval <interval> ]`  
`no ip pim rp-candidate [<interface>]`

Parameter	Description
<interface>	Interface name
<priority>	<0-255> configure priority for an RP candidate.
<interval>	advertisement interval specified in the range <1-16383> (in seconds).

**Default** The priority value for a candidate RP is 0 by default until specified using the **priority** parameter.

**Mode** Global Configuration

**Usage notes** Note that issuing the command **ip pim rp-candidate <interface>** without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 0.

**Examples** To specify a priority of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 priority 3
```

To stop the device from being an RP candidate on vlan2 , use the following commands:

```
awplus# configure terminal
awplus(config)# no ip pim rp-candidate vlan2
```

**Related commands** [ip pim rp-address](#)  
[ip pim rp-register-kat](#)  
[ip pim crp-cisco-prefix](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim rp-register-kat

**Overview** Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SM Register packets.

Use the **no** variant of this command to return the PIM-SM KAT timer to its default value of 210 seconds.

**Syntax** `ip pim rp-register-kat <1-65535>`  
`no ip pim rp-register-kat`

Parameter	Description
<1-65535>	Specify the KAT timer in seconds. The default value is 210 seconds.

**Mode** Global Configuration

**Default** The default PIM-SM KAT timer value is 210 seconds.

**Examples** `awplus# configure terminal`  
`awplus(config)# ip pim rp-register-kat 3454`  
`awplus# configure terminal`  
`awplus(config)# no ip pim rp-register-kat`

**Related commands** [ip pim rp-address](#)  
[ip pim rp-candidate](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim sparse-mode

**Overview** Use this command to enable PIM-SM on the VLAN interface.  
Use the **no** variant of this command to disable PIM-SM on the VLAN interface.

**Syntax** ip pim sparse-mode  
no ip pim sparse-mode

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim sparse-mode
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim sparse-mode
```

# ip pim sparse-mode join-prune-batching

**Overview** Use this command to enable batching of Join and Prune messages in PIM-SM. This functionality reduces the number of PIM packets that must be sent to maintain a large number of groups

When using VRF-lite, you can use this command to enable Join and Prune batching in PIM-SM for a named VRF instance.

Use the **no** variant of this command to disable batching of Join and Prune messages in PIM-SM.

**Syntax** `ip pim sparse-mode join-prune-batching`  
`no ip pim sparse-mode join-prune-batching`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>]sparse-mode join-prune-batching`  
`no ip pim [vrf <vrf-name>]sparse-mode join-prune-batching`

Parameter	Description
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.

**Default** Disabled.

**Mode** Global Configuration

**Examples** To enable Join/Prune batching for PIM-SM, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim sparse-mode join-prune-batching
```

To disable Join/Prune batching for PIM-SM, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim sparse-mode join-prune-batching
```

**Example (VRF-lite)** To enable Join/Prune batching for the VRF instance 'red', use the commands:

```
awplus# configure terminal
awplus(config)# ip pim vrf red sparse-mode join-prune-batching
```

To disable Join/Prune batching for the VRF instance 'red', use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim vrf red sparse-mode
join-prune-batching
```

**Related commands** [ip pim sparse-mode wrong-vif-suppression](#)

**Command changes** Version 5.4.8-2.3: command added.

# ip pim sparse-mode passive

**Overview** Use this command to enable and disable passive mode operation for local members on the VLAN interface.

Use the **no** variant of this command to disable passive mode operation for local members on the VLAN interface.

**Syntax** ip pim sparse-mode passive  
no ip pim sparse-mode passive

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** Passive mode essentially stops PIM transactions on the interface, allowing only IGMP mechanism to be active. To turn off passive mode, use the **no ip pim sparse-mode passive** or the **ip pim sparse-mode** command. To turn off PIM activities on the VLAN interface, use the **no ip pim sparse-mode** command.

**Examples**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim sparse-mode passive
```

# ip pim sparse-mode wrong-vif-suppression

**Overview** Use this command to permit or block multicast packets that arrive on the wrong VLAN Interface (VIF).

When using VRF-lite, you can use this command to enable wrong VIF suppression for a named VRF instance.

Use the **no** variant of this command to disable wrong VIF suppression.

**Syntax** `ip pim sparse-mode wrong-vif-suppression`  
`no ip pim sparse-mode wrong-vif-suppression`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>]sparse-mode wrong-vif-suppression`  
`no ip pim [vrf <vrf-name>]sparse-mode wrong-vif-suppression`

Parameter	Description
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** This command enables wrong VIF suppression for PIM sparse-mode. Wrong VIF suppression prevents multicast packets received on the wrong upstream interface from being copied to the CPU.

**Examples** To enable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim sparse-mode wrong-vif-suppression
```

To disable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim sparse-mode wrong-vif-suppression
```

**Example (VRF-lite)** To enable wrong VIF suppression for the VRF instance 'green', use the commands:

```
awplus# configure terminal
awplus(config)# ip pim vrf green sparse-mode
wrong-vif-suppression
```

To disable wrong VIF suppression for the VRF instance 'green', use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim vrf green sparse-mode
wrong-vif-suppression
```

**Related commands** [ip pim sparse-mode join-prune-batching](#)

**Command changes** Version 5.4.8-2.3: command added.

# ip pim spt-threshold

**Overview** This command turns on the ability for the last-hop PIM router to switch to SPT (shortest-path tree).  
The **no** variant of this command turns off the ability for the last-hop PIM router to switch to SPT.

**NOTE:** *The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.*

**Syntax** ip pim spt-threshold  
no ip pim spt-threshold

**Mode** Global Configuration

**Examples** To enable the last-hop PIM-SM router to switch to SPT, use the following commands:

```
awplus# configure terminal  
awplus(config)# ip pim spt-threshold
```

To stop the last-hop PIM-SM router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal  
awplus(config)# no ip pim spt-threshold
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

## ip pim ssm

**Overview** Use this command to define the Source Specific Multicast (SSM) range of IP multicast addresses. The default keyword defines the SSM range as 232/8.

Use the **no** variant of this command to disable the SSM range.

**Syntax** `ip pim ssm default`  
`no ip pim ssm`

**Default** By default, the command is disabled.

**Mode** Global Configuration

**Usage** When an SSM range of IP multicast addresses is defined by the `ip pim ssm` command, the `no (*,G)` or `(S,G,rpt)` state will be initiated for groups in the SSM range.

The messages corresponding to these states will not be accepted or originated in the SSM range.

**Examples** The following commands show how to set PIM-SSM as default:

```
awplus# configure terminal
awplus(config)# ip pim ssm default
```

The following commands show how to disable PIM-SSM:

```
awplus# configure terminal
awplus(config)# no ip pim ssm
```

# service pim

**Overview** Use this command to enable PIM sparse mode services.  
Use the **no** version of the command to disable unused PIM sparse mode services.

**Syntax** `service pim`  
`no service pim`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Sometimes it may be desirable to disable unused services, in order to reduce memory use.  
Disabling the PIM services will only take effect after you save the configuration and restart the device.

**Example** To disable the PIM sparse mode service, use the commands:

```
awplus# configure terminal  
awplus(config)# no service pim
```

**Output** Figure 40-3: Example output from **no service pim**

```
awplus(config)#no service pim  
% Save the config and restart the device for this change to take  
effect
```

**Command changes** Version 5.5.0-0.1: command added

# show debugging pim sparse-mode

**Overview** This command displays the status of the debugging of the system.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging pim sparse-mode`

**Mode** User Exec and Privileged Exec

**Example** To display PIM-SM debugging settings, use the command:

```
awplus# show debugging pim sparse-mode
```

Figure 40-4: Output from **show debugging pim sparse-mode**

```
Debugging status:
PIM event debugging is on
PIM Hello THT timer debugging is on
PIM event debugging is on
PIM MFC debugging is on
PIM state debugging is on
PIM packet debugging is on
PIM incoming packet debugging is on
PIM outgoing packet debugging is on
```

**Related commands** [debug pim sparse-mode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode bsr-router

**Overview** Use this command to show the Bootstrap Router (BSR) (v2) address.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode bsr-router`

**Mode** User Exec and Privileged Exec

**Output** Figure 40-5: Output from the **show ip pim sparse-mode bsr-router** command

```
PIMv2 Bootstrap information
BSR address: 10.10.11.35 (?)
Uptime:      00:00:38, BSR Priority: 0, Hash mask length: 10
Expires:     00:01:32
Role: Non-candidate BSR
State: Accept Preferred
```

**Related commands** [show ip pim sparse-mode rp mapping](#)  
[show ip pim sparse-mode neighbor](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode interface

**Overview** Use this command to show PIM-SM interface information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)

**Syntax** `show ip pim sparse-mode interface`

**Mode** User Exec and Privileged Exec

**Example** To display information about PIM-SM interfaces, use the command:

```
awplus# show ip pim sparse-mode interface
```

**Output** Figure 40-6: Example output from **show ip pim sparse-mode interface**

```
Total configured interfaces: 16   Maximum allowed: 31
Total active interfaces:      12

Address      Interface VIFindex Ver/   Nbr   DR      DR
            Mode     Count  Prior
192.168.1.53 vlan2     0      v2/S  2      2      192.168.1.53
192.168.10.53 vlan3     2      v2/S  0      2      192.168.10.53

... Note that this screen has been edited to remove any additional interfaces.
```

**Table 1:** Parameters in the output from the **show ip pim sparse-mode interface** command

Parameters	Description
Total configured interfaces	The number of configured PIM Sparse Mode interfaces.
Maximum allowed	The maximum number of PIM Sparse Mode interfaces that can be configured.
Total active interfaces	The number of active PIM Sparse Mode interfaces.
Address	Primary PIM-SM address.
Interface	Name of the PIM-SM interface.
VIF Index	The Virtual Interface index of the VLAN.
Ver/Mode	PIM version/Sparse mode.
Nbr Count	Neighbor count of the PIM-SM interface.

**Table 1:** Parameters in the output from the **show ip pim sparse-mode interface** command (cont.)

Parameters	Description
DR Priority	Designated Router priority.
DR	The IP address of the Designated Router.

**Command changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode interface detail

**Overview** Use this command to show detailed information on a PIM-SM interface.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode interface detail`

**Mode** User Exec and Privileged Exec

**Output** Figure 40-7: Example output from the **show ip pim sparse-mode interface detail** command

```
vlan3 (vif 3):  
  Address 192.168.1.149, DR 192.168.1.149  
  Hello period 30 seconds, Next Hello in 15 seconds  
  Triggered Hello period 5 seconds  
  Neighbors:  
    192.168.1.22  
  
vlan2 (vif 0):  
  Address 10.10.11.149, DR 10.10.11.149  
  Hello period 30 seconds, Next Hello in 18 seconds  
  Triggered Hello period 5 seconds  
  Neighbors:  
    10.10.11.4
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode local-members

**Overview** Use this command to show detailed local member information on a VLAN interface configured for PIM-SM. If you do not specify a VLAN interface then detailed local member information is shown for all VLAN interfaces configured for PIM-SM.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode local-members [<interface>]`

Parameter	Description
<interface>	Optional. Specify the interface. For instance, VLAN interface <code>vlan2</code> .

**Mode** User Exec and Privileged Exec

**Example** To show detailed PIM-SM information for all PIM-SM configured VLAN interfaces, use the command:

```
awplus# show ip pim sparse-mode local-members
```

**Output** Figure 40-8: Example output from the **show ip pim sparse-mode local-members** command

```
awplus#show ip pim sparse-mode local-members
PIM Local membership information

vlan1:
  (*, 224.0.0.4) : Include

vlan203:
  (*, 223.0.0.3) : Include
```

**Example** To show detailed PIM-SM information for the PIM-SM configured interface `vlan1`, use the command:

```
awplus# show ip pim sparse-mode local-members vlan1
```

**Output** Figure 40-9: Example output from the **show ip pim sparse-mode local-members vlan1** command

```
awplus#show ip pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:
  (*, 224.0.0.4) : Include
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode mroute

**Overview** Use this command to display the IP multicast routing table or the IP multicast routing table based on a specific address or addresses.

**Syntax**

```
show ip pim sparse-mode mroute brief
show ip pim sparse-mode mroute
show ip pim sparse-mode mroute <group-address>
show ip pim sparse-mode mroute <source-address>
show ip pim sparse-mode mroute <source-address> <group-address>
```

Parameter	Description
brief	Shows only a summary of the number of each type of multicast entry and the cache.
<group-address>	Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.
<source-address>	Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source.

**Mode** Privileged Exec

**Usage notes** Note that when a feature license is enabled, the output for the **show ip pim sparse-mode mroute** command will only show 32 interfaces because of the terminal display width limit. Use the **show ip pim sparse-mode mroute detail** command to display detailed entries of the IP multicast routing table.

**Example** To display the IP multicast routing table for the address 40.40.40.11, enter the command:

```
awplus# show ip pim sparse-mode mroute 40.40.40.11
```

**Output** Figure 40-10: Example output from **show ip pim sparse-mode mroute brief**

```
awplus#show ip pim sparse-mode mroute brief

Version 5.4.8-2.1: **brief** parameter added.

# show ip pim sparse-mode mroute detail

**Overview** This command displays detailed entries of the IP multicast routing table, or detailed entries of the IP multicast routing table based on the specified address or addresses.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax**

```
show ip pim sparse-mode mroute [<group-address>] detail
show ip pim sparse-mode mroute [<source-address>] detail
show ip pim sparse-mode mroute [<group-address>
<source-address>] detail
show ip pim sparse-mode mroute [<source-address>
<group-address>] detail
```

Parameter	Description
<group-address>	Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.
<source-address>	Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source.
detail	Show detailed information.

**Usage notes** Based on the group and source address, the output is the selected route if present in the multicast route tree.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip pim sparse-mode mroute detail
awplus# show ip pim sparse-mode mroute 40.40.40.11 detail
awplus# show ip pim sparse-mode mroute 224.1.1.1 detail
awplus# show ip pim sparse-mode mroute 224.1.1.1 40.40.40.11
detail
```

**Command  
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode neighbor

**Overview** Use this command to show the PIM-SM neighbor information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode neighbor [<interface>] [<ip-address>] [detail]`

Parameter	Description
<interface>	Interface name (e.g. vlan2). Show neighbors on an interface.
<ip-address>	Show neighbors with a particular address on an interface. The IP address entered in the form A.B.C.D.
detail	Show detailed information.

**Mode** Privileged Exec

**Examples** `awplus# show ip pim sparse-mode neighbor`  
`awplus# show ip pim sparse-mode neighbor vlan5 detail`

Figure 40-13: Example output from the **show ip pim sparse-mode neighbor** command

Neighbor Address	Interface	Uptime/Expires	Ver	DR Priority/
10.10.0.9	vlan2	00:55:33/00:01:44	v2	1 /
10.10.0.136	vlan2	00:55:20/00:01:25	v2	1 /
10.10.0.172	vlan2	00:55:33/00:01:32	v2	1 / DR
192.168.0.100	vlan3	00:55:30/00:01:20	v2	N / DR

```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode nexthop

**Overview** Use this command to see the next hop information as used by PIM-SM.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)

**Syntax** `show ip pim sparse-mode nexthop`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim sparse-mode nexthop`

Figure 40-15: Example output from the **show ip pim sparse-mode nexthop** command

Flags: N = New, R = RP, S = Source, U = Unreachable								
Destination	Type	Nexthop Num	Nexthop Addr	Nexthop	Nexthop Ifindex	Metric	Pref	Refcnt
10.10.0.9	.RS.	1	0.0.0.0	4	0	0	1	

**Table 2:** Parameters in output of the **show ip pim sparse-mode nexthop** command

Parameter	Description
Destination	The destination address for which PIM-SM requires next hop information.
Type	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
Nexthop Num	The number of next hops to the destination. PIM-SM always uses only 1 next hop.
Nexthop Addr	The address of the primary next hop gateway.
Nexthop IfIndex	The interface on which the next hop gateway can be reached.
Nexthop Name	The name of next hop interface.
Metric	The metric of the route towards the destination.
Preference	The preference of the route towards destination.
Refcnt	Only used for debugging.

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode packet statistics

**Overview** Use this command to display the current packet receive counts for PIM sparse-mode.

**Syntax** `show ip pim sparse-mode packet statistics`

**Mode** Privileged Exec

**Example** The following command displays the current packet receive counts for PIM sparse-mode:

```
awplus# configure terminal
awplus(config)# show ip pim sparse-mode statistics
```

**Output** Figure 40-16: Example output from **show ip pim sparse-mode statistics**

```
awplus(config)#show ip pim sparse-mode statistics
PIM-SM Receive Packet Statistics :
All PIM-SM      :   Total : 25   Valid : 25
Hello          :   Total : 14   Valid : 14
Register       :   Total : 5    Valid : 5
Register Stop  :   Total : 0    Valid : 0

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode rp-hash

**Overview** Use this command to display the Rendezvous Point (RP) to be chosen based on the group selected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode rp-hash <group-addr>`

Parameter	Description
<code>&lt;group-addr&gt;</code>	The group address for which to find the RP, entered in the form A.B.C.D.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim sparse-mode rp-hash 224.0.1.3`

Figure 40-17: Output from the **show ip pim sparse-mode rp-hash** command

```
RP: 10.10.11.35  
Info source: 10.10.11.35, via bootstrap
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode rp mapping

**Overview** Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode rp mapping`

**Mode** Privileged Exec

**Example** `awplus# show ip pim sparse-mode rp mapping`

Figure 40-18: Output from the **show ip pim sparse-mode rp mapping** command

```
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4
RP: 10.10.0.9
   Info source: 10.10.0.9, via bootstrap, priority 192
   Uptime: 16:52:39, expires: 00:02:50
```

**Related commands** [show ip pim sparse-mode rp-hash](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# undebbug all pim sparse-mode

**Overview** Use this command to disable all PIM-SM debugging.

**Syntax** `undebbug all pim sparse-mode`

**Mode** Privileged Exec

**Example** `awplus# undebbug all pim sparse-mode`

**Related commands** [debug pim sparse-mode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

## Introduction

**Overview** This chapter provides an alphabetical reference of PIM-SMv6 commands. For IPv6 Multicast commands, see [Multicast Commands](#). For an overview of PIM-SMv6, see the [PIM-SMv6 Feature Overview and Configuration Guide](#).

IPv6 must be enabled on an interface with the `ipv6 enable` command, IPv6 forwarding must be enabled globally for routing IPv6 with the `ipv6 forwarding` command, and IPv6 multicasting must be enabled globally with the `ipv6 multicast-routing` command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the `clear ipv6 mroute` command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous IPv6 static multicast routes.

**NOTE:** The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPv6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

# clear ipv6 mroute pim

**Overview** Use this command to clear all Multicast Forwarding Cache (MFC) entries in PIM-SMv6.

**NOTE:** Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the *clear ipv6 mroute* command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

**Syntax** `clear ipv6 mroute [*] pim sparse-mode`

Parameter	Description
*	Clears all PIM-SMv6 multicast routes. Using this command without this optional operator only deletes the multicast router table entries.

**Mode** Privileged Exec

**Example**  
`awplus# clear ipv6 mroute pim sparse-mode`  
`awplus# clear ipv6 mroute * pim sparse-mode`

# clear ipv6 mroute pim sparse-mode

**Overview** Use this command to clear all multicast route table entries learned through PIM-SMv6 for a specified multicast group address, and optionally a specified multicast source address.

**NOTE:** *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the `clear ipv6 mroute` command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

**Syntax** `clear ipv6 mroute <Group-IPv6-add> pim sparse-mode`  
`clear ipv6 mroute <Group-IPv6-add> <Source-IPv6-add> pim sparse-mode`

Parameter	Description
<code>&lt;Group-IPv6-add&gt;</code>	Specify a multicast group IPv6 address, entered in the form X:X::X:X.
<code>&lt;Source-IPv6-add&gt;</code>	Specify a source group IPv6 address, entered in the form X:X::X:X.

**Mode** Privileged Exec

**Example** `awplus# clear ipv6 mroute 2001:db8:: pim sparse-mode`  
`awplus# clear ipv6 mroute 2001:db8:: 2002:db8:: pim sparse-mode`

# clear ipv6 pim sparse-mode bsr rp-set \*

**Overview** Use this command to clear all Rendezvous Point (RP) sets learned through the PIM-SMv6 Bootstrap Router (BSR).

**NOTE:** *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the `clear ipv6 mroute` command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

**Syntax** `clear ipv6 pim sparse-mode bsr rp-set *`

Parameter	Description
*	Clears all RP sets.

**Mode** Privileged Exec

**Usage** For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

**Example** `awplus# clear ipv6 pim sparse-mode bsr rp-set *`

# debug ipv6 pim sparse-mode

**Overview** Use this command to activate PIM-SMv6 debugging.

Use the no variant of this command to deactivate PIMv6 debugging. Note that the [undebug ipv6 pim sparse-mode](#) command is an alias of the no variant of this command.

**Syntax** `debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [state] [timer]`  
`no debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [state] [timer]`

Parameter	Description
all	Activates/deactivates all PIM-SMv6 debugging.
events	Activates debug printing of PIM-SMv6 events.
mfc	Activates debug printing of MFC (Multicast Forwarding Cache).
mib	Activates debug printing of PIM-SMv6 MIBs.
nexthop	Activates debug printing of PIM-SMv6 next hop communications.
nsm	Activates debugging of PIM-SMv6 NSM (Network Services Module) communications.
state	Activates debug printing of state transition on all PIM-SMv6 FSMs.
timer	Activates debug printing of PIM-SMv6 timers.

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode all
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode events
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode nexthop
```

**Validation output** Figure 41-1: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing **multiple debug ipv6 pim sparse-mode** commands

```
awplus#debug ipv6 pim sparse-mode state
awplus#debug ipv6 pim sparse-mode events
awplus#debug ipv6 pim sparse-mode packet
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:
  PIM event debugging is on
  PIM MFC debugging is off
  PIM state debugging is on
  PIM packet debugging is on
  PIM Hello HT timer debugging is off
  PIM Hello NLT timer debugging is off
  PIM Hello THT timer debugging is off
  PIM Join/Prune JT timer debugging is off
  PIM Join/Prune ET timer debugging is off
  PIM Join/Prune PPT timer debugging is off
  PIM Join/Prune KAT timer debugging is off
  PIM Join/Prune OT timer debugging is off
  PIM Assert AT timer debugging is off
  PIM Register RST timer debugging is off
  PIM Bootstrap BST timer debugging is off
  PIM Bootstrap CRP timer debugging is off
  PIM mib debugging is off
  PIM nsm debugging is off
  PIM nexthop debugging is off
```

**Related commands** [show debugging ipv6 pim sparse-mode](#)  
[undebug all ipv6 pim sparse-mode](#)  
[undebug ipv6 pim sparse-mode](#)

# debug ipv6 pim sparse-mode packet

**Overview** Use this command to activate PIM-SMv6 packet debugging.  
Use the no variant of this command to deactivate PIMv6 packet debugging.

**Syntax** debug ipv6 pim sparse-mode packet {in|out}  
no debug ipv6 pim sparse-mode packet {in|out}

Parameter	Description
packet	Activates debug printing of incoming and/or outgoing IPv6 packets.
in	Specify incoming packet debugging.
out	Specify outgoing packet debugging.

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet in
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet out
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet in
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet out
```

**Related commands** [show debugging ipv6 pim sparse-mode](#)  
[undebug all ipv6 pim sparse-mode](#)

# debug ipv6 pim sparse-mode timer

**Overview** Use this command to enable debugging for the specified PIM-SMv6 timers. Use the **no** variants of this command to disable debugging for the specified PIM-SMv6 timers.

**Syntax**

```
debug ipv6 pim sparse-mode timer assert [at]
no debug ipv6 pim sparse-mode timer assert [at]
debug pim ipv6 sparse-mode timer bsr [bst|crp]
no debug pim ipv6 sparse-mode timer bsr [bst|crp]
debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
no debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
debug pim ipv6 sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim ipv6 sparse-mode timer joinprune
[jt|et|ppt|kat|ot]
debug pim ipv6 sparse-mode timer register [rst]
no debug pim ipv6 sparse-mode timer register [rst]
```

Parameter	Description
assert	Enable or disable debugging for the Assert timers.
at	Enable or disable debugging for the Assert Timer.
bsr	Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers.
bst	Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.
crp	Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.
hello	Enable or disable debugging for the specified Hello timer, or all Hello timers.
ht	Enable or disable debugging for the Hello timer: Hello Timer.
nlt	Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.
tht	Enable or disable debugging for the Hello timer: Triggered Hello Timer.
joinprune	Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.
jt	Enable or disable debugging for the JoinPrune timer: upstream Join Timer.
et	Enable or disable debugging for the JoinPrune timer: Expiry Timer.
ppt	Enable or disable debugging for the JoinPrune timer: PrunePending Timer.

Parameter	Description
kat	Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.
ot	Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.
register	Enable or disable debugging for the Register timers.
rst	Enable or disable debugging for the Register timer: Register Stop Timer.

**Default** By default, all debugging is disabled.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging for the PIM-SMv6 Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug ipv6 pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SMv6 Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug ipv6 pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SMv6 Joinprune expiry timer, use the command:

```
awplus# debug ipv6 pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SMv6 Register timer, use the command:

```
awplus# no debug ipv6 pim sparse-mode timer register
```

**Related commands** [show debugging ipv6 pim sparse-mode](#)

# ipv6 pim anycast-rp

**Overview** Use this command to configure Anycast RP (Rendezvous Point) in an RP set.  
Use the **no** variant of this command to remove the configuration.

**Syntax** `ipv6 pim anycast-rp <anycast-rp-address> <member-rp-address>`  
`no ipv6 pim anycast-rp <anycast-rp-address>`  
`[<member-rp-address>]`

Parameter	Description
<code>&lt;anycast-rp-address&gt;</code>	<code>&lt;X:X::X:X&gt;</code> Specify an Anycast IPv6 address to configure an Anycast RP (Rendezvous Point) in a RP set.
<code>&lt;member-rp-address&gt;</code>	<code>&lt;A:B::C:D&gt;</code> Specify an Anycast RP (Rendezvous Point)IPv6 address to configure an Anycast RP in a RP set.

**Mode** Global Configuration

**Usage notes** Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IPv6 address range from many sources, resulting in packets addressed to destination addresses in this range being routed to the nearest source announcing the given destination IPv6 address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

**Examples** The following example shows how to configure the Anycast RP address with **ipv6 pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ipv6 pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

# ipv6 pim bsr-border

**Overview** Use the **ipv6 pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through a VLAN interface. The BSR border is the border of the PIM-SMv6 domain.

Use the **no** variant of this command to disable the configuration set with **ipv6 pim bsr-border**.

**Syntax** `ipv6 pim bsr-border`  
`no ipv6 pim bsr-border`

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** When this command is configured on a VLAN interface, no PIM-SMv6 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM-SMv6 domain with this command to avoid BSR messages from being exchanged between the two PIM-SMv6 domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM-SMv6 protocol from working as intended.

**Examples** The following example configures the VLAN interface vlan2 to be the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim bsr-border
```

The following example removes the VLAN interface vlan2 from the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim bsr-border
```

The following example configures the PPP interface ppp0 to be the PIM -SMv6 domain border:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim bsr-border
```

The following example removes the PPP interface ppp0 from the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim bsr-border
```

# ipv6 pim bsr-candidate

**Overview** Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IPv6 address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

**Syntax** `ipv6 pim bsr-candidate <interface> [<hash>] [<priority>]`  
`no ipv6 pim bsr-candidate [<interface>]`

Parameter	Description
<interface>	Specify the interface. For instance, VLAN interface <code>vlan2</code> .
<hash>	<0-128> configure the hash mask length used for RP selection. The default hash value if you do not configure this parameter is 126.
<priority>	<0-255> configure priority for a BSR candidate. Note that you must also specify the <hash> (mask length) when specifying the <priority>. The default priority if you do not configure this parameter is 64.

**Mode** Global Configuration

**Default** The default hash parameter value is 126 and the default priority parameter value is 64.

**Examples** To set the BSR candidate to the VLAN interface `vlan2`, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan2 20 30
```

To withdraw the address of `vlan2` from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 pim bsr-candidate vlan2
```

To set the BSR candidate to the PPP interface `ppp0`, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate ppp0 20 30
```

To withdraw the address of ppp0 from being offered as a BSR candidate, enter:

```
awplus# configure terminal
```

```
awplus(config)# no ipv6 pim bsr-candidate ppp0
```

# ipv6 pim cisco-register-checksum

**Overview** Use this command to configure the option to calculate the Register Checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

**Syntax** `ipv6 pim cisco-register-checksum`  
`no ipv6 pim cisco-register-checksum`

**Default** This command is disabled by default. By default, Register Checksum is calculated only over the header.

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum
awplus# configure terminal
awplus(config)# no ipv6 pim cisco-register-checksum
```

# ipv6 pim crp-cisco-prefix

**Overview** Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0.

Use the **no** variant of this command to revert to the default settings.

**Syntax** `ipv6 pim crp-cisco-prefix`  
`no ipv6 pim crp-cisco-prefix`

**Mode** Global Configuration

**Usage** Cisco's BSR code does not conform to the latest BSR draft, it does not accept candidate RPs with a group prefix number of zero. To make the candidate RP work with a Cisco BSR, use the **ipv6 pim crp-cisco-prefix** command when interoperating with older versions of Cisco IOS.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim crp-cisco-prefix
awplus# configure terminal
awplus(config)# no ipv6 pim crp-cisco-prefix
```

**Related commands** [ipv6 pim rp-candidate](#)

# ipv6 pim dr-priority

**Overview** Use this command to set the Designated Router priority value.  
Use the **no** variant of this command to disable this function.

**Syntax** `ipv6 pim dr-priority <priority>`  
`no ipv6 pim dr-priority [<priority>]`

Parameter	Description
<priority>	<0-4294967294> Specify the Designated Router priority value. Note that a higher value has a higher preference or higher priority.

**Default** The default value is 1. The negated form of this command restores the value to the default.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples** To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim dr-priority
```

To set the Designated Router priority value to 11234 for the PPP interface ppp0, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim dr-priority 11234
```

To disable the Designated Router priority value for the PPP interface ppp0, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim dr-priority
```

**Related commands** [ipv6 pim ignore-rp-set-priority](#)

# ipv6 pim exclude-genid

**Overview** Use this command to exclude the GenID option from Hello packets sent out by the PIM-SMv6 module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

**Syntax** `ipv6 pim exclude-genid`  
`no ipv6 pim exclude-genid`

**Default** By default, this command is disabled; the GenID option is included.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim exclude-genid
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim exclude-genid
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim exclude-genid
```

# ipv6 pim ext-srcs-directly-connected

**Overview** Use this command to configure PIM-SMv6 to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM-SMv6 to treat only directly connected sources as directly connected.

**Syntax** `ipv6 pim ext-srcs-directly-connected`  
`no ipv6 pim ext-srcs-directly-connected`

**Default** The **no** variant of this command is the default behavior.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Example** To configure PIM-SMv6 to treat all sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim ext-srcs-directly-connected
```

To configure PIM-SMv6 to treat only directly connected sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim ext-srcs-directly-connected
```

To configure PIM to treat all sources as directly connected for PPP interface `ppp0`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for PPP interface `ppp0`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim ext-srcs-directly-connected
```

# ipv6 pim hello-holdtime

**Overview** This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 \* the current hello-interval.

**Syntax** `ipv6 pim hello-holdtime <holdtime>`  
`no ipv6 pim hello-holdtime`

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

**Default** The default hello-holdtime value is 3.5 \* the current hello-interval. The default hello- holdtime is restored using the negated form of this command.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** Each time the hello interval is updated, the hello holdtime is also updated, according to the following rules:

If the hello holdtime is not configured; or if the hello holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 \* hello interval). Otherwise, it retains the configured value.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-holdtime 123
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-holdtime 123
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-holdtime
```

# ipv6 pim hello-interval

**Overview** This command configures a hello-interval value for PIM-SMv6. Use the **no** variant of this command to reset the hello-interval for PIM-SMv6 to the default.

**Syntax** `ipv6 pim hello-interval <interval>`  
`no ipv6 pim hello-interval`

Parameter	Description
<interval>	<1-65535> The value in seconds (no fractional seconds accepted).

**Default** The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** When the hello interval is configured, and the hello holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 \* hello interval). Otherwise, the hello-holdtime value is the configured value.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-interval 123
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-interval 123
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-interval
```

# ipv6 pim ignore-rp-set-priority

**Overview** Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

Use the **no** variant of this command to disable this setting.

**Syntax** `ipv6 pim ignore-rp-set-priority`  
`no ipv6 pim ignore-rp-set-priority`

**Mode** Global Configuration

**Usage** This command is used to inter-operate with older Cisco IOS versions.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim ignore-rp-set-priority
awplus# configure terminal
awplus(config)# no ipv6 pim ignore-rp-set-priority
```

# ipv6 pim jp-timer

**Overview** Use this command to set the PIM-SMv6 join/prune timer. Note that the value set by the join/prune timer is the value that the device puts into the holdtime field of the join/prune packets it sends to its neighbors.

Use the **no** variant of this command to return the PIM-SMv6 join/prune timer to its default value of 210 seconds.

**Syntax** `ipv6 pim jp-timer <1-65535>`  
`no ipv6 pim jp-timer [<1-65535>]`

Parameter	Description
<1-65535>	Specifies the Join/Prune timer value. The default value is 210 seconds.

**Default** The default PIM-SMv6 join/prune timer value is 210 seconds.

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim jp-timer 300
awplus# configure terminal
awplus(config)# no ipv6 pim jp-timer
```

# ipv6 pim neighbor-filter

**Overview** The AR3050S and AR4050S devices don't support access control list in 5.4.5-0.1 release.

This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SMv6 will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering IPv6 access list.

Use the **no** variant of this command to disable this function.

**Syntax** `ipv6 pim neighbor-filter <IPv6-accesslist>`  
`no ipv6 pim neighbor-filter <IPv6-accesslist>`

Parameter	Description
<code>&lt;IPv6-accesslist&gt;</code>	Specify a Standard or an Extended software IPv6 access list name for the PIM-SMv6 neighbor filter.

**Default** By default, there is no neighbor filtering applied to an interface.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim neighbor-filter filter1
```

# ipv6 pim register-rate-limit

**Overview** Use this command to configure the rate of register packets sent by this DR, in units of packets per second. The configured rate is per (S, G) state, and is not a system wide rate.

Use the **no** variant of this command to remove the limit and reset to the default rate limit.

**Syntax** `ipv6 pim register-rate-limit <1-65535>`  
`no ipv6 pim register-rate-limit`

Parameter	Description
<1-65535>	Specifies the maximum number of packets that can be sent per second.

**Mode** Global Configuration

**Default** The default is 0, as reset with the **no** variant, which also specifies an unlimited rate limit.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rate-limit 3444
awplus# configure terminal
awplus(config)# no ipv6 pim register-rate-limit 3444
```

# ipv6 pim register-rp-reachability

**Overview** Use this command to enable the RP reachability check for PIMv6 Register processing at the DR. The default setting is no checking for RP-reachability. Use the **no** variant of this command to disable this processing.

**Syntax** `ipv6 pim register-rp-reachability`  
`no ipv6 pim register-rp-reachability`

**Default** This command is disabled; by default, there is no checking for RP-reachability.

**Mode** Global Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rp-reachability
awplus# configure terminal
awplus(config)# no ipv6 pim register-rp-reachability
```

# ipv6 pim register-source

**Overview** Use this command to configure the source IPv6 address of register packets sent by this DR, overriding the default source IPv6 address, which is the IPv6 address of the RPF interface toward the source host.

Use the **no** variant of this command to remove the IPv6 source address of Register packets sent by this DR, reverting back to use the default IPv6 source address that is the address of the RPF interface toward the source host.

**Syntax** `ipv6 pim register-source [<source-IPv6-address> | <interface>]`  
`no ipv6 pim register-source`

Parameter	Description
<source-IPv6-address>	The IPv6 address, entered in the form X::X:X, to be used as the source of the register packets.
<interface>	The name of the VLAN interface to be used as the source of the register packets.

**Usage** The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback IPv6 interface address, but can also be a physical IPv6 address. This IPv6 address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM-SMv6 enabled.

**Mode** Global Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source 3ffe::24:2
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source vlan2
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# no ipv6 pim register-source
```

# ipv6 pim register-suppression

**Overview** Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

**Syntax** `ipv6 pim register-suppression <1-65535>`  
`no ipv6 pim register-suppression`

Parameter	Description
<1-65535>	Register suppression on time in seconds.

**Mode** Global Configuration

**Default** The default PIM-SMv6 register suppression time is 60 seconds, and is restored with the no variant of this command.

**Usage** Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the `ipv6 pim rp-register-kat` command is not used.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-suppression 192
awplus# configure terminal
awplus(config)# no ipv6 pim register-suppression
```

# ipv6 pim rp-address

**Overview** The AR3050S and AR4050 devices don't support access control list in 5.4.5-0.1 release.

Use this command to statically configure RP (Rendezvous Point) address for IPv6 multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for IPv6 multicast groups.

**Syntax** `ipv6 pimv6 rp-address <IPv6-address>`  
`no ipv6 pim rp-address <IPv6-address>`

Parameter	Description
<code>&lt;IPv6-address&gt;</code>	Specify the IPv6 address of the Rendezvous Point, entered in the form X:X::X:X.

**Mode** Global Configuration

**Usage notes** The AlliedWare Plus™ PIM-SMv6 implementation supports multiple static RPs. It also supports usage of static-RP and BSR mechanism simultaneously. The **ipv6 pim rp-address** command is used to statically configure the RP address for IPv6 multicast groups.

You need to understand the following information before using this command.

If the RP-address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP-address configured through BSR is chosen over the statically configured RP-address.

If multiple static-RPs are available for a group range, then one with the highest IPv6 address is chosen.

After configuration, the RP-address is inserted into a static-RP group tree based on the configured group ranges. For each group range, multiple static-RPs are maintained in a list. This list is sorted in a descending order of IPv6 addresses. When selecting static-RPs for a group range, the first element (which is the static-RP with highest IPv6 address) is chosen.

RP-address deletion is handled by removing the static-RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by the `ipv6 pim rp-address` command. Commands with the `override` keyword take precedence over dynamically learned mappings.

**Examples** `awplus# configure terminal`  
`awplus(config)# no ipv6 pim rp-address 3ffe:30:30:5::153 G2`

**Related  
commands** [ipv6 pim rp-candidate](#)  
[ipv6 pim rp-register-kat](#)

# ipv6 pim rp-candidate

**Overview** Use this command to make the device an RP (Rendezvous Point) candidate, using the IPv6 address of the specified VLAN interface.

Use the **no** variant of this command to stop the device from being an RP candidate.

**Syntax** `ipv6 pim rp-candidate <interface> [priority <priority> | interval <interval> | grouplist <accesslist>]`  
`no ipv6 pim rp-candidate [<interface>]`

Parameter	Description
<interface>	Specify a VLAN interface name.
<priority>	Specify the priority for the RP candidate in the range 0 to 255.
<interval>	Specify a candidate RP advertisement interval in the range 1 to 16383 (seconds).
<accesslist>	Specify a Standard or an Extended software IPv6 access list name.

**Default** The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

**Mode** Global Configuration

**Usage notes** Note that issuing the command **ipv6 pim rp-candidate <interface>** without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

**Examples** To specify a priority of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-candidate vlan2 priority 3
```

To stop the device from being an RP candidate on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-candidate vlan2
```

**Related commands** [ipv6 pim rp-address](#)  
[ipv6 pim rp-register-kat](#)

# ipv6 pim rp embedded

**Overview** Use this command to configure and enable embedded RP (Rendezvous Point) in PIM-SMv6.

This command only applies to the embedded RP group range **ff7x::/12** and **fffx::/12**.

Use the **no** variant of this command to disable embedded RP support. Since embedded RP support is enabled by default, use the **no** variant of this command to disable the default.

**Syntax** `ipv6 pim rp embedded`  
`no ipv6 pim rp embedded`

**Mode** Global Configuration

**Default** Embedded RP is enabled by default in the AlliedWare Plus implementation of PIM-SMv6.

**Examples** The following example re-enables embedded RP support, the default state in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp embedded
```

The following example disables embedded RP support, which is enabled by default in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp embedded
```

# ipv6 pim rp-register-kat

**Overview** Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SMv6 Register packets.

Use the **no** variant of this command to return the PIM-SMv6 KAT timer to its default value of 210 seconds.

**Syntax** `ipv6 pim rp-register-kat <1-65535>`  
`no ipv6 pim rp-register-kat`

Parameter	Description
<1-65536>	Specify the KAT timer in seconds. The default value is 210 seconds.

**Mode** Global Configuration

**Default** The default PIM-SMv6 KAT timer value is 210 seconds.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-register-kat 3454
awplus# configure terminal
awplus(config)# no ipv6 pim rp-register-kat
```

**Related commands** [ipv6 pim rp-address](#)  
[ipv6 pim rp-candidate](#)

# ipv6 pim sparse-mode

**Overview** Use this command to enable PIM-SMv6 on a VLAN interface or a PPP interface. Use the **no** variant of this command to disable PIM-SMv6 on a VLAN interface or a PPP interface.

**Syntax** `ipv6 pim sparse-mode`  
`no ipv6 pim sparse-mode`

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim sparse-mode
```

# ipv6 pim sparse-mode passive

**Overview** Use this command to enable and disable PIM-SMv6 passive mode operation for local members on a VLAN interface or a PPP interface.

Use the **no** variant of this command to disable PIM-SMv6 passive mode operation for local members on a VLAN interface or a PPP interface.

**Syntax** `ipv6 pim sparse-mode passive`  
`no ipv6 pim sparse-mode passive`

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage** Passive mode essentially stops PIM-SMv6 transactions on the interface, allowing only the MLD mechanism to be active.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode passive
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim sparse-mode passive
```

# ipv6 pim spt-threshold

**Overview** This command turns on the ability for the last-hop PIM-SMv6 router to switch to SPT (shortest-path tree).

The **no** variant of this command turns off the ability for the last-hop PIM-SMv6 router to switch to SPT.

**NOTE:** *The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.*

**Syntax** `ipv6 pim spt-threshold`  
`no ipv6 pim spt-threshold`

**Mode** Global Configuration

**Examples** To enable the last-hop PIM-SMv6 router to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold
```

To stop the last-hop PIM-SMv6 router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold
```

# ipv6 pim ssm

**Overview** Use this command to define the Source Specific Multicast (SSM) range of IPv6 multicast addresses. PIM-SMv6 routers will only install (S,G) entries for multicast groups (addresses) residing in the SSM range.

Use the **no** variant of this command to disable the SSM range.

**Syntax** `ipv6 pim ssm [default]`  
`no ipv6 pim ssm`

Parameter	Description
default	Named Standard Access List. Use FF3x::/32 group range for SSM.

**Default** By default, the command is disabled.

**Mode** Global Configuration

**Usage** Any (\*,G) or (S,G,rpt) joins received for multicast groups (addresses) within the range, are not installed in PIM-SMv6 mroute table.

**Examples** The following commands show how to set PIM-SSM as default:

```
awplus# configure terminal
awplus(config)# ipv6 pim ssm default
```

The following commands show how to disable PIM-SSM:

```
awplus# configure terminal
awplus(config)# no ipv6 pim ssm
```

# ipv6 pim unicast-bsm

**Overview** Use this command to enable support for the sending and receiving of unicast Boot Strap Messages (BSM) on a VLAN interface.

Use the **no** variant of this command to disable the sending and receiving of unicast BSM on a VLAN interface.

**Syntax** `ipv6 pim unicast-bsm`  
`no ipv6 pim unicast-bsm`

**Mode** Interface Configuration for a VLAN interface.

**Default** Unicast BSM is disabled by default on an interface.

**Usage** This command provides backward compatibility with older versions of the Boot Strap Router (BSR) specification, which directs unicast BSM to refresh the state of new or restarting neighbors. The current BSR specification defines a No Forward BSM to achieve the same result.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim unicast-bsm
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim unicast-bsm
```

# service pim6

**Overview** Use this command to enable IPv6 PIM sparse mode services.  
Use the **no** version of the command to disable unused IPv6 PIM sparse mode services.

**Syntax** `service pim6`  
`no service pim6`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Sometimes it may be desirable to disable unused services, in order to reduce memory use.  
Disabling the PIM services will only take effect after you save the configuration and restart the device.

**Example** To disable the IPv6 PIM sparse mode service, use the commands:

```
awplus# configure terminal
awplus(config)# no service pim6
```

**Output** Figure 41-2: Example output from **no service pim6**

```
awplus(config)#no service pim6
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-0.1: command added

# show debugging ipv6 pim sparse-mode

**Overview** Use this command to see what debugging is turned on for PIM-SMv6.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show debugging ipv6 pim sparse-mode`

**Mode** User Exec and Privileged Exec

**Example** To display PIM-SMv6 debugging settings, use the command:

```
awplus# show debugging ipv6 pim sparse-mode
```

Figure 41-3: Example output from the **show debugging ipv6 pim sparse-mode** command

```
awplus#show debugging ipv6 pim sparse-mode
Debugging status:
  PIM event debugging is on
  PIM MFC debugging is on
  PIM state debugging is on
  PIM packet debugging is on

  PIM Bootstrap CRP timer debugging is on
```

**Related commands** [debug ipv6 pim sparse-mode](#)  
[undebug ipv6 pim sparse-mode](#)

# show ipv6 pim sparse-mode bsr-router

**Overview** Use this command to show the PIM-SMv6 Bootstrap Router (BSR) IPv6 address.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 pim sparse-mode bsr-router`

**Mode** User Exec and Privileged Exec

**Example** To display the BSR IPv6 address, use the command:

```
awplus# show ipv6 pim sparse-mode bsr-router
```

**Output** Figure 41-4: Example output from the **show ipv6 pim sparse-mode bsr-router** command

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
  BSR address: 2001:203::213 (?)
  Uptime:      00:36:25, BSR Priority: 64, Hash mask length: 126
  Expires:     00:01:46
  Role: Candidate BSR
  State: Candidate BSR

Candidate RP: 2001:5::211(vlan5)
  Advertisement interval 60 seconds
  Next C-RP advertisement in 00:00:43
```

**Related commands** [show ipv6 pim sparse-mode rp mapping](#)  
[show ipv6 pim sparse-mode neighbor](#)

# show ipv6 pim sparse-mode interface

**Overview** Use this command to show PIM-SMv6 interface information. Note that you can specify an individual VLAN interface with the optional parameter. Alternatively, you can display PIM-SMv6 interface information for all interfaces if you omit the optional interface parameter.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** show ipv6 pim sparse-mode interface

**Mode** User Exec and Privileged Exec

**Examples** To display information about all PIM-SMv6 interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode interface
```

```
awplus#show ipv6 pim sparse-mode interface
Interface VIFindex Ver/   Nbr   DR
                Mode   Count Priority
vlan2      0      v2/S   2     1

```

**Table 1:** Parameters in the output from the **show ipv6 pim sparse-mode interface** command

Parameters	Description
Address	Primary PIM-SMv6 address.
Interface	Name of the PIM-SMv6 interface.
VIF Index	The Virtual Interface index of the VLAN.
Ver/Mode	PIMv6 version/Sparse mode.
Nbr Count	Neighbor count of the PIM-SMv6 interface.
DR Priority	Designated Router priority.
DR	The IPv6 address of the Designated Router.

# show ipv6 pim sparse-mode local-members

**Overview** Use this command to show detailed local member information on a VLAN interface configured for PIM-SMv6. If you do not specify a VLAN interface then detailed local member information is shown for all VLAN interfaces configured for PIM-SMv6.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 pim sparse-mode local-members [<interface>]`

Parameter	Description
<interface>	Optional Specify the interface. For instance, VLAN interface vlan2.

**Mode** User Exec and Privileged Exec

**Example** To show detailed PIM-SMv6 information for all PIM-SMv6 configured VLAN interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode local-members
```

**Output** Figure 41-6: Example output from the **show ipv6 pim sparse-mode local-members** command

```
awplus#show ipv6 pim sparse-mode local-members
PIM Local membership information

vlan1:

  (*, ff02::1:ff6b:4783) : Include

vlan203:

  (*, ff0e:1::4) : Include
```

**Example** To show detailed PIM-SMv6 information for the PIM-SMv6 configured interface vlan1, use the command:

```
awplus# show ipv6 pim sparse-mode local-members vlan1
```

**Output** Figure 41-7: Example output from the **show ipv6 pim sparse-mode local-members vlan1** command

```
awplus#show ipv6 pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:

(*, ff02::1:ff6b:4783) : Include
```

# show ipv6 pim sparse-mode mroute

**Overview** This command displays the IPv6 multicast routing table, or the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be entered simultaneously; two source IPv6 addresses cannot be entered simultaneously.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax**

```
show ipv6 pim sparse-mode mroute
show ipv6 pim sparse-mode mroute <group-IPv6-address>
show ipv6 pim sparse-mode mroute <source-IPv6-address>
show ipv6 pim sparse-mode mroute <group-IPv6-address>
<source-IPv6-address>
show ipv6 pim sparse-mode mroute <source-IPv6-address>
<group-IPv6-address>
show ipv6 pim sparse-mode mroute brief
```

Parameter	Description
<i>&lt;group-IPv6-address&gt;</i>	Group IPv6 address, entered in the form X:X::X:X. Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.
<i>&lt;source-IPv6-address&gt;</i>	Source IPv6 address, entered in the form X:X::X:X. Based on the source and group IPv6 address, the output is the selected route if present in the multicast route tree.
brief	Brief display

**Mode** User Exec and Privileged Exec

**Usage notes** Note that when a feature license is enabled, the output for the [show ipv6 pim sparse-mode mroute](#) command will only show 100 interfaces because of the terminal display width limit. Use the [show ipv6 pim sparse-mode mroute detail](#) command to display detailed entries of the IPv6 multicast routing table.

**Examples**

```
awplus# show ipv6 pim sparse-mode mroute
awplus# show ipv6 pim sparse-mode mroute 2001:db8::
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8::
awplus# show ipv6 pim sparse-mode mroute brief
```

# show ipv6 pim sparse-mode mroute detail

**Overview** This command displays detailed entries of the IPv6 multicast routing table, or detailed entries of the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two IPv6 source addresses cannot be used simultaneously.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 pim sparse-mode mroute [<source-IPv6-address>] detail`

Parameter	Description
<code>&lt;source-IPv6-address&gt;</code>	Source IPv6 address, entered in the form X:X::X:X. Output is all multicast entries belonging to that source.
<code>detail</code>	Show detailed information.

**Usage notes** Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ipv6 pim sparse-mode mroute detail
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: detail
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8::
detail
```

# show ipv6 pim sparse-mode neighbor

**Overview** Use this command to show the PIM-SMv6 neighbor information.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 pim sparse-mode neighbor [<interface>]  
[<IPv6-address>] [detail]`

Parameter	Description
<interface>	Interface name (e.g. vlan2). Show neighbors on an interface.
<IPv6-address>	Show neighbors with a particular address on an interface. The IPv6 address entered in the form X:X::X:X.
detail	Show detailed information.

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ipv6 pim sparse-mode neighbor`  
`awplus# show ipv6 pim sparse-mode neighbor vlan5 detail`

Figure 41-11: Example output from the **show ipv6 pim sparse-mode neighbor** command

```
awplus#show ipv6 pim sparse-mode neighbor
Neighbor Address          Interface    Uptime/Expires          DR
                               Pri/Mode
fe80::202:b3ff:fed4:69fe  vlan2       05:33:52/00:01:41 1 /
fe80::20e:cff:fe01:facc  vlan3       05:33:53/00:01:26 1 / DR
```

Figure 41-12: Example output from the **show ipv6 pim sparse-mode neighbor interface detail** command

```
awplus#show ipv6 pim sparse-mode neighbor detail
Nbr fe80::211:11ff:fe44:4cd8 (vlan1), DR
Expires in 64 seconds, uptime 00:00:53
Holdtime: 70 secs, T-bit: off, Lan delay: 1, Override interval: 3
DR priority: 100, Gen ID: 1080091886,
Secondary addresses:
3ffe:10:10:10:3::180
```

# show ipv6 pim sparse-mode nexthop

**Overview** Use this command to see the next hop information as used by PIM-SMv6.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** show ipv6 pim sparse-mode nexthop

**Mode** User Exec and Privileged Exec

**Example** awplus# show ipv6 pim sparse-mode nexthop

Figure 41-13: Example output from the **show ipv6 pim sparse-mode nexthop** command

```
awplus#show ipv6 pim sparse-mode nexthop
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination          Type  Nexthop Nexthop Nexthop  Nexthop Metric   Pref  Refcnt
                   Num   Addr    Iindex  Name
-----
3ffe:10:10:5::153   .RS.  1       fe80::20e:cff:fe01:facc  2    30   110   1
```

**Table 2:** Parameters in output of the **show ipv6 pim sparse-mode nexthop** command

Parameter	Description
Destination	The destination address for which PIM-SMv6 requires next hop information.
Type	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
Nexthop Num	The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.
Nexthop Addr	The address of the primary next hop gateway.
Nexthop IfIndex	The interface on which the next hop gateway can be reached.
Nexthop Name	The name of next hop interface.
Metric	The metric of the route towards the destination.
Preference	The preference of the route towards destination.
Refcnt	Only used for debugging.

# show ipv6 pim sparse-mode rp-hash

**Overview** Use this command to display the Rendezvous Point (RP) to be chosen based on the IPv6 group address selected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 pim sparse-mode rp-hash <IPv6-group-addr>`

Parameter	Description
<code>&lt;IPv6-group-addr&gt;</code>	The IPv6 group address used to find the RP, entered in the form X:X::X:X.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode rp-hash ff04:10`

Figure 41-14: Output from the **show ipv6 pim sparse-mode rp-hash** command:

```
awplus#show ipv6 pim sparse-mode rp-hash ff04::10
RP: 3ffe:10:10:5::153
Info source: 3ffe:10:10:5::153, via bootstrap
```

**Related commands** [show ipv6 pim sparse-mode rp mapping](#)

# show ipv6 pim sparse-mode rp mapping

**Overview** Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 pim sparse-mode rp mapping`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode rp mapping`

Figure 41-15: Output from the **show ipv6 pim sparse-mode rp mapping** command

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff00::/8
  RP: 3ffe:10:10:5::153
    Info source: 3ffe:10:10:5::153, via bootstrap, priority 192
    Uptime: 05:36:40
```

**Related commands** [show ipv6 pim sparse-mode rp-hash](#)

# show ipv6 pim sparse-mode rp nexthop

**Overview** Use this command to display the RP (Rendezvous Point) next hop information used by PIM-SMv6.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 pim sparse-mode rp nexthop <RP-group-addr>`

Parameter	Description
<code>&lt;RP-group-addr&gt;</code>	Specify the RP group address used to display next hop RP information, entered in the form X:X::X:X.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153`

Figure 41-16: Example output from the **show ipv6 pim sparse-mode rp nexthop** command

```
awplus#show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination          Type  Nexthop Nexthop Nexthop  Nexthop Metric   Pref  Refcnt
                   Num   Addr    Ifindex Name
-----
3ffe:10:10:5::153   .RS.  1       fe80::20e:cff:fe01:facc 2    30   110   1
```

**Table 3:** Parameters in output of the **show ipv6 pim sparse-mode rp nexthop** command

Parameter	Description
Destination	The destination address for which PIM-SMv6 requires next hop information.
Type	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
Nexthop Num	The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.
Nexthop Addr	The address of the primary next hop gateway.
Nexthop IfIndex	The interface on which the next hop gateway can be reached.
Nexthop Name	The name of next hop interface.

**Table 3:** Parameters in output of the **show ipv6 pim sparse-mode rp nexthop** command (cont.)

Parameter	Description
Metric	The metric of the route towards the destination.
Preference	The preference of the route towards destination.
Refcnt	Only used for debugging.

# undebbug all ipv6 pim sparse-mode

**Overview** Use this command to disable all PIM-SMv6 debugging.

**Syntax** `undebbug all ipv6 pim sparse-mode`

**Mode** Privileged Exec

**Example** `awplus# undebbug all ipv6 pim sparse-mode`

**Related commands** [debug ipv6 pim sparse-mode](#)

# undebbug ipv6 pim sparse-mode

**Overview** Use this command to deactivate PIM-SMv6 debugging. Note that this command is an alias of the no variant of the [debug ipv6 pim sparse-mode](#) command.

**Syntax** `undebbug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [state] [timer]`

Parameter	Description
all	Deactivates all PIM-SMv6 debugging.
events	Deactivates debug printing of PIM-SMv6 events.
mfc	Deactivates debug printing of MFC (Multicast Forwarding Cache).
mib	Deactivates debug printing of PIM-SMv6 MIBs.
nexthop	Deactivates debug printing of PIM-SMv6 next hop communications.
nsm	Deactivates debugging of PIM-SMv6 NSM (Network Services Module) communications.
state	Deactivates debug printing of state transition on all PIM-SMv6 FSMs.
timer	Deactivates debug printing of PIM-SMv6 timers.

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebbug ipv6 pim sparse-mode all
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebbug ipv6 pim sparse-mode events
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebbug ipv6 pim sparse-mode nexthop
```

**Validation Output** Figure 41-17: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing the **undebg ipv6 pim sparse-mode all** command

```
awplus#undebg ipv6 pim sparse-mode all
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:
  PIM event debugging is off
  PIM MFC debugging is off

# class (htb)

**Overview** Use this command to configure a hierarchy token bucket (HTB) class within a traffic control policy.

Use the **no** variant of this command to delete an existing class under a current policy.

**Syntax** `class <class-name> [cir <committed-rate>] [pir <peak-rate>]  
[bc <1-100000000>] [be <1-100000000>] [preference <0-7>]  
[queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve  
<red-curve-name>]`

```
class <class-name> [cir <committed-rate>] [pir <peak-rate>]  
[bc <1-100000000>] [be <1-100000000>] [preference <0-7>]  
sub-class-policy htb
```

```
no class <class-name>
```

Parameter	Description
<code>&lt;class-name&gt;</code>	Name of the class.
<code>cir &lt;committed-rate&gt;</code>	Set the Committed Information Rate (CIR) for the queue. This parameter is compulsory when creating a new class. When editing an existing class, this parameter is optional.
<code>pir &lt;peak-rate&gt;</code>	Set the Peak Information Rate (PIR) for the queue. This is the rate of the queue under peak conditions. Specified in kbit/mbit/gbit per second, in the range 1kbit-100gbit.
<code>bc &lt;1-100000000&gt;</code>	Set the Committed Burst size (BC). This is the burst allowed above the CIR sent at the PIR rate.
<code>be &lt;1-100000000&gt;</code>	Set the Excess Burst size (BE). This is the burst allowed above the PIR sent at the maximum rate.
<code>preference &lt;0-7&gt;</code>	Set the preference for a class to receive spare bandwidth. Preference for the class to receive spare bandwidth (highest is 7).
<code>queue-length &lt;2-65536&gt;</code>	Set the maximum queue length.
<code>set-dscp &lt;dscp-value&gt;</code>	Set the DSCP value to apply to the packets.
<code>red-curve &lt;red-curve-name&gt;</code>	Apply a random early discard template with the class (only available on leaf queues when specifying class policy). If the keyword <code>&lt;default&gt;</code> is used then the default RED curve is applied.
<code>sub-class-policy</code>	Specify that the class will contain sub-classes.
<code>htb</code>	Sub-classes will use the Hierarchy Token Bucket (HTB) queueing discipline.

**Default** BC and BE are assigned suitable values proportional to the CIR and PIR respectively, and are larger than the MTU. The PIR defaults to the CIR. The Preference defaults to 7 and the queue-length defaults to 1000 (if the class is a leaf). If the keyword `<default>` is used then the default RED curve is applied.

**Mode** Traffic-Control Policy for an HTB policy.

**Usage** If there is already a class in the same level that has the specified name, the command will replace the configuration of the existing class if it does not have any sub-classes.

If a sub-class policy is specified, this command uses the Traffic-Control Class mode to apply it.

**Examples** To configure a leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01 cir 100mbit pir 150mbit
```

To configure a class with a sub-sub-class as the leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01 cir 100mbit pir 150mbit
sub-class-policy htb

awplus(config-tc-class)#sub-class s01 cir 10mbit sub-sub-class
policy htb

awplus(config-tc-subclass)#sub-sub-class ss01 cir 5mbit
queue-length 200 red-curve ss01-red
```

To enter Traffic-Control Class mode for an existing class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#
```

To delete an existing class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#no class c01
```

**Related commands** [policy \(traffic-control\)](#)  
[sub-class \(htb\)](#)  
[traffic-control](#)

# class (priority)

**Overview** Use this command to configure a priority queue class within a traffic control policy.

Use the **no** variant of this command to delete an existing priority class under a current policy.

**Syntax** `class <class-name> [priority-level <0-15>] [max <max-rate>]  
[queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve  
<red-curve-name>]`

`class <class-name> [priority-level <0-15>] sub-class-policy  
{priority|wrr|htb}`

`no class <class-name>`

Parameter	Description
<code>&lt;class-name&gt;</code>	Name of the class.
<code>priority-level &lt;0-15&gt;</code>	Set the priority level (15 is the highest). This parameter is compulsory when creating a new class. When editing an existing class, this parameter is optional.
<code>max &lt;max-rate&gt;</code>	Set the maximum traffic rate of the queue (in kbit/mbit/gbit per second, 1kbit-100gbit).
<code>queue-length &lt;2-65535&gt;</code>	Set the maximum queue length in packets (only available on leaf queues when specifying sub-class policy).
<code>set-dscp &lt;dscp-value&gt;</code>	Set the DSCP value to apply to the packets (only available on leaf queues when specifying sub-class policy).
<code>red-curve &lt;red-curve-name&gt;</code>	Apply a random early discard template with the class (only available on leaf queues when specifying class policy). If the keyword <code>&lt;default&gt;</code> is used then the default RED curve is applied.
<code>sub-class-policy</code>	Create a sub-class within the policy.
<code>priority</code>	Sub-classes use the Priority Queue scheduling algorithm.
<code>wrr</code>	Sub-classes use the Weighted Round Robin scheduling algorithm.
<code>htb</code>	Sub-classes use the Hierarchy Token Bucket scheduling algorithm.

**Default** No priority class is applied. If the keyword `<default>` is used then the default RED curve is applied.

**Mode** Traffic Control Policy for a priority policy.

**Usage** If there is already a class in the same level with the specified name, the command will replace the configuration of the existing class if it does not have any sub-classes.

If a sub-class policy is specified, this command uses the Traffic-Control Class mode to apply it.

**Examples** To configure a leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01 priority-level 5
```

To configure a class with a sub-sub-class as the leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01 priority-level 5
sub-class-policy priority
awplus(config-tc-class)#sub-class s01 priority-level 7
sub-sub-class-policy priority
awplus(config-tc-subclass)#sub-sub-class ss01 priority-level 3
max 5mbit queue-length 200 red-curve ss01-red
```

To enter Traffic-Control Class mode for an existing class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#
```

To delete an existing policy class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#no class c01
```

**Related commands**

- [policy \(traffic-control\)](#)
- [sub-class \(htb\)](#)
- [sub-class \(wrr\)](#)
- [traffic-control](#)

# class (wrr)

**Overview** Use this command to configure a Weighted Round-Robin (WRR) class within a traffic control policy.

Use the **no** variant of this command to delete an existing class under a current policy.

**Syntax** `class <class-name> [weight <1-100>] [queue-length <2-65536>]  
[set-dscp <dscp-value>] [red-curve <red-curve-name>]  
class <class-name> [weight <1-100>] sub-class-policy wrr  
no class <class-name>`

Parameter	Description
<code>&lt;class-name&gt;</code>	Name of the class.
<code>weight &lt;1-100&gt;</code>	Set the weight. The relative weight is the available bandwidth divided between sibling WRR classes according to the ratio of their configured weights. This parameter is compulsory when creating a new class. When editing an existing class, this parameter is optional.
<code>queue-length &lt;2-65536&gt;</code>	Set the maximum queue length in packets.
<code>set-dscp &lt;dscp-value&gt;</code>	Set the DSCP value to apply to packets.
<code>red-curve &lt;red-curve-name&gt;</code>	Apply a random early discard template with the class (only available on leaf queues when specifying class policy). If the keyword <code>&lt;default&gt;</code> is used then the default RED curve is applied.
<code>sub-class-policy</code>	Create a sub-class within the policy.
<code>wrr</code>	Sub-classes use the Weighted Round Robin queueing algorithm.

**Default** A weighted round-robin class has no DSCP value or sub-class policy. The queue length is 1000 by default. If the keyword `<default>` is used then the default RED curve is applied.

**Mode** Traffic-Control Policy for a WRR policy.

**Usage** If there is already a class in the same level with the specified name, the command will replace the configuration of the existing class if it does not have any sub-classes.

If a sub-class policy is specified, this command uses the Traffic-Control Class mode to apply it.

**Examples** To configure a leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 wrr
awplus(config-tc-policy)#class c01 weight 50
```

To configure a class with a sub-sub-class as the leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 wrr
awplus(config-tc-policy)#class c01 weight 50 sub-class-policy
wrr
awplus(config-tc-class)#sub-class s01 weight 30 sub-sub-class-
policy wrr
awplus(config-tc-subclass)#sub-sub-class ss01 weight 5
queue-length 200 red-curve ss01-red
```

To enter Traffic-Control Class mode for an existing class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#
```

To delete an existing class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#no class c01
```

**Related commands** [traffic-control](#)  
[policy \(traffic-control\)](#)  
[sub-class \(wrr\)](#)

# debug traffic-control

**Overview** Use this command to enable traffic-control debugging. This will cause additional detailed debugging information to be logged and available using the show debugging traffic-control.

Use the **no** variant of this command to disable traffic-control debugging.

**Syntax** debug traffic-control  
no debug traffic-control

**Default** Disabled

**Mode** Privileged Exec

**Examples** To enable traffic control debugging, use the commands:

```
awplus#debug traffic-control
```

To disable traffic control debugging, use the commands:

```
awplus#no debug traffic-control
```

**Related commands** traffic-control  
show debugging traffic-control

# interface (traffic-control)

**Overview** Use this command to configure interface specific parameters for traffic control.

**Syntax** `interface <interface-name> {overhead  
[<overhead-bytes>/ethernet]|virtual-bandwidth  
<bandwidth>|system-bandwidth <system-percentage>}`

Parameter	Description
<interface-name>	Name of interface to configure
overhead	Set overhead to add to each packet when calculating the packet size
<overhead-bytes>	Number of bytes to add to the packet for packet size calculations. The range is from 0 to 512 and the default is 0.
ethernet	Setting the overhead to 'ethernet' adds 24 bytes to the packet to account for preamble + CRC + inter-frame gap.
virtual-bandwidth	Specify the virtual-bandwidth of the interface. This is the maximum amount of traffic that traffic control will allow to be sent via the interface..
<bandwidth>	Value for the virtual bandwidth in kbit, mbit or gbits. For example 5mbit.
system-bandwidth	Specify the percentage of the interface bandwidth to reserve for system traffic. The default when a traffic control policy is applied to the interface is 5%.
<system-percentage>	Percentage of the bandwidth to reserve for system traffic in the range from 1 to 99.

**Default** The default overhead is 0, the default bandwidth is the interface speed if it can be read. It is recommended to always set the virtual bandwidth when using traffic control. The system bandwidth default is 5%.

**Mode** Traffic-Control

**Usage** This command allows configuring traffic control parameters specific to the traffic egress interface.

**Examples** To rate limit eth1 to 10mbit while taking into account the ethernet framing overhead and reserving only 1% of the bandwidth for system traffic, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#interface eth1 overhead ethernet
virtual-bandwidth 10mbit system-bandwidth 1
```

**Related commands** [show running-config traffic-control](#)  
[show traffic-control interface](#)

# l3-filtering enable

**Overview** Use this command to enable traffic control for bridged traffic on a bridge interface. Use the **no** variant of this command to disable traffic control for bridged traffic on a bridge interface.

**Syntax** `l3-filtering enable`  
`no l3-filtering enable`

**Default** Traffic control is disabled by default for bridged traffic.

**Mode** Interface mode for a bridge interface

**Usage notes** We do not recommend shaping bridged traffic on firewalls that are running Unified Threat Management (UTM) features, because both Traffic Control and UTM require significant CPU resources.

**Example** To enable traffic control for bridged traffic on br1, use the commands:

```
awplus# configure terminal
awplus(config)# interface br1
awplus(config-if)# l3-filtering enable
```

**Related commands** [traffic-control](#)

**Command changes** Version 5.4.7-0.1: command added. Previously, traffic control was enabled by default on all bridge interfaces.

# move rule (traffic-control)

**Overview** Use this command to change the identification of an existing traffic control rule.

**Syntax** `move rule [<1-65535> to <1-65535>]`

Parameter	Description
<1-65535>	Range of the rule ID to move from
<1-65535>	Range of the destination ID for the rule to move to

**Default** None

**Mode** Traffic-Control

**Example** To change rule ID 10 to rule ID 25, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#move rule 10 to 25
```

**Related commands**

- [show traffic-control rule config-check](#)

# policy (traffic-control)

**Overview** Use this command to configure a traffic control policy, that can then be used with rules that have been created.

Use the **no** variant of this command to delete an existing policy.

**Syntax** `policy <policy-name> [priority|wrr|htb]`  
`no policy <policy-name>`

Parameter	Description
<code>&lt;policy_name&gt;</code>	The name of the policy
<code>priority</code>	Use Priority Queueing (PQ)
<code>wrr</code>	Use Weighted Round Robin (WRR)
<code>htb</code>	Use Hierarchy Token Bucket (HTB)

**Default** No policies are configured

**Mode** Traffic-Control

**Usage** A policy specifies a top-level queueing discipline which determines the type of classes that can be configured under the policy. This command uses the Traffic-Control Policy mode.

**Examples** To configure a policy, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#
```

To delete an existing policy, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#no policy p01 htb
```

sub-sub-class (wrr)

# red-curve

**Overview** Use this command to allow configuration of a RED (Random Early Discard) curve template.

Use the **no** variant of this command to set the RED curve back to the default.

**Syntax** `red-curve <red-curve-name> [limit <4-127>] [avpkt <64-1518>]  
[min <3-126>] [max <4-127>] [probability <1-100>]  
[ecn [ecn-drop]]`  
`no red-curve [<red-curve-name>]`

Parameter	Description
<code>&lt;red-curve-name&gt;</code>	The RED curve name.
<code>limit &lt;4-127&gt;</code>	The hard queue length limit (in packets) for the RED curve. Once the queue length reaches the limit, all packets are dropped.
<code>avpkt &lt;64-1518&gt;</code>	The average packet size to use for queue size calculations in bytes.
<code>min &lt;3-126&gt;</code>	The minimum queue length for random early discard (in packets). Between <code>&lt;min&gt;</code> and <code>&lt;max&gt;</code> the drop probability will increase linearly.
<code>max &lt;4-127&gt;</code>	The maximum queue length where packets are probabilistically dropped. At <code>&lt;max&gt;</code> the drop probability equals <code>&lt;probability&gt;</code> . Beyond <code>&lt;max&gt;</code> the drop or marking probability is 100%.
<code>probability &lt;1-100&gt;</code>	The probability of a packet being dropped when queue-length reaches <code>&lt;max&gt;</code> . The drop probability increases linearly from 0 to <code>&lt;probability&gt;</code> in between <code>&lt;min&gt;</code> and <code>&lt;max&gt;</code> .
<code>ecn</code>	Use explicit congestion notification marking instead of dropping the packet.
<code>ecn-drop</code>	When average queue size exceeds <code>&lt;max&gt;</code> drop packets instead of marking.

**Default** The default RED curve is **red-curve default limit 127 avpkt 576B min 10 max 32 prob 2**.

**Mode** Traffic-control

**Usage notes** The RED curve template can later be applied to a traffic control class, sub-class, or sub-sub-class.

**Example** To configure a RED curve with ECN dropping and the default curve shape, use the commands:

```
awplus# configure terminal
awplus(config)# traffic-control
awplus(config-tc)# red-curve red-ecn ecn
```

To configure an aggressive RED curve, use the commands:

```
awplus# configure terminal
awplus(config)# traffic-control
awplus(config-tc)# red-curve aggressive min 5 max 50
probability 70
```

# rule (traffic-control)

**Overview** Use this command to create a traffic-control rule.

Use the **no** variant of this command to remove a traffic-control rule

**Syntax** rule [*<1-65535>*] match *<application>* from *<source-entity>* to *<destination-entity>* policy *<policy>*  
no rule [*<1-65535>*]

Parameter	Description
<i>&lt;1-65535&gt;</i>	The rule ID is an integer in the range from 1 to 65535. If you do not designate a rule ID, one will be automatically generated and it will be greater than the current highest rule ID. Lower IDs have higher priority.
match	Application traffic to match
<i>&lt;application&gt;</i>	Application name
from	Set the source of the entity
<i>&lt;source_entity&gt;</i>	Source entity name. Entities represent logical grouping of subnets, hosts or interfaces.
to	Set the destination of the entity
<i>&lt;destination_entity&gt;</i>	Source entity name. Entities represent logical grouping of subnets, hosts or interfaces.
policy	Policy to apply to matched traffic
<i>&lt;policy&gt;</i>	Traffic control policy. This consists of a top-level policy name followed by the name of a class within that policy, and sub-class (of the class) and a sub-sub-class if applicable. Examples are: p01.c03 p01.c03.sc02 p01.c03.scc02.ssc01 P01 is the policy name, c03 is the class name, sc02 is the sub-class, and ssc01 is the sub-sub-class..

**Default** No rules

**Mode** Traffic-Control

**Usage** Rules are used to apply traffic-control policies to a type of traffic. When traffic control is enabled and no rules are added, a default traffic-control policy is installed on all supported interfaces.

If the application, source entity or destination entity specified in the rule is not configured correctly, the rule is not valid and is not installed.

You can change the rule order by using the move rule (traffic-control) command.

Rules are applied to destination interfaces in the order of their ID (lower IDs are applied first). If traffic matches a rule, then the rest are ignored. If traffic does not match any rule, then it is classified to the default class.

A rule can specify the system class as the policy. System traffic is high priority traffic that is allocated a fixed amount of bandwidth on an interface. Use the interface (traffic-control) command to configure system bandwidth on an interface.

**Examples** To configure a rule, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#rule 10 match ftp from wan to private policy
p01.c02.sc03
```

To delete a rule, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#no rule 10
```

## traffic-control

# show traffic-control counters

**Overview** Use this command to display counters related to traffic control. This command displays counters for the number of packets sent, queued or dropped by each traffic control class. The information is shown by each interface. There is an overall counter for the policy, and counters for each leaf class in the policy.

If no interface name is specified then information for all interfaces with traffic control policies applied is displayed.

**Syntax** show traffic-control counters [<interface-name>]

Parameter	Description
<interface-name>	Name of Interface to display traffic control counters

**Default** None

**Mode** Privileged Exec

**Examples** To show the traffic control counters for all interfaces, use the commands:

```
awplus#show traffic-control counters
```

Figure 42-3: Example output from **show traffic-control counters**

```
awplus#show traffic-control counters
Traffic Control Counters
Interface eth1:

**Related commands** [show running-config traffic-control](#)

# show traffic-control interface

**Overview** Use this command to display information about interfaces known to traffic control, such as the applied policy, the virtual-bandwidth configured on the interface, the bandwidth reserved for system traffic and the overhead applied to the packet size calculations. If no interface name is specified, information is shown for all interfaces known to traffic control.

**Syntax** `show traffic-control interface [<interface-name>]`

Parameter	Description
<interface-name>	Name of interface to display information

**Default** None

**Mode** Privileged Exec

**Examples** To show traffic control information for all interfaces, use the command:

```
awplus#show traffic-control interface
```

**Output** Figure 42-4: Example output from **show traffic-control interface**

```
awplus#show traffic-control interface

**Related commands** [show running-config](#)  
[show running-config traffic-control](#)

# show traffic-control red-curve

**Overview** Use this command to show configured RED curve templates.

**Syntax** show traffic-control red-curve <red-curve-name>

Parameter	Description
<red-curve-name>	The name of the RED curve. The default RED curve is <b>red-curve default limit 127 avpkt 576B min 10 max 32 prob 2.</b>

**Default** None

**Mode** Privileged Exec

**Usage notes** If you have not configured some parameters, default values will display. If no RED curve name is given, all configured RED curves are shown.

**Example** To show all RED curves, use the command:

```
awplus# show traffic-control red-curve
```

To show a specified red curve called "TCP\_session\_1", use the command:

```
awplus# show traffic-control red-curve TCP_session_1
```

**Output** Figure 42-6: Example output from **show traffic-control red-curve**

```
awplus#show traffic-control red-curve
Traffic Control RED Curves:

RED curve default:
  Average packet size: 576 bytes
  Minimum: 10 packets
  Maximum: 32 packets
  Limit: 127 packets
  Drop probability: 2%
  ECN marking: disabled

RED curve TCP_session_1:
  Average packet size: 576 bytes
  Minimum: 20 packets
  Maximum: 60 packets
  Limit: 127 packets
  Drop probability: 20%
  ECN marking: disabled
```

Figure 42-7: Example output from **show traffic-control red-curve TCP\_session\_1**

# show traffic-control rule config-check

**Overview** Use this command to show information about traffic control rule validity.

**Syntax** `show traffic-control rule config-check`

**Default** None

**Mode** Privileged Exec

**Usage** An asterisk is printed before each rule that is invalid. To help determine why the rule is invalid, the `show traffic-control rule config-check` command will print the reasons why the rule is invalid. Information is only shown for invalid rules. If all rules are valid, a message will be printed showing all rules are valid.

**Example** To check if configured rules are valid, use the commands:

```
awplus#show traffic-control rule config-check
```

**Output** Figure 42-8: Example output from **show traffic-control rule config-check**

```
awplus#show traffic-control rule config-check

Rule 30:
  "From" entity does not exist
  "To" entity does not exist
  Policy doesn't exist or is not leaf
```

# show traffic-control rule

**Overview** Use this command to show specific rules or a complete list of rules configured for traffic control.

**Syntax** `show traffic-control rule [<1-65535>]`

Parameter	Description
<1-65535>	The ID of the rule you want to display. If no ID is entered, all rules are displayed.

**Default** None

**Mode** Privileged Exec

**Usage** An asterisk will be printed at the start of a row if the rule is invalid. The rules are shown in a table showing the rule ID, the application, source and destination that the rule matches on and the policy and class that the matching traffic will be sent to.

**Examples** To show a list of all traffic control rules configured, use the command:

```
awplus#show traffic-control rule
```

To show traffic control rule 10 configured, use the command:

```
awplus#show traffic-control rule 10
```

**Output** Figure 42-9: Example output from **show traffic-control rule**

```
awplus#show traffic-control rule

[traffic-control enable](#)

# sub-class (htb)

**Overview** Use this command to configure a hierarchy token bucket (HTB) sub-class within an existing class.

Use the **no** variant of this command to delete an existing sub-class under the current class.

**Syntax**

```
sub-class <class-name> [cir <committed-rate>] [pir <peak-rate>]
[bc <1-100000000>] [be <1-100000000>] [preference <0-7>]
[queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve
<red-curve-name>]

sub-class <class-name> [cir <committed-rate>] [pir <peak-rate>]
[bc <1-100000000>] [be <1-100000000>] [preference <0-7>]
sub-sub-class-policy htb

no sub-class <class-name>
```

Parameter	Description
<class-name>	Name of the class.
cir <committed-rate>	Set the Committed Information Rate (CIR) for the queue. Specified in kbit/mbit/gbit per second, 1kbit-100gbit. This parameter is compulsory when creating a new sub-class. When editing an existing sub-class, this parameter is optional.
pir <peak-rate>	Set the Peak Information Rate (PIR) for the queue. This is the rate of the queue under peak conditions. Specified in kbit/mbit/gbit per second, in the range 1kbit-100gbit.
bc <1-100000000>	Set the Committed Burst size (BC). This is the burst allowed above the CIR, sent at the PIR rate.
be <1-100000000>	Set the Excess Burst size (BE). This is the burst allowed above the PIR, sent at the maximum rate.
preference <0-7>	Set the preference for a class to receive spare bandwidth (highest is 7).
queue-length <2-65536>	Set the maximum queue length in packets.
set-dscp <dscp-value>	Set the DSCP value to apply to the packets.
red-curve <red-curve-name>	Apply a random early discard template with the sub-class and enter the name of the red curve template to apply.
sub-sub-class-policy	Specify that the sub-class will contain sub-sub-classes.
htb	Sub-sub-classes will use the Hierarchy Token Bucket (HTB) queueing discipline.

**Default** BC and BE are assigned suitable values proportional to the CIR and PIR respectively and are larger than the MTU. PIR defaults to the CIR. Preference defaults to 7 and the queue length default to 1000 if the class is a leaf.

**Mode** Traffic-Control Class for an HTB sub-class policy.

**Usage** If there is already a sub-class in the same level with the specified name, the command will replace the configuration of the existing sub class if it does not have any sub-sub-classes.

If you specify a sub-sub-class policy, this command puts you into sub-class mode so you can specify the sub-sub-class.

**Examples** To configure a leaf sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01 cir 100mbit pir 150mbit
sub-class-policy htb
wplus(config-tc-class)#sub-class s02 cir 20mbit queue-length
200 red-curve s02-red
```

To enter Traffic-Control Class mode for an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#
```

To delete an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#no sub-class s01
```

**Related commands**

- [class \(priority\)](#)
- [policy \(traffic-control\)](#)
- [sub-sub-class \(htb\)](#)
- [traffic-control](#)

# sub-class (priority)

**Overview** Use this command to configure a priority queue sub-class within a class.

Use the **no** variant of this command to delete an existing sub-class under the current class.

**Syntax** `sub-class <class-name> [priority-level <0-15>] [max <max-rate>]  
[queue-length <2-65536>] [set-dscp <dscp_value>] [red-curve  
<red-curve-name>]`

`sub-class <class-name> [priority-level <0-15>]`

`sub-sub-class-policy {priority|wrr|htb}`

`no sub-class <class-name>`

Parameter	Description
<code>&lt;class-name&gt;</code>	Name of the class.
<code>priority-level &lt;0-15&gt;</code>	Set the priority level (15 is the highest). This parameter is compulsory when creating a new sub-class. When editing an existing sub-class, this parameter is optional.
<code>max &lt;max-rate&gt;</code>	Set the maximum traffic rate of the queue (in kbit/mbit/gbit per second, 1kbit-100gbit).
<code>queue-length &lt;2-65536&gt;</code>	Set the maximum queue length in packets.
<code>set-dscp&lt;dscp-value&gt;</code>	Set the DSCP value to apply to the packets.
<code>red-curve &lt;red-curve-name&gt;</code>	Apply a random early discard template with the sub class and enter the name of the red curve template to apply.
<code>sub-sub-class-policy</code>	Create a sub-sub-class for the policy.
<code>priority</code>	Sub-sub-classes will use the Priority Queue queueing algorithm.
<code>wrr</code>	Sub-sub-classes will use the Weighted Round Robin (WRR) queueing algorithm.
<code>htb</code>	Sub-classes will use the Hierarchy Token Bucket (HTB) queueing algorithm.

**Default** A priority queue sub class has no max rate, DSCP value or sub-sub class policy. The queue length is 1000 by default if the class is a leaf.

**Mode** Traffic-Control Class for a priority sub-class policy.

**Usage** If there is already a sub-class in the same level with the specified name, the command will replace the configuration of the existing sub class if it does not have any sub-sub classes.

If a sub-sub class policy is specified, this command uses the Traffic-Control Class mode to apply it.

**Examples** To configure a sub-class as the leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01 priority-level 5
sub-class-policy priority
awplus(config-tc-class)#sub-class s02 priority-level 8 max
50mbit queue-length 200 red-curve ss01-red
```

To enter Traffic-Control Class mode for an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#
```

To delete an existing class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#no sub-class s01
```

# sub-class (wrr)

**Overview** Use this command to configure a Weighted Round-Robin (WRR) sub-class within a class.

Use the **no** variant of this command to delete an existing sub-class under the current class.

**Syntax** `sub-class <class-name> [weight <1-100>] [queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve <red-curve-name>]`  
`sub-class <class-name> [weight <1-100>] sub-sub-class-policy wrr`  
`no sub-class <class-name>`

Parameter	Description
<code>&lt;class-name&gt;</code>	Name of the sub-class.
<code>weight&lt;1-100&gt;</code>	Set the weight. The relative weight is the available bandwidth divided between sibling WRR classes according to the ratio of their configured weights. This parameter is compulsory when creating a new sub-class. When editing an existing sub-class, this parameter is optional.
<code>queue-length&lt;2-65536&gt;</code>	Set the maximum queue length in packets.
<code>set-dscp</code>	Set the DSCP value to apply to packets.
<code>&lt;dscp-value&gt;</code>	DSCP value as an integer or lower-case DSCP name.
<code>red curve &lt;red-curve-name&gt;</code>	Apply a random early discard template with the sub-class and enter the name of the red curve template to apply.
<code>sub-sub-class-policy</code>	Create a sub-sub-class within the policy.
<code>wrr</code>	Sub sub classes use the Weighted Round Robin queueing discipline.

**Default** A weighted round-robin sub class has no DSCP value or sub-sub-class policy. The queue length is 1000 by default.

**Mode** Traffic-Control Class for a WRR sub-class policy.

**Usage** If there is already a class in the same level with the specified name, the command will replace the configuration of the existing class if it does not have any sub-classes.

If a sub class policy is specified, this command uses the Traffic-Control Class mode to apply it.

**Examples** To configure a sub-class as a leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 wrr
awplus(config-tc-policy)#class c02 weight 30 sub-class-policy
wrr
awplus(config-tc-class)#sub-class s02 weight 40 queue-length
200 red-curve s02-red
```

To enter Traffic-Control Class mode for an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#
```

To delete an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#no sub-class s01
```

## sub-sub-class (htb)

**Overview** Use this command to configure a Hierarchy Token Bucket (HTB) sub-sub-class for a sub-class.

Use the **no** variant of this command to delete an existing sub-sub-class from the current sub-class.

**Syntax** `sub-sub-class <class-name> [cir <committed-rate>] [pir <peak-rate>] [bc <1-100000000>] [be <1-100000000>] [preference <0-7>] [queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve <red-curve-name>]`  
`no sub-sub-class <class-name>`

Parameter	Description
<code>&lt;class-name&gt;</code>	Name of the sub-sub-class.
<code>cir &lt;committed-rate&gt;</code>	Set the Committed Information Rate (CIR) for the queue. Specified in kbit/mbit/gbit per second, 1kbit-100gbit. This parameter is compulsory when creating a new sub-sub-class. When editing an existing sub-sub-class, this parameter is optional.
<code>pir &lt;peak-rate&gt;</code>	Set the Peak Information Rate (PIR) for the queue. This is the rate of the queue under peak conditions. Specified in kbit/mbit/gbit per second, in the range 1kbit-100gbit.
<code>bc &lt;1-100000000&gt;</code>	Set the Committed Burst size (BC). This is the burst allowed above the CIR, sent at the PIR rate.
<code>be &lt;1-100000000&gt;</code>	Set the Excess Burst size (BE. This is the burst allowed above the PIR, sent at the maximum rate..
<code>preference &lt;0-7&gt;</code>	Set the preference for a class to receive spare bandwidth (highest is 7).
<code>queue-length &lt;2-65536&gt;</code>	Set the maximum queue length.
<code>set-dscp &lt;dscp-value&gt;</code>	Set the DSCP value to apply to the packets.
<code>red-curve &lt;red-curve-name&gt;</code>	Apply a random early discard template with the sub-sub-class and enter the name of the red curve template to apply.

**Default** BC and BE are assigned suitable values proportional to the CIR and PIR respectively and are larger than the MTU. PIR defaults to the CIR. Preference defaults to 7 and Queue length defaults to 1000.

**Mode** Traffic-Control Sub-class for an HTB sub-sub-class policy.

**Usage** If there is already a sub-sub-class in the same level with the specified name, this command will replace the configuration of the existing sub-sub-class.

**Examples** To configure a sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01 cir 100mbit pir 150mbit
sub-class-policy htb
awplus(config-tc-class)#sub-class s01 cir 10mbit
```

To configure a leaf sub-sub-class with a RED curve, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01 cir 100mbit pir 150mbit
sub-class-policy htb
awplus(config-tc-class)#sub-class s01 cir 10mbit
sub-sub-class-policy htb
awplus(config-tc-subclass)#sub-sub-class ss01 cir 5mbit
queue-length 200 red-curve ss01-red
```

To delete an existing sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#no sub-sub-class ss01
```

**Related commands**

# sub-sub-class (priority)

**Overview** Use this command to configure a priority queue sub-sub-class for a sub-class.  
Use the **no** variant of this command to delete an existing sub-sub-class from the current sub-class.

**Syntax** `sub-sub-class <class-name> [priority-level <0-15>] [max <max-rate>] [queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve <red-curve-name>]`  
`no sub-sub-class <class-name>`

Parameter	Description
<code>&lt;class-name&gt;</code>	Name of the class.
<code>priority-level &lt;0-15&gt;</code>	Set the priority level (15 is the highest). This parameter is compulsory when creating a new sub-sub-class. When editing an existing sub-sub-class, this parameter is optional.
<code>max &lt;max-rate&gt;</code>	Set the maximum traffic rate of the queue (in kbit/mbit/gbit per second, 1kbit-100gbit).
<code>queue-length &lt;2-65536&gt;</code>	Set the maximum queue length in packets.
<code>set-dscp &lt;dscp-value&gt;</code>	Set the DSCP value to apply to the packets.
<code>red-curve &lt;red-curve-name&gt;</code>	Apply a random early discard template with the sub-sub-class and enter the name of the red curve template to apply.

**Default** A priority queue sub-sub-class has no max rate or DSCP value. The queue length is 1000.

**Mode** Traffic-Control Sub-class for a priority sub-sub-class policy.

**Usage** If there is already a sub-sub-class in the same level with the specified name, this command will replace the configuration of the existing sub-sub-class.

**Examples** To configure a sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01 priority-level 5
awplus(config-tc-class)#sub-class s01 priority-level 7
awplus(config-tc-subclass)#sub-sub-class ss01 priority-level 3
```

To configure a sub-sub-class with a RED curve, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01 priority-level 5
sub-class-policy priority
awplus(config-tc-class)#sub-class s01 priority-level 7
sub-sub-class-policy priority
awplus(config-tc-subclass)#sub-sub-class ss01 priority-level 3
max 5mbit queue-length 200 red-curve ss01-red
```

To delete an existing sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#no sub-sub-class ss01
```

# sub-sub-class (wrr)

**Overview** Use this command to configure a Weighted Round-Robin (WRR) sub-sub-class within a sub-class.

Use the **no** variant of this command to delete an existing sub-sub-class from the current sub-class.

**Syntax** `sub-sub-class <class-name> [weight <1-100>] [queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve <red-curve-name>]`  
`no sub-sub-class <class-name>`

Parameter	Description
<code>&lt;class-name&gt;</code>	Name of the sub-class.
<code>weight &lt;1-100&gt;</code>	Set the weight. The relative weight is the available bandwidth divided between sibling WRR classes according to the ratio of their configured weights. This parameter is compulsory when creating a new sub-sub-class. When editing an existing sub-sub-class, this parameter is optional.
<code>queue-length &lt;2-65536&gt;</code>	Set the maximum queue length in packets.
<code>set-dscp &lt;dscp-value&gt;</code>	Set the DSCP value to apply to packets.
<code>red-curve &lt;red-curve-name&gt;</code>	Apply a random early discard template with the sub-sub-class and enter the name of the red curve template to apply.

**Default** A weighted round-robin sub-sub-class has no DSCP value. The queue length is 1000 by default.

**Mode** Traffic-Control Sub-class for a WRR sub-sub-class policy.

**Usage** If there is already a sub-sub-class in the same level with the specified name, this command will replace the configuration of the existing sub-sub-class.

**Examples** To configure a sub-sub-class as a leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 wrr
awplus(config-tc-policy)#class c01 weight 50 sub-class-policy
wrr
awplus(config-tc-class)#sub-class s01 weight 30 sub-sub-class
policy wrr
awplus(config-tc-subclass)#sub-sub-class ss01 weight 5
queue-length 200
```

To configure a sub-sub-class with a RED curve, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 wrr
awplus(config-tc-policy)#class c01 weight 50 sub-class-policy
wrr
awplus(config-tc-class)#sub-class s01 weight 30
sub-sub-class-policy wrr
awplus(config-tc-subclass)#sub-sub-class ss01 weight 5
queue-length 200 red-curve ss01-red
```

To delete an existing sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#no sub-sub-class ss01
```

**Related  
commands**

[traffic-control](#)  
[policy \(traffic-control\)](#)  
[sub-class \(priority\)](#)  
[sub-class \(wrr\)](#)

# traffic-control enable

**Overview** Use this command to enable traffic control.  
Use the **no** variant of this command to disable traffic control without losing your existing traffic control configuration.

**Syntax** traffic-control enable  
no traffic-control enable

**Default** Disabled

**Mode** Traffic-Control

**Usage** When traffic control is enabled and no rules are added, a default queueing discipline is applied to all interfaces that support traffic control. You can use the policy command to configure traffic control policies and the rule (traffic-control) command to apply the configured policies to the traffic.

**Examples** To enable traffic control, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#traffic-control enable
```

To disable traffic control, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#no traffic-control enable
```

**Related commands** [policy \(traffic-control\)](#)  
[rule \(traffic-control\)](#)  
[traffic-control](#)

# traffic-control

**Overview** Use this command to enter into Traffic-Control configuration mode.  
Use the **no** variant of this command to remove all traffic control configuration.

**Syntax** traffic-control  
no traffic-control

**Default** Disabled

**Mode** Global Configuration

**Usage** This command enters you into Traffic-Control configuration mode.  
In Traffic-Control Configuration mode you can:

- enable or disable traffic control
- create and delete traffic control policies
- create, move and delete rules for traffic control
- set and unset packet overhead, system bandwidth and virtual bandwidth of interfaces

**Examples** To configure traffic-control, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#
```

To remove all traffic control configuration, use the commands:

```
awplus#configure terminal
awplus(config)#no traffic-control
awplus(config)#
```

# 802.1X Commands

## Introduction

**Overview** 802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device. Devices wishing to access services behind a port must authenticate themselves before any Ethernet packets are allowed to pass through. The protocol is referred to as 802.1X because it was initially defined in the IEEE standard 802.1X, published in 2001 and revised in 2004 and again as the current 802.1X 2010 standard.

The AR4050S supports 802.1X authentication with the following limitations:

- Only supported on the device's switch ports.
- Not supported on static channel-groups and dynamic (LACP) channel-groups.

This chapter provides an alphabetical reference of commands used to configure 802.1X port access control. For more information, see the [AAA and Port Authentication\\_Feature Overview and Configuration Guide](#).

# dot1x accounting

**Overview** This command overrides the **default** RADIUS accounting method for IEEE 802.1X-based authentication on an interface by allowing you to apply a user-defined named method list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method list.

**Syntax** dot1x accounting {default|<list-name>}  
no dot1x accounting

Parameter	Description
default	Apply the default accounting method list
<list-name>	Apply the user-defined named list

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x accounting
```

**Related commands** [aaa accounting dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x authentication

**Overview** This command overrides the **default** 802.1X-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** dot1x authentication {default|<list-name>}  
no dot1x authentication

Parameter	Description
<i>default</i>	Apply the default authentication method list
<list-name>	Apply the user-defined named list

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x authentication
```

**Related commands** [aaa authentication dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# debug dot1x

**Overview** Use this command to enable 802.1X IEEE Port-Based Network Access Control troubleshooting functions.

Use the **no** variant of this command to disable this function.

**Syntax** debug dot1x [all|auth-web|event|nsm|packet|timer]  
no debug all dot1x  
no debug dot1x [all|auth-web|event|nsm|packet|timer]

Parameter	Description
all	Used with the <b>no</b> variant of this command exclusively; turns off all debugging for 802.1X.
auth-web	Specifies debugging for 802.1X auth-web information.
events	Specifies debugging for 802.1X events.
nsm	Specifies debugging for NSM messages.
packet	Specifies debugging for 802.1X packets.
timer	Specifies debugging for 802.1X timers.

**Mode** Privileged Exec and Global Configuration

**Usage notes** This command turns on a mode where trace-level information is output during authentication conversations. Be aware that this is a very verbose output. It is mostly useful to capture this as part of escalating an issue to ATI support.

**Examples** Use this command without any parameters to turn on normal 802.1X debug information.

```
awplus# debug dot1x  
awplus# show debugging dot1x
```

```
802.1X debugging status:  
802.1X events debugging is  
802.1X timer debugging is on  
802.1X packets debugging is on  
802.1X NSM debugging is on
```

**Related commands** [show debugging dot1x](#)  
[undebug dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x control-direction

**Overview** This command sets the direction of the filter for the unauthorized interface. If the optional **in** parameter is specified with this command then packets entering the specified port are discarded. The **in** parameter discards the ingress packets received from the supplicant.

If the optional **both** parameter is specified with this command then packets entering (ingress) and leaving (egress) the specified port are discarded. The **both** parameter discards the packets received from the supplicant and sent to the supplicant.

The **no** variant of this command sets the direction of the filter to **both**. The port will then discard both ingress and egress traffic.

**Syntax** dot1x control-direction {in|both}  
no dot1x control-direction

Parameter	Description
in	Discard received packets from the supplicant (ingress packets).
both	Discard received packets from the supplicant (ingress packets) and transmitted packets to the supplicant (egress packets).

**Default** The authentication port direction is set to **both** by default.

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Examples** To set the port direction to the default (**both**) for port1.0.2, use the commands:

```
awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# no dot1x control-direction
```

To set the port direction to **in** for port1.0.2, use the commands:

```
awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# dot1x control-direction in
```

To set the port direction to **in** for authentication profile 'student', use the commands:

```
awplus# configure terminal  
awplus(config)# auth profile student  
awplus(config-auth-profile)# dot1x control-direction in
```

**Related commands** auth profile (global)  
show dot1x  
show dot1x interface  
show auth interface

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x eap

**Overview** This command selects the transmit mode for the EAP packet. If the authentication feature is not enabled then EAP transmit mode is not enabled. The default setting discards EAP packets.

**Syntax** `dot1x eap {discard|forward|forward-untagged-vlan|forward-vlan}`

Parameter	Description
discard	Discard.
forward	Forward to all ports on the switch.
forward-untagged-vlan	Forward to ports with the same untagged VLAN.
forward-vlan	Forward to ports with the same VLAN.

**Default** The transmit mode is set to `discard` EAP packets by default.

**Mode** Global Configuration

**Examples** To set the transmit mode of EAP packet to **forward**, to forward EAP packets to all ports on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward
```

To set the transmit mode of EAP packet to **discard**, to discard EAP packets, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap discard
```

To set the transmit mode of EAP packet to **forward-untagged-vlan**, to forward EAP packets to ports with the same untagged VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-untagged-vlan
```

To set the transmit mode of EAP packet to **forward-vlan**, to forward EAP packets to ports with the same VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-vlan
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x eapol-version

**Overview** This command sets the EAPOL protocol version for EAP packets when 802.1X port authentication is applied.

Use the **no** variant of this command to set the EAPOL protocol version to 1.

The default EAPOL protocol version is version 1.

**Syntax** dot1x eapol-version {1|2}  
no dot1x eapol-version

Parameter	Description
1   2	EAPOL protocol version 1 or 2.

**Default** The EAP version for 802.1X authentication is set to 1 by default.

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Examples** To set the EAPOL protocol version to 2 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x eapol-version 2
```

To set the EAPOL protocol version to the default version (1) for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x eapol-version
```

To set the EAPOL protocol version to 2 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x eapol-version 2
```

**Validation Commands** auth profile (global)

show dot1x

show dot1x interface

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x initialize interface

**Overview** This command removes authorization for a specified connected interface. The connection will attempt to re-authorize when the specified port attempts to make use of the network connection.

**NOTE:** *Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the interface trying to access the network resources.*

**Syntax** `dot1x initialize interface <interface-list>`

Parameter	Description
<code>&lt;interface-list&gt;</code>	The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> The specified interfaces must exist.

**Mode** Privileged Exec

**Examples** To initialize 802.1X port authentication on the interface port1.0.2, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize switch port1.0.2 and attempt reauthentication on switch port1.0.2, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize all switch ports for a 18-port device and attempt reauthentication, use the command:

```
awplus# dot1x initialize interface port1.0.1-port1.0.18
```

**Related commands** [dot1x initialize supplicant](#)  
[show dot1x](#)  
[show dot1x interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x initialize supplicant

**Overview** This command removes authorization for a connected supplicant with the specified MAC address or username. The connection will attempt to re-authorize when the specified supplicant attempts to make use of the network connection.

**NOTE:** *Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the supplicant trying to access the network resources.*

**Syntax** dot1x initialize supplicant {<macadd>|username}

Parameter	Description
dot1x	IEEE 802.1X Port-Based Access Control.
initialize	Initialize the port to attempt reauthentication.
supplicant	Specify the supplicant to initialize.
<macadd>	MAC (hardware address of the supplicant.
username	The name of the supplicant entry.

**Mode** Privileged Exec

**Example** To initialize the supplicant authentication, use the commands

```
awplus# configure terminal
awplus(config)# dot1x initialize supplicant 0090.99ab.a020
awplus(config)# dot1x initialize supplicant guest
```

**Related commands** [dot1x initialize interface](#)

[show dot1x supplicant](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x keytransmit

**Overview** Use this command to enable key transmission on the interface specified previously in Interface mode.

This command enables key transmission over an Extensible Authentication Protocol (EAP) packet between the authenticator and supplicant.

The **no** variant of this command disables key transmission on the interface specified.

**Syntax** dot1x keytransmit  
no dot1x keytransmit

**Default** Key transmission for port authentication is disabled by default.

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Examples** To enable the key transmit feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x keytransmit
```

To disable the key transmit feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x keytransmit
```

**Related commands** [show dot1x](#)  
[show dot1x interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x max-auth-fail

**Overview** Use this command to configure the maximum number of login attempts for a supplicant (client device) using the **auth-fail vlan** feature, when using 802.1X port authentication on an interface.

The **no** variant of this command resets the maximum login attempts for a supplicant (client device) using the auth-fail vlan feature, to the default configuration of 3 login attempts.

**Syntax** dot1x max-auth-fail <0-10>  
no dot1x max-auth-fail

Parameter	Description
<0-10>	Specify the maximum number of login attempts for supplicants on an interface using 802.1X port authentication.

**Default** The default maximum number of login attempts for a supplicant on an interface using 802.1X port authentication is 3 login attempts.

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Usage notes** This command sets the maximum number of login attempts for supplicants on an interface. The supplicant is moved to the auth-fail VLAN from the Guest VLAN after the number of failed login attempts using 802.1X authentication is equal to the number set with this command.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- the auth-fail VLAN feature, and
- restrictions regarding combinations of authentication enhancements working together

**Examples** To configure the maximum number of login attempts for a supplicant on interface port1.0.2 to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-auth-fail 1
```

To configure the maximum number of login attempts for a supplicant on interface port1.0.2 to the default number of 3 login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-auth-fail
```

To configure the maximum number of login attempts for a supplicant on authentication profile 'student' to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-auth-fail 1
```

**Related  
commands**

[auth auth-fail vlan](#)  
[auth profile \(global\)](#)  
[dot1x max-reauth-req](#)  
[show dot1x interface](#)

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x max-reauth-req

**Overview** Use this command to set the number of reauthentication attempts before an interface is unauthorized.

The **no** variant of this command resets the reauthentication delay to the default.

**Syntax** `dot1x max-reauth-req <1-10>`  
`no dot1x max-reauth-req`

Parameter	Description
<1-10>	Specify the maximum number of reauthentication attempts for supplicants on an interface using 802.1X port authentication.

**Default** The default maximum reauthentication attempts for interfaces using 802.1X port authentication is two (2) reauthentication attempts, before an interface is unauthorized.

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Usage notes** Use this command to set the maximum reauthentication attempts after failure.

**Examples** To configure the maximum number of reauthentication attempts for interface port1.0.2 to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-reauth-req 1
```

To configure the maximum number of reauthentication attempts for interface port1.0.2 to the default maximum number of two (2) reauthentication attempts, use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-reauth-req
```

To configure the maximum number of reauthentication attempts for authentication profile 'student' to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-reauth-req 1
```

**Related commands** [auth profile \(global\)](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x port-control

**Overview** This command enables 802.1X port authentication on the interface specified, and sets the control of the authentication port.

The **no** variant of this command disables the port authentication on the interface specified.

**Syntax** `dot1x port-control {force-unauthorized|force-authorized|auto}`  
`no dot1x port-control`

Parameter	Description
<code>force-unauthorized</code>	Force the port state to unauthorized. Specify this to force a port to always be in an unauthorized state.
<code>force-authorized</code>	Force the port state to authorized. Specify this to force a port to always be in an authorized state.
<code>auto</code>	Allow the port client to negotiate authentication. Specify this to enable authentication on the port.

**Default** 802.1X port control is disabled by default.

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Usage notes** Use this command to force a port state.

When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

**Examples** To enable port authentication on the interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
```

To enable port authentication force authorized on the interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control force-authorized
```

To disable port authentication on the interface port1.0.2 use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x port-control
```

To enable port authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x port-control auto
```

changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x timeout tx-period

**Overview** This command sets the transmit timeout for the authentication request on the specified interface.

The **no** variant of this command resets the transmit timeout period to the default (30 seconds).

**Syntax** `dot1x timeout tx-period <1-65535>`  
`no dot1x timeout tx-period`

Parameter	Description
<1-65535>	Seconds.

**Default** The default transmit period for port authentication is 30 seconds.

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Usage notes** Use this command to set the interval between successive attempts to request an ID.

**Examples** To set the transmit timeout period to 5 seconds on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x timeout tx-period 5
```

To reset transmit timeout period to the default (30 seconds) on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x timeout tx-period
```

To set the transmit timeout period to 5 seconds on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x timeout tx-period 5
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show debugging dot1x

**Overview** Use this command to see what debugging is turned on for 802.1X.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging dot1x`

**Mode** User Exec and Privileged Exec

**Example** To enable 802.1X debugging and display the debugging option set, use the following commands:

```
awplus# debug dot1x
awplus# show debugging dot1x
```

```
802.1X debugging status:
 802.1X events debugging is on
 802.1X timer debugging is on
 802.1X packets debugging is on
 802.1X NSM debugging is on
```

**Related commands** [debug dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x

**Overview** Use this command to show authentication information for 802.1X port authentication.

If you specify the optional **all** parameter then this command also displays all authentication information for each port available on the switch.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show dot1x [all]`

Parameter	Description
all	Displays all authentication information for each port available on the switch.

**Mode** Privileged Exec

**Example** `awplus# show dot1x all`

**Table 1:** Example output from the **show dot1x all** command

```
awplus# show dot1x all

# show dot1x diagnostics

**Overview** This command shows 802.1X authentication diagnostics for the specified interface (optional).

If no interface is specified then authentication diagnostics are shown for all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show dot1x diagnostics [interface <interface-list>]`

Parameter	Description
<code>interface</code>	Specify a port to show.
<code>&lt;interface-list&gt;</code>	The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> The specified interfaces must exist.

**Mode** Privileged Exec

**Example** See the sample output below showing 802.1X authentication diagnostics for port1.0.2:

```
awplus# show dot1x diagnostics interface port1.0.2
```

**Output** Figure 43-1: Example output from the **show dot1x diagnostics** command

**Command changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x sessionstatistics

**Overview** This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show dot1x sessionstatistics [interface <interface-list>]`

Parameter	Description
interface	Specify a port to show.
<interface-list>	The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul>

**Mode** Privileged Exec

**Example** See sample output below showing 802.1X authentication session statistics for port1.0.2:

```
awplus# show dot1x sessionstatistics interface port1.0.2
```

```
Authentication session statistics for interface port1.0.2
  session user name: manager
    session authentication method: Remote server
    session time: 19440 secs
    session terminat cause: Not terminated yet
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x statistics interface

**Overview** Use this command to show the authentication statistics for the specified interface. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

The output from this command is the same as the output from the [show auth statistics interface](#) command.

**Syntax** `show dot1x statistics interface <interface-list>`

Parameter	Description
<code>&lt;interface-list&gt;</code>	The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul>

**Mode** Privileged Exec

**Example** To display 802.1X authentication statistics for port1.0.2, use the command:

```
awplus# show dot1x statistics interface port1.0.2
```

**Output** Figure 43-2: Example output from **show dot1x statistics interface** for a port

```
awplus# show dot1x statistics interface port1.0.2
802.1X statistics for interface port1.0.2
  EAPOL Frames Rx: 5 - EAPOL Frames Tx: 16
  EAPOL Start Frames Rx: 0 - EAPOL Logoff Frames Rx: 0

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x supplicant

**Overview** This command shows the supplicant state of the authentication mode set for the switch.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** show dot1x supplicant [*<macadd>*] [brief]

Parameter	Description
<i>&lt;macadd&gt;</i>	MAC (hardware) address of the Supplicant.
brief	Brief summary of the Supplicant state.

**Mode** Privileged Exec

**Example** See sample output below showing the 802.1X authenticated supplicant on the switch:

```
awplus# show dot1x supplicant
```

```
authenticationMethod: dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
macBasedAuthenticationSupplicantNum: 0
dot1xAuthenticationSupplicantNum: 1
webBasedAuthenticationSupplicantNum: 0
Supplicant name: manager
Supplicant address: 00d0.59ab.7037
  authenticationMethod: dot1x
    Two-Step Authentication:
      firstAuthentication: Pass - Method: mac
      secondAuthentication: Pass - Method: dot1x
portStatus: Authorized - currentId: 4
abort:F fail:F start:F timeout:F success:T
PAE: state: Authenticated - portMode: Auto
PAE: reAuthCount: 0 - rxRespId: 0
PAE: quietPeriod: 60 - maxReauthReq: 2 - txPeriod: 30
BE: state: Idle - reqCount: 0 - idFromServer: 3
BE: suppTimeout: 30 - serverTimeout: 30
CD: adminControlledDirections: in - operControlledDirections: in
CD: bridgeDetected: false
KR: rxKey: false
KT: keyAvailable: false - keyTxEnabled: false
RADIUS server group (auth): radius
RADIUS server (auth): 192.168.1.40
```

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant 00d0.59ab.7037 brief
```

```
Interface port1.0.2
 authenticationMethod: dot1x
 totalSupplicantNum: 1
 authorizedSupplicantNum: 1
   macBasedAuthenticationSupplicantNum: 0
   dot1xAuthenticationSupplicantNum: 1
   webBasedAuthenticationSupplicantNum: 0
```

Interface	VID	Mode	MAC Address	Status	IP Address	Username
port1.0.2	2	D	00d0.59ab.7037	Authenticated	192.168.2.201	manager

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant brief
```

For example, if two-step authentication is configured with 802.1X authentication as the first method and web authentication as the second method then the output is as follows:

```
Interface port1.0.2 authenticationMethod: dot1x/web
 Two-Step Authentication
   firstMethod: dot1x
   secondMethod: web
 totalSupplicantNum: 1
 authorizedSupplicantNum: 1
   macBasedAuthenticationSupplicantNum: 0
   dot1xAuthenticationSupplicantNum: 0
   webBasedAuthenticationSupplicantNum: 1
   otherAuthenticationSupplicantNum: 0
```

Interface	VID	Mode	MAC Address	Status	IP Address	Username
port1.0.2	5	W	0008.0d5e.c216	Authenticated	192.168.1.200	web

**Related commands** [show dot1x supplicant interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x supplicant interface

**Overview** Use this command to show the supplicant state of the authentication mode set for the interface.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show dot1x supplicant interface <interface-list> [brief]`

Parameter	Description
<code>&lt;interface-list&gt;</code>	The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul>
<code>brief</code>	Brief summary of the Supplicant state.

**Mode** Privileged Exec

**Examples** See sample output below showing the supplicant on the interface port1.0.2:

```
awplus# show dot1x supplicant interface port1.0.2
```

```
Interface port1.0.2
 authenticationMethod: dot1x
  totalSupplicantNum: 1

# 44

# Authentication Commands

## Introduction

**Overview** Port authentication commands enable you to specify three different types of device authentication: 802.1X authentication, web authentication, and MAC authentication.

- 802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device.
- Web authentication is applicable to devices that have a human user who opens the web browser and types in a user name and password when requested.
- MAC authentication is used to authenticate devices that have neither a human user nor implement 802.1X supplicant when making a network connection request.

The AR4050S supports port authentication with the following limitations:

- MAC authentication is supported on the device's switch ports static channel-groups and dynamic (LACP) channel-groups.
- 802.1X authentication is supported on the device's switch ports only. It is not supported on static channel-groups and dynamic (LACP) channel-groups.
- Web authentication is supported on the device's Eth interfaces only.

This chapter provides an alphabetical reference for MAC and web authentication commands. For a list of 802.1X commands see the [802.1X Commands](#) chapter.

For more information on configuring and using port authentication, see the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

# auth auth-fail vlan

**Overview** Use this command to enable the **auth-fail vlan** feature on the specified vlan interface. This feature assigns supplicants (client devices) to the specified VLAN if they fail port authentication.

Use the **no** variant of this command to disable the auth-fail vlan feature for a specified VLAN interface.

**Syntax** `auth auth-fail vlan <1-4094>`  
`no auth auth-fail vlan`

Parameter	Description
<1-4094>	Assigns the VLAN ID to any supplicants that have failed port authentication.

**Default** The auth-fail vlan feature is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use the auth-fail vlan feature when using web authentication instead of the Guest VLAN feature, when you need to separate networks where one supplicant (client device) requires authentication and another supplicant does not require authentication from the same interface.

This is because the DHCP lease time using the Web-Authentication feature is shorter, and the auth-fail vlan feature enables assignment to a different VLAN if a supplicant fails authentication.

To enable the auth-fail vlan feature with web authentication, you need to set the web authentication server virtual IP address by using the `auth-web-server ipaddress` command or the `auth-web-server dhcp ipaddress` command.

When using 802.1X port authentication, use a `dot1x max-auth-fail` command to set the maximum number of login attempts. Three login attempts are allowed by default for 802.1X port authentication before supplicants trying to authenticate are moved from the Guest VLAN to the auth-fail VLAN. See the `dot1x max-auth-fail` on page 2080 for command information.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- the auth-fail VLAN feature, which allows the Network Administrator to separate the supplicants who attempted authentication, but failed, from the supplicants who did not attempt authentication, and
- restrictions regarding combinations of authentication enhancements working together

**Examples** To enable the auth-fail vlan feature for port1.0.2 and assign VLAN 100, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth auth-fail vlan 100
```

To disable the auth-fail vlan feature for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth auth-fail vlan
```

**Related** [auth profile \(global\)](#)

**Command** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S  
**changes**

# auth critical

**Overview** Use this command to enable the critical port feature on the interface. When the critical port feature is enabled on an interface, and all the RADIUS servers are unavailable, then the interface becomes authorized.

The **no** variant of this command disables the critical port feature on the interface.

**Syntax** `auth critical`  
`no auth critical`

**Default** The critical port of port authentication is disabled.

**Mode** `auth-web`: Interface Configuration for an Eth interface, or Authentication Profile mode.  
`auth-mac`: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.  
`dot1x`: Interface Configuration for a a switch port; or Authentication Profile mode.

**Examples** To enable the critical port feature on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth critical
```

To disable the critical port feature on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth critical
```

To enable the critical port feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth critical
```

**Related commands** [auth profile \(global\)](#)  
[show auth-web-server](#)  
[show dot1x](#)  
[show dot1x interface](#)  
[show running-config](#)

# auth dhcp-framed-ip-lease

**Overview** Use this command to enable DHCP Framed IP Lease on an interface.

When the DHCP Framed IP Lease feature is enabled on an interface, supplicants authenticated using 802.1x or MAC authentication will be assigned a specific IP address, and other network settings, gathered from the RADIUS server during the authentication process.

Use the **no** variant of this command to disable DHCP Framed IP Lease.

**Syntax** `auth dhcp-framed-ip-lease`  
`no auth dhcp-framed-ip-lease`

**Default** DHCP Framed IP Lease is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** You need to complete the following steps to configure the DHCP Framed IP Lease feature on your network.

**On the RADIUS server:**

- Configure the RADIUS server with the username and password for 802.1x or MAC authentication
- Configure the following 'framed' RADIUS attributes on the RADIUS server for the that user:
  - Framed-IP-Address (8): the IPv4 address for the supplicant
  - Framed-IP-Netmask (9): the netmask for the supplicant
  - Framed-Route (22): the default gateway IPv4 address for the supplicant
  - Session-Timeout (27): IP address lease time for the supplicant

**NOTE:** *The Frame-IP-Address (8) attribute must be configured for this feature to work. All other attributes are optional.*

**On the DHCP server:**

- Configure the RADIUS client
- Enable 802.1x or MAC authentication on the required interface/s
- Enable DHCP Framed IP Lease feature on the required interface/s
- Setup a DHCP pool with the network range for the IP address/es registered on the RADIUS server
- Enable DHCP server

For more information, see the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Example** To enable DHCP Framed IP Lease on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# auth dhcp-framed-ip-lease
```

To disable DHCP Framed IP Lease on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no auth dhcp-framed-ip-lease
```

**Related commands** [show dot1x supplicant](#)  
[show ip dhcp pool](#)

**Command changes** Version 5.4.8-2.1: command added

# auth dynamic-vlan-creation

**Overview** Use this command to enable and disable the Dynamic VLAN assignment feature.

The Dynamic VLAN assignment feature allows a supplicant (client device) to be placed into a specific VLAN based on information returned from the RADIUS server during authentication, on a given interface.

Use the **no** variant of this command to disable the Dynamic VLAN assignment feature.

**Syntax** `auth dynamic-vlan-creation [rule {deny|permit}]`  
`no auth dynamic-vlan-creation`

Parameter	Description
rule	VLAN assignment rule.
deny	Deny a differently assigned VLAN ID. This is the default rule.
permit	Permit a differently assigned VLAN ID.

**Default** By default, the Dynamic VLAN assignment feature is disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** If the Dynamic VLAN assignment feature is enabled (disabled by default), VLAN assignment is dynamic. If the Dynamic VLAN assignment feature is disabled then RADIUS attributes are ignored and configured VLANs are assigned to ports.

The optional **rule** parameter specifies the VLAN assignment rule when the second supplicant's VLAN ID is different from VLAN ID from the first supplicant. If the **deny** value is applied with the command then the second supplicant with a different VLAN ID is rejected. If the **permit** value is applied with the command then the second supplicant with a different VLAN ID is accepted and assigned to the first supplicant's VLAN.

If you issue an **auth dynamic-vlan-creation** command without a **rule** parameter then a second supplicant with a different VLAN ID is rejected. It is not assigned to the first supplicant's VLAN. Issuing an **auth dynamic-vlan-creation** command without a **rule** parameter has the same effect as issuing an **auth dynamic-vlan-creation rule deny** command rejecting supplicants with differing VLANs.

**Examples** To enable the Dynamic VLAN assignment feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport access vlan 10
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# interface vlan10
awplus(config-if)# ip address 10.1.1.1/24
```

To enable the Dynamic VLAN assignment feature with Web Authentication on interface port1.0.2 when Web Authentication is needed, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 1.2.3.4
awplus(config)# access-list hardware acl-web send-to-cpu ip any
1.2.3.4
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# access-group acl-web
awplus(config-if)# interface vlan1
awplus(config-if)# ip address 10.1.1.1/24
```

To disable the Dynamic VLAN assignment feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth dynamic-vlan-creation
```

To enable the Dynamic VLAN assignment feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth dynamic-vlan-creation
```

**Related commands**

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth guest-vlan

**Overview** Use this command to enable and configure the Guest VLAN feature on the interface specified by associating a Guest VLAN with an interface. This command does not start authentication. The supplicant's (client device's) traffic is associated with the native VLAN of the interface unless it is already associated with another VLAN. The **routing** option enables routing from the Guest VLAN to another VLAN, so the switch can lease DHCP addresses and accept access to a limited network.

The **no** variant of this command disables the guest VLAN feature on the interface specified.

**Syntax** `auth guest-vlan <1-4094> [routing]`  
`no auth guest-vlan [routing]`

Parameter	Description
<1-4094>	VLAN ID (VID).
routing	Enables routing from the Guest VLAN to other VLANs.

**Default** The Guest VLAN authentication feature is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** The Guest VLAN feature may be used by supplicants (client devices) that have not attempted authentication, or have failed the authentication process. Note that if a port is in multi-supplicant mode with per-port dynamic VLAN configuration, after the first successful authentication, subsequent hosts cannot use the guest VLAN due to the change in VLAN ID. This may be avoided by using per-user dynamic VLAN assignment.

When using the Guest VLAN feature with the multi-host mode, a number of supplicants can communicate via a guest VLAN before authentication. A supplicant's traffic is associated with the native VLAN of the specified switch port. The supplicant must belong to a VLAN before traffic from the supplicant can be associated.

Note that you must enable 802.1X on the port and define a VLAN using the [vlan](#) command before you can configure it as a guest VLAN.

Note that Guest VLAN can use only untagged ports.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- Guest VLAN, and
- restrictions regarding combinations of authentication enhancements working together

**Examples** To define vlan100 and assign the guest VLAN feature to vlan100 on interface port1.0.2, and enable routing from the guest VLAN to other VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth guest-vlan 100 routing
```

To disable the guest VLAN feature on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan
```

To define vlan100 and assign the guest VLAN feature to vlan100 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan 100
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth guest-vlan forward

**Overview** Use this command to enable packet forwarding from the guest VLAN to a destination IP address or subnet. If this command is configured, the device can lease DHCP addresses and accept access to a limited part of your network. Also, when using NAP authentication, the supplicant can log on to a domain controller to gain certification.

Use the **no** variant of this command to disable packet forwarding from the Guest VLAN to a destination IP address or subnet.

**Syntax** `auth guest-vlan forward {<ip-address>|<ip-address/mask>} [dns|tcp <1-65535>|udp <1-65535>]`  
`no auth guest-vlan forward {<ip-address>|<ip-address/mask>} [dns|tcp <1-65535>|udp <1-65535>]`

Parameter	Description
<code>&lt;ip-address&gt;</code> <code>&lt;ip-address/mask&gt;</code>	The IP address or subnet to which the guest VLAN can forward packets, in dotted decimal notation
<code>dns</code>	Enable forwarding of DNS packets
<code>tcp &lt;1-65535&gt;</code>	Enable forwarding of packets for the specified TCP port number
<code>udp &lt;1-65535&gt;</code>	Enable forwarding of packets for the specified UDP port number

**Default** Forwarding is disabled by default.

**Mode** Interface Configuration mode for a specified switch port, or Authentication Profile mode

**Usage** Before using this command, you must configure the guest VLAN with the [auth guest-vlan](#) command.

**Example** To enable packet forwarding from the guest VLAN to the destination IP address on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth guest-vlan forward 10.0.0.1
```

To enable forwarding of DNS packets from the guest VLAN to the destination IP address on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface
awplus(config-if)# auth guest-vlan forward 10.0.0.1 dns
```

To disable forwarding of DNS packets from the guest VLAN to the destination IP address on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan forward 10.0.0.1 dns
```

To enable the TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan forward 10.0.0.1
tcp 137
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth host-mode

**Overview** Use this command to select the host mode on the specified interface.  
Use the **no** variant of this command to set host mode to the default setting (single host).

**Syntax** `auth host-mode {single-host|multi-host|multi-supPLICANT}`  
`no auth host-mode`

Parameter	Description
single-host	In this mode, only one supplicant is allowed per port. This is the default mode.
multi-host	In this mode, once the first host on a port is authenticated, all other downstream hosts are allowed without being authenticated (piggy-back mode).
multi-supPLICANT	In this mode, multiple separate supplicants are individually authenticated on one port.

**Default** The default host mode for port authentication is for a single host.

**Mode** `auth-web`: Interface Configuration for an Eth interface, or Authentication Profile mode.  
`auth-mac`: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.  
`dot1x`: Interface Configuration for a a switch port; or Authentication Profile mode.

## Usage notes **Single-host mode**

With this mode, only one supplicant may be authenticated on the port. Once that host has been authenticated, no other supplicants may be authenticated until the first supplicant's session has closed. This means, of course, that none of the other hosts downstream of the port will be able to send or receive traffic on that port.

This option is recommended when you know that there should only be one host connected to a port. By limiting the port to a single authenticated host, you guard against the consequences of someone accidentally or maliciously connecting a downstream switch to the port.

## **Multi-host mode**

With this mode, once the first host has been authenticated on the port, all other downstream hosts are allowed without being authenticated. This is sometimes known as piggy-back mode. It is useful when the downstream switch attached to the authenticating port is an intelligent switch that can act as an authentication supplicant.

If you trust that malicious users cannot be connected to that switch but you do not know the identity of those users, then you can simply authenticate the switch and then allow its attached users to have network access. If the valid switch is

disconnected and an invalid one is connected which is not configured with the correct authentication credentials, then the devices connected to the invalid switch will be blocked from accessing the network.

**Examples** To set the host mode to multi-supPLICANT on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth host-mode multi-supPLICANT
```

To set the host mode to default (single host) on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth host-mode
```

To set the host mode to multi-supPLICANT on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth host-mode multi-supPLICANT
```

To set the host mode to default (single host) on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth host-mode
```

**Related commands**

- [auth profile \(global\)](#)
- [show dot1x](#)
- [show dot1x interface](#)
- [show running-config](#)

# auth log

**Overview** Use this command to configure the types of authentication feature log messages that are output to the log file.

Use the **no** variant of this command to remove either specified types or all types of authentication feature log messages that are output to the log file.

**Syntax**

```
auth log {dot1x|auth-mac|auth-web}  
{success|failure|logoff|all}  
  
no auth log {dot1x|auth-mac|auth-web}  
{success|failure|logoff|all}
```

Parameter	Description
dot1x	Specify only 802.1X-Authentication log messages are output to the log file.
auth-mac	Specify only MAC-Authentication log messages are output to the log file.
auth-web	Specify only Web-Authentication log messages are output to the log file.
success	Specify only successful authentication log messages are output to the log file.
failure	Specify only authentication failure log messages are output to the log file.
logoff	Specify only authentication log-off messages are output to the log file. Note that link down, age out and expired ping polling messages will be included.
all	Specify all types of authentication log messages are output to the log file. Note that this is the default behavior for the authentication logging feature.

**Default** All types of authentication log messages are output to the log file by default.

**Mode**

- auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.
- auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.
- dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

**Examples** To configure the logging of web authentication failures to the log file for supplicants (client devices) connected to interface eth1, use the following commands:

```
awplus# configure terminal  
awplus(config)# interface eth1  
awplus(config-if)# auth log auth-web failure
```

To configure the logging of web authentication failures to the log file for supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth log auth-web failure
```

To disable the logging of all types of authentication log messages to the log file for auth-mac supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth log auth-mac all
```

**Related commands**

- [auth profile \(global\)](#)
- [show running-config](#)

# auth max-supPLICANT

**Overview** Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port. Once this value is exceeded, further supplicants will not be authenticated.

The **no** variant of this command resets the maximum supplicant number to the default.

**Syntax** `auth max-supPLICANT <2-1024>`  
`no auth max-supPLICANT`

Parameter	Description
<2-1024>	Limit number.

**Default** The max supplicant of port authentication is 1024.

**Mode** `auth-web`: Interface Configuration for an Eth interface, or Authentication Profile mode.  
`auth-mac`: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.  
`dot1x`: Interface Configuration for a a switch port; or Authentication Profile mode.

**Examples** To set the maximum number of supplicants to 10 on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth max-supPLICANT 10
```

To reset the maximum number of supplicants to the default value on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth max-supPLICANT
```

To set the maximum number of supplicants to 10 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth max-supPLICANT 10
```

To reset the maximum number of supplicants to the default value on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth max-supPLICANT
```

**Related  
commands**

[auth profile \(global\)](#)  
[show dot1x](#)  
[show dot1x interface](#)  
[show running-config](#)

# auth multi-vlan-session

**Overview** Use this command to enable packet forwarding on multiple VLANs for an authenticated supplicant attached to a trunked (tagged VLAN) port.

By default, AlliedWare Plus only allows packet forwarding on the VLAN that a device was authenticated on. This command enables packet forwarding to the attached device on any VLAN configured on the switchport. After the device authenticates it will have access to all VLANs configured on the switchport.

Use the **no** variant of this command to disable packet forwarding on multiple VLANs for an authenticated supplicant.

**Syntax** `auth multi-vlan-session`  
`no auth multi-vlan-session`

**Default** By default, **multi-vlan-session** is disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To allow a client attached to port1.0.2 to access all VLANs configured on the AlliedWare Plus device, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan all
awplus(config-if)# auth host-mode multi-supplicant
awplus(config-if)# auth multi-vlan-session
```

To disable **multi-vlan-session** on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth multi-vlan-session
```

**Related commands**

- [show dot1x interface](#)

**Command changes** Version 5.4.8-1.1: command added  
Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth profile (global)

**Overview** Use this command to enter port authentication profile mode and configure a port authentication profile.

If the specified profile does not exist a new authentication profile is created with the name provided.

Use the **no** variant of this command to delete the specified port authentication profile.

**Syntax** `auth profile <profile-name>`  
`no auth profile <profile-name>`

Parameter	Description
<code>&lt;profile-name&gt;</code>	Name of the profile to create or configure.

**Default** No port authentication profiles are created by default.

**Mode** Global Configuration

**Usage** A port authentication profile is a configuration object that aggregates multiple port authentication commands. These profiles are attached or detached from an interface using the [auth profile \(interface\)](#) command.

**Example** To create a new authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)#
```

To delete an authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# no auth profile student
```

**Related commands** [auth profile \(interface\)](#)  
[description \(auth-profile\)](#)

# auth profile (interface)

**Overview** Use this command to attach a port authentication profile to the current interface. Use the **no** variant of this command to detach a port authentication profile from the current interface.

**Syntax** `auth profile <profile-name>`  
`no auth profile <profile-name>`

Parameter	Description
<code>&lt;profile-name&gt;</code>	The name of the profile to attach to the current interface.

**Default** No profile is attached by default.

**Mode** `auth-web`: Interface Configuration for an Eth interface, or Authentication Profile mode.  
`auth-mac`: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.  
`dot1x`: Interface Configuration for a a switch port; or Authentication Profile mode.

**Usage** This command attaches an authentication profile, that was created using the [auth profile \(global\)](#) command, to an Eth port, a static channel, a dynamic (LACP) channel group, or a switch port.

You can only attach one profile to an interface at a time. Use the **no** variant of the command to detach a profile before attempting to attach another one.

**Example** To attach the authentication profile 'student' to eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth profile student
```

To detach the authentication profile 'student' from eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth profile student
```

**Related commands** [auth profile \(global\)](#)

# auth reauthentication

**Overview** Use this command to enable reauthentication on the interface specified in the Interface mode.  
Use the **no** variant of this command to disable reauthentication on the interface.

**Syntax** `auth reauthentication`  
`no auth reauthentication`

**Default** Reauthentication of port authentication is disabled by default.

**Mode** `auth-web`: Interface Configuration for an Eth interface, or Authentication Profile mode.  
`auth-mac`: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.  
`dot1x`: Interface Configuration for a a switch port; or Authentication Profile mode.

**Examples** To enable reauthentication on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth reauthentication
```

To disable reauthentication on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth reauthentication
```

To enable reauthentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth reauthentication
```

**Related commands** [auth profile \(global\)](#)  
[show dot1x](#)  
[show dot1x interface](#)  
[show running-config](#)

# auth roaming disconnected

**Overview** This command allows a supplicant to move to another authenticating interface without reauthentication, even if the link is down for the interface that the supplicant is currently connected to.

You must enter the [auth roaming enable](#) command on both interfaces before using this command.

The **no** variant of this command disables roaming authentication on interfaces that are link-down, and forces a supplicant to be reauthenticated when moving between interfaces.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for further information about this feature.

**Syntax** `auth roaming disconnected`  
`no auth roaming disconnected`

**Default** By default, the authentication status for a roaming supplicant is deleted when an interface goes down, so supplicants must reauthenticate.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Note that 802.1X port authentication, MAC-authentication, or Web-authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

**Examples** To allow supplicants to move from port1.0.2 without reauthentication even when the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth roaming enable
awplus(config-if)# auth roaming disconnected
```

To require supplicants to reauthenticate when moving from port1.0.2 if the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth roaming disconnected
```

To allow supplicants using authentication profile 'student' to move between ports without reauthentication even when the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming disconnected
```

To require supplicants using authentication profile 'student' to reauthenticate when moving between ports if the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth roaming disconnected
```

**Related  
commands**

- auth profile (global)
- auth-mac enable
- auth roaming enable
- auth-web enable
- show auth interface
- show running-config

# auth roaming enable

**Overview** Use this command to allow a supplicant to move to another authenticating interface without reauthentication, providing the link is up for the interface that the supplicant is currently connected to.

The **no** variant of this command disables roaming authentication on an interface, and forces a supplicant to be reauthenticated when moving between interfaces.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for further information about this feature.

**Syntax** `auth roaming enable`  
`no auth roaming enable`

**Default** Roaming authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Note that 802.1X port authentication or MAC authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

This command only enables roaming authentication for links that are up. If you want roaming authentication on links that are down, you must also use the command [auth roaming disconnected](#).

**Examples** To enable roaming authentication for port1.0.4, when using auth-mac authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# auth-mac enable
awplus(config-if)# auth roaming enable
```

To disable roaming authentication for port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no auth roaming enable
```

To enable roaming authentication for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming enable
```

**Related commands**

# auth supplicant-ip

**Overview** Use this command to add a supplicant (client device) IP address on a given interface and provides parameters for its configuration.

Use the **no** variant of this command to delete the supplicant IP address and reset other parameters to their default values. The IP address can be determined before authentication for auth-web clients only.

**Syntax** `auth supplicant-ip <ip-addr> [max-reauth-req <1-10>] [port-control {auto|force-authorized|force-unauthorized|skip-second-auth}] [quiet-period <1-65535>] [reauth-period <1-4294967295>] [supp-timeout <1-65535>] [server-timeout <1-65535>] [reauthentication]`  
`no auth supplicant-ip <ip-addr> [reauthentication]`

Parameter	Description
<code>&lt;ip-addr&gt;</code>	IP address of the supplicant entry in A.B.C.D/P format.
<code>max-reauth-req</code>	The number of reauthentication attempts before becoming unauthorized.
<code>&lt;1-10&gt;</code>	Count of reauthentication attempts (default 2).
<code>port-control</code>	Port control commands.
<code>auto</code>	A port control parameter that allows port clients to negotiate authentication.
<code>force-authorized</code>	A port control parameter that forces the port state to authorized.
<code>force-unauthorized</code>	A port control parameter that forces the port state to unauthorized.
<code>skip-second-auth</code>	Skip the second authentication.
<code>quiet-period</code>	Quiet period during which the port remains in the HELD state (default 60 seconds).
<code>&lt;1-65535&gt;</code>	Seconds for quiet period.
<code>reauth-period</code>	Seconds between reauthorization attempts (default 3600 seconds).
<code>&lt;1-4294967295&gt;</code>	Seconds for reauthorization attempts (reauth-period).
<code>supp-timeout</code>	Supplicant response timeout.
<code>&lt;1-65535&gt;</code>	Seconds for supplicant response timeout (default 30 seconds).
<code>server-timeout</code>	The period, in seconds, before the authentication server response times out.

Parameter	Description
<1-65535>	The server-timeout period, in seconds, default 3600 seconds.
reauthentication	Enable reauthentication on a port.

**Default** No supplicant IP address for port authentication exists by default until first created with the **auth supplicant-ip** command. The defaults for parameters applied are as shown in the table above.

**Mode**  
 auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.  
 auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.  
 dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

**Examples** To add the supplicant IP address 192.168.10.0/24 to force authorized port control for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth supplicant-ip 192.168.10.0/24
port-control force-authorized
```

To delete the supplicant IP address 192.168.10.0/24 for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
```

To disable reauthentication for the supplicant(s) IP address 192.168.10.0/24 for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
reauthentication
```

To add the supplicant IP address 192.168.10.0/24 to force authorized port control for auth profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-ip
192.168.10.0/24 port-control force-authorized
```

**Related commands**

- [show auth](#)
- [show dot1x](#)
- [show dot1x interface](#)
- [show running-config](#)

# auth supplicant-mac

**Overview** This command adds a supplicant (client device) MAC address or MAC mask on a given interface with the parameters as specified in the table below.

Use the **no** variant of this command to delete the supplicant MAC address and reset other parameters to their default values.

**Syntax** `auth supplicant-mac <mac-addr> [mask <mac-addr-mask>]  
[max-reauth-req <1-10>] [port-control {auto|force-authorized|  
force-unauthorized|skip-second-auth}] [quiet-period <1-65535>]  
[reauth-period <1-4294967295>] [supp-timeout <1-65535>]  
[server-timeout <1-65535>] [reauthentication]  
  
no auth supplicant-mac <mac-addr> [reauthentication]`

Parameter	Description
<mac-addr>	MAC (hardware) address of the supplicant entry in HHHH.HHHH.HHHH MAC address hexadecimal format.
mask	A mask applied to MAC addresses in order to select only those addresses containing a specific string.
<mac-addr-mask>	The mask comprises a string of three (period separated) bytes, where each byte comprises four hexadecimal characters that will generally be either 1 or 0. When the mask is applied to a specific MAC address, a match is only required for characters that correspond to a 1 in the mask. Characters that correspond to a 0 in the mask are effectively ignored.  In the examples section below, the mask ffff.ff00.0000 is applied for the MAC address 0000.5E00.0000. The applied mask will then match only those MAC addresses that begin with 0000.5E (in this case the OUI component). The remaining portion of the addresses (in this case the NIC component) will be ignored.
port-control	Port control commands.
auto	Allow port client to negotiate authentication.
force-authorized	Force port state to authorized.
force-unauthorized	Force port state to unauthorized.
skip-second-auth	Skip the second authentication.
quiet-period	Quiet period in the HELD state (default 60 seconds).
<1-65535>	Seconds for quiet period.
reauth-period	Seconds between reauthorization attempts (default 3600 seconds).
<1-4294967295>	Seconds for reauthorization attempts (reauth-period).
supp-timeout	Supplicant response timeout (default 30 seconds).

Parameter	Description
<1-65535>	Seconds for supplicant response timeout.
server-timeout	Authentication server response timeout (default 30 seconds).
<1-65535>	Seconds for authentication server response timeout.
reauthentication	Enable reauthentication on a port.
max-reauth-req	No of reauthentication attempts before becoming unauthorized (default 2).
<1-10>	Count of reauthentication attempts.

**Default** No supplicant MAC address for port authentication exists by default until first created with the **auth supplicant-mac** command. The defaults for parameters are shown in the table above.

**Mode** auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.  
 auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.  
 dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

**Examples** To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0000.5E00.5343
port-control force-authorized
```

To apply the mask ffff.ff00.0000 in order to add any supplicant MAC addresses whose MAC address begins with 0000.5E, and then to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0000.5E00.0000 mask
ffff.ff00.0000 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
```

To disable reauthentication for the supplicant MAC address 0000.5E00.5343 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
reauthentication
```

To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-mac
0000.5E00.5343 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth supplicant-mac
0000.5E00.5343
```

[show dot1x](#)  
[show dot1x interface](#)  
[show running-config](#)

# auth timeout connect-timeout

**Overview** Use this command to set the connect-timeout period for the interface.  
Use the **no** variant of this command to reset the connect-timeout period to the default.

**Syntax** `auth timeout connect-timeout <1-65535>`  
`no auth timeout connect-timeout`

Parameter	Description
<1-65535>	Specifies the connect-timeout period (in seconds).

**Default** The connect-timeout default is 30 seconds.

**Mode** `auth-web`: Interface Configuration for an Eth interface, or Authentication Profile mode.  
`auth-mac`: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.  
`dot1x`: Interface Configuration for a a switch port; or Authentication Profile mode.

**Usage notes** This command is used for MAC and web authentication. If the connect-timeout has lapsed and the supplicant has the state **connecting**, then the supplicant is deleted. When `auth-web-server session-keep` or `auth two-step enable` is enabled, we recommend you configure a longer connect-timeout period.

**Examples** To set the connect-timeout period to 3600 seconds for interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth timeout connect-timeout 3600
```

To reset the connect-timeout period to the default (30 seconds) for interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth timeout connect-timeout
```

To set the connect-timeout period to 3600 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout connect-timeout 3600
```

**Related commands** [auth profile \(global\)](#)

`show dot1x`

`show dot1x interface`

# auth timeout quiet-period

**Overview** Use this command to set a time period for which another authentication request is not accepted on a given interface, after an authentication request has failed.

Use the **no** variant of this command to reset the quiet period to the default.

**Syntax** `auth timeout quiet-period <1-65535>`  
`no auth timeout quiet-period`

Parameter	Description
<1-65535>	Specifies the quiet period (in seconds).

**Default** The quiet period for port authentication is 60 seconds.

**Mode** `auth-web`: Interface Configuration for an Eth interface, or Authentication Profile mode.  
`auth-mac`: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.  
`dot1x`: Interface Configuration for a a switch port; or Authentication Profile mode.

**Examples** To set the quiet period to 10 seconds for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth timeout quiet-period 10
```

To reset the quiet period to the default (60 seconds) for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth timeout quiet-period
```

To set the quiet period to 10 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout quiet-period 10
```

**Related commands** [auth profile \(global\)](#)

# auth timeout reauth-period

**Overview** Use this command to set the timer for reauthentication on a given interface. The re-authentication for the supplicant (client device) is executed at this timeout. The timeout is only applied if the **auth reauthentication** command is applied.

Use the **no** variant of this command to reset the **reauth-period** parameter to the default (3600 seconds).

**Syntax** `auth timeout reauth-period <1-4294967295>`  
`no auth timeout reauth-period`

Parameter	Description
<1-4294967295>	The reauthentication timeout period (in seconds).

**Default** The default reauthentication period for port authentication is 3600 seconds, when reauthentication is enabled on the port.

**Mode** `auth-web`: Interface Configuration for an Eth interface, or Authentication Profile mode.  
`auth-mac`: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.  
`dot1x`: Interface Configuration for a a switch port; or Authentication Profile mode.

**Examples** To set the reauthentication period to 1 day for interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth timeout reauth-period
```

To set the reauthentication period to 1 day for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout reauth-period
```

# auth timeout server-timeout

**Overview** Use this command to set the timeout for the waiting response from the RADIUS server on a given interface.

Use the **no** variant of this command to reset the server-timeout to the default (30 seconds).

**Syntax** `auth timeout server-timeout <1-65535>`  
`no auth timeout server-timeout`

Parameter	Description
<1-65535>	Server timeout period (in seconds).

**Default** The server timeout for port authentication is 30 seconds.

**Mode** `auth-web`: Interface Configuration for an Eth interface, or Authentication Profile mode.  
`auth-mac`: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.  
`dot1x`: Interface Configuration for a a switch port; or Authentication Profile mode.

**Examples** To set the server timeout to 120 seconds for interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth timeout server-timeout
```

To set the server timeout to 120 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout server-timeout
```

**Related  
commands**    `auth profile (global)`

                  `show dot1x interface`  
                  `show running-config`

# auth timeout supp-timeout

**Overview** This command sets the timeout of the waiting response from the supplicant (client device) on a given interface.

The **no** variant of this command resets the supplicant timeout to the default (30 seconds).

**Syntax** `auth timeout supp-timeout <1-65535>`  
`no auth timeout supp-timeout`

Parameter	Description
<1-65535>	The supplicant timeout period (in seconds).

**Default** The supplicant timeout for port authentication is 30 seconds.

**Mode** `auth-web`: Interface Configuration for an Eth interface, or Authentication Profile mode.  
`auth-mac`: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.  
`dot1x`: Interface Configuration for a a switch port; or Authentication Profile mode.

**Examples** To set the supplicant timeout to 2 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout supp-timeout 2
```

To reset the supplicant timeout to the default (30 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout supp-timeout
```

To set the supplicant timeout to 2 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout supp-timeout 2
```

**Related commands** [auth profile \(global\)](#)  
[show dot1x](#)  
[show dot1x interface](#)  
[show running-config](#)

# auth two-step enable

**Overview** Use this command to enable a two-step authentication feature on an interface. When this feature is enabled, the supplicant is authorized in a two-step process. If authentication succeeds, the supplicant becomes authenticated.

Use this command to apply the two-step authentication method based on 802.1X or MAC authentication.

Use the **no** variant of this command to disable the two-step authentication feature.

**Syntax** `auth two-step enable`  
`no auth two-step enable`

**Default** Two step authentication is disabled by default.

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Usage** The single step authentication methods (either user or device authentication) have a potential security risk:

- an unauthorized user can access the network with an authorized device, or
- an authorized user can access the network with an unauthorized device.

Two-step authentication solves this problem by authenticating both the user and the device. The supplicant will only become authenticated if both these steps are successful. If the first authentication step fails, then the second step is not started.

**Examples** To enable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth two-step enable
```

To disable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth two-step enable
```

To enable MAC authentication followed by 802.1X authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable the two step authentication feature for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth two-step enable
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth two-step order

**Overview** Use this command to configure the order for two-step authentication. Two-step authentication and the relevant authentication methods must be enabled on the interface.

Use the **no** variant of this command to reset the authentication order to the default.

**Syntax**

```
auth two-step order auth-mac dot1x
auth two-step order dot1x auth-mac
no auth two-step order
```

Parameter	Description
auth-mac	MAC authentication
dot1x	802.1X authentication

**Default** Order is determined by the authentication methods configured on the interface (see **Usage notes**).

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Usage notes** The default authentication order depends on the combination of the authentication methods configured on the interface:

- If auth-mac is configured then auth-mac will be the first method.
- If auth-mac is **not** configured then dot1x will become the first method.

**Examples** To set the two-step authentication order on port1.0.1 for 802.1X authentication and then MAC authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth two-step enable
awplus(config-if)# auth two-step order dot1x auth-mac
```

To reset the two-step authentication order back to the default, which would be MAC authentication then 802.1X authentication if configured as above, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no auth two-step order
```

**Related commands** auth two-step enable  
auth-mac enable  
dot1x port-control

show auth supplicant

**Command changes** Version 5.5.0-0.3: command added

# auth-mac accounting

**Overview** Use this command to override the **default** RADIUS accounting method for MAC-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** `auth-mac accounting {default|<list-name>}`  
`no auth-mac accounting`

Parameter	Description
default	Apply the default accounting method list
<list-name>	Apply the user-defined named list

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the accounting method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac accounting
```

**Related commands** [aaa accounting auth-mac](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac authentication

**Overview** This command overrides the **default** MAC authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** `auth-mac authentication {default|<list-name>}`  
`no auth-mac authentication`

Parameter	Description
default	Apply the default authentication method list
<list-name>	Apply a user-defined named list

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac authentication
```

**Related commands** [aaa authentication auth-mac](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac enable

**Overview** This command enables MAC authentication on the interface specified in the Interface command mode.

Use the **no** variant of this command to disable MAC authentication on an interface.

**Syntax** `auth-mac enable`  
`no auth-mac enable`

**Default** MAC-Authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Enabling **spanning-tree edgeport** on ports after enabling MAC authentication avoids unnecessary re-authentication when the port state changes, which does not happen when spanning tree edgeport is enabled. Note that re-authentication is correct behavior without **spanning-tree edgeport** enabled.

Applying **switchport mode access** on ports is also good practice to set the ports to access mode with ingress filtering turned on, whenever ports for MAC authentication are in a VLAN.

**Examples** To enable MAC authentication on interface port1.0.2 and enable spanning tree edgeport to avoid unnecessary re-authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac enable
awplus(config-if)# spanning-tree edgeport
awplus(config-if)# switchport mode access
```

To disable MAC authentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac enable
```

To enable MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac enable
```

**Command  
changes**

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac method

**Overview** This command sets the type of authentication method for MAC authentication that is used with RADIUS on the interface specified in the interface command mode.

The **no** variant of this command resets the authentication method used to the default method (PAP) as the RADIUS authentication method used by the MAC authentication.

**Syntax** `auth-mac method [eap-md5|pap]`  
`no auth-mac method`

Parameter	Description
<code>eap-md5</code>	Enable EAP-MD5 as the authentication method.
<code>pap</code>	Enable PAP as the authentication method.

**Default** The MAC authentication method is PAP.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the MAC authentication method to PAP on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac method pap
```

To set the MAC authentication method to the default on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac method
```

To set the MAC authentication method to EAP-MD5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac method eap-md5
```

`show running-config`

**Command  
changes**

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac password

**Overview** This command changes the password for MAC-based authentication. Use the **no** variant of this command to return the password to its default.

**Syntax** `auth-mac [encrypted] password <password>`  
`no auth-mac password`

Parameter	Description
<code>auth-mac</code>	MAC-based authentication
<code>encrypted</code>	Specify an encrypted password
<code>password</code>	Configure the password
<code>&lt;password&gt;</code>	The new password. Passwords can be up to 64 characters in length and can contain any printable characters except: <ul style="list-style-type: none"><li>• ?</li><li>• " (double quotes)</li><li>• space</li></ul>

**Default** By default, the password is the MAC address of the supplicant.

**Mode** Global Configuration

**Usage notes** Changing the password increases the security of MAC-based authentication, because the default password is easy for an attacker to discover. This is particularly important if:

- some MAC-based supplicants on the network are intelligent devices, such as computers.

**Examples** To change the password to `verySecurePassword`, use the commands:

```
awplus# configure terminal
awplus(config)# auth-mac password verySecurePassword
```

**Related commands** [show auth](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac reauth-relearning

**Overview** This command sets the MAC address learning of the supplicant (client device) to re-learning for re-authentication on the interface specified in the interface command mode.

Use the **no** variant of this command to disable the auth-mac re-learning option.

**Syntax** `auth-mac reauth-relearning`  
`no auth-mac reauth-relearning`

**Default** Re-learning for port authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable the re-authentication re-learning feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac reauth-relearning
```

To disable the re-authentication re-learning feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac reauth-relearning
```

To enable the re-authentication re-learning feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac reauth-relearning
```

# auth-mac static

**Overview** This command configures MAC authentication to use static entries in the FDB. Static entries persist in the FDB, even if there is no traffic flow from the supplicant.

When static FDB entries are configured, the [auth roaming disconnected](#) command is supported for MAC authentication. This command allows a supplicant to move to another authenticating interface without re-authentication.

Use the **no** variant of this command to revert to dynamic FDB entries.

**Syntax** `auth-mac static`  
`no auth-mac static`

**Default** By default MAC authentication supplicants are added to the FDB dynamically.

**Mode** Global Configuration

**Example** To configure MAC authentication to use static FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac static
```

To configure MAC authentication to use dynamic FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-mac static
```

**Related commands** [auth roaming disconnected](#)

# auth-mac username

**Overview** Use this command to specify the format of the MAC address in the username and password field when a request for MAC-based authorization is sent to a RADIUS server.

**Syntax** `auth-mac username {ietf|unformatted} {lower-case|upper-case}`

Parameter	Description
ietf	The MAC address includes a hyphen between each 2 bytes. (Example: xx-xx-xx-xx-xx-xx)
unformatted	The MAC address does not include hyphens. (Example: xxxxxxxxxxxx)
lower-case	The MAC address uses lower-case characters (a-f)
upper-case	The MAC address uses upper-case characters (A-F)

**Default** `auth-mac username ietf lower-case`

**Mode** Global Configuration

**Usage** This command is provided to allow other vendors', AlliedWare, and AlliedWare Plus switches to share the same format on the RADIUS server.

**Example** To configure the format of the MAC address in the username and password field to be changed to IETF and upper-case, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac username ietf upper-case
```

**Related commands** [auth-mac username](#)

# auth-web accounting

**Overview** This command overrides the default RADIUS accounting method for web-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

**Syntax** `auth-web accounting {default|<list-name>}`  
`no auth-web accounting`

Parameter	Description
default	Apply the default accounting method list
<list-name>	Apply a named accounting method list

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for an Eth interface, or Authentication Profile mode.

**Example** To apply the named list 'example\_acct' on the eth1 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web accounting example_acct
```

To remove the named list from the eth1 interface and set the accounting method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web accounting
```

**Related commands** [aaa accounting auth-web](#)

# auth-web authentication

**Overview** Use this command to override the default web-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

**Syntax** `auth-web authentication {default|<list-name>}`  
`no auth-web authentication`

Parameter	Description
default	Apply the default authentication method list
<list-name>	Apply the user-defined named list

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for an Eth interface, or Authentication Profile mode.

**Example** To apply the named list 'example\_auth' on the eth1 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web authentication example_auth
```

To remove the named list from the eth1 interface and set the authentication method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web authentication
```

**Related commands** [aaa authentication auth-web](#)

# auth-web enable

**Overview** Use this command to enable web-based authentication in Interface mode on the interface specified.

Use the **no** variant of this command to apply its default.

**Syntax** auth-web enable  
no auth-web enable

**Default** Web authentication is disabled by default.

**Mode** Interface Configuration for an Eth interface, or Authentication Profile mode.

**Usage notes** You need to configure an IPv4 address for the Ethernet interface on which Web Authentication is running.

When the **protect (firewall)** command and the **web-auth enable** command are both configured, you need to configure a firewall rule to allow Auth-web traffic to pass through the firewall. Web-auth uses TCP ports 8081, 8082, 8083 and 8084. You can create a firewall rule like the following example:

```
!
application auth-apl
protocol tcp
dport 8081 to 8084
!
!
firewall
    rule 65 permit auth-apl from private.supPLICANT to
private.supPLICANT.router
!
```

**Examples** To enable web authentication on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web enable
```

To disable web authentication on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web enable
```

To enable web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web enable
```

To disable web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web enable
```

**Related  
commands**

[auth profile \(global\)](#)  
[show auth](#)  
[show auth interface](#)  
[show running-config](#)

# auth-web forward

**Overview** Use this command to enable the web authentication packet forwarding feature on the interface specified. This command also enables ARP forwarding, and adds forwarded packets to the **tcp** or **udp** port number specified.

Use the **no** variant of this command to disable the specified packet forwarding feature on the interface.

**Syntax** `auth-web forward [<ip-address>|<ip-address/prefix-length>]  
{dns|tcp <1-65535>|udp <1-65535>}`

or

`auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

The **no** variants of this command are:

`no auth-web forward [<ip-address>|<ip-address/prefix-length>]  
{dns|tcp <1-65535>|udp <1-65535>}`

or

`no auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

Parameter	Description
<code>&lt;ip-address&gt;</code> <code>&lt;ip-address/ prefix-length&gt;</code>	The IP address or subnet on which the web authentication is to be enabled.
<code>arp</code>	Enable forwarding of ARP.
<code>dhcp</code>	Enable forwarding of DHCP (67/udp).
<code>dns</code>	Enable forwarding of DNS (53/udp).
<code>tcp</code>	Enable forwarding of TCP specified port number.
<code>&lt;1-65535&gt;</code>	TCP Port number.
<code>udp</code>	Enable forwarding of UDP specified port number.
<code>&lt;1-65535&gt;</code>	UDP Port number.

**Default** Packet forwarding for port authentication is enabled by default for "arp", "dhcp" and "dns".

**Mode** Interface Configuration for an Eth interface, or Authentication Profile mode.

**Usage notes** For more information about the `<ip-address>` parameter, and an example, see the "auth-web forward" section in the [AlliedWare Plus Technical Tips and Tricks](#).

**Examples** To enable the ARP forwarding feature on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web forward arp
```

To add TCP forwarding port 137 on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web forward tcp 137
```

To disable the ARP forwarding feature on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web forward arp
```

To delete TCP forwarding port 137 on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web forward tcp 137
```

To delete all TCP forwarding on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web forward tcp
```

To enable the ARP forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward arp
```

To add TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward tcp 137
```

To disable the ARP forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward arp
```

To delete TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp 137
```

To delete all TCP forwarding on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp
```

**Related commands**

- [auth profile \(global\)](#)
- [show auth](#)
- [show auth interface](#)

# auth-web idle-timeout enable

**Overview** Use this command to enable the idle-timeout for client of web authentication on the interface.

The **no** variant of this command to disable the idle-timeout for client of web authentication on the interface.

**Syntax** `auth-web idle-timeout enable`  
`no auth-web idle-timeout enable`

**Default** The idle-timeout is disabled by default.

**Mode** Interface Configuration for an Eth interface, or Authentication Profile mode.

**Example** To enable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config)# auth-web enable
awplus(config-if)# auth-web idle-timeout enable
```

To disable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout enable
```

**Related commands** [auth-web enable](#)  
[auth-web idle-timeout timeout](#)

# auth-web idle-timeout timeout

**Overview** Use this command to set the timeout value for web authentication client in seconds. The client will be unauthorized when it does not have any activity for a period that exceeds the timeout value.

The **no** variant of this command sets the timeout value to the default setting, 3600 seconds.

**Syntax** `auth-web idle-timeout timeout <420-86400>`  
`no auth-web idle-timeout timeout`

Parameter	Description
<420-86400>	Time in seconds.

**Default** The timeout is 3600 seconds by default.

**Mode** Interface Configuration for an Eth interface, or Authentication Profile mode.

**Example** To set 30 minutes as the idle-timeout, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web idle-timeout timeout 1800
```

To return the idle-timeout to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout timeout
```

**Related commands** [auth-web enable](#)  
[auth-web idle-timeout enable](#)

# auth-web max-auth-fail

**Overview** Use this command to set the number of authentication failures allowed before rejecting further authentication requests. When the supplicant (client device) fails more than the specified number of times, then login requests are refused during the quiet period.

Use the **no** variant of this command to reset the maximum number of authentication failures to the default.

**Syntax** `auth-web max-auth-fail <0-10>`  
`no auth-web max-auth-fail`

Parameter	Description
<code>&lt;0-10&gt;</code>	The maximum number of authentication failures allowed before login requests are refused.

**Default** The maximum number of authentication failures is set to 3.

**Mode** Interface Configuration for an Eth interface, or Authentication Profile mode.

**Examples** To set the lock count to 5 on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web max-auth-fail 5
```

To set the lock count to the default on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web max-auth-fail
```

To set the lock count to 5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web max-auth-fail 5
```

To set the lock count to the default on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web max-auth-fail
```

**Related commands**

- auth profile (global)
- auth timeout quiet-period
- show auth
- show auth interface
- show running-config

# auth-web method

**Overview** Use this command to set the web authentication access method that is used with RADIUS on the interface specified.

Use the **no** variant of this command to set the authentication method to PAP for the interface specified when web authentication is also used with the RADIUS authentication method.

**Syntax** `auth-web method { eap-md5 | pap }`  
`no auth-web method`

Parameter	Description
<code>eap-md5</code>	Enable EAP-MD5 as the authentication method.
<code>pap</code>	Enable PAP as the authentication method.

**Default** The web authentication method is set to PAP by default.

**Mode** Interface Configuration for an Eth interface, or Authentication Profile mode.

**Example** To set the web authentication method to EAP-MD5 on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web method eap-md5
```

To set the web authentication method to EAP-MD5 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web method eap-md5
```

**Related commands**

- [auth profile \(global\)](#)
- [show auth](#)
- [show auth interface](#)
- [show running-config](#)

# auth-web-server dhcp ipaddress

**Overview** Use this command to assign an IP address and enable the DHCP service on the Web-Authentication server for supplicants (client devices).

Use the **no** variant of this command to remove an IP address and disable the DHCP service on the Web-Authentication server for supplicants.

**Syntax** `auth-web-server dhcp ipaddress <ip-address/prefix-length>`  
`no auth-web-server dhcp ipaddress`

Parameter	Description
<code>&lt;ip-addr/prefix-length&gt;</code>	The IPv4 address and prefix length assigned for the DHCP service on the Web-Authentication server for supplicants.

**Default** No IP address for the Web-Authentication server is set by default.

**Mode** Global Configuration

**Usage notes** See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

**Examples** To assign the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp ipaddress 10.0.0.1/8
```

To remove an IP address on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp ipaddress
```

**Related commands** [auth-web-server dhcp lease](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth-web-server dhcp lease

**Overview** Use this command to set the DHCP lease time for supplicants (client devices) using the DHCP service on the Web-Authentication server.

Use the **no** variant of this command to reset to the default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server.

**Syntax** `auth-web-server dhcp lease <20-60>`  
`no auth-web-server dhcp lease`

Parameter	Description
<20-60>	DHCP lease time for supplicants using the DHCP service on the Web-Authentication server in seconds.

**Default** The default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server is set to 30 seconds.

**Mode** Global Configuration

**Usage notes** See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

**Examples** To set the DHCP lease time to 1 minute for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp lease 60
```

To reset the DHCP lease time to the default setting (30 seconds) for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp lease
```

**Validation Commands** `show running-config`

**Related commands** `show auth-web-server`  
`auth-web-server dhcp ipaddress`

# auth-web-server dhcp-wpad-option

**Overview** This command sets the DHCP WPAD (Web Proxy Auto-Discovery) option for the Web-Authentication temporary DHCP service.

For more information and examples, see the “Web Auth Proxy” section in the [AlliedWare Plus Technical Tips and Tricks](#).

Use the **no** variant of this command to disable the DHCP WPAD function.

**Syntax** `auth-web-server dhcp wpad-option <url>`  
`no auth-web-server dhcp wpad-option`

Parameter	Description
<code>&lt;url&gt;</code>	URL to the server which gets a .pac file.

**Default** The Web-Authentication server DHCP WPAD option is not set.

**Mode** Global Configuration

**Usage notes** If the supplicant is configured to use WPAD, the supplicant’s web browser will use TCP port 80 as usual. Therefore, the packet can be intercepted by Web-Authentication as normal, and the Web-Authentication Login page can be sent. However, after authentication, the browser does not know where to get the WPAD file and so cannot access external web pages. The WPAD file is usually named proxy.pac file and tells the browser what web proxy to use.

Use this command to tell the supplicant where it can get this file from. The switch itself can be specified as the source for this file, and it can deliver it to the supplicant on request.

**Example** To specify that the proxy.pac file is found on the server at 192.168.1.100, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp wpad-option
http://192.168.1.100/proxy/proxy.pac
```

**Related commands** [show auth-web-server](#)

# auth-web-server host-name

**Overview** This command assigns a hostname to the web authentication server.  
Use the **no** variant of this command to remove the hostname from the web authentication server.

**Syntax** `auth-web-server host-name <hostname>`  
`no auth-web-server host-name`

Parameter	Description
<code>&lt;hostname&gt;</code>	URL string of the hostname

**Default** The web authentication server has no hostname.

**Mode** Global Configuration

**Usage notes** When the web authentication server uses HTTPS protocol, the web browser will validate the certificate. If the certificate is invalid, the web page gives a warning message before displaying server content. However, the web page will not give warning message if the server has a hostname same as the one stored in the installed certificate.

**Examples** To set the `auth.example.com` as the hostname of the web authentication server, use the commands:

```
awplus# configure terminal  
awplus(config)# auth-web-server host-name auth.example.com
```

To remove hostname `auth.example.com` from the web authentication server, use the commands:

```
awplus# configure terminal  
awplus(config)# no auth-web-server host-name
```

**Related commands** [aaa authentication auth-web](#)  
[auth-web enable](#)

# auth-web-server intercept-port

**Overview** This command specifies any additional TCP port numbers that the Web-Authentication server is to intercept.

Use the **no** variant of this command to stop intercepting the TCP port numbers.

**Syntax** `auth-web-server intercept-port {<1-65535>|any}`  
`no auth-web-server intercept-port {<1-65535>|any}`

Parameter	Description
<1-65535>	TCP port number.
any	Intercept all TCP packets

**Default** No additional TCP port numbers are intercepted by default.

**Mode** Global Configuration

**Usage notes** If this command is not specified, AlliedWare Plus Web-Authentication intercepts the supplicant's initial TCP port 80 connection to a web page and sends it the Web-Authentication Login page. However, if the supplicant is configured to use a web proxy, then it will usually be using TCP port 8080 (or another user configured port number). In this case Web-Authentication cannot intercept the connection.

To overcome this limitation you can use this command to tell the switch which additional port it should intercept, and then send the Web-Authentication Login page to the supplicant.

When the web authentication switch is in a guest network, the switch does not know the proxy server's port number in the supplicant's proxy setting. To overcome this limitation, you can use the **any** option in this command to intercept all TCP packets.

When you use this command in conjunction with a proxy server configured in the web browser, you must add the proxy server's network as a 'No Proxy' network. You can specify 'No Proxy' networks in the proxy settings in your web browser. For more information, see the "Web Auth Proxy" section in the [Alliedware Plus Technical Tips and Tricks](#).

**Example** To additionally intercept port number 3128, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server intercept-port 3128
```

**Related commands** [show auth-web-server](#)

# auth-web-server ipaddress

**Overview** This command sets the IP address for the Web-Authentication server.

Use the **no** variant of this command to delete the IP address for the Web-Authentication server.

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

**Syntax** `auth-web-server ipaddress <ip-address>`  
`no auth-web-server ipaddress`

Parameter	Description
<code>&lt;ip-address&gt;</code>	Web-Authentication server dotted decimal IP address in A.B.C.D format.

**Default** The Web-Authentication server address on the system is not set by default.

**Mode** Global Configuration

**Examples** To set the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 10.0.0.1
```

To delete the IP address from the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ipaddress
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server page language

**Overview** Use this command to set the presentation language of Web authentication pages. Titles and subtitles of Web authentication pages will be set accordingly. Note that presently only English or Japanese are offered.

Use the **no** variant of this command to set the presentation language of Web authentication pages to its default (English).

**Syntax** `auth-web-server page language {english|japanese}`  
`no auth-web-server page language`

Parameter	Description
english	Web authentication pages are presented in English.
japanese	Web authentication pages are presented in Japanese.

**Default** Web authentication pages are presented in English by default.

**Mode** Global Configuration

**Examples** To set Japanese as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language japanese
```

To set English as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language english
```

To unset the presentation language of Web authentication pages and use English as the default presentation language, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page language
```

**Related commands** [auth-web-server page title](#)  
[auth-web-server page sub-title](#)  
[show auth-web-server page](#)

# auth-web-server login-url

**Overview** This command sets the web-authentication login page URL. This lets you replace the login page with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for details.

Use the **no** variant of this command to delete the URL.

**Syntax** `auth-web-server login-url <URL>`  
`no auth-web-server login-url`

Parameter	Description
<URL>	Set login page URL

**Default** The built-in login page is set by default.

**Mode** Global Configuration

**Examples** To set `http://example.com/login.html` as the login page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server login-url
http://example.com/login.html
```

To unset the login page URL, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server login-url
```

**Related commands** [show running-config](#)

# auth-web-server page logo

**Overview** This command sets the type of logo that will be displayed on the web authentication page.

Use the **no** variant of this command to set the logo type to **auto**.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page logo {auto|default|hidden}`  
`no auth-web-server page logo`

Parameter	Description
auto	Display the custom logo if installed; otherwise display the default logo
default	Display the default logo
hidden	Hide the logo

**Default** Logo type is **auto** by default.

**Mode** Global Configuration

**Examples** To display the default logo with ignoring installed custom logo, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page logo default
```

To set back to the default logo type **auto**, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page logo
```

**Validation Commands** `show auth-web-server page`

# auth-web-server page sub-title

**Overview** This command sets the custom sub-title on the web authentication page.

Use the **no** variant of this command to reset the sub-title to its default.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page sub-title {hidden|text <sub-title>}`  
`no auth-web-server page sub-title`

Parameter	Description
hidden	Hide the sub-title
<sub-title>	Text string of the sub-title

**Default** “Allied-Telesis” is displayed by default.

**Mode** Global Configuration

**Examples** To set the custom sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title text Web
Authentication
```

To hide the sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title hidden
```

To change back to the default title, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page sub-title
```

**Validation Commands** `show auth-web-server page`

# auth-web-server page success-message

**Overview** This command sets the success message on the web-authentication page.

Use the **no** variant of this command to remove the success message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page success-message text <success-message>`  
`no auth-web-server page success-message`

Parameter	Description
<code>&lt;success-message&gt;</code>	Text string of the success message

**Default** No success message is set by default.

**Mode** Global Configuration

**Examples** To set the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page success-message text Your
success message
```

To unset the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page success-message
```

**Validation  
Commands** `show auth-web-server page`

# auth-web-server page title

**Overview** This command sets the custom title on the web authentication page.

Use the **no** variant of this command to remove the custom title.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page title {hidden|text <title>}`  
`no auth-web-server page title`

Parameter	Description
hidden	Hide the title
<title>	Text string of the title

**Default** “Web Access Authentication Gateway” is displayed by default.

**Mode** Global Configuration

**Examples** To set the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title text Login
```

To hide the title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title hidden
```

To unset the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page title
```

**Validation Commands** `show auth-web-server page`

# auth-web-server page welcome-message

**Overview** This command sets the welcome message on the web-authentication login page.

Use the **no** variant of this command to remove the welcome message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page welcome-message text <welcome-message>`  
`no auth-web-server page welcome-message`

Parameter	Description
<code>&lt;welcome-message&gt;</code>	Text string of the welcome message

**Default** No welcome message is set by default.

**Mode** Global Configuration

**Examples** To set the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page welcome-message text Your
welcome message
```

To remove the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page welcome-message
```

**Validation Commands** `show auth-web-server page`

# auth-web-server ping-poll enable

**Overview** This command enables the ping polling to the supplicant (client device) that is authenticated by Web-Authentication.

The **no** variant of this command disables the ping polling to the supplicant that is authenticated by Web-Authentication.

**Syntax** `auth-web-server ping-poll enable`  
`no auth-web-server ping-poll enable`

**Default** The ping polling feature for Web-Authentication is disabled by default.

**Mode** Global Configuration

**Examples** To enable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
```

To disable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll enable
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll failcount

**Overview** This command sets a fail count for the ping polling feature when used with Web-Authentication. The **failcount** parameter specifies the number of unanswered pings. A supplicant (client device) is logged off when the number of unanswered pings are greater than the failcount set with this command.

Use the **no** variant of this command to resets the fail count for the ping polling feature to the default (5 pings).

**Syntax** `auth-web-server ping-poll failcount <1-100>`  
`no auth-web-server ping-poll failcount`

Parameter	Description
<1-100>	Count.

**Default** The default failcount for ping polling is 5 pings.

**Mode** Global Configuration

**Examples** To set the failcount of ping polling to 10 pings, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll failcount 10
```

To set the failcount of ping polling to default, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll failcount
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll interval

**Overview** This command is used to change the ping poll interval. The interval specifies the time period between pings when the supplicant (client device) is reachable.

Use the **no** variant of this command to reset to the default period for ping polling (30 seconds).

**Syntax** `auth-web-server ping-poll interval <1-65535>`  
`no auth-web-server ping-poll interval`

Parameter	Description
<1-65535>	Seconds.

**Default** The interval for ping polling is 30 seconds by default.

**Mode** Global Configuration

**Examples** To set the interval of ping polling to 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll interval 60
```

To set the interval of ping polling to the default (30 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll interval
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll reauth-timer-refresh

**Overview** This command modifies the **reauth-timer-refresh** parameter for the Web-Authentication feature. The **reauth-timer-refresh** parameter specifies whether a re-authentication timer is reset and when the response from a supplicant (a client device) is received.

Use the **no** variant of this command to reset the **reauth-timer-refresh** parameter to the default setting (disabled).

**Syntax** `auth-web-server ping-poll reauth-timer-refresh`  
`no auth-web-server ping-poll reauth-timer-refresh`

**Default** The `reauth-timer-refresh` parameter is disabled by default.

**Mode** Global Configuration

**Examples** To enable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll reauth-timer-refresh
```

To disable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll
reauth-timer-refresh
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll timeout

**Overview** This command modifies the ping poll **timeout** parameter for the Web-Authentication feature. The **timeout** parameter specifies the time in seconds to wait for a response to a ping packet.

Use the **no** variant of this command to reset the timeout of ping polling to the default (1 second).

**Syntax** `auth-web-server ping-poll timeout <1-30>`  
`no auth-web-server ping-poll timeout`

Parameter	Description
<1-30>	Seconds.

**Default** The default timeout for ping polling is 1 second.

**Mode** Global Configuration

**Examples** To set the timeout of ping polling to 2 seconds, use the command:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll timeout 2
```

To set the timeout of ping polling to the default (1 second), use the command:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll timeout
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server port

**Overview** This command sets the HTTP port number for the Web-Authentication server. Use the **no** variant of this command to reset the HTTP port number to the default (80).

**Syntax** `auth-web-server port <port-number>`  
`no auth-web-server port`

Parameter	Description
<code>&lt;port-number&gt;</code>	Set the local Web-Authentication server port within the TCP port number range 1 to 65535.

**Default** The Web-Authentication server HTTP port number is set to 80 by default.

**Mode** Global Configuration

**Examples** To set the HTTP port number 8080 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server port 8080
```

To reset to the default HTTP port number 80 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server port
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server redirect-delay-time

**Overview** Use this command to set the delay time in seconds before redirecting the supplicant to a specified URL when the supplicant is authorized.

Use the variant **no** to reset the delay time set previously.

**Syntax** `auth-web-server redirect-delay-time <5-60>`  
`no auth-web-server redirect-delay-time`

Parameter	Description
<code>redirect-delay-time</code>	Set the delay time before jumping to a specified URL after the supplicant is authorized.
<code>&lt;5-60&gt;</code>	The time in seconds.

**Default** The default redirect delay time is 5 seconds.

**Mode** Global Configuration

**Examples** To set the delay time to 60 seconds for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-delay-time 60
```

To reset the delay time, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-delay-time
```

**Related commands** [auth-web-server redirect-url](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth-web-server redirect-url

**Overview** This command sets a URL for supplicant (client device) authentication. When a supplicant is authorized it will be automatically redirected to the specified URL. Note that if the http redirect feature is used then this command is ignored.

Use the **no** variant of this command to delete the URL string set previously.

**Syntax** `auth-web-server redirect-url <url>`  
`no auth-web-server redirect-url`

Parameter	Description
<code>&lt;url&gt;</code>	URL (hostname or dotted IP notation).

**Default** The redirect URL for the Web-Authentication server feature is not set by default (null).

**Mode** Global Configuration

**Examples** To enable and set redirect a URL string `www.alliedtelesis.com` for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-url
http://www.alliedtelesis.com
```

To delete a redirect URL string, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-url
```

**Related commands** [auth-web-server redirect-delay-time](#)  
[show auth](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth-web-server session-keep

**Overview** This command enables the session-keep feature to jump to the original URL after being authorized by Web-Authentication.

Use the **no** variant of this command to disable the session keep feature.

**Syntax** `auth-web-server session-keep`  
`no auth-web-server session-keep`

**Default** The session-keep feature is disabled by default.

**Mode** Global Configuration

**Usage notes** This function doesn't ensure to keep session information in all cases. Authenticated supplicant may be redirected to unexpected page when session-keep is enabled. This issue occurred by supplicant sending HTTP packets automatically after authentication page is displayed and the URL is written.

**Examples** To enable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server session-keep
```

To disable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server session-keep
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ssl

**Overview** This command enables HTTPS functionality for the Web-Authentication server feature.

Use the **no** variant of this command to disable HTTPS functionality for the Web-Authentication server.

**Syntax** `auth-web-server ssl`  
`no auth-web-server ssl`

**Default** HTTPS functionality for the Web-Authentication server feature is disabled by default.

**Mode** Global Configuration

**Examples** To enable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal  
awplus(config)# auth-web-server ssl
```

To disable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal  
awplus(config)# no auth-web-server ssl
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ssl intercept-port

**Overview** Use this command to register HTTPS intercept port numbers when the HTTPS server uses custom port number (not TCP port number 443).

Note that you need to use the **auth-web-server intercept-port** command to register HTTP intercept port numbers.

Use the **no** variant of this command to delete registered port number.

**Syntax** `auth-web-server ssl intercept-port <1-65535>`  
`no auth-web-server ssl intercept-port <1-65535>`

Parameter	Description
<1-65535>	TCP port number in the range from 1 through 65535

**Default** 443/TCP is registered by default.

**Mode** Global Configuration

**Examples** To register HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl intercept-port 3128
```

To delete HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl intercept-port 3128
```

**Validation Commands** `show auth-web-server`

**Related commands** `auth-web-server intercept-port`

# copy proxy-autoconfig-file

**Overview** Use this command to download the proxy auto configuration (PAC) file to your switch. The Web-Authentication supplicant can get the downloaded file from the system web server.

**Syntax** `copy <filename> proxy-autoconfig-file`

Parameter	Description
<code>&lt;filename&gt;</code>	The URL of the PAC file.

**Mode** Privileged Exec

**Example** To download the PAC file to this device, use the command:

```
awplus# copy tftp://server/proxy.pac proxy-autoconfig-file
```

**Related commands** [show proxy-autoconfig-file](#)  
[erase proxy-autoconfig-file](#)

# copy web-auth-https-file

**Overview** Use this command to download the SSL server certificate for web-based authentication. The file must be in PEM (Privacy Enhanced Mail) format, and contain the private key and the server certificate.

**Syntax** `copy <filename> web-auth-https-file`

Parameter	Description
<code>&lt;filename&gt;</code>	The URL of the server certificate file.

**Mode** Privileged Exec

**Example** To download the server certificate file `verisign_cert.pem` from the TFTP server directory `server`, use the command:

```
awplus# copy tftp://server/verisign_cert.pem  
web-auth-https-file
```

**Related commands**

- [auth-web-server ssl](#)
- [erase web-auth-https-file](#)
- [show auth-web-server](#)

# description (auth-profile)

**Overview** Use this command to add a description to an authentication profile in Authentication Profile mode.

Use the **no** variant of this command to remove the current description.

**Syntax** `description <description>`

Parameter	Description
<code>&lt;description&gt;</code>	Text describing the selected authentication profile.

**Default** No description configured by default.

**Mode** Authentication Profile

**Example** To add a description to the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# description student room setting
```

To remove a description from the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no description
```

**Related commands** [auth profile \(global\)](#)

# erase proxy-autoconfig-file

**Overview** Use this command to remove the proxy auto configuration file.

**Syntax** `erase proxy-autoconfig-file`

**Mode** Privileged Exec

**Example** To remove the proxy auto configuration file, use the command:

```
awplus# erase proxy-autoconfig-file
```

**Related commands** [show proxy-autoconfig-file](#)  
[copy proxy-autoconfig-file](#)

# erase web-auth-https-file

**Overview** Use this command to remove the SSL server certificate for web-based authentication.

**Syntax** `erase web-auth-https-file`

**Mode** Privileged Exec

**Example** To remove the SSL server certificate file for web-based authentication use the command:

```
awplus# erase web-auth-https-file
```

**Related commands**

- [auth-web-server ssl](#)
- [copy web-auth-https-file](#)
- [show auth-web-server](#)

# show auth

**Overview** This command shows the configuration state of authentication.

**Syntax** show auth [all]

Parameter	Description
all	Display all authentication information for each authenticated interface. This can be a static channel (or static aggregator), or a dynamic (or LACP) channel group, or a switch port.

**Mode** Privileged Exec

**Example** To display all authentication information, enter the command:

```
awplus# show auth all
```

**Output** Figure 44-1: Example output from the **show auth** command

```
awplus# show auth all
802.1X Port-Based Authentication Enabled

# show auth diagnostics

**Overview** This command shows authentication diagnostics, optionally for the specified interface, which may be an Ethernet port.

If no interface is specified then authentication diagnostics are shown for all interfaces.

**Syntax** `show auth diagnostics [interface <interface-list>]`

Parameter	Description
interface	Specify ports to show.
<interface-list>	The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"><li>• an interface (e.g. eth1)</li><li>• a continuous range of interfaces, e.g. eth1-2</li><li>• a comma-separated list of the above; e.g. eth1, eth2.</li></ul> The specified interfaces must exist.

**Mode** Privileged Exec

**Example** To display authentication diagnostics for eth1, enter the command:

```
awplus# show auth diagnostics interface eth1
```

**Output** Figure 44-2: Example output from the **show auth diagnostics** command

```
Authentication Diagnostics for interface eth1

    BackendOtherrequestToSupplicant: 3
    BackendAuthSuccess: 1
```

# show auth interface

**Overview** This command shows the status of port authentication on the specified interface.

**Syntax** `show auth interface <interface-list>`

Parameter	Description
<code>&lt;interface-list&gt;</code>	The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul>

**Mode** Privileged Exec

**Example** To display the port-based authentication status for eth1, enter the command:

```
awplus# show auth interface eth1
```

If port-based authentication is not configured, the output will be:

```
% Port-Control not configured on eth1
```

To display the port-based authentication status for eth1, enter the command:

```
awplus# show auth interface eth1
```

```
awplus# show auth interface eth1
Authentication Info for interface eth1
portEnabled: true - portControl: Auto
portStatus: Authorized
reAuthenticate: disabled

- [show dot1x statistics interface](#)
- [show dot1x supplicant interface](#)

# show auth sessionstatistics

**Overview** This command shows authentication session statistics for the specified interface.

**Syntax** `show auth sessionstatistics [interface <interface-list>]`

Parameter	Description
interface	Specify ports to show.
<interface-list>	The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"><li>• an interface (e.g. eth1)</li><li>• a continuous range of interfaces, e.g. eth1-2</li><li>• a comma-separated list of the above; e.g. eth1, eth2</li></ul> The specified interfaces must exist.

**Mode** Privileged Exec

**Example** To display authentication statistics for eth1, enter the command:

```
awplus# show auth sessionstatistics interface eth1
```

**Output** Figure 44-3: Example output from the **show auth sessionstatistics** command

```
Authentication session statistics for interface eth1      session
user name: manager
  session authentication method: Remote server
  session time: 19440 secs
  session terminat cause: Not terminated yet
```

# show auth statistics interface

**Overview** Use this command to show the authentication statistics for the specified interface.

**Syntax** show auth statistics interface *<interface-list>*

Parameter	Description
<i>&lt;interface-list&gt;</i>	The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul>

**Mode** Privileged Exec

**Example** To display authentication statistics for port1.0.2, enter the command:

```
awplus# show auth statistics interface port1.0.2
```

**Output** Figure 44-4: Example output from **show auth statistics interface** for a port

# show auth supplicant

**Overview** Use this command to show the supplicant (client device) state when authentication is configured for the switch. Use the optional **brief** parameter to show a summary of the supplicant state.

**Syntax** show auth supplicant [*<macadd>*] [brief]

Parameter	Description
<i>&lt;macadd&gt;</i>	Mac (hardware) address of the supplicant. Entry format is HHHH.HHHH.HHHH (hexadecimal).
brief	Brief summary of the supplicant state.

**Mode** Privileged Exec

**Examples** To display a summary of authenticated supplicant information on the device, enter the command:

```
awplus# show auth supplicant brief
```

To display authenticated supplicant information on the device, enter the command:

```
awplus# show auth supplicant
```

To display authenticated supplicant information for device with MAC address 0000.5E00.5301, enter the command:

```

# show auth supplicant interface

**Overview** This command shows the supplicant (client device) state for the authentication mode set for the interface. Use the optional **brief** parameter to show a summary of the supplicant state.

**Syntax** `show auth-web supplicant interface <interface-list> [brief]`

Parameter	Description
<code>&lt;interface-list&gt;</code>	The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"><li>• an interface (e.g. eth1)</li><li>• a continuous range of interfaces, e.g. eth1-2</li><li>• a comma-separated list of the above; e.g. eth1 , eth2</li></ul> The specified interfaces must exist.
<code>brief</code>	Brief summary of the supplicant state.

**Mode** Privileged Exec

**Examples** To display the authenticated supplicant on the interface eth1, enter the command:

```
awplus# show auth supplicant interface eth1
```

To display brief summary output for the authenticated supplicant on the interface eth1, enter the command:

```
awplus# show auth supplicant interface eth1 brief
```

# show auth two-step supplicant brief

**Overview** This command displays the supplicant state of the two-step authentication feature on the interface.

**Syntax** `show auth two-step supplicant [interface <interface-list>] brief`

Parameter	Description
interface	The interface selected for display.
<interface-list>	The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul>

**Mode** Privileged Exec

**Usage notes** Do not mix interface types in a list. The specified interfaces must exist.

**Example** To display the supplicant state of the two-step authentication feature, enter the command:

```
awplus# show two-step supplicant interface port1.0.2 brief
```

**Output** Figure 44-8: Example output from **show auth two-step supplicant brief**

```
interface port1.0.2

authenticationMethod: dot1x/mac

Two-Step Authentication:
  firstMethod:mac
  secondMethod:dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
  macBasedAuthenticationSupplicantNum: 0
  dot1xAuthenticationSupplicantNum: 1
  webBasedAuthenticationSupplicantNum: 0
  otherAuthenticationSupplicantNum: 0

Interface  VID Mode  MAC Address      Status           FirstStep        SecondStep
=====  ===  =====  =====
port1.0.8  1    D        000b..db67.00f7  Authenticated   Pass             Pass
```

**Related commands** [auth two-step enable](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show auth-web-server

**Overview** This command shows the Web-Authentication server configuration and status on the switch.

**Syntax** show auth-web-server

**Mode** Privileged Exec

**Example** To display Web-Authentication server configuration and status, enter the command:

```
awplus# show auth-web-server
```

**Output** Figure 44-9: Example output from the **show auth-web-server** command

```
Web authentication server
  Server status: enabled
  Server mode: none
  Server address: 192.168.1.1/24
    DHCP server enabled
    DHCP lease time: 20
    DHCP WPAD Option URL: http://192.168.1.1/proxy.pac
  HTTP Port No: 80
  Security: disabled
  Certification: default
  SSL Port No: 443
  Redirect URL: --
  Redirect Delay Time: 5
  HTTP Redirect: enabled
  Session keep: disabled
  PingPolling: disabled
  PingInterval: 30
  Timeout: 1
  FailCount: 5

[erase proxy-autoconfig-file](#)

## Introduction

**Overview** AAA is the collective title for the three related functions of Authentication, Authorization and Accounting. These function can be applied in a variety of methods with a variety of servers.

The purpose of the AAA commands is to map instances of the AAA functions to sets of servers. The Authentication function can be performed in multiple contexts, such as authentication of users logging in at a console, or 802.1X-Authentication of devices connecting to Ethernet ports.

For each of these contexts, you may want to use different sets of servers for examining the proffered authentication credentials and deciding if they are valid. AAA Authentication commands enable you to specify which servers will be used for different types of authentication.

The AR4050S supports port authentication with the following limitations:

- MAC authentication is supported on the device's switch ports static channel-groups and dynamic (LACP) channel-groups.
- 802.1X authentication is supported on the device's switch ports only. It is not supported on static channel-groups and dynamic (LACP) channel-groups.
- Web authentication is supported on the device's Eth interfaces only.

This chapter provides an alphabetical reference for AAA commands for Authentication, Authorization and Accounting. For more information, see the [AAA and Port\\_Authentication Feature Overview and Configuration Guide](#).

# aaa accounting auth-mac

**Overview** This command configures an accounting method list for MAC-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with MAC-based authentication enabled, or a named method list, which can be applied to an interface with the [auth-mac accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for MAC-based authentication. Once all method lists are disabled, AAA accounting for MAC-based authentication is disabled globally.

**Syntax**

```
aaa accounting auth-mac {default|<list-name>}  
{start-stop|stop-only|none} group {<group-name>|radius}  
no aaa accounting auth-mac {default|<list-name>}
```

Parameter	Description
default	Configure the default accounting method list
<list-name>	Configure a named accounting method list
start-stop	Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session.
stop-only	Only sends a stop accounting message at the end of the session.
none	No accounting record sent.
group	Use a server group
<group-name>	Server group name.
radius	Use all RADIUS servers.

**Default** RADIUS accounting for MAC-based Authentication is disabled by default

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with MAC-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-mac accounting](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command

- **group** <group-name>: use the specified RADIUS server group configured with the [aaa group server](#) command

The accounting event to send to the RADIUS server is configured with the following options:

- **start-stop**: sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only**: sends a **stop** accounting message at the end of a session.
- **none**: disables accounting.

**Examples** To enable the default RADIUS accounting for MAC-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac default start-stop
group radius
```

To disable RADIUS accounting for MAC-based Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac default
```

To enable a named RADIUS accounting method list 'vlan10\_acct' for MAC-based authentication, with the RADIUS server group 'rad\_group\_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10\_acct' for MAC-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac vlan10_acct
```

**Related commands**

- [aaa authentication auth-mac](#)
- [aaa group server](#)
- [auth-mac accounting](#)
- [auth-mac enable](#)
- [radius-server host](#)
- [show aaa server group](#)

# aaa accounting auth-web

**Overview** This command configures an accounting method list for Web-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with Web-based authentication enabled, or a named method list, which can be applied to an interface with the [auth-web accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for Web-based authentication. Once all method lists are disabled, AAA accounting for Web-based authentication is disabled globally.

**Syntax**

```
aaa accounting auth-web {default | <list-name>}  
{start-stop | stop-only | none} group {<group-name> | radius}  
no aaa accounting auth-web {default | <list-name>}
```

Parameter	Description
default	Configure the default accounting method list
<list-name>	Configure a named accounting method list
start-stop	Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session.
stop-only	Only sends a stop accounting message at the end of the session.
none	No accounting record sent.
group	Use a server group
<group-name>	Server group name.
radius	Use all RADIUS servers.

**Default** RADIUS accounting for Web-based authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web accounting](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command

- **group** <group-name>: use the specified RADIUS server group configured with the `aaa group server` command

Configure the accounting event to be sent to the RADIUS server with the following options:

- **start-stop**: sends a start accounting message at the beginning of a session and a stop accounting message at the end of the session.
- **stop-only**: sends a stop accounting message at the end of a session.
- **none**: disables accounting.

**Examples** To enable the default RADIUS accounting method for Web-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web default start-stop
group radius
```

To disable the default RADIUS accounting method for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web default
```

To enable a named RADIUS accounting method list 'example\_acct' for Web-based authentication, with the RADIUS server group 'rad\_group\_example', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web example_acct start-stop
group rad_group_example
```

To disable a named RADIUS accounting method list 'example\_acct' for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web example_acct
```

**Related commands**

- [aaa authentication auth-web](#)
- [aaa group server](#)
- [auth-web accounting](#)
- [auth-web enable](#)
- [radius-server host](#)
- [show aaa server group](#)

# aaa accounting commands

**Overview** This command configures and enables TACACS+ accounting on commands entered at a specified privilege level. Once enabled for a privilege level, accounting messages for commands entered at that privilege level will be sent to a TACACS+ server.

In order to account for all commands entered on a device, configure command accounting for each privilege level separately.

The command accounting message includes, the command as entered, the date and time the command finished executing, and the user-name of the user who executed the command.

Use the **no** variant of this command to disable command accounting for a specified privilege level.

**Syntax** `aaa accounting commands <1-15> default stop-only group tacacs+`  
`no aaa accounting commands <1-15> default`

Parameter	Description
<1-15>	The privilege level being configured, in the range 1 to 15.
default	Use the default method list, this means the command is applied globally to all user exec sessions.
stop-only	Send accounting message when the commands have stopped executing.
group	Specify the server group where accounting messages are sent. Only the tacacs+ group is available for this command.
tacacs+	Use all TACACS+ servers configured by the <code>tacacs-server host</code> command.

**Default** TACACS+ command accounting is disabled by default.

**Mode** Global Configuration

**Usage notes** This command only supports a **default** method list, this means that it is applied to every console and VTY line.

The **stop-only** parameter indicates that the command accounting messages are sent to the TACACS+ server when the commands have stopped executing.

The **group tacacs+** parameters signifies that the command accounting messages are sent to the TACACS+ servers configured by the `tacacs-server host` command.

Note that up to four TACACS+ servers can be configured for accounting. The servers are checked for reachability in the order they are configured with only the first reachable server being used. If no server is found, the accounting message is dropped.

Command accounting cannot coexist with triggers. An error message is displayed if you attempt to enable command accounting while a trigger is configured. Likewise, an error message is displayed if you attempt to configure a trigger while command accounting is configured.

**Examples** To configure command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting commands 1 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 7 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 15 default stop-only
group tacacs+
```

To disable command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting commands 1 default
awplus(config)# no aaa accounting commands 7 default
awplus(config)# no aaa accounting commands 15 default
```

**Related commands**

- [aaa authentication login](#)
- [aaa accounting login](#)
- [accounting login](#)
- [tacacs-server host](#)

# aaa accounting dot1x

**Overview** Use this command to configure an accounting method list for IEEE 802.1X-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with IEEE 802.1X-based authentication enabled, or a named method list, which can be applied to an interface with the [dot1x accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for 802.1X-based authentication. Once all method lists are disabled, AAA accounting for 802.1x-based authentication is disabled globally.

**Syntax**

```
aaa accounting dot1x {default | <list-name>}  
{start-stop | stop-only | none} group {<group-name> | radius}  
no aaa accounting dot1x {default | <list-name>}
```

Parameter	Description
default	Configure the default accounting method list
<list-name>	Configure a named accounting method list
start-stop	Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session.
stop-only	Only sends a stop accounting message at the end of the session.
none	No accounting record sent.
group	Use a server group
<group-name>	Server group name.
radius	Use all RADIUS servers.

**Default** RADIUS accounting for 802.1X-based authentication is disabled by default (there is no default server set by default).

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with 802.1X-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [dot1x accounting](#) command.

There are two ways to define servers where RADIUS accounting messages will be sent:

- **group radius:** use all RADIUS servers configured by `radius-server host` command.
- **group <group-name>:** use the specified RADIUS server group configured with the `aaa group server` command.

The accounting event to send to the RADIUS server is configured by the following options:

- **start-stop:** sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only:** sends a **stop** accounting message at the end of a session.
- **none:** disables accounting.

**Examples** To enable RADIUS accounting for 802.1X-based authentication, and use all available RADIUS Servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x default start-stop group
radius
```

To disable RADIUS accounting for 802.1X-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x default
```

To enable a named RADIUS accounting method list 'vlan10\_acct' for 802.1X-based authentication, with the RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10\_acct' for 802.1X-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x vlan10_acct
```

**Related commands**

[aaa authentication dot1x](#)  
[aaa group server](#)  
[dot1x accounting](#)  
[dot1x port-control](#)  
[radius-server host](#)  
[show aaa server group](#)

**Command changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# aaa accounting login

**Overview** This command configures RADIUS and TACACS+ accounting for login shell sessions. The specified method list name can be used by the **accounting login** command in the Line Configuration mode. If the **default** parameter is specified, then this creates a default method list that is applied to every console and VTY line, unless another accounting method list is applied on that line.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

Use the **no** variant of this command to remove an accounting method list for login shell sessions configured by an **aaa accounting login** command. If the method list being deleted is already applied to a console or VTY line, accounting on that line will be disabled. If the default method list name is removed by this command, it will disable accounting on every line that has the default accounting configuration.

**Syntax**

```
aaa accounting login  
{default | <list-name>} {start-stop | stop-only | none} {group  
{radius | tacacs+ | <group-name>}}  
  
no aaa accounting login {default | <list-name>}
```

Parameter	Description
default	Default accounting method list.
<list-name>	Named accounting method list.
start-stop	Start and stop records to be sent.
stop-only	Stop records to be sent.
none	No accounting record to be sent.
group	Specify the servers or server group where accounting packets are sent.
radius	Use all RADIUS servers configured by the <a href="#">radius-server host</a> command.
tacacs+	Use all TACACS+ servers configured by the <a href="#">tacacs-server host</a> command.
<group-name>	Use the specified RADIUS server group, as configured by the <a href="#">aaa group server</a> command.

**Default** Accounting for login shell sessions is disabled by default.

**Mode** Global Configuration

**Usage notes** This command enables you to define a named accounting method list. The items that you define in the accounting options are:

- the types of accounting packets that will be sent
- the set of servers to which the accounting packets will be sent

You can define a default method list with the name **default** and any number of other named method lists. The name of any method list that you define can then be used as the *<list-name>* parameter in the [accounting login](#) command.

If the method list name already exists, the command will replace the existing configuration with the new one.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>** : use the specified RADIUS server group configured with the [aaa group server](#) command

There is one way to define servers where TACACS+ accounting messages are sent:

- **group tacacs+** : use all TACACS+ servers configured by [tacacs-server host](#) command

The accounting event to send to the RADIUS or TACACS+ server is configured with the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

**Examples** To configure RADIUS accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
radius
```

To configure TACACS+ accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
tacacs+
```

To reset the configuration of the default accounting list, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting login default
```

**Related commands**

- [aaa accounting commands](#)
- [aaa authentication login](#)
- [aaa accounting login](#)
- [accounting login](#)
- [radius-server host](#)
- [tacacs-server host](#)

# aaa accounting update

**Overview** This command enables periodic accounting reporting to either the RADIUS or TACACS+ accounting server(s) wherever login accounting has been configured.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

Use the **no** variant of this command to disable periodic accounting reporting to the accounting server(s).

**Syntax** `aaa accounting update [periodic <1-65535>]`  
`no aaa accounting update`

Parameter	Description
<code>periodic</code>	Send accounting records periodically.
<code>&lt;1-65535&gt;</code>	The interval to send accounting updates (in minutes). The default is 30 minutes.

**Default** Periodic accounting update is disabled by default.

**Mode** Global Configuration

**Usage notes** Use this command to enable the device to send periodic AAA login accounting reports to the accounting server. When periodic accounting report is enabled, interim accounting records are sent according to the interval specified by the **periodic** parameter. The accounting updates are start messages.

If the **no** variant of this command is used to disable periodic accounting reporting, any interval specified by the **periodic** parameter is reset to the default of 30 minutes when accounting reporting is reenabled, unless this interval is specified.

**Examples** To configure the switch to send period accounting updates every 30 minutes, the default period, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update
```

To configure the switch to send period accounting updates every 10 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update periodic 10
```

To disable periodic accounting update wherever accounting has been configured, use the following commands:

```
awplus# configure terminal  
awplus(config)# no aaa accounting update
```

**Related  
commands**

[aaa accounting auth-mac](#)  
[aaa accounting auth-web](#)  
[aaa accounting dot1x](#)  
[aaa accounting login](#)

# aaa authentication auth-mac

**Overview** This command enables MAC-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running MAC-based authentication, or a user named authentication method list, which is applied to an interface with the [auth-mac authentication](#) command.

Use the **no** variant of this command to disable either the default or a named method list for MAC-based authentication. Once all method lists are disabled MAC-based authentication is disabled globally.

**Syntax**

```
aaa authentication auth-mac {default|<list-name>} group  
{<group-name>|radius}  
  
no aaa authentication auth-mac {default|<list-name>}
```

Parameter	Description
default	Configure the default authentication method list
<list-name>	Configure a named authentication method list
group	Use a server group
<group-name>	Server group name.
radius	Use all RADIUS servers.

**Default** MAC-based Port Authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web authentication](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command

All configured RADIUS Servers are automatically members of the server group **radius**. If a server is added to a named group **<group-name>**, it also remains a member of the group **radius**.

**Examples** To enable MAC-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac default group
radius
```

To disable MAC-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac default
```

To enable MAC-based authentication for named list 'vlan10\_auth', with RADIUS server group 'rad\_group\_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac vlan10_auth group
rad_group_vlan10
```

To disable MAC-based authentication for named list 'vlan10\_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac vlan10_acct
```

**Related commands**

- [aaa group server](#)
- [auth-mac authentication](#)
- [auth-mac enable](#)
- [radius-server host](#)
- [show aaa server group](#)

# aaa authentication auth-web

**Overview** This command enables Web-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running Web-based authentication, or a user named authentication method list, which is applied to an interface with the [auth-web authentication](#) command.

Use the **no** variant of this command to disable either the default or a named method list for Web-based authentication. Once all method lists are disabled Web-based authentication is disabled globally.

**Syntax**

```
aaa authentication auth-web {default|<list-name>} group  
{<group-name>|radius}  
  
no aaa authentication auth-web {default|<list-name>}
```

Parameter	Description
default	Configure the default authentication method list
<list-name>	Configure a named authentication method list
group	Use a server group
<group-name>	Server group name.
radius	Use all RADIUS servers.

**Default** Web-based authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web authentication](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command

Note that you need to configure an IPv4 address for the VLAN interface on which Web authentication is running.

**Examples** To enable Web-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web default group
radius
```

To disable Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-web default
```

To enable Web-based authentication for named list 'example\_auth', with RADIUS server group 'rad\_group\_example, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web example_auth group
rad_group_example
```

To disable Web-based authentication for named list 'example\_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication example_auth
```

**Related commands**

- [aaa accounting auth-web](#)
- [aaa group server](#)
- [auth-web authentication](#)
- [radius-server host](#)

# aaa authentication dot1x

**Overview** Use this command to enable IEEE 802.1X-based authentication globally and to allow you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running IEEE 802.1X-based authentication, or a user named authentication method list, which is applied to an interface with the [dot1x authentication](#) command.

Use the **no** variant of this command to disable either the default or a named method list for 802.1X-based authentication. Once all method lists are disabled 802.1x-based authentication is disabled globally.

**Syntax**

```
aaa authentication dot1x {default|<list-name>} group  
{<group-name>|radius}  
  
no aaa authentication dot1x {default|<list-name>}
```

Parameter	Description
default	Configure the default authentication method list
<list-name>	Configure a named authentication method list
group	Use a server group
<group-name>	Server group name.
radius	Use all RADIUS servers.

**Default** 802.1X-based Port Authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with 802.1X-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [aaa authentication dot1x](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command

**Examples** To enable 802.1X-based authentication globally with all RADIUS servers, and use all available RADIUS servers, use the command:

```
awplus# configure terminal  
awplus(config)# aaa authentication dot1x default group radius
```

To disable 802.1X-based authentication, use the command:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x default
```

To enable 802.1X-based authentication for named list 'vlan10\_auth', with RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x vlan10_auth group
rad_group_vlan10
```

To disable 802.1X-based authentication for named list 'vlan10\_auth' use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x vlan10_acct
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# aaa authentication enable default group tacacs+

**Overview** This command enables privilege level authentication against a TACACS+ server. Use the **no** variant of this command to disable privilege level authentication.

**Syntax** `aaa authentication enable default group tacacs+ [local] [none]`  
`no aaa authentication enable default`

Parameter	Description
local	Use the locally configured enable password ( <b>enable password</b> command) for authentication.
none	No authentication.

**Default** Local privilege level authentication is enabled by default (`aaa authentication enable default local` command).

**Mode** Global Configuration

**Usage notes** A user is configured on a TACACS+ server with a maximum privilege level. When they enter the `enable` (**Privileged Exec mode**) command they are prompted for an enable password which is authenticated against the TACACS+ server. If the password is correct and the specified privilege level is equal to or less than the users maximum privilege level, then they are granted access to that level. If the user attempts to access a privilege level that is higher than their maximum configured privilege level, then the authentication session will fail and they will remain at their current privilege level.

**NOTE:** If both **local** and **none** are specified, you must always specify **local** first.

If the TACACS+ server goes offline, or is not reachable during enable password authentication, and command level authentication is configured as:

- **aaa authentication enable default group tacacs+**  
then the user is never granted access to Privileged Exec mode.
- **aaa authentication enable default group tacacs+ local**  
then the user is authenticated using the locally configured enable password, which if entered correctly grants the user access to Privileged Exec mode. If no enable password is locally configured (**enable password** command), then the enable authentication will fail until the TACACS+ server becomes available again.

- **aaa authentication enable default group tacacs+ none**  
then the user is granted access to Privileged Exec mode with no authentication. This is true even if a locally configured enable password is configured.
- **aaa authentication enable default group tacacs+ local none**  
then the user is authenticated using the locally configured enable password. If no enable password is locally configured, then the enable authentication will grant access to Privileged Exec mode with no authentication.

If the password for the user is not successfully authenticated by the server, then the user is again prompted for an enable password when they enter **enable** via the CLI.

**Examples** To enable a privilege level authentication method that will not allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
```

To enable a privilege level authentication method that will allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, and a locally configured enable password is configured, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
local
```

To disable privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

**Related commands**

- [aaa authentication login](#)
- [aaa authentication enable default local](#)
- [enable \(Privileged Exec mode\)](#)
- [enable password](#)

- [tacacs-server host](#)

# aaa authentication enable default local

**Overview** This command enables local privilege level authentication.  
Use the **no** variant of this command to disable local privilege level authentication.

**Syntax** `aaa authentication enable default local`  
`no aaa authentication enable default`

**Default** Local privilege level authentication is enabled by default.

**Mode** Global Configuration

**Usage notes** The privilege level configured for a particular user in the local user database is the privilege threshold above which the user is prompted for an [enable \(Privileged Exec mode\)](#) command.

**Examples** To enable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default local
```

To disable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

**Related commands** [aaa authentication login](#)  
[enable \(Privileged Exec mode\)](#)  
[enable password](#)  
[enable secret \(deprecated\)](#)

# aaa authentication isakmp

**Overview** Use this command to enable global RADIUS authentication for ISAKMP tunnels. Use the **no** variant of this command to disable global RADIUS authentication of ISAKMP tunnels.

**Syntax** `aaa authentication isakmp default group [<group-name>|radius]`  
`no aaa authentication isakmp default`

Parameter	Description
<code>&lt;group-name&gt;</code>	Server group name
<code>radius</code>	Use all RADIUS servers

**Default** Disabled

**Mode** Global Configuration

**Usage notes** When RADIUS authentication is enabled globally to ISAKMP tunnels it is automatically applied to every ISAKMP tunnel interface. There are two ways to define servers where radius accounting messages are sent:

- Group `radius`, where all RADIUS servers configured using this command are used
- Group `<group-name>`, where the specified RADIUS server group configured is used

**Examples** To enable RADIUS authentication for ISAKMP tunnels globally and use all available radius servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication isakmp default group radius
```

To disable RADIUS authentication for ISAKMP tunnels, use the commands:

```
awplus# configure terminal
awplus(config)# no authentication isakmp default
```

**Related commands** [radius-server host](#)  
[aaa group server](#)

**Command changes** Version 5.4.9-0.1: command added

# aaa authentication login

**Overview** Use this command to create an ordered list of methods to use to authenticate user login, or to replace an existing method list with the same name. Specify one or more of the options **local** or **group**, in the order you want them to be applied. If the **default** method list name is specified, it is applied to every console and VTY line immediately unless another method list is applied to that line by the [login authentication](#) command. To apply a non-default method list, you must also use the [login authentication](#) command.

Use the **no** variant of this command to remove an authentication method list for user login. The specified method list name is deleted from the configuration. If the method list name has been applied to any console or VTY line, user login authentication on that line will fail.

Note that the **no aaa authentication login default** command does not remove the default method list. This will return the default method list to its default state (**local** is the default).

**Syntax**

```
aaa authentication login {default | <list-name>} {[local] [group  
{radius | tacacs+ | <group-name>}]}  
no aaa authentication login {default | <list-name>}
```

Parameter	Description
default	Set the default authentication server for user login.
<list-name>	Name of authentication server.
local	Use the local username database.
group	Use server group.
radius	Use all RADIUS servers configured by the <a href="#">radius-server host</a> command.
tacacs+	Use all TACACS+ servers configured by the <a href="#">tacacs-server host</a> command.
<group-name>	Use the specified RADIUS server group, as configured by the <a href="#">aaa group server</a> command.

**Default** If the default server is not configured using this command, user login authentication uses the local user database only.

If the **default** method list name is specified, it is applied to every console and VTY line immediately unless a named method list server is applied to that line by the **login authentication** command.

**local** is the default state for the default method list unless a named method list is applied to that line by the **login authentication** command. Reset to the default method list using the **no aaa authentication login default** command.

**Mode** Global Configuration

**Usage notes** When a user attempts to log in, the switch sends an authentication request to the first authentication server in the method list. If the first server in the list is reachable and it contains a username and password matching the authentication request, the user is authenticated and the login succeeds. If the authentication server denies the authentication request because of an incorrect username or password, the user login fails. If the first server in the method list is unreachable, the switch sends the request to the next server in the list, and so on.

For example, if the method list specifies **group tacacs+ local**, and a user attempts to log in with a password that does not match a user entry in the first TACACS+ server, if this TACACS+ server denies the authentication request, then the switch does not try any other TACACS+ servers not the local user database; the user login fails.

**Examples** To configure the default authentication method list for user login to first use all available RADIUS servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group radius
local
```

To configure a user login authentication method list called **USERS** to first use the RADIUS server group RAD\_GROUP1 for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group RAD_GROUP1
local
```

To configure a user login authentication method list called USERS to first use the TACACS+ servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group tacacs+
local
```

To return to the default method list (**local** is the default server), use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login default
```

To delete an existing authentication method list USERS created for user login authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login USERS
```

**Related commands** [aaa accounting commands](#)  
[aaa authentication enable default group tacacs+ login authentication](#)

# aaa authentication openvpn

**Overview** This command enables RADIUS authentication of OpenVPN tunnels globally. It is automatically applied to every OpenVPN tunnel interface.

Use the **no** variant of this command to globally disable RADIUS authentication of OpenVPN tunnels.

**Syntax** `aaa authentication openvpn default group {<group-name>|radius}`  
`no aaa authentication openvpn default`

Parameter	Description
radius	Use all RADIUS servers.
<group-name>	Server group name.

**Default** RADIUS authentication of OpenVPN tunnels is disabled by default.

**Mode** Global Configuration

**Usage notes** Use the **no** variant of this command to reset the default authentication method for OpenVPN tunnels, to its default, that is, to use the group **radius**, containing all RADIUS servers configured by the **radius-server host** command.

Note that if the default authentication method is used, all OpenVPN tunnels will use the group **radius**, containing all RADIUS servers.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>** : use the specified RADIUS server group configured with the [aaa group server](#) command

**Examples** To enable RADIUS authentication of OpenVPN tunnels globally and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication openvpn default group radius
```

To disable RADIUS authentication of OpenVPN tunnels, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication openvpn default
```

**Related commands** [aaa group server](#)  
[radius-server host](#)

# aaa authorization commands

**Overview** This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

**Syntax**

```
aaa authorization commands <privilege-level>
{default|<list-name>} group tacacs+ [none]

no aaa authorization commands <privilege-level>
{default|<list-name>}
```

Parameter	Description
<privilege-level>	The privilege level of the set of commands the method list will be applied to. AlliedWare Plus defines three sets of commands, that are indexed by a level value: <b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive <b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive <b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15
group	Specify the server group where authorization messages are sent. Only the <code>tacacs+</code> group is available for this command.
tacacs+	Use all TACACS+ servers configured by the <code>tacacs-server host</code> command.
default	Configure the default authorization commands method list.
<list-name>	Configure a named authorization commands method list
none	If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.

**Mode** Global Configuration

**Usage notes** TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.

- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

**Example** To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 15 TAC15 group
tacacs+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 7 default group
tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization commands 15 TAC15
```

**Related commands** [aaa authorization config-commands](#)  
[authorization commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# aaa authorization config-commands

**Overview** Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

**Syntax** `aaa authorization config-commands`  
`no aaa authorization config-commands`

**Default** By default, command authorization is disabled on configuration mode commands.

**Mode** Global Configuration

**Usage notes** If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

**NOTE:** *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

**Example** To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

**Related commands** [aaa authorization commands](#)  
[authorization commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# aaa group server

**Overview** This command configures a RADIUS server group. A server group can be used to specify a subset of RADIUS servers in **aaa** commands. The group name **radius** is predefined, which includes all RADIUS servers configured by the **radius-server host** command.

RADIUS servers are added to a server group using the **server** command. Each RADIUS server should be configured using the **radius-server host** command.

Use the **no** variant of this command to remove an existing RADIUS server group.

**Syntax** `aaa group server radius <group-name>`  
`no aaa group server radius <group-name>`

Parameter	Description
<code>&lt;group-name&gt;</code>	Server group name.

**Mode** Global Configuration

**Usage notes** Use this command to create an AAA group of RADIUS servers, and to enter Server Group Configuration mode, in which you can add servers to the group. Use a server group to specify a subset of RADIUS servers in AAA commands. Each RADIUS server must be configured by the **radius-server host** command. To add RADIUS servers to a server group, use the **server** command.

**Examples** To create a RADIUS server group named GROUP1 with hosts 192.168.1.1, 192.168.2.1 and 192.168.3.1, use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1 auth-port 1812 acct-port 1813
awplus(config-sg)# server 192.168.2.1 auth-port 1812 acct-port 1813
awplus(config-sg)# server 192.168.3.1 auth-port 1812 acct-port 1813
```

To remove a RADIUS server group named GROUP1 from the configuration, use the command:

```
awplus(config)# no aaa group server radius GROUP1
```

# aaa local authentication attempts lockout-time

**Overview** This command configures the duration of the user lockout period.

Use the **no** variant of this command to restore the duration of the user lockout period to its default of 300 seconds (5 minutes).

**Syntax** `aaa local authentication attempts lockout-time <lockout-time>`  
`no aaa local authentication attempts lockout-time`

Parameter	Description
<code>&lt;lockout-time&gt;</code>	<code>&lt;0-10000&gt;</code> . Time in seconds to lockout the user.

**Mode** Global Configuration

**Default** The default for the lockout-time is 300 seconds (5 minutes).

**Usage notes** While locked out all attempts to login with the locked account will fail. The lockout can be manually cleared by another privileged account using the [clear aaa local user lockout](#) command.

**Examples** To configure the lockout period to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts lockout-time
600
```

To restore the default lockout period of 5 minutes (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts
lockout-time
```

**Related commands** [aaa local authentication attempts max-fail](#)

# aaa local authentication attempts max-fail

**Overview** This command configures the maximum number of failed login attempts before a user account is locked out. Every time a login attempt fails the failed login counter is incremented.

Use the **no** variant of this command to restore the maximum number of failed login attempts to the default setting (five failed login attempts).

**Syntax** `aaa local authentication attempts max-fail <failed-logins>`  
`no aaa local authentication attempts max-fail`

Parameter	Description
<code>&lt;failed-logins&gt;</code>	<code>&lt;1-32&gt;</code> . Number of login failures allowed before locking out a user.

**Mode** Global Configuration

**Default** The default for the maximum number of failed login attempts is five failed login attempts.

**Usage** When the failed login counter reaches the limit configured by this command that user account is locked out for a specified duration configured by the [aaa local authentication attempts lockout-time](#) command.

When a successful login occurs the failed login counter is reset to 0. When a user account is locked out all attempts to login using that user account will fail.

**Examples** To configure the number of login failures that will lock out a user account to two login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail 2
```

To restore the number of login failures that will lock out a user account to the default number of login attempts (five login attempts), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
```

**Related commands** [aaa local authentication attempts lockout-time](#)  
[clear aaa local user lockout](#)

# aaa login fail-delay

**Overview** Use this command to configure the minimum time period between failed login attempts. This setting applies to login attempts via the console, SSH and Telnet. Use the **no** variant of this command to reset the minimum time period to its default value.

**Syntax** `aaa login fail-delay <1-10>`  
`no aaa login fail-delay`

Parameter	Description
<1-10>	The minimum number of seconds required between login attempts

**Default** 1 second

**Mode** Global configuration

**Example** To apply a delay of at least 5 seconds between login attempts, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa login fail-delay 5
```

**Related commands** [aaa authentication login](#)  
[aaa local authentication attempts lockout-time](#)  
[clear aaa local user lockout](#)

# accounting login

**Overview** This command applies a login accounting method list to console or VTY lines for user login. When login accounting is enabled using this command, logging events generate an accounting record to the accounting server.

The accounting method list must be configured first using this command. If an accounting method list is specified that has not been created by this command then accounting will be disabled on the specified lines.

The **no** variant of this command resets AAA Accounting applied to console or VTY lines for local or remote login. **default** login accounting is applied after issuing the **no accounting login** command. Accounting is disabled with **default**.

**Syntax** `accounting login {default|<list-name>}`  
`no accounting login`

Parameter	Description
default	Default accounting method list.
<list-name>	Named accounting method list.

**Default** By default login accounting is disabled in the **default** accounting server. No accounting will be performed until accounting is enabled using this command.

**Mode** Line Configuration

**Examples** To apply the accounting server `USERS` to all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# accounting login USERS
```

To reset accounting for login sessions on the console, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no accounting login
```

**Related commands** [aaa accounting commands](#)  
[aaa accounting login](#)

# authorization commands

**Overview** This command applies a command authorization method list, defined using the [aaa authorization commands](#) command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

**Syntax** `authorization commands <privilege-level> {default|<list-name>}`  
`no authorization commands <privilege-level>`

Parameter	Description
<code>&lt;privilege-level&gt;</code>	The privilege level of the set of commands the method list will be applied to. AlliedWare Plus defines three sets of commands, that are indexed by a level value: <b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive <b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive <b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15
<code>default</code>	Configure the default authorization commands method list.
<code>&lt;list-name&gt;</code>	Configure a named authorization commands method list

**Default** The **default** method list is applied to each console and VTY line by default.

**Mode** Line Configuration

**Usage notes** If the specified method list does not exist users will not be able to execute any commands in the specified method list on the specified VTY lines.

**Example** To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

**Related commands** [aaa authorization commands](#)

aaa authorization config-commands

tacacs-server host

**Command changes** Version 5.4.6-2.1: command added

# clear aaa local user lockout

**Overview** Use this command to clear the lockout on a specific user account or all user accounts.

**Syntax** `clear aaa local user lockout {username <username>|all}`

Parameter	Description
username	Clear lockout for the specified user.
<username>	Specifies the user account.
all	Clear lockout for all user accounts.

**Mode** Privileged Exec

**Examples** To unlock the user account 'bob' use the following command:

```
awplus# clear aaa local user lockout username bob
```

To unlock all user accounts use the following command:

```
awplus# clear aaa local user lockout all
```

**Related commands** [aaa local authentication attempts lockout-time](#)

# debug aaa

**Overview** This command enables AAA debugging.

Use the **no** variant of this command to disable AAA debugging.

**Syntax** debug aaa [accounting|all|authentication|authorization]  
no debug aaa [accounting|all|authentication|authorization]

Parameter	Description
accounting	Accounting debugging.
all	All debugging options are enabled.
authentication	Authentication debugging.
authorization	Authorization debugging.

**Default** AAA debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable authentication debugging for AAA, use the command:

```
awplus# debug aaa authentication
```

To disable authentication debugging for AAA, use the command:

```
awplus# no debug aaa authentication
```

**Related commands** [show debugging aaa](#)  
[undebug aaa](#)

# login authentication

**Overview** Use this command to apply an AAA server for authenticating user login attempts from a console or remote logins on these console or VTY lines. The authentication method list must be specified by the **aaa authentication login** command. If the method list has not been configured by the **aaa authentication login** command, login authentication will fail on these lines.

Use the **no** variant of this command to reset AAA Authentication configuration to use the default method list for login authentication on these console or VTY lines.

**Command Syntax** login authentication {default|<list-name>}  
no login authentication

Parameter	Description
default	The default authentication method list. If the default method list has not been configured by the <a href="#">aaa authentication login</a> command, the local user database is used for user login authentication.
<list-name>	Named authentication server.

**Default** The default login authentication method list, as specified by the [aaa authentication login](#) command, is used to authenticate user login. If this has not been specified, the default is to use the local user database.

**Mode** Line Configuration

**Examples** To apply the authentication method list called CONSOLE to the console port terminal line (asyn 0), use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# login authentication CONSOLE
```

To reset user authentication configuration on all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# no login authentication
```

**Related commands** [aaa authentication login](#)  
[line](#)

# proxy-port

**Overview** Use this command to change the local UDP port used for communication between local RADIUS client applications and the RadSecProxy AAA application. Any unused UDP port may be selected. The default port is 1645.

Use the **no** variant of this command to change the UDP port back to the default of 1645.

**Syntax** `proxy-port <port>`  
`no proxy-port`

Parameter	Description
<code>&lt;port&gt;</code>	UDP Port Number, 1-65536.

**Default** The default port is 1645.

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** It is not necessary to change the value from the default unless UDP port 1645 is required for another purpose. RADIUS requests received on this port from external devices will be ignored. The port is only used for local (intra-device) communication.

**Example** To configure change the UDP port to 7001, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# proxy-port 7001
```

**Related commands** [radius-secure-proxy aaa](#)  
[server \(radsecproxy-aaa\)](#)  
[server name-check](#)  
[server trustpoint](#)

# radius-secure-proxy aaa

**Overview** Use this command to enter the RadSecProxy AAA (authentication, authorization, and accounting) application configuration mode. This application allows local RADIUS-based clients on system to communicate with remote RadSec servers via a secure (TLS) proxy.

**Syntax** `radius-secure-proxy aaa`

**Mode** Global Configuration Mode

**Example** To change mode from User Exec mode to the RadSecProxy AAA configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)#
```

**Related commands**

- [proxy-port](#)
- [server \(radsecproxy-aaa\)](#)
- [server name-check](#)
- [server trustpoint](#)

# server (radsecproxy-aaa)

**Overview** Use this command to add a server to the RadSecProxy AAA application. Local RADIUS client applications will attempt, via the proxy, to communicate with any RadSec servers that are operational (in addition to any non-TLS RADIUS servers that are configured).

Use the **no** variant of this command to delete a previously-configured server from the RadSecProxy AAA application.

**Syntax** `server {<hostname>|<ip-addr>} [timeout <1-1000>] [name-check {on|off}]`

`no server {<hostname>|<ip-addr>}`

Parameter	Description
<code>&lt;hostname&gt;</code>	Hostname of RadSec server
<code>&lt;ip-addr&gt;</code>	Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).
<code>timeout</code>	Specify the amount of time that the RadSecProxy AAA application should wait for replies from this server. RADIUS server timeout (which defaults to 5 seconds).
<code>&lt;1-1000&gt;</code>	Time in seconds to wait for a server reply.
<code>name-check</code>	Specify whether or not to enforce certificate name checking for this client. If the parameter is not specified then the global behavior, which defaults to <b>on</b> , is used.
<code>on</code>	Enable name checking for this client.
<code>off</code>	Disable name checking for this client.

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** The server may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each server may be configured with a timeout; if not specified, the global timeout value for RADIUS servers will be used. The global timeout may be changed using the **radius-server timeout** command. The default global timeout is 5 seconds.

Each server may be configured to use certificate name-checking; if not specified, the global behavior defined by **server name-check** or **no server name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the server's X.509 certificate must match the domain name or IP address specified in this command.

**Example** To add a server 'mynas.local' with a timeout of 3 seconds, and name checking off, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server mynas.local name-check
off
```

**Related commands**

- [server trustpoint](#)

# server mutual-authentication

**Overview** This command enables or disables mutual certificate authentication for all RadSecProxy servers. When enabled, the RadSecProxy AAA application will send a local X.509 certificate to the server when establishing a TLS connection.

Use the **no** variant of this command to disable mutual certificate validation causing the RadSecProxy AAA application to not transmit a certificate to the server.

**NOTE:** *If mutual authentication is disabled on the client (AAA) application but enabled on the server, a connection will not be established.*

**Syntax** `server mutual-authentication`  
`no server mutual-authentication`

**Default** Mutual authentication is enabled by default.

**Mode** RadSecProxy AAA Configuration Mode

**Example** Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server
mutual-authentication
```

**Related commands** [radius-secure-proxy aaa](#)  
[server name-check](#)  
[server \(radsecproxy-aaa\)](#)

**Command changes** Version 5.4.6-2.1: command added

# server name-check

**Overview** This command sets the global behavior for certificate name-checking for the RadSecProxy AAA application to **on**. This behavior will be used for all servers associated with the application that do not specify a behavior on a per-server basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **server (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

**Syntax** `server name-check`  
`no server name-check`

**Default** Certificate name checking is on by default.

**Mode** RadSecProxy AAA Configuration Mode

**Example** Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server name-check
```

**Related commands** [proxy-port](#)  
[radius-secure-proxy aaa](#)  
[server \(radsecproxy-aaa\)](#)  
[server trustpoint](#)

# server trustpoint

**Overview** This command adds one or more trustpoints to be used with the RadSecProxy AAA application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** `server trustpoint [<trustpoint-list>]`  
`no server trustpoint [<trustpoint-list>]`

Parameter	Description
<trustpoint-list>	Specify one or more trustpoints to be added or deleted.

**Default** By default, no trustpoints are associated with the application.

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no server trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints to the RadSecProxy AAA application by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server trustpoint example_1
awplus(config-radsecproxy-aaa)# server trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-aaa)# server trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy AAA application using the command:

```
awplus(config-radsecproxy-aaa)# no server trustpoint
```

**Related commands** [proxy-port](#)

# show aaa local user locked

**Overview** This command displays the current number of failed attempts, last failure time and location against each user account attempting to log into the device.

Note that once the lockout count has been manually cleared by another privileged account using the [clear aaa local user lockout](#) command or a locked account successfully logs into the system after waiting for the lockout time, this command will display nothing for that particular account.

**Syntax** show aaa local user locked

**Mode** User Exec and Privileged Exec

**Example** To display the current failed attempts for local users, use the command:

```
awplus# show aaa local user locked
```

**Output** Figure 45-1: Example output from the **show aaa local user locked** command

```
awplus# show aaa local user locked

# show debugging aaa

**Overview** Use this command to see what debugging is turned on for AAA (Authentication, Authorization, Accounting).

**Syntax** `show debugging aaa`

**Mode** User Exec and Privileged Exec

**Example** To display the current debugging status of AAA, use the command:

```
awplus# show debug aaa
```

**Output** Figure 45-3: Example output from the **show debug aaa** command

```
AAA debugging status:  
Authentication debugging is on  
Accounting debugging is off
```

# show radius server group

**Overview** Use this command to show the RADIUS server group configuration.

**Syntax** show radius server group [*<group-name>*]

Parameter	Description
<i>&lt;group-name&gt;</i>	RADIUS server group name.

**Default** Command name is set to something by default.

**Mode** Privileged Exec

**Usage** Use this command with the *<group-name>* parameter to display information for a specific RADIUS server group, or without the parameter to display information for all RADIUS server groups.

**Example** To display information for all RADIUS server groups, use the command:

```
awplus# show radius server group
```

To display a information for a RADIUS server group named 'rad\_group\_list1', use the command:

```
awplus# show radius server group rad_group_list1
```

**Output** Figure 45-4: Example output from **show radius server group**

```
awplus#show radius server group

# deadtime (RADIUS server group)

**Overview** Use this command to configure the **deadtime** parameter for the RADIUS server group. This command overrides the global dead-time configured by the [radius-server deadtime](#) command. The configured deadtime is the time period in minutes to skip a RADIUS server for authentication or accounting requests if the server is “dead”. Note that a RADIUS server is considered “dead” if there is no response from the server within a defined time period.

Use the **no** variant of this command to reset the deadtime configured for the RADIUS server group. If the global deadtime for RADIUS server is configured the value will be used for the servers in the group. The global deadtime for the RADIUS server is set to 0 minutes by default.

**Syntax** `deadtime <0-1440>`  
`no deadtime`

Parameter	Description
<code>&lt;0-1440&gt;</code>	Amount of time in minutes.

**Default** The deadtime is set to 0 minutes by default.

**Mode** Server Group Configuration

**Usage** If the RADIUS server does not respond to a request packet, the packet is retransmitted the number of times configured for the **retransmit** parameter (after waiting for a **timeout** period to expire). The server is then marked “dead”, and the time is recorded. The **deadtime** parameter configures the amount of time to skip a dead server; if a server is dead, no request message is sent to the server for the **deadtime** period.

**Examples** To configure the deadtime for 5 minutes for the RADIUS server group “GROUP1”, use the command:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1
awplus(config-sg)# deadtime 5
```

To remove the deadtime configured for the RADIUS server group “GROUP1”, use the command:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no deadtime
```

**Related commands** [aaa group server](#)  
[radius-server deadtime](#)

# debug radius

**Overview** This command enables RADIUS debugging. If no option is specified, all debugging options are enabled.

Use the **no** variant of this command to disable RADIUS debugging. If no option is specified, all debugging options are disabled.

**Syntax** debug radius [packet|event|all]  
no debug radius [packet|event|all]

Parameter	Description
packet	Debugging for RADIUS packets is enabled or disabled.
event	Debugging for RADIUS events is enabled or disabled.
all	Enable or disable all debugging options.

**Default** RADIUS debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable debugging for RADIUS packets, use the command:

```
awplus# debug radius packet
```

To enable debugging for RADIUS events, use the command:

```
awplus# debug radius event
```

To disable debugging for RADIUS packets, use the command:

```
awplus# no debug radius packet
```

To disable debugging for RADIUS events, use the command:

```
awplus# no debug radius event
```

**Related commands** [show debugging radius](#)  
[undebug radius](#)

# ip radius source-interface

**Overview** This command configures the source IP address of every outgoing RADIUS packet to use a specific IP address or the IP address of a specific interface. If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing RADIUS packets depends on the interface the packets leave.

Use the **no** variant of this command to remove the source interface configuration. The source IP address in outgoing RADIUS packets will be the IP address of the interface from which the packets are sent.

**Syntax** `ip radius source-interface {<interface>|<ip-address>}`  
`no ip radius source-interface`

Parameter	Description
<code>&lt;interface&gt;</code>	Interface name.
<code>&lt;ip-address&gt;</code>	IP address in the dotted decimal format A.B.C.D.

**Default** Source IP address of outgoing RADIUS packets depends on the interface the packets leave.

**Mode** Global Configuration

**Examples** To configure all outgoing RADIUS packets to use the IP address of the interface "vlan1" for the source IP address, use the following commands:

```
awplus# configure terminal  
awplus(config)# ip radius source-interface vlan1
```

To configure the source IP address of all outgoing RADIUS packets to use 192.168.1.10, use the following commands:

```
awplus# configure terminal  
awplus(config)# ip radius source-interface 192.168.1.10
```

To reset the source interface configuration for all outgoing RADIUS packets, use the following commands:

```
awplus# configure terminal  
awplus(config)# no ip radius source-interface
```

**Related commands** [radius-server host](#)

# radius-server deadtime

**Overview** Use this command to specify the global **deadtime** for all RADIUS servers. If a RADIUS server is considered dead, it is skipped for the specified deadtime. This command specifies for how many minutes a RADIUS server that is not responding to authentication requests is passed over by requests for RADIUS authentication.

Use the **no** variant of this command to reset the global deadtime to the default of 0 seconds, so that RADIUS servers are not skipped even if they are dead.

**Syntax** `radius-server deadtime <minutes>`  
`no radius-server deadtime`

Parameter	Description
<code>&lt;minutes&gt;</code>	RADIUS server deadtime in minutes in the range 0 to 1440 (24 hours).

**Default** The default RADIUS deadtime configured on the system is 0 seconds.

**Mode** Global Configuration

**Usage** The RADIUS client considers a RADIUS server to be dead if it fails to respond to a request after it has been retransmitted as often as specified globally by the [radius-server retransmit](#) command or for the server by the [radius-server host](#) command. To improve RADIUS response times when some servers may be unavailable, set a **deadtime** to skip dead servers.

**Examples** To set the dead time of the RADIUS server to 60 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server deadtime 60
```

To disable the dead time of the RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server deadtime
```

**Related commands** [deadtime \(RADIUS server group\)](#)  
[radius-server host](#)  
[radius-server retransmit](#)

# radius-server host

**Overview** Use this command to specify a remote RADIUS server host for authentication or accounting, and to set server-specific parameters. The parameters specified with this command override the corresponding global parameters for RADIUS servers. This command specifies the IP address or host name of the remote RADIUS server host and assigns authentication and accounting destination UDP port numbers.

This command adds the RADIUS server address and sets parameters to the RADIUS server. The RADIUS server is added to the running configuration after you issue this command. If parameters are not set using this command then common system settings are applied.

Use the **no** variant of this command to remove the specified server host as a RADIUS authentication and/or accounting server and set the destination port to the default RADIUS server port number (1812).

**Syntax**

```
radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key <key-string>] [retransmit <0-100>] [timeout <1-1000>]
```

```
no radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>]
```

Parameter	Description
<host-name>	Server host name. The DNS name of the RADIUS server host.
<ip-address>	The IP address of the RADIUS server host.
acct-port	Accounting port. Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the server is not used for accounting. The default UDP port for accounting is 1813.
<0-65535>	UDP port number. (Accounting port number is set to (accounting port number is set to 1813 by default) Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the host is not used for accounting.
auth-port	Authentication port. Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the server is not used for authentication. The default UDP port for authentication is 1812.
<0-65535>	UDP port number (authentication port number is set to 1812 by default). Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the host is not used for authentication.
timeout	Specifies the amount of time to wait for a response from the server. If this parameter is not specified the global value configured by the <b>radius-server timeout</b> command is used.

Parameter	Description
<1-1000>	Time in seconds to wait for a server reply (timeout is set to 5 seconds by default). The time interval (in seconds to wait for the RADIUS server to reply before retransmitting a request or considering the server dead. This setting overrides the global value set by the <b>radius-server timeout</b> command. If no timeout value is specified for this server, the global value is used.
retransmit	Specifies the number of retries before skip to the next server. If this parameter is not specified the global value configured by the <b>radius-server retransmit</b> command is used.
<0-100>	Maximum number of retries (maximum number of retries is set to 3 by default). The maximum number of times to resend a RADIUS request to the server, if it does not respond within the timeout interval, before considering it dead and skipping to the next RADIUS server. This setting overrides the global setting of the <b>radius-server retransmit</b> command. If no retransmit value is specified, the global value is used.
key	Set shared secret key with RADIUS servers.
<key-string>	Shared key string applied. Specifies the shared secret authentication or encryption key for all RADIUS communications between this device and the RADIUS server. This key must match the encryption used on the RADIUS daemon. All leading spaces are ignored, but spaces within and at the end of the string are used.  If spaces are used in the string, do not enclose the string in quotation marks unless the quotation marks themselves are part of the key. This setting overrides the global setting of the <b>radius-server key</b> command. If no key value is specified, the global value is used.

**Default** The RADIUS client address is not configured (null) by default. No RADIUS server is configured.

**Mode** Global Configuration

**Usage** Multiple **radius-server host** commands can be used to specify multiple hosts. The software searches for hosts in the order they are specified. If no host-specific timeout, retransmit, or key values are specified, the global values apply to that host. If there are multiple RADIUS servers for this client, use this command multiple times—once to specify each server.

If you specify a host without specifying the auth port or the acct port, it will by default be configured for both authentication and accounting, using the default UDP ports. To set a host to be a RADIUS server for authentication requests only, set the **acct-port** parameter to 0; to set the host to be a RADIUS server for accounting requests only, set the auth-port parameter to 0.

A RADIUS server is identified by IP address, authentication port and accounting port. A single host can be configured multiple times with different authentication or accounting ports. All the RADIUS servers configured with this command are included in the predefined RADIUS server group radius, which may be used by AAA authentication, authorization and accounting commands. The client transmits

(and retransmits, according to the **retransmit** and **timeout** parameters) RADIUS authentication or accounting requests to the servers in the order you specify them, until it gets a response.

**Examples** To add the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20
```

To set the secret key to **allied** on the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key allied
```

To delete the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host 10.0.0.20
```

To configure rad1.company.com for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad1.company.com acct-port 0
```

To remove the RADIUS server rad1.company.com configured for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host rad1.company.com
acct-port 0
```

To configure rad2.company.com for accounting only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad2.company.com auth-port 0
```

To configure 192.168.1.1 with authentication port 1000, accounting port 1001 and retransmit count 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 192.168.1.1 auth-port 1000
acct-port 1001 retransmit 5
```

**Command changes** Version 5.4.9-2.1: **key-encrypted** parameter added.

**Related commands**

- [aaa group server](#)
- [radius-server key](#)
- [radius-server retransmit](#)
- [radius-server timeout](#)

# radius-server key

**Overview** This command sets a global secret key for RADIUS authentication on the device. The shared secret text string is used for RADIUS authentication between the device and a RADIUS server.

Note that if no secret key is explicitly specified for a RADIUS server, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to reset the secret key to the default (null).

**Syntax** `radius-server key <key-string>`  
`no radius-server key`

Parameter	Description
<code>&lt;key-string&gt;</code>	Shared secret among RADIUS server and 802.1X client.

**Default** The RADIUS server secret key on the system is not set by default (null).

**Mode** Global Configuration

**Usage** Use this command to set the global secret key shared between this client and its RADIUS servers. If no secret key is specified for a particular RADIUS server using the **radius-server host** command, this global key is used.

After enabling AAA authentication with the **aaa authentication login** command, set the authentication and encryption key using the **radius-server key** command so the key entered matches the key used on the RADIUS server.

**Examples** To set the global secret key to **allied** for RADIUS server, use the following commands:

```
awplus# configure terminal  
awplus(config)# radius-server key allied
```

To set the global secret key to **secret** for RADIUS server, use the following commands:

```
awplus# configure terminal  
awplus(config)# radius-server key secret
```

To delete the global secret key for RADIUS server, use the following commands:

```
awplus# configure terminal  
awplus(config)# no radius-server key
```

**Related commands** [radius-server host](#)

# radius-server retransmit

**Overview** This command sets the retransmit counter to use RADIUS authentication on the device. This command specifies how many times the device transmits each RADIUS request to the RADIUS server before giving up.

This command configures the **retransmit** parameter for RADIUS servers globally. If the **retransmit** parameter is not specified for a RADIUS server by the **radius-server host** command then the global configuration set by this command is used for the server instead.

Use the **no** variant of this command to reset the re-transmit counter to the default (3).

**Syntax** `radius-server retransmit <retries>`  
`no radius-server retransmit`

Parameter	Description
<code>&lt;retries&gt;</code>	RADIUS server retries in the range <0-100>. The number of times a request is resent to a RADIUS server that does not respond, before the server is considered dead and the next server is tried. If no retransmit value is specified for a particular RADIUS server using the <b>radius-server host</b> command, this global value is used.

**Default** The default RADIUS retransmit count on the device is 3.

**Mode** Global Configuration

**Examples** To set the RADIUS **retransmit** count to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 1
```

To set the RADIUS **retransmit** count to the default (3), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server retransmit
```

To configure the RADIUS **retransmit** count globally with 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 5
```

To disable retransmission of requests to a RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 0
```

**Related  
commands** [radius-server deadtime](#)  
[radius-server host](#)

# radius-server timeout

**Overview** Use this command to specify the RADIUS global timeout value. This is how long the device waits for a reply to a RADIUS request before retransmitting the request, or considering the server to be dead. If no timeout is specified for the particular RADIUS server by the **radius-server host** command, it uses this global timeout value.

Note that this command configures the **timeout** parameter for RADIUS servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

**Syntax** `radius-server timeout <seconds>`  
`no radius-server timeout`

Parameter	Description
<code>&lt;seconds&gt;</code>	RADIUS server timeout in seconds in the range 1 to 1000. The global time in seconds to wait for a RADIUS server to reply to a request before retransmitting the request, or considering the server to be dead (depending on the <b>radius-server retransmit</b> command).

**Default** The default RADIUS transmit timeout on the system is 5 seconds.

**Mode** Global Configuration

**Examples** To globally set the device to wait 20 seconds before retransmitting a RADIUS request to unresponsive RADIUS servers, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 20
```

To set the RADIUS **timeout** parameter to 1 second, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 1
```

To set the RADIUS **timeout** parameter to the default (5 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

To configure the RADIUS server **timeout** period globally with 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 3
```

To reset the global **timeout** period for RADIUS servers to the default, use the following command:

```
awplus# configure terminal  
awplus(config)# no radius-server timeout
```

**Related  
commands**

[radius-server deadtime](#)  
[radius-server host](#)  
[radius-server retransmit](#)

## server (server group)

**Overview** This command adds a RADIUS server to a server group in Server-Group Configuration mode. The RADIUS server should be configured by the [radius-server host](#) command.

The server is appended to the server list of the group and the order of configuration determines the precedence of servers. If the server exists in the server group already, it will be removed before added as a new server.

The server is identified by IP address and authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports. The **auth-port** specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set `auth-port` to 0. If the authentication port is missing, the default port number is 1812. The **acct-port** specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set `acct-port` to 0. If the accounting port is missing, the default port number is 1812.

Use the **no** variant of this command to remove a RADIUS server from the server group.

**Syntax**

```
server {<hostname>|<ip-address>} [auth-port <0-65535>][acct-port <0-65535>]
no server {<hostname>|<ip-address>} [auth-port <0-65535>][acct-port <0-65535>]
```

Parameter	Description
<code>&lt;hostname&gt;</code>	Server host name
<code>&lt;ip-address&gt;</code>	Server IP address The server is identified by IP address, authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports.
<code>auth-port</code>	Authentication port The <b>auth-port</b> specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set <b>auth-port</b> to 0. If the authentication port is missing, the default port number is 1812.
<code>&lt;0-65535&gt;</code>	UDP port number (default: 1812)
<code>acct-port</code>	Accounting port The <b>acct-port</b> specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set <b>acct-port</b> to 0. If the accounting port is missing, the default port number is 1813.
<code>&lt;0-65535&gt;</code>	UDP port number (default: 1813)

**Default** The default Authentication port number is 1812 and the default Accounting port number is 1813.

**Mode** Server Group Configuration

**Usage notes** The RADIUS server to be added must be configured by the **radius-server host** command. In order to add or remove a server, the **auth-port** and **acct-port** parameters in this command must be the same as the corresponding parameters in the **radius-server host** command.

**Examples** To create a RADIUS server group RAD\_AUTH1 for authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_AUTH1
awplus(config-sg)# server 192.168.1.1 acct-port 0
awplus(config-sg)# server 192.168.2.1 auth-port 1000 acct-port 0
```

To create a RADIUS server group RAD\_ACCT1 for accounting, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_ACCT1
awplus(config-sg)# server 192.168.2.1 auth-port 0 acct-port 1001
awplus(config-sg)# server 192.168.3.1 auth-port 0
```

To remove server 192.168.3.1 from the existing server group **GROUP1**, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no server 192.168.3.1
```

**Related commands**

- [aaa accounting login](#)
- [aaa authentication login](#)
- [aaa group server](#)
- [radius-server host](#)

# show debugging radius

**Overview** This command displays the current debugging status for the RADIUS servers.

**Syntax** show debugging radius

**Mode** User Exec and Privileged Exec

**Example** To display the current debugging status of RADIUS servers, use the command:

```
awplus# show debugging radius
```

**Output** Figure 46-1: Example output from the **show debugging radius** command

```
RADIUS debugging status:  
RADIUS event debugging is off  
RADIUS packet debugging is off
```

# show radius

**Overview** This command displays the current RADIUS server configuration and status.

**Syntax** show radius

**Mode** User Exec and Privileged Exec

**Example** To display the current status of RADIUS servers, use the command:

```
awplus# show radius
```

**Output** Figure 46-2: Example output from the **show radius** command showing RADIUS servers

```
RADIUS Global Configuration
Source Interface : not configured
Secret Key : secret
Timeout : 5 sec
Retransmit Count : 3
Deadtime : 20 min
Server Host : 192.168.1.10
Authentication Port : 1812
Accounting Port : 1813
Secret Key : secret
Timeout : 3 sec
Retransmit Count : 2
Server Host : 192.168.1.11
Authentication Port : 1812
Accounting Port : not configured

Server Name/   Auth   Acct   Auth   Acct
IP Address    Port   Port   Status Status
-----
192.168.1.10  1812  1813  Alive  Alive
192.168.1.11  1812  N/A   Alive  N/A
```

**Example** See the sample output below showing RADIUS client status and RADIUS configuration:

```
awplus# show radius
```

**Output** Figure 46-3: Example output from the **show radius** command showing RADIUS client status

```
RADIUS global interface name: awplus
  Secret key:
  Timeout: 5
  Retransmit count: 3
  Deadtime: 0

Server Address: 150.87.18.89
  Auth destination port: 1812
  Accounting port: 1813
  Secret key: swg
  Timeout: 5
  Retransmit count: 3
  Deadtime: 0
```

Output Parameter	Meaning
Source Interface	The interface name or IP address to be used for the source address of all outgoing RADIUS packets.
Secret Key	A shared secret key to a radius server.
Timeout	A time interval in seconds.
Retransmit Count	The number of retry count if a RADIUS server does not response.
Deadtime	A time interval in minutes to mark a RADIUS server as "dead".
Interim-Update	A time interval in minutes to send Interim-Update Accounting report.
Group Deadtime	The deadtime configured for RADIUS servers within a server group.
Server Host	The RADIUS server hostname or IP address.
Authentication Port	The destination UDP port for RADIUS authentication requests.
Accounting Port	The destination UDP port for RADIUS accounting requests.

Output Parameter	Meaning
Auth Status	The status of the authentication port. The status ("dead", "error", or "alive") of the RADIUS authentication server and, if dead, how long it has been dead for.
	Alive      The server is alive.
	Error      The server is not responding.
	Dead      The server is detected as dead and it will not be used for deadtime period. The time displayed in the output shows the server is in dead status for that amount of time.
	Unknown    The server is never used or the status is unknown.
Acct Status	The status of the accounting port. The status ("dead", "error", or "alive") of the RADIUS accounting server and, if dead, how long it has been dead for.

# undebbug radius

**Overview** This command applies the functionality of the **no debug radius** command.

# 47

# Local RADIUS Server Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the local RADIUS server on the device. For more information, see the [Local RADIUS Server Feature Overview and Configuration Guide](#).

# attribute

**Overview** Use this command to define a RADIUS attribute for the local RADIUS server user group.

For a complete list of defined RADIUS attributes and values, see the [Local RADIUS Server Feature Overview and Configuration Guide](#).

When used with the **value** parameter the **attribute** command configures RADIUS attributes to the user group. If the specified attribute is already defined then it is replaced with the new value.

Use the **no** variant of this command to delete an attribute from the local RADIUS server user group.

**Syntax** `attribute [repeated] {<attribute-name>|<attribute-id>} <value>`  
`no attribute {<attribute-name>|<attribute-id>}`

Parameter	Description
repeated	This optional parameter allows you to set multiple instances of the same attribute name or attribute id.
<attribute-name>	RADIUS attribute name for standard attributes or Vendor-Specific attributes (see the <a href="#">Local RADIUS Server Feature Overview and Configuration Guide</a> for tables of attributes).
<attribute-id>	RADIUS attribute numeric identifier for standard attributes.
<value>	RADIUS attribute value.

**Default** By default, no attributes are configured.

**Mode** RADIUS Server Group Configuration

**Usage notes** For the Standard attributes, the attribute may be specified using either the attribute name, or its numeric identifier. For example, the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

In the same way, where the specific attribute has a pre-defined value, the parameter <value> may be substituted with the Value Name or with its numeric value, for example the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause  
user-request
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

or the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

You can define more than one instance of an attribute name (or id) by using the **repeated** parameter. For example:

```
awplus(config-radsrv-group)# attribute repeated  
Nas-filter-Rule "deny in tcp from any to 0.0.0.0/0 23"  
  
awplus(config-radsrv-group)# attribute repeated  
Nas-filter-Rule "deny in tcp from any to fe80::b1 23"
```

**Examples** To define the attribute name 'Service-Type' with Administrative User (6) to the RADIUS User Group 'Admin', use the following commands:

```
awplus# configure terminal  
awplus(config)# radius-server local  
awplus(config-radsrv)# group Admin  
awplus(config-radsrv-group)# attribute Service-Type 6
```

To delete the attribute 'Service-Type' from the RADIUS User Group 'Admin', use the following commands:

```
awplus# configure terminal  
awplus(config)# radius-server local  
awplus(config-radsrv)# group Admin  
awplus(config-radsrv-group)# no attribute Service-Type
```

To define multiple values for attribute 'NAS-Filter-Rule', use the commands:

```
awplus# configure terminal  
awplus(config)# radius-server local  
awplus(config-radsrv)# group dynamicAcl  
awplus(config-radsrv-group)# attribute repeated  
NAS-Filter-Rule "deny in tcp from any to 0.0.0.0/0 23"  
awplus(config-radsrv-group)# attribute repeated  
NAS-Filter-Rule "deny in tcp from any to fe80::b1 23"
```

To delete a specific value from the attribute 'NAS-Filter-Rule', use the commands:

```
awplus# configure terminal  
awplus(config)# radius-server local  
awplus(config-radsrv)# group dynamicAcl  
awplus(config-radsrv-group)# no attribute NAS-Filter-Rule "deny  
in tcp from any to 0.0.0.0/0 23"
```

**Related commands** [egress-vlan-id](#)  
[egress-vlan-name](#)  
[help radius-attribute](#)

**Command changes** Version 5.5.0-1.1: **repeated** parameter added

# authentication

**Overview** Use this command to enable the specified authentication methods on the local RADIUS server.

Use the **no** variant of this command to disable specified authentication methods on the local RADIUS server.

**Syntax** authentication {mac | eapmd5 | eaptls | peap}  
no authentication {mac | eapmd5 | eaptls | peap}

Parameter	Description
mac	Enable MAC authentication method.
eapmd5	Enable EAP-MD5 authentication method.
eaptls	Enable EAP-TLS authentication method.
peap	Enable EAP-PEAP authentication method.

**Default** All authentication methods are enabled by default.

**Mode** RADIUS Server Configuration

**Examples** The following commands enable EAP-MD5 authentication methods on the local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# authentication eapmd5
```

The following commands disable EAP-MD5 authentication methods on Local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no authentication eapmd5
```

**Related commands** [server enable](#)  
[show radius local-server statistics](#)

# client (radsecproxy-srv)

**Overview** Use this command to add a RadSec client (for example, a NAS device) to the RadSecProxy local-server application. The application will accept RADIUS requests from all configured clients.

Use the **no** variant of this command to delete a previously-configured client from the RadSecProxy local-server application.

**Syntax** `client {<hostname>|<ip-addr>} [name-check {on|off}]`  
`no client {<hostname>|<ip-addr>}`

Parameter	Description
<code>&lt;hostname&gt;</code>	Hostname of client.
<code>&lt;ip-addr&gt;</code>	Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).
<code>name-check</code>	Specify whether or not to enforce certificate name checking for this client. If the parameter is not specified then the global behavior, which defaults to <b>on</b> , is used.
<code>on</code>	Enable name checking for this client.
<code>off</code>	Disable name checking for this client.

**Mode** RadSecProxy Local Server Configuration

**Usage notes** The client may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each client may be configured to use certificate name-checking; if not specified, the global behavior defined by **client name-check** or **no client name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in this command.

**NOTE:** *If mutual authentication is disabled then this parameter has no effect, see the [client mutual-authentication](#) command.*

**Example** To add a client called 'mynas.local' with certificate name checking **off**, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client mynas.local name-check
off
```

**Related commands** [client mutual-authentication](#)  
[client name-check](#)

client trustpoint  
radius-secure-proxy local-server

# client mutual-authentication

**Overview** This command enables or disables mutual certificate authentication for all RadSecProxy clients. When enabled, the RadSecProxy local-server application will request and validate an X.509 certificate from the client when establishing a connection.

The **no** variant of this command disables mutual certificate validation. The local-server application will still transmit the local server certificate to the client, but will not expect or validate a certificate from the client.

**Syntax** `client mutual-authentication`  
`no client mutual-authentication`

**Default** Mutual authentication is enabled by default.

**Mode** RadSecProxy Local Server Configuration

**Example** Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# no client
mutual-authentication
```

**Related commands** [client \(radsecproxy-srv\)](#)  
[client name-check](#)  
[radius-secure-proxy local-server](#)

**Command changes** Version 5.4.6-2.1: command added

# client name-check

**Overview** This command sets the global behavior for certificate name-checking for the RadSecProxy localserver application to **on**. This behavior will be used for all clients associated with the application that do not specify a behavior on a per-client basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **client (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

**Syntax** `client name-check`  
`no client name-check`

**Default** Certificate name checking is on by default.

**Mode** RadSecProxy Local Server Configuration

**Example** Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# no client name-check
```

**Related commands** [client \(radsecproxy-srv\)](#)  
[client trustpoint](#)  
[radius-secure-proxy local-server](#)

# client trustpoint

**Overview** This command adds one or more trustpoints to be used with the RadSecProxy local-server application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** `client trustpoint [<trustpoint-list>]`  
`no client trustpoint [<trustpoint-list>]`

Parameter	Description
<trustpoint-list>	Specify one or more trustpoints to be added or deleted.

**Mode** RadSecProxy Local Server Configuration

**Usage notes** The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no client trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints to the RadSecProxy local-server by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client trustpoint example_1
awplus(config-radsecproxy-srv)# client trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-srv)# client trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy local-server application using the command:

```
awplus(config-radsecproxy-srv)# no client trustpoint
```

**Related commands** [client \(radsecproxy-srv\)](#)  
[client name-check](#)  
[radius-secure-proxy local-server](#)

# clear radius local-server statistics

**Overview** Use this command to clear the statistics stored on the device for the local RADIUS server.

Use this command without any parameters to clear all types of local RADIUS server statistics.

**Syntax** `clear radius local-server statistics [nas|server|user]`

Parameter	Description
nas	Clear the NAS (Network Access Server) statistics on the device. For example, clearing statistics stored for NAS server invalid passwords.
server	Clear the Local RADIUS Server statistics on the device. For example, clearing Local RADIUS Servers statistics for all failed login attempts.
user	Clear the Local RADIUS Server user statistics. For example, clearing statistics stored for the number of successful user logins.

**Mode** Privileged Exec

**Usage** Refer to the sample output for the [show radius local-server statistics](#) for further information about the type of statistics each parameter option for this command clears. Both the **nas** and **server** parameters clear unknown username and invalid passwords statistics, while the **user** parameter clears the number of successful and failed logins for each local RADIUS server user.

**Examples** To clear the NAS (Network Access Server) statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics nas
```

To clear the local RADIUS server statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics server
```

To clear the local RADIUS server user statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics user
```

**Related commands** [show radius local-server statistics](#)

# copy fdb-radius-users (to file)

**Overview** Use this command to create a set of local RADIUS server users from MAC addresses in the local FDB. A local RADIUS server user created using this command can be used for MAC authentication.

**Syntax** `copy fdb-radius-users  
{local-radius-user-db|nvs|flash|card|usb|debug|tftp|scp|  
fserver|<url>} [interface <port>] [vlan <vid>] [group <name>]  
[export-vlan [<radius-group-name>]]`

Parameter	Description
local-radius-user-db	Copy the local RADIUS server users created to the local RADIUS server.
nvs	Copy the local RADIUS server users created to NVS memory.
flash	Copy the local RADIUS server users created to Flash memory.
card	Copy the local RADIUS server users created to SD card.
usb	Copy the local RADIUS server users created to USB storage device.
debug	Copy the local RADIUS server users created to debug.
tftp	Copy the local RADIUS server users created to the TFTP destination.
scp	Copy the local RADIUS server users created to the SCP destination.
fserver	Copy the local RADIUS server users created to the remote file server.
<url>	Copy the local RADIUS server users created to the specified URL.
interface <port>	Copy only MAC addresses learned on a specified device port. Wildcards may be used when specifying an interface name.
vlan <vid>	Copy only MAC addresses learned on a specified VLAN.
group <name>	Assign a group name to the local RADIUS server users created.
export-vlan	Export VLAN ID assigned to exported FDB entry.
<radius-group-name>	Prefix for Radius group name storing VLAN ID

**Mode** Privileged Exec

**Usage notes** The local RADIUS server users created are written to a specified destination file in local RADIUS user CSV (Comma Separated Values) format. The local RADIUS server users can then be imported to a local RADIUS server using the [copy local-radius-user-db \(from file\)](#) command.

The name and password of the local RADIUS server users created use a MAC address, which can be used for MAC authentication.

This command does not copy a MAC address learned by the CPU or the management port.

This command can filter FDB entries by the interface name and the VLAN ID. When the interface name and the VLAN ID are specified, this command generates local RADIUS server users from only the MAC address learned on the specified interface and on the specified VLAN.

**Examples** To register the local RADIUS server users from the local FDB directly to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db
```

To register the local RADIUS server users from the interface port1.0.1 to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db interface port1.0.1
```

To copy output generated as local RADIUS server user data from MAC addresses learned on vlan10 on interface port1.0.1 to the file radius-user.csv, use the command:

```
awplus# copy fdb-radius-users radius-user.csv interface port1.0.1 vlan10
```

To copy output generated as local RADIUS server user data from MAC addresses learned on vlan10 on interface port1.0.1 to a file on the remote file server, use the command:

```
awplus# copy fdb-radius-users fserver interface port1.0.1 vlan10
```

**Related commands** [copy local-radius-user-db \(to file\)](#)  
[copy local-radius-user-db \(from file\)](#)

# copy local-radius-user-db (from file)

**Overview** Use this command to copy the Local RADIUS server user data from a file. The file, including the RADIUS user data in the file, must be in the CSV (Comma Separated Values) format.

You can select **add** or **replace** as the copy method. The **add** parameter option copies the contents of specified file to the local RADIUS server user database. If the same user exists then the old user is removed before adding a new user. The **replace** parameter option deletes all contents of the local RADIUS server user database before copying the contents of specified file.

**Syntax** `copy <source-url> local-radius-user-db [add|replace]`

Parameter	Description
<code>&lt;source-url&gt;</code>	URL of the source file.
<code>add</code>	Add file contents to local RADIUS server user database.
<code>replace</code>	Replace current local RADIUS server user database with file contents.

**Default** When no copy method is specified with this command the **replace** option is applied.

**Mode** Privileged Exec

**Examples** To replace the current local RADIUS server user data to the contents of `http://datahost/user.csv`, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db
```

To add the contents of `http://datahost/user.csv` to the current local RADIUS server user database, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db add
```

**Related commands** [copy fdb-radius-users \(to file\)](#)  
[copy local-radius-user-db \(to file\)](#)

## copy local-radius-user-db (to file)

**Overview** Use this command to copy the local RADIUS server user data to a file. The output file produced is CSV (Comma Separated Values) format.

**Syntax** `copy local-radius-user-db  
{nvs|flash|card|usb|tftp|scp|<destination-url>}`

Parameter	Description
nvs	Copy to NVS memory.
flash	Copy to Flash memory.
card	Copy to SD card.
usb	Copy to USB storage device.
tftp	Copy to TFTP destination.
scp	Copy to SCP destination.
<destination-url>	URL of the Destination file.

**Mode** Privileged Exec

**Example** Copy the current local RADIUS server user data to `http://datahost/user.csv`.  
`awplus# copy local-radius-user-db http://datahost/user.csv`

**Related commands** [copy fdb-radius-users \(to file\)](#)  
[copy local-radius-user-db \(from file\)](#)

# crypto pki enroll local (deleted)

<url>
```

Note that "local" is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

# crypto pki trustpoint local (deleted)

**Overview** This command is no longer available. Please use the following command instead:

```
crypto pki trustpoint <trustpoint>
```

Note that "local" is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

# debug crypto pki (deleted)

**Overview** This command is no longer available.

# domain-style

**Overview** Use this command to enable a specified domain style on the local RADIUS server. The local RADIUS server decodes the domain portion of a username login string when this command is enabled.

Use the **no** variant of this command to disable the specified domain style on the local RADIUS server.

**Syntax** domain-style {suffix-atsign|ntdomain}  
no domain-style {suffix-atsign|ntdomain}

Parameter	Description
suffix-atsign	Enable at sign "@" delimited suffix style, i.e. "user@domain".
ntdomain	Enable NT domain style, i.e. "domain\user".

**Default** This feature is disabled by default.

**Mode** RADIUS Server Configuration

**Usage notes** When both domain styles are enabled, the first domain style configured has the highest priority. A username login string is matched against the first domain style enabled. Then, if the username login string is not decoded, it is matched against the second domain style enabled.

**Examples** To enable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# domain-style ntdomain
```

To disable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no domain-style ntdomain
```

**Related commands** [server enable](#)

# egress-vlan-id

**Overview** Use this command to configure the standard RADIUS attribute “Egress-VLANID (56)” for the local RADIUS Server user group.

Use the **no** variant of this command to remove the Egress-VLANID attribute from the local RADIUS server user group.

**Syntax** `egress-vlan-id <vid> [tagged|untagged]`  
`no egress-vlan-id`

Parameter	Description
<vid>	The VLAN identifier to be used for the Egress VLANID attribute, in the range 1 to 4094.
tagged	Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.
untagged	Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged.

**Default** By default, no Egress-VLANID attributes are configured.

**Mode** RADIUS Server Group Configuration

**Examples** To set the “Egress-VLANID” attribute for the *NormalUsers* local RADIUS server user group to VLAN identifier 200, with tagged frames, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-id 200 tagged
```

To remove the “Egress-VLANID” attribute for the *NormalUsers* local RADIUS server user group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-id
```

**Related commands** [attribute](#)  
[egress-vlan-name](#)

# egress-vlan-name

**Overview** Use this command to configure the standard RADIUS attribute "Egress-VLAN-Name (58)" for the local RADIUS server user group.

Use the **no** variant of this command to remove the Egress-VLAN-Name attribute from the local RADIUS server user group.

**Syntax** `egress-vlan-name <vlan-name> [tagged|untagged]`  
`no egress-vlan-name`

Parameter	Description
<code>&lt;vlan-name&gt;</code>	The VLAN name to be configured as the Egress-VLAN-Name attribute.
<code>tagged</code>	Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.
<code>untagged</code>	Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged.

**Default** By default, no Egress-VLAN-Name attributes are configured.

**Mode** RADIUS Server Group Configuration

**Examples** To configure the "Egress-VLAN-Name" attribute for the RADIUS server user group *NormalUsers* with the VLAN name *vlan2* and all frames on this VLAN tagged, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-name vlan2 tagged
```

To delete the "Egress-VLAN-Name" attribute for the *NormalUsers* group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-name
```

**Related commands** [attribute](#)  
[egress-vlan-id](#)

# group

**Overview** Use this command to create a local RADIUS server user group, and enter local RADIUS Server User Group Configuration mode.

Use the **no** variant of this command to delete the local RADIUS server user group.

**Syntax** `group <user-group-name>`  
`no group <user-group-name>`

Parameter	Description
<code>&lt;user-group-name&gt;</code>	User group name string.

**Mode** RADIUS Server Configuration

**Examples** The following command creates the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
```

The following command deletes user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no group NormalUsers
```

**Related commands** [user \(RADIUS server\)](#)  
[show radius local-server user](#)  
[vlan \(RADIUS server\)](#)

# nas

**Overview** This command adds a client device (the Network Access Server or the NAS) to the list of devices that are able to send authentication requests to the local RADIUS server. The NAS is identified by its IP address and a shared secret (also referred to as a shared key) must be defined that the NAS will use to establish its identity.

Use the **no** variant of this command to remove a NAS client from the list of devices that are allowed to send authentication requests to the local RADIUS server.

**Syntax** `nas <ip-address> key <nas-keystring>`  
`no nas <ip-address>`

Parameter	Description
<code>&lt;ip-address&gt;</code>	RADIUS NAS IP address.
<code>&lt;nas-keystring&gt;</code>	NAS shared keystring.

**Mode** RADIUS Server Configuration

**Examples** The following commands add the NAS with an IP address of 192.168.1.2 to the list of clients that may send authentication requests to the local RADIUS server. Note the shared key that this NAS will use to establish its identify is NAS\_PASSWORD.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# nas 192.168.1.2 key NAS_PASSWORD
```

The following commands remove the NAS with an IP address of 192.168.1.2 from the list of clients that are allowed to send authentication requests to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no nas 192.168.1.2
```

**Related commands** [show radius local-server nas](#)

# help radius-attribute

**Overview** Use this command to display a list of standard and vendor specific valid RADIUS attributes that are supported by the local RADIUS server.

**Syntax** `help radius-attribute [<attribute-name>|<attribute-ID>]`

Parameter	Description
<code>&lt;attribute-name&gt;</code>	List the details and predefined values for the named attribute.
<code>&lt;attribute-ID&gt;</code>	List the details and predefined values for the given attribute ID.

**Mode** Privileged Exec

**Usage notes** When used without a parameter, this command lists all of the available RADIUS attributes.

When used with an attribute name or ID, this command displays the attribute name, value type, and any predefined values.

**Example** To list all available RADIUS attributes, use the following command:

```
awplus# help radius-attribute
```

```
awplus#help radius-attribute
Standard Attributes:
 1      User-Name
 2      User-Password
 3      CHAP-Password
 4      NAS-IP-Address
 5      NAS-Port
 6      Service-Type
...
```

To display the details for the RADIUS attribute Frag-Status, use the following command:

```
awplus# help radius-attribute frag-status
```

```
awplus#help radius-attribute frag-status
Frag-Status : integer (Integer number)

Pre-defined values :
  Fragmentation-Supported (1)
  More-Data-Pending (2)
  More-Data-Request (3)
  Reserved (0)
```

# radius-secure-proxy local-server

**Overview** Use this command to enter the RadSecProxy local-server application configuration mode. This application allows remote RadSec clients to communicate with the local RADIUS server process via a secure (TLS) proxy.

**Syntax** `radius-secure-proxy local-server`

**Mode** Global Configuration Mode

**Example** To change mode from User Exec mode to the RadSecProxy local-server configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)#
```

**Related commands**

- [client \(radsecproxy-srv\)](#)
- [client name-check](#)
- [client trustpoint](#)

# radius-server local

**Overview** Use this command to navigate to the Local RADIUS server configuration mode (`config-radsrv`) from the Global Configuration mode (`config`).

**Syntax** `radius-server local`

**Mode** Global Configuration

**Example** Local RADIUS Server commands are available from `config-radsrv` configuration mode. To change mode from User Exec mode to the Local RADIUS Server mode (`config-radsrv`), use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)#
```

## Output

```
awplus(config)#radius-server local
Creating Local CA repository.....OK
Enrolling Local System to local trustpoint..OK
awplus(config-radsrv)#
```

**Related commands**

# server auth-port

**Overview** Use this command to change the UDP port number for local RADIUS server authentication.

Use the **no** variant of this command to reset the RADIUS server authentication port back to the default.

**Syntax** `server auth-port <1-65535>`  
`no server auth-port`

Parameter	Description
<1-65535>	UDP port number.

**Default** The default local RADIUS server UDP authentication port number is 1812.

**Mode** RADIUS Server Configuration

**Examples** The following commands set the RADIUS server authentication port to 10000.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server auth-port 10000
```

The following commands reset the RADIUS server authentication port back to the default UDP port of 1812.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server auth-port
```

**Related commands** [server enable](#)  
[show radius local-server statistics](#)

# server enable

**Overview** This command enables the local RADIUS server. The local RADIUS server feature is started immediately when this command is issued.

The **no** variant of this command disables local RADIUS server. When this command is issued, the local RADIUS server stops operating.

**Syntax** `server enable`  
`no server enable`

**Default** The local RADIUS server is disabled by default and must be enabled for use with this command.

**Mode** RADIUS Server Configuration

**Examples** To enable the local RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server enable
```

To disable the local RADIUS server, use the command:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server enable
```

**Related commands** [server auth-port](#)  
[show radius local-server statistics](#)

# show radius local-server group

**Overview** Use this command to display information about the local RADIUS server user group.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show radius local-server group [<user-group-name>]`

Parameter	Description
<code>&lt;user-group-name&gt;</code>	User group name string.

**Mode** User Exec and Privileged Exec

**Example** The following command displays Local RADIUS server user group information.

```
awplus# show radius local-server group
```

## Output

**Table 1:** Example output from the **show radius local-server group** command

Group-Name	Vlan
-----	-----
NetworkOperators	ManagementNet
NormalUsers	CommonNet

**Table 2:** Parameters in the output of the **show radius local-server group** command

Parameter	Description
Group-Name	Group name.
Vlan	VLAN name assigned to the group.

**Related commands** [group](#)

# show radius local-server nas

**Overview** Use this command to display information about NAS (Network Access Servers) registered to the local RADIUS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show radius local-server nas [<ip-address>]`

Parameter	Description
<ip-address>	Specify NAS IP address for show output.

**Mode** User Exec and Privileged Exec

**Example** The following command displays NAS information.

```
awplus# show radius local-server nas
```

## Output

**Table 3:** Example output from the **show radius local-server nas** command

NAS-Address	Shared-Key
127.0.0.1	awplus-local-radius-server

**Table 4:** Parameters in the output of the **show radius local-server nas** command

Parameter	Description
NAS-Address	IP address of NAS.
Shared-Key	Shared key used for RADIUS connection.

**Related commands** `nas`

# show radius local-server statistics

**Overview** Use this command to display statistics about the local RADIUS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show radius local-server statistics

**Mode** User Exec and Privileged Exec

**Usage notes** Both unknown usernames and invalid passwords will display as failed logins in the show output.

**Example** The following command displays Local RADIUS server statistics.

```
awplus# show radius local-server statistics
```

## Output

**Table 5:** Example output from the **show radius local-server statistics** command

```

# show radius local-server user

**Overview** Use this command to display information about the local RADIUS server user.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax**

```
show radius local-server user [<user-name>]  
show radius local-server user [<user-name>] format csv  
show radius local-server user [<user-name>] detail
```

Parameter	Description
<user-name>	RADIUS user name. If no user name is specified, information for all users is displayed.
format csv	Format output as CSV.
detail	Display detailed information about the user.

**Mode** User Exec and Privileged Exec

**Examples** The following command displays Local RADIUS server user information for user Tom.

```
awplus# show radius local-server user Tom
```

**Table 6:** Example output from the **show radius local-server user** command

User-Name	Password	Group	Vlan
Tom	abcd	NetworkOperators	ManagementNet

The following command displays all Local RADIUS server information for all users.

```
awplus# show radius local-server user
```

The following command displays Local RADIUS server user information for Tom in CSV format.

```
awplus# show radius local-server user Tom format csv
```

**Table 7:** Example output from the **show radius local-server user Tom format csv** command

true,"NetworkOperators","Tom","abcd",0,2099/01/01,1,"","","ManagementNet",false,3600,false,0,"",false,"
---

The following command displays detailed Local RADIUS server user information for all users.

```
awplus# show radius local-server detail
```

**Table 8:** Example output from the **show radius local-server detail** command

```
awplus# show radius local-server user detail
-----
Username   : 00-00-cd-38-00-68
Password   : mssv+c7URUgtfltKy46Rt0VgPefRdihWOXEUEcM8Bw=
Group      : GroupName
Vlan       : VlanName

Group      : GroupName
Vlan       : VlanName
```

**Table 9:** Parameters in the output from the **show radius local-server user** command

Parameter	Description
User-Name	User name.
Password	User password.
Group	Group name assigned to the user.
Vlan	VLAN name assigned to the user.

**Related commands**

group  
user (RADIUS server)

**Command changes**

Version 5.4.9-0.1: **detail** parameter added

# user (RADIUS server)

**Overview** Use this command to register a user to the local RADIUS server.  
Use the **no** variant of this command to delete a user from the local RADIUS server.

**Syntax** `user <radius-user-name> [encrypted] password <user-password>  
[group <user-group>]`  
`no user <radius-user-name>`

Parameter	Description
<code>&lt;radius-user-name&gt;</code>	RADIUS user name. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.
<code>encrypted</code>	Specifies that the password is being entered in its encrypted form, so that it is not further encrypted. When creating a new user, enter the password in plaintext, and do not use the <b>encrypted</b> parameter. Use the <b>encrypted</b> parameter only when referring to a user that has previously been created. For instance, when adding an existing user from another RADIUS server, use the <b>encrypted</b> parameter, and enter the encrypted version of the password that appears in the output of <b>show</b> commands for the user.
<code>&lt;user-password&gt;</code>	User password. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.
<code>group</code>	Specify the group for the user.
<code>&lt;user-group&gt;</code>	User group name.

**Mode** RADIUS Server Configuration

**Usage notes** RADIUS user names cannot contain question mark (?), space ( ), or quote (" ") characters. RADIUS user names containing the below characters cannot use certificate authentication:

`/ \ '$ &()*!< > `|`

Certificates cannot be created and exported for RADIUS user names that contain the above characters. We advise you to avoid using these characters in RADIUS user names if you need to use certificate authentication, because you will not be able to create and export certificates.

You also can use the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) to specify a supplicant MAC address to configure the user name and user password parameters to use local RADIUS server for MAC Authentication. See the [AAA and Port\\_Authentication Feature Overview and Configuration\\_Guide](#) for a sample MAC configuration. See also the command **user**

**00-db-59-ab-70-37 password 00-db-59-ab-70-37** as shown in the command examples.

**Examples** The following commands add user "Tom" to the local RADIUS server and sets his password to "QwerSD".

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD
```

The following commands add user "Tom" to the local RADIUS server user group "NormalUsers" and sets his password "QwerSD".

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD group
NormalUsers
```

The following commands remove user "Tom" from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user Tom
```

The following commands add the supplicant MAC address 00-d0-59-ab-70-37 to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user 00-db-59-ab-70-37 password
00-db-59-ab-70-37
```

The following commands remove the supplicant MAC address 00-d0-59-ab-70-37 from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user 00-db-59-ab-70-37
```

**Related commands** [group](#)  
[show radius local-server user](#)

## vlan (RADIUS server)

**Overview** Use this command to set the VLAN ID or name for the local RADIUS server user group. The VLAN information is used for authentication with the dynamic VLAN feature.

Use the **no** variant of this command to clear the VLAN ID or VLAN name for the local RADIUS server user group.

**Syntax** `vlan {<vid>|<vlan-name>}`  
`no vlan`

Parameter	Description
<code>&lt;vid&gt;</code>	VLAN ID.
<code>&lt;vlan-name&gt;</code>	VLAN name.

**Default** VLAN information is not set by default.

**Mode** RADIUS Server Group Configuration

**Examples** The following commands set VLAN ID 200 to the group named *NormalUsers*:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# vlan 200
```

The following commands remove VLAN ID 200 from the group named *NormalUsers*:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no vlan
```

**Related commands** [group](#)

# Public Key Infrastructure and Crypto Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure the Public Key Infrastructure (PKI) capabilities on an AlliedWare Plus device. For more information about PKI, see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#).

- Command List**
- “crypto key generate rsa” on page 2332
  - “crypto key zeroize” on page 2333
  - “crypto pki authenticate” on page 2334
  - “crypto pki enroll” on page 2335
  - “crypto pki enroll user” on page 2336
  - “crypto pki export pem” on page 2338
  - “crypto pki export pkcs12” on page 2339
  - “crypto pki import pem” on page 2341
  - “crypto pki import pkcs12” on page 2343
  - “crypto pki trustpoint” on page 2344
  - “enrollment (ca-trustpoint)” on page 2345
  - “fingerprint (ca-trustpoint)” on page 2346
  - “no crypto pki certificate” on page 2348
  - “rsakeypair (ca-trustpoint)” on page 2349
  - “show crypto key mypubkey rsa” on page 2350
  - “show crypto pki certificates” on page 2351
  - “show crypto pki enrollment user” on page 2353
  - “show crypto pki trustpoint” on page 2354
  - “subject-name (ca-trustpoint)” on page 2355

# crypto key generate rsa

**Overview** Use this command to generate a cryptographic public/private key pair for the Rivest-Shamir-Adleman (RSA) encryption algorithm.

**Syntax** `crypto key generate rsa [label <keylabel>] [<1024-4096>]`

Parameter	Description
<keylabel>	The name of the key to be created. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. If no label is specified the default value "server-default" is used.
<1024-4096>	The bit length for the key. If no bit length is specified the default of 2048 is used.

**Mode** Privileged Exec

**Usage notes** The generated key may be used for multiple server certificates in the system. A key is referenced by its label. A bit length between 1024 and 4096 bits may be specified. Larger bit lengths are more secure, but require more computation time. The specified key must not already exist.

**Example** To create a key with the label "example-server-key" and a bit length of 2048, use the commands:

```
awplus> enable
awplus# crypto key generate rsa label example-server-key 2048
```

**Related commands**

- [crypto key zeroize](#)
- [rsakeypair \(ca-trustpoint\)](#)
- [show crypto key mypubkey rsa](#)

# crypto key zeroize

**Overview** Use this command to delete one or all cryptographic public/private key pairs.

**Syntax** `crypto key zeroize rsa <keylabel>`  
`crypto key zeroize all`

Parameter	Description
<code>rsa &lt;keylabel&gt;</code>	Delete a single key pair for the Rivest-Shamir-Adleman (RSA) encryption algorithm.
<code>all</code>	Delete all keys.

**Mode** Privileged Exec

**Usage notes** Note that this command has the same effect as using the **delete** command (it deletes the file from Flash memory but does not overwrite it with zeros).

The specified key must exist but must not be in use for any existing server certificates.

A key may not be deleted if it is associated with the server certificate or server certificate signing request for an existing trustpoint. To remove a server certificate so that the key may be deleted, use the **no crypto pki enroll** command to de-enroll the server.

**Example** To delete an RSA key named "example-server-key", use the following command:

```
awplus# crypto key zeroize rsa example-server-key
```

**Related commands** [crypto key generate rsa](#)  
[show crypto key mypubkey rsa](#)

**Command changes** Version 5.4.6-1.1: zeroize functionality added to x930 Series  
Version 5.4.8-1.2: zeroize functionality added to x220, XS900MX, x550 Series  
Version 5.4.8-2.1: zeroize functionality added to SBx908 GEN2, x950 Series

# crypto pki authenticate

**Overview** Use this command to authenticate a trustpoint by generating or importing the root CA certificate. This must be done before the server can be enrolled to the trustpoint.

**Syntax** `crypto pki authenticate <trustpoint>`

Parameter	Description
<code>&lt;trustpoint&gt;</code>	The name of the trustpoint to be authenticated.

**Mode** Privileged Exec

**Usage notes** If the trustpoint's **enrollment** setting is "selfsigned", then this command causes a private key to be generated for the root CA, and a self-signed certificate to be generated based on that key.

If the trustpoint's **enrollment** setting is "terminal", then this command prompts the user to paste a certificate Privacy Enhanced Mail (PEM) file at the CLI terminal. If the certificate is a valid selfsigned CA certificate, then it will be stored as the trustpoint's root CA certificate.

The specified trustpoint must already exist, and its enrollment mode must have been defined.

**Example** To show the **enrollment** setting of a trustpoint named "example" and then generate a certificate from it, use the commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# enrollment selfsigned
awplus(config)# exit
awplus# exit
awplus# crypto pki authenticate example
```

**Related commands**

- [crypto pki import pem](#)
- [crypto pki trustpoint](#)
- [enrollment \(ca-trustpoint\)](#)

# crypto pki enroll

**Overview** Use this command to enroll the local server to the specified trustpoint.  
Use the **no** variant of this command to de-enroll the server by removing its certificate

**Syntax** `crypto pki enroll <trustpoint>`  
`no crypto pki enroll <trustpoint>`

Parameter	Description
<code>&lt;trustpoint&gt;</code>	The name of the trustpoint to be enrolled

**Mode** Privileged Exec

**Usage notes** For the local server, “enrollment” is the process of creating of a certificate for the server that has been signed by a CA associated with the trustpoint. The public portion of the RSA key pair specified using the `rsa` parameter for the trustpoint will be included in the server certificate.

If the trustpoint represents a locally self-signed certificate authority, then this command results in the direct generation of the server certificate, signed by the root CA for the trustpoint.

If the trustpoint represents an external certificate authority, then this command results in the generation of a Certificate Signing Request (CSR) file, which is displayed at the terminal in Privacy-Enhanced Mail (PEM) format, suitable for copying and pasting into a file or message. The CSR must be sent to the external CA for processing. When the CA replies with the signed certificate, that certificate should be imported using the `crypto pki import pem` command, to complete the enrollment process.

The specified trustpoint must already exist, and it must already be authenticated.

**Example** To enroll the local server with the trustpoint “example”, use the following commands:

```
awplus> enable
awplus# crypto pki enroll example
```

**Related commands** [crypto pki enroll user](#)  
[crypto pki import pem](#)  
[crypto pki trustpoint](#)  
[enrollment \(ca-trustpoint\)](#)

# crypto pki enroll user

**Overview** Use this command to enroll a single RADIUS user or all RADIUS users to the specified trustpoint.

Use the **no** variant of this command to remove the PKCS#12 file from the system. Note that the PKCS#12 files are generated in a temporary (volatile) file system, so a system restart also results in removal of all of the files.

**Syntax**

```
crypto pki enroll <trustpoint>
{user <username>|local-radius-all-users}

no crypto pki enroll <trustpoint>
{user <username>|local-radius-all-users}
```

Parameter	Description
<trustpoint>	The name of the trustpoint to which users are to be enrolled.
<username>	The name of the user to enroll to the trustpoint.

**Mode** Privileged Exec

**Usage notes** For RADIUS users, “enrollment” is the process of generating a private key and a corresponding client certificate for each user, with the certificate signed by the root CA for the trustpoint. The resulting certificates may be exported to client devices, for use with PEAP or EAP-TLS authentication with the local RADIUS server.

The specified trustpoint must represent a locally self-signed certificate authority.

The private key and certificate are packaged into a PKCS#12-formatted file, suitable for export using the **crypto pki export pkcs12** command. The private key is encrypted for security, with a passphrase that is entered at the command line. The passphrase is required when the PKCS#12 file is imported on the client system. The passphrase is not stored anywhere on the device, so users are responsible for remembering it until the export-import process is complete.

If **local-radius-all-users** is specified instead of an individual user, then keys and certificates for all RADIUS users will be generated at once. All the keys will be encrypted using the same passphrase.

The specified trustpoint must already exist, it must represent a locally self-signed CA, and it must already have been authenticated.

**Example** To enroll the user “example-user” with the trustpoint “example”, use the following commands:

```
awplus> enable
awplus# crypto pki enroll example user example-user
```

To enroll all local RADIUS users with the trustpoint "example", use the following commands:

```
awplus> enable
```

```
awplus# crypto pki enroll example local-radius-all-users
```

**Related commands**

- [crypto pki export pkcs12](#)
- [crypto pki trustpoint](#)

# crypto pki export pem

**Overview** Use this command to export the root CA certificate for the given trustpoint to a file in Privacy-Enhanced Mail (PEM) format. The file may be transferred to the specified destination URL, or displayed at the terminal.

**Syntax** `crypto pki export <trustpoint> pem [terminal|<url>]`

Parameter	Description
<trustpoint>	The name of the trustpoint for which the root CA certificate is to be exported.
terminal	Display the PEM file to the terminal.
<url>	Transfer the PEM file to the specified URL.

**Default** The PEM will be displayed to the terminal by default.

**Mode** Privileged Exec

**Usage notes** The specified trustpoint must already exist, and it must already be authenticated.

**Example** To display the PEM file for the trustpoint "example" to the terminal, use the following commands:

```
awplus> enable
awplus# crypto pki export example pem terminal
```

To export the PEM file "example.pem" for the trustpoint "example" to the URL "tftp://server\_a/", use the following commands:

```
awplus> enable
awplus# crypto pki export example pem
tftp://server_a/example.pem
```

**Related commands**

- [crypto pki authenticate](#)
- [crypto pki import pem](#)
- [crypto pki trustpoint](#)

# crypto pki export pkcs12

**Overview** Use this command to export a certificate and private key for an entity in a trustpoint to a file in PKCS#12 format at the specified URL. The private key is encrypted with a passphrase for security.

**Syntax** `crypto pki export <trustpoint> pkcs12 {ca|server|<username>} <url>`

Parameter	Description
<trustpoint>	The name of the trustpoint for which the certificate and key are to be exported.
ca	If this option is specified, the command exports the root CA certificate and corresponding key.
server	If this option is specified, the command exports the server certificate and corresponding key.
<username>	If a RADIUS username is specified, the command exports the PKCS#12 file that was previously generated using the <code>crypto pki enroll user</code> command. To avoid ambiguity with keywords, the username may be prefixed by the string "user:".
<url>	The destination URL for the PKCS#12 file. The format of the URL is the same as any valid destination for a file copy command.

**Mode** Privileged Exec

**Usage notes** If the **ca** option is specified, this command exports the root CA certificate and the corresponding private key, if the trustpoint has been authenticated as a locally selfsigned CA. (If the trustpoint represents an external CA, then there is no private key on the system corresponding to the root CA certificate. Use the **crypto pki export pem** file to export the certificate by itself.) The command prompts for a passphrase to encrypt the private key.

If the **server** option is specified, this command exports the server certificate and the corresponding private key, if the server has been enrolled to the trustpoint. The command prompts for a passphrase to encrypt the private key.

If a RADIUS username is specified, this command exports the PKCS#12 file that was generated using the **crypto pki enroll user** command. (The key within the file was already encrypted as part of the user enrollment process.)

In the event that there is a RADIUS user named "ca" or "server", enter "user:ca" or "user:server" as the username.

The key and certificate must already exist.

**Example** To export the PKCS#12 file "example.pk12" for the trustpoint "example" to the URL "tftp://backup/", use the following commands:

```
awplus> enable  
  
awplus# crypto pki export example pkcs12 ca  
tftp://backup/example.pk12
```

**Related commands**

- crypto pki enroll user
- crypto pki export pem
- crypto pki import pkcs12

# crypto pki import pem

**Overview** This command imports a certificate for the given trustpoint from a file in Privacy-Enhanced Mail (PEM) format. The file may be transferred from the specified destination URL, or entered at the terminal.

**Syntax** `crypto pki import <trustpoint> pem [terminal|<url>]`

Parameter	Description
<code>&lt;trustpoint&gt;</code>	The name of the trustpoint for which the root CA certificate is to be imported.
<code>terminal</code>	Optional parameter, If specified, the command prompts the user to enter (or paste) the PEM file at the terminal. If parameter is specified terminal is assumed by default.
<code>&lt;url&gt;</code>	Optional parameter, If specified, the PEM file is transferred from the specified URL

**Default** The PEM will be imported from the terminal by default.

**Mode** Privileged Exec

**Usage notes** The command is generally used for trustpoints representing external certificate authorities. It accepts root CA certificates, intermediate CA certificates, and server certificates. The system automatically detects the certificate type upon import.

Using this command to import root CA certificates at the terminal is identical to the functionality provided by the `crypto pki authenticate` command, for external certificate authorities. The imported certificate is validated to ensure it is a proper CA certificate.

Intermediate CA certificates are validated to ensure they are proper CA certificates, and that the issuer chain ends in a root CA certificate already installed for the trustpoint. If there is no root CA certificate for the trustpoint (i.e., if the trustpoint is unauthenticated) then intermediate CA certificates may not be imported.

Server certificates are validated to ensure that the issuer chain ends in a root CA certificate already installed for the trustpoint. If there is no root CA certificate for the trustpoint (i.e., if the trustpoint is unauthenticated) then server certificates may not be imported.

The specified trustpoint must already exist. If the imported certificate is self-signed, then no certificates may exist for the trustpoint. Otherwise, the issuer's certificate must already be present for the trustpoint.

**Example** To import the PEM file for the trustpoint "example" from the terminal, use the following commands:

```
awplus> enable
awplus# crypto pki import example pem
```

To import the PEM file for the trustpoint "example" from the URL "tftp://server\_a/", use the following commands:

```
awplus> enable  
  
awplus# crypto pki import example pem  
tftp://server_a/example.pem
```

**Related commands**

- crypto pki authenticate
- crypto pki export pem
- crypto pki trustpoint

# crypto pki import pkcs12

**Overview** This command imports a certificate and private key for an entity in a trustpoint from a file in PKCS#12 format at the specified URL. The command prompts for a passphrase to decrypt the private key within the file.

**Syntax** `crypto pki import <trustpoint> pkcs12 {ca|server} <url>`

Parameter	Description
<trustpoint>	The name of the trustpoint for which the certificate and key are to be imported.
ca	If this option is specified, the command imports the root CA certificate and corresponding key.
server	If this option is specified, the command imports the server certificate and corresponding key.
<url>	The source URL for the PKCS#12 file. The format of the URL is the same as any valid destination for a file copy command.

**Mode** Privileged Exec

**Usage notes** If the **ca** option is specified, this command imports the root CA certificate and the corresponding private key. This is only valid if the root CA certificate does not already exist for the trustpoint (i.e., if the trustpoint is unauthenticated).

If the **server** option is specified, this command imports the server certificate and the corresponding private key. The imported private key is given a new unique label of the form "localN", where N is a non-negative integer. This operation is only valid if the server certificate does not already exist for the trustpoint (i.e., if the server is not enrolled to the trustpoint).

PKCS#12 files for RADIUS users may not be imported with this command. (There is no value in doing so, as the files are not needed on the local system.)

The specified trustpoint must already exist. The key and certificate must not already exist.

**Example** To import the PKCS#12 file "example.pk12" for the trustpoint "example" to the URL "tftp://backup/", use the following commands:

```
awplus> enable
awplus# crypto pki import example pkcs12 ca
tftp://backup/example.pk12
```

**Related commands** [crypto pki export pkcs12](#)  
[crypto pki import pem](#)

# crypto pki trustpoint

**Overview** Use this command to declare the named trustpoint and enter trustpoint configuration mode.

Use the **no** variant of this command to destroy the trustpoint.

**Syntax** `crypto pki trustpoint <trustpoint>`  
`no crypto pki trustpoint <trustpoint>`

Parameter	Description
<code>&lt;trustpoint&gt;</code>	The name of the trustpoint. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters.

**Mode** Global Configuration

**Usage notes** If the trustpoint did not previously exist, it is created as a new trustpoint. The trustpoint will be empty (unauthenticated) unless the name "local" is selected, in which case the system will automatically authenticate the trustpoint as a local self-signed certificate authority.

The **no** variant of this command destroys the trustpoint by removing all CA and server certificates associated with the trustpoint, as well as the private key associated with the root certificate (if the root certificate was locally self-signed). This is a destructive and irreversible operation, so this command should be used with caution.

**Example** To configure a trustpoint named "example", use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
```

**Related commands** [show crypto pki certificates](#)  
[show crypto pki trustpoint](#)

**Command changes** Version 5.4.6-1.1: command added to x930 Series  
Version 5.4.8-1: command added to x220, XS900MX, x550 Series  
Version 5.4.8-2.1: command added to SBx908 GEN2, x950 Series

# enrollment (ca-trustpoint)

**Overview** Use this command to declare how certificates will be added to the system for the current trustpoint.

**Syntax** `enrollment {selfsigned|terminal}`

Parameter	Description
<code>selfsigned</code>	Sets the enrollment mode for the current trustpoint to selfsigned.
<code>terminal</code>	Sets the enrollment mode for the current trustpoint to terminal.

**Mode** Trustpoint Configuration

**Usage notes** If the enrollment is set to **selfsigned**, then the system will generate a root CA certificate and its associated key when the **crypto pki authenticate** command is issued. It will generate a server certificate (signed by the root CA certificate) when the **crypto pki enroll** command is issued.

If the enrollment is set to **terminal**, then the system will prompt the user to paste the root CA certificate Privacy Enhanced Mail (PEM) file at the terminal, when the **crypto pki authenticate** command is issued. It will create a Certificate Signing Request (CSR) file for the local server when the **crypto pki enroll** command is issued. The server certificate received from the external CA should be imported using the **crypto pki import pem** command.

The trustpoint named "local" may only use the **selfsigned** enrollment setting.

If no enrollment mode is specified, the **crypto pki authenticate** command will fail for the trustpoint.

**Example** To configure the trustpoint named "example" and set its enrollment to **selfsigned**, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# enrollment selfsigned
```

**Related commands** [crypto pki enroll](#)

# fingerprint (ca-trustpoint)

**Overview** Use this command to declare that certificates with the specified fingerprint should be automatically accepted, when importing certificates from an external certificate authority. This can affect the behavior of the **crypto pki authenticate** and **crypto pki import pem** commands.

Use the **no** variant of this command to remove the specified fingerprint from the pre-accepted list.

**Syntax** fingerprint <word>  
no fingerprint <word>

Parameter	Description
<word>	The fingerprint as a series of 40 hexadecimal characters, optionally separated into multiple character strings.

**Default** By default, no fingerprints are pre-accepted for the trustpoint.

**Mode** Trustpoint Configuration

**Usage notes** Specifying a fingerprint adds it to a list of pre-accepted fingerprints for the trustpoint. When a certificate is imported, if it matches any of the pre-accepted values, then it will be saved in the system automatically. If the imported certificate's fingerprint does not match any pre-accepted value, then the user will be prompted to verify the certificate contents and fingerprint visually.

This command is useful when certificates from an external certificate authority are being transmitted over an insecure channel. If the certificate fingerprint is delivered via a separate messaging channel, then pre-entering the fingerprint value via cut-and-paste may be less errorprone than attempting to verify the fingerprint value visually.

The fingerprint is a series of 40 hexadecimal characters. It may be entered as a continuous string, or as a series of up to multiple strings separated by spaces. The input format is flexible because different certificate authorities may provide the fingerprint string in different formats.

**Example** To configure a fingerprint "5A81D34C 759CC4DA CFCA9F65 0303AD83 410B03AF" for the trustpoint named "example", use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# fingerprint 5A81D34C 759CC4DA CFCA9F65
0303AD83 410B03AF
```

**Related commands** [crypto pki authenticate](#)

## crypto pki import pem

# no crypto pki certificate

**Overview** Use this command to delete a certificate with the specified fingerprint from the specified trustpoint.

**Syntax** `no crypto pki certificate <trustpoint> <word>`

Parameter	Description
<code>&lt;trustpoint&gt;</code>	The name of the trustpoint.
<code>&lt;word&gt;</code>	The fingerprint as a series of 40 hexadecimal characters, optionally separated into multiple character strings.

**Default** By default, no fingerprints are pre-accepted for the trustpoint.

**Mode** Privileged Exec

**Usage notes** The fingerprint can be found in the output of the **show crypto pki certificates** command. If there are dependent certificates in the trustpoint (i.e., if other certificates were signed by the specified certificate), the command will be rejected. If the specified certificate is the root CA certificate and the trustpoint represents a locally selfsigned CA, then the corresponding private key is also deleted from the system. Deleting the root CA certificate effectively resets the trustpoint to an unauthenticated state.

**Example** To delete a certificate with the fingerprint "594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792" from the trustpoint "example", use the following commands:

```
awplus> enable
awplus# no crypto pki certificate example
594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792
```

**Related commands** [no crypto pki trustpoint](#)  
[show crypto pki certificates](#)

# rsakeypair (ca-trustpoint)

**Overview** Use this command to declare which RSA key pair should be used to enroll the local server with the trustpoint. Note that this defines the key pair used with the server certificate, not the key pair used with the root CA certificate.

Use the **no** variant of this command to restore the default value, "server-default".

**Syntax** `rsakeypair <keylabel> [<1024-4096>]`  
`no rsakeypair`

Parameter	Description
<code>&lt;keylabel&gt;</code>	The key to be used with the server certificate for this trustpoint. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters.
<code>&lt;1024-4096&gt;</code>	The bit length for the key, to be used if the key is implicitly generated during server enrollment.

**Default** The default value for **keylabel** is "server-default".  
The default value for the key bit length is 2048.

**Mode** Trustpoint Configuration

**Usage notes** If the label specified does not refer to an existing key created by the **crypto key generate rsa** command, the key will be implicitly generated when the **crypto pki enroll** command is issued to generate the server certificate or the server certificate signing request. The optional numeric parameter defines the bit length for the key, and is only applicable for keys that are implicitly created during enrollment.

This command does not affect server certificates or server certificate signing requests that have already been generated. The trustpoint's server certificate is set to use whatever key pair was specified for the trustpoint at the time the **crypto pki enroll** command is issued.

The default key pair is "server-default". The default bit length is 2048 bits.

**Example** To configure trustpoint "example" to use the key pair "example-server-key" with a bit length of 2048, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# rsakeypair example-server-key 2048
```

**Related commands** [crypto key generate rsa](#)

# show crypto key mypubkey rsa

**Overview** Use this command to display information about the specified Rivest-Shamir-Adleman encryption key.

**Syntax** `show crypto key mypubkey rsa [<keylabel>]`

Parameter	Description
<keylabel>	The name of the key to be shown, if specified.

**Default** By default, all keys will be shown.

**Mode** Privileged Exec

**Usage notes** If no key label is specified, information about all keys is shown. The command displays the bit length of the key, a key fingerprint (a hash of the key contents to help uniquely identify a key), and a list of trustpoints in which the server certificate is using the key.

The specified keys must exist.

**Example** To show all keys, use the following commands:

```
awplus> enable
awplus# show crypto key mypubkey rsa
```

**Output** Figure 48-1: Example output from **show crypto key mypubkey rsa**

```
awplus#show crypto key mypubkey rsa
-----
RSA Key Pair "example-server-key":
  Key size      : 2048 bits
  Fingerprint  : 1A605D73 C2274CB7 853886B3 1C802FC6 7CDE45FB
  Trustpoints   : example
-----
RSA Key Pair "server-default":
  Key size      : 2048 bits
  Fingerprint  : 34AC4D2D 5249A168 29D426A3 434FFC59 C4A19901
  Trustpoints   : local
```

**Related commands** [crypto key generate rsa](#)

# show crypto pki certificates

**Overview** Use this command to display information about existing certificates for the specified trustpoint.

**Syntax** `show crypto pki certificates [<trustpoint>]`

Parameter	Description
<code>&lt;trustpoint&gt;</code>	The trustpoint for which the certificates are to be shown.

**Default** By default, the certificates for all trustpoints are shown.

**Mode** Privileged Exec

**Usage notes** If no trustpoint is specified, certificates for all trustpoints are shown. The command displays the certificates organized into certificate chains. It starts with the server certificate and then displays its issuer, and continues up the issuer chain until the root CA certificate is reached.

For each certificate, the command displays the certificate type, the subject's distinguished name (the entity identified by the certificate), the issuer's distinguished name (the entity that signed the certificate), the validity dates for the certificate, and the fingerprint of the certificate. The fingerprint is a cryptographic hash of the certificate contents that uniquely identifies the certificate.

The specified trustpoints must already exist.

**Example** To show the certificates for the trustpoint "example", use the following command:

```
awplus> enable
awplus# show crypto pki certificates example
```

**Output** Figure 48-2: Example output from **show crypto pki certificates**

```
awplus>enable
awplus#show crypto pki certificates example

```

**Related commands** [crypto pki trustpoint](#)

# show crypto pki enrollment user

**Overview** Use this command to display a list of trustpoints for which RADIUS user enrollments have been performed, using the **crypto pki enroll user** command. This indicates that PKCS#12 files for the user are available for export for the given trustpoints, using the **crypto pki export pkcs12** command.

**Syntax** `crypto pki enrollment user <username>`

Parameter	Description
<code>&lt;username&gt;</code>	The user for which enrollments are to be shown.

**Mode** Privileged Exec

**Example** To show the list of trustpoints to which user "exampleuser1" is enrolled, use the following commands:

```
awplus> enable
awplus(config)# show crypto pki enrollment user exampleuser1
```

**Output** Figure 48-3: Example output from **show crypto pki enrollment user**

```
awplus> enable
awplus# show crypto pki enrollment user exampleuser1
User "exampleuser1" is enrolled to the following trustpoints:
local,example
```

**Related commands** [crypto pki enroll user](#)  
[crypto pki export pkcs12](#)

# show crypto pki trustpoint

**Overview** Use this command to display information about the specified trustpoint.

**Syntax** `show crypto pki trustpoint [<trustpoint>]`

Parameter	Description
<trustpoint>	The name of the trustpoint to be shown

**Default** By default, all trustpoints are shown.

**Mode** Privileged Exec

**Usage notes** If no trustpoint is specified, information about all trustpoints is shown. The command displays the authentication status of the trustpoint, the fingerprint of the root CA certificate (if it exists), the enrollment status of the local server with the trustpoint, a list of any applications that are configured to use the trustpoint, and the trustpoint parameters that were configured from trustpoint-configuration mode.

The specified trustpoints must already exist.

**Example** To show the details of the trustpoint "example", use the following commands:

```
awplus> enable
awplus# show crypto pki trustpoint example
```

**Output** Figure 48-4: Example output from **show crypto pki trustpoint**

```
awplus> enable
awplus# show crypto pki trustpoint example
-----
Trustpoint "example"
  Type           : Self-signed certificate authority
  Root Certificate: 50C1856B EEC7555A 0F3A61F6 690D9463 67DF74D1
  Local Server   : The server is enrolled to this trustpoint.
  Server Key     : example-server-key
  Applications   : RADIUS

Authentication and Enrollment Parameters:
  Enrollment     : selfsigned
  RSA Key Pair   : example-server-key (2048 bits)
-----
```

**Related commands** [crypto pki trustpoint](#)  
[show crypto pki certificates](#)

# subject-name (ca-trustpoint)

**Overview** Use this command to specify the distinguished name string that should be used for the subject field in the server certificate, when enrolling the server (generating the server certificate or server certificate signing request).

**Syntax** `subject-name <word>`

Parameter	Description
<code>&lt;word&gt;</code>	Specify the subject name as a distinguished name string. Complex strings (e.g., strings containing spaces) should be surrounded with double-quote characters.

**Default** If no subject name is specified for the trustpoint, then the system automatically builds a name of the form `/O=AlliedWare Plus/CN=xxxx.yyyy.zzz`, where `xxxx` is the hostname of the system and `yyyy.zzz` is the default search domain for the system.

**Mode** Trustpoint Configuration

**Usage notes** The subject name is specified as a variable number of fields, where each field begins with a forward-slash character (`/`). Each field is of the form `XX=value`, where `XX` is the abbreviation of the node type in the tree.

Common values include:

- `"C"` (country),
- `"ST"` (state),
- `"L"` (locality),
- `"O"` (organization),
- `"OU"` (organizational unit), and
- `"CN"` (common name).

Of these fields, `"CN"` is usually the most important.

**NOTE:** For a server certificate, many applications require that the network name of the server matches the common name in the server's certificate.

**Example** To configure the trustpoint named "example" and set its subject name, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# subject-name "/O=My
Company/CN=192.168.1.1
```

**Related  
commands** `crypto pki enroll`

# 49

# TACACS+ Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the device to use TACACS+ servers. For more information about TACACS+, see the [TACACS+ Feature Overview and Configuration Guide](#).

- Command List**
- [“aaa authorization commands”](#) on page 2358
  - [“aaa authorization config-commands”](#) on page 2360
  - [“authorization commands”](#) on page 2361
  - [“ip tacacs source-interface”](#) on page 2363
  - [“show tacacs+”](#) on page 2364
  - [“tacacs-server host”](#) on page 2366
  - [“tacacs-server key”](#) on page 2368
  - [“tacacs-server timeout”](#) on page 2369

# aaa authorization commands

**Overview** This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

**Syntax** `aaa authorization commands <privilege-level>  
{default|<list-name>} group tacacs+ [none]`  
`no aaa authorization commands <privilege-level>  
{default|<list-name>}`

Parameter	Description
<code>&lt;privilege-level&gt;</code>	The privilege level of the set of commands the method list will be applied to. AlliedWare Plus defines three sets of commands, that are indexed by a level value: <b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive <b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive <b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15
<code>group</code>	Specify the server group where authorization messages are sent. Only the <code>tacacs+</code> group is available for this command.
<code>tacacs+</code>	Use all TACACS+ servers configured by the <code>tacacs-server host</code> command.
<code>default</code>	Configure the default authorization commands method list.
<code>&lt;list-name&gt;</code>	Configure a named authorization commands method list
<code>none</code>	If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.

**Mode** Global Configuration

**Usage notes** TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.

- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

**Example** To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 15 TAC15 group
tacacs+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 7 default group
tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization commands 15 TAC15
```

**Related commands** [aaa authorization config-commands](#)  
[authorization commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# aaa authorization config-commands

**Overview** Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

**Syntax** `aaa authorization config-commands`  
`no aaa authorization config-commands`

**Default** By default, command authorization is disabled on configuration mode commands.

**Mode** Global Configuration

**Usage notes** If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

**NOTE:** *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

**Example** To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

**Related commands** [aaa authorization commands](#)  
[authorization commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# authorization commands

**Overview** This command applies a command authorization method list, defined using the [aaa authorization commands](#) command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

**Syntax** `authorization commands <privilege-level> {default|<list-name>}`  
`no authorization commands <privilege-level>`

Parameter	Description
<code>&lt;privilege-level&gt;</code>	The privilege level of the set of commands the method list will be applied to. AlliedWare Plus defines three sets of commands, that are indexed by a level value: <b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive <b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive <b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15
<code>default</code>	Configure the default authorization commands method list.
<code>&lt;list-name&gt;</code>	Configure a named authorization commands method list

**Default** The **default** method list is applied to each console and VTY line by default.

**Mode** Line Configuration

**Usage notes** If the specified method list does not exist users will not be able to execute any commands in the specified method list on the specified VTY lines.

**Example** To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

**Related commands** [aaa authorization commands](#)

aaa authorization config-commands

tacacs-server host

**Command changes** Version 5.4.6-2.1: command added

# ip tacacs source-interface

**Overview** This command sets the source interface, or IP address, to use for all TACACS+ packets sent from the device. By default, TACACS+ packets use the source IP address of the egress interface.

Use the **no** variant of this command to remove the source interface configuration and use the source IP address of the egress interface.

**Syntax** `ip tacacs source-interface {<interface>|<ip-address>}`  
`no ip tacacs source-interface`

Parameter	Description
<code>&lt;interface&gt;</code>	Interface name.
<code>&lt;ip-address&gt;</code>	IP address in the dotted decimal format A.B.C.D.

**Default** The source IP address of outgoing TACACS+ packets default to the IP address of the egress interface.

**Mode** Global Configuration

**Usage notes** Setting the source interface ensures that all TACACS+ packets sent from the device will have the same source IP address. Once configured this affects all TACACS+ packets, namely accounting, authentication, and authorization.

If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing TACACS+ packets will default to the IP address of the egress interface.

**Example** To configure all outgoing TACACS+ packets to use the IP address of the loop-back "lo" interface as the source IP address, use the following commands:

```
awplus# configure terminal  
awplus(config)# ip tacacs source-interface lo
```

To reset the source interface configuration for all TACACS+ packets, use the following commands:

```
awplus# configure terminal  
awplus(config)# no ip tacacs source-interface
```

**Related commands** [tacacs-server host](#)  
[show tacacs+](#)

**Command changes** Version 5.4.6-2.1: command added

# show tacacs+

**Overview** This command displays the current TACACS+ server configuration and status.

**Syntax** show tacacs+

**Mode** User Exec and Privileged Exec

**Example** To display the current status of TACACS+ servers, use the command:

```
awplus# show tacacs+
```

**Output** Figure 49-1: Example output from the **show tacacs+** command

```
TACACS+ Global Configuration
  Source Interface      : not configured
  Timeout              : 5 sec

Server Host/          Server
IP Address            Status
-----
192.168.1.10         Alive
192.168.1.11         Unknown
```

**Table 1:** Parameters in the output of the **show tacacs+** command

Output Parameter	Meaning	
Source Interface	IP address of source interface if set with <code>ip tacacs source-interface</code> .	
Timeout	A time interval in seconds.	
Server Host/IP Address	TACACS+ server hostname or IP address.	
Server Status	The status of the authentication port.	
	Alive	The server is alive.
	Dead	The server has timed out.
	Error	The server is not responding or there is an error in the key string entered.
	Unknown	The server is never used or the status is unknown.
	Unreachable	The server is unreachable.
	Unresolved	The server name can not be resolved.

**Command changes** Version 5.4.6-2.1: **Source Interface** parameter added

# tacacs-server host

**Overview** Use this command to specify a remote TACACS+ server host for authentication, authorization and accounting, and to set the shared secret key to use with the TACACS+ server. The parameters specified with this command override the corresponding global parameters for TACACS+ servers.

Use the **no** variant of this command to remove the specified server host as a TACACS+ authentication and authorization server.

**Syntax** `tacacs-server host {<host-name>|<ip-address>} [key [8]<key-string>]`  
`no tacacs-server host {<host-name>|<ip-address>}`

Parameter	Description
<code>&lt;host-name&gt;</code>	Server host name. The DNS name of the TACACS+ server host.
<code>&lt;ip-address&gt;</code>	The IP address of the TACACS+ server host, in dotted decimal notation A.B.C.D.
<code>key</code>	Set shared secret key with TACACS+ servers.
<code>8</code>	Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password. The running config displays the new password as an encrypted string even if password encryption is turned off.
<code>&lt;key-string&gt;</code>	Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and the TACACS+ server. This key must match the encryption used on the TACACS+ server. This setting overrides the global setting of the <code>tacacs-server key</code> command. If no key value is specified, the global value is used.

**Default** No TACACS+ server is configured by default.

**Mode** Global Configuration

**Usage** A TACACS+ server host cannot be configured multiple times like a RADIUS server.

As many as four TACACS+ servers can be configured and consulted for login authentication, enable password authentication and accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, not if a login authentication attempt is rejected. The reasons a server would fail are:

- it is not network reachable
- it is not currently TACACS+ capable

- it cannot communicate with the switch properly due to the switch and the server having different secret keys

**Examples** To add the server `tacl.company.com` as the TACACS+ server host, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tacl.company.com
```

To set the secret key to `secret` on the TACACS+ server `192.168.1.1`, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host 192.168.1.1 key secret
```

To remove the TACACS+ server `tacl.company.com`, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host tacl.company.com
```

**Related commands**

- [aaa accounting commands](#)
- [aaa authentication login](#)
- [tacacs-server key](#)
- [tacacs-server timeout](#)
- [show tacacs+](#)

# tacacs-server key

**Overview** This command sets a global secret key for TACACS+ authentication, authorization and accounting. The shared secret text string is used for TACACS+ communications between the switch and all TACACS+ servers.

Note that if no secret key is explicitly specified for a TACACS+ server with the [tacacs-server host](#) command, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to remove the global secret key.

**Syntax** `tacacs-server key [8] <key-string>`  
`no tacacs-server key`

Parameter	Description
8	Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off.
<key-string>	Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and all TACACS+ servers. This key must match the encryption used on the TACACS+ server.

**Mode** Global Configuration

**Usage notes** Use this command to set the global secret key shared between this client and its TACACS+ servers. If no secret key is specified for a particular TACACS+ server using the [tacacs-server host](#) command, this global key is used.

**Examples** To set the global secret key to `secret` for TACACS+ server, use the following commands:

```
awplus# configure terminal  
awplus(config)# tacacs-server key secret
```

To delete the global secret key for TACACS+ server, use the following commands:

```
awplus# configure terminal  
awplus(config)# no tacacs-server key
```

**Related commands** [tacacs-server host](#)  
[show tacacs+](#)

# tacacs-server timeout

**Overview** Use this command to specify the TACACS+ global timeout value. The timeout value is how long the device waits for a reply to a TACACS+ request before considering the server to be dead.

Note that this command configures the **timeout** parameter for TACACS+ servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

**Syntax** tacacs-server timeout <seconds>  
no tacacs-server timeout

Parameter	Description
<seconds>	TACACS+ server timeout in seconds, in the range 1 to 1000.

**Default** The default timeout value is 5 seconds.

**Mode** Global Configuration

**Examples** To set the timeout value to 3 seconds, use the following commands:

```
awplus# configure terminal  
awplus(config)# tacacs-server timeout 3
```

To reset the timeout period for TACACS+ servers to the default, use the following commands:

```
awplus# configure terminal  
awplus(config)# no tacacs-server timeout
```

**Related commands** [tacacs-server host](#)  
[show tacacs+](#)

# Part 6: High Availability

# 50

# High Availability Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure high availability. For more information, see the [High Availability Feature Overview and Configuration\\_Guide](#).

- Command List**
- “ha associate” on page 2372
  - “wan-bypass (interface mode)” on page 2374

# ha associate

**Overview** This command is used to change the mode of a VRRP session to High Availability (HA) mode, and to associate it with a HA bypass port.

Use the **no** variant of this command to take the VRRP session out of HA-Mode.

**Syntax** `ha associate [wan-bypass <1-2>]`  
`no ha associate [wan-bypass <1-2>]`

Parameter	Description
<code>&lt;wan-bypass&gt;</code>	The control wan bypass port.
<code>&lt;1-2&gt;</code>	The identifier number of wan bypass port.

**Default** The default state of bypass port 1 and port 2 is deactivated.

**Mode** Router Configuration

**Usage notes** One VRRP session can have the control of one or two bypass ports. After VRRP has the control of the wan-bypass ports, the state of the wan-bypass ports will be determined by the VRRP state. If the VRRP session is in master state, then the associated wan-bypass ports will be deactivated. If the VRRP session is in backup or initial state, then the associated wan-bypass ports will be activated.

If no wan-bypass ports are specified, then it puts the VRRP session in HA mode and the wan-bypass ports will always be deactivated.

If there are one or more VRRP sessions running in HA mode, then the wan-bypass ports should not be controlled by an other feature.

**Examples** To change a VRRP session into HA mode, use the following commands:

```
awplus#configure terminal
awplus(config)#router vrrp 1 vlan1
awplus(config-router)#ha associate
```

To change a VRRP session into HA mode and allow it to control wan-bypass port 1, use the following commands:

```
awplus#configure terminal
awplus(config)#vrrp 1 vlan1
awplus(config-router)#ha associate wan-bypass 1
```

To change a VRRP session to stop control of a wan-bypass port 1, use the following commands:

```
awplus#configure terminal
awplus(config)#router vrrp 1 vlan1
awplus(config-router)#no ha associate wan-bypass 1
```

To change a VRRP session out of HA-mode, use the following commands:

```
awplus#configure terminal
awplus(config)#router vrrp 1 vlan1
awplus(config-router)#no ha associate
```

**Related  
commands** [show vrrp](#)

# wan-bypass (interface mode)

**Overview** Use this command to manually activate bypass mode for a device's Ethernet interface. In bypass mode, the Ethernet interface is electrically disconnected from the device and diverted to the associated bypass port.

Use the **no** variant of this command to deactivate bypass mode.

**Syntax** wan-bypass  
no wan-bypass

**Default** Bypass mode is deactivated by default.

**Mode** Interface Configuration for an Eth interface.

**Example** To activate bypass mode on the interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# wan-bypass
```

To deactivate bypass mode on the interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no wan-bypass
```

**Related commands** [ha associate](#)

**Command changes** Version 5.5.0-1.3: command added

# advertisement-interval

**Overview** Use this command to configure the advertisement interval of the virtual router. This is the length of time, in seconds, between each advertisement sent from the master to its backup(s).

IPv6 VRRP advertisements are sent to the multicast address assigned to the VRRP group (ff02:0:0:0:0) and a backup virtual router has to join all multicast groups within this range. VRRP advertisements are sent to a multicast address (ff02::12) every second by default.

Use the **no** variant of this command to remove an advertisement interval of the virtual router, which has been set using the **advertisement-interval** command, and revert to the default advertisement interval of 1 second.

**Syntax** advertisement-interval [**<1-255>** | csec **<1-4095>**]  
no advertisement-interval

Parameter	Description
<b>&lt;1-255&gt;</b>	Specifies the advertisement interval in seconds.
csec	Use centiseconds instead of seconds for the advertisement interval.
<b>&lt;1-4095&gt;</b>	Specifies the advertisement interval in centiseconds.

**Default** The default advertisement interval is 1 second.

**Mode** Router Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information about:

- setting the advertisement-interval when configuring VRRP
- using seconds for VRRPv2 host compatibility whenever you use [transition-mode](#) to upgrade or transition from VRRPv2 to VRRPv3
- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details

**Examples** The example below shows you how to configure the advertisement interval to 6 seconds for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

The example below shows you how to reset the advertisement interval to the default of 1 second for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no advertisement-interval
```

The example below shows you how to configure the advertisement interval to 6 seconds for the VRRPv3 IPv6 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

**Related commands**

- [router ipv6 vrrp \(interface\)](#)

# alternate-checksum-mode

**Overview** Use this command to enable an alternate checksum mode for VRRPv3 to allow inter-operability with some other vendors' products. The IPv4 checksum for VRRPv3 advertisements will then use a pseudo header in the calculation.

This mode may be required if the other product indicates checksum errors on VRRP packets sent by AlliedWare Plus devices.

Use the **no** variant of this command to disable the alternate checksum mode.

**Syntax** `alternate-checksum-mode`  
`no alternate-checksum-mode`

**Default** Disabled

**Mode** Router Configuration

**Example** To turn on the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# alternate-checksum-mode
```

To turn off the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# no alternate-checksum-mode
```

**Related commands** [show running-config](#)

**Command changes** Version 5.4.7-1.1: command added

# circuit-failover

**Overview** Use this command to enable the VRRP circuit failover feature.

Circuit failover enables the device to take action if the uplink interface goes down, so that the VRRP backup, whose uplink interface is still active, takes over as VRRP master. See the Usage section below and the [VRRP Feature Overview and Configuration Guide](#) for more information.

Use the **no** variant of this command to disable this feature.

**Syntax** `circuit-failover <interface> <1-253>`  
`no circuit-failover [<interface> <1-253>]`

Parameter	Description
<code>&lt;interface&gt;</code>	The interface of the router that is monitored. The interface must exist on the router, and is usually an upstream interface. Should the interface go down, then another router that is configured as a backup router in the group takes over as the master. You should configure the circuit failover on an interface other than the active VRRP interface - generally the uplink interface.
<code>&lt;1-253&gt;</code>	Delta value. The value by which virtual routers decrement their priority value during a circuit failover event. Configure this value to be greater than the difference of priorities on the master and backup routers. In the case of failover, this priority delta value is subtracted from the current VR Master Router priority value.

**Mode** Router Configuration

**Usage notes** You can use Circuit Failover to monitor up to 32 interfaces per VRRP instance. If a VRRP instance is configured to monitor multiple interfaces, the VRRP priority will be cumulatively decremented by the configured delta for each interface as it goes down.

For example, if VRRP is configured to monitor VLAN2 and VLAN3 with the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip address 192.168.1.1/24
awplus(config-if)# exit
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# virtual-ip 192.168.1.10 backup
awplus(config-router)# priority 100
awplus(config-router)# circuit-failover vlan2 10
awplus(config-router)# circuit-failover vlan3 20
```

then the following examples explain the effect of each VLAN going down:

- If only VLAN2 fails, then the VRRP priority will be decremented by 10. VRRP priority would be adjusted to become 90, because  $100 - 10 = 90$ .
- If only VLAN3 fails, then the VRRP priority will be decremented by 20. VRRP priority would be adjusted to become 80, because  $100 - 20 = 80$ .
- If both VLAN2 and VLAN3 fail, then the VRRP priority will be decremented by the cumulative delta values of all monitored interfaces. VRRP priority would therefore be adjusted to become 70, because  $100 - 10 - 20 = 70$ .

As each monitored interface recovers, the VRRP priority is incremented by the same delta value.

When you configure the delta values of the monitored interfaces, make sure their sum is high enough to ensure that the VRRP priority stays above zero if all the interfaces go down.

**Examples** To configure circuit failover on an IPv4 VRRP instance, so that if interface VLAN3 goes down, then the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRP IPv4 session with VR ID 1 on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

To configure circuit failover on a VRRPv3 IPv6 session with VR ID 1, so that when interface VLAN3 goes down, the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRPv3 IPv6 session with VR ID 1 on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

**Related commands** [router vrrp \(interface\)](#)  
[router ipv6 vrrp \(interface\)](#)

# debug vrrp

**Overview** Use this command to specify debugging options for VRRP. The **all** parameter turns on all the debugging options.

Use the **no** variant of this command to disable this function.

**Syntax** `debug vrrp [all]`  
`no debug vrrp [all]`

**Mode** Privileged Exec and Global Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp all
```

The example below shows you how to disable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp all
```

**Related commands** [show debugging vrrp](#)  
[undebug vrrp](#)

# debug vrrp events

**Overview** Use this command to specify debugging options for VRRP event troubleshooting. Use the **no** variant of this command to disable this function.

**Syntax** `debug vrrp events`  
`no debug vrrp events`

**Mode** Privileged Exec and Global Configuration

**Usage notes** The **debug vrrp events** command enables the display of debug information related to VRRP internal events.  
See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp events
```

The example below shows you how to disable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp events
```

**Related commands** [show debugging vrrp](#)  
[undebug vrrp events](#)

# debug vrrp packet

**Overview** Use this command to specify debugging options for VRRP packets.  
Use the **no** variant of this command to disable this function.

**Syntax** debug vrrp packet [send|recv]  
no debug vrrp packet [send|recv]

Parameter	Description
send	Specifies the debug option set for sent packets.
recv	Specifies the debug option set for received packets.

**Mode** Privileged Exec and Global Configuration

**Usage notes** The **debug vrrp packet** command enables the display of debug information related to the sending and receiving of packets.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable received and sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet
```

The example below shows you how to enable only received packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet recv
```

The example below shows you how to enable only sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet send
```

The example below shows you how to disable packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp packet
```

**Related commands** [show debugging vrrp](#)  
[undebug vrrp packet](#)

# disable (VRRP)

**Overview** Use this command to disable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router to stop it participating in virtual routing. Note that when this command is configured then a backup router assumes the role of master router depending on its priority. See the [enable \(VRRP\)](#) command to enable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router.

**Syntax** `disable`

**Mode** Router Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** The example below shows you how to disable the VRRP session for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# disable
```

The example below shows you how to disable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# disable
```

**Related commands**

- [enable \(VRRP\)](#)
- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)
- [show vrrp](#)

# enable (VRRP)

**Overview** Use this command to enable the VRRP session on the router to make it participate in virtual routing. To make changes to the VRRP configuration, first disable the router from participating in virtual routing using the [disable \(VRRP\)](#) command.

**Syntax** enable

**Mode** Router Configuration

**Usage notes** You must configure the virtual IP address and define the interface for the VRRP session (using the [virtual-ip](#) or [virtual-ipv6](#) and the [router vrrp \(interface\)](#) or [router ipv6 vrrp \(interface\)](#) commands) before using this command.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** To enable the VRRP session for VRRP VR ID 5 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# enable
```

To enable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# enable
```

**Related commands**

- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)
- [show vrrp](#)
- [virtual-ip](#)
- [virtual-ipv6](#)

# preempt-mode

**Overview** Use this command to configure preempt mode. If preempt-mode is set to **true**, then the highest priority backup will always be the master when the default master is unavailable.

If preempt-mode is set to **false**, then a higher priority backup will not preempt a lower priority backup who is acting as master.

If preempt-mode is set to **true**, an extra parameter is available called **delay-time**. If the delay-time parameter is used, a VRRP router with a higher priority will wait the configured length of time before it preempts the lower priority VRRP router to take over as master.

**Syntax** `preempt-mode {true|false}[delay-time <0-3600>]`

Parameter	Description
true	Preemption is enabled.
false	Preemption is disabled.
delay-time	Enable preempting but delay the preempt by the amount of seconds specified by the delay-time value. Note, a delay-time of 0 means delayed preempting is disabled.

**Default** The default is **true**.

**Mode** Router Configuration

**Usage notes** When the master router fails, the backup routers come online in priority order—highest to lowest. Preempt mode means that a higher priority backup router will take over the master role from a lower priority backup. Preempt mode set to **true** allows a higher priority backup router to relieve a lower priority backup router.

By default, a preemptive scheme is enabled whereby a higher priority backup virtual router that becomes available takes over from the backup virtual router that was previously elected to become the master virtual router.

This preemptive scheme can be disabled using the **preempt-mode false** command. If preemption is disabled on a backup virtual router that is starting up, and this router has a higher priority than the current master, the higher priority backup will not preempt the current master, and the lower priority master will stay in the master role.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- preempt mode and preempt delay-time

**Examples** The example below shows you how to configure preempt-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure preempt-mode as true for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure delay-time as 20 seconds for VRRPv3 VR ID 5 on vlan5:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan5
awplus(config-router)# preempt-mode true delay-time 20
```

**Related commands**

- [circuit-failover](#)
- [priority](#)
- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)

# priority

**Overview** Use this command to configure the VRRP router priority within the virtual router. The highest priority router is Master (unless [preempt-mode](#) is false).

Use the **no** variant of this command to remove the VRRP router priority within the virtual router, which has been set using the **priority** command.

**Syntax** `priority <1-255>`  
`no priority`

Parameter	Description
<1-255>	The priority. For the master router, use 255 for this parameter; otherwise use any number from the range <1-254>.

**Default** Defaults for priority are: **master router**= 255; **backup**= 100.

**Mode** Router Configuration

**Usage notes** Priority determines the role that each VRRP router plays and what happens if the master virtual router fails. If a VRRP router owns the IP address of the virtual router and the IP address of the interface, then this VRRP router functions as the master virtual router.

Priority also determines whether a VRRP router functions as a backup virtual router and the order of ascendancy to becoming a master virtual router if the master virtual router fails. Configure the priority of each backup virtual router with a value of 1 through 254.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** The example below shows you how to configure 101 as the priority for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# priority 101
```

The example below shows you how to remove the priority configured for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no priority
```

The example below shows you how to configure 101 as the priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# priority 101
```

The example below shows you how to remove the configured priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no priority
```

**Related commands** [circuit-failover](#)  
[preempt-mode](#)

# router ipv6 vrrp (interface)

**Overview** Use this command to configure VRRPv3 for IPv6 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRPv3 for IPv6 configuration. Disable the VRRP session before using the **no** variant of this command.

**Syntax** `router ipv6 vrrp <vrid> <interface>`  
`no router ipv6 vrrp <vrid> <interface>`

Parameter	Description
<vrid>	<1-255> The ID of the virtual router VRRPv3 IPv6 session to create.
<interface>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages.

**Mode** Global Configuration

**Usage notes** Use the required <interface> placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

**NOTE:** *Tunnels and PPP interfaces are not supported. VRRP is only configurable on VLANs.*

**NOTE:** *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Examples** The example below shows you how to enable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan2
awplus(config-router)# enable
awplus(config-router)#
```

The example below shows you how to disable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router ipv6 vrrp 3 vlan2
awplus(config)#
```

**Related commands** [advertisement-interval](#)  
[circuit-failover](#)

# router vrrp (interface)

**Overview** Use this command to configure VRRP IPv4 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRP IPv4 configuration. Disable the VRRP session before using the **no** variant of this command.

**Syntax** `router vrrp <vrid> <interface>`  
`no router vrrp <vrid> <interface>`

Parameter	Description
<vrid>	<1-255> The ID of the virtual router VRRP IPv4 session to create.
<interface>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRP IPv4 advertisement messages.

**Mode** Global Configuration

**Usage notes** Use the required <interface> placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

**NOTE:** *Tunnels and PPP interfaces are not supported. VRRP is only configurable on VLANs*

**NOTE:** *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Examples** To enable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan1
awplus(config-router)# enable
```

To disable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router vrrp 5 vlan1
```

**Related  
commands**

- advertisement-interval
- circuit-failover

  circuit-failover vlan3 3  
  advertisement-interval 6  
  preempt-mode false  
!
```

# show running-config router vrrp

**Overview** Use this command to show the running configuration for VRRP IPv4.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show running-config router vrrp`

**Mode** Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

**Example** The example below shows you how to display the running configuration for VRRP IPv4:

```
awplus# show running-config router vrrp
```

**Output** Figure 51-2: Example output from the **show running-config router vrrp** command

```
!  
router vrrp 2 vlan2  
  circuit-failover vlan2 2  
  advertisement-interval 4  
  preempt-mode true  
!
```

# show vrrp

**Overview** Use this command to display information about all VRRP IPv4 sessions. This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** show vrrp [brief]

Parameter	Description
brief	Brief summary of VRRP sessions.

**Mode** User Exec and Privileged Exec

**Example** To display information about all VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp
```

To display brief summary output about VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp brief
```

**Output** Figure 51-3: Example output from the **show vrrp** command

```
awplus#show vrrp
VMAC enabled
Address family IPv4
VRRP Id: 1 on interface: vlan2
State: AdminUp - Master
Virtual IP address: 192.168.1.2 (Not-owner)
Priority is 100

```

**Related  
commands**    enable (VRRP)  
                  disable (VRRP)

# show vrrp counters

**Overview** This command displays VRRP SNMP counters on the console, as described in the VRRP MIB and RFC2787, for debugging use while you configure VRRP with commands in this chapter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show vrrp counters

**Mode** User Exec and Privileged Exec

**Usage notes** The output has a section for global counters and a section of counters for each VRRP instance configured. See the descriptions of the counters below the sample output as per RFC2787.

**NOTE:** Note that the counters displayed with this commands are the same counters as described in RFC 2787 (Copyright (C) The Internet Society (2000). All Rights Reserved) except for the “Monitored Circuit Up” and “Monitored Circuit Down” counters, which are additions beyond the MIB.

**Example** To display information about VRRP SNMP counters on the console, enter the command:

```
awplus# show vrrp counters
```

Figure 51-5: Example output from the **show vrrp counters** command

```
awplus#show vrrp counters
VRRP Global Counters:
  Checksum Errors .... 230
  Version Errors ..... 0
  VRID Errors ..... 230

VRRP IPv4 counters for VR 10/vlan10:
  Master Transitions ..... 0
  Received Advertisements ... 0
  Internal Errors ..... 0
  TTL Errors ..... 0
  Received Priority 0 Pkt ... 0
  Sent Priority 0 Pkt ..... 0
  Received Invalid Type ..... 0
  Address List Errors ..... 0
  Packet Length Errors ..... 0
  Monitored Circuit Up ..... 0
  Monitored Circuit Down..... 0
```

```
VRRP IPv4 counters for VR 100/vlan100:
Master Transitions ..... 1
Received Advertisements ... 1614
Internal Errors ..... 0
TTL Errors ..... 0
Received Priority 0 Pkt ... 0
Sent Priority 0 Pkt ..... 0
Received Invalid Type ..... 0
Address List Errors ..... 0
Packet Length Errors ..... 0
Monitored Circuit Up ..... 0
Monitored Circuit Down.... 2
```

**Table 1:** Global counters with descriptions for the **show vrrp counters** command:

Counter	Description
Checksum Errors	The total number of VRRP packets received with an invalid VRRP checksum value.
Version Errors	The total number of VRRP packets received with an unknown or unsupported version number.
VRID Errors	The total number of VRRP packets received with an invalid VRID for this virtual router.

**Table 2:** Per VR counters with descriptions for the **show vrrp counters** command:

Counter	Description
Master Transitions	The total number of times that this virtual router's state has transitioned to MASTER.
Received Advertisements	The total number of VRRP advertisements received by this virtual router.
Internal Errors	The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router.
TTL Errors	The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.
Received Priority 0 Pkt	The total number of VRRP packets received by the virtual router with a priority of '0'.
Sent Priority 0 Pkt	The total number of VRRP packets sent by the virtual router with a priority of '0'.
Received Invalid Type	The number of VRRP packets received by the virtual router with an invalid value in the 'type' field.
Address List Errors	The total number of packets received for which the address list does not match the locally configured list for the virtual router.

**Table 2:** Per VR counters with descriptions for the **show vrrp counters** command: (cont.)

Counter	Description
Packet Length Errors	The total number of packets received with a packet length less than the length of the VRRP header.
Monitored Circuit Up	The total number of times the monitored circuit has generated the UP event.
Monitored Circuit Down	The total number of times the monitored circuit has generated the down event.

# show vrrp ipv6

**Overview** Use this command to display information about all configured VRRPv3 IPv6 sessions for all interfaces, or all VRRPv3 IPv6 sessions for a given interface with the optional parameter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Syntax** `show vrrp ipv6 [<interface>]`

Parameter	Description
<interface>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages.

**Mode** User Exec and Privileged Exec

**Example** To display information about all VRRPv3 IPv6 sessions, enter the command:

```
awplus# show vrrp ipv6
```

**Output** Figure 51-6: Example output from the **show vrrp ipv6 vlan2** command

```
awplus#show vrrp ipv6 vlan2
VrId <1>
  State is Master
  Virtual IP is fe80::202:b3ff:fed5:983e (Owner)
  Interface is vlan2
  Priority is 255
  Advertisement interval is 4 sec
  Preempt mode is FALSE
```

**Related commands** [enable \(VRRP\)](#)  
[disable \(VRRP\)](#)

# show vrrp (session)

**Overview** Use this command to display information for a particular VRRP session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show vrrp <vrid> <interface>`

Parameter	Description
<code>&lt;vrid&gt;</code>	<code>&lt;1-255&gt;</code> The virtual router ID for which to display information. Session must already exist.
<code>&lt;interface&gt;</code>	The interface to display information about, for instance, <code>vlan2</code> .

**Mode** User Exec and Privileged Exec

**Usage notes** See the below sample output from the **show vrrp** command displaying information about VRRP session 1 configured on **vlan2**. Output shows that a Virtual IP address has been set.

```
awplus# show vrrp 1 vlan2
```

```
awplus#show vrrp 1 vlan2
Address family IPv4
VrId <1>
  Interface is vlan2
  State is Initialize
  Virtual IP address is 10.10.11.250 (Not IP owner)
  Priority is 100
  Advertisement interval is 1 sec
  Preempt mode is TRUE
  Multicast membership on IPv4 interface vlan1: JOINED
  Transition mode: FALSE
  Accept mode: TRUE
  Master address: 192.168.24.5
  High Availability:
  enabled
  wan-bypass 1 (eth1) is on
```

See the below sample output from the **show vrrp** command displaying information about VRRP session 1 configured on **vlan3**. Output shows a Virtual IP address has not been set.

```
awplus# show vrrp 1 vlan3
```

```
awplus#show vrrp 1 vlan3
Address family IPv4
VrId <1>
  Interface is vlan3
  State is Initialize
  Virtual IP address is unset
  Priority is 100
  Advertisement interval is 1 sec
  Preempt mode is TRUE
Preempt mode is TRUE
  Multicast membership on IPv4 interface vlan3: JOINED
  Transition mode: FALSE
  Accept mode: TRUE
  Master address: 192.168.24.5
  High Availability:
  enabled
  wan-bypass 1 (eth1) is on
```

**Example** The following command shows information about VRRP session 5 for interface **vlan2**.

```
awplus# show vrrp 5 vlan2
```

# transition-mode

**Overview** Use this command to configure the IPv4 transition mode. Transition mode allows you to upgrade from VRRPv2 to VRRPv3 and gives interoperability between VRRPv2 and VRRPv3.

If transition-mode is set to **true**, then the IPv4 transition mode is enabled and VRRPv2 and VRRPv3 advertisements are sent allowing VRRPv2 and VRRPv3 interoperability. Received VRRPv2 advertisement packets are accepted and processed when transition-mode is true.

If transition-mode is set to **false**, then the IPv4 transition mode is disabled and only VRRPv3 advertisements are sent. Received VRRPv2 advertisement packets are dropped.

Note the [advertisement-interval](#) should not be configured to less than 1 second when using transition-mode. VRRPv2 can only use advertisements in whole second intervals.

**Syntax** transition-mode {true|false}

Parameter	Description
true	Transition mode is enabled. This results in VRRPv2 and VRRPv3 IPv4 advertisements being sent. Transition mode is only available on VRRPv3 for interoperability with VRRPv2 while upgrading to VRRPv3.
false	Transition mode is disabled. This stops VRRPv2 IPv4 advertisements being sent. Only VRRPv3 advertisements are sent when disabled. Disable transition-mode after upgrading from VRRPv2 to VRRPv3.

**Default** The default is **false**.

**Mode** Router Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- further information about configuring transition mode to upgrade from VRRPv2 to VRRPv3

**Examples** The example below shows you how to configure IPv4 transition-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode true
```

The example below shows you how to configure IPv4 transition-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode false
```

**Related commands** [router vrrp \(interface\)](#)

# undebug vrrp

**Overview** Use this command to disable all VRRP debugging.

**Syntax** undebug vrrp all

**Mode** Privileged Exec

**Example** The example below shows you how to disable all VRRP debugging:

```
awplus# undebug vrrp all
```

**Related commands** [debug vrrp](#)

# undebug vrrp events

**Overview** Use this command to disable debugging options for VRRP event troubleshooting.

**Syntax** `undebug vrrp events`

**Mode** Privileged Exec

**Example** The example below shows you how to disable VRRP event debugging:

```
awplus# undebug vrrp events
```

**Related commands** [debug vrrp events](#)

# undebbug vrrp packet

**Overview** Use this command to disable debugging options for VRRP packets.

**Syntax** `undebbug vrrp packet [send|recv]`

Parameter	Description
send	Disable the debug option set for sent packets.
recv	Disable the debug option set for received packets.

**Mode** Privileged Exec

**Examples** The example below shows you how to disable VRRP sent packet debugging:

```
awplus# undebbug vrrp packet send
```

The example below shows you how to disable VRRP received packet debugging:

```
awplus# undebbug vrrp packet recv
```

The example below shows you how to disable all VRRP packet debugging:

```
awplus# undebbug vrrp packet
```

**Related commands** [debug vrrp packet](#)

# virtual-ip

**Overview** Use this command to set the virtual IP address for the VRRP session. This is the IP address of the virtual router that end hosts set as their default gateway.

Use the **no** variant of this command to disable this feature.

**Syntax** `virtual-ip <ip-address> [master|backup|owner]`  
`no virtual-ip`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The virtual IPv4 address of the virtual router, entered in dotted decimal format A.B.C.D.
<code>master</code>	Sets the default state of the VRRP router within the Virtual Router as <b>master</b> . For master, the router must own the Virtual IP address. Specify the <b>owner</b> option before using <b>master</b> option.
<code>backup</code>	Sets the default state of the VRRP router within the Virtual Router as <b>backup</b> .
<code>owner</code>	Sets the IPv6 address of the VRRP router within the Virtual Router as the <b>owner</b> . Specify this before using the <b>master</b> option.

**Mode** Router Configuration

**Usage notes** The VRRP master and owner of the virtual IPv4 address for the VRRP session only responds to the packets destined to the virtual IPv4 address. The VRRP master that is not an owner of the virtual IPv4 address for the VRRP session does not respond to the packets destined to the virtual IPv4 address, but forwards packets with a VMAC as the destination address. See the [vrrp vmac](#) command to enable and disable this feature.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Examples** The example below shows you how to set the virtual IP address for VRRP VR ID 5 and the router as the VRRP master:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 master
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as the VRRP backup:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 backup
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as owner of the virtual IPv4 address:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 owner
```

The example below shows you how to disable the virtual IPv4 address for VRRP VR ID 5

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no virtual-ip
```

**Related commands**

- [router vrrp \(interface\)](#)
- [enable \(VRRP\)](#)
- [vrrp vmac](#)

# virtual-ipv6

**Overview** Use this command to set the virtual IPv6 address for the VRRPv3 session. This is the IPv6 address of the virtual router that end hosts set as their default gateway.

Note that the primary IPv6 address specified is an IPv6 link-local address. See the Usage note below for further information.

Use the **no** variant of this command to disable this feature.

**Syntax** `virtual-ipv6 <ipv6-address> [master|backup]  
[primary|secondary]`  
`no virtual-ipv6`

Parameter	Description
<code>&lt;ipv6-address&gt;</code>	The IPv6 address of the virtual router, entered in hexadecimal, in the format X:X::X.X.
<code>master</code>	Sets <b>master</b> to be the default state of the VRRPv3 router within the Virtual Router. For <b>master</b> , we recommend using a Virtual IP address that is not owned by any of the VRRP routers in the same grouping (that share the same VRID).
<code>backup</code>	Sets <b>backup</b> to be the default state of the VRRPv3 router within the Virtual Router.
<code>primary</code>	Sets the specified address as the primary IPv6 address. The primary address must be a link-local IPv6 address.
<code>secondary</code>	Sets the specified address as the secondary IPv6 address. Normally this would be a globally-routable IPv6 address. This enables you to specify a globally-routable address as the default gateway address for all the hosts on a VLAN.

**Mode** Router Configuration

**Usage notes** The virtual router will reply to ping, telnet, and SSH requests to the virtual IP address. The virtual router will reply even if it does not own the virtual IP address.

The AlliedWare Plus VRRPv3 implementation supports one IPv6 virtual link local address per virtual router ID. Note that in the command examples fe80::1 is an IPv6 link-local address. An IPv6 link-local address is used because IPv6 link-local addresses are used by IPv6 ND (Neighbor Discovery). A host's default route to a router points to the IPv6 link-local address, not a specific global IPv6 address for the router. For the host's traffic to switch over to a backup router, the IPv6 link-local address of the router is used by VRRPv3.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Examples** The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 master:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 master
```

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 backup:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 backup
```

The example below shows you disable the virtual IPv6 address for VRRPv3 VR ID 3:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no virtual-ipv6
```

**Related commands**

- [router ipv6 vrrp \(interface\)](#)
- [enable \(VRRP\)](#)
- [vrrp vmac](#)

## vrrp vmac

**Overview** Use this command to enable or disable the VRRP Virtual MAC feature. This feature is used by VRRP to make the hosts use the virtual MAC address as the physical hardware address of their gateway.

A VRRP router master will use the virtual MAC address for any ARP responses associated with the virtual IP address, or any gratuitous ARPs sent on behalf of the virtual IP address.

All VRRP advertisements are sent using this virtual MAC address as the source MAC address.

The virtual MAC address has the form 00:00:5e:00:01:<VRID>, where VRID is the ID of the Virtual Router.

**Syntax** `vrrp vmac {enable|disable}`

**Mode** Global Configuration

**Examples** To enable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac enable
```

To disable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac disable
```

[virtual-ipv6](#)

# Part 7: Network Management

# 52

# Allied Telesis Management Framework™ (AMF) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for Allied Telesis Management Framework™ (AMF) commands.

**AMF master nodes** Every AMF network must have at least one master node, which acts as the core of the AMF network. Not all AlliedWare Plus devices are capable of acting as an AMF master. See the [AMF Feature Overview and Configuration Guide](#) for information about AMF master support.

**AMF edge** AlliedWare Plus CentreCOM® Series switches can only be used as edge switches in an AMF network. The full management power and convenience of AMF is available on these switches, but they can only link to one other AMF node. They cannot form cross-links or virtual links.

**AMF naming convention** When AMF is enabled on a device, it will automatically be assigned a host name. If a host name has already been assigned, by using the command [hostname](#) on page 277, this will remain. If however, no host name has been assigned, then the name applied will be the prefix, **host\_** followed (without a space) by the MAC address of the device. For example, a device whose MAC address is **0016.76b1.7a5e** will have the name **host\_0016\_76b1\_7a5e** assigned to it.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network devices, and apply an appropriate hostname to each device in your AMF network.

**AMF and STP** On AR-Series UTM firewalls and Secure VPN routers, you cannot use STP at the same time as AMF.

# application-proxy ip-filter

**Overview** Use this command to enable global IP filtering on a device. Once enabled the device will add a global ACL in response to a threat message from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable global IP filtering.

**Syntax** `application-proxy ip-filter`  
`no application-proxy ip-filter`

**Default** Global IP filtering is disabled by default.

**Mode** Global Configuration

**Usage notes** For this feature to work, the AMF Application Proxy service needs to be enabled on your network, using the command [service atmf-application-proxy](#).

**Example** To enable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy ip-filter
```

To disable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy ip-filter
```

**Related commands** [application-proxy redirect-url](#)  
[application-proxy threat-protection](#)  
[clear application-proxy threat-protection](#)  
[service atmf-application-proxy](#)  
[show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.5: command added

# application-proxy quarantine-vlan

**Overview** Use this command to set the quarantine VLAN to use when an AMF Security (AMF-Sec) Controller detects a threat. The port/s on which the threat is detected are moved to this VLAN if the [application-proxy threat-protection](#) action is set to **quarantine**.

Use the **no** variant of this command to delete the quarantine VLAN. If no quarantine VLAN is specified then no quarantine action will be performed.

**Syntax** `application-proxy quarantine-vlan <vlan-id>`  
`no application-proxy quarantine-vlan`

Parameter	Description
<code>&lt;vlan-id&gt;</code>	The ID of the VLAN to use. In the range 1-4094.

**Default** By default, no quarantine VLAN is configured.

**Mode** Global Configuration

**Example** To configure VLAN 100 as the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy quarantine-vlan 100
```

To delete the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy quarantine-vlan
```

# application-proxy redirect-url

**Overview** Use this command to redirect a user to a helpful URL when they are blocked because of an [application-proxy ip-filter](#).

Use the **no** variant of this command to remove the URL redirect.

**Syntax** `application-proxy redirect-url <url>`  
`no application-proxy redirect-url`

Parameter	Description
<code>&lt;url&gt;</code>	URL to redirect the user to.

**Default** No URL is configured by default.

**Mode** Global Configuration

**Example** To configure a redirect URL, use the command:

```
awplus# application-proxy redirect-url http://my.dom/help.html
```

To remove a redirect URL, use the command:

```
awplus# no application-proxy redirect-url
```

**Related commands** [application-proxy ip-filter](#)  
[application-proxy threat-protection](#)  
[clear application-proxy threat-protection](#)  
[service atmf-application-proxy](#)  
[show application-proxy threat-protection](#)

**Command changes** Version 5.4.9-0.1: command added

# application-proxy threat-protection

**Overview** Use this command to set the blocking action to take when a threat detected message is received from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable threat protection blocking actions on the port.

**Syntax** `application-proxy threat-protection {drop|link-down|quarantine|log-only}`  
`no application-proxy threat-protection`

Parameter	Description
drop	Apply a Layer 2 drop for traffic generating the threat reports.
link-down	Set the link to error disabled in response to threats.
quarantine	Move the offending port to a quarantine VLAN.
log-only	Log when a threat is detected.

**Default** Threat protection is disabled by default.

**Mode** Interface Configuration

**Example** To set the threat protection blocking action on port1.0.4 to drop, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy threat-protection drop
```

To disable threat protection blocking actions on port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy threat-protection
```

**Related commands**

- Version 5.4.9-0.1: **log-only** parameter added

# application-proxy threat-protection send-summary

**Overview** Use this command to send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes. This command can only be performed on an AMF master.

**Syntax** `application-proxy threat-protection send-summary`

**Mode** Privileged Exec

**Example** To send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes, use the command:

```
awplus# application-proxy threat-protection send-summary
```

**Related commands**

- [application-proxy quarantine-vlan](#)

**Command changes** Version 5.4.7-2.2: command added

# application-proxy whitelist advertised-address

**Overview** Use this command to register a Layer 3 interface, and the IPv4 address that is attached to this interface, as the advertised application-proxy whitelist address for a device.

Use the **no** variant of this command to stop advertising the Layer 3 interface and its associated IPv4 address.

**Syntax** `application-proxy whitelist advertised-address <interface>`  
`no application-proxy whitelist advertised-address`

Parameter	Description
<code>&lt;interface&gt;</code>	Layer 3 interface to configure as the advertised address.

**Default** No address advertised by default.

**Mode** Global Configuration

**Example** To configure the IPv4 address attached to VLAN 1 as the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist advertised-address
vlan1
```

To remove the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist
advertised-address
```

**Related commands** [application-proxy whitelist server](#)  
[show application-proxy whitelist advertised-address](#)

**Command changes** Version 5.4.9-1.1: command added

# application-proxy whitelist enable

**Overview** Use this command to enable application-proxy whitelist based authentication on an interface.

Use the **no** variant of this command to disable the whitelist authentication.

**Syntax** application-proxy whitelist enable  
no application-proxy whitelist enable

**Default** Application-proxy whitelist is disabled by default.

**Mode** Interface Configuration

**Example** To enable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy whitelist enable
```

To disable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy whitelist enable
```

**Related commands** application-proxy whitelist server  
show application-proxy whitelist interface  
show application-proxy whitelist server  
show application-proxy whitelist supplicant

**Command changes** Version 5.4.9-0.1: command added

# application-proxy whitelist server

**Overview** Use this command to set an AMF master to act as a whitelist authentication proxy between AMF members, acting as Network Access Servers, and an external whitelist RADIUS server.

Use the **no** variant of this command to disable the whitelist proxy functionality.

**Syntax** `application-proxy whitelist server <ip-address> key <key>`  
`[auth-port <1-65535>]`  
`no application-proxy whitelist server`

Parameter	Description
<code>&lt;ip-address&gt;</code>	IPv4 address of the upstream RADIUS server in dotted decimal format A.B.C.D.
<code>key &lt;key&gt;</code>	Set the shared secret encryption key for communication with the upstream RADIUS server.
<code>auth-port &lt;1-65535&gt;</code>	Set the RADIUS server UDP port. This is only necessary if you don't want to use the default port 1812.

**Default** Disabled by default.

**Mode** Global Configuration

**Example** To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on port 1822, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey auth-port 1822
```

To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on the default port (1812), use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey
```

To disable the whitelist proxy, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist server
```

**Related commands**

- [application-proxy whitelist enable](#)
- [service atmf-application-proxy](#)
- [show application-proxy whitelist interface](#)
- [show application-proxy whitelist server](#)

show application-proxy whitelist supplicant

**Command changes** Version 5.4.9-0.1: command added

# application-proxy whitelist trustpoint

**Overview** Use this command to set the trustpoint to use when communicating with the external whitelist RADIUS server. This enables RADIUS over TLS (RadSec) protection.

Use the **no** variant of this command to stop using a trustpoint.

**Syntax** `application-proxy whitelist trustpoint <name>`  
`no application-proxy whitelist trustpoint`

Parameter	Description
<code>&lt;name&gt;</code>	Name of the trustpoint.

**Default** No trustpoint configured.

**Mode** Global Configuration

**Example** To configure an AMF application-proxy whitelist to use the trustpoint 'corpca', use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist trustpoint corpca
```

To configure an AMF application-proxy whitelist to use not use a trustpoint, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist trustpoint
```

**Related commands** [application-proxy whitelist server](#)  
[show application-proxy whitelist server](#)

**Command changes** Version 5.4.9-1.1: command added

# area-link

**Overview** Use this command to create an area-link between a Virtual AMF Appliance (VAA) host controller and an AMF container.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an area-link from a container.

**Syntax** `area-link <area-name>`  
`no area-link`

Parameter	Description
<code>&lt;area-name&gt;</code>	AMF area name of the container's area.

**Mode** AMF Container Configuration

**Usage notes** The AMF area-link connects the AMF controller on a VAA host to the AMF container. Once a container has been created with the [atmf container](#) command and an area-link configured with the **area-link** command, it can be enabled using the [state](#) command.

You can only configure a single area-link on a container. You will see the following message if you try and configure a second one:

```
% AreaLink already configured for this container
```

Each container has two virtual interfaces:

- Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, configured using this area-link command.
- Interface eth1, used to connect to the outside world using a bridged L2 network link, configured using the [bridge-group](#) command.

See the [AMF Feature Overview and Configuration\\_Guide](#) for more information on these virtual interfaces and links.

**Example** To create the area-link to "wlg" on container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# area-link wlg
```

To remove an area-link from container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no area-link
```

**Related  
commands**

[atmf container](#)  
[show atmf container](#)

**Command  
changes**

Version 5.4.7-0.1: command added

# atmf-arealink

**Overview** This command to enable an Eth interface on an AR-series device as an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network. This command is only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF area links that may exist for the selected Eth interface.

**Syntax** `atmf-arealink remote-area <area-name> vlan <2-4094>`  
`no atmf-arealink`

Parameter	Description
<area-name>	The name of the remote area that the interface is connecting to.
<2-4094>	The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link.

**Default** By default, no area links are configured

**Mode** Eth interface on an AR-series device.

**Usage notes** Run this command on the interface at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will synchronize the area information stored on the two nodes.

You can configure multiple area links between two area nodes, but only one area link at any time will be in use. All other area links will block information, to prevent network storms.

**NOTE:** See the [switchport atmf-arealink](#) command to configure an AMF area link on an a switch port or link aggregator

**Example** To configure eth1 as an AMF area link to the 'Auckland' area on VLAN 6, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# atmf-arealink remote-area Auckland vlan 6
```

To remove eth1 as an AMF area link, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# no atmf-arealink
```

**Related commands** `atmf area`  
`atmf area password`  
`atmf virtual-link`  
`show atmf links`

**Command changes** Version 5.5.0-1.1: command added

# atmf-link

**Overview** Use this command to enable an Eth interface on an AR-series device as an up/down AMF link. This command is only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF link that may exist for the selected Eth interface.

**Syntax** atmf-link  
no atmf-link

**Mode** Eth interface on an AR-series device.

**Usage notes** Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

If you run the command and AMF secure mode is not enabled, you will see the following error message:

```
Node_1(config)#int eth1
Node_1(config-if)#atmf-link
% Cannot configure eth1 because atmf secure-mode is not enabled.
```

**NOTE:** See the [switchport atmf-link](#) command to configure an AMF up/down link on an a switch port or link aggregator

**Example** To configure eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# atmf-link
```

To remove eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# no atmf-link
```

**Related commands** [atmf recover over-eth](#)  
[atmf secure-mode](#)  
[show atmf detail](#)  
[show atmf links](#)  
[switchport atmf-link](#)

**Command changes** Version 5.5.0-1.1: command added

# atmf area

**Overview** This command creates an AMF area and gives it a name and ID number. Use the **no** variant of this command to remove the AMF area. This command is only valid on AMF controllers, master nodes and gateway nodes.

**Syntax** `atmf area <area-name> id <1-126> [local]`  
`no atmf area <area-name>`

Parameter	Description
<area-name>	The AMF area name. The area name can be up to 15 characters long. Valid characters are: a..z A..Z 0..9 - _ Names are case sensitive and must be unique within an AMF network. The name cannot be the word "local" or an abbreviation of the word "local" (such as "l", "lo" etc.).
<1-126>	An ID number that uniquely identifies this area.
local	Set the area to be the local area. The local area contains the device you are configuring.

**Mode** Global Configuration

**Usage notes** This command enables you to divide your AMF network into areas. Each area is managed by at least one AMF master node. Each area can have up to 120 nodes, depending on the license installed on that area's master node.

The whole AMF network is managed by up to 8 AMF controllers. Each AMF controller can communicate with multiple areas. The number of areas supported on a controller depends on the license installed on that controller.

You must give each area in an AMF network a unique name and ID number.

Only one local area can be configured on a device. You must specify a local area on each controller, remote AMF master, and gateway node.

**Example** To create the AMF area named *New-Zealand*, with an ID of 1, and specify that it is the local area, use the command:

```
controller-1(config)# atmf area New-Zealand id 1 local
```

To configure a remote area named *Auckland*, with an ID of 100, use the command:

```
controller-1(config)# atmf area Auckland id 100
```

**Related  
commands**

- atmf area password
- show atmf area
- show atmf area summary
- show atmf area nodes
- switchport atmf-arealink

# atmf area password

**Overview** This command sets a password on an AMF area.

Use the **no** variant of this command to remove the password.

This command is only valid on AMF controllers, master nodes and gateway nodes. The area name must have been configured first.

**Syntax** `atmf area <area-name> password [8] <password>`  
`no atmf area <area-name> password`

Parameter	Description
<area-name>	The AMF area name.
8	This parameter is displayed in <b>show running-config</b> output to indicate that it is displaying the password in encrypted form. You should not enter <b>8</b> on the CLI yourself.
<password>	The password is between 8 and 32 characters long. It can include spaces.

**Mode** Global Configuration

**Usage notes** You must configure a password on each area that an AMF controller communicates with, except for the controller's local area. The areas must already have been created using the `atmf area` command.

Enter the password identically on both of:

- the area that locally contains the controller, and
- the remote AMF area masters

The command **show running-config atmf** will display the encrypted version of this password. The encryption keys will match between the controller and the remote AMF master.

If multiple controller and masters exist in an area, they must all have the same area configuration.

**Example** To give the AMF area named *Auckland* a password of "secure#1" use the following command on the controller:

```
controller-1(config)# atmf area Auckland password secure#1
```

and also use the following command on the master node for the Auckland area:

```
auck-master(config)# atmf area Auckland password secure#1
```

**Related  
commands**

- atmf area
- show atmf area
- show atmf area summary
- show atmf area nodes
- switchport atmf-arealink

# atmf authorize

**Overview** On an AMF network, with secure mode enabled, use this command on an AMF master to authorize an AMF node to join the network. AMF nodes waiting to be authorized appear in the pending authorization queue, which can be examined using the [show atmf authorization](#) command with the **pending** parameter.

Use the **no** variant of this command to revoke authorization for an AMF node on an AMF master.

**Syntax** `atmf authorize {<node-name> [area <area-name>]|all-pending}`  
`no atmf authorize <node-name> [area <area-name>]`

Parameter	Description
<node-name>	The name of the node to be authorized or have its authorization revoked.
area	Specify an AMF area.
<area-name>	This is the name of the area the node belongs to.
all-pending	Authorize all nodes in the pending queue.

**Mode** Privileged Exec

**Usage notes** On an AMF controller, AMF remote-area masters must be authorized by the controller, and the AMF remote-area masters will also need to authorized access from the AMF controller.

**Example** To authorize all AMF nodes in the pending authorization queue on an AMF master, use the command:

```
awplus# atmf authorize all-pending
```

To authorize a node called "node2" in remote AMF area "area3", use the command:

```
awplus# atmf authorize node2 area "area3"
```

To authorize a node called "node4" on an AMF master, use the command:

```
awplus# atmf authorize node4
```

To revoke authorization for a node called "node4" on an AMF master, use the command:

```
awplus# no atmf authorize node4
```

**Related commands**

- [atmf secure-mode](#)
- [clear atmf secure-mode certificates](#)
- [show atmf authorization](#)
- [show atmf secure-mode](#)

show atmf secure-mode certificates

show atmf secure-mode statistics

**Command changes** Version 5.4.7-0.3: command added

# atmf authorize provision

**Overview** Use this command from an AMF controller or AMF master to pre-authorize a node on an AMF network running in secure mode. This allows a node to join the AMF network the moment the `atmf secure-mode` command is run on that node.

Use the **no** variant of this command to remove a provisional authorization from and AMF controller or AMF master.

**Syntax**

```
atmf authorize provision [timeout <minutes>] node <node-name>
interface <interface-name> [area <area-name>]

atmf authorize provision [timeout <minutes>] mac <mac-address>

atmf authorize provision [timeout <minutes>] all

no atmf authorize provision node <node-name> interface
<interface-name> [area <area-name>]

no atmf authorize provision mac <mac-address>

no atmf authorize provision all
```

Parameter	Description
timeout	Timeout for provisional authorization. Authorization for provisioned nodes expires after the timeout period specified.
<minutes>	Timeout in minutes. A value between 1 and 6000 is permissible with the default being 60 minutes.
node	Specify a node to provision by node name.
<node-name>	The name of the node to provisionally authorize.
interface	Specify the interface the node will connect on.
<interface-name>	The name of the interface, this can be a switchport, link aggregator, LACP link, or virtual link.
area	Specify the AMF area.
<area-name>	This is the name of the area the node belongs to.
mac	Specify a node to provision by MAC address.
<mac-address>	Enter a MAC address to provisionally authorize in the format HHHH.HHHH.HHHH.
all	Provision authorization for all secure mode capable nodes.

**Default** The default timeout is 60 minutes.

**Mode** Privileged Exec

**Example** To provisionally authorize all non-secure AMF nodes, use the command:

```
awplus# atmf authorize provision all
```

To authorize a node with a MAC address of 0000.cd28.0880 for 2 hours, use the command:

```
awplus# authorize provision timeout 120 mac 0000.cd28.0880
```

To remove all provisional authorization, on an AMF master, use the command:

```
awplus# no atmf authorize provision all
```

**Related commands** [show atmf authorization](#)  
[show atmf secure-mode](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf backup

**Overview** This command can only be applied to a master node. It manually schedules an AMF backup to start at a specified time and to execute a specified number of times per day.

Use the **no** variant of this command to disable the schedule.

**Syntax** `atmf backup {default|<hh:mm> frequency <1-24>}`

Parameter	Description
default	Restore the default backup schedule.
<hh:mm>	Sets the time of day to apply the first backup, in hours and minutes. Note that this parameter uses the 24 hour clock.
backup	Enables AMF backup to external media.
frequency <1-24>	Sets the number of times within a 24 hour period that backups will be taken.

**Default** Backups run daily at 03:00 AM, by default

**Mode** Global Configuration

**Usage notes** Running this command only configures the schedule. To enable the schedule, you should then apply the command [atmf backup enable](#).

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To schedule backup requests to begin at 11 am and execute twice per day (11 am and 11 pm), use the following command:

```
node_1# configure terminal
node_1(config)# atmf backup 11:00 frequency 2
```

**CAUTION:** File names that comprise identical text, but with differing case, such as *Test.txt* and *test.txt*, will not be recognized as being different on FAT32 based backup media such as a USB storage device. However, these filenames will be recognized as being different on your Linux based device. Therefore, for good practice, ensure that you apply a consistent case structure for your back-up file names.

**Related commands** [atmf backup enable](#)  
[atmf backup stop](#)  
[show atmf backup](#)

# atmf backup area-masters delete

**Overview** Use this command to delete from external media, a backup of a specified node in a specified area.

Note that this command can only be run on an AMF controller.

**Syntax** `atmf backup area-masters delete area <area-name> node <node-name>`

Parameter	Description
<code>&lt;area-name&gt;</code>	The area that contains the node whose backup will be deleted.
<code>&lt;node-name&gt;</code>	The node whose backup will be deleted.

**Mode** Privileged Exec

**Example** To delete the backup of the remote area-master named “well-gate” in the AMF area named Wellington, use the command:

```
controller-1# atmf backup area-masters delete area Wellington  
node well-gate
```

**Related commands** [show atmf backup area](#)

# atmf backup area-masters enable

**Overview** Use this command to enable backup of remote area-masters from the AMF controller. This command is only valid on AMF controllers.

Use the **no** form of the command to stop backups of remote area-masters.

**Syntax** `atmf backup area-masters enable`  
`no atmf backup area-masters enable`

**Mode** Global configuration

**Default** Remote area backups are disabled by default

**Usage notes** Use the following commands to configure the remote area-master backups:

- [atmf backup](#) to configure when the backups begin and how often they run
- [atmf backup server](#) to configure the backup server.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To enable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf backup area-masters enable
```

To disable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf backup area-masters enable
```

**Related commands** [atmf backup server](#)  
[atmf backup](#)  
[show atmf backup area](#)

# atmf backup area-masters now

**Overview** Use this command to run an AMF backup of one or more remote area-masters from the AMF controller immediately.

This command is only valid on AMF controllers.

**Syntax** `atmf backup area-masters now [area <area-name> | area <area-name> node <node-name>]`

Parameter	Description
<code>&lt;area-name&gt;</code>	The area whose area-masters will be backed up.
<code>&lt;node-name&gt;</code>	The node that will be backed up.

**Mode** Privileged Exec

**Example** To back up all local master nodes in all areas controlled by controller-1, use the command

```
controller-1# atmf backup area-masters now
```

To back up all local masters in the AMF area named Wellington, use the command

```
controller-1# atmf backup area-masters now area Wellington
```

To back up the local master "well-master" in the Wellington area, use the command

```
controller-1# atmf backup area-masters now area Wellington node well-master
```

**Related commands** [atmf backup area-masters enable](#)  
[atmf backup area-masters synchronize](#)  
[show atmf backup area](#)

# atmf backup area-masters synchronize

**Overview** Use this command to synchronize backed-up area-master files between the active remote file server and the backup remote file server. Files are copied from the active server to the remote server.

Note that this command is only valid on AMF controllers.

**Syntax** `atmf backup area-masters synchronize`

**Mode** Privileged Exec

**Example** To synchronize backed-up files between the remote file servers for all area-masters, use the command:

```
controller-1# atmf backup area-masters synchronize
```

**Related commands**

- [atmf backup area-masters enable](#)
- [atmf backup area-masters now](#)
- [show atmf backup area](#)

# atmf backup bandwidth

**Overview** This command sets the maximum bandwidth in kilobytes per second (kBps) available to the AMF backup process. This command enables you to restrict the bandwidth that is utilized for downloading file contents during a backup.

**NOTE:** *This command will only run on an AMF master. An error message will be generated if the command is attempted on node that is not a master.*

*Also note that setting the bandwidth value to zero will allow the transmission of as much bandwidth as is available, which can exceed the maximum configurable speed of 1000 kBps. In effect, zero means unlimited.*

Use the **no** variant of this command to reset (to its default value of zero) the maximum bandwidth in kilobytes per second (kBps) available when initiating an AMF backup. A value of zero tells the backup process to transfer files using unlimited bandwidth.

**Syntax** `atmf backup bandwidth <0-1000>`  
`no atmf backup bandwidth`

Parameter	Description
<code>&lt;0-1000&gt;</code>	Sets the bandwidth in kilobytes per second (kBps)

**Default** The default value is zero, allowing unlimited bandwidth when executing an AMF backup.

**Mode** Global Configuration

**Examples** To set an atmf backup bandwidth of 750 kBps, use the commands:

```
node2# configure terminal
node2(config)# atmf backup bandwidth 750
```

To set the AMF backup bandwidth to the default value for unlimited bandwidth, use the commands:

```
node2# configure terminal
node2(config)# no atmf backup bandwidth
```

**Related commands** [show atmf backup](#)

# atmf backup delete

**Overview** This command removes the backup file from the external media of a specified AMF node.

Note that this command can only be run from an AMF master node.

**Syntax** `atmf backup delete <node-name>`

Parameter	Description
<code>&lt;node-name&gt;</code>	The AMF node name of the backup file to be deleted.

**Mode** Privileged Exec

**Example** To delete the backup file from node2, use the following command:

```
Node_1# atmf backup delete node2
```

**Related commands**

- `show atmf backup`
- `atmf backup now`
- `atmf backup stop`

# atmf backup enable

**Overview** This command enables automatic AMF backups on the AMF master node that you are connected to. By default, automatic backup starts at 3:00 AM. However, this schedule can be changed by the [atmf backup](#) command. Note that backups are initiated and stored only on the master nodes.

Use the **no** variant of this command to disable any AMF backups that have been scheduled and previously enabled.

**Syntax** `atmf backup enable`  
`no atmf backup enable`

**Default** Automatic AMF backup functionality is enabled on the AMF master when it is configured and external media, i.e. an SD card or a USB storage device or remote server, is detected.

**Mode** Global Configuration

**Usage notes** A warning message will appear if you run the [atmf backup enable](#) command with either insufficient or marginal memory availability on your external storage device.

You can use the command [show atmf backup](#) on page 2595 to check the amount of space available on your external storage device.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To turn on automatic AMF backup, use the following command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup enable
```

**Related commands** [show atmf](#)  
[show atmf backup](#)  
[atmf backup](#)  
[atmf backup now](#)  
[atmf enable](#)

# atmf backup guests delete

**Overview** This command removes a guest node's backup files from external media such as a USB drive, SD card, or an external file server.

**Syntax** `atmf backup guests delete <node-name> <guest-port>`

Parameter	Description
<code>&lt;node-name&gt;</code>	The name of the guest's parent node.
<code>&lt;guest-port&gt;</code>	The port number on the parent node.

**Mode** User Exec/Privileged Exec

**Example** On a parent node named "node1" (which, in this case, the user has a direct console connection to) use the following command to remove the backup files of the guest node that is directly connected to port1.0.3.

```
node1# atmf backup guests delete node1 port1.0.3
```

**Related Command**

- [atmf backup delete](#)
- [atmf backup area-masters delete](#)
- [show atmf backup guest](#)

# atmf backup guests enable

**Overview** Use this command to enable backups of remote guest nodes from an AMF master. Use the **no** variant of this command to disable the ability of the guest nodes to be backed up.

**Syntax** `atmf backup guests enable`  
`no atmf backup guests enable`

**Default** Guest node backups are enabled by default.

**Mode** Global Config

**Usage notes** We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** On the AMF master node, enable all scheduled guest node backups:

```
atmf-master# configure terminal
atmf-master(config)# atmf backup guests enable
```

**Related commands** `atmf backup area-masters enable`  
`show atmf backup guest`  
`atmf backup guests synchronize`

# atmf backup guests now

**Overview** This command manually triggers an AMF backup of guest nodes on a AMF Master.

**Syntax** `atmf backup guests now [<node-name>] [<guest-port>]`

Parameter	Description
<code>&lt;node-name&gt;</code>	The name of the guest's parent node.
<code>&lt;guest-port&gt;</code>	The port number that connects to the guest node.

**Default** n/a

**Mode** Privileged Exec

**Example** Use the following command to manually trigger the backup of all guests in the AMF network

```
awplus# atmf backup guests now
```

**Example** To manually trigger the backup of a guest node connected to port 1.0.23 of node1, use the following command:

```
awplus# atmf backup guests now node1 port1.0.23
```

**Related commands** [show atmf backup guest](#)

# atmf backup guests synchronize

**Overview** This command initiates a manual synchronization of all guest backup file-sets across remote file servers and various redundancy backup media, such as USB storage devices. This facility ensures that each device contains the same backup image files. Note that this backup synchronization process will occur as part of the regular backups scheduled by the [atmf backup](#) command.

**Syntax** `atmf backup guests synchronize`

**Default** n/a

**Mode** User Exec/Privileged Exec

**Example** To synchronize backups across remote file servers and storage devices, use the command:

```
Node1#atmf backup guests synchronize
```

**Related commands** [atmf backup redundancy enable](#)  
[show atmf guests](#)  
[atmf backup guests enable](#)

# atmf backup now

**Overview** This command initiates an immediate AMF backup of either all AMF members, or a selected AMF member. Note that this backup information is stored in the external media on the master node of the device on which this command is run, even though the selected AMF member may not be a master node.

Note that this command can only be run on an AMF master node.

**Syntax** `atmf backup now [<nodename>]`

Parameter	Description
<nodename> or <hostname>	The name of the AMF member to be backed up, as set by the command <code>hostname</code> on page 277. Where no name has been assigned to this device, then you must use the default name, which is the word "host", then an underscore, then (without a space) the MAC address of the device to be backed up. For example <code>host_0016_76b1_7a5e</code> . Note that the node-name appears as the command Prompt when in Privileged Exec mode.

**Default** A backup is initiated for all nodes on the AMF (but stored on the master nodes).

**Mode** Privileged Exec

**Usage notes** Although this command will select the AMF node to be backed-up, it can only be run from any AMF master node.

**NOTE:** *The backup produced will be for the selected node but the backed-up config will reside on the external media of the AMF master node on which the command was run. However, this process will result in the information on one master being more up-to-date. To maintain concurrent backups on both masters, you can apply the backup now command to the master working-set. This is shown in Example 4 below.*

**Example 1** In this example, an AMF member has not been assigned a host name. The following command is run on the AMF\_Master\_2 node to immediately backup the device that is identified by its MAC address of 0016.76b1.7a5e:

```
AMF_Master_2# atmf backup now host_0016_76b1_7a5e
```

**NOTE:** *When a host name is derived from its MAC address, the syntax format entered changes from XXXX.XXXX.XXXX to XXXX\_XXXX\_XXXX.*

**Example 2** In this example, an AMF member has the host name, **office\_annex**. The following command will immediately backup this device:

```
AMF_Master_2# atmf backup now office_annex
```

This command is initiated on the device's master node named **AMF\_Master\_2** and initiates an immediate backup on the device named **office\_annex**.

**Example 3** To initiate from AMF\_master\_1 an immediate backup of all AMF member nodes, use the following command:

```
AMF_Master_1# amf backup now
```

**Example 4** To initiate an immediate backup of the node with the host-name “office\_annex” and store the configuration on both masters, use the following process:

From the AMF\_master\_1, set the working-set to comprise only of the automatic group, master nodes.

```
AMF_Master_1# atmf working-set group master
```

This command returns the following display:

```
=====
AMF_Master_1, AMF_Master_2
=====

Working set join
```

Backup the AMF member with the host name, **office\_annex** on both the master nodes as defined by the working set.

```
AMF_Master[2]# atmf backup now office_annex
```

Note that the [2] shown in the command prompt indicates a 2 node working-set.

- [atmf backup](#)
  - [atmf backup stop](#)
  - [hostname](#)
  - [show atmf backup](#)

# atmf backup redundancy enable

**Overview** This command is used to enable or disable AMF backup redundancy.

**Syntax** `atmf backup redundancy enable`  
`no atmf backup redundancy enable`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** If the AMF Master or Controller supports any removable media (SD card/USB), it uses the removable media as the redundant backup for the AMF data backup.

This feature is valid only if remote file servers are configured on the AMF Master or Controller.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To enable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# atmf backup redundancy enable
```

To disable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf backup redundancy enable
```

**Related commands** [atmf backup synchronize](#)  
[show atmf backup](#)  
[show atmf backup area](#)

# atmf backup server

**Overview** This command configures remote file servers as the destination for AMF backups.

Use the **no** variant of this command to remove the destination server(s). When all servers are removed the system will revert to backup from external media.

**Syntax** `atmf backup server id {1|2} <hostlocation> username <username> [path <path>|port <1-65535>]`  
`no atmf backup server id {1|2}`

Parameter	Description
id	Remote server backup server identifier.
{1 2}	The backup server identifier number (1 or 2). Note that there can be up to two backup servers, numbered 1 and 2 respectively, and you would need to run this command separately for each server.
<hostlocation>	Either the name or the IP address (IPv4 or IPv6) of the selected backup server (1 or 2).
username	Configure the username to log in with on the selected remote file server.
<username>	The selected remote file server's username.
path	The location of the backup files on the selected remote file server. By default this will be the home directory of the username used to log in with.
<path>	The directory path utilized to store the backup files on the selected remote file server. No spaces are allowed in the path.
port	The connection to the selected remote backup file server using SSH. By default SSH connects to a device on TCP port 22 but this can be changed with this command.
<1-65535>	A TCP port within the specified range.

**Defaults** Remote backup servers are not configured. The default SSH TCP port is 22. The path utilized on the remote file server is the home directory of the username.

**Mode** Global Exec

**Usage notes** The hostname and username parameters must both be configured.

**Examples** To configure server 1 with an IPv4 address and a username of *backup1*, use the commands:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 192.168.1.1
username backup1
```

To configure server 1 with an IPv6 address and a username of *backup1*, use the command:

```
AMF_backup1_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 FFEE::01 username
backup1
```

To configure server 2 with a hostname and username, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com
username backup2
```

To configure server 2 with a hostname and username in addition to the optional path and port parameters, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com
username backup2 path tokyo port 1024
```

To unconfigure the AMF remote backup file server 1, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# no atmf backup server id 1
```

**Related commands** [show atmf backup](#)

# atmf backup stop

**Overview** Running this command stops a backup that is currently running on the master node you are logged onto. Note that if you have two masters and want to stop both, then you can either run this command separately on each master node, or add both masters to a working set, and issue this command to the working set.

Note that this command can only be run on a master node.

**Syntax** `atmf backup stop`

**Mode** Privileged Exec

**Usage notes** This command is used to halt an AMF backup that is in progress. In this situation the backup process will finish on its current node and then stop.

**Example** To stop a backup that is currently executing on master node node-1, use the following command:

```
AMF_Master_1# amf backup stop
```

**Related commands**

- [atmf backup](#)
- [atmf backup enable](#)
- [atmf backup now](#)
- [show atmf backup](#)

# atmf backup synchronize

**Overview** For the master node you are connected to, this command initiates a system backup of files from the node's active remote file server to its backup remote file server. Note that this process happens automatically each time the network is backed up.

Note that this command can only be run from a master node.

**Syntax** `atmf backup synchronize`

**Mode** Privileged Exec

**Example** When connected to the master node `AMF_Master_1`, the following command will initiate a backup of all system related files from its active remote file server to its backup remote file server.

```
AMF_Master_1# atmf backup synchronize
```

**Related commands**

- [atmf backup enable](#)
- [atmf backup redundancy enable](#)
- [show atmf](#)
- [show atmf backup](#)

# atmf cleanup

**Overview** This command is an alias to the [erase factory-default](#) command.

# atmf container

**Overview** Use this command to create or update an AMF container on a Virtual AMF Appliance (VAA) virtual machine.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an AMF container.

**Syntax** `atmf container <container-name>`  
`no atmf container <container-name>`

Parameter	Description
<code>&lt;container-name&gt;</code>	The name of the AMF container to create, update, or remove.

**Mode** AMF Container Configuration

**Usage notes** You cannot delete a container while it is still running. First use the **state disable** command to stop the container.

**Examples** To create or update the AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)#
```

To remove the AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# no atmf container vac-wlg-1
```

**Related commands**

- [area-link](#)
- [atmf container login](#)
- [bridge-group](#)
- [description \(amf-container\)](#)
- [show atmf container](#)
- [state](#)

**Command changes** Version 5.4.7-0.1: command added

# atmf container login

**Overview** Use this command to login to an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `atmf container login <container-name>`

Parameter	Description
<code>&lt;container-name&gt;</code>	The name of the AMF container you wish to login into.

**Mode** Privileged Exec

**Usage notes** If you try to login to a AMF container that has not been created, or is not running, you will see the following message:

```
% Container does not exist or is not running.
```

To exit from a container and return to the host VAA press `<Ctrl+a q>`.

**Example** To login to container “vac-wlg-1”, use the command:

```
awplus# atmf container login vac-wlg-1
```

You will then be presented with a login screen for that container:

```
Connected to tty 1
Type <Ctrl+a q> to exit the console, <Ctrl+a Ctrl+a> to enter Ctrl+a itself

vac-wlg-1 login: manager
Password: friend

AlliedWare Plus (TM) 5.4.7 02/03/17 08:46:12

vac-wlg-1>
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# atmf controller

**Overview** Use this command to configure the device as an AMF controller. This enables you to split a large AMF network into multiple areas.

AMF controller is a licensed feature. The number of areas supported on a controller depends on the license installed on that controller.

Use the **no** variant of this command to remove the AMF controller functionality.

**Syntax** `atmf controller`  
`no atmf controller`

**Mode** Global configuration

**Usage notes** If a valid AMF controller license is not available on the device, the device will accept this command but will not act as a controller until you install a valid license. The following message will warn you of this:

“An AMF Controller license must be installed before this feature will become active”

**NOTE:** *If the AMF controller functionality is removed from a device using the **no atmf controller** command then the device must be rebooted if it is to function properly as an AMF master.*

**Example** To configure the node named *controller-1* as an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf controller
```

To stop the node named *controller-1* from being an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf controller
```

**Related commands** `atmf area`  
`show atmf`

# atmf distribute firmware

**Overview** This command can be used to upgrade software one AMF node at a time. A URL can be selected from any media location. The latest compatible release for a node will be selected from this location.

Several procedures are performed to ensure the upgrade will succeed. This includes checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash on the new location.

The new release name is updated using the **boot system** command. The old release will become the backup release file. If a release file exists in a remote device (such as TFTP or HTTP, for example) then the URL should specify the exact release filename without using a wild card character.

The command will continue to upgrade software until all nodes are upgraded. At the end of the upgrade cycle the command should be used on the working-set.

**Syntax** `atmf distribute firmware <filename>`

Parameter	Description
<code>&lt;filename&gt;</code>	The filename and path of the file. See the <a href="#">File Management Feature Overview and Configuration Guide</a> for valid syntax.

**Mode** Privileged Exec

**Examples** To upgrade nodes in a AMF network with a predefined AMF group called 'teams', use the following command:

```
Team1# atmf working-set group teams
```

```
=====
Team1, Team2, Team3:
=====
Working set join
```

```
ATMF_NETWORK[3]# atmf distribute firmware card:*.rel
```

```
Retrieving data from Team1
Retrieving data from Team2
Retrieving data from Team3

ATMF Firmware Upgrade:

Node Name          New Release File          Status
-----
Team1              x510-5.4.7-1.1.rel       Release ready
Team2              x930-5.4.7-1.1.rel       Release ready
Team3              x930-5.4.7-1.1.rel       Release ready
Continue the rolling reboot ? (y/n):y
=====
Copying Release    : x510-5.4.7-1.1.rel to Team1
Updating Release   : x510-5.4.7-1.1.rel information on Team1
=====
Copying Release    : x930-5.4.7-1.1.rel to Team2
Updating Release   : x930-5.4.7-1.1.rel information on Team2
=====
Copying Release    : x930-5.4.7-1.1.rel to Team3
Updating Release   : x930-5.4.7-1.1.rel information on Team3
=====
New firmware will not take effect until nodes are rebooted.
=====

ATMF_NETWORK[3]#
```

**Related commands** [atmf working-set](#)

# atmf domain vlan

**Overview** The AMF domain VLAN is created when the AMF network is first initiated and is assigned a default VID of 4091. This command enables you to change the VID from this default value on this device.

The AMF domain VLAN is one of AMF's internal VLANs (the management VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

An important point conceptually is that although the domain VLAN exists globally across the AMF network, it is assigned separately to each domain. The AMF network therefore can be thought of as comprising a series of domain VLANs each having the same VID and each being applied to a horizontal slice (domain) of the AMF. It follows therefore that the domain VLANs are only applied to ports that form cross-links and not to ports that form uplinks/downlinks.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to reset the VLAN ID to its default value of 4091.

**Syntax** atmf domain vlan <2-4090>  
no atmf domain vlan

Parameter	Description
<2-4090>	The VLAN number in the range 2 to 4090.

**Default** VLAN 4091

**Mode** Global Configuration

**Usage notes** We recommend you only change the domain VLAN when first creating the AMF network, and only if VLAN 4091 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
```

```
test(config)[10]# atmf domain vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

- 4) Create the working set again, using the commands:

```
master(config)# exit
```

```
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

**NOTE:** The domain VLAN will automatically be assigned an IP subnet address based on the value configured by the command *atmf management subnet*.

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

**Examples** To change the AMF domain VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
```

```
test[10]# configure terminal
```

```
test(config)[10]# atmf domain vlan 4090
```

```
master(config)# exit
```

```
master# atmf working-set group all
```

```
test[10]# write
```

To reset the AMF domain VLAN to its default of 4091 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf domain vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands**

- [atmf management subnet](#)
- [atmf management vlan](#)

# atmf enable

**Overview** This command manually enables (turns on) the AMF feature for the device being configured.

Use the **no** variant of this command to disable (turn off) the AMF feature on the member node.

**Syntax** atmf enable  
no atmf enable

**Default** Once AMF is configured, the AMF feature starts automatically when the device starts up.

**Mode** Global Configuration

**Usage notes** The device does not auto negotiate AMF domain specific settings such as the Network Name. You should therefore, configure your device with any domain specific (non default) settings before enabling AMF.

**Examples** To turn off AMF, use the command:

```
MyNode# config terminal
MyNode(config)# no atmf enable
```

To turn on AMF, use the command:

```
MyNode(config)# atmf enable
```

This command returns the following display:

```
% Warning: The ATMF network config has been set to enable
% Save the config and restart the system for this change to take
effect.
```

# atmf group (membership)

**Overview** This command configures a device to be a member of one or more AMF groups. Groups exist in three forms: Implicit Groups, Automatic Groups, and User-defined Groups.

- Implicit Groups
  - all: All nodes in the AMF
  - current: The current working-set
  - local: The originating node.

Note that the Implicit Groups do not appear in show group output.

- Automatic Groups - These are defined by hardware architecture, e.g. x510, x230, x8100, AR3050S, AR4050S.
- User-defined Groups - These enable you to define arbitrary groups of AMF members based on your own criteria.

Each node in the AMF is automatically assigned membership to the implicit groups, and the automatic groups that are appropriate to its node type, e.g. x230, PoE. Similarly, nodes that are configured as masters are automatically assigned to the master group.

Use the **no** variant of this command to remove the membership.

**Syntax** `atmf group <group-list>`  
`no atmf group <group-list>`

Parameter	Description
<code>&lt;group-list&gt;</code>	A list of group names. These should be entered as a comma delimited list without spaces. Names can contain alphanumeric characters, hyphens and underscores.

**Mode** Global Configuration

**Usage notes** You can use this command to define your own arbitrary groups of AMF members based on your own network's configuration requirements. Applying a node to a non existing group will result in the group automatically being created.

Note that the master nodes are automatically assigned to be members of the pre-existing master group.

The following example configures the device to be members of three groups; two are company departments, and one comprises all devices located in building\_2. To avoid having to run this command separately on each device that is to be added to these groups, you can remotely assign all of these devices to a working-set, then use the capabilities of the working-set to apply the [atmf group \(membership\)](#) command to all members of the working set.

**Example 1** To specify the device to become a member of AMF groups named *marketing*, *sales*, and *building\_2*, use the following commands:

```
node-1# configure terminal
node-1(config)# atmf group marketing,sales,building_2
```

**Example 2** To add the nodes *member\_node\_1* and *member\_node\_2* to groups *building1* and *sales*, first add the nodes to the working-set:

```
master_node# atmf working-set member_node_1,member_node_2
```

This command returns the following output confirming that the nodes *member\_node\_1* and *member\_node\_2* are now part of the working-set:

```
=====
member_node_1, member_node_2
=====

Working set join
```

Then add the members of the working set to the groups:

```
atmf-net[2]# configure terminal
atmf-net[2](config)# atmf group building1,sales
atmf-net[2](config)# exit
atmf-net[2]# show atmf group
```

This command returns the following output displaying the groups that are members of the working-set.

```
=====
member_node_1
=====

AMF group information

building1, sales
```

**Related commands** [show atmf group](#)  
[show atmf group members](#)

# atmf guest-class

**Overview** This modal command creates a guest-class. Guest-classes are modal templates that can be applied to selected guest types. Once you have created a guest-class, you can select it by entering its mode. From here, you can then configure a further set of operational settings specifically for the new guest-class.

These settings can then all be applied to a guest link by running the [switchport atmf-guestlink](#) command. The following settings can be configured from each guest class mode:

- discovery method
- model type
- http-enable setting
- guest port, user name, and password

The **no** variant of this command removes the guest-class. Note that you cannot remove a guest-class that is assigned to a port.

**Syntax** `atmf guest-class <guest-class-name>`  
`no atmf guest-class <guest-class-name>`

Parameter	Description
<code>&lt;guest-class-name&gt;</code>	The name assigned to the guest-class type. This can be chosen from an arbitrary string of up to 15 characters.

**Mode** Global Configuration

**Example** To create a guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class camera
node1(config-atmf-guest)#
```

To remove the guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# no atmf guest-class camera
```

# atmf log-verbose

**Overview** This command limits the number of log messages displayed on the console or permanently logged.

Use the **no** variant of this command to reset to the default.

**Syntax** atmf log-verbose <1-3>  
no atmf log-verbose

Parameter	Description
<1-3>	The verbose limitation (3 = noisiest, 1 = quietest)

**Default** The default log display is 3.

**Usage** This command is intended for use in large networks where verbose output can make the console unusable for periods of time while nodes are joining and leaving.

**Mode** Global Configuration

**Example** To set the log-verbose to noise level 2, use the command:

```
node-1# configure terminal
node-1(config)# atmf log-verbose 2
```

**Validation Command** `show atmf`

# atmf management subnet

**Overview** This command is used to assign a subnet that will be allocated to the AMF management and domain management VLANs. From the address space defined by this command, two subnets are created, a management subnet component and a domain component, as explained in the Usage section below.

AMF uses these internal IPv4 subnets to communicate network status information between nodes. These subnet addresses must be reserved for AMF and not used for other purposes.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to remove the assigned subnet.

**Syntax** atmf management subnet <a.b.0.0>  
no atmf management subnet

Parameter	Description
<a.b.0.0>	The IP address selected for the management subnet. Because a mask of 255.255.0.0 (i.e. /16) will be applied automatically, an IP address in the format a.b.0.0 must be selected. Usually this subnet address is selected from an appropriate range from within the private address space of 172.16.0.0 to 172.31.255.255, or 192.168.0.0, as defined in RFC1918.

**Default** 172.31.0.0. A subnet mask of 255.255.0.0 will automatically be applied.

**Mode** Global Configuration

**Usage notes** Running this command will result in the creation of a further two subnets (within the class B address space assigned) and the mask will extend from /16 to /17.

For example, if the management subnet is assigned the address 172.31.0.0/16, this will result in the automatic creation of the following two subnets:

- 172.31.0.0/17 assigned to the [atmf management vlan](#)
- 172.31.128.0/17 assigned to the [atmf domain vlan](#).

We recommend you only change the management subnet when first creating the AMF network, and only if 172.31.0.0 is already being used in your network.

However, if you do need to change the subnet on an existing AMF network, use the following steps:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN, management VLAN, or management subnet. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new subnet address, using the commands:

```
test[10]# configure terminal
```

```
test(config)[10]# atmf management subnet <a.b.0.0>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new subnet.

- 4) Create the working set again, using the commands:

```
master(config)# exit
```

```
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the subnet on missing devices by logging into their consoles directly.

**Examples** To change the AMF management subnet address to 172.25.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
```

```
test[10]# configure terminal
```

```
test(config)[10]# atmf management subnet 172.25.0.0
```

```
master(config)# exit
```

```
master# atmf working-set group all
```

```
test[10]# write
```

To reset the AMF management subnet address to its default of 172.31.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management subnet
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands**

- [atmf domain vlan](#)
- [atmf management vlan](#)

# atmf management vlan

**Overview** The AMF management VLAN is created when the AMF network is first initiated and is assigned a default VID of 4092. This command enables you to change the VID from this default value on this device.

The AMF management VLAN is one of AMF's internal VLANs (the domain VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to restore the VID to the default of 4092.

**Syntax** atmf management vlan <2-4090>  
no atmf management vlan

Parameter	Description
<2-4090>	The VID assigned to the AMF management VLAN.

**Default** VLAN 4092

**Mode** Global Configuration

**Usage notes** We recommend you only change the management VLAN when first creating the AMF network, and only if VLAN 4092 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps to ensure you change it on all nodes simultaneously:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the management VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
test(config)[10]# atmf management vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

- 4) Create the working set again, using the commands:

```
master(config)# exit
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

**NOTE:** The management VLAN will automatically be assigned an IP subnet address based on the value configured by the command [atmf management subnet](#).

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

**Examples** To change the AMF management VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf management vlan 4090
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF management VLAN to its default of 4092 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands** [atmf domain vlan](#)  
[atmf management subnet](#)

# atmf master

**Overview** This command configures the device to be an AMF master node and automatically creates an AMF master group. The master node is considered to be the core of the AMF network, and must be present for the AMF to form. The AMF master has its node depth set to 0. Note that the node depth vertical distance is determined by the number of uplinks/downlinks that exist between the node and its master.

An AMF master node must be present for an AMF network to form. Up to two AMF master nodes may exist in a network, and they **must** be connected by an AMF crosslink.

**NOTE:** Master nodes are an essential component of an AMF network. In order to run AMF, an AMF License is required for each master node.

If the crosslink between two AMF masters fails, then one of the masters will become isolated from the rest of the AMF network.

Use the **no** variant of this command to remove the device as an AMF master node. The node will retain its node depth of 0 until the network is rebooted.

**NOTE:** Node depth is the vertical distance (or level) from the master node (whose depth value is 0).

**Syntax** atmf master  
no atmf master

**Default** The device is not configured to be an AMF master node.

**Mode** Global Configuration

**Example** To specify that this node is an AMF master, use the following command:

```
node-1# configure terminal
node-1(config)# atmf master
```

**Related commands** [show atmf](#)  
[show atmf group](#)

# atmf mtu

**Overview** This command configures the AMF network Maximum Transmission Unit (MTU). The MTU value will be applied to the AMF Management VLAN, the AMF Domain VLAN and AMF Area links.

Use the **no** variant of this command to restore the default MTU.

**Syntax** `atmf mtu <1300-1442>`  
`no atmf mtu`

Parameter	Description
<1300-1442>	The value of the maximum transmission unit for the AMF network, which sets the maximum size of all AMF packets generated from the device.

**Default** 1300

**Mode** Global Configuration

**Usage notes** The default value of 1300 will work for all AMF networks (including those that involve virtual links over IPsec tunnels). If there are virtual links over IPsec tunnels anywhere in the AMF network, we recommend not changing this default. If there are no virtual links over IPsec tunnels, then this AMF MTU value may be increased for network efficiency.

**Example** To change the ATMF network MTU to 1442, use the command:

```
awplus(config)# atmf mtu 1442
```

**Related commands** [show atmf detail](#)

# atmf network-name

**Overview** This command applies an AMF network name to a (prospective) AMF node. In order for an AMF network to be valid, its network-name must be configured on at least two nodes, one of which must be configured as a master and have an AMF License applied. These nodes may be connected using either AMF downlinks or crosslinks.

For more information on configuring an AMF master node, see the command [atmf master](#).

Use the **no** variant of this command to remove the AMF network name.

**Syntax** `atmf network-name <name>`  
`no atmf network-name`

Parameter	Description
<code>&lt;name&gt;</code>	The AMF network name. Up to 15 printable characters can be entered for the network-name.

**Mode** Global Configuration

**Usage notes** This is one of the essential commands when configuring AMF and must be entered on each node that is to be part of the AMF.

A switching node (master or member) may be a member of only one AMF network.

**CAUTION:** *Ensure that you enter the correct network name. Entering an incorrect name will cause the AMF network to fragment (at the next reboot).*

**Example** To set the AMF network name to `amf_net` use the command:

```
Node_1(config)# atmf network-name amf_net
```

# atmf provision (interface)

**Overview** This command configures a specified port on an AMF node to accept a provisioned node, via an AMF link, some time in the future.

Use the **no** variant of this command to remove the provisioning on the node.

**Syntax** `atmf provision <nodename>`  
`no atmf provision`

Parameter	Description
<code>&lt;nodename&gt;</code>	The name of the provisioned node that will appear on the AMF network in the future.

**Mode** Interface Configuration for a switchport, a static aggregator, dynamic channel group or an Eth port on an AR-Series device.

**Usage notes** The port should be configured as an AMF link or cross link and should be 'down' to add or remove a provisioned node.

**Example** To provision an AMF node named node1 for port1.0.1, use the commands:

```
host1(config)# interface port1.0.1
host1(config-if)# atmf provision node1
```

**Related commands**

- `atmf provision node`
- `clone (amf-provision)`
- `configure boot config (amf-provision)`
- `configure boot system (amf-provision)`
- `copy (amf-provision)`
- `create (amf-provision)`
- `delete (amf-provision)`
- `identity (amf-provision)`
- `license-cert (amf-provision)`
- `locate (amf-provision)`
- `show atmf provision nodes`
- `show atmf links`
- `switchport atmf-link`
- `switchport atmf-crosslink`

# atmf provision node

**Overview** Use this command to provision a replacement node for a specified interface. Node provisioning is effectively the process of creating a backup file-set on a master node that can be loaded onto a provisioned node some time in the future. This file-set is created just as if the provisioned node really existed and was connected to the network. Typically these comprise configuration, operating system, and license files etc.

You can optionally provision a node with multiple device-type backups. When a device is then attached to the network, AMF uses its device-type to find the correct configuration to use. For example you can create an x510 and an x530 provisioning configuration for a node called 'node1' and if either an x510 or an x530 is attached to that node the appropriate configuration will be used.

Use the **no** variant of this command to remove a provisioned node.

**Syntax** `atmf provision node <nodename> [device <device-type>]`  
`no atmf provision node <nodename> [device <device-type>]`

Parameter	Description
<nodename>	The name of the provisioned node that will appear on the AMF network.
device	Optionally specify a device type.
<device-type>	Any valid device type e.g. AR3050s, ie200, x950. For a full list of valid device types use the command <b>atmf provision node &lt;nodename&gt; device ?</b> .

**Mode** Privileged Exec

**Usage notes** This command creates the directory structure for the provisioned node's file-set. It also switches to the AMF provision node prompt so that the nodes backup file-set can be created or updated. This is typically done with the [create \(amf-provision\)](#) or [clone \(amf-provision\)](#) commands.

For more information on AMF provisioning, see the [AMF Feature Overview and Configuration Guide](#)..

**Example** To configure node named 'node1', use the command:

```
awplus# atmf provision node node1  
awplus(atmf-provision)#
```

To configure a node named 'node1' for device type 'x530', use the command:

```
awplus# atmf provision node node1 device x530  
awplus(atmf-provision)#
```

**Related commands**

- atmf provision (interface)
- clone (amf-provision)
- configure boot config (amf-provision)
- configure boot system (amf-provision)
- copy (amf-provision)
- create (amf-provision)
- delete (amf-provision)
- identity (amf-provision)
- license-cert (amf-provision)
- locate (amf-provision)
- show atmf provision nodes

**Command changes** Version 5.4.9-0.1: command added

# atmf reboot-rolling

**Overview** This command enables you to reboot the nodes in an AMF working-set, one at a time, as a rolling sequence in order to minimize downtime. Once a rebooted node has finished running its configuration and its ports are up, it re-joins the AMF network and the next node is rebooted.

By adding the *url* parameter, you can also upgrade your devices' software one AMF node at a time.

The **force** parameter forces the rolling reboot to continue even if a previous node does not rejoin the AMF network. Without the **force** parameter, the unsuitable node will time-out and the rolling reboot process will stop. However, with the **force** parameter applied, the process will ignore the timeout and move on to reboot the next node in the sequence.

This command can take a significant amount of time to complete.

**Syntax** `atmf reboot-rolling [force] [<url>]`

Parameter	Description
<code>force</code>	Ignore a failed node and move on to the next node. Where a node fails to reboot a timeout is applied based on the time taken during the last reboot.
<code>&lt;url&gt;</code>	The path to the software upgrade file.

**Mode** Privileged Exec

**Usage notes** You can load the software from a variety of locations. The latest compatible release for a node will be selected from your selected location, based on the parameters and URL you have entered.

For example `card:/5.4.6/x*-5.4.6-*.rel` will select from the folder `card:/5.4.6` the latest file that matches the selection `x` (wildcard) `-5.4.6-` (wildcard).`rel`. Because `x*` is applied, each device type will be detected and its appropriate release file will be installed.

Other allowable entries are:

Entry	Used when loading software
<code>card:*.rel:</code>	from an SD card
<code>tftp:&lt;ip-address&gt;:</code>	from a TFTP server
<code>usb:</code>	from a USB flash drive
<code>flash:</code>	from flash memory, e.g. from one x930 switch to another
<code>scp:</code>	using secure copy
<code>http:</code>	from an HTTP file server

Several checks are performed to ensure the upgrade will succeed. These include checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash to a new location on each node as it is processed. The new release name will be updated using the **boot system**<release-name> command, and the old release will become the backup release file.

**NOTE:** If you are using TFTP or HTTP, for example, to access a file on a remote device then the URL should specify the exact release filename without using wild card characters.

On bootup the software release is verified. Should an upgrade fail, the upgrading unit will revert back to its previous software version. At the completion of this command, a report is run showing the release upgrade status of each node.

**NOTE:** Take care when removing external media or rebooting your devices. Removing an external media while files are being written entails a significant risk of causing a file corruption.

**Example 1** To reboot all x510 nodes in an AMF network, use the following command:

```
Bld2_Floor_1# atmf working-set group x510
```

This command returns the following type of screen output:

```
=====
node1, node2, node3:
=====

Working set join

AMF_NETWORK[3]#
```

```
ATMF_NETWORK[3]# atmf reboot-rolling
```

When the reboot has completed, a number of status screens appear. The selection of these screens will depend on the parameters set.

```
Bld2_Floor_1#atmf working-set group x510

=====
SW_Team1, SW_Team2, SW_Team3:
=====

Working set join

ATMF_NETWORK[3]#atmf reboot-rolling

Continue upgrading releases ? (y/n):

# atmf recover

**Overview** This command is used to manually initiate the recovery (or replication) of an AMF node, usually when a node is being replaced.

**Syntax** `atmf recover [<node-name> master <node-name>]`  
`atmf recover [<node-name> controller <node-name>]`

Parameter	Description
<i>&lt;node-name&gt;</i>	The name of the device whose configuration is to be recovered or replicated.
master <i>&lt;node-name&gt;</i>	The name of the master device that holds the required configuration information. Note that although you can omit both the node name and the master name; you cannot specify a master name unless you also specify the node name.
controller <i>&lt;node-name&gt;</i>	The name of the controller that holds the required configuration information. Note that although you can omit both the node name and the controller name; you cannot specify a controller name unless you also specify the node name.

**Mode** Privileged Exec

**Usage notes** The recovery/replication process involves loading the configuration file for a node that is either about to be replaced or has experienced some problem. You can specify the configuration file of the device being replaced by using the *<node-name>* parameter, and you can specify the name of the master node or controller holding the configuration file.

If the *<node-name>* parameter is not entered then the node will attempt to use one that has been previously configured. If the replacement node has no previous configuration (and has no previously used node-name), then the recovery will fail.

If the master or controller name is not specified then the device will poll all known AMF masters and controllers and execute an election process (based on the last successful backup and its timestamp) to determine which to use. If no valid backup master or controller is found, then this command will fail.

No error checking occurs when this command is run. Regardless of the last backup status, the recovering node will attempt to load its configuration from the specified master node or controller.

If the node has previously been configured, we recommend that you suspend any AMF backup before running this command. This is to prevent corruption of the backup files on the AMF master as it attempts to both backup and recover the node at the same time.

**Example** To recover the AMF node named Node\_10 from the AMF master node named Master\_2, use the following command:

```
Master_2# atmf recover Node_10 master Master_2
```

**Related commands**

- atmf backup stop
- show atmf backup
- show atmf

# atmf recover guest

**Overview** Use this command to initiate a guest node recovery or replacement by reloading its backup file-set that is located within the AMF backup system. Note that this command must be run on the edge node device that connects to the guest node.

**Syntax** `atmf recover guest [<guest-port>]`

Parameter	Description
<code>&lt;guest-port&gt;</code>	The port number that connects to the guest node.

**Mode** User Exec/Privileged Exec

**Example** To recover a guest on node1 port1.0.1, use the following command

```
node1# atmf recover guest port1.0.1
```

**Related commands** [show atmf backup guest](#)

# atmf recover led-off

**Overview** This command turns off the recovery failure flashing port LEDs. It reverts the LED's function to their normal operational mode, and in doing so assists with resolving the recovery problem. You can repeat this process until the recovery failure has been resolved. For more information, see the [AMF Feature Overview and Configuration Guide](#).

**Syntax** `atmf recover led-off`

**Default** Normal operational mode

**Mode** Privileged Exec

**Example** To revert the LEDs on Node1 from recovery mode display to their normal operational mode, use the command:

```
Node1# atmf recover led-off
```

**Related commands** [atmf recover](#)

# atmf recover over-eth

**Overview** Use this command to enable AMF recovery over an AR-series device's Eth port. This setting persists even after restoring a device to a 'clean' state with the [erase factory-default](#) or [atmf cleanup](#) command.

Use the **no** variant of this command to disable AMF recover over an Eth port.

**Syntax** `atmf recover over-eth`  
`no atmf recover over-eth`

**Default** Eth ports cannot be used for recovery.

**Mode** Privileged Exec

**Usage notes** AMF links over Eth ports are only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

**Example** To enable AMF recovery over an Eth port, use the command:

```
awplus# atmf recover over-eth
```

To disable AMF recovery over an Eth port, use the commands:

```
awplus# no atmf recover over-eth
```

**Related commands** [atmf-link](#)

**Command changes** Version 5.5.0-1.1: command added

# atmf recovery-server

**Overview** Use this command on an AMF master to process recovery requests from isolated AMF nodes. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This option allows these nodes, which have no AMF neighbors, to be identified for recovery or provisioning purposes. They are identified using an identity token which is stored on the AMF master.

Use the **no** variant of this command to disable processing of recovery requests from isolated AMF nodes.

**Syntax** `atmf recovery-server`  
`no atmf recovery-server`

**Default** Recovery-server is disabled by default.

**Mode** Global Configuration

**Usage notes** Once **recovery-server** is enabled on an AMF network, the next time an isolated node is backed up its identity token will be stored in the AMF master's database. Should the device fail it can then be replaced and auto-recovery will occur as long as:

- the AMF master is accessible to the isolated node, and
- either, a DHCP server is configured to send the Uniform Resource Identifier (URI) of the AMF master to the recovering node, or
- a DNS server is configured to resolve the default recovery URI (`https://amf recovery.alliedtelesis.com`) to the IP address of the AMF master.

Provisioning of isolated nodes is achieved by creating an identity token for the new node using the [identity \(amf-provision\)](#) command.

See the [AMF Feature Overview and Configuration Guide](#) for information on preparing your network for recovering or provisioning isolated nodes.

**Example** To enable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# atmf recovery-server
```

To disable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf recovery-server
```

**Related commands**

**Command changes** Version 5.4.7-2.1: command added

# atmf remote-login

**Overview** Use this command to remotely login to other AMF nodes in order to run commands as if you were a local user of that node.

**Syntax** `atmf remote-login [user <name>] <nodename>`

Parameter	Description
<name>	The name of a user on the remote node.
<nodename>	The name of the remote AMF node you are connecting to.

**Mode** Privileged Exec (This command will only run at privilege level 15)

**Usage notes** You do not need a valid login on the local device in order to run this command. The session will take you to the enable prompt on the new device. If the remote login session exits for any reason (e.g. device reboot) you will be returned to the originating node.

You can create additional user accounts on nodes. AMF's goal is to provide a uniform management plane across the whole network, so we recommend you use the same user accounts on all the nodes in the network.

In reality, though, it is not essential to have the same accounts on all the nodes. Users can remote login from one node to a second node even if they are logged into the first node with a user account that does not exist on the second node (provided that `atmf restricted-login` is disabled and the user account on the first node has privilege level 15).

Moreover, it is possible to use a RADIUS or TACACS+ server to manage user authentication, so users can log into AMF nodes using user accounts that are present on the RADIUS or TACACS+ server, and not present in the local user databases of the AMF nodes.

The software will not allow you to run multiple remote login sessions. You must exit an existing session before starting a new one.

If you disconnect from the VTY session without first exiting from the AMF remote session, the device will keep the AMF remote session open until the `exec-timeout` time expires (10 minutes by default). If the `exec-timeout` time is set to infinity (`exec-timeout 0 0`), then the device is unable to ever close the remote session. To avoid this, we recommend you use the `exit` command to close AMF remote sessions, instead of closing the associated VTY sessions. We also recommend you avoid setting the `exec-timeout` to infinity.

**Example** To remotely login from node Node10 to Node20, use the following command:

```
Node10# atmf remote-login node20
Node20>
```

To close the session on Node20 and return to Node10's command line, use the following command:

```
Node20# exit  
Node10#
```

In this example, user User1 is a valid user of node5. They can remotely login from node5 to node3 by using the following commands:

```
node5# atmf remote-login user User1 node3  
node3> enable
```

**Related commands** [atmf restricted-login](#)

**Command changes** Version 5.4.6-2.1: changes to AMF user account requirements

# atmf restricted-login

**Overview** By default, users who are logged into any node on an AMF network are able to manage any other node by using either working-sets or an AMF remote login. If the access provided by this feature is too wide, or contravenes network security restrictions, it can be limited by running this command, which changes the access so that:

- users who are logged into non-master nodes cannot execute any commands that involve working-sets, and
- from non-master nodes, users can use remote-login, but only to login to a user account that is valid on the remote device (via a statically configured account or RADIUS/TACACS+). Users are also required to enter the password for that user account.

Once entered on any AMF master node, this command will propagate across the network.

Use the **no** variant of this command to disable restricted login on the AMF network. This allows access to the **atmf working-set** command from any node in the AMF network.

**Syntax** `atmf restricted-login`  
`no atmf restricted-login`

**Mode** Privileged Exec

**Default** Master nodes operate with **atmf restricted-login** disabled.  
Member nodes operate with **atmf restricted-login** enabled.

**NOTE:** *The default conditions of this command vary from those applied by its “no” variant. This is because the restricted-login action is only applied by **master** nodes, and in the absence of a master node, the default is to apply the restricted action to all **member** nodes with AMF configured.*

**Usage notes** In the presence of a **master** node, its default of **atmf restricted-login disabled** will propagate to all its member nodes. Similarly, any change in this command’s status that is made on a master node, will also propagate to all its member nodes

Note that once you have run this command, certain other commands that utilize the AMF working-set command, such as the **include**, **atmf reboot-rolling** and **show atmf group members** commands, will operate only on master nodes.

Restricted-login must be enabled on AMF areas with more than 120 nodes.

**Example** To enable restricted login, use the command

```
Node_20(config)# atmf restricted-login node20
```

**Related commands** `atmf remote-login`  
`show atmf`

**Command changes** Version 5.4.6-2.1: changes to AMF user account requirements

# atmf retry guest-link

**Overview** Use this command to retry an AMF guest-link by restarting AMF guest discovery on a port if it is currently in the failed state.

If no port is specified then all configured AMF guest-link ports that are in the failed state are retried.

If a port is specified then that port will only be retried if it is both:

- configured as an AMF guest-link, and
- it is currently in the failed state.

**Syntax** `atmf retry guest-link [<interface>]`

Parameter	Description
<code>&lt;interface&gt;</code>	Name of the interface the guest-link you want to retry is configured on.

**Mode** Privileged Exec

**Example** To retry all configured AMF guest-link currently in a failed state, use the command:

```
awplus# atmf retry guest-link
```

To retry an AMF guest-link configured on port1.0.2 currently in a failed state, use the command:

```
awplus# atmf retry guest-link port1.0.2
```

**Related commands** [show atmf links guest](#)  
[switchport atmf-guestlink](#)

# atmf secure-mode

**Overview** Use this command to enable AMF secure mode on an AMF node. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before and AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once the secure mode command is run on all nodes on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

Use the **no** variant of this command to disable AMF secure mode on an AMF node.

**Syntax** `atmf secure-mode`  
`no atmf secure-mode`

**Default** Secure mode is disabled by default.

**Mode** Global Configuration

**Usage notes** When an AMF network is running in AMF secure mode the [atmf restricted-login](#) feature is automatically enabled. This restricts the [atmf working-set](#) command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

**Example** To enable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode
```

To disable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode
```

**Related commands** [atmf authorize](#)  
[atmf secure-mode certificate expiry](#)

show atmf secure-mode statistics

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate expire

**Overview** Use this command on an AMF master to expire a secure mode certificate. Running this command will force the removal of the AMF node from the network.

**Syntax** `atmf secure-mode certificate expire <node-name> [area <area-name>]`

Parameter	Description
<code>&lt;node-name&gt;</code>	Name of the AMF node you want to expire the certificate for.
<code>area</code>	Specify an AMF area.
<code>&lt;area-name&gt;</code>	Name of the AMF area you want to expire the AMF nodes certificate for.

**Mode** Privileged Exec

**Example** To remove an AMF node named "node3" from an AMF network, use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node3
```

To remove an AMF node named "node2" in an area named "area2", use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node2 area area2
```

**Related commands**

- [atmf secure-mode](#)
- [show atmf secure-mode](#)
- [show atmf secure-mode certificates](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate expiry

**Overview** Use this command to set the expiry time of AMF secure mode certificates. Once an AMF node's certificate expires it must re-authorize and obtain a new certificate from the AMF master.

Use the **no** variant of this command to reset the expiry time to 180 days.

**Syntax** `atmf secure-mode certificate expiry {<days>|infinite}`  
`no atmf secure-mode certificate expiry`

Parameter	Description
<code>&lt;days&gt;</code>	Length of time, in days, that an AMF secure mode certificate remains valid. A value between 1 and 365.
<code>infinite</code>	The authorization certificate does not expire, in other words AMF nodes stay authorized indefinitely.

**Default** The default expiry time is 180 days.

**Mode** Global Configuration

**Example** To set AMF secure mode certificate expiry to 7 days, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode certificate expiry 7
```

To set AMF secure mode certificates to never expire, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode certificate expiry infinite
```

To reset the certificate expiry to 180 days, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode certificate expiry
```

**Related commands** [atmf secure-mode](#)  
[show atmf secure-mode](#)  
[show atmf secure-mode certificates](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate renew

**Overview** Use this command to force all local certificates to expire and be renewed on an AMF secure mode network.

Secure mode certificates renew automatically but this command could be used to renew a certificate in a situation where the automatic renewal may happen while the device is not attached to the AMF network.

**Syntax** `atmf secure-mode certificate renew`

**Mode** Privileged Exec

**Example** To renew a local certificate on a AMF member or AMF master, use the command:

```
awplus# atmf secure-mode certificate renew
```

**Related commands** [show atmf secure-mode certificates](#)  
[show atmf secure-mode statistics](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode enable-all

**Overview** Use this command to enable AMF secure mode on an entire network. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before an AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once this command is run on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

This command can only be run on an AMF master.

Use the **no** variant of this command to disable AMF secure mode on an entire network.

**Syntax** `atmf secure-mode enable-all`  
`no atmf secure-mode enable-all`

**Default** Secure mode is disabled by default.

**Mode** Privileged Exec

**Usage notes** When an AMF network is running in AMF secure mode the [atmf restricted-login](#) feature is automatically enabled. This restricts the [atmf working-set](#) command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

Running **atmf secure-mode enable-all**:

- Groups all AMF members in a working set.
- Executes [clear atmf secure-mode certificates](#) on the working set of members, which removes existing secure mode certificates from all the nodes.
- Groups all the AMF masters in a working set.
- Executes [atmf authorize provision all](#) on the working set of masters, so all masters provision all nodes.
- Groups all AMF nodes in a working set.

- Runs a script which executes `atmf secure-mode` and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

Running **no atmf secure-mode enable-all**:

- Groups all AMF nodes in a working set.
- Runs a script which executes **no atmf secure-mode** and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

**NOTE:** Enabling or disabling secure mode on the network saves the running-config on every device.

**Example** To enable AMF secure mode on the entire network, use the command:

```
awplus# atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
Total number of nodes 21
21 nodes support secure-mode

Enable secure-mode across the AMF network ? (y/n): y
```

To disable AMF secure mode on the entire network, use the command:

```
awplus# no atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
% Warning: All security certificates will be deleted.
Disable secure-mode across the AMF network ? (y/n): y
```

**Related commands** [aaa authentication auth-web](#)  
[show atmf](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf select-area

**Overview** Use this command to access devices in an area outside the core area on the controller network. This command will connect you to the remote area-master of the specified area.

This command is only valid on AMF controllers.

The **no** variant of this command disconnects you from the remote area-master.

**Syntax** `atmf select-area {<area-name>|local}`  
`no atmf select-area`

Parameter	Description
<code>&lt;area-name&gt;</code>	Connect to the remote area-master of the area with this name.
<code>local</code>	Return to managing the local controller area.

**Mode** Privileged Exec

**Usage notes** After running this command, use the [atmf working-set](#) command to select the set of nodes you want to access in the remote area.

**Example** To access nodes in the area Canterbury, use the command

```
controller-1# atmf select-area Canterbury
```

This displays the following output:

```
Test_network[3]#atmf select-area Canterbury
=====
Connected to area Canterbury via host Avensis:
=====
```

To return to the local area for controller-1, use the command

```
controller-1# atmf select-area local
```

Alternatively, to return to the local area for controller-1, use the command

```
controller-1# no atmf select-area
```

**Related commands** [atmf working-set](#)

# atmf topology-gui enable

**Overview** Use this command to enable the operation of Vista Manager EX on the Master device.

Vista Manager EX delivers state-of-the-art monitoring and management for your Autonomous Management Framework™ (AMF) network, by automatically creating a complete topology map of switches, firewalls and wireless access points (APs). An expanded view includes third-party devices such as security cameras.

Use the **no** variant of this command to disable operation of Vista Manager EX.

**Syntax** atmf topology-gui enable  
no atmf topology-gui enable

**Default** Disabled by default on AMF Master and member nodes. Enabled by default on Controllers.

**Mode** Global Configuration mode

**Usage notes** To use Vista Manager EX, you must also enable the HTTP service on all AMF nodes, including all AMF masters and controllers. The HTTP service is enabled by default on AlliedWare Plus switches and disabled by default on AR-Series firewalls. To enable it, use the commands:

```
Node1# configure terminal
Node1(config)# service http
```

On one master in each AMF area in your network, you also need to configure the master to send event notifications to Vista Manager EX. To do this, use the commands:

```
Node1# configure terminal
Node1(config)# log event-host <ip-address> atmf-topology-event
```

**Examples** To enable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# atmf topology-gui enable
```

To disable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# no atmf topology-gui enable
```

**Related commands** [atmf enable](#)  
[log event-host](#)  
[service http](#)

# atmf trustpoint

**Overview** Use this command to set a PKI trustpoint for an AMF network. This command needs to be run on an AMF master or controller.

The self-signed certificate authority (CA) certificate is distributed to every node on the AMF network. It is used to verify client certificates signed by the trustpoint.

Use the **no** variant of this command to remove an AMF trustpoint.

**Syntax** `atmf trustpoint <trustpoint-name>`  
`no atmf trustpoint <trustpoint-name>`

Parameter	Description
<code>&lt;trustpoint-name&gt;</code>	Name of the trustpoint.

**Default** No trustpoint is configured by default.

**Mode** Global Configuration

**Usage notes** Before using the **atmf trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'our\_trustpoint' with keypair 'our\_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint our_trustpoint
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair our_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate our_trustpoint
awplus# crypto pki enroll our_trustpoint
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#)

**Example** To configure an AMF trustpoint for the trustpoint 'our\_trustpoint', use the commands:

```
awplus# configure terminal
awplus(config)# atmf trustpoint our_trustpoint
```

To remove an AMF trustpoint for the trustpoint 'our\_trustpoint', use the commands:

```
awplus# configure terminal
awplus(config)# no atmf trustpoint our_trustpoint
```

**Related commands** [crypto pki trustpoint](#)  
[show atmf](#)

**Command changes** Version 5.4.7-2.1: command added

# atmf virtual-crosslink

**Overview** Use this command to create a virtual crosslink. A virtual crosslink connects an AMF master or controller on a physical device to a Virtual AMF Appliance (VAA) master or controller.

All AMF master nodes must reside in the same AMF domain and are required to be directly connected using AMF crosslinks. In order to be able to meet this requirement for AMF masters running on VAAs, a virtual crosslink connects the AMF master or controller on the physical device to the master or controller on the VAA.

Use the **no** variant of this command to remove a virtual crosslink.

**Syntax** `atmf virtual-crosslink id <local-id> ip <local-ip> remote-id <remote-id> remote-ip <remote-ip>`  
`no atmf virtual-crosslink id <local-id>`

Parameter	Description
<local-id>	ID of the local tunnel port, a value between 1 and 4094.
<local-ip>	IPv4 address of the local tunnel port in a.b.c.d format.
<remote-id>	ID of the remote tunnel port, a value between 1 and 4094.
<remote-ip>	IPv4 address of the remote tunnel port in a.b.c.d format.

**Default** No AMF virtual crosslinks are created by default.

**Mode** Global Configuration

**Usage notes** This command allows a virtual tunnel to be created between two remote sites over a layer 3 link. The tunnel encapsulates AMF packets and allows them to be sent transparently across a Wide Area Network (WAN) such as the Internet.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address. Each side of the tunnel must be configured with the same, but mirrored parameters.

**NOTE:** *Virtual crosslinks are not supported on AMF container masters, therefore if multiple tenants on a single VAA host are configured for secure mode, only a single AMF master is supported per area.*

**Example** To setup a virtual link from a local site, "siteA", to a remote site, "siteB", (assuming there is already IP connectivity between the sites), run the following commands at the local site:

```
siteA# configure terminal
siteA(config)# atmf virtual-crosslink id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1
```

At the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# atmf virtual-crosslink id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1
```

To remove this virtual crosslink, run the following commands on the local site:

```
siteA# configure terminal
siteA(config)# no atmf virtual-crosslink id 5
```

On the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# no atmf virtual-crosslink id 10
```

**Related  
commands**

[show atmf links](#)  
[switchport atmf-crosslink](#)

**Command  
changes**

Version 5.4.7-0.3: command added

# atmf virtual-link

**Overview** This command creates one or more Layer 2 tunnels that enable AMF nodes to transparently communicate across a wide area network using Layer 2 connectivity protocols.

Once connected through the tunnel, the remote member will have the same AMF capabilities as a directly connected AMF member.

Use the **no** variant of this command to remove the specified virtual link.

**Syntax**

```
atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>  
remote-ip <a.b.c.d> [remote-area <area-name>]  
  
atmf virtual-link id <1-4094> interface <interface-name>  
remote-id <1-4094> remote-ip <a.b.c.d> [remote-area  
<area-name>]  
  
no atmf virtual-link id <1-4094>
```

Parameter	Description
id <1-4094>	ID of the local tunnel point, in the range 1 to 4094.
ip <a.b.c.d>	Specify the local IP address of the local interface for the virtual-link (alternatively you can specify the interface's name, see below).
interface <interface-name>	Specify the local interface name for the virtual-link. This allows you to use a dynamic, rather than a static, local IP address.
remote-id<1-4094>	The ID of the (same) tunnel that will be applied by the remote node. Note that this must match the local-id that is defined on the remote node. This means that (for the same tunnel) the local and remote tunnel IDs are reversed on the local and remote nodes.
remote-ip <a.b.c.d>	The IP address of the remote node.
remote-area <area-name>	The name of the remote area connected to this virtual-link.

**Mode** Global Configuration

**Usage notes** The Layer 2 tunnel that this command creates enables a local AMF session to appear to pass transparently across a Wide Area Network (WAN) such as the Internet. The addresses configured as the local and remote tunnel IP addresses must have IP connectivity to each other. If the tunnel is configured to connect a head office and branch office over the Internet, typically this would involve using some type of managed WAN service such as a site-to-site VPN. Tunnels are only supported using IPv4.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address. A reciprocal configuration is also required on the corresponding remote device. The local tunnel ID must be unique to the device on which it is configured.

If an interface acquires its IP address dynamically then the local side of the tunnel can be specified by using the interface's name instead of using its IP address. When using a dynamic local address the remote address of the other side of the virtual-link must be configured with either:

- the IP address of the NAT device the dynamically configured interface is behind, or
- 0.0.0.0, if the virtual-link is configured as a secure virtual-link.

For instructions on how to configure dynamic IP addresses on virtual-links, see the [AMF Feature Overview and Configuration Guide](#).

The tunneled link may operate via external (non AlliedWare Plus) routers in order to provide wide area network connectivity. However in this configuration, the routers perform a conventional router to router connection. The protocol tunneling function is accomplished by the AMF nodes.

**NOTE:** AMF cannot achieve zero touch replacement of the remote device that terminates the tunnel connection, because you must pre-configure the local IP address and tunnel ID on that remote device.

**Example 1** Use the following commands to create the tunnel shown in the figure below.

Figure 52-1: AMF virtual link example

```
Node_10(config)# atmf virtual-link id 1 ip 192.168.1.1
remote-id 2 remote-ip 192.168.2.1

Node_20(config)# atmf virtual-link id 2 ip 192.168.2.1
remote-id 1 remote-ip 192.168.1.1
```

**Example 2** To set up an area virtual link to a remote site (assuming IP connectivity between the sites already), one site must run the following commands:

```
SiteA# configure terminal
SiteA(config)# atmf virtual-link id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1 remote-area SiteB-AREA
```

The second site must run the following commands:

```
SiteB# configure terminal
SiteB(config)# atmf virtual-link id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1 remote-area SiteA-AREA
```

Before you can apply the above **atmf virtual-link** command, you must configure the area names *SiteB-AREA* and *SiteA-AREA*.

**Command changes** Version 5.4.9-0.1: **interface** parameter added

# atmf virtual-link description

**Overview** Use this command to add a description to an existing AMF virtual-link. Use the **no** variant of this command to remove a description from an AMF virtual-link.

**Syntax** `atmf virtual-link id <1-4094> description <description>`  
`no atmf virtual-link id <1-4094> description`

Parameter	Description
<code>id &lt;1-4094&gt;</code>	ID of the local tunnel point.
<code>&lt;description&gt;</code>	A description for the virtual-link.

**Default** No description is set by default.

**Mode** Global Configuration

**Example** To add a description to the virtual-link with id '5', use the commands:

```
awplus# configure terminal
awplus(config)# atmf virtual-link id 5 description TO SITE B
```

To remove a description from the virtual-link with id '5', use the commands:

```
awplus# configure terminal
awplus(config)# no atmf virtual-link id 5
```

**Related commands** [atmf virtual-link](#)  
[show atmf links](#)  
[show atmf virtual-links](#)

# atmf virtual-link protection

**Overview** Use this command to add protection to an existing AMF virtual-link. Secure AMF virtual-links encapsulate the L2TPv3 frames of the virtual-link with IPsec.

Use the **no** variant of this command to remove protection from an AMF virtual-link.

**Syntax** `atmf virtual-link id <1-4094> protection ipsec key [8]  
<key-string>`  
`no atmf virtual-link id <1-4094> protection`

Parameter	Description
id	Specify the link ID.
<1-4094>	Link ID in the range 1 to 4094,
protection	Protection is on for this link.
ipsec	Security provided using IPsec.
key	Set the shared key.
8	Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off.
<key-string>	Specify the shared key for the link.

**Default** Protection is off by default.

**Mode** Global Configuration

**Usage notes** The following limitations need to be considered when creating secure virtual-links.

- Switch devices support a maximum of 20 downstream AMF nodes when using a secure virtual-link as an uplink.
- When there are two or more AMF members behind a shared NAT device, only one of the members will be able to use secure virtual-links.
- An AMF Multi-tenant environment supports a maximum cumulative total of 1200 secure virtual-links across all AMF containers.

Secure virtual-links are only supported on the following device listed in the table below. There is also a limit to the number of links these devices support.

Device	Virtual-link Limit
AMF Cloud/ VAA	300
AR4050S AR3050S AR2050V AR2010V	60
x220 x230/x230L x310 x510/x510L IX5-28GPX	2

**Example** To create and configure a virtual link with protection first create the virtual-link:

```
Host-A# configure terminal
```

```
Host-A(config)# atmf virtual-link id 1 ip 192.168.1.1 remote-id  
2 remote-ip 192.168.2.1
```

Enable protection on the virtual link:

```
Host-A(config)# atmf virtual-link id 1 protection ipsec key  
securepassword
```

Repeat these steps on the other side of the link:

```
Host-B(config)# atmf virtual-link id 2 ip 192.168.2.1 remote-id  
1 remote-ip 192.168.1.1
```

```
Host-B(config)# atmf virtual-link id 2 protection ipsec key  
securepassword
```

**Command  
changes** Version 5.4.9-0.1: command added

# atmf working-set

**Overview** Use this command to execute commands across an individually listed set of AMF nodes or across a named group of nodes.

Note that this command can only be run on a master node.

Use the **no** variant of this command to remove members or groups from the current working-set.

**Syntax** `atmf working-set { [<node-list> ] | [group <group-list> | all | local | current] }`  
`no atmf working-set { [<node-list> ] | [group <group-list> ] }`

Parameter	Description
<code>&lt;node-list&gt;</code>	A comma delimited list (without spaces) of nodes to be included in the working-set.
<code>group</code>	The AMF group.
<code>&lt;group-list&gt;</code>	A comma delimited list (without spaces) of groups to be included in the working-set. Note that this can include either defined groups, or any of the Automatic, or Implicit Groups shown earlier in the bulleted list of groups.
<code>all</code>	All nodes in the AMF.
<code>local</code>	Local node Running this command with the parameters <b>group local</b> will return you to the local prompt and local node connectivity.
<code>current</code>	Nodes in current list.

**Mode** Privileged Exec

**Usage notes** You can put AMF nodes into groups by using the [atmf group \(membership\)](#) command.

This command opens a session on multiple network devices. When you change the working set to anything other than the local device, the prompt will change to the AMF network name, followed by the size of the working set, shown in square brackets. This command has to be run at privilege level 15.

In addition to the user defined groups, the following system assigned groups are automatically created:

- Implicit Groups
  - local: The originating node.
  - current: All nodes that comprise the current working-set.
  - all: All nodes in the AMF.

- Automatic Groups - These can be defined by hardware architecture, e.g. x510, x610, x8100, AR3050S or AR4050S, or by certain AMF nodal designations such as master.

Note that the Implicit Groups do not appear in `show atmf group` command output. If a node is an AMF master it will be automatically added to the master group.

**Example 1** To add all nodes in the AMF to the working-set, use the command:

```
node1# atmf working-set group all
```

**NOTE:** This command adds the implicit group "all" to the working set, where "all" comprises all nodes in the AMF.

This command displays an output screen similar to the one shown below:

```
=====
node1, node2, node3, node4, node5, node6:
=====

Working set join

ATMF_NETWORK_Name[6]#
```

**Example 2** To return to the local prompt, and connect to only the local node, use the command:

```
ATMF_Network_Name[6]# atmf working-set group local
node1#
```

The following table describes the meaning of the prompts in this example.

Parameter	Description
ATMF_Network_Name	The name of the AMF network, as set by the <code>atmf network-name</code> command.
[ 6 ]	The number of nodes in the working-set.
node1	The name of the local node, as set by the <code>hostname</code> command.

# bridge-group

**Overview** Use this command to connect an AMF container to a bridge created on a Virtual AMF Appliance (VAA) virtual machine. This allows the AMF container to connect to a physical network.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove a bridge-group from an AMF container.

**Syntax** `bridge-group <bridge-id>`  
`no bridge-group`

Parameter	Description
<code>&lt;bridge-id&gt;</code>	The ID of the bridge group to join, a number between 1 and 64.

**Mode** AMF Container Configuration

**Usage notes** Each container has two virtual interfaces:

- 1) Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, and configured using this [area-link](#) command.
- 2) Interface eth1, used to connect to the outside world using a bridged L2 network link, and configured using the **bridge-group** command.

Before using this command, a bridge must be created with the same bridge-id on the VAA host using the **bridge <bridge-id>** command.

See the [AMF Feature Overview and Configuration Guide](#) for more information on configuring the bridge.

**Example** To create a bridge group for AMF container "vac-wlg-1" and , use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# bridge-group 1
```

**Related commands** [atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# clear application-proxy threat-protection

**Overview** Use this command to clear the threat protection for a specified address.

**Syntax** clear application-proxy threat-protection {<ip-address>|<mac-address>|all}

Parameter	Description
<ip-address>	The IPv4 address you wish to clear the threat for, in A.B.C.D format.
<mac-address>	The MAC address you wish to clear the threat for, in HHHH.HHHH.HHHH format.
all	Clear the threat for all IPv4 and MAC addresses.

**Mode** Privileged Exec

**Example** To clear the threat for 10.34.199.117, use the command:

```
awplus# clear application-proxy threat-protection 10.34.199.117
```

**Related commands**

**Command changes** Version 5.4.7-2.2: command added

# clear atmf links

**Overview** Use this command with no parameters to manually reset all the AMF links on a device. You can optionally specify an interface or range of interfaces to reset the links on.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct, view of the network.

**Syntax** `clear atmf links [<interface-list>]`

Parameter	Description
<code>&lt;interface-list&gt;</code>	<p>The interfaces or ports to perform the reset on. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.1)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a local port (e.g. of0)</li><li>• You can specify a continuous range of interfaces separated by a hyphen, or a comma-separated list (e.g. port1.0.1, port1.0.4-port1.0.18).</li></ul> <p>The specified interfaces must exist. If this parameter is left out then all links of the specified type will be reset on the device.</p>

**Mode** Privileged Exec

**Example** To clear all AMF links on a device, use the following command:

```
awplus# clear atmf links
```

To clear all AMF links on port1.0.1 to port1.0.4 and static aggregator sa1, use the following command:

```
awplus# clear atmf links port1.0.1-port1.0.4,sa1
```

**Related commands** [clear atmf links virtual](#)  
[show atmf links](#)

**Command changes** Version 5.4.8-2.1: command added

# clear atmf links virtual

**Overview** Use this command with no parameters to manually reset all the AMF virtual links on a device. You can, optionally, specify a comma separated list of virtual links to reset.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct view of the network.

**Syntax** `clear atmf links virtual [<virtuallink-list>]`

Parameter	Description
<code>&lt;virtuallink-list&gt;</code>	A single, or list, of AMF virtual link identifiers to reset. This must be a comma separated list of links e.g. <code>vlink1, vlink2, vlink3</code> . Specifying a link range e.g. <code>vlink1-vlink3</code> is not supported.

**Mode** Privileged Exec

**Example** To clear all AMF virtual links on a device, use the following command:

```
awplus# clear atmf links virtual
```

To clear AMF virtual links `vlink11` and `vlink21`, use the following command:

```
awplus# clear atmf links virtual vlink11,vlink22
```

**Related commands** [clear atmf links](#)  
[show atmf links](#)

**Command changes** Version 5.4.8-2.1: command added

# clear atmf links statistics

**Overview** This command resets the values of all AMF link, port, and global statistics to zero.

**Syntax** `clear atmf links statistics`

**Mode** Privilege Exec

**Example** To reset the AMF link statistics values, use the command:

```
node_1# clear atmf links statistics
```

**Related commands** [show atmf links statistics](#)

# clear atmf recovery-file

**Overview** Use this command to delete all of a node's recovery files. It deletes the recovery files stored on:

- the local node,
- neighbor nodes, and
- external media (USB or SD card).

**Syntax** `clear atmf recovery-file`

**Mode** Privileged Exec

**Usage notes** AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

An AMF node with one of these special links pushes its startup configuration to its neighbors and to any attached external media. It then fetches and applies this configuration at recovery time. This configuration enables it to contact the AMF master and initiate a recovery.

Recovery files can become out of date if:

- a node's neighbor is off line when changes are made to its configuration, or
- when a node no longer contains a special link.

**Example** To clear a node's recovery files, use the command:

```
node1# clear atmf recovery-file
```

**Output** Figure 52-2: If AlliedWare Plus detects that a node contains a special link then the following message is displayed

```
node1#clear atmf recovery-file
% Warning: ATMF recovery files have been removed.
ATMF recovery may fail. Please save running-configuration.
```

**Related commands** [show atmf recovery-file](#)

**Command changes** Version 5.4.8-0.2: command added

# clear atmf secure-mode certificates

**Overview** Use this command to remove all certificates from an AMF member or master. AMF nodes will need to be re-authorized once this command has been run.

**Syntax** `clear atmf secure-mode certificates`

**Mode** Privileged Exec

**Example** To clear all certificates from an AMF node, use the command:

```
awplus# clear atmf secure-mode certificates
```

If this is the only master on the network you will see the following warning:

```
% Warning: This node is the only master in the network!  
All the nodes will become isolated and refuse to join any ATMF  
network. The certificates on all the isolated nodes must be  
cleared before rejoining an ATMF network will be possible.  
  
To clear certificates a reboot of the device is required.  
Clear certificates and Reboot ? (y/n):
```

On an AMF member you will see the following message:

```
To clear certificates a reboot of the device is required.  
Clear certificates and Reboot ? (y/n):
```

**Command changes** Version 5.4.7-0.3: command added

# clear atmf secure-mode statistics

**Overview** Use this command to reset all secure mode statistics to 0.

**Syntax** `clear atmf secure-mode statistics`

**Mode** Privileged Exec

**Example** To reset the AMF secure mode statistics information, use the command:

```
awplus# clear atmf secure-mode statistic
```

**Related commands** [show atmf secure-mode](#)  
[show atmf secure-mode statistics](#)

**Command changes** Version 5.4.7-0.3: command added

# clone (amf-provision)

**Overview** This command sets up a space on the backup media for use with a provisioned node and copies into it almost all files and directories from a chosen backup or provisioned node.

Alternatively, you can set up a new, unique provisioned node by using the command [create \(amf-provision\)](#).

**Syntax** `clone <source-nodename>`

Parameter	Description
<code>&lt;source-nodename&gt;</code>	The name of the node whose configuration is to be copied for loading to the clone.

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network.

When using this command it is important to be aware of the following:

- A copy of `<media>:atmf/<atmf_name>/nodes/<source_node>/flash` will be made for the provisioned node and stored in the backup media.
- The directory `<node_backup_dir>/flash/.config/ssh` is excluded from the copy.
- All contents of `<root_backup_dir>/nodes/<nodename>` will be deleted or overwritten.
- Settings for the expected location of other provisioned nodes are excluded from the copy.

The active and backup configuration files are automatically modified in the following ways:

- The **hostname** command is modified to match the name of the provisioned node.
- The **stack virtual-chassis-id** command is removed, if present.

**Example** To copy from the backup of 'device2' to create backup files for the new provisioned node 'device3' use the following command:

```
device1# atmf provision node device3  
device1(atmf-provision)# clone device2
```

Figure 52-3: Sample output from the **clone** command

```
device1# atmf provision node device3  
device1(atmf-provision)# clone device2  
Copying...  
Successful operation
```

To confirm that a new provisioned node has been cloned, use the command:

```
device1# show atmf backup
```

The output from this command is shown in the following figure, and shows the details of the new provisioned node 'device3'.

Figure 52-4: Sample output from the **show atmf backup** command

```
device1#show atmf backup

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# configure boot config (amf-provision)

**Overview** This command sets the configuration file to use during the next boot cycle. This command can also set a backup configuration file to use if the main configuration file cannot be accessed for an AMF provisioned node. To unset the boot configuration or the backup boot configuration use the **no boot** command.

**Syntax** `configure boot config [backup] <file-path|URL>`  
`configure no boot config [backup]`

Parameter	Description
backup	Specify that this is the backup configuration file.
<file-path URL>	The path or URL and name of the configuration file.

**Default** No boot configuration files or backup configuration files are specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** When using this command to set a backup configuration file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

**Examples** To set the configuration file 'branch.cfg' on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot config
branch.cfg
```

To set the configuration file 'backup.cfg' as the backup to the main configuration file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName(atmf-provision)# configure boot config backup
usb:/atmf/amf_net/nodes/node1/config/backup.cfg
```

To unset the boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config
```

To unset the backup boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config backup
```

**Command  
changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# configure boot system (amf-provision)

**Overview** This command sets the release file that will load onto a specified provisioned node during the next boot cycle. This command can also set the backup release file to be loaded for an AMF provisioned node. To unset the boot system release file or the backup boot release file use the **no boot** command.

Use the **no** variant of this command to return to the default.

This command can only be run on AMF master nodes.

**Syntax** `configure boot system [backup] <file-path|URL>`  
`configure no boot system [backup]`

Parameter	Description
<code>&lt;file-path URL&gt;</code>	The path or URL and name of the release file.

**Default** No boot release file or backup release files are specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** When using this command to set a backup release file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

**Examples** To set the release file x930-5.4.9-0.1.rel on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system
x930-5.4.9-0.1.rel
```

To set the backup release file x930-5.4.8-2.5.rel as the backup to the main release file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system backup
card:/atmf/amf_net/nodes/node1/flash/x930-5.4.8-2.5.rel
```

To unset the boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system
```

To unset the backup boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system backup
```

**Related commands** [atmf provision \(interface\)](#)

atmf provision node  
clone (amf-provision)  
configure boot config (amf-provision)  
create (amf-provision)  
delete (amf-provision)  
identity (amf-provision)  
license-cert (amf-provision)  
locate (amf-provision)  
show atmf provision nodes

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# copy (amf-provision)

**Overview** Use this command to copy configuration and release files for the node you are provisioning.

For more information about using the copy command see [copy \(filename\)](#) in the File and Configuration Management chapter.

**Syntax** `copy [force] <source-name> <destination-name>`

Parameter	Description
<code>force</code>	This parameter forces the copy command to overwrite the destination file, if it already exists, without prompting the user for confirmation.
<code>&lt;source-name&gt;</code>	The filename and path of the source file. See the <a href="#">Introduction</a> of the File and Configuration Management chapter for valid syntax.
<code>&lt;destination-name&gt;</code>	The filename and path for the destination file. See <a href="#">Introduction</a> of the File and Configuration Management chapter for valid syntax.

**Mode** AMF Provisioning

**Example** To copy a configuration file named `current.cfg` from Node\_4's Flash into the `future_node` directory, and set that configuration file to load onto `future_node`, use the following commands:

```
node_4# atmf provision node future_node
node_4(atmf-provision)# create
node_4(atmf-provision)# locate
node_4(atmf-provision)# copy flash:current.cfg
./future_node.cfg
node_4(atmf-provision)# configure boot config future_node.cfg
```

**Related commands**

- [create \(amf-provision\)](#)
- [delete \(amf-provision\)](#)
- [locate \(amf-provision\)](#)
- [show atmf provision nodes](#)

**Command changes** Version 5.4.9-2.1: command added

# create (amf-provision)

**Overview** This command sets up an empty directory on the backup media for use with a provisioned node. This directory can have configuration and release files copied to it from existing devices. Alternatively, the configuration files can be created by the user.

An alternative way to create a new provisioned node is with the command [clone \(amf-provision\)](#).

This command can only run on AMF master nodes.

**Syntax** create

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network.

A date and time is assigned to the new provisioning directory reflecting when this command was executed. If there is a backup or provisioned node with the same name on another AMF master then the most recent one will be used.

**Example** To create a new provisioned node named "device2" use the command:

```
device1# atmf provision node device2  
device1(atmf-provision)# create
```

Running this command will create the following directories:

- `<media>:atmf/<atmf_name>/nodes/<node>`
- `<media>:atmf/<atmf_name>/nodes/<node>/flash`

To confirm the new node's settings, use the command:

```
device1# show atmf backup
```

The output for the **show atmf backup** command is shown in the following figure, and shows details for the new provisioned node 'device2'.

Figure 52-5: Sample output from the **show atmf backup** command

```
device1#show atmf backup

Scheduled Backup ..... Enabled
  Schedule ..... 1 per day starting at 03:00
  Next Backup Time .... 01 Oct 2018 03:00

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# debug atmf

**Overview** This command enables the AMF debugging facilities, and displays information that is relevant (only) to the current node. The detail of the debugging displayed depends on the parameters specified.

If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

The **no** variant of this command disables either all AMF debugging information, or only the particular information as selected by the command's parameters.

**Syntax**

```
debug atmf  
[link | crosslink | arealink | database | neighbor | error | all]  
  
no debug atmf  
[link | crosslink | arealink | database | neighbor | error | all]
```

Parameter	Description
link	Output displays debugging information relating to uplink or downlink information.
crosslink	Output displays all crosslink events.
arealink	Output displays all arealink events.
database	Output displays only notable database events.
neighbor	Output displays only notable AMF neighbor events.
error	Output displays AMF error events.
all	Output displays all AMF events.

**Default** All debugging facilities are disabled.

**Mode** User Exec and Global Configuration

**Usage notes** If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

**NOTE:** An alias to the **no** variant of this command is [undebg atmf](#) on page 2676.

**Examples** To enable all AMF debugging, use the command:

```
node_1# debug atmf
```

To enable AMF uplink and downlink debugging, use the command:

```
node_1# debug atmf link
```

To enable AMF error debugging, use the command:

```
node_1# debug atmf error
```

**Related** no debug all  
**commands**

# debug atmf packet

**Overview** This command configures AMF Packet debugging parameters. The debug only displays information relevant to the current node. The command has following parameters:

**Syntax** debug atmf packet [direction {rx|tx|both}] [level {1|2|3}]  
 [timeout <seconds>] [num-pkts <quantity>]  
 [filter {node <name>|interface <ifname>}]  
 [pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]]

## Simplified Syntax

debug atmf packet	[direction {rx tx both}]
	[level {[1][2][3]}]
	[timeout <seconds>]
	[num-pkts <quantity>]
debug atmf packet filter	[node <name>]
	[interface <ifname>]
	[pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]]

**NOTE:** You can combine the syntax components shown, but when doing so, you must retain their original order.

**Default** Level 1, both Tx and Rx, a timeout of 60 seconds with no filters applied.

**NOTE:** An alias to the **no** variant of this command - *undebug atmf* - can be found elsewhere in this chapter.

**Mode** User Exec and Global Configuration

**Usage notes** If no additional parameters are specified, then the command output will apply a default selection of parameters shown below:

Parameter	Description
direction	Sets debug to packet received, transmitted, or both
rx	packets received by this node
tx	Packets sent from this node
1	AMF Packet Control header Information, Packet Sequence Number. Enter 1 to select this level.
2	AMF Detailed Packet Information. Enter 2 to select this level.
3	AMF Packet HEX dump. Enter 3 to select this level.
timeout	Sets the execution timeout for packet logging

Parameter	Description
<seconds>	Seconds
num-pkts	Sets the number of packets to be dumped
<quantity>	The actual number of packets
filter	Sets debug to filter packets
node	Sets the filter on packets for a particular Node
<name>	The name of the remote node
interface	Sets the filter to dump packets from an interface (portx.x.x) on the local node
<ifname>	Interface port or virtual-link
pkt-type	Sets the filter on packets with a particular AMF packet type
1	Crosslink Hello BPDU packet with crosslink links information. Enter 1 to select this packet type.
2	Crosslink Hello BPDU packet with downlink domain information. Enter 2 to select this packet type.
3	Crosslink Hello BPDU packet with uplink information. Enter 3 to select this packet type.
4	Downlink and uplink hello BPDU packets. Enter 4 to select this packet type.
5	Non broadcast hello unicast packets. Enter 5 to select this packet type.
6	Stack hello unicast packets. Enter 6 to select this packet type.
7	Database description. Enter 7 to select this packet type.
8	DBE request. Enter 8 to select this packet type.
9	DBE update. Enter 9 to select this packet type.
10	DBE bitmap update. Enter 10 to select this packet type.
11	DBE acknowledgment. Enter 11 to select this packet type.
12	Area Hello Packets. Enter 12 to select this packet type.
13	Gateway Hello Packets. Enter 13 to select this packet type.

**Examples** To set a packet debug on node 1 with level 1 and no timeout, use the command:

```
node_1# debug atmf packet direction tx timeout 0
```

To set a packet debug with level 3 and filter packets received from AMF node 1:

```
node_1# debug atmf packet direction tx level 3 filter node_1
```

To enable send and receive 500 packets only on vlink1 for packet types 1, 7, and 11, use the command:

```
node_1# debug atmf packet num-pkts 500 filter interface vlink1  
pkt-type 1 7 11
```

This example applies the **debug atmf packet** command and combines many of its options:

```
node_1# debug atmf packet direction rx level 1 num-pkts 60  
filter node x930 interface port1.0.1 pkt-type 4 7 10
```

# delete (amf-provision)

**Overview** This command deletes files that have been created for loading onto a provisioned node. It can only be run on master nodes.

**Syntax** delete

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network. The command will only work if the provisioned node specified in the command has already been set up (although the device itself is still yet to be installed). Otherwise, an error message is shown when the command is run.

You may want to use the **delete** command to delete a provisioned node that was created in error or that is no longer needed.

This command cannot be used to delete backups created by the AMF backup procedure. In this case, use the command [atmf backup delete](#) to delete the files.

**NOTE:** *This command allows provisioned entries to be deleted even if they have been referenced by the [atmf provision \(interface\)](#) command, so take care to only delete unwanted entries.*

**Example** To delete backup files for a provisioned node named device3 use the command:

```
device1# atmf provision node device3  
device1(atmf-provision)# delete
```

To confirm that the backup files for provisioned node device3 have been deleted use the command:

```
device1# show atmf backup
```

The output should show that the provisioned node device3 no longer exists in the backup file, as shown in the figure below:

Figure 52-6: Sample output showing the **show atmf backup** command

```
device1#show atmf backup

Scheduled Backup ..... Enabled
  Schedule ..... 1 per day starting at 03:00
  Next Backup Time .... 01 Oct 2016 03:00

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# discovery

**Overview** Use this command to specify how AMF learns about guest nodes.

AMF nodes gather information about guest nodes by using one of two internally defined discovery methods: static or dynamic.

With dynamic learning (the default method), AMF learns IP address and MAC addresses of guest nodes from LLDP or DHCP snooping. Dynamic learning is only supported when using IPv4. For IPv6, use static learning.

With static learning, you use the `switchport atmf-guestlink` command to specify the guest class name and IP address of the guest node attached to each individual switch port. AMF then learns the MAC addresses of each of the guests of that class from ARP or Neighbor discovery tables.

If you are using the static method, ensure that you have configured the appropriate class type for each of your statically discovered guest nodes.

The **no** variant of this command returns the discovery method to **dynamic**.

**Syntax** `discovery [static|dynamic]`  
`no discovery`

Parameter	Description
<code>static</code>	Statically assigned.
<code>dynamic</code>	Learned from DCHCP Snooping or LLDP.

**Default** Dynamic

**Mode** AMF Guest Configuration

**Usage notes** This command is one of several modal commands that are configured and applied for a specific guest-class (mode). Its settings are automatically applied to a guest-node link by the `switchport atmf-guestlink` command.

**NOTE:** *AMF guest nodes are not supported on ports using the OpenFlow protocol.*

**Example 1** To configure the discovery of the guest-class camera to operate statically, use the following commands:

```
Node1# configure terminal
Node1(config)# atmf guest-class camera
Node1(config-atmf-guest)# discovery static
```

**Example 2** To return the discovery method for the guest class TQ4600-1 to its default of **dynamic**, use the following commands:

```
Node1# configure terminal
Node1(config)# atmf guest-class TQ4600-1
Node1(config-atmf-guest)# no discovery
```

**Related commands**

- atmf guest-class
- switchport atmf-guestlink
- show atmf links guest
- show atmf nodes

# description (amf-container)

**Overview** Use this command to set the description on an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove the description from an AMF container.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	Enter up to 128 characters of text describing the AMF container.

**Mode** AMF Container Configuration

**Example** To set the description for AMF container “vac-wlg-1” to “Wellington area”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# description Wellington area
```

To remove the description for AMF container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no description
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# erase factory-default

**Overview** This command erases all data from NVS and all data from flash **except** the following:

- the boot release file (a .rel file) and its release setting file
- all license files
- the latest GUI release file

The device is then rebooted and returned to its factory default condition. The device can then be used for AMF automatic node recovery.

**Syntax** `erase factory-default`

**Mode** Privileged Exec

**Usage notes** This command is an alias to the [atmf cleanup](#) command.

**Example** To erase data, use the command:

```
Node_1# erase factory-default
```

```
This command will erase all NVS, all flash contents except for  
the boot release, a GUI resource file, and any license files,  
and then reboot the switch. Continue? (y/n):y
```

**Related commands** [atmf cleanup](#)

# http-enable

**Overview** This command is used to enable GUI access to a guest node. When **http-enable** is configured, the port number is set to its default of 80. If the guest node is using a different port for HTTP, you can configure this using the **port** parameter.

This command is used to inform the GUI that this device has an HTTP interface at the specified port number so that a suitable URL can be provided to the user.

Use the **no** variant of this command to disable HTTP.

**Syntax** `http-enable [port <port-number>]`  
`no http-enable`

Parameter	Description
port	TCP port number.
<port-number>	The port number to be configured.

**Default** Not set

**Mode** AMF Guest Configuration

**Usage notes** If **http-enable** is selected without a **port** parameter the port number will default to 80.

**Example** To enable HTTP access to a guest node on port 80 (the default), use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable
```

To enable HTTP access to a guest node on port 400, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable port 400
```

To disable HTTP access to a guest node, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# no http-enable
```

**Related commands** [atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf links guest](#)

`show atmf nodes`

# identity (amf-provision)

**Overview** Use this command to create an identity token for provisioning an isolated AMF node. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This command allows these nodes, which have no AMF neighbors, to be identified for provisioning purposes. They are identified using an identity token which is based on either the next-hop MAC address of the provisioned node, or the serial number of the device being provisioned. This identity token is stored on the AMF master.

Use the **no** variant of this command to remove the identity token for a node.

**Syntax**

```
identity mac-address <mac-address> prefix  
<ip-address/prefix-length>  
  
identity serial-number <serial-number> prefix  
<ip-address/prefix-length>  
  
no identity
```

Parameter	Description
mac-address	Specify the next-hop MAC address of the device being provisioned.
<mac-address>	MAC address of the port the provisioned node is connected to, in the format xxxx.xxxx.xxxx.
serial-number	Specify the serial number of the device to be provisioned.
<serial-number>	Serial number of the device that is being provisioned.
prefix	IPv4 address, and prefix length, of the virtual-link interface on the isolated node
<ip-address/ prefix-length>	IPv4 address, and prefix length, in A.B.C.D/M format.

**Mode** AMF Provisioning

**Usage notes** To provision an isolated node, first create a configuration for the node using the [create \(amf-provision\)](#) and/or the [clone \(amf-provision\)](#) commands.

Then create an identity token for the provisioned node by either specifying its next-hop MAC address or by specifying the serial number of the replacement device. The advantage of using the next-hop MAC address is that any device, regardless of its serial number, can be added to the network but using the serial number maybe preferred in situations where the next-hop MAC address is not easy to obtain.

The [atmf recovery-server](#) option must be enabled on the AMF master before attempting to provision the device. This option allows the AMF master to process recovery requests from isolated AMF nodes.

See the [AMF Feature Overview and Configuration Guide](#) for information on preparing your network for recovering or provisioning isolated nodes.

**Example** To create a identity token on your AMF master for a device named “my-x930” with serial number “A10064A172100008”, use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# identity serial-number
A10064A172100008 prefix 192.168.2.25/24
```

To create a identity token on your AMF master for a device named “my-x930” with next-hop MAC address “0000.cd28.0880”, use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# identity mac-address 0000.cd28.0880
prefix 192.168.2.25/24
```

To delete the identity token from your AMF master for a device named “my-x930”, use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# no identity
```

**Related commands**

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode  
Version 5.4.7-2.1: command added

# license-cert (amf-provision)

**Overview** This command is used to set up the license certificate for a provisioned node.

The certificate file usually has all the license details for the network, and can be stored anywhere in the network. This command makes a hidden copy of the certificate file and stores it in the space set up for the provisioned node on AMF backup media.

For node provisioning, the new device has not yet been part of the AMF network, so the user is unlikely to know its product ID or its MAC address. When such a device joins the network, assuming that this command has been applied successfully, the copy of the certificate file will be applied automatically to the provisioned node.

Once the new device has been resurrected on the network and the certificate file has been downloaded to the provisioned node, the hidden copy of the certificate file is deleted from AMF backup media.

Use the **no** variant of this command to set it back to the default.

This command can only be run on AMF master nodes.

**Syntax** `license-cert <file-path/URL>`  
`no license-cert`

Parameter	Description
<code>&lt;file-path/URL&gt;</code>	The name of the certificate file. This can include the file-path of the file.

**Default** No license certificate file is specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network. It will only operate if the provisioned node specified in the command has already been set up, and if the license certification is present in the backup file. Otherwise, an error message is shown when the command is run.

**Example 1** To apply the license certificate 'cert1.txt' stored on a TFTP server for AMF provisioned node "device2", use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# license-cert
tftp://192.168.1.1/cert1.txt
```

**Example 2** To apply the license certificate 'cert2.txt' stored in the AMF master's flash directory for AMF provisioned node 'host2', use the command:

```
device1# atmf provision node host2
device1(atmf-provision)# license-cert /cert2.txt
```

To confirm that the license certificate has been applied to the provisioned node, use the command `show atmf provision nodes`. The output from this command is shown below, and displays license certification details in the last line.

Figure 52-7: Sample output from the `show atmf provision nodes` command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media .....: SD (Total 3827.0MB, Free 3481.1MB)

Node Name           : device2
Date & Time         : 06-Oct-2016 & 23:25:44
Provision Path      : card:/atmf/nodes

Boot configuration :
Current boot image  : x510-5.4.6-1.4.rel (file exists)
Backup boot image   : x510-5.4.6-1.3.rel (file exists)
Default boot config : flash:/default.cfg (file exists)
Current boot config : flash:/abc.cfg (file exists)
Backup boot config  : flash:/xyz.cfg (file exists)

Software Licenses :
Repository file     : ../configs/.sw_v2.lic
                   : ../configs/.swfeature.lic

  - [locate \(amf-provision\)](#)
  - [show atmf provision nodes](#)

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# locate (amf-provision)

**Overview** This command changes the present working directory to the directory of a provisioned node. This makes it easier to edit files and create a unique provisioned node in the backup.

This command can only be run on AMF master nodes.

**NOTE:** We advise that after running this command, you return to a known working directory, typically *flash*.

**Syntax** locate

**Mode** AMF Provisioning

**Example** To change the working directory that happens to be on device1 to the directory of provisioned node device2, use the following command:

```
device1# atmf provision node device2  
device1[atmf-provision]# locate
```

The directory of the node device2 should now be the working directory. You can use the command `pwd` to check this, as shown in the following figure.

Figure 52-8: Sample output from the `pwd` command

```
device2#pwd  
card:/atmf/building_2/nodes/device2/flash
```

The output above shows that the working directory is now the flash of device2.

**Related commands**

- delete (amf-provision)
- identity (amf-provision)
- license-cert (amf-provision)
- locate (amf-provision)
- pwd
- show atmf provision nodes

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# log event-host

**Overview** Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

**Syntax** `log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`  
`no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	ipv4 address of the event host
<code>&lt;ipv6-addr&gt;</code>	ipv6 address of the event host

**Default** Log events are disabled by default.

**Mode** Global Configuration

**Usage notes** Event hosts are set so syslog sends the messages out as they come.

Note that there is a difference between log event and log host messages:

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

**Example** To enable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

**Related commands** [atmf topology-gui enable](#)

# login-fallback enable

**Overview** Use this command to enable login fallback on TQ model AMF guest nodes. This allows AMF to try the factory default username and password if the guest node's saved username and password fail.

Use the **no** variant of this command to disable login fallback.

**Syntax** login-fallback enable  
no login-fallback enable

**Default** Disabled

**Mode** AMF Guest Configuration

**Usage notes** This feature is only supported on TQ model guest nodes.

Login fallback means: if a guest node's saved username and password fail, AMF will try to connect to the node using the factory default username and password (manager/friend). When a new TQ replaces an existing TQ, this allows the new TQ to be discovered and managed as an AMF guest node. AMF can then start the AMF guest node recovery procedure.

**Example** To use the login fallback feature, first create an AMF guest class for TQ model APs. Then enable the login fall back feature.

For example, to enable login fallback on the guest-class AT-TQ5k, use the commands:

```
node1#configuration terminal
node1(config)#atmf guest-class AT-TQ5k
node1(config-atmf-guest)#login-fallback enable
node1(config-atmf-guest)#end
node1#
```

**Related commands** [atmf guest-class](#)  
[modeltype](#)  
[switchport atmf-guestlink](#)  
[show atmf links guest](#)

**Command changes** Version 5.5.0-1.1: command added

# modeltype

**Overview** This command sets the expected model type of the guest node. The model type will default to **other** if nothing is set.

Use the **no** variant of this command to reset the model type to **other**.

**Syntax** `modeltype {alliedware|aw+|onvif|tq|other}`  
`no modeltype`

Parameter	Description
alliedware	A legacy Allied Telesis operating system.
aw+	The Allied Telesis AlliedWare Plus operating system.
onvif	ONVIF (Open Network Video Interface Forum) Profile Q devices
tq	An Allied Telesis TQ Series wireless access point.
other	Used where the model type is outside the above definitions.

**Default** Default to **other**

**Mode** AMF Guest Configuration

**Examples** To assign the model type **tq** to the guest-class called 'tq\_device', use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# modeltype tq
```

To remove the model type **tq** from the guest-class called 'tq\_device', and reset it to the default of **other**, use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# no modeltype
```

**Related commands** [atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf links guest](#)

**Command changes** Version 5.4.9-2.1: **onvif** parameter added

# service atmf-application-proxy

**Overview** Use this command to enable the AMF Application Proxy service. This service distributes messages across all AMF nodes.

Currently this is used for threat protection. When an AMF Security (AMF-Sec) Controller detects a threat, it issues a request to block the address the threat originated from. The AMF Application Proxy service distributes this message to all AMF nodes. An AMF master accepts this block request and instructs the subordinate AMF node to block the relevant device.

Use the **no** variant of this command to disable the AMF Application Proxy service.

**Syntax** `service atmf-application-proxy`  
`no service atmf-application-proxy`

**Default** The AMF Application Proxy service is disabled by default.

**Mode** Global Configuration

**Usage notes** The AMF master maintains a list of all threats and will send this list to any AMF node, or VCS member, when it boots and joins the AMF network.

In order for this to work the follow must be configured:

- the AMF Application Proxy service on all AMF nodes that need to receive the messages.
- the Hypertext Transfer Protocol (HTTP) service on all nodes that are running the AMF Application Proxy service (see [service http](#)).

**Example** To enable the AMF Application Proxy service, use the commands

```
awplus# configure terminal  
awplus(config)# service atmf-application-proxy
```

To disable the AMF Application Proxy service, use the commands

```
awplus# configure terminal  
awplus(config)# no service atmf-application-proxy
```

**Related commands** [application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# show application-proxy threat-protection

**Overview** Use this command to list all the IP addresses blocked by the AMF Application Proxy service. It also shows the global threat-detection configuration.

**Syntax** `show application-proxy threat-protection [all]`

Parameter	Description
all	Include information for non-local blocks.

**Mode** Privileged Exec

**Example** To list the addresses blocked by the AMF Application Proxy service, use the command:

```
awplus# show application-proxy threat-protection
```

**Output** Figure 52-9: Example output from **show application-proxy threat-protection**

```
awplus#show application-proxy threat-protection
Quarantine Vlan      : vlan200
Global IP-Filter     : Enabled
IP-Filter Limit Exceeded : 0
Redirect-URL        : http://my.dom/help.html

Client IP           Interface      MAC Address    VLAN    Action
-----
10.34.199.110      -             -              -       link-down
10.34.199.116      port1.0.3     001a.eb93.ec5d 1        drop
10.1.179.1         *             *              *       ip-filter
...
```

Table 52-1: Parameters in the output from **show application-proxy threat-protection**

Parameter	Description
Quarantine Vlan	The name of the quarantine VLAN.
Global IP-Filter	The status of global IP filtering.
IP-Filter Limit Exceeded	The number of times an ACL failed to be installed due to insufficient space.
Redirect-URL	The URL a blocked user is redirected to.

# show application-proxy whitelist advertised-address

**Overview** Use this command to show the Layer 3 interface and its IPv4 address that is advertised as the application-proxy whitelist address.

**Syntax** `show application-proxy whitelist advertised-address`

**Mode** Privileged Exec

**Example** To display the interface and IPv4 address advertised as the application-proxy whitelist address, use the command:

```
awplus# show application-proxy whitelist advertised-address
```

**Output** Figure 52-10: Example output from **show application-proxy whitelist advertised-address**

```
awplus#show application-proxy whitelist advertised-address

# show application-proxy whitelist interface

**Overview** Use this command to display the status of port authentication on the specified interface.

**Syntax** `show application-proxy whitelist interface [<interface-list>]`

Parameter	Description
<code>&lt;interface-list&gt;</code>	<p>The interfaces or ports to display information about. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> <p>The specified interface must exist.</p>

**Mode** Privileged Exec

**Example** To display the port authentication information for all interfaces, use the command:

```
awplus# show application-proxy whitelist interface
```

To display the port authentication information for port1.0.4, use the command

```
awplus# show application-proxy whitelist interface port1.0.4
```

**Output** Figure 52-11: Example output from **show application-proxy whitelist interface**

```
awplus#sh application-proxy whitelist interface

**Command changes** Version 5.4.9-0.1: command added

# show application-proxy whitelist supplicant

**Overview** Use this command to display the current configuration and status for each supplicant attached to an application-proxy whitelist port.

**Syntax** `show application-proxy whitelist supplicant [interface <interface-list> | <mac-addr> | brief]`

Parameter	Description
<code>interface</code> <code>&lt;interface-list&gt;</code>	The interfaces or ports to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> The specified interface must exist.
<code>&lt;mac-addr&gt;</code>	MAC (hardware) address of the supplicant. Entry format is HHHH.HHHH.HHHH (hexadecimal)
<code>brief</code>	Brief summary of the supplicant state.

**Mode** Privileged Exec

**Example** To display the supplicant information for all ports, use the command:

```
awplus# show application-proxy whitelist supplicant
```

To display the supplicant information for port1.0.4, use the command:

```
awplus# show application-proxy whitelist supplicant interface port1.0.4
```

**Command changes** Version 5.4.9-0.1: command added

# show atmf

**Overview** Displays information about the current AMF node.

**Syntax** `show atmf [summary|tech|nodes|session]`

Parameter	Description
summary	Displays summary information about the current AMF node.
tech	Displays global AMF information.
nodes	Displays a list of AMF nodes together with brief details.
session	Displays information on an AMF session.

**Default** Only summary information is displayed.

**Mode** User Exec and Privileged Exec

**Usage notes** AMF uses internal VLANs to communicate between nodes about the state of the AMF network. Two VLANs have been selected specifically for this purpose. Once these have been assigned, they are reserved for AMF and cannot be used for other purposes

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Example 1** To show summary information on AMF node\_1 use the following command:

```
node_1# show atmf summary
```

**Table 53:** Output from the **show atmf summary** command

```
node_1#show atmf summary
ATMF Summary Information:

ATMF Status           : Enabled
Network Name          : Test_network
Node Name              : node_1
Role                   : Master
Restricted login       : Disabled
Current ATMF Nodes    : 3
```

**Example 2** To show information specific to AMF nodes use the following command:

```
node_1# show atmf nodes
```

**Example 3** The **show amf session** command displays all CLI (Command Line Interface) sessions for users that are currently logged in and running a CLI session.

To display AMF active sessions, use the following command:

```
node_1# show atmf session
```

For example, in the output below, node\_1 and node\_5 have active users logged in.

**Table 54:** Output from the **show atmf session** command

```
node_1#show atmf session

CLI Session Neighbors

Session ID           : 73518
Node Name            : node_1

DBE Request List Length : 0
```

**Example 4** The AMF tech command collects all the AMF commands, and displays them. You can use this command when you want to see an overview of the AMF network.

To display AMF technical information, use the following command:

```
node_1# show atmf tech
```

**Table 55:** Output from the **show atmf tech** command

```
node_1#show atmf tech
ATMF Summary Information:

Management Domain Ifindex : 4391
Management Domain VLAN   : 4091
Management ifindex       : 4392
Management VLAN          : 4092
```

**Table 56:** Parameter definitions from the **show atmf tech** command

Parameter	Definition
ATMF Status	The Node's AMF status, either Enabled or Disabled.
Network Name	The AMF network that a particular node belongs to.

**Table 56:** Parameter definitions from the **show atmf tech** command (cont.)

Parameter	Definition
Node Name	The name assigned to a particular node.
Role	The role configured for this AMF device, either Master or Member.
Current ATMF Nodes	The count of AMF nodes in an AMF Network.
Node Address	An address used to access a remotely located node (.atmf).
Node ID	A unique identifier assigned to a Node on an AMF network.
Node Depth	The number of nodes in path from this node to level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.
Domain State	The state of Node in a Domain in AMF network as Controller/Backup.
Recovery State	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.
Management VLAN	The VLAN created for traffic between Nodes of different domain (up/down links). <ul style="list-style-type: none"> <li>• VLAN ID - In this example VLAN 4092 is configured as the Management VLAN.</li> <li>• Management Subnet - Network prefix for the subnet.</li> <li>• Management IP Address - The IP address allocated for this traffic.</li> <li>• Management Mask - The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>
Domain VLAN	The VLAN assigned for traffic between Nodes of same domain (crosslink). <ul style="list-style-type: none"> <li>• VLAN ID - In this example VLAN 4091 is configured as the domain VLAN.</li> <li>• Domain Subnet. The subnet address used for this traffic.</li> <li>• Domain IP Address. The IP address allocated for this traffic.</li> <li>• Domain Mask. The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>
Device Type	The Product Series name.
ATMF Master	Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).
SC	The device configuration, one of C - Chassis (SBx8100 Series), S - Stackable (VCS) or N - Standalone.
Parent	The node to which the current node has an active uplink.
Node Depth	The number of nodes in the path from this node to the master node.

**Related commands** [show atmf detail](#)

# show atmf area

**Overview** Use this command to display information about an AMF area. On AMF controllers, this command displays all areas that the controller is aware of. On remote AMF masters, this command displays the controller area and the remote local area. On gateways, this command displays the controller area and remote master area.

**Syntax** `show atmf area [detail] [<area-name>]`

Parameter	Description
detail	Displays detailed information
<area-name>	Displays information about master and gateway nodes in the specified area only.

**Mode** Privileged Exec

**Example 1** To show information about all areas, use the command:

```
controller-1# show atmf area
```

The following figure shows example output from running this command on a controller.

**Table 57:** Example output from the **show atmf area** command on a Controller.

```
controller-1#show atmf area

ATMF Area Information:

* = Local area

Area          Area  Local  Remote  Remote  Node
Name          ID    Gateway Gateway Master   Count
-----
* NZ          1     Reachable  N/A     N/A     3
Wellington   2     Reachable  Reachable  Auth OK  120
Canterbury   3     Reachable  Reachable  Auth Error  -
SiteA-AREA   14    Unreachable  Unreachable  Unreachable  -
Auckland     100   Reachable  Reachable  Auth Start  -
Southland    120   Reachable  Reachable  Auth OK    54

Area count:      6                      Area node count:      177
```

The following figure shows example output from running this command on a remote master.

**Table 58:** Example output from the **show atmf area** command on a remote master.

```

Canterbury#show atmf area

  ATMF Area Information:

  * = Local area

Area          Area  Local      Remote      Remote      Node
Name         ID   Gateway    Gateway     Master       Count
-----
NZ           1    Reachable  N/A         N/A         -
* Canterbury 3    Reachable  N/A         N/A         40

Area count:      2                      Local area node count: 40
    
```

**Table 59:** Parameter definitions from the **show atmf area** command

Parameter	Definition
*	Indicates the area of the device on which the command is being run.
Area Name	The name of each area.
Area ID	The ID of the area.
Local Gateway	Whether the local gateway node is reachable or not.
Remote Gateway	Whether the remote gateway node is reachable or not. This is one of the following: <ul style="list-style-type: none"> <li>Reachable, if the link has been established.</li> <li>Unreachable, if a link to the remote area has not been established. This could mean that a port or vlan is down, or that inconsistent VLANs have been configured using the <a href="#">switchport atmf-arealink</a> command.</li> <li>N/A for the area of the controller or remote master on which the command is being run, because the gateway node on that device is local.</li> <li>Auth Start, which may indicate that the area names match on the controller and remote master, but the IDs do not match.</li> <li>Auth Error, which indicates that the areas tried to authenticate but there is a problem. For example, the passwords configured on the controller and remote master may not match, or a password may be missing on the remote master.?</li> <li>Auth OK, which indicates that area authentication was successful and you can now use the <a href="#">atmf select-area</a> command.</li> </ul>
Remote Master	Whether the remote master node is reachable or not. This is N/A for the area of the controller or remote master on which the command is being run, because the master node on that device is local.
Node Count	The number of nodes in the area.
Area Count	The number of areas controlled by the controller.
Area Node Count	The total number of nodes in the area.

**Example 2** To show detailed information about the areas, use the command:

```
controller-1# show atmf area detail
```

The following figure shows example output from running this command.

**Table 60:** Output from the **show atmf area detail** command

```
controller-1#show atmf area detail

ATMF Area Detail Information:

Controller distance      : 0

Controller Id           : 21

# show atmf area guests

**Overview** This command will display details of all guests that the controller is aware of.

**Syntax** show atmf area guests [*<area-name>*] [*<node-name>*]

Parameter	Description
<i>&lt;area-name&gt;</i>	The area name for guest information
<i>&lt;node-name&gt;</i>	The name of the node that connects to the guests.

**Default** n/a

**Mode** User Exec/Privileged Exec

**Example 1** To display atmf area guest nodes on a controller, use the command,

```
GuestNode[1]#show atmf area guests
```

**Output** Figure 52-14: Example output from the **show atmf area guests** command

```
main-building Area Guest Node Information:
Device      MAC                               IP/IPv6

main-building guest node count 4

GuestNode[1]#
```

**Table 61:** Parameters in the output from **show atmf area guests** command

Parameter	Description
Device Type	The device type as read from the guest node.
MAC Address	The MAC address of the guest-node
Parent	The device that directly connects to the guest-node
Port	The port number on the parent node that connects to the guest node.
IP/IPv6	The IP or IPv6 address of the guest node.

**Related  
commands** [show atmf area](#)  
[show atmf area nodes](#)  
[show atmf backup guest](#)  
[show atmf area guests-detail](#)

# show atmf area guests-detail

**Overview** This command displays the local and remote guest information from an AMF controller.

**Syntax** `show atmf area guests-detail [<area-name>] [<node-name>]`

Parameter	Description
<i>&lt;area-name&gt;</i>	The name assigned to the AMF area. An area is an AMF network that is under the control of an AMF Controller.
<i>&lt;node-name&gt;</i>	The name assigned to the network node.

**Default** n/a.

**Mode** Privileged Exec

**Example** To display detailed information for all guest nodes attached to “node1”, which is located within the area named “northern”, use the following command:

```
AMF_controller#show atmf area guests-detail northern node1
```

**Output** Figure 52-15: Example output from the **show atmf guest detail** command.

```
#show atmf guest detail

Node Name           : Node1

```

**Table 62:** Parameters shown in the output of the **show atmf guest detail** command

Parameter	Description
Node Name	The name of the guest's parent node.
Port Name	The port on the parent node that connects to the guest.
IFindex	An internal index number that maps to the port number on the parent node.
Guest Description	A brief description of the guest node as manually entered into the <code>description (interface)</code> command for the guest node port on the parent node.
Device Type	The device type as supplied by the guest node itself.
Backup Supported	Indicates whether AMF supports backup of this guest node.
MAC Address	The MAC address of the guest node.
IP Address	The IP address of the guest node.
IPv6 Address	The IPv6 address of the guest node.
HTTP Port	The HTTP port enables you to specify a port when enabling http to allow a URL for the http user interface of a Guest Node. This is determined by the <code>http-enable</code> command.
Firmware Version	The firmware version that the guest node is currently running.

# show atmf area nodes

**Overview** Use this command to display summarized information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

**Syntax** `show atmf area nodes <area-name> [<node-name>]`

Parameter	Description
<code>&lt;area-name&gt;</code>	Displays information about nodes in the specified area.
<code>&lt;node-name&gt;</code>	Displays information about the specified node.

**Mode** Privileged Exec

**Usage notes** If you do not limit the output to a single area or node, this command lists all remote nodes that the controller is aware of. This can be a very large number of nodes.

**Example** To show summarized information for all the nodes in area 'Wellington', use the command:

```
controller-1# show atmf area nodes Wellington
```

The following figure shows partial example output from running this command.

**Table 63:** Output from the `show atmf area nodes Wellington` command

```
controller-1#show atmf area nodes Wellington

Wellington Area Node Information:

Node          Device          ATMF          Node
Name          Type            Master  SC    Parent          Depth
-----
well-gate     x230-18GP       N         N    well-master     1
well-master   AT-x930-28GPX   Y         N    none            0

Wellington node count 2

...
```

**Table 64:** Parameter definitions from the `show atmf area nodes` command

Parameter	Definition
Node Name	The name assigned to a particular node.
Device Type	The Product series name.

**Table 64:** Parameter definitions from the **show atmf area nodes** command (cont.)

Parameter	Definition
ATMF Master	Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).
SC	The device configuration, one of C - Chassis (SBx8100 series), S - Stackable (VCS) or N - Standalone.
Parent	The node to which the current node has an active uplink.
Node Depth	The number of nodes in the path from this node to the master node.

**Related commands** [show atmf area](#)  
[show atmf area nodes-detail](#)

# show atmf area nodes-detail

**Overview** Use this command to display detailed information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

**Syntax** `show atmf area nodes-detail <area-name> [<node-name>]`

Parameter	Description
<code>&lt;area-name&gt;</code>	Displays detailed information about nodes in the specified area.
<code>&lt;node-name&gt;</code>	Displays detailed information about the specified node.

**Mode** Privileged Exec

**Usage notes** If you do not limit the output to a single area or node, this command displays information about all remote nodes that the controller is aware of. This can be a very large number of nodes.

**Example** To show information for all the nodes in area 'Wellington', use the command:

```
controller-1# show atmf area nodes-detail Wellington
```

The following figure shows partial example output from running this command.

**Table 65:** Output from the **show atmf area nodes-detail Wellington** command

```
controller-1#show atmf area nodes-detail Wellington

Wellington Area Node Information:

[show atmf area nodes](#)

# show atmf area summary

**Overview** Use this command to display a summary of IPv6 addresses used by AMF, for one or all of the areas controlled by an AMF controller.

**Syntax** `show atmf area summary [<area-name>]`

Parameter	Description
<code>&lt;area-name&gt;</code>	Displays information for the specified area only.

**Mode** Privileged Exec

**Example 1** To show a summary of IPv6 addresses used by AMF, for all of the areas controlled by controller-1, use the command:

```
controller-1# show atmf area summary
```

The following figure shows example output from running this command.

**Table 67:** Output from the **show atmf area summary** command

```
controller-1#show atmf area summary

ATMF Area Summary Information:

Management Information
Local IPv6 Address           : fd00:4154:4d46:1::15

Area Information
Area Name                    : NZ (Local)
Area ID                      : 1
Area Master IPv6 Address     : -

Area Name                    : Wellington
Area ID                      : 2
Area Master IPv6 Address     : fd00:4154:4d46:2::149

Area Name                    : Canterbury
Area ID                      : 3
Area Master IPv6 Address     : fd00:4154:4d46:3::f

Area Name                    : Auckland
Area ID                      : 100
Area Master IPv6 Address     : fd00:4154:4d46:64::17
Interface                    : vlink2000
```

# show atmf authorization

**Overview** Use this command on an AMF master to display the authorization status of other AMF members and masters on the network.

On an AMF controller this command will show the authorization status of remote area AMF masters.

**Syntax** `show atmf authorization {current|pending|provisional}`

Parameter	Description
current	Show the status of all authorized nodes.
pending	Show the status of unauthorized nodes in the pending queue. These are nodes that enabled secure mode with <code>atmf secure-mode</code> but have not yet been authorized with <code>atmf authorize</code> .
provisional	Show the status of provisionally authorized nodes. These are nodes that have been provisioned with <code>atmf authorize provision</code> .

**Mode** Privileged Exec

**Example** To display all authorized AMF nodes on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization current
```

To display AMF nodes which are requesting authorization on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization pending
```

To display AMF nodes which have provisional authorization, use the command:

```
awplus# show atmf authorization provisional
```

**Output** Figure 52-16: Example output from **show atmf authorization current**

NZ Authorized Nodes:		
Node Name	Signer	Expires
-----	-----	-----
master_1	master_1	4 Mar 2017
area_1_node_1	master_1	4 Mar 2017
area_1_node_2	master_1	4 Mar 2017

Table 52-1: Parameters in the output from **show atmf authorization current**

Parameter	Description
Node Name	AMF node name of the authorized node.
Signer	Name of the AMF master that authorized the node.
Expires	Expiry date of the authorization. Authorization expiry time is set using <code>atmf secure-mode certificate expiry</code> .

**Output** Figure 52-17: Example output from **show atmf authorization pending**

```

Pending Authorizations:

NZ Requests:
Node Name           Product           Parent Node       Interface
-----
area_1_node_3      x230-18GP        master_1          port1.2.9
area_1_node_4      x510-52GTX       master_1          sal
    
```

Table 52-2: Parameters in the output from **show atmf authorization pending**

Parameter	Description
Node Name	Name of the node that is requesting authorization.
Product	Product name.
Parent Node	Authorization authority of the requesting node.
Interface	Interface that the authorization request came in on.

**Output** Figure 52-18: Example output from **show atmf authorization provisional**

```

ATMF Provisional Authorization:

Area - Node Name           Start           Timeout
or MAC Address           Interface       Time           Minutes
-----
3333.4444.5555           5 Sep 2016 02:35:54   3
1111.2222.3333           5 Sep 2016 02:35:24   60
NZ - blue                 port1.0.3       5 Sep 2016 02:35:06   60
    
```

Table 52-3: Parameters in the output from **show atmf authorization provisional**

Parameter	Description
Area - Node Name or MAC Address	MAC address or node name of the node that has been provisionally authorized.
Interface	Interface that the node has been provisioned on.
Start Time	Time the node was provisioned.
Timeout Minutes	Length of time from Start Time until the provisional authorization expires.

# show atmf backup

**Overview** This command displays information about AMF backup status for all the nodes in an AMF network. It can only be run on AMF master and controller nodes.

**Syntax**

```
show atmf backup
show atmf backup logs
show atmf backup server-status
show atmf backup synchronize [logs]
```

Parameter	Description
logs	Displays detailed log information.
server-status	Displays connectivity diagnostics information for each configured remote file server.
synchronize	Display the file server synchronization status
logs	For each remote file server, display the logs for the last synchronization

**Mode** Privileged Exec

**Example 1** To display the AMF backup information, use the command:

```
node_1# show atmf backup
```

To display log messages to do with backups, use the command:

```
node_1# show atmf backup logs
```

Table 52-4: Output from **show atmf backup**

```
Node_1# show atmf backup
ScheduledBackup .....Enabled
  Schedule.....1 per day starting at 03:00
  Next Backup Time...04 May 2019 03:00

Current Action.....Starting manual backup
Started.....04 May 2019 10:08
CurrentNode.....atmf_testbox1
Backup Redundancy ...Enabled
  Local media .....SD (Total 3788.0MB, Free 3679.5MB)
  State .....Active
```

Node Name	Date	Time	In ATMF	On Media	Status
atmf_testbox1	04 May 2019	09:58:59	Yes	Yes	In Progress
atmf_testbox2	04 May 2019	10:01:23	Yes	Yes	Good

Table 52-5: Output from **show atmf backup logs**

```
Node_1#show atmf backup logs

Backup Redundancy ..... Enabled
Local media ..... SD (Total 3788.0MB, Free 1792.8MB)
State ..... Inactive (Remote file server is not available)

Log File Location: card:/atmf/ATMF/logs/rsync_<node name>.log

Node
Name Log Details
-----
atmf_testbox
2019/05/04 18:16:51 [9045] receiving file list
2019/05/04 18:16:51 [9047] .d..t.... flash/
2019/05/04 18:16:52 [9047] >f+++++++ flash/a.rel
```

**Example 2** To display the AMF backup synchronization status, use the command:

```
node_1# show atmf backup synchronize
```

To display log messages to do with synchronization of backups, use the command:

```
node_1# show atmf backup synchronize logs
```

Table 52-6: Output from **show atmf backup synchronize**

```
Node_1#show atmf backup synchronize

ATMF backup synchronization:

* = Active file server

  Id  Date           Time           Status
-----
  1   04 May 2016    22:25:57     Synchronized
* 2   -              -              Active
```

Table 52-7: Output from **show atmf backup synchronize logs**

```
Node_1#show atmf backup synchronize logs

Id    Log Details
-----
1     2019/05/04 22:25:54 [8039] receiving file list
      2019/05/04 22:25:54 [8039] >f..t.... backup_Box1.info
      2019/05/04 22:25:54 [8039] sent 46 bytes received 39 bytes total size 40
```

**Example 3** To display the AMF backup information with the optional parameter **server-status**, use the command:

```
Node_1# show atmf backup server-status
```

```

Node1#sh atmf backup server-status

Id    Last Check    State
-----
1     186 s        File server ready
2     1 s          SSH no route to host
    
```

**Table 53:** Parameter definitions from the **show atmf backup** command

Parameter	Definition
Scheduled Backup	Indicates whether AMF backup scheduling is enabled or disabled.
Schedule	Displays the configured backup schedule.
Next Backup Time	Displays the date and time of the next scheduled.
Backup Media	The current backup medium in use. This will be SD or NONE. SD card only (and not USB) is supported for AMF backup. Utilized and available memory (MB) will be indicated if backup media memory is present.
Current Action	The task that the AMF backup mechanism is currently performing. This will be a combination of either (Idle, Starting, Doing, Stopping), or (manual, scheduled).
Started	The date and time that the currently executing task was initiated in the format DD MMM YYYY HH:MM
Current Node	The name of the node that is currently being backed up.
Backup Redundancy	Whether backup redundancy is enabled or disabled.
Local media	The local media to be used for backup redundancy; SD, USB, INTERNAL, or NONE, and total and free memory available on the media.
State	Whether SD or USB media is installed and available for backup redundancy. May be Active (if backup redundancy is functional—requires both the local redundant backup media and a remote server to be configured and available) or Inactive.
Node Name	The name of the node that is storing backup data - on its backup media.
Date	The data of the last backup in the format DD MMM YYYY.
Time	The time of the last backup in the format HH:MM:SS.
In ATMF	Whether the node shown is active in the AMF network, (Yes or No).
On Media	Whether the node shown has a backup on the backup media (Yes or No).

**Table 53:** Parameter definitions from the **show atmf backup** command (cont.)

Parameter	Definition
Status	The output can contain one of four values: <ul style="list-style-type: none"><li>• “-” meaning that the status file cannot be found or cannot be read.</li><li>• “Errors” meaning that there are issues - note that the backup may still be deemed successful depending on the errors.</li><li>• “Stopped” meaning that the backup attempt was manually aborted.</li><li>• “Good” meaning that the backup was completed successfully.</li><li>• “In Progress” meaning that the backup is currently running on that node.</li></ul>
Log File Location	All backup attempts will generate a result log file in the identified directory based on the node name. In the above example this would be: card:/amf/office/logs/rsync_amf_testbox1.log.
Log Details	The contents of the backup log file.
server-status	Displays connectivity diagnostics information for each configured remove file server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Related commands** [show atmf](#)  
[atmf network-name](#)

# show atmf backup area

**Overview** Use this command to display backup status information for the master nodes in one or more areas.

Note that this command is only available on AMF controllers.

**Syntax** `show atmf backup area [<area-name> [<node-name>]] [logs]`

Parameter	Description
logs	Displays the logs for the last backup of each node.
<area-name>	Displays information about nodes in the specified area.
<node-name>	Displays information about the specified node.

**Mode** Privileged Exec

**Example** To show information about backups for an area, use the command:

```
controller-1# show atmf backup area
```

**Table 54:** Output from the **show atmf backup area** command

```

controller-1#show atmf backup area

# show atmf container

**Overview** Use this command to display information about the AMF containers created on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `show atmf container [detail] [<container-name>]`

Parameter	Description
detail	Show detailed information.
<container-name>	The name of the AMF container you wish to display information for.

**Mode** Privileged Exec

**Output** Figure 52-20: Example output from **show atmf container**

```
awplus#show atmf container
ATMF Container Information:
  Container      Area      Bridge   State    Memory    CPU%
-----
  vac-wlg-1     wlg       br1      running  70.3 MB   1.2
  vac-akl-1     ak1       br2      stopped  0 bytes   0.0
  vac-nsn-1     nsn       br3      running  53.2 MB   0.7
Current ATMF Container count: 3
```

Figure 52-21: Example output from **show atmf container vac-wlg-1**

```
awplus#show atmf container vac-wlg-1
ATMF Container Information:
  Container      Area      Bridge   State    Memory    CPU%
-----
  vac-wlg-1     wlg       br1      running  70.3 MB   1.2
Current ATMF Container count: 1
```

Table 52-2: Parameters in the output from **show atmf container**

Parameter	Description
Container	Name of the AMF container.
Area	Name of the area the container is in.
Bridge	Name of the bridge connecting the container to the physical network.
State	Container state, <code>running</code> or <code>stopped</code> . This is set with the <code>state</code> command.
Memory	The amount of memory the container is using on the VAA host.
CPU%	The percentage of CPU time the container is using on the VAA, at the time the show command is run.

Figure 52-22: Example output from **show atmf container detail vac-wlg-1**

```
awplus#show atmf container detail vac-wlg-1

ATMF Container Information:

Name: vac-wlg-1
State: RUNNING
PID: 980

Table 52-3: Parameters in the output from **show atmf container detail**

Parameter	Description
Name	Name of the AMF container.
State	Container state, <code>RUNNING</code> or <code>STOPPED</code> . This is set with the <code>state</code> command.

Table 52-3: Parameters in the output from **show atmf container detail** (cont.)

Parameter	Description
PID	Internal container id.
IP	This lists the IP addresses used by the container. These include the eth1 IP address and the AMF management IP address.
CPU use	The CPU usage of the container since it was enabled.
Memory use	Container memory usage.
Link	Each container has two links: <ol style="list-style-type: none"><li>1 An AMF area-link, this connects the container to the AMF controller and uses virtual interface eth0 on the AMF container.</li><li>2 A bridged L2 network link, this connects the container to the outside world and uses the virtual interface eth1 on the AMF container.</li></ol> See the <a href="#">AMF Feature Overview and Configuration_Guide</a> for more information on these links.
TX/RX bytes	Bytes sent and received on a link.
Total bytes	Total bytes transferred on a link.

**Command changes**

Version 5.4.7-0.1: command added

# show atmf detail

**Overview** This command displays details about an AMF node. It can only be run on AMF master and controller nodes.

**Syntax** show atmf detail

Parameter	Description
detail	Displays output in greater depth.

**Mode** Privileged Exec

**Example 1** To display the AMF node1 information in detail, use the command:

```
controller-1# show atmf detail
```

A typical output screen from this command is shown below:

```
atmf-1#show atmf detail
ATMF Detail Information:

Network Name           : Test_network
Network Mtu           : 1300
Node Name              : controller-1
Node Address           : controller-1.atmf
Node ID                : 342
Node Depth             : 0
Domain State           : BackupDomainController
Recovery State         : None
Recovery Over ETH Ports : Disabled
Log Verbose Setting    : Verbose
Topology GUI           : Disabled

Management VLAN
VLAN ID                : 4000
Management Subnet      : 172.31.0.0
Management IP Address  : 172.31.1.86
Management Mask        : 255.255.128.0
Management IPv6 Address : fd00:4154:4d46:1::156
Management IPv6 Prefix Length : 64

Domain VLAN
VLAN ID                : 4091
Domain Subnet          : 172.31.128.0
Domain IP Address      : 172.31.129.86
Domain Mask            : 255.255.128.0
```

**Table 53:** Parameter definitions from the **show atmf detail** command

Parameter	Definition
Network MTU	The network MTU for the ATMF network.
Network Name	The AMF network that a particular node belongs to.
Node Name	The name assigned to a particular node.
Node Address	An address used to access a remotely located node. This is simply the Node Name plus the dotted suffix atmf (.atmf).
Node ID	A unique identifier assigned to a node on an AMF network.
Node Depth	The number of nodes in the path from this node to the level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.
Domain State	The state of a node in a Domain in an AMF network as Controller/Backup.
Recovery State	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.
Recovery Over ETH Ports	Allow AMF recovery over the Eth port on an AR-series device.
Log Verbose Setting	The state of the <code>atmf log-verbose</code> command.
Topology GUI	This feature allows your AMF network to interact with Vista Manager EX and must be enabled on your AMF master.
Management VLAN	The VLAN created for traffic between nodes of different domain (up/down links). <ul style="list-style-type: none"> <li>• VLAN ID - in this example VLAN 4092 is configured as the Management VLAN.</li> <li>• Management Subnet - the network prefix for the subnet.</li> <li>• Management IP Address - the IP address allocated for this traffic.</li> <li>• Management Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>
Domain VLAN	The VLAN assigned for traffic between nodes of the same domain (crosslink). <ul style="list-style-type: none"> <li>• VLAN ID - in this example VLAN 4091 is configured as the domain VLAN.</li> <li>• Domain Subnet - the subnet address used for this traffic.</li> <li>• Domain IP Address - the IP address allocated for this traffic.</li> <li>• Domain Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>
Node Depth	The number of nodes in the path from this node to the core domain.

# show atmf group

**Overview** This command can be used to display the group membership within to a particular AMF node. It can also be used with the working-set command to display group membership within a working set.

Each node in the AMF is automatically added to the group that is appropriate to its hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group.

You can create arbitrary groups of AMF members based on your own selection criteria. You can then assign commands collectively to any of these groups.

**Syntax** `show atmf group [user-defined|automatic]`

Parameter	Description
<code>user-defined</code>	User-defined-group information display.
<code>automatic</code>	Automatic group information display.

**Default** All groups are displayed

**Mode** Privileged Exec

**Example 1** To display group membership of node2, use the following command:

```
node2# show atmf group
```

A typical output screen from this command is shown below:

```
ATMF group information

master, x510

node2#
```

This screen shows that node2 contains the groups **master** and **x510**. Note that although the node also contains the implicit groups, these do not appear in the show output.

**Example 2** The following commands (entered on *node2*) will display all the automatic groups within the working set containing *node1* and all nodes that have been pre-defined to contain the *sysadmin* group:

First define the working-set:

```
node1# #atmf working-set node1 group sysadmin
```

A typical output screen from this command is shown below:

```

ATMF group information

master, poe, x8100

=====
node1, node2, node3, node4, node5, node6:
=====

ATMF group information

sysadmin, x8100

AMF_NETWORK[6]#
    
```

This confirms that the six nodes (*node1* to *node6*) are now members of the working-set and that these nodes reside within the *AMF-NETWORK*.

Note that to run this command, you must have previously entered the command [atmf working-set](#) on page 2526. This can be seen from the network level prompt, which in this case is *AMF\_NETWORK[6]#*.

**Table 54:** Sample output from the **show atmf group** command for a working set.

```

AMF_NETWORK[6]#show atmf group
=====
node3, node4, node5, node6:
=====

ATMF group information

edge_switches, x510
    
```

**Table 55:** Parameter definitions from the **show atmf group** command for a working set

Parameter	Definition
ATMF group information	Displays a list of nodes and the groups that they belong to, for example: <ul style="list-style-type: none"> <li>• master - Shows a common group name for Nodes configured as AMF masters.</li> <li>• Hardware Arch - Shows a group for all Nodes sharing a common Hardware architecture, e.g. x8100, x230, for example.</li> <li>• User-defined - Arbitrary groups created by the user for AMF nodes.</li> </ul>

# show atmf group members

**Overview** This command will display all group memberships within an AMF working-set. Each node in the AMF working set is automatically added to automatic groups which are defined by hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group. Users can define arbitrary groupings of AMF members based on their own criteria, which can be used to select groups of nodes.

**Syntax** `show atmf group members [user-defined|automatic]`

Parameter	Description
user-defined	User defined group membership display.
automatic	Automatic group membership display.

**Mode** Privileged Exec

**Example** To display group membership of all nodes in a working-set, use the command:

```
ATMF_NETWORK[9]# show atmf group members
```

**Table 56:** Sample output from the **show atmf group members** command

```
ATMF Group membership
Automatic          Total
Groups            Members  Members
-----
master            1         Building_1
poe               1         HW_Team1
x510              3         SW_Team1 SW_Team2 SW_Team3
x930              1         HW_Team1
x8100             2         Building_1 Building_2

ATMF Group membership
User-defined       Total
Groups            Members  Members
-----
marketing         1         Bld1_Floor_1
software          3         SW_Team1 SW_Team2 SW_Team3
```

**Table 57:** Parameter definitions from the **show atmf group members** command

Parameter	Definition
Automatic Groups	Lists the Automatic Groups and their nodal composition. The sample output shows AMF nodes based on the same Hardware type or belonging to the same Master group.
User-defined Groups	Shows the grouping of AMF nodes in user defined groups.
Total Members	Shows the total number of members in each group.
Members	Shows the list of AMF nodes in each group.

**Related commands**

- [show atmf group](#)
- [show atmf](#)
- [atmf group \(membership\)](#)

# show atmf guests

**Overview** This command is available on any AMF master or controller in the network. It displays a summary of the AMF guest nodes that exist in the AMF network, including device type, parent node, and IP address.

**Syntax** show atmf guests

**Mode** User Exec/Privileged Exec

**Usage notes** Use this command to display all guest nodes in a network. If you want to see only the guests attached to a single node, use the [show atmf links guest](#) command, which shows information about the guest nodes and also about their link to their parent node.

**Example** To display the AMF guest output, use the command:

```
awplus# show atmf guests
```

**Output** Figure 52-23: Example output from the **show atmf guests** command

```
master#show atmf guests

Guest Information:

Device      Device      Parent      Guest      IP/IPv6
Name        Type        Node        Port        Address
-----
node1-2.0.1 x600-24Ts   node1       2.0.1       192.168.2.10
wireless-zone1 AT-TQ4600   node2       1.0.1       192.168.1.10
wireless-zone2 AT-TQ4600   node2       1.0.2       192.168.1.12

Current ATMF guest node count 3
```

**Table 58:** Parameters shown in the output of the **show atmf guests** command

Parameter	Description
Device Name	The name that is discovered from the device, or failing that, a name that is auto-assigned by AMF. The auto-assigned name consists of: <parent node name>-<attached port number> You can change this by configuring a description on the port.
Device Type	The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command.

**Table 58:** Parameters shown in the output of the **show atmf guests** command

Parameter	Description
Parent Node	The name of the AMF node that directly connects to the guest node.
Guest Port	The port on the parent node that directly connects to the guest node.
IP/IPv6 Address	The address discovered from the node, or statically configured on the parent node's attached port.

**Related  
commands**

[atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf backup guest](#)  
[show atmf links guest](#)

# show atmf guests detail

**Overview** This command is available on any AMF master in the network. It displays details about the AMF guest nodes that exist in the AMF network, such as device type, IP address, MAC address etc.

**Syntax** `show atmf guests detail [<node-name>] [<guest-port>]`

Parameter	Description
<code>&lt;node-name&gt;</code>	The name of the guest node's parent.
<code>&lt;guest-port&gt;</code>	The port name on the parent node.

**Mode** User Exec/Privileged Exec

**Usage notes** If you want to see only the guests attached to a single node, you can use either:

- this command and specify the node name, or
- [show atmf links guest detail](#), which shows information about the guest nodes and also about their link to their parent node.

Note that the parameters that are displayed depend on the guest node's model.

**Example** To display the AMF guest output, use the command:

```
awplus# show atmf guests detail
```

**Output** Figure 52-24: Example output from **show atmf guests detail**

```
master#show atmf guests detail

ATMF Guest Node Information:

Node Name           : master
Port Name           : port1.0.9
Ifindex             : 5009
Guest Description   : red-1.0.9
Device Type         : x600-24Ts
Backup Supported    : No
MAC Address         : 0000.cd38.0c4d
IP Address          : 192.168.1.5
IPv6 Address        : Not Set
HTTP Port           : 0
Firmware Version    : 5.4.2-0.1
```

Node Name	: node1
Port Name	: port1.0.13
Ifindex	: 5013
Guest Description	: node1-1.0.13
Device Type	: AT-TQ4600
Backup Supported	: Yes
MAC Address	: ecd.6df2.daa0
IP Address	: 192.168.5.6
IPv6 Address	: Not Set
HTTP Port	: 80
Firmware Version	: 3.1.0 B01

**Table 59:** Parameters in the output from **show atmf guests detail**.

Parameter	Description
Node Name	The name of the parent node, which is the AMF node that directly connects to the guest node.
Port Name	The port on the parent node that connects to the guest.
IfIndex	An internal index number that maps to the port number on the parent node.
Guest Description	A description that is discovered from the device, or failing that, auto-assigned by AMF. The auto-assigned name consists of: <parent node name>-<attached port number>. You can change this by configuring a description on the port.
Device Type	The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command.
Username	The user name configured on the guest node.
Backup Supported	Whether the guest node supports AMF backup functionality.
MAC Address	The MAC address of the guest node.
IP Address	The IP address of the guest node.
IPv6 Address	The IPv6 address of the guest node.
Firmware Version	The version of the firmware operating on the guest node.
HTTP port	The HTTP port as specified with the <a href="#">http-enable</a> command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).

**Related  
commands**    [atmf guest-class](#)  
                  [switchport atmf-guestlink](#)  
                  [show atmf backup guest](#)

# show atmf links

**Overview** This command displays information about AMF links on a switch. The display output contains link status state information.

**Syntax** `show atmf links [brief]`

Parameter	Description
brief	A brief summary of AMF links, their configuration and status.

**Mode** User Exec and Privileged Exec

**Usage notes** The **show atmf links** and **show atmf links brief** commands both produce a table of summarized link information. For a more detailed view use the [show atmf links detail](#) command.

This command does not show links that are configured on provisioned ports.

**Example** To display a brief summary of the AMF links, use the following command:

```
node-1# show atmf links brief
```

Figure 52-25: Example output from **show atmf links brief**

```
Example-core# show atmf links
ATMF Link Brief Information:
Local   Link   Link   ATMF   Adjacent   Adjacent   Link
Port    Type   Status State   Node       Ifindex    State
-----
1.0.10  Crosslink Down   Init   *crosslink1 -          Blocking
1.0.14  Crosslink Down   Init   *crosslink2 -          Blocking
1.0.1   Downlink Down   Init   -         -          Blocking
1.0.2   Downlink Up     Full   Node2    5001      Forwarding
1.0.8   Downlink Up     Full   downlink1 5001      Forwarding

* = Provisioned.
```

Table 52-1: Parameter in the output from **show atmf links brief**

Parameter	Definition
Local Port	Shows the local port on the selected node.
Link Type	Shows link type as Uplink or Downlink (parent and child) or Cross-link (nodes in same domain).
Link Status	Shows the link status of the local port on the node as either Up or Down.

Table 52-1: Parameter in the output from **show atmf links brief** (cont.)

Parameter	Definition
ATMF State	Shows AMF state of the local port: <ul style="list-style-type: none"> <li>• Init - Link is down.</li> <li>• Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable.</li> <li>• Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations.</li> <li>• OneWay - Link is up and has waited the hold down period and now attempting to link to another unit in another domain.</li> <li>• OneWaySim - Device is running in secure mode and link is up but waiting for authorization from an AMF master.</li> <li>• Full - Link hello packets are sent and received from its neighbor with its own node id.</li> <li>• Shutdown - Link has been shut down by user configuration.</li> </ul>
Adjacent Node	Shows the Adjacent AMF Node to the one being configured.
Adjacent IF Index	Shows the IF index for the Adjacent AMF Node connected to the node being configured.
Link State	Shows the state of the AMF link. Valid states are either Forwarding or Blocking.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

# show atmf links detail

**Overview** This command displays detailed information on all the links configured in the AMF network. It can only be run on AMF master and controller nodes.

**Syntax** show atmf links detail

Parameter	Description
detail	Detailed AMF links information.

**Mode** User Exec

**Usage notes** For summarized link information see the [show atmf links](#) command.  
This command does not show links that are configured on provisioned ports.

**Example** To display the AMF link details use this command:

```
device1# show atmf links detail
```

The output from this command will display all the internal data held for AMF links. The following example gives details of the links that are summarized in the example in [show atmf links](#).

**Related commands** no debug all  
clear atmf links statistics  
show atmf

# show atmf links guest

**Overview** This command displays information about guest nodes visible to an AMF device.

**Syntax** `show atmf links guest [interface <interface-range>]`

Parameter	Description
interface <interface-range>	Select a specific range of ports to display information about guest nodes.

**Default** With no parameters specified this command will display its standard output for all ports with guest nodes connected.

**Mode** User Exec/Privileged Exec

**Usage notes** Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use [show atmf guests](#).

**Example 1** To display information about AMF guests that are connectible from node1, use the command:

```
node1# show atmf links guest
```

**Output** Figure 52-26: Example output from **show atmf links guest**

```
node1#sh atmf links guest

Guest Link Information:

DC = Discovery configuration
   S = static D = dynamic

Local   Guest      Model      MAC      IP / IPv6
Port    Class       Type       DC Address Address
-----
1.0.1   -           other      D 0013.1a1e.4589 192.168.1.2
1.0.2   aastra-phone other      D 0008.5d10.7635 192.168.1.3
1.0.3   cisco-phone2 other      S -              192.168.2.1
1.0.4   panasonic... other      D 0800.239e.f1fe 192.168.1.5
```

Table 52-1: Parameters in the output from **show atmf links guest**

Parameter	Description
Local Port	The port on the parent node that connects to the guest.
Guest Class	The name of the ATMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command.

Table 52-1: Parameters in the output from **show atmf links guest** (cont.)

Parameter	Description
Model Type	The model type of the guest node, as entered by the <code>modeltype</code> command. Can be one of the following: <ul style="list-style-type: none"><li>• alliedware</li><li>• aw+</li><li>• tq</li><li>• other</li></ul>
DC	The discovery method as applied by the <code>discovery</code> command. This can be either dynamic (D) or static (S).
MAC Address	The MAC address of the guest node.
IP / IPv6 Address	The IP address of the guest node.

**Related commands**

- `discovery`
- `http-enable`
- `username`
- `modeltype`
- `switchport atmf-guestlink`
- `show atmf backup guest`

# show atmf links guest detail

**Overview** This command displays detailed information about guest nodes visible to an AMF device.

**Syntax** `show atmf links guest detail [interface <interface-range>]`

Parameter	Description
<code>interface</code> <code>&lt;interface-range&gt;</code>	Select a specific range of ports to display information about guest nodes.

**Mode** User Exec and Privileged Exec

**Usage notes** Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use [show atmf guests detail](#).

Note that the parameters that are displayed depend on the guest node's model and state.

**Example** To display detailed information about AMF guests, use the command:

```
node1# show atmf links guest detail
```

**Output** Figure 52-27: Example output from **show atmf links guest detail**

```

node1#show atmf links guest detail

Detailed Guest Link Information:

Interface           : port1.0.13
Link State          : Down
Class Name          : test
Model Type          : Other
Discovery Method    : Static
IP Address           : 192.168.1.13
Node State           : Down

Interface           : port1.0.5
Link State          : Full
Class Name          : tq_device
Model Type          : TQ
Discovery Method    : Dynamic
IP Address           : 192.168.1.221
Username            : manager
Login Fallback      : Yes
Node State          : Full
Backup Supported    : Yes
MAC address         : 001a.ebab.d2e0
Device Type         : AT-TQ4600
Description         : AP221
Firmware Version    : 3.2.1 B02
HTTP port           : 80
    
```

Table 52-2: Parameters in the output from **show atmf links guest detail**

Parameter	Description
Interface	The port on the parent node that connects to the guest.
Link State	The state of the link to the guest node; one of: <ul style="list-style-type: none"> <li>Down: The physical link is down.</li> <li>Up: The physical link has come up, but it is still during a timeout period that is enforced to allow other links to come up.</li> <li>Learn: The timeout period described above has elapsed, and the link is now learning information from the AMF guest node. You can see what information it is learning from the "Node State" field below.</li> <li>Full: The node connected by this link has joined the AMF network.</li> <li>Fail: The port is physically up but something has prevented the guest node from joining the AMF network.</li> </ul>
Class Name	The name of the ATMF guest-class that has been assigned to the guest node by the <code>atmf guest-class</code> command.

Table 52-2: Parameters in the output from **show atmf links guest detail** (cont.)

Parameter	Description
Model Type	The model type of the guest node, as entered by the <code>modeltype</code> command. The mode type can be one of the following: <ul style="list-style-type: none"> <li>• alliedware</li> <li>• aw+</li> <li>• onvif</li> <li>• tq</li> <li>• other</li> </ul>
Discovery Method	The discovery method as applied by the <code>discovery</code> command. This can be either dynamic or static.
IP Address	The IP address of the guest node.
Username	The user name configured on the guest node.
Login Fallback	Whether the guest node supports Login Fallback. For TQ model guest nodes, when login fallback is enabled, if a guest node is replaced, then AMF logs in to the new TQ using the factory default manager/friend settings. The new TQ is then discovered and managed as an AMF guest node by an AMF master or member. This means any backed up settings for the replaced guest node can also be recovered.
Node state	The state of the guest node; one of: <ul style="list-style-type: none"> <li>• Down: The initial state when a link to a guest node is first configured. This is also the state if the physical link goes down.</li> <li>• Getting IP: The AMF device is in the process of retrieving the IP address of the guest node.</li> <li>• Getting Mac: The AMF device is in the process of retrieving the MAC address of the guest node.</li> <li>• Getting Info: The AMF device is in the process of retrieving any other available information from the guest (firmware version etc). The information available depends on what device the guest node is.</li> <li>• Full: The AMF device has retrieved all necessary information and the guest node has joined the AMF network. Once this state is reached, the Link State also changes to "Full".</li> <li>• Failure: The physical link is up but the AMF member has failed to retrieve enough information to allow the guest node to join the AMF network.</li> </ul>
Backup Supported	Whether the guest node supports AMF backup functionality.
MAC Address	The MAC address of the guest node.

Table 52-2: Parameters in the output from **show atmf links guest detail** (cont.)

Parameter	Description
Device Type	Model information for the guest node. This field shows the model information that AMF retrieved from the guest node. In contrast, the Model Type shows what a user entered as the type of device they intended this guest node to be.
Description	By default, this is a concatenation of the guest node's parent node and the port to which it is attached. You can change it by configuring a description on the port.
Serial Number	The serial number of the guest node.
Firmware Name	The name of the firmware operating on the guest node.
Firmware Version	The version of the firmware operating on the guest node.
HTTP port	The HTTP port as specified with the <a href="#">http-enable</a> command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).

**Command changes**

Version 5.5.0-1.1: **Login Fallback** parameter added

# show atmf links statistics

**Overview** This command displays details of the AMF links configured on the device and also displays statistics about the AMF packet exchanges between the devices.

It is also possible to display the AMF link configuration and packet exchange statistics for a specified interface.

This command can only be run on AMF master and controller nodes

**Syntax** `show atmf links statistics [interface [<port-number>]]`

Parameter	Description
interface	Specifies that the command applies to a specific interface (port) or range of ports. Where both the interface and port number are unspecified, full statistics (not just those relating to ports) will be displayed.
<port-number>	Enter the port number for which statistics are required. A port range, a static channel or LACP link can also be specified. Where no port number is specified, statistics will be displayed for all ports on the device.

**Mode** User Exec

**Example 1** To display AMF link statistics for the whole device, use the command:

```
device1# show atmf links statistics
```

**Table 53:** Sample output from the **show atmf links statistics** command

ATMF Statistics:		
	Receive	Transmit

Type24 0      : Discard arealink hello packet - not in correct state
Type25 0      : Discard arealink hello packet - failed basic processing
Type26 0      : Discard unicast packet - MAC address does not match node
Type27 0      : AMF Master license node limit exceeded
  
```

**Example 2** To display the AMF links statistics on interface port1.0.4, use the command:

```
device1# show atmf links statistics interface port1.0.4
```

Figure 52-28: Sample output from the **show atmf links statistics** command for interface port1.0.4

```

device1# show atmf links statistics interface port1.0.4

ATMF Port Statistics:

-----
port1.0.4  Crosslink Hello                231      232
port1.0.4  Crosslink Hello Domain           116      116
port1.0.4  Crosslink Hello Uplink           116      115
port1.0.4  Hello Link                        0         0
port1.0.4  Arealink Hello                   0         0
    
```

Figure 52-29: Parameter definitions from the **show atmf links statistics** command output

Parameter	Definition
Receive	Shows a count of AMF protocol packets received per message type.
Transmit	Shows the number of AMF protocol packets transmitted per message type.
Database Entries	Shows the number of AMF elements existing in the distributed database.
Database Full Ages	Shows the number of times the entries aged in the database.
ATMF Packet Discards	Shows the number of discarded packets of each type.

- no debug all
  - clear atmf links statistics
  - show atmf

# show atmf nodes

**Overview** This command displays nodes currently configured within the AMF network.

Note that the output also tells you whether or not node map exchange is active. Node map exchange improves the tracking of nodes joining and leaving an AMF network. This improves the efficiency of AMF networks. Node map exchange is only available if every node in your AMF network is running version 5.4.6-2.1 or later. We recommend running the latest version on all nodes in your network, so you receive the advantages of node map exchange and other improvements.

**Syntax** `show atmf nodes [guest|all]`

Parameter	Description
guest	Display only guest nodes in the AMF network.
all	Display all nodes in the AMF network, including guest nodes.

**Mode** Privileged Exec

**Usage notes** You can use this command to display one of three sets of nodes:

- all nodes except guest nodes, by specifying **show atmf nodes**
- all nodes including guest nodes, by specifying **show atmf nodes all**
- only guest nodes, by specifying **show atmf nodes guest**

**Examples** To display AMF information for all nodes except guest nodes, use the command:

```
node1# show atmf nodes
```

Table 52-1: Sample output from **show atmf nodes**

```
node1#show atmf nodes guest

Node Information:

* = Local device

SC = Switch Configuration:
C = Chassis   S = Stackable   N = Standalone

Node          Device          ATMF          Parent          Node
Name          Type            Master  SC    Domain          Depth
-----
* M1          x510-28GTX     Y         S     none            0
N3           x230-18GP     N         N     M1              1
N1           AR4050S       N         N     M1              1

Node map exchange is active
Current ATMF node count 3
```

To display AMF information for all nodes, including guest nodes, use the command:

```
node1# show atmf nodes all
```

**Table 53:** Sample output from **show atmf nodes all**. In this example, not all nodes support node map exchange, as shown by the message at the end

```
node1#show atmf nodes all

# show atmf provision nodes

**Overview** This command displays information about each provisioned node with details about date and time of creation, boot and configuration files available in the backup, and license files present in the provisioned backup. This includes nodes that have joined the network but are yet to run their first backup.

This command can only be run on AMF master and controller nodes.

**Syntax** `show atmf provision nodes`

**Mode** Privileged Exec

**Usage notes** This command will only work if provisioned nodes have already been set up. Otherwise, an error message is shown when the command is run.

**Example** To show the details of all the provisioned nodes in the backup use the command:

```
NodeName# show atmf provision nodes
```

Figure 52-30: Sample output from the **show atmf provision nodes** command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media .....: SD (Total 3827.0MB, Free 3481.1MB)

Node Name           : device2
Date& Time          : 06-Oct-2016 & 23:25:44
Provision Path      : card:/atmf/provision_nodes

# show atmf recovery-file

**Overview** Use this command to display the recovery file information for an AMF node. AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

**Syntax** `show atmf recovery-file`

**Mode** Privileged Exec

**Example** To display recovery file information for an AMF node, use the command:

```
node1# show atmf recovery-file
```

**Output** Figure 52-31: Example output from **show atmf recovery-file**

```
node1#show atmf recovery-file

ATMF Recovery File Info: Special Link Present
Location                Date           Time
USB storage device      30 Apr 2018   14:50:32

```

Table 52-2: Parameters in the output from **show atmf secure-mode**

Parameter	Description
Secure Mode Status	Shows the status of secure mode, Enabled or Disabled.
Certificate Expiry	Certificate expiry time. Set with <a href="#">atmf secure-mode certificate expiry</a>
Certificates Total	Total number of certificates.
Certificates Revoked	Certificates that have been revoked by the AMF master.
Certificates Rejected	Certificates that have been rejected by the AMF master.
Certificates Active	Certificates that are currently active.
Provisional Authorization	Number of nodes with provisional authorization. For more information use the <a href="#">show atmf authorization provisional</a> command.
Pending Requests	Number of nodes waiting for authorization on the AMF master. For more information use the <a href="#">show atmf authorization pending</a> command.
Trusted Master	List of trusted masters in the AMF area.
Key Fingerprint	The AMF node's key fingerprint.

[show atmf secure-mode](#)

**Command changes** Version 5.4.7-0.3: command added

# show atmf secure-mode certificates

**Overview** Use this command to display the certificate status details when secure mode is enabled on an AMF network.

**Syntax** `show atmf secure-mode certificates [detail] [area <area-name>] [node <node-name>]`

Parameter	Description
detail	Display detailed certificate information.
area	Specify an AMF area.
<area-name>	The AMF area you want to see the certificate information for.
node	Specify an AMF node.
<node-name>	The AMF node you want to see information for.

**Mode** Privileged Exec

**Example** To display AMF secure mode certificates on a master or member node, use the command:

```
awplus# show atmf secure-mode certificates
```

To display detailed information about AMF secure mode certificates for a node named "area\_2\_node\_1" in an area named "area-2", use the command:

```
awplus# show atmf secure-mode certificates detail area area-2 node area_2_node_1
```

**Output** Figure 52-36: Example output from **show atmf secure-mode certificates**

```
Area-1 Certificates:
Node Name          Signer            Expires           Status
-----
area_1_node_1     master_1          11 Mar 2017
                  master_2          4 Mar 2017       Active
area_1_node_2     master_1          11 Mar 2017
                  master_2          4 Mar 2017       Revoked

Area-2 Certificates:
Node Name          Signer            Expires           Status
-----
area_2_node_1     master_1          18 Mar 2017       Active
area_2_node_2     master_1          18 Mar 2017       Rejected
```

Table 52-5: Parameters in the output from **show atmf secure-mode certificates**

Parameter	Description
Node Name	Name of AMF node the certificate was issued to.
Signer	Name of AMF master that issued the certificate.
Expires	Certificate expiry date.
Status	The status column will display <i>Active</i> before a member node is trusted, and can be accessed using AMF commands. Valid statuses are <i>Active</i> , <i>Revoked</i> , and <i>Rejected</i> .

**Output** Figure 52-37: Example output from **show atmf secure-mode certificates detail area area-2 node area\_2\_node\_1**

```
Certificates Detail:

# show atmf secure-mode sa

**Overview** Use this command to display the security associations on the network. This is the list of links and neighbors that are trusted.

**Syntax** `show atmf secure-mode sa [detail] [link|neighbor|broadcast]`

Parameter	Description
detail	Display detailed security association information.
link	Display security associations for type links.
neighbor	Display security associations for type neighbors.
broadcast	Display security associations for type broadcast.

**Mode** Privileged Exec

**Example** To display an overview of AMF secure mode security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa
```

To display a detailed overview of AMF secure mode neighbor security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa detail neighbor
```

**Output** Figure 52-38: Example output from **show atmf secure-mode sa**

```

Number of Neighbors	: 5
Number of Non Broadcast Neighbors	: 3
Number of Link State Entries	: 1
Number of Up Uplinks	: 0
Number of Up Uplinks on This Node	: 0
DBE Checksum	: 84fc6
Number of DBE Entries	: 0
...	

**Table 54:** Parameter definitions from the **show atmf tech** command

Parameter	Definition
ATMF Status	Shows status of AMF feature on the Node as Enabled/Disabled.
Network Name	The name of the AMF network to which this node belongs.
Node Name	The name assigned to the node within the AMF network.
Role	The role configured on the device within the AMF - either master or member.
Current ATMF Nodes	A count of the AMF nodes in the AMF network.
Node Address	The identity of a node (in the format name.atmf) that enables its access it from a remote location.
Node ID	A unique identifier assigned to an AMF node.
Node Depth	The number of nodes in the path from this node to the core domain.
Domain State	A node's state within an AMF Domain - either controller or backup.
Recovery State	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - either Auto, Manual, or None.
Management VLAN	The VLAN created for traffic between nodes of different domains (up/down links). VLAN ID - In this example VLAN 4092 is configured as the Management VLAN. Management Subnet - the Network prefix for the subnet. Management IP Address - the IP address allocated for this traffic. Management Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17)

**Table 54:** Parameter definitions from the **show atmf tech** command (cont.)

Parameter	Definition
Domain VLAN	The VLAN assigned for traffic between Nodes of same domain (crosslink). VLAN ID - In this example VLAN 4091 is configured as the domain VLAN. Domain Subnet - the Subnet address used for this traffic. Domain IP Address - the IP address allocated for this traffic. Domain Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17)
Device Type	Shows the Product Series Name.
ATMF Master	Indicates the node's membership of the core domain (membership is indicated by Y)
SC	Shows switch configuration: <ul style="list-style-type: none"><li>• C - Chassis (such as SBx8100 series)</li><li>• S - Stackable (VCS)</li><li>• N - Standalone</li></ul>
Parent	A node that is connected to the present node's uplink, i.e. one layer higher in the hierarchy.
Node Depth	Shows the number of nodes in path from the current node to the Core domain.

**NOTE:** The **show atmf tech** command can produce very large output. For this reason only the most significant terms are defined in this table.

# show atmf virtual-links

**Overview** This command displays a summary of all virtual links (L2TP tunnels) currently in the running configuration.

**Syntax** `show atmf virtual-links [macaddr]`  
`show atmf virtual-links [id <1-4094>] [remote-id <1-4094>]`  
`show atmf virtual-links detail [id <1-4094>]`

Parameter	Description
macaddr	Display the virtual AMF links' MAC addresses.
id <1-4094>	ID of the local virtual link.
remote-id <1-4094>	ID of the remote virtual link
detail	Display information about a specific virtual link ID or range of virtual link IDs. Displays information such as: local and remote IP address, link type, packets received and transmitted.

**Mode** Privileged Exec

**Example 1** To display AMF virtual links, use the command:

```
node_1# show atmf virtual-links
```

Table 52-1: Example output from **show atmf virtual-links**

```
ATMF Virtual-Link Information:
-----
Local      Local      Remote      Tunnel      Tunnel
Port      ID   IP          ID   IP          Protect     State
-----
vlink1    1     172.16.24.2  2     1.0.0.2     -           Complete
vlink2    2     172.16.24.2* 10    172.16.24.3* ipsec       Complete
vlink3    3     (eth0)*      1     1.2.3.4     -           AcquireLocal

* = Dynamic Address.

Virtual Links Configured: 3
```

In the above example, a centrally located switch has the IP address space 192.0.2.x/24. It has two VLANs assigned the subnets 192.0.2.33 and 192.0.2.65 using the prefix /27. Each subnet connects to a virtual link. The first link has the IP address 192.168.1.1 and has a Local ID of 1. The second has the IP address 192.168.2.1 and has the Local ID of 2.

**Example 2** To display details about AMF virtual link with ID 1, use the command:

```
node_1# show atmf virtual-links detail id 1
```

Table 52-2: Example output from **show atmf virtual-links**

```

Virtual Link Detailed Information:

ID 1      Description      : None
ID 1      Local IP Address  : 192.168.5.1
ID 1      Remote ID        : 1
ID 1      Remote IP Address  : 192.168.5.20
ID 1      Link Type         : virtual-link
ID 1      Packets Received  : 236465
ID 1      Packets Transmitted : 192626
    
```

**Example 3** To display AMF virtual links’ MAC address information, use the command:

```
node_1# show atmf virtual-links macaddr
```

Table 52-3: Example output from **show atmf virtual-links macaddr**

```

ATMF Link Remote Information:

ATMF Management Bridge Information:

Bridge: br-atmfmgmt

port no mac addr          is local?    ageing timer
  1    00:00:cd:27:c2:07    yes          0.00
  2    8e:c7:ae:81:7e:68    yes          0.00
  2    00:00:cd:28:bf:e7    no           0.01
    
```

Table 52-4: Parameters in the output from **show atmf virtual-links**

Parameter	Definition
Local Port	The tunnel name e.g. vlink1, vlink2, equivalent to an L2TP tunnel.
Local ID	The local ID of the virtual link. This matches the vlink<number>
Tunnel Protect	Tunnel protection protocol.
Tunnel State	The operational state of the vlink (either Up or Down). This state is always displayed once a vlink has been created.
mac addr	AMF virtual links terminate on an internal soft bridge. The “show atmf virtual-links macaddress” command displays MAC Address information.
is local?	Indicates whether the MAC displayed is for a local or a remote device.
ageing timer	Indicates the current aging state for each MAC address.

**Related commands** [atmf virtual-link](#)

# show atmf working-set

**Overview** This command displays the nodes that form the current AMF working-set.

**Syntax** `show atmf working-set`

**Mode** Privileged Exec

**Example** To show current members of the working-set, use the command:

```
ATMF_NETWORK[6]# show atmf working-set
```

**Table 53:** Sample output from the **show atmf working-set** command.

```
ATMF Working Set Nodes:
node1, node2, node3, node4, node5, node6
Working set contains 6 nodes
```

# show debugging atmf

**Overview** Use this command to see what debugging is turned on for AMF.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging atmf`

**Mode** Privileged Exec

**Example** To display the AMF debugging status, use the command:

```
node_1# show debugging atmf
```

Table 52-1: Sample output from the **show debugging atmf** command.

```
node_1# show debugging atmf
ATMF debugging status:
ATMF arealink debugging is on
ATMF link debugging is on
ATMF crosslink debugging is on
ATMF database debugging is on
ATMF neighbor debugging is on
ATMF packet debugging is on
ATMF error debugging is on
```

**Related commands** [debug atmf packet](#)

# show debugging atmf packet

**Overview** Use this command to see what debugging is turned on for AMF Packet debug. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging atmf packet`

**Mode** User Exec and Privileged Exec

**Example** To display the AMF packet debugging status, use the command:

```
node_1# show debug atmf packet
```

Table 52-2: Sample output from the **show debugging atmf packet** command.

```
ATMF packet debugging is on
=== ATMF Packet Debugging Parameters===
Node Name: x908
Port name: port1.1.1
Limit: 500 packets
Direction: TX
Info Level: Level 2
Packet Type Bitmap:
2. Crosslink Hello BPDU pkt with downlink domain info
3. Crosslink Hello BPDU pkt with uplink info
4. Down and up link Hello BPDU pkts
6. Stack hello unicast pkts
8. DBE request
9. DBE update
10. DBE bitmap update
```

**Related commands** [debug atmf](#)  
[debug atmf packet](#)

# show running-config atmf

**Overview** This command displays the running system information that is specific to AMF.

**Syntax** `show running-config atmf`

**Mode** User Exec and Global Configuration

**Example** To display the current configuration of AMF, use the following commands:

```
node_1# show running-config atmf
```

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Related commands** `show running-config`  
`no debug all`

# state

**Overview** This command sets the running state of an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `state {enable|disable}`

Parameter	Description
disable	Stop the AMF container. The container's state changes to stopped.
enable	Start the AMF container. The container's state changes to running.

**Default** By default, **state** is disabled.

**Mode** AMF Container Configuration

**Usage notes** The first time the **state enable** command is executed on a container it assigns the container to an area and configures it as an AMF master. This is achieved by automatically adding the following configuration to the AMF container:

```
atmf network-name <AMF network-name>
atmf master
atmf area <container area-name> <container area-id> local
atmf area <container area-name> password <container area-password>
atmf area <host area-name> <host area-id>

interface eth0
  atmf-arealink remote-area <host area-name> vlan 4094
```

For this reason the **state enable** command should be run after the container has been created with the [atmf container](#) command and an area-link configured with the [area-link](#) command.

Once the start-up configuration has been saved from within the AMF container, all further configuration changes need to be made manually.

**Example** To start the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state enable
```

To stop the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state disable
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# switchport atmf-agentlink

**Overview** Use this command to configure a link between this device and an x600 Series switch, in order to integrate the x600 Series switch into your AMF network. The x600 Series switch is called an “AMF agent”, and the link between the x600 and this device is called an “agent link”.

The x600 Series switch must be running version 5.4.2-3.16 or later.

Use the **no** variant of this command to remove the agent link. If the x600 Series switch is still connected to the switch port, it will no longer be part of the AMF network.

**Syntax** `switchport atmf-agentlink`  
`no switchport atmf-agentlink`

**Default** By default, no agent links exist and x600 Series switches are not visible to AMF networks.

**Mode** Interface mode for a switch port. Note that the link between the x600 and the AMF network must be a single link, not an aggregated link.

**Usage notes** The x600 Series switch provides the following information to the AMF node that it is connected to:

- The MAC address
- The IPv4 address
- The IPv6 address
- The name/type of the device (Allied Telesis x600)
- The name of the current firmware
- The version of the current firmware
- The configuration name

AMF guestnode also makes most of this information available from x600 Series switches, but requires configuration with DHCP and/or LLDP. AMF agent is simpler; as soon the x600 is connected to an appropriately configured port of an AMF node, it is immediately integrated into the AMF network.

To see information about the x600 Series switch, use the **show atmf links guest detail** command.

**Example** To configure port1.0.1 as an agent link, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport atmf-agentlink
```

**Related commands** [show atmf links guest](#)

# switchport atmf-arealink

**Overview** This command enables you to configure a port or aggregator to be an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network.

Use the **no** variant of this command to remove any AMF area link that may exist for the selected port or aggregated link.

This command is only available on AMF controllers and master nodes.

**Syntax** `switchport atmf-arealink remote-area <area-name> vlan <2-4094>`  
`no switchport atmf-arealink`

Parameter	Description
<area-name>	The name of the remote area that the port is connecting to.
<2-4094>	The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link.

**Default** No arealinks are configured.

**Mode** Interface Configuration for a switchport, a static aggregator, or a dynamic channel group.

**Usage notes** Run this command on the port or aggregator at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will automatically place the port or static aggregator into trunk mode (i.e. switchport mode trunk) and will synchronize the area information stored on the two nodes.

You can configure multiple arealinks between two area nodes, but only one arealink at any time will be in use. All other arealinks will block information, to prevent network storms.

**NOTE:** See the [atmf-arealink](#) command to configure an AMF area link on an AR-series Eth interface.

**Example** To make switchport port1.0.2 an arealink to the 'Auckland' area on VLAN 6, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.2
controller-1(config-if)# switchport atmf-arealink remote-area
Auckland vlan 6
```

To remove switchport port1.0.1 as an AMF area link, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.1
controller-1(config-if)# no switchport atmf-arealink
```

**Related  
commands**

[atmf area](#)  
[atmf area password](#)  
[atmf virtual-link](#)  
[show atmf links](#)

# switchport atmf-crosslink

**Overview** This command configures the selected port, statically aggregated link or dynamic channel group (LACP) to be an AMF crosslink. Running this command will automatically place the port or aggregator into trunk mode (i.e. **switchport mode trunk**).

The connection between two AMF masters must utilize a crosslink. Crosslinks are used to carry the AMF control information between master nodes. Multiple crosslinks can be configured between two master nodes, but only one crosslink can be active at any particular time. All other crosslinks between masters will be placed in the blocking state, in order to prevent broadcast storms.

Use the **no** variant of this command to remove any crosslink that may exist for the selected port or aggregated link.

**Syntax** `switchport atmf-crosslink`  
`no switchport atmf-crosslink`

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage notes** Crosslinks can be used anywhere within an AMF network. They have the effect of separating the AMF network into separate domains.

Where this command is used, it is also good practice to use the **switchport trunk native vlan** command with the parameter **none** selected. This is to prevent a network storm on a topology of ring connected devices.

**Example 1** To make switchport port1.0.1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-crosslink
```

**Example 2** This example is shown twice. Example 2A is the most basic command sequence. Example 2B is a good practice equivalent that avoids problems such as broadcast storms that can otherwise occur.

**Example 2A** To make static aggregator sa1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
```

**Example 2B** To make static aggregator sa1 an AMF crosslink, use the following commands for good practice:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
Node_1(config-if)# switchport trunk allowed vlan add 2
Node_1(config-if)# switchport trunk native vlan none
```

In this example VLAN 2 is assigned to the static aggregator, and the native VLAN (VLAN 1) is explicitly excluded from the aggregated ports and the crosslink assigned to it.

**NOTE:** *The AMF management and domain VLANs are automatically added to the aggregator and the crosslink.*

**Related commands** [show atmf links statistics](#)

# switchport atmf-guestlink

**Overview** Guest links are used to provide basic AMF functionality to non AMF capable devices. Guest links can be configured for either a selected switch port or a range of switch ports and use generic protocols to collect status and configuration information that the guest devices make available.

Use the **no** variant of this command to remove the guest node functionality from the selected port or ports.

**NOTE:** AMF guest nodes are not supported on ports using the OpenFlow protocol.

**Syntax** `switchport atmf-guestlink [class <guest-class>] [ip <A.B.C.D> | ipv6 <X:X::X:X>]`  
`no switchport atmf-guestlink`

Parameter	Description
<code>class</code>	Set a guest class
<code>&lt;guest-class&gt;</code>	The name of the guest class.
<code>ip</code>	Specifies that the address following will have an IPv4 format
<code>&lt;A.B.C.D&gt;</code>	The guest node's IP address in IPv4 format.
<code>ipv6</code>	Specifies that the address following will have an IPv6 format
<code>&lt;X:X::X:X&gt;</code>	The guest node's IP address in IPv6 format.

**Default** No guest links are configured.

**Mode** Interface

**Example 1** To configure switchport port1.0.1 to be a guest link, that will connect to a guest node having a guest class of **camera** and an IPv4 address of **192.168.3.3**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class camera ip
192.168.3.3
```

**Example 2** To configure switchport port1.0.1 to be a guest link, which will connect to a guest node having a guest class of **phone** and an IPv6 address of **2001:db8:21e:10d::5**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class phone ipv6
2000:db8:21e:10d::5
```

**Example 3** To configure switchport port1.0.1 to be a guest link, using the default model type and learning method address, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink
```

**Example 4** To configure switchports port1.0.1 to port1.0.3 to be guest links, for the guest class **camera**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1-port1.0.3
node1(config-if)# switchport atmf-guestlink class camera
```

**Example 5** To remove the guest-link functionality from switchport port1.0.1, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# no switchport atmf-guestlink
```

**Related commands**

- atmf guest-class
- discovery
- http-enable
- username

- show atmf links guest
- show atmf guests

# switchport atmf-link

**Overview** This command enables you to configure a port or aggregator to be an up/down AMF link. Running this command will automatically place the port or aggregator into trunk mode. If the port was previously configured in access mode, the configured access VLAN will be removed.

Use the **no** variant of this command to remove any AMF link that may exist for the selected port or aggregated link.

**Syntax** `switchport atmf-link`  
`no switchport atmf-link`

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage notes** Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

Within each domain, cross-links between AMF nodes define those nodes as siblings within the same domain. You can form rings by combining cross-links with up/down links and/or virtual links, as long as each AMF domain links upwards to only a single parent domain. Each domain may link downwards to multiple child domains.

**NOTE:** See the [atmf-link](#) command to configure an AMF up/down link on an AR-series Eth interface.

**Example** To configure switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-link
```

To remove switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# no switchport atmf-link
```

**Related commands** [atmf-link](#)  
[show atmf detail](#)  
[show atmf links](#)

# type atmf node

**Overview** This command configures a trigger to be activated at an AMF node join event or leave event.

**Syntax** type atmf node {join|leave}

Parameter	Description
join	AMF node join event.
leave	AMF node leave event.

**Mode** Trigger Configuration

**CAUTION:** Only configure this trigger on one device because it is a network wide event.

**Example 1** To configure trigger 5 to activate at an AMF node leave event, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger) type atmf node leave
```

**Example 2** The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

Display the trigger configurations

AMF-Net[3]# show trigger

This command returns the following display:

```
=====
node1:
=====

TR# Type & Details      Description          Ac Te Tr Repeat      #Scr Days/Date
-----
001 Periodic (2 min)    Periodic Status Chk Y  N  Y Continuous    1  smtwtfS
005 ATMF node (leave)  E-mail on ATMF Exit Y  N  Y Continuous    1  smtwtfS
-----

=====
Node2, Node3,
=====

TR# Type & Details      Description          Ac Te Tr Repeat      #Scr Days/Date
-----
005 ATMF node (leave)  E-mail on ATMF Exit Y  N  Y Continuous    1  smtwtfS
-----
```

Display the triggers configured on each of the nodes in the AMF Network.

AMF-Net[3]# show running-config trigger

This command returns the following display:

```
=====
Node1:
=====

trigger 1
  type periodic 2
  script 1 atmf.scp
trigger 5
  type atmf node leave
  description "E-mail on ATMF Exit"
  script 1 email_me.scp
!

=====
Node2, Node3:
=====

trigger 5
  type atmf node leave
  description "E-mail on ATMF Exit"
  script 1 email_me.scp
!
```

**Related  
commands** [show trigger](#)

# undebbug atmf

**Overview** This command is an alias for the **no** variant of the [debug atmf](#) command.

# username

**Overview** This command enables you to assign a **username** to a guest class. Guests may require a username and possibly also a password. In its non-encrypted form the password must be between 1 and 32 characters and will allow spaces. In its encrypted form the password must be between 1 to 64 characters and will allow any character

**Syntax** `username <name> password [8] <userpass>`  
`no username`

Parameter	Description
<code>username</code>	Indicates that a user name is to follow.
<code>&lt;name&gt;</code>	User name of the guest node.
<code>password</code>	Indicates that a password (or specifier) is to follow.
<code>8</code>	Specifier indicating that the following password is encrypted. It's primary purpose is to differentiate between the configuration input and the CLI input. You should not specify this for CLI input.
<code>&lt;userpass&gt;</code>	The password to be entered for the guest node.

**Default** No usernames configured

**Mode** AMF Guest Configuration

**Example** To assign the user name 'reception' and the password of 'secret' to an AMF guest node that has the guest class of 'phone1' use the following commands:

```
node1# configure terminal
node1(config)# amf guest-class phone1
node1(config-atmf-guest)# username reception password secret
```

To remove a guest node username and password for the user guest class 'phone1', use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class phone1
node1(config-atmf-guest)# no username
```

# 53

# Autonomous Wave Control Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure *Autonomous Wave Control (AWC)*.

AWC is an advanced network technology that utilizes game theory to deliver significant improvements in wireless network connectivity and performance. AWC can automatically minimize coverage gaps and reduce Access Point (AP) interference and respond to network configuration changes and bandwidth demands from user devices.

You can configure AWC through the command line, or through the Device GUI.

The Auto Setup feature configures your wireless network automatically. AP configuration is created for discovered APs including their IP addresses and MAC addresses. The AP profile is created automatically by the model name. The network and security is created using defined default values.

For more information, see the [Vista Manager mini User Guide](#).

# airtime-fairness enable (wireless-ap-prof-radio)

**Overview** Use this command to enable **airtime-fairness** for all wireless clients regardless of speed.

Use the **no** variant of this command to disable airtime-fairness for all wireless clients.

**Syntax** `airtime-fairness enable`  
`no airtime-fairness enable`

**Default** Disabled.

**Mode** Wireless AP Profile Radio Configuration

**Usage notes** Airtime-fairness ensures that every client has equal access to air time, regardless of client capability. Client capability includes the wireless standard 802.11 mode and Radio Frequency (RF) link signal strength.

If two clients were each assigned a 10 Mbps bandwidth and sending equally sized frames then they potentially could have unequal air time if their RF link characteristics were different.

RF link characteristics are based upon the distance of the client from the Access Point (AP). A client that is closer to the AP typically operates at a higher data rate than a client farther from the AP. This is because the AP and client are deliberately designed to adapt their transmission rates in order to maintain an optimal quality of the RF link.

This behavior is normal between the AP and clients since the client devices are not expected to remain at a constant or equal distance from the AP. This could mean that one device is consuming more airtime than it is entitled to, even though that device is not consuming more than its bandwidth limit.

Note: This command is valid on TQ series devices only.

**Example** To enable airtime-fairness for 'radio 2' on 'ap-profile100' use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-prof 100
awplus(config-wireless-ap-prof)# ap-prof 100
awplus(config-wireless-ap-prof-radio)# radio 2
awplus(config-wireless-ap-prof-radio)# airtime-fairness enable
```

**Related commands** [radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# antenna (wireless-ap-prof-radio)

**Overview** Use the antenna command to set the antenna model for a wireless Access Point (AP).

Use the **no** variant of this command to remove the designated antenna model for a wireless AP.

**Syntax** antenna {an2458-10dp|an5158-16dp|an5158-19dp}  
no antenna

Parameter	Description
an2458-10dp	Antenna model AN2458-10DP
an5158-16dp	Antenna model AN5158-16DP
an5158-19dp	Antenna model AN5158-19DP

**Default** Not set.

**Mode** Wireless AP Profile Radio Configuration

**Example** To configure an AP radio configuration to use the antenna model AN5158-19DP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap)# hwtype tq single spec 11n
awplus(config-wireless-ap)# band 5
awplus(config-wireless-ap)# radio 1
awplus(config-wireless-ap-radio)# antenna an5158-19dp
```

**Related commands** [hwtype](#)  
[band](#)

**Command changes** Version 5.4.7-2.4: command added

# ap

**Overview** Use this command to configure an Access Point (AP).  
If the AP doesn't already exist, then this command creates it.  
Use the **no** variant of this command to remove an AP configuration.

**Syntax** `ap <1-65535>`

Parameter	Description
<1-65535>	AP configuration ID number.

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** This command adds an AP configuration and enters the AP configuration mode.

**Example** To configure an AP with an ID of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 10
```

**Related commands**

- [login-password \(wireless-ap\)](#)
- [wds radio \(wireless-ap\)](#)
- [radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# ap-profile (wireless)

**Overview** Use this command to configure an AP (Access Point) profile. If the AP profile doesn't already exist, then this command creates it.

Use the **no** variant of this command to delete an AP profile.

**Syntax** `ap-profile <1-65535>`  
`no ap-profile <1-65535>`

Parameter	Description
<1-65535>	The AP profile ID number.

**Default** Not set.

**Mode** Wireless Configuration

**Example** To configure an AP profile with the ID profile number of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
```

To remove the AP profile 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no ap-profile 10
```

**Related commands** [show wireless ap-profile](#)

[hwtype](#)  
[outdoor](#)  
[ntp designated-server](#)  
[led enable](#)  
[radio \(wireless-ap-profile\)](#)  
[show wireless ap-profile](#)

**Command changes** Version 5.4.7-2.4: command added

# ap-profile (wireless-ap)

**Overview** Use this command to set an Access Point (AP) Profile to an AP.  
Use the **no** variant of this command to delete an AP Profile.

**Syntax** `ap-profile <1-65535>`  
`no ap-profile`

Parameter	Description
<code>&lt;1-65535&gt;</code>	AP Profile configuration ID number.

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To set AP Profile (ap-profile 100) to the AP 1 configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 1
awplus(config-wireless-ap)# ap-profile 100
```

**Related commands** [ap](#)  
[ap-profile \(wireless\)](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# authentication (wireless-sec-wep)

**Overview** Use this command to enable or disable authentication on a wireless Access Point (AP).

**Syntax** authentication {both|open-system|shared-key}

Parameter	Description
both	Use both types of authentication: open-system and shared-key authentication.
open-system	No authentication.
shared-key	WEP authentication.

**Default** Open-system.

**Mode** Wireless Security WEP Configuration

**Usage notes** For **MWS** series devices, select either the open-system or shared-key parameter. You can't select the **both** parameter.

**Example** To configure WEP as the security authentication mode for clients, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wep
awplus(config-wireless-sec-wep)# authentication shared-key
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# auto-discovery disable

**Overview** Use this command to disable the automatic search for new APs in an AWC Smart Connect (AWC-SC) network.

Use the **no** variant of this command to enable the automatic search for new APs.

**Syntax** auto-discovery disable  
no auto-discovery disable

**Default** Enabled

**Mode** Wireless Smart Connect Profile Configuration

**Usage notes** Auto-discovery is a function that allows an AP that is in the factory default state to automatically become part of an AWC-SC network. This is because when a wireless AP is activated in the factory default state, its IP and MAC address are added to the AP profile and the Smart Connect profile.

**Example** To turn auto-discovery off for Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# auto-discovery disable
```

**Related commands** [smart-connect-profile](#)

**Command changes** Version 5.5.0-0.1: command added

# band

**Overview** Use this command to assign a frequency band to a single antenna wireless AP. Use the **no** variant of this command to set the band to the default value of 2.

**Syntax** band {2|5}  
no band

Parameter	Description
2	2.4GHz band
5	5GHz band

**Default** The default band is 2 (2.4GHz).

**Mode** Wireless AP Profile Configuration

**Usage notes** The command can only be used with single antenna APs.

**Example** To configure a 5GHz band for a single antenna AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# band 5
```

**Related commands** [ap-profile \(wireless\)](#)  
[show wireless ap-profile](#)  
[antenna \(wireless-ap-prof-radio\)](#)

**Command changes** Version 5.4.7-2.4: command added

# band-steering (wireless-network)

**Overview** Use this command to enable band steering on a wireless Access Point (AP).  
Use the **no** variant of this command to disable band steering.

**Syntax** band-steering  
no band-steering

**Default** Disabled.

**Mode** Wireless Network Configuration

**Usage notes** Band Steering detects dual-band capable clients and steers them to the 5 GHz frequency. This leaves the more crowded 2.4 GHz band available for legacy clients.  
This helps improve end user experience by reducing channel utilization, especially in high density environments  
This command is not supported on the **MWS** series products.

**Example** To enable band steering, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# band-steering
```

**Related commands** [network \(wireless\)](#)  
[show wireless network](#)

**Command changes** Version 5.4.7-2.4: command added.

# bandwidth (wireless-ap-prof-radio)

**Overview** Use this command to assign a bandwidth to an Access Point (AP).  
Use the **no** variant of this command to revert to the default bandwidth.

**Syntax** bandwidth {20|40|80}  
no bandwidth

Parameter	Description
20	20MHz bandwidth
40	40MHz bandwidth
80	80MHz bandwidth

**Default** The default bandwidth value varies according to the configured hardware and radio type.

**Mode** Wireless AP Profile Radio Configuration

**Example** To assign a 40MHz bandwidth to AP-profile 100 for Radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# bandwidth 40
```

**Related commands** [ap-profile \(wireless\)](#)  
[country-code](#)  
[hwtype](#)  
[outdoor](#)  
[radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# bcast-key-refresh-interval (wireless-sec-wpa-ent)

**Overview** Use this command to set the refresh interval for the broadcast key used in a WPA-enterprise security configuration.

Use the **no** variant of this command to set the refresh interval for the broadcast key to the default.

**Syntax** `bcast-key-refresh-interval <0-86400>`  
`no bcast-key-refresh-interval`

Parameter	Description
<code>&lt;0-86400&gt;</code>	The refresh interval in seconds For the <b>MWS series</b> , the broadcast key refresh rate is <code>&lt;0, 30-3600&gt;</code> seconds.

**Default** The default refresh interval is 0 seconds.

**Mode** Wireless Security WPA-enterprise Configuration

**Example** To set 3600 seconds as the broadcast key refresh interval, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)#
bcast-key-refresh-interval 3600
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

# bcast-key-refresh-interval (wireless-sec-wpa-psnl)

**Overview** Use this command to set the refresh interval for a broadcast (group) key used in a WPA-personal security configuration.

Use the **no** variant of this command to set the refresh interval to the default value.

**Syntax** `bcast-key-refresh-interval <0-86400>`  
`no bcast-key-refresh-interval`

Parameter	Description
<code>&lt;0-86400&gt;</code>	The broadcast key refresh interval. For the <b>MWS series</b> , the broadcast key refresh rate is <code>&lt;0, 30-3600&gt;</code> seconds.

**Default** The default value is 0.

**Mode** Wireless Security WPA-personal Configuration

**Example** To set the broadcast key refresh interval to 3600 seconds on a WPA-personal security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)#
bcast-key-refresh-interval 3600
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# captive-portal

**Overview** Use this command to add a Captive Portal (web authentication) configuration and enter the Captive Portal configuration mode.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

This setting is only valid for AT-TQ series wireless access points.

Use the **no** variant of this command to remove a Captive Portal configuration.

**Syntax** captive-portal  
no captive-portal

**Default** Captive Portal is not set.

**Mode** Wireless Network Configuration

**Example** To enter the Captive Portal configuration mode of network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
```

To reset all the Captive Portal configuration settings of network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no captive-portal
```

**Related commands**

- [enable \(wireless-network-cp\)](#)
- [page-proxy-url](#)
- [radius auth group \(wireless-network-cp\)](#)
- [redirect-url](#)
- [session-keep](#)
- [mode \(wireless-network-cp\)](#)

**Command changes** Version 5.4.9-1.1: command added

# captive-portal virtual-ip

**Overview** Use this command to configure the virtual IP address on Captive Portal.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

Use the **no** variant of this command to remove the virtual IP address on Captive Portal.

**Syntax** captive-portal virtual-ip <ip-address>  
no captive-portal virtual-ip

Parameter	Description
<ip-address>	The IPv4 address uses the format A.B.C.D

**Default** Not set.

**Mode** Wireless AP Profile Configuration

**Usage notes** Captive Portal uses the AP's management IP address to show an authentication page. To avoid a potential security risk, this command allows you to hide the AP management IP address by providing a virtual IP address for Captive Portal authentication.

**Example** To configure a virtual IP address for Captive Portal, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 5
awplus(config-wireless-ap-prof)# captive-portal virtual-ip
1.1.1.1
```

**Related commands** [show wireless ap-profile](#)  
[captive-portal](#)  
[page-proxy-url](#)  
[radius auth group \(wireless-network-cp\)](#)  
[redirect-url](#)  
[session-keep](#)  
[mode \(wireless-network-cp\)](#)

**Command changes** Version 5.5.0-1.3: command added

# cb-channel

**Overview** Use this command to designate the fixed channel for channel blanket used by each of the radios in an AP profile.

Use the **no** variant of this command to revert to the default channel setting.

**Syntax** `cb-channel radio <1-3> channel <channel-number>`  
`no cb-channel radio <1-3>`

Parameter	Description
<1-3>	Select the radio interface number to be a fixed channel.
<channel-number>	Fixed channel number. Select the channel from the eligible channels listed in the AP profile.

**Default** Not set. When the parameter is blank, an eligible channel is configured automatically.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Example** To configure cb-channel 10 to radio1 and cb-channel 40 to radio2 on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof)# cb-channel radio 1 channel 10
awplus(config-wireless-ap-prof)# cb-channel radio 2 channel 40
```

**Related commands** [show wireless ap-profile](#)  
[channel-blanket](#)

**Command changes** Version 5.4.9-1.1: command added

# channels (wireless-ap-prof-radio)

**Overview** Use this command to set the channel that a wireless Access Point (AP) uses when it is set to auto.

Use the **no** variant of this command to return the AP channel to its default.

**Syntax** channels <1-255>  
no channels

Parameter	Description
<1-255>	The channel number.

**Default** The default channel varies with each type of AP, its country-code, and outdoor settings.

**Mode** Wireless AP Profile Radio Configuration

**Example** To set the wireless AP radio channel, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# channels 10
```

**Related commands** [radio \(wireless-ap-profile\)](#)  
[hwtype](#)  
[outdoor](#)  
[country-code](#)

**Command changes** Version 5.4.7-2.4: command added.

# channel-blanket

**Overview** Use this command to enter the wireless-AP-profile-channel-blanket configuration mode. Once in this mode, you can modify the channel blanket configuration parameters for a wireless AP profile. A wireless AP profile defines the radio settings, such as band and channel selection and the control VLAN. The AP profile names the SSIDs to which it applies.

**NOTE:** *The channel-blanket setting can only be used with AT-TQ5403 and AT-TQ5403e APs. If this is set for other APs, you will not be able to manage those APs.*

Use the **no** variant of this command to reset all parameters for channel blanket to default.

**Syntax** channel-blanket  
no channel-blanket

**Default** Not set

**Mode** Wireless AP Profile Configuration

**Usage notes** When the command is entered, if the "key" parameter is empty, the automatically generated value is set.

**Example** To enter the channel blanket configuration mode for AP profile 2, enter the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap profile 2
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)#
```

To reset all the channel blanket parameters of AP profile 2, enter the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap profile 2
awplus(config-wireless-ap-prof)# no channel-blanket
```

**Related commands** [show wireless ap-profile](#)  
[vap](#)

**Command changes** Version 5.4.9-1.1: command added

# channel (wireless-ap-radio)

**Overview** Use this command to configure a channel on an Access Point (AP). You can configure an AP to automatically select a channel or use a fixed channel.

Use the **no** variant of this command to remove any configured channels and return to the default value.

**Syntax** channel {auto|<1-255>}  
no channel

Parameter	Description
auto	The channel is automatically selected.
<1-255>	A list of fixed channels. The list is determined by the country-code.

**Default** The default is **auto**.

**Mode** Wireless AP Radio Configuration

**Example** To configure a fixed channel for an AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# channel 1
```

**Related commands**

**Command changes** Version 5.4.7-2.4: command added.

# ciphers (wireless-sec-wpa-ent)

**Overview** Use this command to set the cipher suite(s) used by WPA-personal security configurations. The cipher suites available are: CCMP (AES) and TKIP.

Use the **no** variant of this command to set the default cipher suite used by WPA-personal security configurations.

**Syntax** `ciphers <cipher-list>`  
`no ciphers`

Parameter	Description
<code>&lt;cipher-list&gt;</code>	The available cipher suite(s) in list format. The list can contain either <b>ccmp</b> or <b>tkip</b> or both and can be in any order.

**Default** CCMP.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** For **MWS** series devices, a combination of versions and ciphers are supported as follows:

- versions wpa2 and ciphers ccmp
- versions wpa, wpa2, and ciphers tkip and ccmp

**Example** To set both CCMP (AES) and TKIP as cipher suites on a security WPA-enterprise configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# ciphers ccma tkip
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

# ciphers (wireless-sec-wpa-psnl)

**Overview** Use this command to set the cipher suite(s) used by WPA-personal security configurations. The cipher suites available are: CCMP (AES) and TKIP.

Use the **no** variant of this command to set the default cipher suite used by WPA-personal security configurations.

**Syntax** `ciphers <cipher-list>`  
`no ciphers`

Parameter	Description
<code>&lt;cipher-list&gt;</code>	The available cipher suite(s) in list format. The list can contain either <b>ccmp</b> or <b>tkip</b> or both and can be in any order.

**Default** `ccmp`.

**Mode** Wireless Security WPA-personal Configuration

**Usage notes** For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions `wpa2` and ciphers `ccmp`
- versions `wpa`, `wpa2`, and ciphers `tkip` and `ccmp`

**Example** To configure WPA-personal to use both CCMP (AES) and TKIP as cipher suites in a security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# ciphers ccmp tkip
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# control-vlan

**Overview** Use this command to create a control VLAN ID for a wireless AP belonging to channel blanket.  
Use the **no** variant of this command to clear an AP's designated channel blanket VLAN ID.

**Syntax** `control-vlan <vlan-id>`  
`no control-vlan`

Parameter	Description
<code>&lt;vlan-id&gt;</code>	The designated VLAN ID <1-4094> used on a wireless AP belonging to channel blanket.

**Default** Not set

**Mode** Wireless AP Profile Channel Blanket Configuration

**Example** To set the channel blanket control VLAN for AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# control-vlan 10
```

**Related commands** [ap-profile \(wireless-ap\)](#)  
[show wireless ap-profile](#)  
[channel-blanket](#)

**Command changes** Version 5.4.9-1.1: command added

# country-code

**Overview** Use this command to set the country code for an AP-profile.

Use the **no** variant of this command to revert back to the default country code for the device's region.

**Syntax** `country code <code>`  
`no country code`

Parameter	Description
<code>&lt;code&gt;</code>	A two letter code representing the country. Use the command <code>show wireless country-code</code> to see the full list of country codes available.

**Default** The default country code is **'jp'** for Japan or **'us'** for other regions.

**Mode** Wireless AP Profile Configuration

**Usage notes** To display a list of the country codes that can be applied, use the command **show wireless country-code**

Note, applying a new country code will reset the following configuration for the **ap-profile** and **ap-radio** modes:

- mode, bandwidth, and channel

**Example** To set the country code to 'New Zealand' for AP-profile 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# country-code nz
```

**Related commands**

- `show wireless country-code`
- `show wireless ap-profile`
- `channel (wireless-ap-radio)`
- `mode (wireless-ap-prof-radio)`
- `bandwidth (wireless-ap-prof-radio)`

**Command changes** Version 5.4.7-2.4: command added

# day (wireless-task)

**Overview** Use this command to set a day or range of days to run a task.

You can use the **time** command along with the **day** command to more fully set the task run time configuration.

Use the **no** variant of this command to remove the day set to run a task.

**Syntax** `day {<day> <month> <year> | <daysofweek> | every-day}`  
`no day`

Parameter	Description
<day>	The day set for the task. Select a number from 1-31.
<month>	The month to run the task. Enter the first three letters of the month, for example Jan, Feb, Mar...
<year>	The year to run the task. Select a year between <2000-2035>.
<daysofweek>	The day or days of the week to run the task. (sunday monday tuesday wednesday thursday friday saturday)
every-day	Set the task to run on every day of the week.

**Default** Not set.

**Mode** Wireless Task Configuration

**Example** To configure task 5 to run on the 22nd of September 2017, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# day 22 Sep 2017
```

**Related commands** [task](#)  
[show wireless task](#)  
[time \(wireless-task\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# debug wireless

**Overview** Use this command to enable wireless debugging. Debugging filters can be based on severity level and module name.

Use the **no** variant of this command to disable all wireless debugging.

**Syntax**

```
debug wireless level  
{all|debug|dump|error|info|notice|trace|warning}  
  
debug wireless module  
{all|apca|apmgr|apreq|clnmgr|cwmcore|rogue|syncscan}  
  
no debug wireless
```

Parameter	Description
level	Filters logging events by severity level and displays the output by one of the following configured options:
all	All level events
debug	Debug events
dump	Dump events
error	Error conditions
info	Information messages
notice	Normal, but significant conditions
trace	Trace events
warning	Warning conditions
module	Filters logging events by module name and displays the output by one of the following configured options:
all	All module events
apca	Auto power/channel assignment events
apmgr	AP manager events
apreq	HTTP AP request events
clnmgr	Client manager events
cwmcore	CWM core events
rogue	Rogue events
syncscan	Sync scan events

**Default** Disabled

**Mode** User Exec

**Example** To enable debugging of wireless with 'info' level on the 'apca' module, use the command:

```
awplus# debug wireless level info module apca
```

To disable debugging of wireless, use the command:

```
awplus# no debug wireless
```

**Related commands** [show debugging wireless](#)

**Command changes** Version 5.5.0-0.1: command added

# description (wireless-ap)

**Overview** Use this command to specify a description to identify an Access Point (AP).  
Use the **no** variant of this command to remove the description of a selected AP.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	Text to describe a specific AP.

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To specify a description for an AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 10
awplus(config-wireless-ap)# description AP10_MEETING_SPACE
```

**Related commands** [ap](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

## description (wireless-ap-prof)

**Overview** Use this command to configure an AP-profile description. You must be in the **config-wireless-ap-prof** mode to use this command.

Use the **no** variant of this command to remove an AP-profile description.

**Syntax** `description <description>`  
`no description`

**Default** Not set.

**Mode** Wireless AP Profile Configuration

**Example** To configure the description "PROF10" for an AP-profile, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# description PROF10
```

**Related commands** [ap-profile \(wireless\)](#)  
[show wireless ap-profile](#)

**Command changes** Version 5.4.7-2.4: command added

# description (wireless-mac-flt)

**Overview** Use this command to set the description of a wireless MAC filter.  
Use the **no** variant of this command to remove the description.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	Text describing the wireless MAC filter.

**Default** No description set by default.

**Mode** Wireless MAC Filter Configuration

**Example** To set the description of MAC filter '20' to 'mywhitelist', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# description mywhitelist
```

To remove the description from MAC filter '20', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# no description
```

**Related commands**

# description (wireless-network)

**Overview** Use this command to set a description for the wireless network.  
Use the **no** variant of this command to remove a description for a wireless network.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	Set a description for a wireless network.

**Default** Not set.

**Mode** Wireless Network Configuration

**Example** To set the description for a wireless network, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# description GUEST_NETWORK
```

**Related commands** [network \(wireless\)](#)  
[show wireless network](#)

**Command changes** Version 5.4.7-2.4: command added.

# description (wireless-sc-prof)

**Overview** Use this command to configure a descriptive name for a Smart Connect profile. Use the **no** variant of this command to remove a Smart Connect profile name.

**Syntax** `description <sc-profile-name>`  
`no description`

Parameter	Description
<code>&lt;sc-profile-name&gt;</code>	The descriptive name given to a Smart Connect profile.

**Default** Not set

**Mode** Wireless Smart Connect Profile Configuration

**Example** To set the descriptive name of SC-PROF10 for Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# description SC-PROF10
```

**Related commands** [smart-connect-profile](#)  
[show wireless ap-profile](#)

# description (wireless-task)

**Overview** Use this command to set a description for a wireless task configuration.  
Use the **no** variant of this command to remove a description for a wireless task configuration.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	The description for a wireless task configuration.

**Default** Not set.

**Mode** Wireless Task Configuration

**Example** To set a description for the wireless task 5 configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# description PERIODIC_AWC_CALC
```

**Related commands** [task](#)  
[show wireless task](#)

**Command changes** Version 5.4.7-2.4: command added.

# designated-ap

**Overview** Use this command to designate an AP to determine the BSSID (or name) of a channel blanket profile.

BSSIDs are used to describe sections of a wireless local area network. It recognizes the AP because it has a unique physical MAC address, which creates the wireless network.

This command configures the BSSID of the designated AP to be used as the BSSID of the channel blanket.

Use the **no** variant of this command to remove a designated AP.

**Syntax** `designated-ap <1-65535>`  
`no designated-ap`

Parameter	Description
<1-65535>	The ID of the designated AP.

**Default** Not set.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Usage notes** If you do not designate an AP, the AP with the lowest ID is assigned automatically.

**Example** To designate AP 1001 on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# designated-ap 1001
```

**Related commands** [ap-profile \(wireless-ap\)](#)  
[channel-blanket](#)  
[radio \(wireless-ap\)](#)

**Command changes** Version 5.4.9-1.1: command added

# emergency-mode

**Overview** Use this command to set emergency mode on a wireless network. Wireless networks in emergency mode are only active when AWC is also in emergency mode. You can use emergency mode to prevent people from being isolated from infrastructure in the event of a natural disaster such as an earthquake or typhoon.

Use the **no** variant of this command to remove the emergency mode from a wireless network.

**Syntax** `emergency-mode`  
`no emergency-mode`

**Default** Disabled.

**Mode** Wireless Network Configuration

**Example** To configure an emergency mode for network 5, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 5
awplus(config-wireless-network)# emergency-mode
```

**Related commands** [show wireless network](#)  
[wireless emergency-mode](#)

**Command changes** Version 5.5.0-0.3: command added

# enable (wireless)

**Overview** Use this command to enable Access Point (AP) management by Autonomous Wave Control (AWC).

Use the **no** variant of this command to disable AP management by AWC.

**Syntax** enable  
no enable

**Default** Disabled.

**Mode** Wireless Configuration

**Usage notes** You must use the **enable** command before you configure a management address.

**Example** To configure AP management by AWC, using an interface with the IP address 192.168.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# enable
awplus(config-wireless)# management address 192.168.0.1
```

**Related commands** [management address](#)  
[show wireless](#)

**Command changes** Version 5.4.7-2.4: command added.

# enable (wireless-ap)

**Overview** Use this command to enable a wireless Access Point (AP) configuration.  
Use the **no** variant of this command to disable wireless AP configuration.

**Syntax** enable  
no enable

**Default** Disabled.

**Mode** Wireless AP Configuration

**Example** To enable the configuration for AP 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)#ap 100
awplus(config-wireless-ap)#enable
```

**Related commands** ap  
show wireless ap

**Command changes** Version 5.4.7-2.4: command added.

# enable (wireless-ap-prof-radio)

**Overview** Use this command to enable a wireless Access Point (AP) profile radio configuration.

Use the **no** variant of this command to disable a wireless AP profile radio configuration.

**Syntax** enable  
no enable

**Default** Disabled.

**Mode** Wireless AP Profile Radio Configuration

**Example** To enable an AP radio profile configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# enable
```

**Related commands** [radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added

# enable (wireless-network-cp)

**Overview** Use this command to enable Captive Portal (web authentication) configuration on the target network.

Use the **no** variant of this command to disable Captive Portal configuration on the target network.

**Syntax** enable  
no enable

**Default** Disabled

**Mode** Wireless Network Configuration

**Example** To enable Captive Portal, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# enable
```

**Related commands** captive-portal  
enable (wireless-network-cp)  
page-proxy-url  
radius auth group (wireless-network-cp)  
redirect-url  
session-keep  
mode (wireless-network-cp)

**Command changes** Version 5.4.9-1.1: command added

# enable (wireless-sec-wep)

**Overview** Use this command to enable a wireless WEP security configuration.  
Use the **no** variant of this command to disable a wireless WEP security configuration.

**Syntax** enable  
no enable

**Default** Disabled.

**Mode** Wireless Security WEP Configuration

**Example** To enable a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# enable
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# enable (wireless-task)

**Overview** Use this command to enable a wireless task configuration.  
Use the **no** variant of this command to disable a wireless task configuration.

**Syntax** enable  
no enable

**Default** Not set.

**Mode** Wireless Task Configuration

**Example** To enable the wireless task 5 configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# enable
```

**Related commands** [task](#)  
[show wireless task](#)

**Command changes** Version 5.4.7-2.4: command added.

# enable (wireless-wds)

**Overview** Use this command to enable a wireless WDS security configuration.  
Use the **no** variant of this command to disable a wireless WDS security configuration.

**Syntax** enable  
no enable

**Default** Not set.

**Mode** Wireless WDS Configuration

**Example** To enable a wireless WDS configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# enable
```

**Related commands** [wds](#)  
[show wireless wds](#)

**Command changes** Version 5.4.7-2.4 command added.

# external-page-url

**Overview** Use this command to configure the external URL authentication page for Captive Portal.

To use this command, you must first specify external-page-redirect using the **mode** command.

Use the **no** variant of this command to reset the external authentication page URL.

**Syntax** external-page-url <URL>  
no external-page-url

Parameter	Description
<URL>	URL of the external authentication page

**Default** Disabled

**Mode** Wireless Network Captive Portal Configuration

**Example** To enable and set URL string 'http://www.example.com' for a Captive Portal external web authentication server on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# external-page-url
http://www.example.com
```

**Related commands** [captive-portal virtual-ip](#)  
[mode \(wireless-network-cp\)](#)

**Command changes** Version 5.5.0-1.3: command added

# filter-entry

**Overview** Use this command to add a filter entry to a wireless MAC filter. You can optionally include a description for the filter.

Use the **no** variant of this command to remove an entry from the MAC filter list.

**Syntax** `filter-entry <mac-address> [description <description>]`  
`no filter-entry <mac-address>`

Parameter	Description
<code>&lt;mac-address&gt;</code>	MAC address of the filter entry in hexadecimal format HHHH.HHHH.HHHH. The maximum number of MAC addresses that can be entered per MAC filter is 2048.
<code>description</code>	Set an optional description for the filter entry.
<code>&lt;description&gt;</code>	Text describing the filter entry.

**Default** No filter entries exist

**Mode** Wireless MAC Filter Configuration

**Example** To add a filter entry to MAC filter '20', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# filter-entry
0000.cd28.0880.1234 description PC01
```

To remove a filter entry from MAC filter '20', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# no filter-entry
0000.cd28.0880.1234
```

**Related commands**

wireless-mac-filter (wireless-ap-prof)  
wireless-mac-filter enable

**Command changes** Version 5.4.8-2.1: command added

# force-disable (wireless-ap-radio)

**Overview** Use this command to override and force the disabling of an Access Point (AP) radio status.

Use the **no** variant of this command to stop overrides of an AP radio status.

**Syntax** `force-disable`  
`no force-disable`

**Default** **no force-disable** (do not override the AP profile radio status).

**Mode** Wireless AP Radio Configuration

**Example** To force a disable of an AP radio status, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# force-disable
```

**Related commands** [show wireless ap-profile](#)  
[radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added

# hide-ssid (wireless-network)

**Overview** Use this command to hide the SSID for a selected wireless network.  
Use the **no** variant of this command to stop hiding the SSID for a selected wireless network.

**Syntax** `hide ssid`  
`no hide ssid`

**Default** The default is Disabled, which means the SSID **is** included in the Access Point (AP) beacon frames. For more information, see the **Usage** section below.

**Mode** Wireless Network Configuration

**Usage notes** The SSID differentiates one wireless network from another, so all APs and all devices attempting to connect to a specific wireless network must use the same SSID to enable effective roaming.

SSIDs are included in beacon frames.

A beacon frame is one of the management frames in the IEEE 802.11 standard. Every compliant AP periodically sends beacon frames to advertise the presence of an AP in an area, its capabilities, and some configuration and security information to the client devices.

**Example** To hide the SSID for network 20, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# hide-ssid
```

**Related commands** [ssid \(wireless-network\)](#)  
[network \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# hwtype

**Overview** Use this command to configure the hardware type used for a wireless AP profile. Use the **no** variant of this command to revert the AP hardware type to the default.

**Syntax** `hwtype <modelname>`  
`hwtype tq {single|dual|triple} spec {11ac|11n}`  
`hwtype tq dual spec {11ac|11n}`  
`no hwtype`

Parameter	Description
<code>&lt;modelname&gt;</code>	Set the model name. See the table below for a list of model names and associated settings.
<code>tq</code>	The hardware type used for the AT-TQ series
<code>mws</code>	The hardware type used for the AT-MWS series
<code>single</code>	Single antenna model. Only available for the AT-TQ series.
<code>dual</code>	Dual antenna model.
<code>spec</code>	Enable selection of support mode of the hardware type
<code>11ac</code>	Support for 802.11ac mode.
<code>11n</code>	Support for 802.11n mode.

**Table 1:** AP **modelname** parameters with applicable values

modelname	series	bands supported	standard supported
<code>at-tq5403</code> <code>at-tqm5403</code> <code>at-tq5403e</code>	<code>tq</code>	<code>triple</code>	<code>11ac</code>
<code>at-tq4400</code> <code>at-tq4400e</code> <code>at-tq4600</code> <code>at-tq1402</code> <code>at-tqm1402</code>	<code>tq</code>	<code>dual</code>	<code>11ac</code>
<code>at-tq2450</code> <code>at-tq3400</code> <code>at-tq3600</code>	<code>tq</code>	<code>dual</code>	<code>11n</code>
<code>at-tq3200</code>	<code>tq</code>	<code>single</code>	<code>11n</code>
<code>at-mws1750ap</code> <code>at-mws2533ap</code>	<code>mws</code>	<code>dual</code>	<code>11ac</code>
<code>at-mws600ap</code>	<code>mws</code>	<code>dual</code>	<code>11n</code>

**Default** hwtype tq dual spec 11ac.

**Mode** Wireless AP Profile Configuration

**Usage notes** This command may reset the following configuration commands for:

- antenna (AP profile)
- mode
- bandwidth
- channel

**Example** To configure the AP hardware type as an AT-TQ5403 (TQ series, triple antenna, supported by 802.11ac), use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# hwtype tq triple 11ac
```

To use the *<modelname>* parameter to configure the AP hardware type as an AT-TQ5403 (TQ series, triple antenna, supported by 802.11ac), use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# hwtype at-tq5403
```

**Related commands** [ap-profile \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

Version 5.4.9-1.1: *<modelname>* parameter added.

# index

**Overview** Use this command to designate the key index number for WEP security.  
Use the **no** variant of this command to use the default key index number for WEP security.

**Syntax** `index <1-4>`  
`no index`

Parameter	Description
<1-4>	The index number for the WEP security key.

**Default** The default key index number is set to **1**.

**Mode** Wireless Security WEP Configuration

**Example** To assign key index number 3 for a WEP security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# index 3
```

**Related commands** [security \(wireless\)](#)  
[key \(wireless-sec-wep\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# initialization-button enable

**Overview** Use this command to enable the initialization button on a wireless AP using the selected AP profile.

Use the **no** variant of this command to disable the initialization button on a wireless AP using the selected AP profile.

**Syntax** `initialization-button enable`  
`no initialization-button enable`

**Default** Enabled.

**Mode** Wireless AP Profile Configuration

**Usage notes** This command effects only APs which have an initialization button.

**Example** To enable the initialization button on APs which use **ap-profile 100**, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# initialization-button enable
```

**Related commands** [ap-profile \(wireless\)](#)  
[show wireless ap-profile](#)

**Command changes** Version 5.4.7-2.4: command added.

# ip-address (wireless-ap)

**Overview** Use this command to specify the IP address of a wireless Access Point (AP).  
Use the **no** variant of this command to remove the IP address of the selected wireless AP.

**Syntax** `ip-address <ip-address>`  
`no ip-address`

Parameter	Description
<code>&lt;ip-address&gt;</code>	IPv4 address of the wireless AP.

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To specify an IPv4 address for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# ip address 192.168.0.100
```

**Related commands** [ap](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# key

**Overview** Use this command to designate the shared secret key used on a wireless AP belonging to channel blanket.

Use the **no** variant of this command to remove a designated key for a wireless AP belonging to channel blanket.

**Syntax** `key [encrypted] <key-string>`  
`no key`

Parameter	Description
<code>encrypted</code>	This parameter is displayed in show running-config output to indicate that it is displaying the password in encrypted form. You should not enter encrypted on the CLI yourself.
<code>&lt;key-string&gt;</code>	The usable key-string characters. They can be up to 16 letters using ASCII Printable excluding double-quote and single-quote.

**Default** Not set.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Usage notes** When not set, a random shared key is automatically generated.

**Example** To configure AP profile 100, with a channel blanket key, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# key L51nJ6Cp/A-bwXx3
```

**Related commands** [ap-profile \(wireless-ap\)](#)  
[show wireless ap-profile](#)

**Command changes** Version 5.4.9-1.1: command added

# key (wireless-sc-prof)

**Overview** Use this command to set the Smart Connect profile security key.  
Use the **no** variant of this command to remove the security key from the Smart Connect profile.

**Syntax** `key <key-word>`  
`no key`

Parameter	Description
<code>&lt;key-word&gt;</code>	The WPA shared key. This is an alphanumeric string 8-64 characters long.

**Default** Not set

**Mode** Wireless Smart Connect Profile Configuration

**Usage notes** This command configures the WPA shared key for the Smart Connect network. If no key is set, the security key will be automatically generated.

**Example** To set the security key for Smart Connect profile 10 to 'sc10-secret-keyword', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# key sc10-secret-keyword
```

**Related commands** [smart-connect-profile](#)  
[show wireless ap-profile](#)

**Command changes** Version 5.5.0-0.1: command added

# key (wireless-sec-wep)

**Overview** Use this command to set the key-string for a WEP security configuration. Use the **no** variant of this command to remove a key-string for a WEP security configuration.

**Syntax** `key <1-4> [encrypted] <key-string>`  
`no key <1-4>`

Parameter	Description
<1-4>	The key's index number. To configure the index number(s), use the <b>index</b> command.
encrypted	This parameter is displayed in <b>show running-config</b> output to indicate that it is displaying the password in encrypted form. You should not enter <b>encrypted</b> on the CLI yourself.
<key-string>	The usable key-string characters, which depend on the key-string type. Use the <b>type</b> command to configure the key-string character type. See the table in the usage section below for more information.

**Default** Not set.

**Mode** Wireless Security WEP Configuration

**Usage notes** When using the **key** command, also use the **type** command to set the key-string type to either ASCII or Hex, this will also set the character and bit number limits as follows.

Type	Number of bits	Number of characters	Case sensitive
ascii	64	5	Yes
ascii	128	13	Yes
hex	64	10	No
hex	128	26	No

**Example** To assign the word 'friend' as the key-string at index 3 for a WEP security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wep
awplus(config-wireless-sec-wep)# type ascii
awplus(config-wireless-sec-wep)# key 3 friend
```

**Related commands** [type \(wireless-sec-wep\)](#)  
[length \(wireless-sec-wep\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# key (wireless-sec-wpa-psnl)

**Overview** Use this command to set a string as the shared secret key on a wireless security WPA-personal configuration.

Use the **no** variant of this command to reset the shared key to the default.

**Syntax** `key [encrypted] <key-string>`  
`no key`

Parameter	Description
<code>encrypted</code>	This parameter is displayed in <b>show running-config</b> output to indicate that it is displaying the password in encrypted form. You should not enter <b>encrypted</b> on the CLI yourself.
<code>&lt;key-string&gt;</code>	The usable key-string characters for the configuration. You can enter 8 to 63 ASCII characters which are case-sensitive.

**Default** Not set.

**Mode** Wireless Security WPA-personal Configuration

**Example** To set **friend** as the shared secret key for a WPA-personal configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# key friend
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# led enable

**Overview** Use this command to turn on the LED of a wireless AP using the selected AP profile.

Use the **no** variant of this command to disable the LED of a wireless AP using the selected AP profile.

**Syntax** led enable  
no led enable

**Default** Enabled.

**Mode** Wireless AP Profile Configuration

**Example** To turn off the LED of a wireless AP using ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# no led enable
```

**Related commands** [ap-profile \(wireless\)](#)  
[show wireless ap-profile](#)

**Command changes** Version 5.4.7-2.4: command added

# length (wireless-sec-wep)

**Overview** Use this command to set the key length for a WEP key on a wireless security WEP configuration.

Use the **no** variant of this command to reset the key length for a WEP key to the default value.

**Syntax** length {64|128}  
no length

Parameter	Description
64	Set 64 bit as the key length for a WEP key
128	Set 128 bit as the key length for a WEP key

**Default** 128 bit.

**Mode** Wireless Security WEP Configuration

**Example** To configure 64 bit length as the key length for a WEP key on a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# length 64
```

**Related commands** [security \(wireless\)](#)  
[key \(wireless-sec-wep\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# log enable destination

**Overview** Use this command to enable the external media function storing of wireless client and neighbor AP log files.

Use the **no** variant of this command to disable the external media function storing of wireless client and neighbor AP log files.

**Syntax** log enable destination {usb|card}  
no log enable

Parameter	Description
usb	USB storage device
card	SD card storage device

**Default** Disabled, there is no destination storage device set as a default.

**Mode** Wireless Configuration

**Example** To enable the log function and configure the log store destination to USB, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log enable destination usb
```

**Related commands** [log size wireless-client](#)  
[log rotate wireless-client](#)  
[log interval neighbor-ap](#)  
[show wireless](#)

**Command changes** Version 5.4.9-2.3: command added

# log interval neighbor-ap

**Overview** Use this command to configure the interval times for storing a neighbor AP log. Use the **no** variant of this command to revert to the default interval time of 30 minutes.

**Syntax** `log interval neighbor-ap <30-1440>`  
`no log interval`

Parameter	Description
<code>&lt;30-1440&gt;</code>	The interval time between storing neighbor AP logs. Enter a number in the range of 30 (min) -1440 (1 day).

**Default** 30 minutes

**Mode** Wireless Configuration

**Example** To configure a 60 minute interval time for storing neighbor AP logs, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log interval neighbor-ap 60
```

**Related commands** [log enable destination](#)  
[log rotate neighbor-ap](#)  
[show wireless](#)

**Command changes** Version 5.4.9-2.3: command added

# log rotate neighbor-ap

**Overview** Use this command to configure the number of rotations for storing neighbor AP log files. When the configured value is reached, the oldest log file is deleted and the latest log file is stored.

Use the **no** variant of this command to revert to the default value of 1.

**Syntax** `log rotate neighbor-ap <0-65534>`  
`no log rotate neighbor-ap`

Parameter	Description
<code>&lt;0-65534&gt;</code>	The number of rotations a neighbor AP log is stored for, before deleting the oldest stored file.

**Default** 1

**Mode** Wireless Configuration

**Example** To configure 100 generations of a neighbor's AP log files to be stored, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log rotate neighbor-ap 100
```

**Related commands** [log enable destination](#)  
[log interval neighbor-ap](#)  
[show wireless](#)

**Command changes** Version 5.4.9-2.3: command added

# log rotate wireless-client

**Overview** Use this command to configure the number of rotations for storing wireless client log files.

You can determine the size of each wireless client log by using this command and the **log size wireless-client** command together.

For example, log size wireless-client 50, log rotate wireless-client 4 ->  $50 / (4+1) = 10$ Kbytes.

Use the **no** variant of this command to revert to the default value of 1.

**Syntax** `log rotate wireless-client <0-255>`  
`no log rotate wireless-client`

Parameter	Description
<0-255>	The number of rotations for a wireless-client log. Set a number in the range 0-255.

**Default** The default number of rotations is 1.

**Mode** Wireless Configuration

**Example** To configure 10 generations of a wireless-client log file, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log rotate wireless-client 10
```

**Related commands** [log enable destination](#)  
[log size wireless-client](#)  
[show wireless](#)

**Command changes** Version 5.4.9-2.3: command added

# log size wireless-client

**Overview** Use this command to configure the file size used for storing wireless client logs. You can determine the size of each wireless client log by using this command and the **log rotate wireless-client** commands together. For example, log size wireless-client 50, log rotate wireless-client 4 ->  $50 / (4+1) = 10$ Kbytes. Use the **no** variant of this command to revert to the default log size value.

**Syntax** log size wireless-client <50-4194304>  
no log size wireless-client

Parameter	Description
<50-4194304>	Wireless client log size in kilobytes

**Default** 50 kilobytes.

**Mode** Wireless Configuration

**Example** To configure a wireless-client log size of 1Mbyte, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log size wireless-client 1000000
```

**Related commands** [log enable destination](#)  
[log rotate wireless-client](#)

**Command changes** Version 5.4.9-2.3: command added

# login username (wireless-ap)

**Overview** Use this command to specify a username and password for a wireless Access Point (AP).

Use the **no** variant of this command to remove a username and password for a wireless AP.

**Syntax** login username <username> password <password>  
no login username

Parameter	Description
<username>	The username for the selected AP.
<password>	An alphanumeric string of characters used as the password for the selected AP.

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To set the username **manager** and password **friend** for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# login username manager password
friend
```

**Related commands** [ap](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# login-password (wireless-ap)

**Overview** Use this command to set the login password for an Access Point (AP).  
Use the **no** variant of this command to remove the login password for an AP.

**Syntax** login-password *<password>*  
no login-password

Parameter	Description
<i>&lt;password&gt;</i>	An alphanumeric string of characters used as the password for the selected AP.

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To configure a password for AP 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# login-password friend
```

**Related commands** [ap](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# mac-address (wireless-ap)

**Overview** Use this command to specify the MAC address for a wireless Access Point (AP).  
Use the **no** variant of this command to remove the MAC address of the selected wireless AP.

**Syntax** `mac-address <mac-address>`  
`no mac-address`

Parameter	Description
<code>&lt;mac-address&gt;</code>	The MAC address of the wireless AP in hexadecimal notation with the format HHHH.HHHH.HHHH.

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To specify a MAC address for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# mac-address 0000.5e00.5301
```

**Related commands** [ap](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# mac-auth password

**Overview** Use this command to change the password for MAC-based authentication. Use the **no** variant of this command to return the password to its default.

**Syntax** `mac-auth password <password>`  
`no mac-auth password`

Parameter	Description
<code>&lt;password&gt;</code>	The new password. Passwords can be up to 64 characters in length and can contain any printable characters except ?, " (double quotes), and spaces.

**Default** By default the password is the MAC address of the supplicant.

**Mode** Wireless Network Configuration

**Example** To set the password for MAC authentication to be 'SECRET', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# mac-auth password SECRET
```

To reset the password for MAC authentication to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no mac-auth password
```

**Related commands**

- [enable \(wireless-network-cp\)](#)
- [network \(wireless\)](#)
- [mac-auth radius auth group \(wireless-network\)](#)
- [mac-auth username](#)

**Command changes** Version 5.4.9-2.1: command added

# mac-auth radius auth group (wireless-network)

**Overview** Use this command to enable MAC authentication of clients with a RADIUS group in a wireless network.

Use the **no** variant of this command to disable MAC authentication with a RADIUS group.

**Syntax** `mac-auth radius auth group {radius | <group-name>}`  
`no mac-auth radius auth group`

Parameter	Description
<code>radius</code>	Use a RADIUS group, which means <b>all</b> RADIUS servers.
<code>&lt;group-name&gt;</code>	The RADIUS server group.

**Default** Not set.

**Mode** Wireless Network.

**Usage notes** This command enables MAC authentication and designates a RADIUS server group to authenticate clients on a wireless network. RADIUS server groups are defined using the **aaa group server** command. RADIUS server groups can consist of multiple server hosts, but this command only uses two servers.

**Example** To enable MAC authentication with a RADIUS server group, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# mac-auth radius auth group
radius
```

**Related commands** [network \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# mac-auth username

**Overview** Use this command to set the format of the MAC address in the username and password field when a request for MAC-based authorization is sent to a RADIUS server.

Use the **no** variant of this command to reset the format to the default of hyphen and lower-case.

**Syntax** `mac-auth username {hyphen|colon|unformatted}`  
`{lower-case|upper-case}`  
`no mac-auth username`

Parameter	Description
hyphen	The MAC address includes hyphens, e.g. xx-xx-xx-xx-xx-xx.
colon	The MAC address includes colons, e.g. xx:xx:xx:xx:xx:xx.
unformatted	The MAC address does not include hyphens or colons, e.g. xxxxxxxxxxxx.
lower-case	The MAC address uses lower-case characters (a-f).
upper-case	The MAC address uses upper-case characters (A-F).

**Default** Default format is hyphen lower-case.

**Mode** Wireless Network Configuration

**Example** To configure the format of the MAC address in the username and password field to be colon and upper-case, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# mac-auth username colon
upper-case
```

To reset the format of the MAC address in the username and password field to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no mac-auth username
```

**Related commands** [enable \(wireless-network-cp\)](#)  
[mac-auth password](#)  
[mac-auth radius auth group \(wireless-network\)](#)

network (wireless)

**Command changes** Version 5.4.9-2.1: command added

# management address

**Overview** Use this command to configure a management address on the router for transmitting Autonomous Wave Control (AWC) packets to Access Points (APs). The management address must already exist on a device interface.

Use the **no** variant of this command to turn off AP management by AWC on the management address.

**Syntax** `managment address <ipv4-addr>`  
`no management address`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	Set the IPv4 interface address used for AP management by AWC.
<code>no</code>	Unset the IPv4 management address used for AP management by AWC.

**Default** Not enabled.

**Mode** Wireless Configuration

**Example** To configure an AP management interface address, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# management address 192.168.0.1
```

To remove an AP management interface address, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no management address
```

**Related commands** [enable \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# management-frame-protection enable (wireless-sec-wpa-ent)

**Overview** Use this command to enable management frame protection (MFP) in a WPA-enterprise configuration.

MFP provides security for management messages passed between wireless Access Points (APs) and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

Use the **no** variant of this command to disable MFP.

**Syntax** `management-frame-protection enable`  
`no management-frame-protection enable`

**Default** Enabled.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** This command is supported on the following AT-TQ series devices: AT-TQ4400, AT-TQ4400e, and AT-TQ4600 with dual-band 802.11ac. Other AT-TQ series and MWS series devices do not support MFP.

**Example** To **disable** MFP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-enterprise
awplus(config-wireless-sec-wpa-psnl)# no
management-frame-protection enable
```

**Related commands** [security \(wireless\)](#)  
[management-frame-protection enable \(wireless-sec-wpa-psnl\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# management-frame-protection enable (wireless-sec-wpa-psnl)

**Overview** Use this command to enable Management Frame Protection (MFP). MFP provides security for management messages passed between wireless Access Points (APs) and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

This parameter will be ignored when the version list includes **wpa3** as WPA3 requires that MFP is enabled, see [versions \(wireless-sec-wpa-psnl\)](#).

Use the **no** variant of this command to disable MFP.

**Syntax** `management-frame-protection enable`  
`no management-frame-protection enable`

**Default** Enabled.

**Mode** Wireless Security WPA-personal Configuration

**Usage notes** This command is supported on the following AT-TQ series devices: AT-TQ4400, AT-TQ4400e, and AT-TQ4600 with dual-band 802.11ac. Other AT-TQ series and MWS series devices do not support MFP.

**Example** To disable MFP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 100 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# no
management-frame-protection enable
```

**Related commands** [security \(wireless\)](#)  
[management-frame-protection enable \(wireless-sec-wpa-ent\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# max-clients

**Overview** Use this command to set the number of clients able to connect to a wireless Access Point (AP).

Use the **no** variant of this command to return the number of clients able to connect to the default value.

**Syntax** `max-clients <0-200>`  
`no max-clients`

Parameter	Description
<code>&lt;0-200&gt;</code>	The number of clients able to connect to the wireless AP. Configuring the <b>number 0</b> will disable all clients from connecting to the selected AP. For the <b>MWS</b> series, the range is: <code>&lt;0-127&gt;</code> with a default of 127.

**Default** 200.

**Mode** Wireless AP Profile Radio Configuration

**Example** To set the maximum number of clients that can connect to a wireless AP to 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# max-clients 100
```

**Related commands** [radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# mode (wireless-ap-prof-radio)

**Overview** Use this command to set the **wireless standard** and **bandwidth** mode used by the Access Points (APs) in a secure wireless security configuration. The AP type or model determines which mode to select.

Use the **no** variant of this command to set the mode to the default values specified for an AP type.

**Syntax** mode {a|bg|a-n|bg-n|n-only-a|n-only-g|a-n-ac|n-ac}  
no mode

Parameter	Standard	Description
a	802.11a	Bandwidth 54Mbps - 5GHz
bg	802.11bg	Bandwidths 11 and 54Mbps- 2.4GHz.
a-n	802.11a/n	Bandwidths 54 and 300 Mbps - 2.4GHz.
bg-n	802.11b/g/n	Bandwidths 11, 54, and 300 Mbps - 2.4GHz
n-only-a	802.11n	Bandwidth 300 Mbps using the 5GHz bandwidth
n-only-g	802.11n	Bandwidth 300 Mbps using the 2.4GHz bandwidth
a-n-ac	802.11a/n/ac	Dual-band: supporting simultaneous connections on both the 2.4 GHz and 5 GHz Wi-Fi bands. 802.11 ac offers backward compatibility to 802.11b/g/n and bandwidth rated up to 1300 Mbps on the 5 GHz band plus up to 450 Mbps on 2.4 GHz.
n-ac	802.11n/ac	Dual-band: Bandwidth 54, and 300Mbps using both the 2.4 and 5GHz frequencies.

**Default** The default values change with each antenna type and AP.

**Mode** Wireless AP Profile Radio Configuration

**Example** To configure the wireless mode **a-n-ac** for AP profile 100, radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# mode a-n-ac
```

**Related commands** [country-code](#)  
[hwtype](#)  
[radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# mode (wireless-network-cp)

**Overview** Use this command to set the Captive Portal (web authentication) mode.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

Use the **no** variant of this command to reset the Captive Portal mode to default.

**Syntax** mode {click-through|radius|external-page-redirect}  
no mode

Parameter	Description
radius	The user name and password entered from the browser screen are sent to the RADIUS server and a network connection is permitted after successful authentication.
click-through	This method asks users to agree to the terms of use (click-through agreement) before allowing them to connect to the wireless network.
external-page-redirect	Redirect the authentication page to a user configured URL such as a third party Captive Portal vendor page.

**Default** click-through

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** Click-through is only valid for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 wireless access points.

Click-through is not supported on TQ2450, TQ3200, TQ3400 or TQ3600 APs. Set the mode to **radius** (external RADIUS authentication) for these devices.

**Example** To set the Captive Portal authentication mode as RADIUS, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# mode radius
```

changes**

Version 5.4.9-1.1: command added

Version 5.5.0-1.3: **external-page-redirect** parameter added

# network (wireless)

**Overview** Use this command to configure an Autonomous Wave Control (AWC) network. If the network doesn't exist, then this command creates it. Use the **no** variant of this command to remove an AWC network.

**Syntax** `network <1-65535>`

Parameter	Description
<1-65535>	The network ID number

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** This commands adds a network configuration and enters the network configuration mode.

**Example** To configure an AWC network with an ID of 20, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
```

**Related commands**

- [show wireless network](#)
- [vap network \(wireless-ap-prof-radio\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# ntp designated-server

**Overview** Use this command to designate the NTP server that a wireless Access point (AP) refers to.

Use the **no** variant of this command to remove the configured IP address or host-name of the NTP server.

**Syntax** `ntp designated-server {ip <ip-address>|host <host-name>}`  
`no ntp designated-server`

Parameter	Description
<code>&lt;ip-address&gt;</code>	Specify the IP address of the NTP server, entered in the form A.B.C.D for an IPv4 address.
<code>&lt;host-name&gt;</code>	Specify the host-name for the NTP server

**Default** Disabled.

**Mode** Wireless AP Profile Configuration

**Usage notes** This command sets the NTP server that a wireless AP refers to. If the NTP server is disabled, then the AP will synchronize its time with the AWC router.

This is because the AP can not hold current time after a reboot because it does not have a real-time clock.

Therefore, the NTP master must be configured on the AWC router.

**Example** To configure an NTP server with an IP address of 192.168.0.254 for ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# ntp designated-server
192.168.0.154
```

**Related commands** [ap-profile \(wireless\)](#)  
[show wireless ap-profile](#)  
[ntp designated-server period](#)

**Command changes** Version 5.4.7-2.4: command added

# ntp designated-server enable

**Overview** Use this command to configure NTP on a wireless Access Point (AP).  
Use the **no** variant of this command to disable the NTP feature on an AP.

**Syntax** ntp designated-server enable  
no ntp designated-server enable

**Default** Enabled.

**Mode** Wireless AP Profile Configuration

**Example** To disable NTP for AP-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# no ntp designated-server
enable
```

**Related commands** [ntp designated-server](#)

**Command changes** Version 5.4.7-2.4: command added.

# ntp designated-server period

**Overview** Use this command to set the time adjustment period for an NTP server. This is the time adjustment period for a wireless AP using the selected AP profile.

Use the **no** variant of this command to reset the time adjustment period to the default of 10 minutes.

**Syntax** `ntp designated-server period <1-9999>`  
`no ntp designated-server period`

Parameter	Description
<1-9999>	The time adjustment period for the NTP server in minutes.

**Default** 10 minutes.

**Mode** Wireless AP Profile Configuration

**Example** To configure 30 minutes as the NTP server time adjustment period for ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# ntp designated-server
192.168.0.254
awplus(config-wireless-ap-prof)# ntp designated-server period
30
```

**Related commands** [ap-profile \(wireless\)](#)  
[show wireless ap-profile](#)  
[ntp designated-server](#)

**Command changes** Version 5.4.7-2.4: command added.

# outdoor

**Overview** Use this command to designate that a wireless AP is located outdoors.

Use the **no** variant of this command to designate when a wireless AP is not located outdoors.

**Syntax** outdoor  
no outdoor

**Default** No outdoor.

**Mode** Wireless AP Profile Configuration

**Usage notes** This command indicates whether the wireless AP is located outdoors, and selects the mode and channel that corresponds to this. To configure a channel number, use the **channel** command in **wireless-ap-prof-radio** mode. If you configure an invalid channel number, an error message displays the valid channels that you may select in your region.

The command is ignored when the AP is already configured using the **hwtype** command.

**Example** To configure an AP to be located outdoors, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# outdoor
```

**Related commands** [ap-profile \(wireless\)](#)  
[show wireless ap-profile](#)  
[channel \(wireless-ap-radio\)](#)  
[bandwidth \(wireless-ap-prof-radio\)](#)  
[channel \(wireless-ap-radio\)](#)

**Command changes** Version 5.4.7-2.4: command added

# page-proxy-url

**Overview** Use this command in Captive Portal mode to set the location of the custom page to display for web authentication. This page will be displayed instead of the wireless access point's built-in authentication or click-through page.

Use the **no** variant of this command to remove the URL pointing to the custom web authentication page.

**Syntax** `page-proxy-url <URL>`  
`no page-proxy-url`

Parameter	Description
<URL>	URL of external web server (hostname or dotted IP notation).

**Default** No custom page is set by default.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** This setting is valid only for AT-TQ5403, AT-TQm5403, AT-TQ5403e, AT-TQ1402, and AT-TQm1402 wireless access points.

**Example** To enable and set the web authentication proxy page, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# page-proxy-url
http://www.mydomain.com/login_page
```

**Related commands**

- [enable \(wireless-network-cp\)](#)
- [mac-auth password](#)
- [mac-auth username](#)
- [page-proxy-url](#)
- [radius auth group \(wireless-network-cp\)](#)
- [redirect-url](#)
- [session-keep](#)
- [mode \(wireless-network-cp\)](#)

**Command changes** Version 5.4.9-1.1: command added

# peer (wireless-wds)

**Overview** Use this command to add a pair of wireless Access Points (APs) to a WDS peer list. Use the **no** variant of this command to remove a pair of wireless APs from a WDS peer list.

**Syntax** peer ap <1-65535> radio <1-3> {ap <1-65535> | mac <mac-addr>}  
radio <1-3>  
no peer

Parameter	Description
ap	Signifies that the first AP identifier follows.
<1-65535>	The first AP identifier.
radio	Select the radio interface of the first AP.
<1-3>	Designate the radio interface for the first AP.
ap	Signifies that the second AP identifier follows.
<1-65535>	The second AP identifier.
mac	Signifies that the MAC address of the second AP follows.
<mac-addr>	The MAC address of the second AP. Enter the address in the format <HHHH.HHHH.HHHH> where <i>H</i> is a hexadecimal number.
radio	Select the radio interface of the second AP.
<1-3>	The radio interface for the second AP.

**Default** There are no APs configured in a WDS peer list by default.

**Mode** Wireless WDS Configuration

**Example** To add a pair of wireless APs to a WDS peer list, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# peer ap 10 radio 1 ap 20 radio 1
```

**Related commands** wds  
show wireless wds  
ap

**Command changes** Version 5.4.7-2.4: command added.

# power (wireless-ap-radio)

**Overview** Use this command to set the power level for client devices on a wireless Access Point (AP).  
Use the **no** variant of this command to return the power level to its default value.

**Syntax** `power <1-100>`  
`no power`

Parameter	Description
<code>&lt;1-100&gt;</code>	The percentage power level value.

**Default** A power level of 100% is the default.

**Mode** Wireless AP Radio Configuration

**Example** To set a power level of 30% for radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# power 30
```

**Related commands** [show wireless ap](#)  
[radio \(wireless-ap\)](#)

**Command changes** Version 5.4.7-2.4: command added

# pre-authentication enable (wireless-sec-wpa-ent)

**Overview** Use this command to enable WPA-enterprise pre-authentication for Access Points (APs) that have WPA2 clients.

Use the **no** variant of this command to disable WPA-enterprise pre-authentication.

**Syntax** `pre-authentication enable`  
`no pre-authentication enable`

**Default** Enabled.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** Enable this option if the AP has WPA2 clients and you want the AP to share the pre-authentication packets from the clients with other access points. If it is enabled, this can speed up authentication for roaming clients who connect to multiple access points. This option does not apply to WPA clients.

The MWS series of devices do not support pre-authentication, therefore, you should **disable** this command on these devices.

**Example** To disable pre-authentication on a WPA-enterprise configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# no pre-authentication
enable
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

# radio (wireless-ap)

**Overview** Use this command to enter **wireless-ap-radio** configuration mode.

**Syntax** radio <1-3>

Parameter	Description
<1-3>	The radio interface.

**Mode** Wireless AP Configuration

**Example** To enter the AP Radio configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)#
```

**Related commands**

ap  
show wireless ap  
show wireless ap neighbors  
show wireless ap client  
description (wireless-ap)  
power (wireless-ap-radio)  
enable (wireless-ap)

**Command changes** Version 5.4.7-2.4: command added

# radio (wireless-ap-profile)

**Overview** Use this command to enter AP profile radio configuration mode. Once in this mode, you can create and modify the radio configuration parameters for an AP profile.

**Syntax** radio <1-3>

Parameter	Description
<1-3>	The radio interface within the AP profile.

**Mode** Wireless AP Profile Configuration

**Example** To enter the AP profile radio configuration mode for interface 1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)#
```

**Related commands**

- vap network (wireless-ap-prof-radio)

**Command changes** Version 5.4.7-2.4: command added.

# radius accounting enable

**Overview** Use this command to configure RADIUS accounting on Captive Portal with external RADIUS.

Use the **no** variant of this command to disable RADIUS accounting on Captive Portal.

**Syntax** radius accounting enable  
no radius accounting enable

**Default** Disabled.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** The server settings used by Captive Portal RADIUS accounting are those configured by the **radius auth group** command. The port number used is the same one set on the primary server by the command **radius-server host**.

**Example** To configure RADIUS accounting on Captive Portal for network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# radius accounting enable
```

**Related commands** captive-portal virtual-ip  
radius accounting enable  
radius auth group (wireless-network-cp)

**Command changes** Version 5.5.0-1.3: command added

# radius auth group (wireless-network-cp)

**Overview** Use this command to set the RADIUS server/s that wireless APs use for Captive Portal (web authentication).

Use the **no** variant of this command to remove the RADIUS server/s used for authentication.

**Syntax** `radius auth group {radius|<groupname>}`  
`no radius auth group {radius|<groupname>}`

Parameter	Description
<code>radius</code>	Use a RADIUS server registered with the <code>radius-server host</code> command.
<code>&lt;groupname&gt;</code>	Use a RADIUS server that belongs to the specified server group. Use a server group created with the <code>aaa group server radius</code> command.

**Default** No RADIUS server set by default.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** This setting is only valid for TQ series APs. It has no effect on MWS series APs.

**Example** To use the RADIUS group 'my\_rad' for Captive Portal authentication, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# mode radius
awplus(config-wireless-network-cp)# radius auth group my_rad
```

**Related commands**

`aaa group server`  
`captive-portal`  
`enable (wireless-network-cp)`  
`mac-auth password`  
`mac-auth username`  
`page-proxy-url`  
`radius auth group (wireless-network-cp)`  
`radius-server host`

redirect-url  
session-keep  
mode (wireless-network-cp)

**Command changes** Version 5.4.9-1.1: command added

# radius auth group (wireless-sec-wpa-ent)

**Overview** Use this command to set the RADIUS server group used to authenticate clients in a wireless WPA-enterprise.

Use the **no** variant of this command to set the RADIUS server group to the default.

**Syntax** radius auth group {radius|<group-name>}  
no radius auth group

Parameter	Description
radius	Use all RADIUS servers.
<group-name>	Server group name

**Default** RADIUS (all RADIUS servers).

**Mode** Wireless Security WPA-enterprise Configuration

**Example** To set **radius**, which means all RADIUS servers, to authenticate a wireless WPA-enterprise, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# radius auth group radius
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

# redirect-url

**Overview** Use this command to enable the redirect-url feature. After successful authentication this feature redirects the web browser to the URL specified in the command. If both [session-keep](#) and **redirect-url** are enabled, session-keep takes precedence.

Use the **no** variant of this command to disable the redirect-url feature.

**Syntax** `redirect-url <URL>`  
`no redirect-url`

Parameter	Description
<URL>	URL of page to redirect the user to (hostname or dotted IP notation).

**Default** Not set by default.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** This setting is valid only for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 APs. It has no effect on TQ2450, TQ3200, TQ3400, TQ3600 and MWS series APs.

**Example** To enable and set the redirect-url for Captive Portal authentication on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# redirect-url
http://www.mydomain.com/welcome
```

**Command changes** Version 5.4.9-1.1: command added

# rogue-ap-detection enable (wireless)

**Overview** Use this command to enable rogue application detection.  
Use the **no** variant of this command to disable rogue application detection.

**Syntax** `rogue-ap-detection enable`  
`no rogue-ap-detection enable`

**Default** Disabled.

**Mode** Wireless Configuration

**Example** To enable rogue application detection, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# rogue-ap-detection enable
```

**Related commands** [show wireless](#)

**Command changes** Version 5.4.7-2.4 command added.

# sc-profile

**Overview** Use this command to add a Smart Connect profile configuration and enter the Smart Connect profile configuration mode.

Use the **no** variant of this command to remove a Smart Connect profile configuration.

**Syntax** `sc-profile <1-65535>`  
`no sc-profile`

Parameter	Description
<code>&lt;1-65535&gt;</code>	The Smart Connect profile ID.

**Default** Not set

**Mode** Wireless AP Profile Configuration

**Example** To add Smart Connect profile 1 to AP profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# sc-profile 1
```

**Related commands** [smart-connect-profile](#)  
[show wireless ap-profile](#)  
[show wireless network](#)

**Command changes** Version 5.5.0-0.1: command added

# sc-channel

**Overview** Use this command to set a fixed radio channel for an access point (AP) using Smart Connect.

Use the **no** variant of this command to delete this setting.

**Syntax** `sc-channel radio <1-3> channel {<channel-number>|auto}`  
`no sc-channel`

Parameter	Description
<1-3>	Select the radio channel fixed for AWC-SC use
<channel-number>	Select the radio channel that is defined in the AP profile
auto	The radio channel is automatically selected

**Default** Not set.

**Mode** Wireless Smart Connect Profile Configuration

**Example** To automatically configure the Smart Connect channel with AP profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# sc-channel radio 2 channel
auto
```

**Related commands** [smart-connect-profile](#)  
[show wireless ap](#)  
[show wireless ap-profile](#)

**Command changes** Version 5.5.0-0.1: command added

# security (wireless)

**Overview** Use this command to configure a wireless security instance. If the instance doesn't already exist, then this command creates it.

Use the **no** variant of this command to remove a wireless security instance.

**Syntax** `security <1-65535> mode {wep|wpa-personal|wpa-enterprise}`  
`no security <1-65535>`

Parameter	Description
<1-65535>	Wireless security instance identification number
mode	Security mode
wep	Security mode WEP. This assigns the configuration identifier to <b>config-wireless-sec-wep</b> mode and enters the mode.
wpa-personal	Security mode WPA-Personal. This assigns the configuration identifier to <b>config-wireless-sec-wpa-psnl</b> mode and enters the mode.
wpa-enterprise	Security mode WPA-Enterprise. This assigns the configuration identifier to <b>config-wireless-sec-wpa-ent</b> mode and enters the mode.

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** You create a wireless security instance by designating a security instance ID and selecting a security mode. There are three types of security modes:

- WEP
- WPA-Personal
- WPA-Enterprise

**Example** To configure and enter the wireless security mode for WPA-Personal, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)#
```

**Related commands** [wireless](#)

# security (wireless-network)

**Overview** Use this command to designate a security configuration identifier for a wireless security configuration.  
Use the **no** variant of this command to remove a security configuration identifier.

**Syntax** `security <1-65535>`  
`no security`

Parameter	Description
<1-65535>	The wireless security configuration identifier.

**Default** Not set.

**Mode** Wireless Network Configuration

**Example** To assign a security configuration identifier of 10 to wireless network 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 2
awplus(config-wireless-network)# security 10
```

**Related commands** [network \(wireless\)](#)  
[show wireless network](#)

**Command changes** Version 5.4.7-2.4: command added.

# security (wireless-wds)

**Overview** Use this command to set a wireless security configuration identifier to the WDS configuration mode.

Use the **no** variant of this command to remove the WDS security configuration identifier.

**Syntax** `security <1-65535>`  
`no security`

Parameter	Description
<1-65535>	The wireless security configuration identifier.

**Default** Not set.

**Mode** Wireless WDS Configuration

**Example** To designate the wireless security configuration identifier to the WDS configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# security 2
```

**Related commands** [wds](#)  
[show wireless wds](#)

**Command changes** Version 5.4.7-2.4: command added

# service wireless

**Overview** Use this command to enable wireless services.  
Use the **no** version of the command to disable unused wireless services.

**Syntax** `service wireless`  
`no service wireless`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** On devices that support the wireless manage feature, sometimes it may be desirable to disable unused services, in order to reduce memory use. Disabling the wireless services will only take effect after you save the configuration and restart the device.

**Example** To disable the wireless service, use the commands:

```
awplus# configure terminal
awplus(config)# no service wireless
```

**Output** Figure 53-1: Example output from **no service wireless**

```
awplus(config)#no service wireless
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-0.1: command added

# session-keep

**Overview** Use this command to enable the session-keep feature. After successful authentication this feature redirects the web browser back to the originally requested URL. If both **session-keep** and [redirect-url](#) are enabled, session-keep takes precedence.

Use the **no** variant of this command to disable the session-keep feature.

**Syntax** `session-keep`  
`no session-keep`

**Default** Not set by default.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** This setting is valid only for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 APs. It has no effect on TQ2450, TQ3200, TQ3400, TQ3600 and MWS series APs.

**Example** To configure session-keep for Captive Portal authentication on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# session-keep
```

**Command changes** Version 5.4.9-1.1: command added

# session-key-refresh-interval

**Overview** Use this command to set the refresh interval for the session key used in a WPA-enterprise security configuration.  
Use the **no** variant of this command to set the refresh interval to the default.

**Syntax** `session-key-refresh-interval <0-86400>`  
`no session-refresh-key-interval`

Parameter	Description
<code>&lt;0-86400&gt;</code>	The refresh interval in seconds.

**Default** The default refresh interval is 0 seconds.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** This command is for TQ series devices only.

**Example** To set 7200 seconds as the session key refresh rate, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wep-ent)#
session-key-refresh-interval 7200
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

# show debugging wireless

**Overview** Use this command to see what debugging is turned on for wireless management. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging wireless`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show debugging wireless`

**Output** Figure 53-2: Example output from the **show debugging wireless** command

```
awplus#show debugging wireless
Wireless debugging is on
Wireless all modules debugging is on
Wireless warning level debugging is on
```

**Related commands** [show wireless](#)

# show wireless

**Overview** Use this command to show the overall status information for Autonomous Wave Control (AWC).

**Syntax** show wireless

**Mode** Privileged Exec

**Example** To show the status of AWC on a device, use the command:

```
awplus# show wireless
```

**Output** Figure 53-3: Example output from **show wireless**

```
awplus> show wireless

# show wireless ap

**Overview** Use this command to display the configuration and status of wireless Access Points (APs).

**Syntax** `show wireless ap {<ap-id-range>|all} [brief|status|detail]`

Parameter	Description
<ap-id-range>	Display the configuration and status for a selected AP or range of APs, <1-65535>.
all	Display the configuration and status of APs.
brief	Display the brief configuration details of APs.
status	Display the status of APs.
detail	Display the detailed status and device information of APs.

**Mode** Privileged Exec

**Example** To display the status and configuration of wireless APs, use the following commands:

```
awplus# show wireless ap
```

**Output** Figure 53-4: Example output from **show wireless ap**

```
awplus#show wireless ap

# show wireless ap capability

**Overview** Use this command to display the configured specifications of a supported wireless Access Point (AP).

**Syntax** `show wireless ap capability`  
`show wireless ap capability hwtype <modelname>`  
`show wireless ap capability hwtype {tq|mws}`  
`[single|dual|triple] [spec {11ac|11n}] [radio {1|2|3}] [country`  
`<country-code>]`

Parameter	Description
hwtype	To specify the display of a hardware type. When omitted, all hardware types will be displayed.
<modelname>	The model name of the wireless AP capabilities to be displayed. See <a href="#">hwtype</a> for a full list of model names.
tq	Display hardware type AT-TQ series only.
mws	Display hardware type AT-MWS series only.
single	Display a single radio interface.
dual	Display a dual radio interface.
spec	To specify the display of an IEEE wireless networking standard mode. When omitted, all modes are displayed.
11ac	Display information for the 802.11ac mode only.
11n	Display information for the 802.11n mode only.
radio	To specify a radio bandwidth. When omitted, all radio bandwidths are displayed.
1	Display information for radio bandwidth 2.4GHz only.
2	Display information for radio 2 bandwidth 5GHz only.
3	Display information for radio 3 bandwidth 5GHz only.
country	To specify the display for a country. When omitted, the default country will be displayed.
<country-code>	Display the specified country code. The default country code is 'jp' for Japan or 'us' for other regions.

**Mode** User Exec and Privileged Exec

**Output** Figure 53-8: Example output from **show wireless ap capability**

```
awplus#show wireless ap capability
Country: jp

Version 5.4.9-1.1: <modelname> parameter added.

# show wireless ap client

**Overview** Use this command to display the client information on a managed wireless Access Point (AP).

**Syntax** `show wireless ap [<ap-id-range>] client [radio <1-3>]`

Parameter	Description
<i>&lt;ap-id-range&gt;</i>	Display information for the selected Access Point, or range <i>&lt;1-65535&gt;</i> .
radio	Select a radio interface on the AP.
<i>&lt;1-3&gt;</i>	Radio interface number.

**Mode** User Exec and Privileged Exec

**Example** To display the wireless AP client settings, use the following commands:

```
awplus# show wireless ap client
```

**Output** Figure 53-9: Example output from **show wireless ap client**

```
awplus#show wireless ap client
```

IP Address	Mac Address	AP	SSID	Radio	Ch	Signal	Age

**Related commands** [radio \(wireless-ap\)](#)

**Command changes** Version 5.4.7-2.4: command added

# show wireless ap neighbors

**Overview** Use this command to display the neighboring wireless Access Points (APs) connected to a radio or range of radios. If no parameters are specified, then all configurations are displayed.

**Syntax** `show wireless ap [<ap-id-range> | all] neighbors [radio <1-3>]`

Parameter	Description
<i>&lt;ap-id-range&gt;</i>	Show the radio and wireless neighbors associated with an AP or range of APs. To select a range, use the range format <i>&lt;1-65535&gt;</i> .
all	Display the radio and neighbors for all APs.
radio	Display the configured radio.
<i>&lt;1-3&gt;</i>	Radio interface number.

**Mode** User Exec and Privileged Exec

**Usage notes** If the total number of AP neighbors in the system exceeds 12500, this command will only show the first 12500 neighbors. You can specify the AP ID to see all neighbors of each AP.

**Example** To display all wireless AP neighbors, use the following command:

```
awplus# show wireless ap neighbors
```

**Output** Figure 53-10: Example output from **show wireless ap neighbors**

```
awplus#show wireless ap neighbors
```

Table 53-1: Parameters in the output from **command name**

Parameter	Description
Last Time executed	The time that the wireless automatic configuration was last executed.
Last Time updated	The time that any AP status was last updated.
auto-config Time-out	The time that an automatic configuration session timed out. If the wireless controller completed a session before timing out, then it will show this time.
AP-Profile	Specified AP Profile ID for new configurations, or new profile ID of an automatically created one.
Country-code	This is a specified two letter code representing the country for the AP profile. If no country is specified then it appears as "Not set".

Table 53-1: Parameters in the output from **command name** (cont.)

Parameter	Description
Status	<p><b>Initialized:</b> Wireless automatic discovery of AP list started.</p> <p><b>In Progress:</b> Discovery AP list achieved, now collecting data and creating configuration.</p> <p><b>IP Modifying:</b> Modifying IP address after creating another configuration (this status is brief in time).</p> <p><b>Completed:</b> All configuration is finished successfully.</p> <p><b>Aborted:</b> Automatic configuration process was stopped using the command <b>wireless auto-config abort</b>.</p> <p><b>Failed:</b> Wireless automatic configuration failed, for example "Failed to set profile to discovered AP".</p>
IP Address	Discovered wireless access point IP address.
MAC Address	Discovered wireless access point MAC address.
Hwtype	Discovered wireless access point hardware type.
AP	AP configuration for discovered wireless access points.
Prof	AP profile that attach to discovered wireless access points.
Status	<p>Discovered wireless access points status:</p> <p><b>Awaiting:</b> Waiting for completion of collecting the data.</p> <p><b>Modify:</b> AP MAC address already exists. It will modify the IP address.</p> <p><b>Skip:</b> Already configured AP MAC address and IP address, so will do nothing.</p> <p><b>Done:</b> Successful retrieval of hardware type (model name) and configuration created.</p> <p><b>NoMatch:</b> hardware type of specified AP profile did not match.</p> <p><b>NoResp:</b> Centralized Wireless Manager (CWM) Agent(AP) did not respond.</p> <p><b>Failed:</b> Failed to create configuration, for example "failed to create network %d".</p>

**Related commands** wireless auto-config

**Command changes** Version 5.4.8-1.1: command added

# show wireless captive-portal network walled-garden

**Overview** Use this command to display wireless network walled garden entries for Captive Portal.

**Syntax** show wireless captive-portal {<network-ID>|all} walled-garden

Parameter	Description
<network-ID>	Display output for the specified wireless network ID or range of network IDs, valid network IDs are <1- 65535>.
all	Display all wireless network walled garden entries.

**Mode** Privileged Exec

**Example** To display the walled garden entries for Captive Portal on network 5, use the commands:

```
awplus# show wireless captive-portal network 5 walled-garden
```

**Output** Figure 53-15: Example output from **show wireless captive-portal network 5 walled-garden**

```
awplus#show wireless captive-portal network 5 walled-garden
WALLED GARDEN LIST FOR NETWORK ID 5:
Entries ..... 3
  Walled Garden
  -----
  example.com
  1.1.1.1
  1.1.1.0/24
```

**Related commands** [captive-portal virtual-ip](#)  
[walled-garden entry](#)

**Command changes** Version 5.5.0-1.3: command added

# show wireless channel-blanket ap status

**Overview** Use this command to display the channel blanket status for a single or range of wireless APs. An AP whose AP ID is displayed as "-" is an AP that is not part of an AWC Lite configuration. If an AP ID (or range) is not selected, then the status of all APs will be displayed.

**Syntax** `show wireless channel-blanket ap {<ap-idrange> | all} status`

Parameter	Description
<code>&lt;ap-idrange&gt;</code>	The AP ID, or range of IDs <1-65535>.
<code>all</code>	Display the channel blanket status of all APs

**Mode** Privileged Exec

**Example** To display the wireless channel blanket status for AP 100, use the command:

```
awplus# show wireless channel-blanket ap 100 status
```

**Output** Figure 53-16: Example output from **show wireless channel-blanket ap status**

```
awplus#show wireless channel-blanket ap 100 status
AP: 100
Last Update Time: 2018-10-04 01:33:33
Number of CB member: 5
AP      MAC Address
-----
11      001a.eb12.3456
12      001a.eb12.3457
13      001a.eb12.3458
14      001a.eb12.3459
-       001a.eb12.3460
```

**Related commands** [ap](#)  
[channel-blanket](#)

**Command changes** Version 5.4.9-1.1: command added

# show wireless channel-blanket ap-profile status

**Overview** Use this command to display the channel blanket status of AP profiles. The command displays the number of channel blanket APs configured and visible from each AP to which the profile is assigned. An AP whose member is displayed as "-" is an AP that is not part of the channel blanket. If an AP Profile (or range) is not selected, then all APs profiles will be displayed.

**Syntax** `show wireless channel-blanket ap-profile {<profile-id> | all} status`

Parameter	Description
<profile-id>	The AP Profile ID, or range of IDs <1-65535>.
all	Display the status of all APs in the AP profile.

**Mode** Privileged Exec

**Example** To display the wireless channel blanket status for APs belonging to AP profile 100, use the following command:

```
awplus# show wireless channel-blanket ap-profile 100 status
```

**Output** Figure 53-17: Example output from **show wireless channel-blanket ap-profile**

```
awplus#show wireless channel-blanket ap-profile 100 status
AP Profile: 100
 AP      Member TimeStamp
-----
 11      4      2018-10-04 01:33:33
 12      4      2018-10-04 01:33:29

# show wireless country-code

**Overview** Use this command to display a list of country codes that can be used on an Access Point (AP) Autonomous Wave Control (AWC) configuration.

**Syntax** `show wireless country-code`

**Mode** User Exec and Privileged Exec

**Example** To display the list of AWC country codes, use the command:

```
awplus# show wireless country-code
```

**Output** Figure 53-18: Example output extract from **show wireless country-code**

```
awplus#show wireless country-code
Code  Country
-----
AD    Andorra
AE    United Arab Emirates
AF    Afghanistan
AG    Antigua and Barbuda
AI    Anguilla
AL    Albania
AM    Armenia
AN    Netherlands Antilles
AO    Angola
AR    Argentina

**Command changes** Version 5.4.7-2.4: command added.

# show wireless network

**Overview** Use this command to display the wireless network configuration for Autonomous Wave Control (AWC).

If you use the **brief** parameter, a summary of the configuration will be displayed, otherwise a detailed version is displayed.

**Syntax** `show wireless network <network-id-range> [brief]`

Parameter	Description
<code>&lt;network-id-range&gt;</code>	Display the network configuration for a selected network ID or network ID range <1-65535>.
<code>brief</code>	Display a brief summary of the network configuration.

**Mode** Privileged Exec

**Example** To display the full wireless network configuration for AWC, use the command:

```
awplus# show wireless network
```

**Output** Figure 53-19: Example output from **show wireless network brief**

```
awplus#show wireless network brief
```

# show wireless sc-profile

**Overview** Use this command to display the Smart Connect profile configuration.

**Syntax** `show wireless sc-profile [<sc-profile-range>|all] [brief]`

Parameter	Description
<sc-profile-range>	The Smart Connect profile ID or IDs to display. Select from the range 1-65535
all	Display all Smart Connect profiles
brief	Display a brief summary of the Smart Connect profile configuration

**Mode** Privileged Exec

**Example** To display all the Smart Connect profile information, use the command:

```
awplus# show wireless sc-profile all
```

**Output** Figure 53-22: Example output from **show wireless sc-profile all**

```
awplus#show wireless sc-profile all

# show wireless security

**Overview** Use this command to display the Autonomous Wave Control (AWC) security configuration. If the **brief** parameter is specified, then a summary of the configuration is displayed, otherwise the detailed configuration is displayed.

**Syntax** `show wireless security [<security-id-range>] [brief]`

Parameter	Description
<security-id-range>	Display the security configuration for a specified ID range. Specify the ID range using the format <1-65535>
brief	Display the brief summary of the security configuration.

**Mode** Privileged Exec

**Examples** To display a detailed AWC security configuration, use the following command:

```
awplus# show wireless security
```

**Output** Figure 53-24: Example output from **show wireless security**

```
awplus# show wireless security

# show wireless smart-connect ap

**Overview** Use this command to display AP connection status for Smart Connect.

**Syntax** show wireless smart-connect ap [*<sc-ap-range>* | all] status

Parameter	Description
<i>&lt;sc-ap-range&gt;</i>	Display the connection status for a single Smart Connect AP or range of APs. Select from ID range 1-65535.
all	Display the connection status for all Smart Connect APs.

**Mode** Privileged Exec

**Output** Figure 53-25: Example output from **show wireless smart-connect ap all status**

```
awplus#show wireless smart-connect ap all status
SC-PROFILE ID: 1
Last Update Time: 2019-12-12 11:14:35

# show wireless task

**Overview** Use this command to display the tasks associated with Autonomous Wave Control (AWC).

**Syntax** `show wireless task [<task-id-range>] [brief|status]`

Parameter	Description
<code>&lt;task-id-range&gt;</code>	Display the task information for a specific task ID or ID range.
<code>brief</code>	Display the task information in summary format.
<code>status</code>	Display the task status information. For example the date and time that the task will be performed next.

**Mode** User Exec and Privileged Exec

**Usage notes** An AWC task is a periodic or scheduled action to be taken, such as applying a configuration to an Access Point (AP) on a specified date, or calculating optimal AP power-channel usage and applying the results to all APs. See the **task** command for more details.

**Example** To display the configured AWC tasks in detail, use the command:

```
awplus# show wireless task
```

**Output** Figure 53-26: Example output from **show wireless task**

# show wireless wds

**Overview** Use this command to display the configuration of a Wireless Distribution System (WDS) with Autonomous Wave Control. A WDS enables the wireless interconnection of Access Points (APs) or Peers in an IEEE802.11 network.

**Syntax** show wireless wds [*<wds-id-range>*][*brief*]

Parameter	Description
<i>&lt;wds-id-range&gt;</i>	Display the configured information for a specified ID or a range of IDs. To display a range of WDS IDs, use the format <i>&lt;1-65535&gt;</i> .
<i>brief</i>	Display a brief summary of the WDS configuration.

**Mode** User Exec and Privileged Exec

**Example** To display the full detail of a WDS configuration for a wireless network, use the following command:

```
awplus# show wireless wds
```

**Output** Figure 53-29: Example output from **show wireless wds**

```
awplus#show wireless wds
WDS ID 1: Enable
Peer 1st AP ..... 10
      2nd AP ..... 11
Security ..... 100

WDS ID 2: Enable
Peer AP1 ..... 20
      AP2 ..... abcd.1234.6789
Security ..... 100

WDS ID 3: Disable
Peer AP1 ..... 30
      AP2 ..... 16
Security ..... 200
```

Figure 53-30: Example output from **show wireless wds brief**

```
awplus# show wireless wds brief
ID   Status  Peer 1st AP  Peer 2nd AP  Security
----  -----  -
1    Enable  10          11           100
2    Enable  20          abcd.1234.6789 100
3    Disable 30          16           200
```

                          enable (wireless-wds)  
                          peer (wireless-wds)  
                          security (wireless-wds)

**Command changes**    Version 5.4.7-2.4 command added.

# show wireless wireless-mac-filter

**Overview** Use this command to display the wireless MAC filter configuration for Autonomous Wave Control.

**Syntax** `show wireless wireless-mac-filter [<mac-filter-range>] [all] [brief]`

Parameter	Description
<i>&lt;mac-filter-range&gt;</i>	<i>&lt;1-65535&gt;</i> Display the information for a specified ID or range of IDs.
all	Display the information for all MAC filters.
brief	Display a brief summary of the information

**Mode** Privileged Exec

**Output** Figure 53-31: Example output from **show wireless-mac-filter**

```
awplus#show wireless wireless-mac-filter

WIRELESS MAC FILTER ID 100:
  Description ..... Floor 1
  Entries ..... 3
  Entries ..... 2

# smart-connect-profile

**Overview** Use this command to create a Smart Connect profile and enter the Smart Connect profile configuration mode.

Use the **no** variant of this command to delete a Smart Connect profile from the wireless configuration.

**Syntax** `smart-connect-profile <1-65535>`  
`no smart-connect-profile <1-65535>`

Parameter	Description
<1-65535>	The Smart Connect profile ID

**Default** Not set

**Mode** Wireless Configuration

**Example** To configure Smart Connect profile 10 and enter the Smart Connect profile configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)#
```

To delete Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no smart-connect-profile 10
```

**Related commands**

**Command changes** Version 5.5.0-0.1: command added

# ssid (wireless-network)

**Overview** Use this command to configure the SSID (Service Set Identifier) for the wireless network.

**Syntax** `ssid <value>`

Parameter	Description
<code>&lt;value&gt;</code>	The unique alphanumeric description or name of the SSID. The maximum character length is 32.

**Default** Default- {NETWORKID}.

Except for the default Guest Network, the default SSID for each network is 'Default-' followed by the unique Network ID.

**Mode** Wireless Network Configuration

**Usage notes** A network must be configured with an SSID of one or more alphanumeric characters. The SSID can be modified, but cannot be deleted.

**Example** To configure a SSID name for a wireless network, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# ssid GUEST_NETWORK_1
```

**Related commands** [network \(wireless\)](#)  
[show wireless network](#)

**Command changes** Version 5.4.7-2.4: command added.

# ssid (wireless-sc-prof)

**Overview** Use this command to set the SSID used for wireless communication between APs in a Smart Connect network.

Use the **no** variant of this command to remove the SSID from a Smart Connect profile.

**Syntax** `ssid <ssid-value>`  
`no ssid`

Parameter	Description
<code>&lt;ssid-value&gt;</code>	The SSID for the Smart Connect network. Enter a string up to 32 characters in length.

**Default** Not set

**Mode** Wireless Smart Connect Profile Configuration

**Example** To set the SSID ID of 10 used for wireless communication between APs in Smart Connect network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 20
awplus(config-wireless-sc-prof)# ssid SC-NETWORK-10
```

# station-isolation enable

**Overview** Use this command to enable to the station-isolation option on channel blanket for a wireless AP profile. When station-isolation is enabled, the AP blocks communication between wireless clients on the same virtual access point (VAP). The AP still allows data traffic between its wireless clients and wired devices on the network.

Use the **no** variant of this command to disable the station-isolation option.

**Syntax** station-isolation enable  
no station-isolation enable

**Default** Disabled.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Example** To enable station-isolation for channel blanket on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# station-isolation enable
```

**Related commands** [ap-profile \(wireless-ap\)](#)

[channel-blanket](#)

**Command changes** Version 5.4.9-1.1: command added

# station-isolation enable (wireless-ap-prof-radio)

**Overview** Use this command to enable the **station-isolation** option. This option designates whether to allow communication between wireless clients which are connected to the same Virtual Access Point (VAP).

Use the **no** variant of this command to disable the station-isolation option on a selected VAP.

**Syntax** station-isolation enable  
no station-isolation enable

**Default** Disabled.

**Mode** Wireless AP Profile Radio Configuration

**Example** To enable the station-isolation option for **radio 2** on **ap-profile100**, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# station-isolation
enable
```

**Related commands** [radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# task

**Overview** Use this command to configure an Autonomous Wave Control (AWC) task. If the task doesn't exist, then this command creates it. Use the **no** variant of this command to remove the task.

**Syntax** task <1-65535>  
no task <1-65535>

Parameter	Description
<1-65535>	Task ID number

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** A task is a configuration for a periodic or scheduled action to be taken. For example, the task may be to run a configuration, start an AWC calculation, or download AP firmware. Use commands such as **description**, **time**, and **day** to configure the task actions.

**Example** To add a task with an ID of 10, use the following commands:

```
awplus# configure terminal  
awplus(config)# wireless  
awplus(config-wireless)# task 10
```

To remove task ID 10, use the following commands:

```
awplus# configure terminal  
awplus(config)# wireless  
awplus(config-wireless)# no task 10
```

**Related commands** [enable \(wireless-task\)](#)  
[description \(wireless-task\)](#)  
[time \(wireless-task\)](#)  
[day \(wireless-task\)](#)  
[type download ap \(wireless-task\)](#)  
[type ap-configuration apply ap](#)  
[type power-channel ap all](#)

**Command changes** Version 5.4.7-2.4: command added

# time (wireless-task)

**Overview** Use this command to set a time to run a task using the 24-hour format. You can use the **day** command along with the **time** command to more fully set the task run time configuration. Use the **no** variant of this command to remove the time set to run a task.

**Syntax** `time <HH:MM>`  
`no time`

Parameter	Description
<HH:MM>	The time set to run a task in 24-hour time format.

**Default** Not set.

**Mode** Wireless Task Configuration

**Example** To set task 5 to run at 11:15 pm, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# time 23:15
```

**Related commands** [task](#)  
[show wireless task](#)  
[day \(wireless-task\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# type (wireless-sec-wep)

**Overview** Use this command to assign the key-string type for a wireless security WEP configuration.

Use the **no** variant of this command to reset the assigned WEP key-string type to the default.

**Syntax** type {ascii|hex}  
no type

Parameter	Description
ascii	Use ASCII as the type for the WEP key
hex	Use Hex as the type for the WEP key

**Default** Hex.

**Mode** Wireless Security WEP Configuration

**Example** To configure ASCII as the key-string type for WEP for a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# type ascii
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# type ap-configuration apply ap

**Overview** Use this command to apply a task configuration type to a selected wireless Access Point (AP) or range of wireless APs.

**Syntax** `type ap-configuration apply ap {all|<ap-id-range>}`

Parameter	Description
all	Apply the configuration to all APs.
<ap-id-range>	Apply the configuration to a selected range of APs.

**Default** Not set.

**Mode** Wireless Task Configuration

**Example** To assign task 5 configuration to wireless AP ranges: 5-9 and 15-19, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# type ap-configuration apply ap
5-9,15-19
```

**Related commands**

- [task](#)
- [show wireless task](#)
- [ap](#)
- [type download ap \(wireless-task\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# type download ap (wireless-task)

**Overview** Use this command to download and update wireless Access Point (AP) firmware. The firmware must be stored on an HTTP server.

**Syntax** `type download ap {all|<ap-id-range>} url <URL> [username <user-name> password <password>]`

Parameter	Description
all	Run the task on all managed APs.
<ap-id-range>	Run the task on the selected identifier.
<URL>	The URL where the firmware is stored and can be downloaded from.
<user-name>	The username requiring authentication and access to the URL.
<password>	The password requiring authentication and access to the URL.

**Mode** Wireless Task Configuration

**Example** To set a task to download new firmware from the IP address 192.168.0.1 to a wireless AP which is assigned '7' as its identifier, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# type download ap 7 url
http://192.168.0.1/AT-TQ4600-4.0.3.b02.img
```

**Related commands**

- [task](#)
- [show wireless task](#)
- [ap](#)
- [type ap-configuration apply ap](#)
- [type power-channel ap all](#)

**Command changes** Version 5.4.7-2.4: command added.

# type power-channel ap all

**Overview** Use this command to calculate the power usage on wireless Access Point (AP) channels and apply the results manually or automatically.

**Syntax** `type power-channel ap all {calculate|apply|calculate-and-apply}`

Parameter	Description
calculate	Run the AWC power calculation on all APs.
apply	Apply the latest AWC power calculation results to all APs.
calculate-and-apply	Run the AWC power calculation and apply the results to all APs.

**Default** Not set.

**Mode** Wireless Task Configuration

**Usage notes** This command allows you to monitor how APs are being utilized at various times and adjust AP power levels if required.

**Example** To calculate all AP power-channel usage and apply the results to all APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config)# type power-channel ap all calculate-and-apply
```

**Related commands**

# vap

**Overview** Use this command to assign a network configuration ID to a Virtual Access Point (VAP) on the radio.

Use the **no** variant of this command to remove a specific VAP configuration.

**NOTE:** The channel-blanket setting can only be used with AT-TQ5403 and AT-TQ5403e APs. If this is set for other APs, you will not be able to manage those APs. Also, even if the AP profile for AT-TQ5403 or AT-TQ5403e does not include the Channel Blanket setting, those AT-TQ5403 or AT-TQ5403e will not be manageable.

**Syntax** `vap <vap-id> network <network-id> [channel-blanket]`  
`no vap <vap-id>`

Parameter	Description
<vap-id>	Enter the VAP ID in the range of <0-7>
<network-id>	Enter the network ID in the range of <1-65535>
channel-blanket	Set the VAP to channel blanket mode

**Default** Not set.

**Mode** Wireless AP Profile Radio Configuration

**Example** To associate a network (ID 100) with the VAP 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# vap 2 network 100
```

To associate a network (ID 100) with the VAP 2 as channel blanket mode, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# vap 2 network 100
channel-blanket
```

**Related commands** [network \(wireless\)](#)  
[radio \(wireless-ap-profile\)](#)  
[show wireless channel-blanket ap status](#)

show wireless channel-blanket ap-profile status

**Command changes** Version 5.4.9-1.1: command added

# vap network (wireless-ap-prof-radio)

**Overview** Use this command to assign a network configuration ID to a Virtual Access Point (VAP) on a radio.

Use the **no** variant of this command to remove the network configuration for a VAP.

**Syntax** vap <0-7> network <1-65535>  
no vap <0-7>

Parameter	Description
<0-7>	VAP identification number
<1-65535>	Network configuration of the designated VAP

**Default** Not set.

**Mode** Wireless AP Profile Radio Configuration

**Usage notes** vap0 is the only VAP identification number valid on the **MWS series**.

**Example** To associate an AP with network (ID 100) to VAP 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# vap 2 network 2
```

**Related commands** [radio \(wireless-ap-profile\)](#)  
[network \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# versions (wireless-sec-wpa-ent)

**Overview** Use this command to set the WPA version used for a WPA-enterprise wireless security configuration.

Use the **no** variant of this command to reset the designated version to the default.

**Syntax** `versions <version-list>`  
`no versions`

Parameter	Description
<code>&lt;version-list&gt;</code>	The version list. You can use either <b>wpa</b> , <b>wpa2</b> , <b>wpa3</b> , or any combination of the three in any order.

**Default** `wpa2`.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions WPA2 and ciphers CCMP
- versions WPA, WPA2, and ciphers TKIP and CCMP

WPA3 is only supported on TS5403 series devices.

**Example** To configure both WPA and WPA2 as WPA versions on a security configuration for WPA-enterprise, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# versions wpa wpa2
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.  
Version 5.4.9-1.1: **wpa3** parameter added.

# versions (wireless-sec-wpa-psnl)

**Overview** Use this command to set the WPA version used for a WPA-personal wireless security configuration.  
Use the **no** variant of this command to reset the designated version to the default.

**Syntax** `versions <version-list>`  
`no versions`

Parameter	Description
<code>&lt;version-list&gt;</code>	The version list. You can use either <b>wpa</b> , <b>wpa2</b> , <b>wpa3</b> , or any combination of the three in any order.

**Default** `wpa2`.

**Mode** Wireless Security WPA-personal Configuration

**Usage notes** For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions WPA2 and ciphers CCMP
- versions WPA, WPA2, and ciphers TKIP and CCMP

WPA3 is only supported on TS5403 series devices.

**Example** To configure both WPA and WPA2 as WPA versions on a security configuration for WPA-personal, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# versions wpa wpa2
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.  
Version 5.4.9-1.1: **wpa3** parameter added.

# vlan (wireless-network)

**Overview** Use this command to configure the wireless VLAN that clients belong to.  
Use the **no** variant of this command to reset the wireless VLAN to the default.

**Syntax** `vlan <1-4094>`  
`no vlan`

Parameter	Description
<1-4094>	VLAN ID number.

**Default** VLAN1.

**Mode** Wireless Network Configuration

**Example** To configure a VLAN ID, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# vlan 100
```

To restore VLAN 20 to its default value, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no vlan
```

**Related commands** [network \(wireless\)](#)  
[show wireless network](#)

**Command changes** Version 5.4.7-2.4: command added

# walled-garden entry

**Overview** Use this command to configure walled garden entry to a wireless network Captive Portal.

On the Internet, a walled garden typically controls a user's access to web content and services. The walled garden directs the user's navigation within particular areas to allow access to a selection of websites or prevent access to other websites.

A common example could be a hotel environment where unauthenticated users are allowed to navigate to a designated login page (for example, a hotel website) and all its contents.

Use the **no** variant of this command to remove a walled garden on a wireless network that's configured with a Captive Portal.

**Syntax** `walled-garden entry {A.B.C.D|A.B.A.D/M|FQDN}`  
`no walled-garden entry {A.B.C.D|A.B.A.D/M|FQDN}`

Parameter	Description
A.B.C.D	IPv4 address format, e.g. 1.1.1.1
A.B.C.D/M	IPv4 address format with subnet mask, e.g. 1.1.1.0/24
FQDN	FDQN format. Sequence of {LETTER/DIGIT/HYPHEN}.{LETTER/DIGIT/HYPHEN}...while each dotted part of the name (aa or bb or cc in this example) MUST NOT end with HYPHEN and the first character MUST be a LETTER or a DIGIT. And each dotted part (aa or bb or cc in this example) must be 63 characters or less, e.g. example.com www.example.com

**Default** Not set

**Mode** Wireless Network Captive Portal Configuration

**Example** To add a new entry to a walled garden list on Captive Portal for network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# walled-garden entry
example.com
```

**Related commands** [captive-portal virtual-ip](#)  
[show wireless network](#)

show wireless captive-portal network walled-garden

**Command changes** Version 5.5.0-1.3: command added

# wds

**Overview** Use this command to add a Wireless Distribution System (WDS) configuration. Use the **no** variant of this command to remove a WDS configuration.

**Syntax** `wds <1-65535>`

Parameter	Description
<code>&lt;1-65535&gt;</code>	WDS configuration ID number.

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** This command adds a WDS configuration and enters the configuration mode.

**Example** To add a WDS configuration for AWC, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
```

To remove a WDS configuration for AWC, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wds 10
```

**Related commands**

- [show wireless wds](#)
- [enable \(wireless-wds\)](#)
- [peer \(wireless-wds\)](#)
- [security \(wireless-wds\)](#)

**Command changes** Version 5.4.7-2.4: command added.

## wds radio (wireless-ap)

**Overview** Use this command to designate a radio interface for an Access Point (AP) in a Wireless Distribution System (WDS) network.

Use the **no** variant of this command to remove a wireless radio interface.

**Syntax** `wds radio <1-3>`  
`no wds radio`

Parameter	Description
<1-3>	Designate a radio interface for the WDS connection.

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To configure 'radio 2' as the radio interface for a WDS connection, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# wds radio 2
```

**Related commands** [ap](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# web-auth radius auth group

**Overview** Use this command to enable Web authentication of clients with a RADIUS group in a wireless network.

Use the **no** variant of this command to disable Web authentication with a RADIUS group.

**Syntax** `web-auth radius auth group {radius|<group-name>}`  
`no web-auth radius auth group`

Parameter	Description
<code>radius</code>	Use a RADIUS group, which means <b>all</b> RADIUS servers.
<code>&lt;group-name&gt;</code>	The RADIUS server group.

**Default** Not set.

**Mode** Wireless Network.

**Usage notes** This command enables Web authentication and designates a RADIUS server group to authenticate clients on a wireless network. RADIUS server groups are defined using the **aaa group server** command. RADIUS server groups can consist of multiple server hosts, but this command only uses two servers.

**Example** To enable Web authentication with a RADIUS server group, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# web-auth radius auth group
radius
```

**Related commands** [aaa group server](#)  
[network \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless

**Overview** Use this command to enter wireless configuration mode.  
Use the **no** variant of this command to exit wireless configuration mode.

**Syntax** wireless  
no wireless

**Mode** Global Configuration

**Example** To enter wireless configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)#
```

**Command changes** Version 5.4.7-2.4: command added.

# wireless ap-configuration apply ap

**Overview** Use this command to apply a configuration to a single Access point (AP) or a range of APs. The configuration must exist before you use this command.

**Syntax** `wireless ap-configuration apply ap {all|<ap-idrange>}`

Parameter	Description
all	Apply the configuration to all APs.
<ap-idrange>	Apply the configuration to a range of APs. The range format is 1-65535.

**Mode** Privileged Exec

**Example** To apply a configuration to the AP range 1-10, use the command:

```
awplus# configure terminal
awplus(config)# wireless ap-configuration apply 1-10
```

To apply a configuration to all APs, use the command:

```
awplus# wireless ap-configuration apply ap all
```

**Related commands** [ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless auto-config

**Overview** Use this command to start an automatic discovery and configuration of wireless APs using Autonomous Wave Control (AWC).

**Syntax** `wireless auto-config create-new [country-code <code>]`  
`wireless auto-config ap-profile <1-65535>`  
`wireless auto-config abort`

Parameter	Description
ap-profile	This parameter selects an existing profile to use for configuring the newly discovered APs.
<1-65535>	Profile ID number from the range 1 to 65535.
create-new	This parameter automatically creates a new profile based on the AP's model name.
country-code	Optional parameter, if specified the new profiles will have the country code set.
<code>	A two letter code representing the country. Use the command <a href="#">show wireless country-code</a> to see the full list of country codes available.
abort	This parameter stops the automatic discovery process.

**Mode** Privileged Exec

**Usage notes** AP configuration is created for discovered APs including their IP addresses and MAC addresses. The AP profile is created automatically based on the model name. The network and security is created using defined default values.

Use the **abort** parameter to stop the automatic discovery process from continuing.

**Examples** To start an automatic discovery and configuration of a wireless network and apply the profile ID "1", use the command:

```
awplus# wireless auto-config ap-profile 1
```

To start an automatic discovery and configuration of a wireless network with a new AP profile, use the command:

```
awplus# wireless auto-config create-new
```

To stop an automatic discovery configuration, use the command:

```
awplus# wireless auto-config abort
```

**Related commands** [show wireless auto-config](#)

**Command changes** Version 5.4.8-1.1: command added

# wireless download ap url

**Overview** Use this command to download Access Point (AP) firmware from a URL.

**Syntax** wireless download ap {all|<aprange>} url [username <user-name>  
password <password>]

Parameter	Description
all	All APs.
<aprange>	A range of APs <1-65535>
username <user-name>	The login username.  The username can contain: <ul style="list-style-type: none"><li>• up to 255 characters.</li><li>• any printable ASCII characters (ASCII 32-126)</li><li>• special characters: backslash, double-quote or space, but they should be escaped with a backslash.</li></ul>
password <password>	Passwords can be up to 64 characters in length and can contain printable characters, except: <ul style="list-style-type: none"><li>• ?</li><li>• "(double quotes)</li><li>• space</li></ul>

**Default** Not set.

**Mode** Privileged Exec

**NOTE:** AWC supports the following firmware version:

- TW series: v4.0.5B02
- MWS2533AP: v2.2.1, v2.2.3
- MWS600AP/MWS1750AP: v2.2.3

**Example** To download new firmware to all APs from the URL 192.168.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless download ap all url
http://192.168.0.1/AT-TQ4600-4.0.3.n.b02.img
```

**Related commands** [show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless emergency-mode

**Overview** Use this command to activate or deactivate AWC emergency mode. Wireless networks that have been flagged for emergency-mode are activated or deactivated when this command is configured.

**Syntax** `wireless emergency-mode {activate|deactivate}`

**Default** Deactivated

**Mode** Privileged Exec

**Example** To activate the emergency mode in AWC, use the command:

```
awplus# wireless emergency-mode activate
```

**Related commands** [emergency-mode](#)  
[show wireless](#)

**Command changes** Version 5.5.0-0.3: command added

# wireless export

**Overview** Use this command to export MAC filter entries to a CSV file. If the specified file does not exist, it will be created. If the file does exist then it will be overwritten with the new data.

**Syntax** `wireless export wireless-mac-filter <mac-filter-id> <url>`

Parameter	Description
<code>&lt;mac-filter-id&gt;</code>	<code>&lt;1-65535&gt;</code> The ID of the MAC filter to export.
<code>&lt;url&gt;</code>	Path and filename of the export file.

**Mode** Privileged Exec

**Example** To export MAC filter '20' to a CSV file named 'whitelist.csv', use the following command:

```
awplus# wireless export wireless-mac-filter 20  
flash://whitelist.csv
```

Figure 53-32: Sample export file:

```
"00:1a:eb:12:34:56", "client1"  
"00:1a:eb:12:34:57", "client2"  
"00:1a:eb:12:34:58", "client3"  
"00:1a:eb:12:34:59", "client4"  
"00:1a:eb:12:34:5a", "client5"
```

**Related commands**

**Command changes** Version 5.4.8-2.1: command added

# wireless import

**Overview** Use this command to import MAC filter entries from a CSV file. The imported entries can either replace or be appended to the existing entries.

**Syntax** `wireless import <url> wireless-mac-filter <mac-filter-id> {add|replace}`

Parameter	Description
<url>	Path and filename of the import file.
<mac-filter-id>	<1-65535> The ID of the MAC filter to import the entries to.
add	Add the filter entries to the specified MAC filter
replace	Overwrite the existing MAC filter with the imported entries.

**Mode** Privileged Exec

**Example** To add MAC filter entries from the file 'whitelist.csv' to MAC filter '20', use the following command:

```
awplus# wireless import flash://whitelist.csv  
wireless-mac-filter 20 add
```

Figure 53-33: Sample import file:

```
"00:1a:eb:12:34:56", "client1"  
"00:1a:eb:12:34:57", "client2"  
"00:1a:eb:12:34:58", "client3"  
"00:1a:eb:12:34:59", "client4"  
"00:1a:eb:12:34:5a", "client5"
```

**Command changes** Version 5.4.8-2.1: command added

# wireless power-channel ap all

**Overview** This command activates AWC to calculate the optimal power-channel levels for all the Access Points (APs) in a wireless network. You can use this command to calculate and apply the latest AWC calculation results to the APs automatically or you can choose to apply them manually.

**Syntax** `wireless power-channel ap all  
{calculate|apply|calculate-and-apply}`

Parameter	Description
calculate	Use AWC to calculate the optimal power-channel levels for all APs.
apply	Apply the latest AWC optimal power-channel level results to all APs.
calculate-and-apply	Use AWC to calculate the optimal power-channel levels for all APs, and apply the results to the APs.

**Default** Not set.

**Mode** Privileged Exec

**Example** To activate AWC to calculate the optimal power-channel levels for all APs, use the following commands:

```
awplus# configure terminal  
awplus(config)# wireless power-channel ap all calculate
```

To apply the latest optimal power-channel results manually to all APs, use the following commands:

```
awplus# configure terminal  
awplus(config)# wireless power-channel ap all apply
```

To activate AWC to calculate the optimal power-channel levels for all APs and then automatically apply the results to the APs, use the following commands:

```
awplus# configure terminal  
awplus(config)# wireless power-channel ap all  
calculate-and-apply
```

**Related commands** [show wireless ap power-channel](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless reset ap

**Overview** Use this command to reset the current configuration applied to a wireless Access Point (AP).

**Syntax** `wireless reset ap {all|<aprange>}`

Parameter	Description
<aprange>	Reset the range of APs in the format <1-65535>
all	Reset all APs.

**Mode** Privileged Exec

**Example** To reset the configuration for wireless APs in the range 1-10, use the following commands:

```
awplus# configure terminal  
awplus(config)# wireless reset ap 1-10
```

To reset the configuration for all wireless APs, use the following commands:

```
awplus# configure terminal  
awplus(config)# wireless reset ap all
```

**Related commands** [ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless-mac-filter (wireless)

**Overview** Use this command to configure a wireless MAC filter. If the filter does not already exist it will be created when you issue this command.

Use the **no** variant of this command to remove a wireless MAC filter.

**Syntax** `wireless-mac-filter <mac-filter-id>`  
`no wireless-mac-filter <mac-filter-id>`

Parameter	Description
<code>&lt;mac-filter-id&gt;</code>	<code>&lt;1-65535&gt;</code> Enter the ID of the MAC filter to assign to the AP profile.

**Default** No MAC filters are set by default.

**Mode** Wireless Configuration

**Example** To add a MAC filter with ID '20' and enter configuration mode for that filter, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)#
```

To remove a MAC filter with ID '20', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wireless-mac-filter 20
```

**Command changes** Version 5.4.8-2.1: command added

# wireless-mac-filter (wireless-ap-prof)

**Overview** Use this command to assign a MAC filter to a wireless AP profile. You can configure the filter as a 'whitelist' or a 'blacklist'. An AP profile can only have one MAC filter assigned to it.

Use the **no** variant of this command to remove a MAC filter from an AP profile.

**Syntax** wireless-mac-filter {permit|deny} <mac-filter-id>  
no wireless-mac-filter

Parameter	Description
permit	Set the MAC filter as a whitelist.
deny	Set the MAC filter as a blacklist.
<mac-filter-id>	<1-65535> Enter the ID of the MAC filter to assign to the AP profile.

**Default** No MAC filter assigned by default.

**Mode** Wireless AP Profile Configuration

**Example** To assign the MAC filter '20' as a whitelist to wireless AP profile '1', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# wireless-mac-filter permit 20
```

To remove a MAC filter from wireless AP profile '1', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# no wireless-mac-filter
```

wireless-mac-filter enable

**Command changes** Version 5.4.8-2.1: command added

# wireless-mac-filter enable

**Overview** Use this command to enable the MAC filter on a Virtual Access Point (VAP). It will enable the MAC filter based on the filter entry set in the AP profile.

Use the **no** variant of this command to disable the AMC filter on a VAP.

**Syntax** wireless-mac-filter enable  
no wireless-mac-filter enable

**Default** Disabled by default.

**Mode** Wireless Network Configuration

**Example** To enable wireless MAC filter on APs that use network 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# wireless-mac-filter enable
```

To disable wireless MAC filter on APs that use network 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# no wireless-mac-filter enable
```

# 54

# Device Discovery using SNMP Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Device Discovery using SNMP.

SNMP Device Discovery is available from the AlliedWare Plus CLI and is also available from Vista Manager mini. This feature provides information that allows the CLI to display third party vendor device data in real time.

For more information, see the [Device Discovery and Monitoring using SNMP Feature Overview and Configuration Guide](#).

- Command List**
- “clear snmp-discovery” on page 2862
  - “service snmp-discovery” on page 2863
  - “show running-config snmp-discovery” on page 2864
  - “show snmp-discovery” on page 2865
  - “snmp-discovery arp-polling-interval” on page 2868
  - “snmp-discovery community” on page 2869
  - “snmp-discovery deny” on page 2870
  - “snmp-discovery permit” on page 2872
  - “snmp-discovery snmp-polling-interval” on page 2873
  - “snmp-discovery snmp-version” on page 2874
  - “snmp-discovery user” on page 2875

# clear snmp-discovery

**Overview** Use this command to remove information learned by the SNMP Discovery process.

**Syntax** `clear snmp-discovery ip [<ipv4-address>]`  
`clear snmp-discovery nodes [<ipv4-address>]`

Parameter	Description
ip	Internet Protocol (IP)
<ipv4-address>	IPv4 network address for the discovered device, for example 192.168.3.1
nodes	Node information
<ipv4-address>	IPv4 network address for the discovered nodes, for example 192.168.3.1

**Default** No information is cleared.

**Mode** Privileged Exec

**Examples** To remove all SNMP discovered devices, use the command:

```
node1# clear snmp-discovery nodes
```

To remove a particular SNMP discovered device, use the command:

```
node1# clear snmp-discovery nodes 192.168.3.1
```

To remove all entries from SNMP Discovery's database of devices discovered by ARP, use the command:

```
node1# clear snmp-discovery ip
```

To remove a particular entry from SNMP Discovery's database of devices discovered by ARP, use the command:

```
node1# clear snmp-discovery ip 192.168.3.1
```

**Related commands** [show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# service snmp-discovery

**Overview** Use this command to enable SNMP Discovery to discover devices on an AMF network.

Use the **no** variant of this command to disable SNMP Discovery.

**Syntax** `service snmp-discovery`  
`no service snmp-discovery`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** The server starts a process which detects IP addresses reachable on a network. An SNMP 'get' request is performed on these IP addresses to detect device information. The SNMP name, SNMP description, SNMP location, and SNMP serial number are obtained if they are available.

SNMP Discovery will not run if there are no Layer 3 IP interfaces configured.

**Example** To start the discovery service on the AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# service snmp-discovery
```

**Related commands** [show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# show running-config snmp-discovery

**Overview** Use this command to display the running configuration for SNMP Discovery.

**Syntax** show running-config snmp-discovery

**Mode** Privileged Exec

**Example** To display the running configuration for SNMP Discovery, use the command:

```
awplus# show running-config snmp-discovery
```

**Output** Figure 54-1: Example output from **show running-config snmp-discovery**

```
node1#show running-config snmp-discovery
service snmp-discovery
snmp-discovery community accounting
snmp-discovery user tim encrypted auth md5

U2FsdGVkX1+FJsefN+ZvSzUUviRt9ZdsFwtB6HU121U=
snmp-discovery permit ip 192.168.3.2
snmp-discovery permit ip 192.168.3.6
snmp-discovery deny ip 192.168.3.5
```

**Related commands** [show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# show snmp-discovery

**Overview** Use this command to show information about the SNMP Discovery process.

**Syntax** `show snmp-discovery [detail|ip|nodes]`

Parameter	Description
detail	SNMP Discovery node detail
ip	SNMP Discovery IP addresses
nodes	SNMP Discovery node information

**Mode** User Exec

**Examples** To display information about the SNMP Discovery status, use the command:

```
awplus# show snmp-discovery
```

To display information about the SNMP Discovery IPv4 addresses learned, use the command:

```
awplus# show snmp-discovery ip
```

To display information about the SNMP Discovery nodes learned, use the command:

```
awplus# show snmp-discovery nodes
```

To display information about the SNMP Discovery in greater detail, use the command:

```
awplus# show snmp-discovery detail
```

**Output** Figure 54-2: Example output from **show snmp-discovery**

```
awplus#show snmp-discovery
SNMP Discovery information:
SNMP Discovery           : Enabled
SNMP Polling interval    : 300
ARP Polling interval     : 60
SNMP Discovery version   : v2c
SNMPv2 Discovery Community : accounting
```

**Related commands**

- [clear snmp-discovery](#)
- [service snmp-discovery](#)
- [show running-config snmp-discovery](#)
- [snmp-discovery arp-polling-interval](#)
- [snmp-discovery deny](#)
- [snmp-discovery permit](#)
- [snmp-discovery snmp-polling-interval](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery arp-polling-interval

**Overview** Use this command to configure the SNMP ARP polling interval.

Use the **no** variant of this command to set the SNMP ARP polling interval back to the default (60 seconds).

**Syntax** `snmp-discovery arp-polling-interval <1-3600>`  
`no snmp-discovery arp-polling-interval`

Parameter	Description
<code>&lt;1-3600&gt;</code>	The polling number in seconds to interval in the range from 1 to 3600.

**Default** ARP requests are sent out every 60 seconds

**Mode** Global Configuration

**Usage notes** SNMP Discovery first uses ARP to discover subnets that are reachable from the AMF node. This polling happens every 60 seconds by default. Use this command to change the polling interval.

**Examples** To configure the SNMP Discovery ARP polling interval to 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery arp-polling-interval 120
```

To set the SNMP Discovery ARP polling interval back to the default (60 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery arp-polling-interval
```

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery community

**Overview** Use this command to create an SNMP community in read-only mode for SNMPv1 and v2c only.

Use the **no** variant of this command to remove an SNMP community.

**Syntax** `snmp-discovery community <community-name>`

Parameter	Description
<code>&lt;community-name&gt;</code>	The name of the community that can be up to 20 characters long and is case sensitive.

**Default** The SNMP Discovery community name is 'public' by default

**Mode** Global Configuration

**Usage notes** This command creates an SNMP community in read-only mode. The community allows access to all MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used for SNMPv3.

**Examples** To configure an SNMP community named 'accounting', use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery community accounting
```

To set the SNMP community name back to the default (public), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery community
```

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery deny

**Overview** Use this command to prevent ARP requests from being sent. When an interface or IPv4 address is denied, it means an ARP request and SNMP 'get' request will never be sent to that device when the command **service snmp-discovery** is enabled.

Use the **no** variant of this command to remove the configuration.

**Syntax** `snmp-discovery deny interface <interface-range>`  
`snmp-discovery deny ip <ipv4-address>`  
`no snmp-discovery deny interface <interface-range>`  
`no snmp-discovery deny ip <ipv4-address>`

Parameter	Description
<code>interface</code>	Interfaces to deny
<code>&lt;interface-name&gt;</code>	Interface name, for example VLAN2
<code>ip</code>	IP address
<code>&lt;ipv4-address&gt;</code>	IPv4 address to deny

**Default** The AMF management VLAN is denied

**Mode** Global Configuration

**Examples** To configure a deny interface command for VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery deny interface vlan2
```

To stop interface VLAN2 from being denied, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery deny interface vlan2
```

To configure a deny IP command for IP address 192.168.3.2, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery deny ip 192.168.3.2
```

To stop IP address 192.168.3.2 from being denied, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery deny ip 192.168.3.2
```

**Output** Figure 54-6: Example output from **show snmp-discovery ip**

```
awplus#show snmp-discovery ip
SNMP Discovery Devices:
```

IP Address	MAC Address	Type	State	Last Seen Time
192.168.3.2	-	Deny	-	-
1.2.3.6	-	Permit	-	30 Jul, 2020 06:30:55
1.2.3.4	-	Permit	-	31 Jul, 2020 05:49:04
192.168.2.2	3863.bb5c.b900	Dynamic	Up	-

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery permit

**Overview** Use this command if you want to allow SNMP Discovery to do requests on interfaces with greater than 256 members. You can permit a specific IP address.

**Syntax** `snmp-discovery permit ip <ipv4-address>`  
`no snmp-discovery permit ip <ipv4-address>`

Parameter	Description
ip	Internet Protocol (IP)
<ipv4-address>	IPv4 network address

**Default** All IPv4 interfaces with 256 members or less are included in SNMP Discovery.

**Mode** Global Configuration

**Examples** To configure a permit IP command for the address 192.168.3.2, use the commands:

```
awplus# configure terminal  
awplus(config)# snmp-discovery permit ip 192.168.3.2
```

To remove the permit configuration for the address 192.168.3.2, use the commands:

```
awplus# configure terminal  
awplus(config)# no snmp-discovery permit ip 192.168.3.2
```

**Output** Figure 54-7: Example output from **show snmp-discovery ip**

```
awplus#show snmp-discovery ip  
SNMP Discovery Devices:
```

IP Address	MAC Address	Type	State	Last Seen Time
1.2.3.5	-	Deny	-	-
1.2.3.6	-	Permit	-	Jul 27, 2020 03:33:39
1.2.3.4	-	Permit	-	Jul 28, 2020 04:25:05
192.168.2.2	3863.bb5c.b900	Dynamic	Up	-
192.168.3.2	4263.cc3c.b500	permit	Up	-

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery snmp-polling-interval

**Overview** Use this command to change the SNMP request polling interval (in seconds).  
Use the **no** variant of this command to set the SNMP request polling interval back to the default (300 seconds).

**Syntax** `snmp-discovery snmp-polling-interval <60-3600>`  
`no snmp-discovery snmp-polling-interval`

Parameter	Description
<code>&lt;60-3600&gt;</code>	The number of seconds for the SNMP polling interval. From the range 60 to 3600.

**Default** 300 seconds (5 minutes)

**Mode** Global Configuration

**Usage notes** ARP polling and SNMP Discovery uses SNMP 'get' requests to poll the devices discovered by the ARP polling. This polling happens every 300 seconds (5 minutes) by default.

SNMP polling is enabled when **service snmp-discovery** is enabled.

**Examples** To configure the SNMP discovery polling interval to 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery snmp-polling-interval 120
```

To set the SNMP discovery polling interval back to the default (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery snmp-polling-interval
```

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery snmp-version

**Overview** Use this command to set the SNMP version that you are using.  
Use the **no** variant of this command to set the SNMP version back to the default (v2c).

**Syntax** `snmp-discovery snmp-version {v1|v2c|v3}`  
`no snmp-discovery snmp-version`

Parameter	Description
v1	Enter the SNMP version number you are using
v2c	If you are using SNMP version v2c, set the community name with the command <b>snmp-discovery community</b>
v3	If you are using SNMP version v3, set the security with the command <b>snmp-discovery user</b>

**Default** SNMP version v2c

**Mode** Global Configuration

**Usage notes** This command defaults to SNMP version v2c and creates an SNMP community in read-only mode. The community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

If using SNMPv3, you can choose the security level and then the authentication protocol and privacy protocol.

**Examples** To configure SNMP Discovery to use SNMP version 3, use the commands:

```
awplus# configure terminal  
awplus(config)# snmp-discovery snmp-version v3
```

To set the SNMP Discovery SNMP version back to the default (v2c), use the commands:

```
awplus# configure terminal  
awplus(config)# no snmp-discovery snmp-version
```

**Related commands** [service snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery user

**Overview** Use this command to create a user for SNMPv3 'get' requests only.

Use the **no** variant of this command to remove an SNMPv3 user.

**Syntax** `snmp-discovery user <user-name> [encrypted] [auth {md5|sha} <auth-password>] [priv {des|aes} <privacy-password>]`  
`no snmp-discovery user <user-name>`

Parameter	Description
<code>&lt;user-name&gt;</code>	The user name is a string up to 20 characters long and is case sensitive. For example, 'Rodger'.
<code>encrypted</code>	Use the encrypted parameter when you want to enter encrypted passwords.
<code>auth</code>	Authentication protocol that can be either MD5 or SHA.
<code>md5</code>	MD5 Message Digest Algorithms.
<code>sha</code>	SHA Secure Hash Algorithm.
<code>&lt;auth-password&gt;</code>	Authentication password that is a string from 8 to 20 characters and is case sensitive.
<code>priv</code>	Privacy protocol that can be either DES or AES.
<code>des</code>	DES Data Encryption Standard.
<code>aes</code>	AES Advanced Encryption Standards.
<code>&lt;privacy-password&gt;</code>	Privacy password is a string from 8 to 20 characters and is case sensitive.

**Default** No user is configured

**Mode** Global Configuration

**Usage notes** Additionally, this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

The authentication method must match what is used on the devices being configured.

Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configurations stored on the switch.

User passwords are entered using plain text without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.

User passwords are viewed as encrypted passwords in running and startup configurations shown from the **show running-config** and **show startup-config** commands. Copy and paste encrypted passwords from the running configuration or startup configuration to avoid entry errors.

**Examples** To add SNMP Discovery user 'authuser' with authentication protocol 'md5', authentication password 'authpass' privacy protocol 'des' and privacy password privpass, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery user authuser auth md5 Authpass
priv des Privpass
```

To enter existing SNMP user 'authuser' with existing passwords with authentication protocol 'md5' plus the encrypted authentication password '0x1c74b9c22118291b0ce0cd883f8dab6b74', privacy protocol 'des' plus the encrypted privacy password '0x0e0133db5453ebd03822b004eeacb6608f', use the following commands:

*Note Copy and paste the encrypted passwords from the running-config or the startup-config displayed, using the show running-config and show startup-config commands respectively, into the command line to avoid key stroke errors issuing this command.*

```
awplus# configure terminal
awplus(config)# snmp-discovery user authuser encrypted auth
md50x1c74b9c22118291b0ce0cd883f8dab6b74 priv des
0x0e0133db5453ebd03822b004eeacb6608f
```

To delete SNMP user 'authuser', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery user authuser
```

**Output** Figure 54-8: Example output from **show snmp-discovery**

```
awplus#show snmp-discovery
SNMP Discovery information:

SNMP Discovery           : Enabled
SNMP Polling interval    : 300
ARP Polling interval     : 60
SNMP Discovery version   : v3

SNMPv2 Discovery Community : accounting
SNMPv3 Discovery User     : authuser
User Encrypted auth       : md5
User Encrypted password   : 0x1c74b9c22118291b0ce0cd883f8dab6b74

# 55

# Dynamic Host Configuration Protocol (DHCP) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure DHCP.

Note that the DHCP client does not support tunnel interfaces.

For more information, see the [DHCP Feature Overview and Configuration Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

# bootfile

**Overview** This command sets the boot filename for a DHCP server pool. This is the name of the boot file that the client should use in its bootstrap process. It may need to include a path.

The **no** variant of this command removes the boot filename from a DHCP server pool.

**Syntax** bootfile <filename>  
no bootfile

Parameter	Description
<filename>	The boot file name.

**Mode** DHCP Configuration

**Example** To configure the boot filename for a pool P2, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# bootfile boot/main_boot.bt
```

# clear ip dhcp binding

**Overview** This command clears either a specific lease binding or the lease bindings specified by the command or DHCP server. The command will only take effect on dynamically allocated bindings, not statically configured bindings.

**Syntax** `clear ip dhcp binding {ip <ip-address>|mac <mac-address>|all|pool <pool-name>|range <low-ip-address> <high-ip-address>}`

Parameter	Description
<code>ip &lt;ip-address&gt;</code>	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D.
<code>mac &lt;mac-address&gt;</code>	MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH.
<code>all</code>	All DHCP bindings.
<code>pool &lt;pool-name&gt;</code>	Description used to identify DHCP server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks".
<code>range&lt;low-ip-address&gt; &lt;high-ip-address&gt;</code>	IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end of the range.

**Mode** User Exec and Privileged Exec

**Usage** A specific binding may be deleted by **ip** address or **mac** address, or several bindings may be deleted at once using **all**, **pool** or **range**.

Note that if you specify to clear the **ip** or **mac** address of what is actually a static DHCP binding, an error message is displayed. If **all**, **pool** or **range** are specified and one or more static DHCP bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

**Examples** To clear the specific IP address binding 192.168.1.1, use the command:

```
awplus# clear ip dhcp binding ip 192.168.1.1
```

To clear all dynamic DHCP entries, use the command:

```
awplus# clear ip dhcp binding all
```

**Related commands** [show ip dhcp binding](#)

# default-router

**Overview** This command adds a default router to the DHCP address pool you are configuring. You can use this command multiple times to create a list of default routers on the client's subnet. This sets the router details using the pre-defined option 3. Note that if you add a user-defined option 3 using the **option** command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified default router, or all default routers from the DHCP pool.

**Syntax** `default-router <ip-address>`  
`no default-router [<ip-address>]`

Parameter	Description
<code>&lt;ip-address&gt;</code>	IPv4 address of the default router, in dotted decimal notation.

**Mode** DHCP Configuration

**Examples** To add a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# default-router 192.168.1.2
```

To remove a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router 192.168.1.2
```

To remove all routers from the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router
```

# dns-server

**Overview** This command adds a Domain Name System (DNS) server to the DHCP address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6.

Note that if you add a user-defined option 6 using the [option](#) command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified DNS server, or all DNS servers from the DHCP pool.

**Syntax** `dns-server <ip-address>`  
`no dns-server [<ip-address>]`

Parameter	Description
<code>&lt;ip-address&gt;</code>	IPv4 address of the DNS server, in dotted decimal notation.

**Mode** DHCP Configuration

**Examples** To add the DNS server with the assigned IP address 192.168.1.1 to the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# dns-server 192.168.1.1
```

To remove the DNS server with the assigned IP address 192.168.1.1 from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server 192.168.1.1
```

To remove all DNS servers from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server
```

**Related commands**

- [default-router](#)
- [option](#)
- [service dhcp-server](#)
- [show ip dhcp pool](#)
- [subnet-mask](#)

# domain-name

**Overview** This command adds a domain name to the DHCP address pool you are configuring. Use this command to specify the domain name that a client should use when resolving host names using the Domain Name System. This sets the domain name details using the pre-defined option 15.

Note that if you add a user-defined option 15 using the [option](#) command, then you will override any settings created with this command.

The **no** variant of this command removes the domain name from the address pool.

**Syntax** `domain-name <domain-name>`  
`no domain-name`

Parameter	Description
<code>&lt;domain-name&gt;</code>	The domain name you wish to assign the DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

**Mode** DHCP Configuration

**Examples** To add the domain name `Nerv_Office` to DHCP pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# domain-name Nerv_Office
```

To remove the domain name `Nerv_Office` from DHCP pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no domain-name Nerv_Office
```

**Related commands**

- [default-router](#)
- [dns-server](#)
- [option](#)
- [service dhcp-server](#)
- [show ip dhcp pool](#)
- [subnet-mask](#)

# host (DHCP)

**Overview** This command adds a static host address to the DHCP address pool you are configuring. The client with the matching MAC address is permanently assigned this IP address. No other clients can request it.

The **no** variant of this command removes the specified host address from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

**Syntax** `host <ip-address> <mac-address>`  
`no host <ip-address>`  
`no host all`

Parameter	Description
<code>&lt;ip-address&gt;</code>	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D
<code>&lt;mac-address&gt;</code>	MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH

**Mode** DHCP Configuration

**Usage** Note that a network/mask must be configured using a **network** command before issuing a **host** command. Also note that a host address must match a network to add a static host address.

**Examples** To add the host at 192.168.1.5 with the MAC address 000a.451d.6e34 to DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# network 192.168.1.0/24
awplus(dhcp-config)# host 192.168.1.5 000a.451d.6e34
```

To remove the host at 192.168.1.5 with the MAC address 000a.451d.6e34 from DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# no host 192.168.1.5 000a.451d.6e34
```

**Related Commands**

- [lease](#)
- [range](#)
- [show ip dhcp pool](#)

# ip address dhcp

**Overview** This command activates the DHCP client on the interface you are configuring. This allows the interface to use the DHCP client to obtain its IP configuration details from a DHCP server on its connected network.

The **client-id** and **hostname** parameters are identifiers that you may want to set in order to interoperate with your existing DHCP infrastructure. If neither option is needed, then the DHCP server uses the MAC address field of the request to identify the host.

The DHCP client supports the following IP configuration options:

- Option 1— the subnet mask for your device.
- Option 3— a list of default routers.
- Option 6 — a list of DNS servers. This list appends the DNS servers set on your device with the [ip name-server](#) command.
- Option 15—a domain name used to resolve host names. This option replaces the domain name set with the [ip domain-name](#) command. Your device ignores this domain name if it has a domain list set using the [ip domain-list](#) command.
- Option 51—lease expiration time.

The **no** variant of this command stops the interface from obtaining IP configuration details from a DHCP server.

**Syntax** `ip address dhcp [client-id <interface>] [hostname <hostname>]`  
`no ip address dhcp`

Parameter	Description
<code>client-id</code> <code>&lt;interface&gt;</code>	The name of the interface you are activating the DHCP client on. If you specify this, then the MAC address associated with the specified interface is sent to the DHCP server in the optional identifier field. Default: no default
<code>hostname</code> <code>&lt;hostname&gt;</code>	The hostname for the DHCP client on this interface. Typically this name is provided by the ISP. Default: no default

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Examples** To set the interface `vlan2` to use DHCP to obtain an IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address dhcp
```

To stop the interface vlan2 from using DHCP to obtain its IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip address dhcp
```

**Related commands**

- [ip address \(IP Addressing and Protocol\)](#)
- [show ip interface](#)
- [show running-config](#)

# ip dhcp bootp ignore

**Overview** This command configures the DHCP server to ignore any BOOTP requests it receives. The DHCP server accepts BOOTP requests by default.

The **no** variant of this command configures the DHCP server to accept BOOTP requests. This is the default setting.

**Syntax** ip dhcp bootp ignore  
no ip dhcp bootp ignore

**Mode** Global Configuration

**Examples** To configure the DHCP server to ignore BOOTP requests, use the commands:

```
awplus# configure terminal  
awplus(config)# ip dhcp bootp ignore
```

To configure the DHCP server to respond to BOOTP requests, use the commands:

```
awplus# configure terminal  
awplus(config)# no ip dhcp bootp ignore
```

**Related commands** [show ip dhcp server summary](#)

# ip dhcp leasequery enable

**Overview** Use this command to enable the DHCP server to respond to DHCPLEASEQUERY packets. Enabling the DHCP leasequery feature allows a DHCP Relay Agent to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

Use the **no** variant of this command to disable the support of DHCPLEASEQUERY packets.

For more information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** ip dhcp leasequery enable  
no ip dhcp leasequery enable

**Default** DHCP leasequery support is disabled by default.

**Mode** Global Configuration

**Examples** To enable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp leasequery enable
```

To disable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp leasequery enable
```

**Related commands** [show counter dhcp-server](#)  
[show ip dhcp server statistics](#)  
[show ip dhcp server summary](#)

# ip dhcp option

**Overview** This command creates a user-defined DHCP option. Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

You can use this option when configuring a DHCP pool, by using the [option](#) command.

The **no** variant of this command removes either the specified user-defined option, or removes all user-defined options. This also automatically removes the user-defined options from the associated DHCP address pools.

**Syntax** `ip dhcp option <1-254> [name <option-name>] [<option-type>]`  
`no ip dhcp option [<1-254>|<option-name>]`

Parameter	Description										
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.										
<option-name>	Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". Default: no default										
<option-type>	The option value. You must specify a value that is appropriate to the option type: <table border="1"><tbody><tr><td>ascii</td><td>An ASCII text string</td></tr><tr><td>hex</td><td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td></tr><tr><td>ip</td><td>An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.</td></tr><tr><td>integer</td><td>A number from 0 to 4294967295.</td></tr><tr><td>flag</td><td>A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b>, <b>on</b>, or <b>enabled</b> will set the flag. <b>false</b>, <b>off</b> or <b>disabled</b> will unset the flag.</td></tr></tbody></table>	ascii	An ASCII text string	hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.	ip	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.	integer	A number from 0 to 4294967295.	flag	A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.
ascii	An ASCII text string										
hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.										
ip	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.										
integer	A number from 0 to 4294967295.										
flag	A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.										

**Mode** Global Configuration

**Examples** To define a user-defined ASCII string option as option 66, without a name, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name "tcpip-node-type", use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name special-address, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option 12
```

To remove the specific user-defined option with the option name perform-router-discovery, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option perform-router-discovery
```

To remove all user-defined option definitions, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option
```

**Related commands**

[default-router](#)

[domain-name](#)  
[option](#)  
[service dhcp-server](#)  
[show ip dhcp server summary](#)  
[subnet-mask](#)

# ip dhcp pool

**Overview** This command will enter the configuration mode for the pool name specified. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCP configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCP pools on devices with multiple interfaces. This allows the device to act as a DHCP server on multiple interfaces to distribute different information to clients on the different networks.

The **no** variant of this command deletes the specific DHCP pool.

**Syntax** `ip dhcp pool <pool-name>`  
`no ip dhcp pool <pool-name>`

Parameter	Description
<code>&lt;pool-name&gt;</code>	Description used to identify this DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

**Mode** Global Configuration

**Example** To create the DHCP pool named P2 and enter DHCP Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)#
```

To delete the DHCP pool named P2, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp pool P2
```

**Related commands** [service dhcp-server](#)

# ip dhcp-client default-route distance

**Overview** Use this command to specify an alternative Administrative Distance (AD) for the current default route (from DHCP) for an interface.

Use the **no** variant of this command to set the AD back to the default of 1.

**Syntax** `ip dhcp-client default-route distance [<1-255>]`  
`no ip dhcp-client default-route distance`

Parameter	Description
<1-255>	Administrative Distance (AD) from the range 1 though 255.

**Default** 1

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** DHCP client interfaces can automatically add a default route with an AD of 1 into the IP Routing Information Base (RIB).

Any pre-existing default route(s) via alternative interfaces (configured with a higher AD) will no longer be selected as the preferred forwarding path for traffic when the DHCP based default route is added to the IP routing table.

This can be problematic if the DHCP client is operating via an interface that is only intended to be used for back-up interface redundancy purposes, such as a VLAN containing a single switchport, or a 4G cellular interface on an AR-Series Firewall.

Use this command to set the AD of the default route (via a specific DHCP client interface) to a non-default (higher cost) value, ensuring any pre-existing default route(s) via any other interface(s) continue to be selected as the preferred forwarding path for network traffic.

When the command is used, the static default route is deleted from the RIB, the distance value of the route is modified to the configured distance value, then it is reinstalled into the RIB.

**Examples** To set the AD for the default route added by DHCP via cellular interface wwan0 to 150, use the commands:

```
awplus# configure terminal
awplus(config)# interface wwan0
awplus(config-if)# ip dhcp-client default-route distance 150
```

To set the AD for the default route back to the default value of 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface wwan0
awplus(config-if)# no ip dhcp-client default-route distance
```

**Related commands** [show ip route](#)  
[show ip route database](#)

**Command changes** Version 5.4.7-0.2 Command added.

# ip dhcp-client request vendor-identifying-specific

**Overview** Use this command to add vendor-identifying vendor-specific information (option 125) requests to the DHCP discovery packets sent by an interface. This option, along with option 124, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-specific request from an interface.

**Syntax** `ip dhcp-client request vendor-identifying-specific`  
`no ip dhcp-client request vendor-identifying-specific`

**Default** The vendor-identifying-specific request is not configured by default.

**Mode** Interface Configuration

**Usage notes** The DHCP client must be activated on the interface, using the [ip address dhcp](#) command, so that DHCP discovery packets are sent.

**Example** To add the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-client request
vendor-identifying-specific
```

To remove the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client request
vendor-identifying-specific
```

**Related commands** [ip address dhcp](#)  
[ip dhcp-client vendor-identifying-class](#)

**Command changes** Version 5.4.7-2.1: command added

# ip dhcp-client vendor-identifying-class

**Overview** Use this command to add a vendor-identifying vendor class (option 124) to the DHCP discovery packets sent by an interface. This option places the Allied Telesis Enterprise number (207) into the discovery packet. Option 124, along with option 125, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-class from an interface.

**Syntax** `ip dhcp-client vendor-identifying-class`  
`no ip dhcp-client vendor-identifying-class`

**Default** The vendor-identifying-class is not configured by default.

**Mode** Interface Configuration

**Usage notes** The DHCP client must be activated on the interface, using the [ip address dhcp](#) command, so that DHCP discovery packets are sent.

**Example** To remove the vendor-identifying-class on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client vendor-identifying-class
```

**Related commands** [ip address dhcp](#)  
[ip dhcp-client request vendor-identifying-specific](#)

**Command changes** Version 5.4.7-2.1: command added

# ip dhcp-relay agent-option

**Overview** This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.*

**Syntax**

```
ip dhcp-relay agent-option
no ip dhcp-relay agent-option
```

**Default** DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage notes** Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the [ip dhcp-relay max-message-length](#) command.

**Examples** To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

To make the relay agent listening on PPP interface ppp0 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the relay agent from appending the DHCP Relay Agent Option 82 field on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip dhcp-relay agent-option
```

**Related commands**

- [ip dhcp-relay agent-option remote-id](#)
- [ip dhcp-relay information policy](#)
- [ip dhcp-relay max-message-length](#)
- [service dhcp-relay](#)

# ip dhcp-relay agent-option checking

**Overview** This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that [ip dhcp-relay agent-option](#) must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option checking`  
`no ip dhcp-relay agent-option checking`

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples** To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

To make the relay agent listening on PPP interface ppp0 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the relay agent from checking the DHCP Relay Agent Information Option (Option 82) field on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip dhcp-relay agent-option checking
```

**Related commands**

- `ip dhcp-relay agent-option`
- `ip dhcp-relay agent-option remote-id`
- `ip dhcp-relay information policy`
- `service dhcp-relay`

# ip dhcp-relay agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option remote-id <remote-id>`  
`no ip dhcp-relay agent-option remote-id`

Parameter	Description
<code>&lt;remote-id&gt;</code>	An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed.

**Default** The Remote ID is set to the device's MAC address by default.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage notes** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

**Examples** To set the Remote ID to myid for client DHCP packets received on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

To set the Remote ID to myid for client DHCP packets received on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0 timeslots all
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0 timeslots all
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [show ip dhcp-relay](#)

# ip dhcp-relay information policy

**Overview** This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.

**Syntax** `ip dhcp-relay information policy {append|drop|keep|replace}`  
`no ip dhcp-relay information policy`

Parameter	Description
append	The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.
drop	The DHCP Relay Agent discards the packet.
keep	The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.
replace	The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples** To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [service dhcp-server](#)

# ip dhcp-relay maxhops

**Overview** This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay maxhops <1-255>`  
`no ip dhcp-relay maxhops`

Parameter	Description
<1-255>	The maximum hop count value.

**Default** The default hop count threshold is 10 hops.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Example** To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay max-message-length

**Overview** This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay max-message-length <548-1472>`  
`no ip dhcp-relay max-message-length`

Parameter	Description
<548-1472>	The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes).

**Default** The default is 1400 bytes.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage notes** When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

**NOTE:** Before setting this command, you must first run the `ip dhcp-relay agent-option` command. This will allow the DHCP Relay Agent Option 82 fields to be appended.

**Example** To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface `vlan2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay server-address

**Overview** This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>  
<server-interface>}`  
`no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>  
<server-interface>}`  
`no ip dhcp-relay`

Parameter	Description
<code>&lt;ipv4-address&gt;</code>	Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D.
<code>&lt;ipv6-address&gt;</code>	Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.
<code>&lt;server-interface&gt;</code>	Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage notes** For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the [service dhcp-relay](#) command to enable the DHCP Relay Agent on your device. The [ip dhcp-relay server-address](#) command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

**Examples** To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay use-client-side-address

**Overview** Use this command to configure DHCP-Relay to use the client-side interface (that is the interface receiving the DHCP client packets) IP address as the source address of the relayed DHCP packets.

Use the **no** variant of this command to disable the use of the client-side interface IP address as the source IP address for relayed DHCP packets.

**Syntax** `ip dhcp-relay use-client-side-address`  
`no ip dhcp-relay use-client-side-address`

Parameter	Description
<code>use-client-side-address</code>	Use the client side interface IP address as the source IP address for relayed DHCP packets.

**Default** By default, the server-side interface IP address is used as the source IP address of DHCP relayed packets.

**Mode** Global Configuration

**Usage notes** In most cases, there are filters placed between the DHCP relay and DHCP server which only allow DHCP packets from the client subnet to the server and back. This command allows you to configure the DHCP relay so that the relay will use the IP address of the interface **receiving** clients DHCP requests to be used as the source IP address of the relayed DHCP packets.

**Example** To configure the client-side IP address as the source IP address of DHCP relayed packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp-relay use-client-side-address
```

**Output** Figure 55-1: Example output from **show ip dhcp-relay**

Note that the second line of the display output shows the status of the client-side address being enabled as the source IP address.

```
awplus#sh ip dhcp-relay

DHCP Relay Service is enabled
Use of client side address as source address is enabled

vlan2 is down, line protocol is down
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
Insertion of Subscriber-ID auto-MAC is disabled
The Remote Id string for Relay Agent Option is 0000.0000.0000
Relay Information policy is to replace existing relay agent information
List of servers : 10.1.1.100
```

**Related commands** [ip dhcp-relay server-address](#)

**Command changes** Version 5.4.9-0.7: command added

# lease

**Overview** This command sets the expiration time for a leased address for the DHCP address pool you are configuring. The time set by the days, hours, minutes and seconds is cumulative. The minimum total lease time that can be configured is 20 seconds. The maximum total lease time that can be configured is 120 days.

Note that if you add a user-defined option 51 using the `option` command, then you will override any settings created with this command. Option 51 specifies a lease time of 1 day.

Use the **infinite** parameter to set the lease expiry time to infinite (leases never expire).

Use the **no** variant of this command to return the lease expiration time back to the default of one day.

**Syntax** `lease <days> <hours> <minutes> [<seconds>]`  
`lease infinite`  
`no lease`

Parameter	Description
<code>&lt;days&gt;</code>	The number of days, from 0 to 120, that the lease expiry time is configured for. Default: 1
<code>&lt;hours&gt;</code>	The number of hours, from 0 to 24, that the lease expiry time is configured for. Default: 0
<code>&lt;minutes&gt;</code>	The number of minutes, from 0 to 60, the lease expiry time is configured for. Default: 0
<code>&lt;seconds&gt;</code>	The number of seconds, from 0 to 60, the lease expiry time is configured for.
<code>infinite</code>	The lease never expires.

**Default** The default lease time is 1 day.

**Mode** DHCP Configuration

**Examples** To set the lease expiration time for address pool P2 to 35 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# lease 0 0 35
```

To set the lease expiration time for the address pool `Nerv_Office` to 1 day, 5 hours, and 30 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# lease 1 5 30
```

To set the lease expiration time for the address pool `P3` to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P3
awplus(dhcp-config)# lease 0 0 0 20
```

To set the lease expiration time for the pool to never expire, use the command:

```
awplus(dhcp-config)# lease infinite
```

To return the lease expiration time to the default of one day, use the command:

```
awplus(dhcp-config)# no lease
```

**Related  
commands**

[option](#)  
[service dhcp-server](#)  
[short-lease-threshold](#)

# network (DHCP)

**Overview** This command sets the network (subnet) that the DHCP address pool applies to. The **no** variant of this command removes the network (subnet) from the DHCP address pool.

**Syntax** network  
{<ip-subnet-address/prefix-length> | <ip-subnet-address/mask>}  
no network

Parameter	Description
<ip-subnet-address/prefix-length>	The IPv4 subnet address in dotted decimal notation followed by the prefix length in slash notation.
<ip-subnet-address/mask>	The IPv4 subnet address in dotted decimal notation followed by the subnet mask in dotted decimal notation.

**Mode** DHCP Configuration

**Usage notes** This command will fail if it would make existing ranges invalid. For example, if they do not lie within the new network you are configuring.

The **no** variant of this command will fail if ranges still exist in the pool. You must remove all ranges in the pool before issuing a **no network** command to remove a network from the pool.

**Examples** To configure a network for the address pool P2, where the subnet is 192.0.2.5 and the mask is 255.255.255.0, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5/24
```

or you can use dotted decimal notation instead of slash notation for the subnet-mask:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5 255.255.255.0
```

**Related commands** [service dhcp-server](#)  
[subnet-mask](#)

## next-server

**Overview** This command sets the next server address for a DHCP server pool. It is the address of the next server that the client should use in its bootstrap process.

The **no** variant of this command removes the next server address from the DHCP address pool.

**Syntax** `next-server <ip-address>`  
`no next-server`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The server IP address, entered in dotted decimal notation.

**Mode** DHCP Configuration

**Example** To set the next-server address for the address pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# next-server 192.0.2.2
```

# option

**Overview** This command adds a user-defined option to the DHCP address pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value. Options with an **ip** type can hold a list of IP addresses or masks (i.e. entries that have the A.B.C.D address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IP addresses.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

The **no** variant of this command removes the specified user-defined option from the DHCP pool, or all user-defined options from the DHCP pool.

**Syntax** `option [<1-254>|<option-name>] <option-value>`  
`no option [<1-254>|<option-value>]`

Parameter	Description								
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.								
<option-name>	Option name associated with the option.								
<option-value>	The option value. You must specify a value that is appropriate to the option type: <table border="1" data-bbox="710 1261 1423 1751"> <tbody> <tr> <td>hex</td> <td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td> </tr> <tr> <td>ip</td> <td>An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.</td> </tr> <tr> <td>integer</td> <td>A number from 0 to 4294967295.</td> </tr> <tr> <td>flag</td> <td>A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.</td> </tr> </tbody> </table>	hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.	ip	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.	integer	A number from 0 to 4294967295.	flag	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.
hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.								
ip	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.								
integer	A number from 0 to 4294967295.								
flag	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.								

**Mode** DHCP Configuration

**Examples** To add the ASCII-type option named `tftp-server-name` to the pool P2 and give the option the value `server1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tftp-server-name server1
```

To add the hex-type option named `tcpiip-node-type` to the pool P2 and give the option the value `08af`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tcpiip-node-type 08af
```

To add multiple IP addresses for the ip-type option 175, use the command:

```
awplus(dhcp-config)# option 175 192.0.2.6
awplus(dhcp-config)# option 175 192.0.2.12
awplus(dhcp-config)# option 175 192.0.2.33
```

To add the option 179 to a pool, and give the option the value `123456`, use the command:

```
awplus(dhcp-config)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the command:

```
awplus(dhcp-config)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the command:

```
awplus(dhcp-config)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the command:

```
awplus(dhcp-config)# no option tftp-server-name
```

**Related  
commands**

[dns-server](#)

[ip dhcp option](#)

[lease](#)

[service dhcp-server](#)

[show ip dhcp pool](#)

# probe enable

**Overview** Use this command to enable lease probing for a DHCP pool. Probing is used by the DHCP server to check if an IP address it wants to lease to a client is already being used by another host.

The **no** variant of this command disables probing for a DHCP pool.

**Syntax** probe enable  
no probe enable

**Default** Probing is enabled by default.

**Mode** DHCP Pool Configuration

**Examples** To enable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe enable
```

To disable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe enable
```

**Related commands**

- [ip dhcp pool](#)
- [probe packets](#)
- [probe timeout](#)
- [probe type](#)
- [show ip dhcp pool](#)

# probe packets

**Overview** Use this command to specify the number of packets sent for each lease probe. Lease probing is configured on a per-DHCP pool basis. When set to 0 probing is effectively disabled.

The **no** variant of this command sets the number of probe packets sent to the default of 5.

**Syntax** `probe packets <0-10>`  
`no probe packets`

Parameter	Description
<0-10>	The number of probe packets sent.

**Default** The default is 5.

**Mode** DHCP Pool Configuration

**Examples** To set the number of probe packets to 2 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe packets 2
```

To set the number of probe packets to the default 5 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe packets
```

**Related commands** [probe enable](#)  
[probe timeout](#)  
[probe type](#)  
[show ip dhcp pool](#)

# probe timeout

**Overview** Use this command to set the timeout value in milliseconds that the server waits for a response after each probe packet is sent. Lease probing is configured on a per-DHCP pool basis.

The **no** variant of this command sets the probe timeout value to the default setting, 200 milliseconds.

**Syntax** `probe timeout <50-5000>`  
`no probe timeout`

Parameter	Description
<50-5000>	Timeout interval in milliseconds.

**Default** The default timeout interval is 200 milliseconds.

**Mode** DHCP Pool Configuration

**Examples** To set the probe timeout value to 500 milliseconds for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe timeout 500
```

To set the probe timeout value for pool P2 to the default, 200 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe timeout
```

**Related commands** [probe enable](#)  
[probe packets](#)  
[probe type](#)  
[show ip dhcp pool](#)

# probe type

**Overview** Use this command to set the probe type for a DHCP pool. The probe type specifies how the DHCP server checks whether an IP address is being used by other hosts, referred to as lease probing. If **arp** is specified, the server sends an ARP request to determine if an address is in use. If **ping** is specified, the server will send an ICMP Echo Request (ping).

The **no** variant of this command sets the probe type to the default setting, ping.

**Syntax** probe type {arp|ping}  
no probe type

Parameter	Description
arp	Probe using ARP.
ping	Probe using ping.

**Default** The default probe type is ping.

**Mode** DHCP Pool Configuration

**Examples** To set the probe type to arp for the pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe type arp
```

To set the probe type for the pool P2 to the default, ping, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe type
```

**Related commands**

- [probe enable](#)
- [probe packets](#)
- [probe timeout](#)
- [show ip dhcp pool](#)

# range

**Overview** This command adds an address range to the DHCP address pool you are configuring. The DHCP server responds to client requests received from the pool's network. It assigns an IP addresses within the specified range. The IP address range must lie within the network. You can add multiple address ranges and individual IP addresses for a DHCP pool by using this command multiple times.

The **no** variant of this command removes an address range from the DHCP pool. Use the **no range all** command to remove all address ranges from the DHCP pool.

**Syntax** `range <ip-address> [<ip-address>]`  
`no range <ip-address> [<ip-address>]`  
`no range all`

Parameter	Description
<code>&lt;ip-address&gt;</code>	IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end. Specify only one IP address to add an individual IP address to the address pool.

**Mode** DHCP Configuration

**Examples** To add an address range of 192.0.2.5 to 192.0.2.16 to the pool `Nerv_Office`, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# range 192.0.2.5 192.0.2.16
```

To add the individual IP address 192.0.2.2 to a pool, use the command:

```
awplus(dhcp-config)# range 192.0.2.2
```

To remove all address ranges from a pool, use the command:

```
awplus(dhcp-config)# no range all
```

**Related commands**

- `ip dhcp pool`
- `service dhcp-server`
- `show ip dhcp pool`

# route

**Overview** This command allows the DHCP server to provide static routes to clients.

**Syntax** `route A.B.C.D/M A.B.C.D {both|opt249|rfc3442}`

Parameter	Description
A.B.C.D/M	Subnet for the route
A.B.C.D	Next hop for the route
both	opt249 and rft3442
opt249	Classless static route option for DHCP
rfc3442	Classless static route option for DHCP

**Mode** DHCP Configuration

**Examples** To distribute static routes for route 0.0.0.0/0 whose next hop is 192.16.1.1 to clients using both opt249 and rfc3442, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool public
awplus(dhcp-config)# route 0.0.0.0/0 192.16.1.1 both
```

**Related commands** [ip dhcp pool](#)

# service dhcp-relay

**Overview** This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

**Syntax** `service dhcp-relay`  
`no service dhcp-relay`

**Mode** Global Configuration

**Usage notes** A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

**Default** The DHCP-relay service is enabled by default.

**Examples** To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

- [ip dhcp-relay server-address](#)

# service dhcp-server

**Overview** This command enables the DHCP server on your device. The server then listens for DHCP requests on all IP interfaces. It will not run if there are no IP interfaces configured.

The **no** variant of this command disables the DHCP server.

**Syntax** `service dhcp-server`  
`no service dhcp-server`

**Mode** Global Configuration

**Example** To enable the DHCP server, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-server
```

**Related commands** [ip dhcp pool](#)  
[show ip dhcp server summary](#)  
[subnet-mask](#)

# short-lease-threshold

**Overview** Use this command to configure a short lease threshold.

Use the **no** variant of this command to return the short lease threshold to the default of one minute.

**Syntax** `short-lease-threshold <hours> <minutes>`  
`no short-lease-threshold`

Parameter	Description
<code>&lt;hours&gt;</code>	The number of hours, from 0 to 24.
<code>&lt;minutes&gt;</code>	The number of minutes, from 0 to 60.

**Default** 1 minute.

**Mode** DHCP Configuration

**Usage notes** DHCP leases need to be backed up in NVS so that when the DHCP server reboots or goes through a power cycle it won't lose all the knowledge of these leases.

Some networks have a high number of mobile devices repeatedly requesting DHCP leases every few seconds before their existing lease expires. This can happen for example, when mobile devices move in and out of a Wi-Fi zone or when Wi-Fi signal strength changes. This means the same IP address can have multiple lease entries which can take up unnecessary backup file space.

The **short-lease-threshold** command allows you to configure the threshold for a short lease, from 1 minute to 24 hours. Any lease less than the threshold is deemed to be a short lease and will NOT be backed up to NVS.

This is useful if you have:

- limited backup file space, and
- you don't need to restore leases after a device reboot or power cycle

**Example** To set the short lease threshold for address pool P2 to 40 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# short-lease-threshold 0 40
```

To set the short lease threshold for address pool Nerv\_Office to 5 hours and 35 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# short-lease-threshold 5 35
```

To return the short lease threshold to the default of one minute, use the following commands:

```
awplus# configure terminal  
awplus(config)# no short-lease-threshold
```

# show counter dhcp-client

**Overview** This command shows counters for the DHCP client on your device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show counter dhcp-client

**Mode** User Exec and Privileged Exec

**Example** To display the message counters for the DHCP client on your device, use the command:

```
awplus# show counter dhcp-client
```

**Output** Figure 55-2: Example output from the **show counter dhcp-client** command

```
show counter dhcp-client
DHCPDISCOVER out      ..... 10
DHCPREQUEST out       ..... 34
DHCPCDECLINE out      ..... 4
DHCPRELEASE out       ..... 0
DHCPOFFER in          ..... 22
DHCPACK in             ..... 18
DHCPNAK in             ..... 0
```

**Table 1:** Parameters in the output of the **show counter dhcp-client** command

Parameter	Description
DHCPDISCOVER out	The number of DHCP Discover messages sent by the client.
DHCPREQUEST out	The number of DHCP Request messages sent by the client.
DHCPCDECLINE out	The number of DHCP Decline messages sent by the client.
DHCPRELEASE out	The number of DHCP Release messages sent by the client.
DHCPOFFER in	The number of DHCP Offer messages received by the client.
DHCPACK in	The number of DHCP Acknowledgement messages received by the client.
DHCPNAK in	The number of DHCP Negative Acknowledgement messages received by the client.

**Related commands** [ip address dhcp](#)

# show counter dhcp-relay

**Overview** This command shows counters for the DHCP Relay Agent on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show counter dhcp-relay

**Syntax (VRF-lite)** show counter dhcp-relay [vrf <vrf-name>|global]

Parameter	Description
vrf	Display the output for a VRF instance
<vrf-name>	The name of the specific VRF instance.
global	Display the output for the Global VRF instance

**Mode** User Exec and Privileged Exec

**Examples** To display counters for the DHCP Relay Agent on your device, use the following command:

```
awplus# show counter dhcp-relay
```

**Output** Figure 55-3: Example output from the **show counter dhcp-relay** command

```
awplus#show counter dhcp-relay

Invalid hlen ..... 0
Bogus giaddr ..... 0
Corrupt Agent Option ..... 0
Missing Agent Option ..... 0
Bad Circuit ID ..... 0
Missing Circuit ID ..... 0
Option Insert Failed ..... 0
```

Parameter	Description
Requests In	The number of DHCP Request messages received from clients.
Replies In	The number of DHCP Reply messages received from servers.
Relayed To Server	The number of DHCP Request messages relayed to servers.
Relayed To Client	The number of DHCP Reply messages relayed to clients.
Out To Server Failed	The number of failures when attempting to send request messages to servers. This is an internal debugging counter.
Out To Client Failed	The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.
Invalid hlen	The number of incoming messages dropped due to an invalid hlen field.
Bogus giaddr	The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.
Corrupt Agent Option	The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.

Parameter	Description
Missing Agent Option	The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Bad Circuit ID	The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Missing Circuit ID	The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Bad Remote ID	The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Missing Remote ID	The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.

Parameter	Description
Option Insert Failed	The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when: <ul style="list-style-type: none"><li>the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the <code>ip dhcp-relay information policy</code> command.</li><li>there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.</li></ul>
Note that the following parameters are only used on the Global VRF instance when DHCPv6 is running	
DHCPv6 Requests In	The number of incoming DHCPv6 Request messages.
DHCPv6 Replies In	The number of incoming DHCPv6 Reply messages.
DHCPv6 Relayed to Server	The number of DHCPv6 messages relayed to the server.
DHCPv6 Relayed to Client	The number of DHCPv6 messages relayed to the client.

# show counter dhcp-server

**Overview** This command shows counters for the DHCP server on your device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show counter dhcp-server

**Mode** User Exec and Privileged Exec

**Example** To display counters for the DHCP server on your device, use the command:

```
awplus# show counter dhcp-server
```

**Output** Figure 55-5: Example output from the **show counter dhcp-server** command

DHCP server counters		
DHCPDISCOVER in	.....	20
DHCPREQUEST in	.....	12
DHCPDECLINE in	.....	1
DHCPRELEASE in	.....	0
DHCPINFORM in	.....	0
DHCPOFFER out	.....	8
DHCPACK out	.....	4
DHCPNAK out	.....	0
BOOTREQUEST in	.....	0
BOOTREPLY out	.....	0

**Table 2:** Parameters in the output of the **show counter dhcp-server** command

Parameter	Description
DHCPDISCOVER in	The number of Discover messages received by the DHCP server.
DHCPREQUEST in	The number of Request messages received by the DHCP server.
DHCPDECLINE in	The number of Decline messages received by the DHCP server.
DHCPRELEASE in	The number of Release messages received by the DHCP server.
DHCPINFORM in	The number of Inform messages received by the DHCP server.
DHCPOFFER out	The number of Offer messages sent by the DHCP server.
DHCPACK out	The number of Acknowledgement messages sent by the DHCP server.

**Table 2:** Parameters in the output of the **show counter dhcp-server** command

Parameter	Description
DHCNPAK out	The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool.
BOOTREQUEST in	The number of bootp messages received by the DHCP server from bootp clients.
BOOTREPLY out	The number of bootp messages sent by the DHCP server to bootp clients.

**Related commands**

- service dhcp-server
- show ip dhcp binding
- show ip dhcp server statistics
- show ip dhcp pool

# show dhcp lease

**Overview** This command shows details about the leases that the DHCP client has acquired from a DHCP server for interfaces on the device.

For information on filtering and saving command output, see “Controlling “show” Command Output” in the “Getting Started with AlliedWare\_Plus” Feature Overview and Configuration Guide.

**Syntax** `show dhcp lease [<interface>]`

Parameter	Description
<interface>	Interface name to display DHCP lease details for.

**Mode** User Exec and Privileged Exec

**Example** To show the current lease expiry times for all interfaces, use the command:

```
awplus# show dhcp lease
```

To show the current lease for vlan1, use the command:

```
awplus# show dhcp lease vlan1
```

**Output** Figure 55-6: Example output from the **show dhcp lease vlan1** command

```
Interface vlan1
-----
IP Address:                192.168.22.4

# show ip dhcp binding

**Overview** This command shows the lease bindings that the DHCP server has allocated clients.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp binding [<ip-address>|<address-pool>]`

Parameter	Description
<code>&lt;ip-address&gt;</code>	IPv4 address of a leased IP address, in dotted decimal notation. This displays the lease information for the specified IP address.
<code>&lt;address-pool&gt;</code>	Name of an address pool. This displays the lease information for all clients within the address pool.

**Mode** User Exec and Privileged Exec

**Examples** To display all leases for every client in all address pools, use the command:

```
awplus# show ip dhcp binding
```

To display the details for the leased IP address 172.16.2.16, use the command:

```
awplus# show ip dhcp binding 172.16.2.16
```

To display the leases from the address pool MyPool, use the command:

```
awplus# show ip dhcp binding MyPool
```

**Output** Figure 55-7: Example output from the **show ip dhcp binding** command

```

```

**Table 3:** Parameters in the output of the **show ip dhcp pool** command

Parameter	Description
Pool	Name of the pool.
network	Subnet and mask length of the pool.
address ranges	Individual IP addresses and address ranges configured for the pool. The DHCP server can offer clients an IP address from within the specified ranges only. Any of these addresses that match an interface address on the device, or a static host address configured in the pool, will be automatically excluded from the range, and a message to this effect will appear beneath the range entry.

**Table 3:** Parameters in the output of the **show ip dhcp pool** command (cont.)

Parameter	Description
static host addresses	The static host addresses configured on the pool. Each IP address is permanently assigned to the client with the matching MAC address. Any of these addresses that match an interface address on the device will be automatically excluded, and a message to this effect will appear beneath the static host entry.
lease <days:hours:minutes>	The lease duration for address allocated by this pool.
domain	The domain name sent by the pool to clients. This is the domain name that the client should use when resolving host names using DNS.
subnet mask	The subnet mask sent by the pool to clients.
Probe - Status	Whether lease probing is enabled or disabled.
Probe - Type	The lease probe type configured. Either ping or ARP.
Probe - Packets	The number of packets sent for each lease probe in the range 0 to 10.
Probe - Timeout	The timeout value in milliseconds to wait for a response after each probe packet is sent. In the range 50 to 5000.
dns servers	The DNS server addresses sent to by the pool to clients.
default-router(s)	The default router addresses sent by the pool to clients.
user-defined options	The list of user-defined options sent by the pool to clients.
Dynamic addresses- Total	The total number of IP addresses that have been configured in the pool for dynamic allocation to DHCP clients.
Dynamic addresses- Leased	The number of IP addresses in the pool that have been dynamically allocated (leased) to DHCP clients.
Dynamic addresses - Utilization	The percentage of IP addresses in the pool that are currently dynamically allocated to clients.
Static host addresses- Total	The number of static IP addresses configured in the pool for specific DHCP client hosts.
Static host addresses - Leased	The number of static IP addresses assigned to specific DHCP client hosts.

- probe type
- range
- service dhcp-server
- subnet-mask

# show ip dhcp-relay

**Overview** This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp-relay [interface <interface-name>]`

**Syntax (VRF-lite)** `show ip dhcp-relay [vrf <name>|global] [interface <interface-name>]`

Parameter	Description
<interface-name>	Name of a specific interface. This displays the DHCP configuration for the specified interface only.
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
global	The Global VRF instance.

**Mode** User Exec and Privileged Exec

**Example** To display the DHCP Relay Agent’s configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

**Output** Figure 55-11: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers : 192.168.1.200
```

**Output (VRF-lite)** Figure 55-12: Example output from the **show ip dhcp-relay** command applied for VRF instance red

```
DHCP Relay Service is enabled

[VRF: red]
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is enabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay Information policy is to replace existing relay agent
information
List of servers :    192.168.1.3
```

- [ip dhcp-relay agent-option checking](#)
- [ip dhcp-relay information policy](#)
- [ip dhcp-relay maxhops](#)
- [ip dhcp-relay server-address](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip dhcp server statistics

**Overview** This command shows statistics related to the DHCP server.

You can display the server counters using the [show counter dhcp-server](#) command as well as with this command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip dhcp server statistics

**Mode** User Exec and Privileged Exec

**Example** To display the server statistics, use the command:

```
awplus# show ip dhcp server statistics
```

**Output** Figure 55-13: Example output from the **show ip dhcp server statistics** command

```
DHCP server counters
DHCPDISCOVER in      ..... 20
DHCPREQUEST in      ..... 12
DHCPDECLINE in      ..... 1
DHCPRELEASE in      ..... 0
DHCPINFORM in      ..... 0
DHCPOFFER out       ..... 8
DHCPACK out         ..... 4
DHCPNAK out         ..... 0
BOOTREQUEST in      ..... 0
BOOTREPLY out       ..... 0
DHCPLEASEQUERY in   ..... 0
DHCPLEASEUNKNOWN out ..... 0
DHCPLEASEACTIVE out ..... 0
DHCPLEASEUNASSIGNED out ..... 0
```

**Table 4:** Parameters in the output of the **show ip dhcp server statistics** command

Parameter	Description
DHCPDISCOVER in	The number of Discover messages received by the DHCP server.
DHCPREQUEST in	The number of Request messages received by the DHCP server.
DHCPDECLINE in	The number of Decline messages received by the DHCP server.

**Table 4:** Parameters in the output of the **show ip dhcp server statistics** command (cont.)

Parameter	Description
DHCPRELEASE in	The number of Release messages received by the DHCP server.
DHCPINFORM in	The number of Inform messages received by the DHCP server.
DHCPOFFER out	The number of Offer messages sent by the DHCP server.
DHCPACK out	The number of Acknowledgement messages sent by the DHCP server.
DHCPNAK out	The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool.
BOOTREQUEST in	The number of bootp messages received by the DHCP server from bootp clients.
BOOTREPLY out	The number of bootp messages sent by the DHCP server to bootp clients.
DHCPLEASEQUERY in	The number of Lease Query messages received by the DHCP server from DHCP Relay Agents.
DHCPLEASEUNKNOWN out	The number of Lease Unknown messages sent by the DHCP server to DHCP Relay Agents.
DHCPLEASEACTIVE out	The number of Lease Active messages sent by the DHCP server to DHCP Relay Agents.
DHCPLEASEUNASSIGNED out	The number of Lease Unassigned messages sent by the DHCP server to DHCP Relay Agents.

**Related commands**

- [show counter dhcp-server](#)
- [service dhcp-server](#)
- [show ip dhcp binding](#)
- [show ip dhcp pool](#)

# show ip dhcp server summary

**Overview** This command shows the current configuration of the DHCP server. This includes:

- whether the DHCP server is enabled
- whether the DHCP server is configured to ignore BOOTP requests
- whether the DHCP server is configured to support DHCP lease queries
- the details of any user-defined options
- a list of the names of all DHCP address pools currently configured

This show command does not include any configuration details of the address pools. You can display these using the [show ip dhcp pool](#) command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp server summary`

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of the DHCP server, use the command:

```
awplus# show ip dhcp server summary
```

**Output** Figure 55-14: Example output from the **show ip dhcp server summary** command

```
DHCP Server service is disabled
BOOTP ignore is disabled
DHCP leasequery support is disabled
Pool list: p2
```

**Related commands**

- [ip dhcp leasequery enable](#)
- [ip dhcp pool](#)
- [service dhcp-server](#)

# subnet-mask

**Overview** This command sets the subnet mask option for a DHCP address pool you are configuring. Use this command to specify the client's subnet mask as defined in RFC 950. This sets the subnet details using the pre-defined option 1. Note that if you create a user-defined option 1 using the [option](#) command, then you will override any settings created with this command. If you do not specify a subnet mask using this command, then the pool's network mask (specified using the [next-server](#) command) is applied.

The **no** variant of this command removes a subnet mask option from a DHCP pool. The pool reverts to using the pool's network mask.

**Syntax** `subnet-mask <mask>`  
`no subnet-mask`

Parameter	Description
<code>&lt;mask&gt;</code>	Valid IPv4 subnet mask, in dotted decimal notation.

**Mode** DHCP Configuration

**Examples** To set the subnet mask option to 255 . 255 . 255 . 0 for DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# subnet-mask 255.255.255.0
```

To remove the subnet mask option from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no subnet-mask
```

# 56

# DHCP for IPv6 (DHCPv6) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure DHCPv6. For more information, see the [DHCPv6 Feature Overview and Configuration Guide](#).

DHCPv6 is a network protocol used to configure IPv6 hosts with IPv6 addresses and IPv6 prefixes for an IPv6 network. DHCPv6 is used instead of SLAAC (Stateless Address Autoconfiguration) at sites where centralized management of IPv6 hosts is needed. IPv6 routers require automatic configuration of IPv6 addresses and IPv6 prefixes.

DHCPv6 Prefix Delegation provides automatic configuration of IPv6 addresses and IPv6 prefixes.

Note that DHCPv6 client does not support tunnel interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**NOTE:** The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

# address prefix

**Overview** Use this command in DHCPv6 Configuration mode to specify an address prefix for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove the address prefix from the DHCPv6 server pool.

**Syntax** `address prefix <ipv6-prefix/prefix-length> [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]`  
`no address prefix <ipv6-prefix/prefix-length>`

Parameter	Description
<code>&lt;ipv6-prefix/prefix-length&gt;</code>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<code>lifetime</code>	Specify a time period for the hosts to remember router advertisements (RAs). If you specify the optional lifetime parameter with this command then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<code>&lt;valid-time&gt;</code>	Specify a valid lifetime in seconds in the range <5-315360000>. The default valid lifetime is 2592000 seconds.
<code>infinite</code>	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<code>&lt;preferred-time&gt;</code>	Specify a preferred lifetime in seconds in the range <5-315360000>. The default preferred lifetime is 604800 seconds.

**Mode** DHCPv6 Configuration

**Default** The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

**Usage notes** This command creates a pool of prefixes from which addresses are assigned to clients on request, and allocates a network prefix from which the DHCPv6 Server leases addresses. This command is an alternative to using a range set using the [address range](#) command.

The DHCPv6 Server selects an IPv6 address from the range available allocated by the IPv6 prefix, randomly generating the suffix of the IPv6 address, with the specified preferred and valid lifetime leases. Leased IPv6 address are found in the

DHCPv6 Server REPLY packet, which is located within the IANA (Identity Association for Non-temporary Addresses) IA address field in the **REPLY** message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** To add IPv6 address prefix 2001:0db8:1::/48 for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address prefix 2001:0db8:1::/48
```

To remove a configured IPv6 address prefix for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address prefix 2001:0db8:1::/48
```

**Related commands** [address range](#)  
[ipv6 dhcp pool](#)

**Validation Commands** [show ipv6 dhcp binding](#)  
[show ipv6 dhcp pool](#)

# address range

**Overview** Use this command in DHCPv6 Configuration mode to specify an address range for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove an address range from the DHCPv6 server pool.

**Syntax** `address range <first-ipv6-address>  
<last-ipv6-address>[lifetime {<valid-time>|infinite}  
{<preferred-time>|infinite}]  
no address range <first-ipv6-address> <last-ipv6-address>`

Parameter	Description
<code>&lt;first-ipv6-address&gt;</code>	Specify the first IPv6 address of the IPv6 address range, in hexadecimal notation in the format <code>X:X::X:X</code> .
<code>&lt;last-ipv6-address&gt;</code>	Specify the last IPv6 address of the IPv6 address range, in hexadecimal notation in the format <code>X:X::X:X</code> .
<code>lifetime</code>	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<code>&lt;valid-time&gt;</code>	Specify a valid lifetime in seconds in the range <code>&lt;5-31536000&gt;</code> . The default valid lifetime is 2592000 seconds.
<code>infinite</code>	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<code>&lt;preferred-time&gt;</code>	Specify a preferred lifetime in seconds in the range <code>&lt;5-31536000&gt;</code> . The default preferred lifetime is 604800 seconds.

**Default** The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

**Mode** DHCPv6 Configuration

**Usage** Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** To add the IPv6 address range 2001:0db8:1::1 to 2001:0db8:1fff::1 for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address range 2001:0db8:1::1
2001:0db8:1fff::1
```

To remove a configured IPv6 address range for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address range
```

**Related commands** [address prefix](#)  
[ipv6 dhcp pool](#)

**Validation Commands** [show ipv6 dhcp binding](#)  
[show ipv6 dhcp pool](#)

# clear counter ipv6 dhcp-client

**Overview** Use this command in Privileged Exec mode to clear DHCPv6 client counters.

**Syntax** `clear counter ipv6 dhcp-client`

**Mode** Privileged Exec

**Example** To clear DHCPv6 client counters, use the following command:

```
awplus# clear counter ipv6 dhcp-client
```

**Related commands** [show counter ipv6 dhcp-client](#)

# clear counter ipv6 dhcp-server

**Overview** Use this command in Privileged Exec mode to clear DHCPv6 server counters.

**Syntax** `clear counter ipv6 dhcp-server`

**Mode** Privileged Exec

**Example** To clear DHCPv6 server counters, use the following command:

```
awplus# clear counter ipv6 dhcp-server
```

**Related commands** [show counter ipv6 dhcp-server](#)

# clear ipv6 dhcp binding

**Overview** Use this command in Privileged Exec mode to clear either a specific lease binding or the lease bindings as specified by the command parameters. The command will only take effect on dynamically allocated bindings, not statically configured bindings. This command clears binding entries on the DHCPv6 server binding table.

**Syntax** `clear ipv6 dhcp binding {ipv6 <prefix>|duid <DUID>|all|pool <name>}`

Parameter	Description
<code>ipv6 &lt;prefix&gt;</code>	Optional. Specify the IPv6 prefix of the DHCPv6 client, in hexadecimal notation in the format X:X::X:X.
<code>duid &lt;DUID&gt;</code>	Specify the DUID (DHCPv6 unique ID) of the DHCPv6 client.
<code>all</code>	All DHCPv6 bindings.
<code>pool &lt;name&gt;</code>	Description used to identify DHCPv6 server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks".

**Mode** Privileged Exec

**Usage notes** A specific binding may be deleted by **ipv6** address or **duid** address, or several bindings may be deleted at once using **all** or **pool**.

Note that if you specify to clear the **ipv6** or **duid** address of what is actually a static DHCPv6 binding, an error message is displayed. If **all** or **pool** are specified and one or more static DHCPv6 bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

The `clear ipv6 dhcp binding` command is used as a server function. A binding table entry on the DHCPv6 server is automatically:

- Created whenever a prefix is delegated to a client from the configuration pool.
- Updated when the client renews, rebinds, or confirms the prefix delegation.
- Deleted when the client releases all the prefixes in the binding, all prefix lifetimes have expired, or when a user runs the `clear ipv6 dhcp binding` command.

If the **clear ipv6 dhcp binding** command is used with the optional IPv6 address parameter, only the binding for the specified client is deleted. If the **clear ipv6 dhcp binding** command is used without the optional IPv6 address parameter, then all automatic client bindings are deleted from the DHCPv6 bindings table.

**Example** To clear all dynamic DHCPv6 server binding entries, use the command:

```
awplus# clear ipv6 dhcp binding all
```

**Output** Figure 56-1: Example output from the **clear ipv6 dhcp binding all** command

```
awplus#clear ipv6 dhcp binding all
% Deleted 1 entries
```

**Related commands** [show ipv6 dhcp binding](#)

# clear ipv6 dhcp client

**Overview** Use this command in Privileged Exec mode to restart a DHCPv6 client on an interface.

**Syntax** `clear ipv6 dhcp client <interface>`

Parameter	Description
<interface>	Specify the interface name to restart a DHCPv6 client on.

**Mode** Privileged Exec

**Example** To restart a DHCPv6 client on interface vlan1, use the following command:

```
awplus# clear ipv6 dhcp client vlan1
```

**Related commands** [show ipv6 dhcp binding](#)

# dns-server (DHCPv6)

**Overview** Use this command to add a Domain Name System (DNS) server to the DHCPv6 address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6. Note that if you add a user-defined option 6 using the [option \(DHCPv6\)](#) command, then you will override any settings created with this command.

Use the **no** variant of this command to remove either the specified DNS server or all DNS servers from the DHCPv6 pool.

**Syntax** `dns-server <ipv6-address>`  
`no dns-server [<ipv6-address>]`

Parameter	Description
<code>&lt;ipv6-address&gt;</code>	Specify an IPv6 address of the DNS server, in hexadecimal notation in the format <code>x : x : : x : x</code> . This parameter is required when adding a DNS server to the DHCPv6 address pool. All DNS servers are removed from the DHCPv6 pool if you enter the <code>no dns-server</code> command without this parameter.

**Mode** DHCPv6 Configuration

**Examples** To add the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` to the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# dns-server 2001:0db8:3000:3000::32
```

To remove the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` from the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server 2001:0db8:3000:3000::32
```

To remove all DNS servers from the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server
```

**Related  
commands**    `ipv6 dhcp pool`  
                  `option (DHCPv6)`  
                  `show ipv6 dhcp pool`

# domain-name (DHCPv6)

**Overview** Use this command in DHCPv6 Configuration mode to add a domain name to the DHCPv6 server address pool you are configuring.

Use the **no** variant of this command to remove a domain name from the address pool.

**Syntax** `domain-name <domain-name>`  
`no domain-name`

Parameter	Description
<code>&lt;domain-name&gt;</code>	Specify the domain name you wish to assign the DHCPv6 server address pool. Valid characters are printable characters. If the name contains spaces then you must enclose it in "quotation marks".

**Mode** DHCPv6 Configuration

**Usage** This command specifies the domain name that a client should use when resolving host names using the Domain Name System, and sets the domain name details using the pre- defined option 15. Note that if you add a user-defined option 15 using the [option \(DHCPv6\)](#) command, then you will override any settings created with this command.

**Examples** To add the domain name `Engineering` to DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# domain-name Engineering
```

To remove the domain name `Engineering` from DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no domain-name Engineering
```

**Related commands**

- [dns-server \(DHCPv6\)](#)
- [option \(DHCPv6\)](#)
- [show ipv6 dhcp pool](#)

# ip dhcp-relay agent-option

**Overview** This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.*

**Syntax** `ip dhcp-relay agent-option`  
`no ip dhcp-relay agent-option`

**Default** DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage notes** Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the [ip dhcp-relay max-message-length](#) command.

**Examples** To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

To make the relay agent listening on PPP interface ppp0 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the relay agent from appending the DHCP Relay Agent Option 82 field on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip dhcp-relay agent-option
```

**Related commands**

- [ip dhcp-relay agent-option remote-id](#)
- [ip dhcp-relay information policy](#)
- [ip dhcp-relay max-message-length](#)
- [service dhcp-relay](#)

# ip dhcp-relay agent-option checking

**Overview** This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that [ip dhcp-relay agent-option](#) must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option checking`  
`no ip dhcp-relay agent-option checking`

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples** To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

To make the relay agent listening on PPP interface ppp0 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the relay agent from checking the DHCP Relay Agent Information Option (Option 82) field on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip dhcp-relay agent-option checking
```

**Related commands**

- ip dhcp-relay agent-option
- ip dhcp-relay agent-option remote-id
- ip dhcp-relay information policy
- service dhcp-relay

# ip dhcp-relay agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option remote-id <remote-id>`  
`no ip dhcp-relay agent-option remote-id`

Parameter	Description
<code>&lt;remote-id&gt;</code>	An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed.

**Default** The Remote ID is set to the device's MAC address by default.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage notes** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

**Examples** To set the Remote ID to myid for client DHCP packets received on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

To set the Remote ID to myid for client DHCP packets received on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0 timeslots all
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0 timeslots all
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [show ip dhcp-relay](#)

# ip dhcp-relay information policy

**Overview** This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.

**Syntax** `ip dhcp-relay information policy {append|drop|keep|replace}`  
`no ip dhcp-relay information policy`

Parameter	Description
append	The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.
drop	The DHCP Relay Agent discards the packet.
keep	The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.
replace	The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Examples** To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [service dhcp-server](#)

# ip dhcp-relay maxhops

**Overview** This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay maxhops <1-255>`  
`no ip dhcp-relay maxhops`

Parameter	Description
<1-255>	The maximum hop count value.

**Default** The default hop count threshold is 10 hops.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Example** To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay max-message-length

**Overview** This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay max-message-length <548-1472>`  
`no ip dhcp-relay max-message-length`

Parameter	Description
<548-1472>	The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes).

**Default** The default is 1400 bytes.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage notes** When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

**NOTE:** Before setting this command, you must first run the `ip dhcp-relay agent-option` command. This will allow the DHCP Relay Agent Option 82 fields to be appended.

**Example** To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface `vlan2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay server-address

**Overview** This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>  
<server-interface>}`  
`no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>  
<server-interface>}`  
`no ip dhcp-relay`

Parameter	Description
<code>&lt;ipv4-address&gt;</code>	Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D.
<code>&lt;ipv6-address&gt;</code>	Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.
<code>&lt;server-interface&gt;</code>	Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage notes** For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the [service dhcp-relay](#) command to enable the DHCP Relay Agent on your device. The [ip dhcp-relay server-address](#) command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

**Examples** To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

**Related commands** [service dhcp-relay](#)

# ipv6 address (DHCPv6 PD)

**Overview** Use this command in Interface Configuration mode for a VLAN interface to append an IPv6 address suffix to the IPv6 prefix provided by a DHCPv6 Prefix Delegation (PD) server.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

**Syntax** `ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]`  
`no ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]`

Parameter	Description
<code>&lt;ipv6-prefix-name&gt;</code>	The IPv6 prefix name advertised on the router advertisement message sent from the device. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.
<code>&lt;ipv6-addr/prefix-length&gt;</code>	Specifies the IPv6 address to be set, for example <code>::1/64</code> . The IPv6 address uses the format <code>X:X::X:X/Prefix-Length</code> . The prefix-length is usually set between 0 and 64.
<code>[eui64]</code>	EUI-64 is a method of automatically deriving the lower 64 bits of an IPv6 address, based on the switch's MAC address.

**Mode** Interface Configuration for a VLAN or a PPP interface.

**Usage notes** When specifying the **eui64** parameter, the interface identifier of the IPv6 address is derived from the MAC address of the device.

For more information about EUI64, see the [IPv6 Feature Overview and Configuration Guide](#).

**Examples** To configure a PD prefix named `prefix1` on interface `vlan1` and then add an IPv6 address, use the following commands. In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix will be `::1` for the last 64 bits:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1::1/64
```

To configure a PD prefix named `prefix1` on interface `vlan1` and then add an IPv6 address using EUI-64 identifiers, use the following commands. In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix is created from the EUI-64 identifier of the interface for the last 64 bits:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1/64 eui64
```

To assign the IPv6 address `2001:0db8::a2/48` to the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/48
```

To remove the IPv6 address `2001:0db8::a2/48` from the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/48
```

To assign the IPv6 address to the PPP interface `ppp0`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-fr-subif)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address `2001:0db8::a2/64` from the PPP interface `ppp0`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

To assign the **eui64** derived address in the prefix `2001:db8::/64` to VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::/64 eui64
```

To remove the **eui64** derived address in the prefix `2001:db8::/32` from VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::/64 eui64
```

**Validation  
Commands** show running-config  
show ipv6 dhcp binding  
show ipv6 interface  
show ipv6 route

**Related  
commands** ipv6 dhcp client pd  
ipv6 dhcp pool  
ipv6 local pool  
ipv6 nd prefix (DHCPv6)  
prefix-delegation pool

# ipv6 address dhcp

**Overview** Use this command to activate the DHCPv6 client on the interface that you are configuring. This allows the interface to use the DHCPv6 client to obtain its IPv6 configuration details from a DHCPv6 server on its connected network.

The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

Use the **no** variant of this command to stop the interface from obtaining IPv6 configuration details from a DHCPv6 server.

The DHCPv6 client supports the following IP configuration options:

- Option 1—the subnet mask for your device.
- Option 3—a list of default routers.
- Option 6—a list of DNS servers. This list appends the DNS servers set on your device with the [dns-server \(DHCPv6\)](#) command.
- Option 15—a domain name used to resolve host names. This option replaces any domain name that you have set with the [domain-name \(DHCPv6\)](#) command.
- Option 51—lease expiration time.

**Syntax** `ipv6 address dhcp [default-route-to-server]`  
`no ipv6 address dhcp`

Parameter	Description
<code>default-route-to-server</code>	Allow the automatic configuration of a default route to the DHCPv6 server. This option is not enabled by default when you enable the DHCP client on an interface.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** Use the **default-route-to-server** option to allow the automatic configuration of a default route to the DHCPv6 server. Note that this option is not enabled by default when you enable the DHCP client on an interface.

**Examples** To set the interface `vlan2` to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 address dhcp
```

To stop the interface vlan2 from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address dhcp
```

To set the PPP interface ppp0 to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 address dhcp
```

To stop the PPP interface ppp0 from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 address dhcp
```

**Related  
commands**

[clear ipv6 dhcp client  
ipv6 address  
ipv6 address \(DHCPv6 PD\)  
show ipv6 dhcp interface  
show running-config](#)

# ipv6 dhcp client pd

**Overview** Use this command in Interface Configuration mode to enable the DHCPv6 client process and enable requests for prefix delegation through the interface that you are configuring.

Use the **no** variant of this command to disable requests for prefix delegation. This is the default setting.

For further information about DHCPv6 Prefix Delegation, which is used to automate the process of assigning prefixes, see the [DHCPv6 Feature Overview and Configuration Guide](#).

**Syntax** `ipv6 dhcp client pd <prefix-name> <default-route-to-server>`  
`no ipv6 dhcp client pd`

Parameter	Description
<code>&lt;prefix-name&gt;</code>	Specify an IPv6 general prefix name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".
<code>&lt;default-route-to-server&gt;</code>	Specify the default route to the DHCP server

**Mode** Interface Configuration

**Default** Prefix delegation is disabled by default on an interface.

**Usage notes** Entering the **ipv6 dhcp client pd** command starts the DHCPv6 client process if not already running, and enables requests for prefix delegation through the interface on which the command is configured.

When prefix delegation is enabled and a prefix is acquired, the prefix is stored in the IPv6 prefix pool with an internal name defined by the required `<prefix-name>` placeholder parameter. The [ipv6 address](#) command can then refer to the prefixes stored in the IPv6 prefix pool.

**Examples** To enable prefix delegation with the prefix name `prefix-name` on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd my-prefix-name
```

To disable prefix delegation on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp client pd
```

**Related  
commands**

- ipv6 enable
- clear ipv6 dhcp client
- ipv6 address (DHCPv6 PD)
- ipv6 nd prefix (DHCPv6)
- show ipv6 dhcp binding
- show ipv6 dhcp interface

# ipv6 dhcp option

**Overview** Use this command in Global Configuration mode to create a user-defined DHCPv6 option. You can then use this option when configuring a DHCPv6 server address pool, by using the [option \(DHCPv6\)](#) command.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Use the **no** variant of this command to remove either the specified user-defined option. This also removes user-defined options from the associated DHCPv6 server address pools.

**Syntax** `ipv6 dhcp option <1-254> [name <option-name>] [<option-type>]`  
`no ipv6 dhcp option <1-254> |<option-name>`

Parameter	Description										
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.										
<option-name>	Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". Default: no default										
<option-type>	The option value. You must specify a value that is appropriate to the option type: <table border="1"><tbody><tr><td>ascii</td><td>An ASCII text string</td></tr><tr><td>hex</td><td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td></tr><tr><td>ipv6</td><td>An IPv6 address or prefix that has hexadecimal notation in the format HHHH : HHHH : : HHHH : HHHH. To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.</td></tr><tr><td>integer</td><td>A number from 0 to 4294967295.</td></tr><tr><td>flag</td><td>A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b>, <b>on</b>, or <b>enabled</b> will set the flag. <b>false</b>, <b>off</b> or <b>disabled</b> will unset the flag.</td></tr></tbody></table>	ascii	An ASCII text string	hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.	ipv6	An IPv6 address or prefix that has hexadecimal notation in the format HHHH : HHHH : : HHHH : HHHH. To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.	integer	A number from 0 to 4294967295.	flag	A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.
ascii	An ASCII text string										
hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.										
ipv6	An IPv6 address or prefix that has hexadecimal notation in the format HHHH : HHHH : : HHHH : HHHH. To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.										
integer	A number from 0 to 4294967295.										
flag	A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.										

**Mode** Global Configuration

**Examples** To define a user-defined ASCII string option as option 66, without a name, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name "tcpip-node-type", use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name special-address, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option 12
```

To remove the specific user-defined option with the option name perform-router-discovery, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option perform-router-discovery
```

**Related commands**

[dns-server \(DHCPv6\)](#)  
[domain-name \(DHCPv6\)](#)  
[option \(DHCPv6\)](#)  
[show ipv6 dhcp](#)

# ipv6 dhcp pool

**Overview** Use this command in Global Configuration mode to enter the DHCPv6 Configuration mode for the DHCPv6 server pool name as specified in the required command parameter. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCPv6 configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCPv6 server pools on devices with multiple interfaces. This allows the device to act as a DHCPv6 server on multiple interfaces to distribute different information to clients on the different networks.

Use the **no** variant of this command to delete the specific DHCPv6 pool.

**Syntax** `ipv6 dhcp pool <DHCPv6-poolname>`  
`no ipv6 dhcp pool <DHCPv6-poolname>`

Parameter	Description
<code>&lt;DHCPv6-poolname&gt;</code>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

**Mode** Global Configuration

**Usage** All DHCPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

**Examples** To create the DHCPv6 pool named P2 and enter DHCPv6 configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)#
```

To delete the DHCPv6 pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp pool P2
```

**Related commands**

- ipv6 local pool
- option (DHCPv6)
- prefix-delegation pool
- show ipv6 dhcp binding
- show ipv6 dhcp pool

# ipv6 dhcp server

**Overview** Use this command in Interface Configuration mode to enable DHCPv6 server for the current IPv6 configured interface to use the specified DHCPv6 server pool name.

The DHCPv6 server service listens for DHCPv6 requests on the IPv6 configured interface. The DHCPv6 server service does not run on interfaces without IPv6 configured on them.

Use the **no** variant of this command to disable the DHCPv6 server.

**Syntax** `ipv6 dhcp-server [<DHCPv6-poolname>]`  
`no ipv6 dhcp-server`

Parameter	Description
<DHCPv6-poolname>	Specify a named DHCPv6 server pool as defined with the <code>ipv6 dhcp pool</code> command. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

**Mode** Interface Configuration

**Usage notes** The **ipv6 dhcp server** command enables the DHCPv6 service on a specified interface using the pool for prefix delegation and configuration through the specified interface.

Note that DHCPv6 client, DHCPv6 server and DHCPv6 relay are mutually exclusive on an interface. When one of the DHCPv6 functions is enabled on an interface then another DHCPv6 function cannot be enabled on the same interface.

**Examples** To enable the DHCPv6 server service and use the DHCPv6 pool named P2 on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 dhcp server P2
```

To disable the DHCPv6 server on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp server
```

**Related commands** `ipv6 dhcp pool`  
`show ipv6 dhcp binding`  
`show ipv6 dhcp pool`

# ipv6 local pool

**Overview** Use this command in Global Configuration mode to configure a local DHCPv6 server prefix delegation pool specifying a poolname and a prefix/prefix length. You can optionally exclude the locally assigned prefix from the pool with the **exclude-local-prefix** keyword.

Use the **no** variant of this command to remove a local DHCPv6 server prefix delegation pool specifying the poolname.

**Syntax** `ipv6 local pool <DHCPv6-poolname> <delegated-prefix-name>  
<ipv6-prefix/prefix-length> <assigned-length>  
[exclude-local-prefix]`  
`no ipv6 local pool`

Parameter	Description
<code>&lt;DHCPv6-poolname&gt;</code>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".
<code>&lt;delegated-prefix-name&gt;</code>	Description used to identify the delegated prefix name from the parent PD (Prefix Delegation) server. If the name contains spaces then you must enclose it in "quotation marks".
<code>&lt;ipv6-prefix/prefix-length&gt;</code>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<code>&lt;assigned-length&gt;</code>	Specify an IPv6 prefix length assigned to the user from the pool in the range <1-128>. Note that the value of the <i>assigned-length</i> parameter entered cannot be less than or equal to the <i>prefix-length</i> parameter value entered. An assigned length must be longer than a prefix length.
<code>exclude-local-prefix</code>	Specify this keyword to exclude the locally assigned prefix from the pool.

**Default** No DHCPv6 server prefix delegation pool is configured by default.

**Mode** Global Configuration

**Usage notes** All IPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

**Examples** To create a local DHCPv6 local pool named P2 with the IPv6 prefix and prefix length 2001:0db8::/32 with an assigned length of 64, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 local pool P2 2001:0db8::/32 64
```

To remove a configured DHCPv6 local pool, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 local pool
```

**Related commands** [ipv6 dhcp pool](#)  
[show ipv6 dhcp pool](#)

## ipv6 nd prefix (DHCPv6)

**Overview** Use this command to specify IPv6 RA (Router Advertisement) prefix information generated from the DHCPv6 server for DHCPv6 prefix-delegation for a VLAN.

Use the **no** variant of this command to remove IPv6 RA prefix information from the DHCPv6 Server for DHCPv6 Prefix-Delegation for the interface. Use the **all** parameter with the **no** variant of this command to remove all prefix names and all prefixes for an interface.

**Syntax** `ipv6 nd prefix <ipv6-prefix-name>  
<ipv6-prefix/length>{<valid-lifetime>|infinite}  
{<preferred-lifetime>|infinite} {off-link|no-autoconfig}`  
`no ipv6 nd prefix {<ipv6-prefix-name>|<ipv6-prefix/length>|all}`

Parameter	Description
<code>&lt;ipv6-prefix-name&gt;</code>	The IPv6 prefix name advertised on the router advertisement message sent from the device. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.
<code>&lt;ipv6-prefix/length&gt;</code>	The IPv6 prefix and prefix length advertised on the router advertisement message sent from the device. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<code>&lt;valid-lifetime&gt;</code>	The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 5 and 315360000 seconds. Note that this period should be set to a value greater than that set for the prefix preferred-lifetime. See the Usage notes after this parameter table for a description of valid lifetime and how it determines invalid IPv6 addresses upon expiry.
<code>infinite</code>	Specifying this keyword instead of entering a value for the <code>&lt;valid-lifetime&gt;</code> parameter applies an infinite valid lifetime.
<code>&lt;preferred-lifetime&gt;</code>	Specifies the IPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered current. Set this to a value between 0 and 315360000 seconds. Note that this period should be set to a value less than that set for the prefix valid-lifetime. See the Usage notes after this parameter table for a description of preferred lifetime and how it determines deprecated IPv6 addresses upon expiry.
<code>infinite</code>	Specifying this keyword instead of entering a value for the <code>&lt;preferred-lifetime&gt;</code> parameter applies an infinite valid lifetime.
<code>off-link</code>	Specify the IPv6 prefix off-link flag.
<code>no-autoconfig</code>	Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration.
<code>all</code>	Specify all prefix names and all prefixes are removed when used with the no variant of this command.

**Mode** Interface Configuration for a VLAN interface or a PPP interface.

**Usage notes** This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** The following example configures the device to issue RAs (Router Advertisements) on the VLAN interface `vlan2`, and advertises the DHCPv6 prefix name `prefix1` and the IPv6 address prefix of `2001:0db8::/32`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 nd prefix prefix1 2001:0db8::/32
```

The following example resets router advertisements on the VLAN interface `vlan2`, so the address prefix of `2001:0db8::/32` is not advertised from the device.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/32
```

The following example removes all prefix names and prefixes from VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix all
```

# link-address

**Overview** Use this command in DHCPv6 Configuration mode to specify a link-address prefix within a DHCPv6 Server pool.

Note that you can only configure one link address per DHCPv6 pool. Configuring another link address in the same DHCPv6 pool overwrites the previously configured link address.

Use the **no** variant of this command to remove the link-address prefix from the DHCPv6 Server pool.

**Syntax** `link-address <ipv6-prefix/prefix-length>`  
`no link-address`

Parameter	Description
<code>&lt;ipv6-prefix/prefix-length&gt;</code>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X/Prefix-Length. The prefix-length is usually set between 0 and 64.

**Default** No DHCPv6 Server pool configuration link address prefix is configured by default.

**Mode** DHCPv6 Configuration

**Usage notes** Link addresses are configured in DHCPv6 Server address pools when there are remote clients that communicate via intermediate relay(s).

RELAY-FORW and RELAY-REPL relay packets contain the requesting link address source.

This command is used to match incoming requests from PD (Prefix Delegation) clients (received via an intermediate relay) to a configured delegation pool.

When an address on the incoming interface of the DHCPv6 server or a link address set in the incoming delegation request packet from the prefix delegation client matches the link-address prefix configured in the delegation pool, the DHCPv6 server is able to match and use the appropriate delegation pool for relayed delegation request messages.

If there is no match between incoming delegation request packets from the prefix delegation client and the link-address prefix configured in the delegation pool, the DHCPv6 Server does not delegate an IPv6 prefix to the requesting device.

The link address should be set to the network prefix where the prefix delegation client resides. The prefix delegation server will also need a forwarding path (IPv6 route) back to the network prefix where the prefix delegation client resides.

For more information, see the [DHCPv6 Feature Overview and Configuration Guide](#).

**Examples** To configure the IPv6 prefix and prefix length 2001:0db8:1::/48 as the link address for pool P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# address prefix 2001:0db8:2::/48
awplus(config-dhcp6)# link-address 2001:0db8:1::/48
```

To remove the link address, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no link-address
```

**Related commands** [ipv6 dhcp pool](#)  
[show ipv6 dhcp pool](#)

# option (DHCPv6)

**Overview** Use this command in DHCPv6 Configuration mode to add a user-defined option to the DHCPv6 prefix pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value.

Use the **no** variant of this command to remove the specified user-defined option from the DHCPv6 server pool, or to remove all user-defined options from the DHCPv6 server pool.

**Syntax** `option [<1-254>|<option-name>] <option-value>`  
`no option [<1-254>|<option-value>]`

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name associated with the option.	
<option-value>	The option value. You must specify a value that is appropriate to the option type:	
	hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	ipv6	An IPv6 prefix that has the hexadecimal X : X : : X : X notation. To create a list of IPv6 prefixes, you must add each IPv6 prefix individually using this command multiple times.
	integer	A number from 0 to 4294967295.
	flag	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.

**Mode** DHCPv6 Configuration

**Usage** You must define a DHCPv6 option using the `ipv6 dhcp option` command before using the `option (DHCPv6)` command.

Note that options with an **ipv6** type can hold a list of IPv6 prefix (i.e. entries that have the X : X : : X : X address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IPv6 prefixes. Also note options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

**Examples** To add the IPv6 type option named `sntp-server-addr` to the pool P2 and give the option the value `ipv6`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 22 name sntp_server_addr ipv6
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option sntp_server_addr ipv6
```

To add the ASCII-type option named `tftp-server-name` to the pool P2 and give the option the value `server1`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tftp-server-name server1
```

To add the hex-type option named `tcPIP-node-type` to the pool P2 and give the option the value `08af`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tcPIP-node-type 08af
```

To add multiple IP addresses for the ip-type option 175, use the following commands:

```
awplus(config-dhcp6)# option 175 2001:0db8:3001::/64
awplus(config-dhcp6)# option 175 2001:0db8:3002::/64
awplus(config-dhcp6)# option 175 2001:0db8:3003::/64
```

To add the option 179 to a pool, and give the option the value `123456`, use the following command:

```
awplus(config-dhcp6)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the following command:

```
awplus(config-dhcp6)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the following command:

```
awplus(config-dhcp6)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the following command:

```
awplus(config-dhcp6)# no option tftp-server-name
```

**Related commands**

- [dns-server \(DHCPv6\)](#)
- [ipv6 dhcp option](#)
- [ipv6 dhcp pool](#)
- [show ipv6 dhcp pool](#)

# prefix-delegation pool

**Overview** Use this command in DHCPv6 Configuration mode to add a DHCPv6 server prefix-delegation pool entry to the current DHCPv6 pool configuration. You must define a DHCPv6 server prefix-delegation pool using the `ipv6 dhcp pool` command before using this command.

Use the **no** variant of this command to remove a DHCPv6 server prefix-delegation pool from the current DHCPv6 pool configuration.

**Syntax** `prefix-delegation pool <DHCPv6-poolname> [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]`  
`no prefix-delegation pool <DHCPv6-poolname>`

Parameter	Description
<code>&lt;DHCPv6-poolname&gt;</code>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".
<code>lifetime</code>	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<code>&lt;valid-time&gt;</code>	Specify a valid lifetime in seconds in the range <code>&lt;5-315360000&gt;</code> .
<code>infinite</code>	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<code>&lt;preferred-time&gt;</code>	Specify a valid lifetime in seconds in the range <code>&lt;5-315360000&gt;</code> .

**Default** No IPv6 local prefix pool is specified by default.

**Mode** DHCPv6 Configuration

**Usage notes** The DHCPv6 server assigns prefixes dynamically from an IPv6 local prefix pool, which is configured using the `ipv6 local pool` command and is associated with a DHCPv6 configuration pool using this command. When the server receives a prefix request from a client, it attempts to obtain unassigned prefixes from the pool. After the client releases the previously assigned prefixes, the server returns the prefixes to the pool for reassignment.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source

address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Example** This example adds DHCPv6 Prefix Delegation pool pd\_pool1 to DHCPv6 pool pool1:

```
awplus# configure terminal
awplus(config)# ipv6 local pool pd_pool1 2001:0db8::/48 56
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# prefix-delegation pool pd_pool1
```

**Related commands**

- [ipv6 local pool](#)
- [show ipv6 dhcp pool](#)

# service dhcp-relay

**Overview** This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

**Syntax** `service dhcp-relay`  
`no service dhcp-relay`

**Mode** Global Configuration

**Usage notes** A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

**Default** The DHCP-relay service is enabled by default.

**Examples** To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

# show counter dhcp-relay

**Overview** This command shows counters for the DHCP Relay Agent on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show counter dhcp-relay

**Syntax (VRF-lite)** show counter dhcp-relay [vrf <vrf-name>|global]

Parameter	Description
vrf	Display the output for a VRF instance
<vrf-name>	The name of the specific VRF instance.
global	Display the output for the Global VRF instance

**Mode** User Exec and Privileged Exec

**Examples** To display counters for the DHCP Relay Agent on your device, use the following command:

```
awplus# show counter dhcp-relay
```

**Output** Figure 56-2: Example output from the **show counter dhcp-relay** command

```
awplus#show counter dhcp-relay

Parameter	Description
Requests In	The number of DHCP Request messages received from clients.
Replies In	The number of DHCP Reply messages received from servers.
Relayed To Server	The number of DHCP Request messages relayed to servers.
Relayed To Client	The number of DHCP Reply messages relayed to clients.
Out To Server Failed	The number of failures when attempting to send request messages to servers. This is an internal debugging counter.
Out To Client Failed	The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.
Invalid hlen	The number of incoming messages dropped due to an invalid hlen field.
Bogus giaddr	The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.
Corrupt Agent Option	The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.

Parameter	Description
Missing Agent Option	The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Bad Circuit ID	The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Missing Circuit ID	The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Bad Remote ID	The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.
Missing Remote ID	The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.

Parameter	Description
Option Insert Failed	<p>The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when:</p> <ul style="list-style-type: none"> <li>the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the <code>ip dhcp-relay information policy</code> command.</li> <li>there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.</li> </ul>
<p>Note that the following parameters are only used on the Global VRF instance when DHCPv6 is running</p>	
DHCPv6 Requests In	The number of incoming DHCPv6 Request messages.
DHCPv6 Replies In	The number of incoming DHCPv6 Reply messages.
DHCPv6 Relayed to Server	The number of DHCPv6 messages relayed to the server.
DHCPv6 Relayed to Client	The number of DHCPv6 messages relayed to the client.

# show counter ipv6 dhcp-client

**Overview** Use this command in User Exec or Privilege Exec mode to show DHCPv6 client counter information. See [show counter ipv6 dhcp-server](#) for DHCPv6 server information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter ipv6 dhcp-client`

**Mode** User Exec and Privileged Exec

**Example** To display the DHCPv6 client counter information, use the command:

```
awplus# show counter ipv6 dhcp-client
```

**Output** Figure 56-4: Example output from the **show counter ipv6 dhcp-client** command

```
awplus#show counter ipv6 dhcp-client
SOLICIT out          ..... 20
ADVERTISE in         ..... 12
REQUEST out          ..... 1
CONFIRM out          ..... 0
RENEW out            ..... 0
REBIND out           ..... 0
REPLY in             ..... 0
RELEASE out          ..... 0
DECLINE out          ..... 0
INFORMATION-REQUEST out ..... 0
```

**Table 1:** Parameters in the output of the **show counter ipv6 dhcp-client** command

Parameter	Description
SOLICIT out	Displays the count of SOLICIT messages sent by the DHCPv6 client.
ADVERTISE in	Displays the count of ADVERTISE messages received by the DHCPv6 client.
REQUEST out	Displays the count of REQUEST messages sent by the DHCPv6 client.
CONFIRM out	Displays the count of CONFIRM messages sent by the DHCPv6 client.
RENEW out	Displays the count of RENEW messages sent by the DHCPv6 client.

**Table 1:** Parameters in the output of the **show counter ipv6 dhcp-client** command (cont.)

Parameter	Description
REBIND out	Displays the count of REBIND messages sent by the DHCPv6 client.
REPLY in	Displays the count of REPLY messages received by the DHCPv6 client.
RELEASE out	Displays the count of RELEASE messages sent by the DHCPv6 client.
DECLINE out	Displays the count of DECLINE messages sent by the DHCPv6 client.
INFORMATION-REQUEST out	Displays the count of INFORMATION-REQUEST messages sent by the DHCPv6 client.

**Related commands** [show counter ipv6 dhcp-server](#)

# show counter ipv6 dhcp-server

**Overview** Use this command in User Exec or Privileged Exec mode to show DHCPv6 server counter information. See [show counter ipv6 dhcp-client](#) for DHCPv6 client information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter ipv6 dhcp-server`

**Mode** User Exec and Privileged Exec

**Example** To display the DHCPv6 server counter information, use the command:

```
awplus# show counter ipv6 dhcp-server
```

**Output** Figure 56-5: Example output from the **show counter ipv6 dhcp-server** command

```
awplus#show counter ipv6 dhcp-server
SOLICIT in          ..... 20
ADVERTISE out       ..... 12
REQUEST in          ..... 1
CONFIRM in          ..... 0
RENEW in            ..... 0
REBIND in           ..... 0
REPLY out           ..... 0
RELEASE in          ..... 0
DECLINE in          ..... 0
INFORMATION-REQUEST in ..... 0
```

**Table 2:** Parameters in the output of the **show counter ipv6 dhcp-server** command

Parameter	Description
SOLICIT in	Displays the count of SOLICIT messages received by the DHCPv6 server.
ADVERTISE out	Displays the count of ADVERTISE messages sent by the DHCPv6 server.
REQUEST in	Displays the count of REQUEST messages received by the DHCPv6 server.
CONFIRM in	Displays the count of CONFIRM messages received by the DHCPv6 server.
RENEW in	Displays the count of RENEW messages received by the DHCPv6 server.

**Table 2:** Parameters in the output of the **show counter ipv6 dhcp-server** command (cont.)

Parameter	Description
REBIND in	Displays the count of REBIND messages received by the DHCPv6 server.
REPLY out	Displays the count of REPLY messages sent by the DHCPv6 server.
RELEASE in	Displays the count of RELEASE messages received by the DHCPv6 server.
DECLINE in	Displays the count of DECLINE messages received by the DHCPv6 server.
INFORMATION-REQUEST in	Displays the count of INFORMATION-REQUEST messages received by the DHCPv6 server

**Related commands** [show counter ipv6 dhcp-client](#)

# show ip dhcp-relay

**Overview** This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp-relay [interface <interface-name>]`

**Syntax (VRF-lite)** `show ip dhcp-relay [vrf <name>|global] [interface <interface-name>]`

Parameter	Description
<interface-name>	Name of a specific interface. This displays the DHCP configuration for the specified interface only.
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
global	The Global VRF instance.

**Mode** User Exec and Privileged Exec

**Example** To display the DHCP Relay Agent’s configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

**Output** Figure 56-6: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers : 192.168.1.200
```

**Output (VRF-lite)** Figure 56-7: Example output from the **show ip dhcp-relay** command applied for VRF instance red

```
DHCP Relay Service is enabled

[VRF: red]
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is enabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay Information policy is to replace existing relay agent
information
List of servers :    192.168.1.3
```

- [ip dhcp-relay agent-option checking](#)
- [ip dhcp-relay information policy](#)
- [ip dhcp-relay maxhops](#)
- [ip dhcp-relay server-address](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ipv6 dhcp

**Overview** Use this command in User Exec or Privileged Exec mode to show the DHCPv6 unique identifier (DUID) configured on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp`

**Mode** User Exec and Privileged Exec

**Usage notes** The DUID is based on the link-layer address for both DHCPv6 client and DHCPv6 server identifiers. The device uses the MAC address from the lowest interface number for the DUID.

The DUID is used by a DHCPv6 client to obtain an IPv6 address from a DHCPv6 server. A DHCPv6 server compares the DUID with its database of DUIDs and sends configuration data for an IPv6 address plus the preferred and valid lease time values to a DHCPv6 client.

**Example** To display the DUID configured on your device, use the command:

```
awplus# show ipv6 dhcp
```

**Output** Figure 56-8: Example output from the **show ipv6 dhcp** command

```
awplus#show ipv6 dhcp
DHCPv6 Server DUID: 0001000117ab6876001577f7ba23
```

**Related commands** [ipv6 address dhcp](#)

# show ipv6 dhcp binding

**Overview** Use this command in User Exec or Privileged Exec mode to show the IPv6 address entries that the DHCPv6 server leases to DHCPv6 clients. Note that applying this command with the optional *summary* keyword parameter displays the number of addresses per pool, but not the address or prefix entries per pool.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp binding [summary]`

Parameter	Description
summary	Optional. Specify the <b>summary</b> keyword to display summarized information for DHCPv6 server leases to client nodes, displaying the number of address entries per pool, not the addresses or prefixes.

**Mode** User Exec and Privileged Exec

**Example 1** To display the total DHCPv6 leasing address entries for all pools, use the command:

```
awplus# show ipv6 dhcp binding summary
```

**Output** Figure 56-9: Example output from the **show ipv6 dhcp binding summary** command

```
awplus# show ipv6 dhcp binding summary
Pool Name                Number of Leased Addresses
-----
ia-na1                   3
ia-pd1                   5
Total in all Pools:      8
```

**Table 3:** Parameters in the output of the **show ipv6 dhcp binding summary** command

Parameter	Description
Pool Name	Displays a list of all the pool names.
Number of Leased Addresses	Displays the number of leased address entries for the pool.
Total in all Pools	Displays the total number of leased address entries for all pools.

**Example 2** To display addresses, prefixes, and lifetimes for all DHCPv6 leasing entries by pool, enter:

```
awplus# show ipv6 dhcp binding
```

**Output** Figure 56-10: Example output from the **show ipv6 dhcp binding** command

```
awplus#show ipv6 dhcp binding
Pool ia-na1
  Address 2002:0:3c0::1
    client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
    preferred lifetime 604800, valid lifetime 2592000
    starts at 20 Aug 2012 18:38:29
    expires at 19 Sep 2012 18:38:29
Pool ia-pd1
  Prefix 2002:0:3c0::/42
    client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
    preferred lifetime 604800, valid lifetime 2592000
    starts at 20 Aug 2012 18:38:29
    expires at 19 Sep 2012 18:38:29
```

**Table 4:** Parameters in the output of the **show ipv6 dhcp binding** command

Parameter	Description
Address	Address delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.
Prefix	Prefix delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.
DUID	DHCPv6 unique identifier (DUID) (see RFC 3315). Each DHCPv6 client has as DUID. DHCPv6 servers use DUIDs to identify clients for the association of IAs (Identity Associations) with DHCPv6 clients. DHCPv6 clients use DUIDs to identify a DHCPv6 server.
IAID	Identify Association Identifier (IAID) (see RFC 3315). IAIDs are identifiers for IAs (Identity Associations), where an IA is a collection of IPv6 addresses assigned to a DHCPv6 client. Each IA has an associated IAD. Each DHCPv6 client may have more than one IA assigned to it. Each IA holds one type of address.
preferred lifetime	The preferred lifetime setting in seconds for the specified IAID and DUID. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.
valid lifetime	The valid lifetime setting in seconds for the specified IAID and DUID. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Table 4:** Parameters in the output of the **show ipv6 dhcp binding** command

Parameter	Description
starts at	The date and time at which the valid lifetime expires.
expires at	The date and time at which the valid lifetime expires.

**Related  
commands**

[clear ipv6 dhcp binding](#)  
[ipv6 dhcp pool](#)  
[show ipv6 dhcp pool](#)

# show ipv6 dhcp interface

**Overview** Use this command in User Exec or Privileged Exec mode to display DHCPv6 information for a specified interface, or all interfaces when entered without the interface parameter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp interface [<interface-name>]`

Parameter	Description
<interface-name>	Optional. Specify the name of the interface to show DHCPv6 information about. Omit this optional parameter to display DHCPv6 information for all interfaces DHCPv6 is configured on.

**Mode** User Exec and Privileged Exec

**Example** To display DHCPv6 information for all interfaces DHCPv6 is configured on, use the command:

```
awplus# show ipv6 dhcp interface
```

**Output** Figure 56-11: Example output from the **show ipv6 dhcp interface** command

```
awplus# show ipv6 dhcp interface
vlan1 is in client mode
Address 1001::3c0:1
    preferred lifetime 9000, valid lifetime 5000
    starts at 20 Jan 2012 09:21:35
    expires at 20 Jan 2012 10:25:32
```

**Example 2** To display DHCPv6 information for interface vlan2, use the command:

```
awplus# show ipv6 dhcp interface vlan2
```

**Output** Figure 56-12: Example output from the **show ipv6 dhcp interface** command for a specific interface

```
awplus# show ipv6 dhcp interface vlan2
vlan2 is in client (Prefix-Delegation) mode
Prefix name pd1
    prefix 2002:0:3c0::/42
    preferred lifetime 604800, valid lifetime 2592000
    starts at 20 Aug 2012 09:21:33
    expires at 19 Sep 2012 09:21:33
```

**Table 5:** Parameters in the output of the **show counter dhcp-client** command

Parameter	Description
<interface> is in server/client/(Prefix-Delegation) mode	Displays whether the specified interface is in server or client mode and whether prefix-delegation is applied to an interface.
Address	Displays the address of the DHCPv6 server on the interface.
Prefix name	Displays the IPv6 general prefix pool name, where prefixes are stored for the interface.
Using pool	Displays the name of the pool used by the interface.
Preference	Displays the preference value for the DHCPv6 server.

**Related commands** [ipv6 dhcp client pd](#)

# show ipv6 dhcp pool

**Overview** Use this command in User Exec or Privileged Exec mode to display the configuration details and system usage of the DHCPv6 address pools configured on the device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp pool [<DHCPv6-address-pool-name>]`

Parameter	Description
<DHCPv6-address-pool-name>	Name of a specific DHCPv6 address pool. This displays the configuration of the specified DHCPv6 address pool only.

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 dhcp pool`

**Output** Figure 56-13: Example output from the **show ipv6 dhcp pool** command

```
awplus# show ipv6 dhcp pool
DHCPv6 Pool: ia-na
  Address Prefix : 1001::/64
    Lifetime: 2592000(valid), 604800(preferred)
  DNS Server: 2001::1
  DNS Server: 2001::2
  Domain Name: example.com
  Domain Name: example.co.jp
  SNTP Server: 2001::5
  SNTP Server: 2001::6
  Option Code : 150
    Value: [ASCII] test-test
DHCPv6 Pool: ia-pd
  PD Pool Name: pd1
  Prefix : 2002::/38-42
  Lifetime : 2592000(valid), 604800(preferred)
```

**Table 6:** Parameters in the output of the **show ipv6dhcp pool** command

Parameter	Description
DHCPv6 Pool	Name of the DHCPv6 pool.
Address Prefix	Address prefix to the DHCPv6 pool.

**Table 6:** Parameters in the output of the **show ipv6dhcp pool** command (cont.)

Parameter	Description
Address Lifetime	Valid and preferred lifetimes to the DHCPv6 pool. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.
DNS Server	IPv6 address of the DNS Server
Domain name	URL for the domain name.
SNTP Server	IPv6 address of the SNTP (Simple Network Time Protocol) Server.
Option Code	DHCP Option code (see RFC 2132).
Option Value	DHCP Option value type (see RFC 2132).

**Related commands** [ipv6 dhcp pool](#)

# sntp-address

**Overview** Use this command in DHCPv6 Configuration mode to add an SNTP Server IPv6 address to a DHCPv6 Server pool.

Use the **no** variant of this command to remove an SNTP Server IPv6 address from a DHCPv6 Server pool.

**Syntax** `sntp-address <ipv6-address>`  
`no sntp-address <ipv6-address>`

Parameter	Description
<code>&lt;ipv6-address&gt;</code>	Specify an SNTP Server IPv6 address, in hexadecimal notation in the format <code>x:x::x:x</code> .

**Mode** DHCPv6 Configuration

**Examples** The following example adds an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# sntp-address 2001:0db8::/32
```

The following example removes an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no sntp-address 2001:0db8::/32
```

# ntp authentication-key

**Overview** This command defines each of the authentication keys. Each key has a key number, a type (MD5 or SHA1), and a value.

The **no** variant of this disables the authentication key.

**Syntax** `ntp authentication-key <keynumber> md5 <key-string> [trusted]`  
`ntp authentication-key <keynumber> sha1 <key-string> [trusted]`  
`no ntp authentication-key <keynumber>`

Parameter	Description
<keynumber>	<1-4294967295> An identification number for the key.
md5	Define an MD5 key.
sha1	Define an SHA1 key.
<key-string>	The authentication key. For SHA1, this is a 20 hexadecimal character string. For MD5, this is a string of up to 31 ASCII characters.
trusted	Add this key to the list of authentication keys that this server trusts.

**Mode** Global Configuration

**Examples** To define an MD5 authentication key number 134343 and a key value 'mystring', use the commands:

```
awplus# configure terminal  
awplus(config)# ntp authentication-key 134343 md5 mystring
```

To disable the authentication key number 134343 with the key value 'mystring', use the commands:

```
awplus# configure terminal  
awplus(config)# no ntp authentication-key 134343
```

**Command changes** Version 5.4.9-2.1 sha1-encrypted parameter added.

# ntp broadcastdelay

**Overview** Use this command to set the estimated round-trip delay for broadcast packets. Use the **no** variant of this command to reset the round-trip delay for broadcast packets to the default offset of 0 microseconds.

**Syntax** `ntp broadcastdelay <delay>`  
`no ntp broadcastdelay`

Parameter	Description
<code>&lt;delay&gt;</code>	<code>&lt;1-999999&gt;</code> The broadcast delay in microseconds.

**Default** 0 microsecond offset, which can only be applied with the **no** variant of this command.

**Mode** Global Configuration

**Examples** To set the estimated round-trip delay to 23464 microseconds for broadcast packets, use these commands:

```
awplus# configure terminal
awplus(config)# ntp broadcastdelay 23464
```

To reset the estimated round-trip delay for broadcast packets to the default setting (0 microseconds), use these commands:

```
awplus# configure terminal
awplus(config)# no ntp broadcastdelay
```

# ntp master

**Overview** Use this command to make the device to be an authoritative NTP server, even if the system is not synchronized to an outside time source.

Use the **no** variant of this command to stop the device being the designated NTP server.

**Syntax** `ntp master [<stratum>]`  
`no ntp master`

Parameter	Description
<stratum>	<1-15> The stratum number defines the configured level that is set for this master within the NTP hierarchy. The default stratum number is 12.

**Mode** Global Configuration

**Usage notes** The stratum levels define the distance from the reference clock and exist to prevent cycles in the hierarchy. Stratum 1 is used to indicate time servers, which are more accurate than Stratum 2 servers. For more information on the Network Time Protocol go to: [www.ntp.org](http://www.ntp.org)

**Examples** To stop the device from being the designated NTP server, use the commands:

```
awplus# configure terminal  
awplus(config)# no ntp master
```

To make the device the designated NTP server with stratum number 2, use the commands:

```
awplus# configure terminal  
awplus(config)# ntp master 2
```

# ntp peer

**Overview** Use this command to configure an NTP peer association. An NTP association is a peer association if this system is willing to either synchronize to the other system, or allow the other system to synchronize to it.

Use the **no** variant of this command to remove the configured NTP peer association.

**Syntax** `ntp peer {<peeraddress>|<peername>}`  
`ntp peer {<peeraddress>|<peername>} [prefer] [key <key>]`  
`[version <version>]`  
`no ntp peer {<peeraddress>|<peername>}`

Parameter	Description
<code>&lt;peeraddress&gt;</code>	Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address.
<code>&lt;peername&gt;</code>	Specify the peer hostname. The peer hostname can resolve to an IPv4 and an IPv6 address.
<code>prefer</code>	Prefer this peer when possible.
<code>key &lt;key&gt;</code>	<code>&lt;1-4294967295&gt;</code> Configure the peer authentication key.
<code>version &lt;version&gt;</code>	<code>&lt;1-4&gt;</code> Configure for this NTP version.

**Mode** Global Configuration

**Examples** See the following commands for options to configure NTP peer association, key and NTP version for the peer with an IPv4 address of 192.0.2.23:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23
awplus(config)# ntp peer 192.0.2.23 prefer
awplus(config)# ntp peer 192.0.2.23 prefer version 4
awplus(config)# ntp peer 192.0.2.23 prefer version 4 key 1234
awplus(config)# ntp peer 192.0.2.23 version 4 key 1234
awplus(config)# ntp peer 192.0.2.23 version 4
awplus(config)# ntp peer 192.0.2.23 key 1234
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 192.0.2.23
```

See the following commands for options to configure NTP peer association, key and NTP version for the peer with an IPv6 address of 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# ntp peer 2001:0db8:010d::1
awplus(config)# ntp peer 2001:0db8:010d::1 prefer
awplus(config)# ntp peer 2001:0db8:010d::1 prefer version 4
awplus(config)# ntp peer 2001:0db8:010d::1 prefer version 4 key
1234
awplus(config)# ntp peer 2001:0db8:010d::1 version 4 key 1234
awplus(config)# ntp peer 2001:0db8:010d::1 version 4
awplus(config)# ntp peer 2001:0db8:010d::1 key 1234
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 2001:0db8:010d::1
```

**Related  
commands**    [ntp server](#)  
              [ntp source](#)

# ntp rate-limit

**Overview** Use this command to enable NTP server response rate-limiting. Limiting NTP server responses can reduce network traffic when occurrences such as misconfigured or broken NTP clients poll the NTP server too frequently. Excessive polling can lead to network overload.

Use the **no** variant of this command to remove the rate-limit configuration.

**Syntax** `ntp rate-limit {interval<1-4096>|burst <1-255>|leak <2-16>}`  
`no ntp rate-limit`

Parameter	Description
interval	The minimum interval between responses configured in seconds. The default interval is 8 seconds.
burst	The maximum number of responses that can be sent in a burst, temporarily exceeding the limit specified by the interval option. The default burst is 8 responses.
leak	The rate at which responses are randomly allowed even if the limits specified by the interval and burst options are exceeded. The default leak is 4, i.e. on average, every fourth request has a response.

**Mode** Global Configuration

**Default** Interval - 8 seconds.

Burst - 8 responses.

Leak - 4.

**Example** To configure an NTP rate-limiting interval of 30 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# ntp rate-limit interval 30
```

**Related commands** [ntp restrict](#)

**Command changes** Version 5.4.8-1.1: command added

# ntp restrict

**Overview** Use this command to configure a restriction (allow or deny) on NTP packets or NTP functionality for a specific host/network or all hosts of a given IP family.

This means you can control host access to NTP service and NTP server status queries.

Use the **no** variant of this command to remove a restriction from one or more hosts.

**Syntax**

```
ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
{allow|deny}

ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} query
{allow|deny}

ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} serve
{allow|deny}

no ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
```

Parameter	Description
default-v4	Apply this restriction to all IPv4 hosts.
default-v6	Apply this restriction to all IPv6 hosts.
<host-address>	Apply this restriction to the specified IPv4 or IPv6 host. Enter an IPv4 address in the format A.B.C.D. Enter an IPv6 address in the format X::X:X.
<host-subnet>	Apply this restriction to the specified IPv4 subnet or IPv6 prefix. Enter an IPv4 subnet in the format A.B.C.D/M. Enter an IPv6 prefix in the format X::X/X.
query	Control NTP server status queries to matching hosts.
serve	Control NTP time service to matching hosts.
allow	Allow the configured restriction.
deny	Deny the configured restriction.

**Default** By default, time service is allowed to all hosts, and NTP server status querying is denied to all hosts.

**Mode** Global Configuration

**Example** To prevent all IPv4 hosts from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict default-v4 deny
```

To prevent the host 192.168.1.1 from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 198.168.1.1 deny
```

To allow all hosts in the 10.10.10.0/24 subnet to access a device for NTP server status, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 10.10.10.0/24 query allow
```

**Related commands** [ntp rate-limit](#)

**Command changes** Version 5.4.8-1.1: command added

# ntp server

**Overview** Use this command to configure an NTP server. This means that this system will synchronize to the other system, and not vice versa.

Use the **no** variant of this command to remove the configured NTP server.

**Syntax** `ntp server {<serveraddress>|<servername>}`  
`ntp server {<serveraddress>|<servername>} [prefer] [key <key>] [version <version>]`  
`no ntp server {<serveraddress>|<servername>}`

Parameter	Description
<serveraddress>	Specify the IP address of the peer, entered in the form A . B . C . D for an IPv4 address, or in the form X : X : : X . X for an IPv6 address.
<servername>	Specify the server hostname. The server hostname can resolve to an IPv4 and an IPv6 address.
prefer	Prefer this server when possible.
key <key>	<1-4294967295> Configure the server authentication key.
version <version>	<1-4> Configure for this NTP version.

**Mode** Global Configuration

**Examples** See the following commands for options to configure an NTP server association, key and NTP version for the server with an IPv4 address of 192.0.1.23:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.1.23
awplus(config)# ntp server 192.0.1.23 prefer
awplus(config)# ntp server 192.0.1.23 prefer version 4
awplus(config)# ntp server 192.0.1.23 prefer version 4 key 1234
awplus(config)# ntp server 192.0.1.23 version 4 key 1234
awplus(config)# ntp server 192.0.1.23 version 4
awplus(config)# ntp server 192.0.1.23 key 1234
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.1.23, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp server 192.0.1.23
```

See the following commands for options to configure an NTP server association, key and NTP version for the server with an IPv6 address of 2001:0db8:010e::2:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2
awplus(config)# ntp server 2001:0db8:010e::2 prefer
awplus(config)# ntp server 2001:0db8:010e::2 prefer version 4
awplus(config)# ntp server 2001:0db8:010e::2 prefer version 4
key 1234
awplus(config)# ntp server 2001:0db8:010e::2 version 4 key 1234
awplus(config)# ntp server 2001:0db8:010e::2 version 4
awplus(config)# ntp server 2001:0db8:010e::2 key 1234
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp server 2001:0db8:010e::2
```

**Related commands**

- [ntp peer](#)
- [ntp source](#)

# ntp source

**Overview** Use this command to configure an IPv4 or an IPv6 address for the NTP source interface. This command defines the socket used for NTP messages, and only applies to NTP client behavior.

Note that you cannot use this command when using AMF (Allied Telesis Management Framework).

Use the **no** variant of this command to remove the configured IPv4 or IPv6 address from the NTP source interface.

**Syntax** `ntp source <source-address>`  
`no ntp source`

Parameter	Description
<code>&lt;source-address&gt;</code>	Specify the IP address of the NTP source interface, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address.

**Default** An IP address is selected based on the most appropriate egress interface used to reach the NTP peer if a configured NTP client source IP address is unavailable or invalid.

**Mode** Global Configuration

**Usage notes** Adding an IPv4 or an IPv6 address allows you to select which source interface NTP uses for peering. The IPv4 or IPv6 address configured using this command is matched to the interface.

When selecting a source IP address to use for NTP messages to the peer, if the configured NTP client source IP address is unavailable then default behavior will apply, and an alternative source IP address is automatically selected. This IP address is based on the most appropriate egress interface used to reach the NTP peer. The configured NTP client source IP may be unavailable if the interface is down, or an invalid IP address is configured that does not reside on the device.

Note that this command only applies to NTP client behavior. The egress interface that the NTP messages use to reach the NTP server is determined by the `ntp peer` and `ntp server` commands.

Note that you cannot use this command when using AMF (Allied Telesis Management Framework).

**Examples** To configure the NTP source interface with the IPv4 address 192.0.2.23, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 192.0.2.23
```

To configure the NTP source interface with the IPv6 address 2001:0db8:010e::2, enter the commands:

```
awplus# configure terminal  
awplus(config)# ntp source 2001:0db8:010e::2
```

To remove a configured address for the NTP source interface, use the following commands:

```
awplus# configure terminal  
awplus(config)# no ntp source
```

**Related commands**

- [ntp peer](#)
- [ntp server](#)

# show ntp associations

**Overview** Use this command to display the status of NTP associations.

**Syntax** show ntp associations

**Mode** User Exec and Privileged Exec

**Example** See the sample output of the **show ntp associations** command displaying the status of NTP associations.

Table 57-1: Example output from **show ntp associations**

```
awplus#show ntp associations
remote          refid          st t when poll reach  delay  offset  disp
-----
*server1.example.com
                192.0.2.2      4 u  47  64  377  0.177  0.021  0.001
+192.168.1.10   10.32.16.80   5 u  46  64  377  0.241  -0.045 0.000
* system peer, # backup, + candidate, - outlier, x false ticker
```

Table 57-2: Parameters in the output from **show ntp associations**

Parameter	Description
* system peer	The peer that NTP uses to calculate variables like the offset and root dispersion of this AlliedWare Plus device. NTP passes these variables to the clients using this AlliedWare Plus device.
# backup	Peers that are usable, but are not among the first six peers sorted by synchronization distance. These peers may not be used.
+ candidate	Peers that the NTP algorithm has determined can be used, along with the system peer, to discipline the clock (i.e. to set the time on the AlliedWare Plus device).
- outlier	Peers that are not used because their time is significantly different from the other peers.
x false ticker	Peers that are not used because they are not consider trustworthy.
space	Peers that are not used because they are, for example, unreachable.
remote	The peer IP address
refid	The IP address of the reference clock, or an abbreviation indicating the type of clock (e.g. GPS indicates that the server uses GPS for the reference clock). INIT indicates that the reference clock is initializing, so it is not operational.

Table 57-2: Parameters in the output from **show ntp associations** (cont.)

Parameter	Description
st	The stratum, which is the number of hops between the server and the accurate time source such as an atomic clock.
t	Type, one of: u: unicast or anycast client b: broadcast or multicast client l: local reference clock s: symmetric peer A: anycast server B: broadcast server M: multicast server
when	When last polled (seconds ago, h hours ago, or d days ago).
poll	Time between NTP requests from the device to the server.
reach	An indication of whether or not the NTP server is responding to requests. 0 indicates there has never been a successful poll; 1 indicates that the last poll was successful; 3 indicates that the last two polls were successful; 377 indicates that the last 8 polls were successful.
delay	The round trip communication delay to the remote peer or server, in milliseconds.
offset	The mean offset (phase) in the times reported between this local host and the remote peer or server (root mean square, milliseconds).
disp	The amount of clock error (in milliseconds) of the server due to clock resolution, network congestion, etc.

# show ntp counters

**Overview** This command displays packet counters for NTP.

**Syntax** show ntp counters

**Mode** Privileged Exec

**Example** To display counters for NTP use the command:

```
awplus# show ntp counters
```

Figure 57-1: Example output from **show ntp counters**

```
awplus#show ntp counters
Server Received          4
Server Dropped          0
Client Sent              90
Client Received          76
Client Valid Received    76
```

Table 57-3: Parameters in the output from **show ntp counters**

Parameter	Description
Server Received	Number of NTP packets received from NTP clients.
Server Dropped	Number of NTP packets received from NTP clients but dropped.
Client Sent	Number of NTP packets sent to servers.
Client Received	Number of NTP packets received from servers
Client Valid Received	Number of valid NTP packets received from servers.

# show ntp counters associations

**Overview** Use this command to display NTP packet counters for individual servers and peers.

**Syntax** show ntp counters associations

**Mode** Privileged Exec

**Examples** To display packet counters for each NTP server and peer that is associated with a device, use the command:

```
awplus# show ntp counters associations
```

**Output** Figure 57-2: Example output from **show ntp counters associations**

```
awplus#show ntp counters associations
Peer 2001::1
  sent:          -
  received:      -
Peer 10.37.219.100
  sent:          7
  received:      7
```

Table 57-4: Parameters in the output from **show ntp counters associations**

Parameter	Description
Peer	An NTP peer or server that the device is associated with.
sent	The number of NTP packets that this device sent to the peer.
received	The number of NTP packets that this device received from the peer.

**Related commands** [ntp restrict](#)

# show ntp status

**Overview** Use this command to display the status of the Network Time Protocol (NTP).

**Syntax** show ntp status

**Mode** User Exec and Privileged Exec

**Example** To see information about NTP status, use the command:

```
awplus# show ntp status
```

For information about the output displayed by this command, see [ntp.org](http://ntp.org).

Figure 57-3: Example output from **show ntp status**

```
awplus#show ntp status
Reference ID   : COA8010A (192.168.1.10)
Stratum       : 4
Ref time (UTC) : Fri Jun 15 05:32:38 2018
System time   : 0.000002004 seconds fast of NTP time

# alias (interface)

**Overview** Use this command to set an alias name for a port, as returned by the SNMP ifMIB in OID 1.3.6.1.2.1.31.1.1.1.18.

Use the **no** variant of this command to remove an alias name from a port.

**Syntax** `alias <ifAlias>`  
`no alias`

Parameter	Description
<code>&lt;ifAlias&gt;</code>	64 character name for an interface in a network management system. All printable characters are valid.

**Default** Not set.

**Mode** Interface Configuration

**Usage notes** The interface alias can also be set via SNMP.

Third-party management systems often use standard MIBs to access device information. Network managers can specify an alias interface name to provide a non-volatile way to access the interface.

**Example** To configure the alias interface name 'uplink\_a' for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# alias uplink_a
```

To remove an alias interface name from port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no alias
```

**Command changes** Version 5.4.8-2.1: command added

# debug snmp

**Overview** This command enables SNMP debugging.

The **no** variant of this command disables SNMP debugging.

**Syntax**

```
debug snmp  
[all|detail|error-string|process|receive|send|xdump]  
  
no debug snmp  
[all|detail|error-string|process|receive|send|xdump]
```

Parameter	Description
all	Enable or disable the display of all SNMP debugging information.
detail	Enable or disable the display of detailed SNMP debugging information.
error-string	Enable or disable the display of debugging information for SNMP error strings.
process	Enable or disable the display of debugging information for processed SNMP packets.
receive	Enable or disable the display of debugging information for received SNMP packets.
send	Enable or disable the display of debugging information for sent SNMP packets.
xdump	Enable or disable the display of hexadecimal dump debugging information for SNMP packets.

**Mode** Privileged Exec and Global Configuration

**Example** To start SNMP debugging, use the command:

```
awplus# debug snmp
```

To start SNMP debugging, showing detailed SNMP debugging information, use the command:

```
awplus# debug snmp detail
```

To start SNMP debugging, showing all SNMP debugging information, use the command:

```
awplus# debug snmp all
```

**Related commands**

- [show debugging snmp](#)
- [terminal monitor](#)
- [undebug snmp](#)

# show counter snmp-server

**Overview** This command displays counters for SNMP messages received by the SNMP agent.

**Syntax** show counter snmp-server

**Mode** User Exec and Privileged Exec

**Example** To display the counters for the SNMP agent, use the command:

```
awplus# show counter snmp-server
```

**Output** Figure 58-1: Example output from the **show counter snmp-server** command

```
SNMP-SERVER counters

InvalidMsgs           ..... 0
UnknownPDUHandlers    ..... 0
```

**Table 1:** Parameters in the output of the **show counter snmp-server** command

Parameter	Meaning
inPkts	The total number of SNMP messages received by the SNMP agent.
inBadVersions	The number of messages received by the SNMP agent for an unsupported SNMP version. It drops these messages. The SNMP agent on your device supports versions 1, 2C, and 3.
inBadCommunityNames	The number of messages received by the SNMP agent with an unrecognized SNMP community name. It drops these messages.
inBadCommunityUses	The number of messages received by the SNMP agent where the requested SNMP operation is not permitted from SNMP managers using the SNMP community named in the message.
inASNParseErrs	The number of ASN.1 or BER errors that the SNMP agent has encountered when decoding received SNMP Messages.
inTooBig	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'tooBig'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inNoSuchNames	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'noSuchName'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inBadValues	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'badValue'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inReadOnly	The number of valid SNMP PDUs received by the SNMP agent where the value of the error-status field is 'readOnly'. The SNMP manager should not generate a PDU which contains the value 'readOnly' in the error-status field. This indicates that there is an incorrect implementations of the SNMP.
inGenErrs	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'genErr'.

**Table 1:** Parameters in the output of the **show counter snmp-server** command

Parameter	Meaning
inTotalReqVars	The number of MIB objects that the SNMP agent has successfully retrieved after receiving valid SNMP Get-Request and Get-Next PDUs.
inTotalSetVars	The number of MIB objects that the SNMP agent has successfully altered after receiving valid SNMP Set-Request PDUs.
inGetRequests	The number of SNMP Get-Request PDUs that the SNMP agent has accepted and processed.
inGetNexts	The number of SNMP Get-Next PDUs that the SNMP agent has accepted and processed.
inSetRequests	The number of SNMP Set-Request PDUs that the SNMP agent has accepted and processed.
inGetResponses	The number of SNMP Get-Response PDUs that the SNMP agent has accepted and processed.
inTraps	The number of SNMP Trap PDUs that the SNMP agent has accepted and processed.
outPkts	The number of SNMP Messages that the SNMP agent has sent.
outTooBigs	The number of SNMP PDUs that the SNMP agent has generated with the value 'tooBig' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outNoSuchNames	The number of SNMP PDUs that the SNMP agent has generated with the value 'noSuchName' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outBadValues	The number of SNMP PDUs that the SNMP agent has generated with the value 'badValue' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outGenErrs	The number of SNMP PDUs that the SNMP agent has generated with the value 'genErr' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outGetRequests	The number of SNMP Get-Request PDUs that the SNMP agent has generated.

**Table 1:** Parameters in the output of the **show counter snmp-server** command

Parameter	Meaning
outGetNexts	The number of SNMP Get-Next PDUs that the SNMP agent has generated.
outSetRequests	The number of SNMP Set-Request PDUs that the SNMP agent has generated.
outGetResponses	The number of SNMP Get-Response PDUs that the SNMP agent has generated.
outTraps	The number of SNMP Trap PDUs that the SNMP agent has generated.
UnsupportedSecurityLevels	The number of received packets that the SNMP agent has dropped because they requested a securityLevel unknown or not available to the SNMP agent.
NotInTimeWindows	The number of received packets that the SNMP agent has dropped because they appeared outside of the authoritative SNMP agent's window.
UnknownUserNames	The number of received packets that the SNMP agent has dropped because they referenced an unknown user.
UnknownEngineIDs	The number of received packets that the SNMP agent has dropped because they referenced an unknown snmpEngineID.
WrongDigest	The number of received packets that the SNMP agent has dropped because they didn't contain the expected digest value.
DecryptionErrors	The number of received packets that the SNMP agent has dropped because they could not be decrypted.
UnknownSecModels	The number of messages received that contain a security model that is not supported by the server. Valid for SNMPv3 messages only.
InvalidMsgs	The number of messages received where the security model is supported but the authentication fails. Valid for SNMPv3 messages only.
UnknownPDUHandlers	The number of times the SNMP handler has failed to process a PDU. This is a system debugging counter.

**Related commands** [show snmp-server](#)

# show debugging snmp

**Overview** This command displays whether SNMP debugging is enabled or disabled.

**Syntax** `show debugging snmp`

**Mode** User Exec and Privileged Exec

**Example** To display the status of SNMP debugging, use the command:

```
awplus# show debugging snmp
```

**Output** Figure 58-2: Example output from the **show debugging snmp** command

```
Sntp (SMUX) debugging status:  
Sntp debugging is on
```

**Related commands** [debug snmp](#)

# show running-config snmp

**Overview** This command displays the current configuration of SNMP on your device.

**Syntax** `show running-config snmp`

**Mode** Privileged Exec

**Example** To display the current configuration of SNMP on your device, use the command:

```
awplus# show running-config snmp
```

**Output** Figure 58-3: Example output from the **show running-config snmp** command

```
snmp-server contact AlliedTelesis
snmp-server location Philippines
snmp-server group grou1 auth read view1 write view1 notify view1
snmp-server view view1 1 included
snmp-server community public
snmp-server user user1 group1 auth md5 password priv des
password
```

**Related commands** [show snmp-server](#)

# show snmp-server

**Overview** This command displays the status and current configuration of the SNMP server.

**Syntax** `show snmp-server`

**Mode** Privileged Exec

**Example** To display the status of the SNMP server, use the command:

```
awplus# show snmp-server
```

**Output** Figure 58-4: Example output from the **show snmp-server** command

```
SNMP Server ..... Enabled
IP Protocol ..... IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) ..... 0x80001f888021338e4747b8e607

# show snmp-server community

**Overview** This command displays the SNMP server communities configured on the device. SNMP communities are specific to v1 and v2c.

**Syntax** `show snmp-server community`

**Mode** Privileged Exec

**Example** To display the SNMP server communities, use the command:

```
awplus# show snmp-server community
```

**Output** Figure 58-5: Example output from the **show snmp-server community** command

```
SNMP community information:
Community Name ..... public
Access ..... Read-only
View ..... none
```

**Related commands** [show snmp-server](#)  
[snmp-server community](#)

# show snmp-server group

**Overview** This command displays information about SNMP server groups. This command is used with SNMP version 3 only.

**Syntax** `show snmp-server group`

**Mode** Privileged Exec

**Example** To display the SNMP groups configured on the device, use the command:

```
awplus# show snmp-server group
```

**Output** Figure 58-6: Example output from the **show snmp-server group** command

```
SNMP group information:
  Group name ..... guireadgroup
  Security Level ..... priv
  Read View ..... guiview
  Write View ..... none
  Notify View ..... none

  Group name ..... guiwritegroup
  Security Level ..... priv
  Read View ..... none
  Write View ..... guiview
  Notify View ..... none
```

**Related commands** [show snmp-server](#)  
[snmp-server group](#)

# show snmp-server user

**Overview** This command displays the SNMP server users and is used with SNMP version 3 only.

**Syntax** `show snmp-server user`

**Mode** Privileged Exec

**Example** To display the SNMP server users configured on the device, use the command:

```
awplus# show snmp-server user
```

**Output** Figure 58-7: Example output from the **show snmp-server user** command

Name	Group name	Auth	Privacy
freddy	guireadgroup	none	none

**Related commands** [show snmp-server](#)  
[snmp-server user](#)

# show snmp-server view

**Overview** This command displays the SNMP server views and is used with SNMP version 3 only.

**Syntax** `show snmp-server view`

**Mode** Privileged Exec

**Example** To display the SNMP server views configured on the device, use the command:

```
awplus# show snmp-server view
```

**Output** Figure 58-8: Example output from the **show snmp-server view** command

```
SNMP view information:
View Name ..... view1
OID ..... 1
Type ..... included
```

**Related commands** [show snmp-server](#)  
[snmp-server view](#)

# snmp trap link-status

**Overview** Use this command to enable SNMP to send link status notifications (traps) for the interfaces when an interface goes up (linkUp) or down (linkDown).

Use the **no** variant of this command to disable the sending of link status notifications.

**Syntax** `snmp trap link-status [enterprise]`  
`no snmp trap link-status`

Parameter	Description
enterprise	Send an Allied Telesis enterprise type of link trap.

**Default** Disabled

**Mode** Interface Configuration

**Usage notes** The link status notifications can be enabled for the following interface types:

- switch port (e.g. port1.0.1)
- VLAN (e.g. vlan2)
- Ethernet (e.g. eth1)
- static and dynamic link aggregation (e.g. sa2, po2)

To specify where notifications are sent, use the [snmp-server host](#) command. To configure the device globally to send other notifications, use the [snmp-server enable trap](#) command.

**Examples** To enable SNMP to send link status notifications for port1.0.1 to port1.0.3 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status
```

To disable the sending of link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status
```

**Related commands**

- show interface
- snmp trap link-status suppress
- snmp-server enable trap
- snmp-server host

# snmp trap link-status suppress

**Overview** Use this command to enable the suppression of link status notifications (traps) for the interfaces beyond the specified threshold, in the specified interval.

Use the **no** variant of this command to disable the suppression of link status notifications for the ports.

**Syntax** `snmp trap link-status suppress {time {<1-60>|default}|threshold {<1-20>|default}}`

`no snmp trap link-status suppress`

Parameter	Description
time	Set the suppression timer for link status notifications.
<1-60>	The suppress time in seconds.
default	The default suppress time in seconds (60).
threshold	Set the suppression threshold for link status notifications. This is the number of link status notifications after which to suppress further notifications within the suppression timer interval.
<1-20>	The number of link status notifications.
default	The default number of link status notifications (20).

**Default** By default, if link status notifications are enabled (they are enabled by default), the suppression of link status notifications is enabled: notifications that exceed the notification threshold (default 20) within the notification timer interval (default 60 seconds) are not sent.

**Mode** Interface Configuration

**Usage notes** An unstable network can generate many link status notifications. When notification suppression is enabled, a suppression timer is started when the first link status notification of a particular type (linkUp or linkDown) is sent for an interface.

If the threshold number of notifications of this type is sent before the timer reaches the suppress time, any further notifications of this type generated for the interface during the interval are not sent. At the end of the interval, the sending of link status notifications resumes, until the threshold is reached in the next interval.

**Examples** To suppress link status notifications for port1.0.1 to port1.0.3 after 10 notifications in 40 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status suppress time 40
threshold 10
```

To stop suppressing link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status suppress
```

**Related commands**

- [show interface](#)
- [snmp trap link-status](#)

# snmp-server

**Overview** Use this command to enable the SNMP agent (server) on the device. The SNMP agent receives and processes SNMP packets sent to the device, and generates notifications (traps) that have been enabled by the [snmp-server enable trap](#) command.

Use the **no** variant of this command to disable the SNMP agent on the device. When SNMP is disabled, SNMP packets received by the device are discarded, and no notifications are generated. This does not remove any existing SNMP configuration.

**Syntax** `snmp-server [ip|ipv6]`  
`no snmp-server [ip|ipv6]`

Parameter	Description
ip	Enable or disable the SNMP agent for IPv4.
ipv6	Enable or disable the SNMP agent for IPv6.

**Default** By default, the SNMP agent is enabled for both IPv4 and IPv6. If neither the **ip** parameter nor the **ipv6** parameter is specified for this command, then SNMP is enabled or disabled for both IPv4 and IPv6.

**Mode** Global Configuration

**Examples** To enable SNMP on the device for both IPv4 and IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server
```

To enable the SNMP agent for IPv4 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server ip
```

To disable the SNMP agent for both IPv4 and IPv6 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server
```

To disable the SNMP agent for IPv4, use the commands:

```
awplus(config)# no snmp-server ipv4
```

**Related commands**

- show snmp-server user
- snmp-server community
- snmp-server contact
- snmp-server enable trap
- snmp-server engineID local
- snmp-server group
- snmp-server host
- snmp-server location
- snmp-server view

# snmp-server community

**Overview** This command creates an SNMP community, optionally setting the access mode for the community. The default access mode is read only. If view is not specified, the community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

The **no** variant of this command removes an SNMP community. The specified community must already exist on the device.

**Syntax** `snmp-server community <community-name> {view <view-name>|ro|rw}`  
`no snmp-server community <community-name> [{view <view-name>}]`

Parameter	Description
<code>&lt;community-name&gt;</code>	Community name. The community name is a case sensitive string of up to 20 characters.
<code>view</code>	Configure SNMP view. If view is not specified, the community allows access to all the MIB objects.
<code>&lt;view-name&gt;</code>	View name. The view name is a string up to 20 characters long and is case sensitive.
<code>ro</code>	Read-only community.
<code>rw</code>	Read-write community.

**Mode** Global Configuration

**Example** The following command creates an SNMP community called “public” with read only access to all MIB variables from any management station.

```
awplus# configure terminal
awplus(config)# snmp-server community public ro
```

The following command removes an SNMP community called “public”

```
awplus# configure terminal
awplus(config)# no snmp-server community public
```

**Related commands** [show snmp-server](#)  
[show snmp-server community](#)  
[snmp-server view](#)

# snmp-server contact

**Overview** This command sets the contact information for the system. The contact name is:

- displayed in the output of the [show system](#) command
- stored in the MIB object sysContact

The **no** variant of this command removes the contact information from the system.

**Syntax** `snmp-server contact <contact-info>`  
`no snmp-server contact`

Parameter	Description
<code>&lt;contact-info&gt;</code>	The contact information for the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

**Mode** Global Configuration

**Example** To set the system contact information to "support@alliedtelesis.co.nz", use the command:

```
awplus# configure terminal
awplus(config)# snmp-server contact
support@alliedtelesis.co.nz
```

**Related commands** [show system](#)  
[snmp-server location](#)  
[snmp-server group](#)

# snmp-server enable trap

**Overview** Use this command to enable the switch to transmit the specified notifications (traps).

Note that the Environmental Monitoring traps defined in the AT-ENVMONv2-MIB are enabled by default.

Use the **no** variant of this command to disable the transmission of the specified notifications.

**Syntax** `snmp-server enable trap <trap-list>`  
`no snmp-server enable trap <trap-list>`

Depending on your device model, you can enable some or all of the traps in the following table:

Parameter	Description
atmf	AMF traps.
atmflink	AMF link traps.
atmfnode	AMF node traps.
atmfrr	AMF reboot-rolling traps.
auth	Authentication failure.
bgp	BGP traps.
chassis	Chassis traps.
dhcpsnooping	DHCP snooping and ARP security traps. These notifications must also be set using the <b>ip dhcp snooping violation</b> command, and/or the arp security violation <b>arp security violation</b> command.
epsr	EPSR traps.
g8032	G.8032 ERP traps.
lldp	Link Layer Discovery Protocol (LLDP) traps. These notifications must also be enabled using the <b>lldp notifications</b> command, and/or the <b>lldp med-notifications</b> command.
loopprot	Loop Protection traps.
mstp	MSTP traps.
nsm	NSM traps.
ospf	OSPF traps.
pim	PIM traps.
power-inline	Power-inline traps (Power Ethernet MIB RFC 3621).
qsp	QoS Storm Protection

Parameter	Description
rmon	RMON traps.
thrash-limit	MAC address Thrash Limiting traps.
vcs	VCS traps.
vrrp	Virtual Router Redundancy (VRRP) traps.
ufo	Upstream Forwarding Only (UFO) traps.

**Default** Disabled

**Mode** Global Configuration

**Usage notes** This command cannot be used to enable link status notifications globally. To enable link status notifications for particular interfaces, use the [snmp trap link-status](#) command.

To specify where notifications are sent, use the [snmp-server host](#) command.

Note that you can enable (or disable) multiple traps with a single command, by specifying a space-separated list of traps.

**Examples** To enable the device to send a notification if an AMF node changes its status, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap atmfnode
```

To enable the device to send MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap thrash-limit
```

To disable the device from sending MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap thrash-limit
```

To enable the device to send OSPF and VRRP-related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap ospf vrrp
```

To disable OSPF traps being sent out by the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap ospf
```

**Related commands** `show snmp-server`  
`snmp trap link-status`  
`snmp-server host`

**Command changes** Version 5.4.7-2.1: **ufo** parameter added

# snmp-server engineID local

**Overview** Use this command to configure the SNMPv3 engine ID. The SNMPv3 engine ID is used to uniquely identify the SNMPv3 agent on a device when communicating with SNMP management clients. Once an SNMPv3 engine ID is assigned, this engine ID is permanently associated with the device until you change it.

Use the **no** variant of this command to set the user defined SNMPv3 engine ID to a system generated pseudo-random value by resetting the SNMPv3 engine. The **no snmp-server engineID local** command has the same effect as the **snmp-server engineID local default** command.

Note that the [snmp-server engineID local reset](#) command is used to force the system to generate a new engine ID when the current engine ID is also system generated.

**Syntax** `snmp-server engineID local {<engine-id>|default}`  
`no snmp-server engineID local`

Parameter	Description
<code>&lt;engine-id&gt;</code>	Specify SNMPv3 Engine ID value, a string of up to 27 characters.
<code>default</code>	Set SNMPv3 engine ID to a system generated value by resetting the SNMPv3 engine, provided the current engine ID is user defined. If the current engine ID is system generated, use the <a href="#">snmp-server engineID local reset</a> command to force the system to generate a new engine ID.

**Mode** Global Configuration

**Usage notes** All devices must have a unique engine ID which is permanently set unless it is configured by the user.

**Example** To set the SNMPv3 engine ID to 800000cf030000cd123456, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local
800000cf030000cd123456
```

To set a user defined SNMPv3 engine ID back to a system generated value, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server engineID local
```

**Output** The following example shows the engine ID values after configuration:

```
awplus(config)#snmp-server engineid local asdgdh231234d
awplus(config)#exit
awplus#show snmp-server

SNMP Server ..... Enabled
IP Protocol ..... IPv4
SNMPv3 Engine ID (configured name) ... asdgdh231234d
SNMPv3 Engine ID (actual) ..... 0x80001f888029af52e149198483

awplus(config)#no snmp-server engineid local
awplus(config)#exit
awplus#show snmp-server

SNMP Server ..... Enabled
IP Protocol ..... IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) ..... 0x80001f888029af52e149198483
```

**Related commands** [show snmp-server](#)  
[snmp-server engineID local reset](#)  
[snmp-server group](#)

# snmp-server engineID local reset

**Overview** Use this command to force the device to generate a new pseudo-random SNMPv3 engine ID by resetting the SNMPv3 engine. If the current engine ID is user defined, use the [snmp-server engineID local](#) command to set SNMPv3 engine ID to a system generated value.

**Syntax** `snmp-server engineID local reset`

**Mode** Global Configuration

**Example** To force the SNMPv3 engine ID to be reset to a system generated value, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local reset
```

**Related commands** [snmp-server engineID local](#)  
[show snmp-server](#)

# snmp-server group

**Overview** This command is used with SNMP version 3 only, and adds an SNMP group, optionally setting the security level and view access modes for the group. The security and access views defined for the group represent the minimum required of its users in order to gain access.

The **no** variant of this command deletes an SNMP group, and is used with SNMPv3 only. The group with the specified authentication/encryption parameters must already exist.

**Syntax** `snmp-server group <groupname> {auth|noauth|priv} [read <readname>|write <writename>|notify <notifysname>]`  
`no snmp-server group <groupname> {auth|noauth|priv}`

Parameter	Description
<groupname>	Group name. The group name is a string up to 20 characters long and is case sensitive.
auth	Authentication.
noauth	No authentication and no encryption.
priv	Authentication and encryption.
read	Configure read view.
<readname>	Read view name.
write	Configure write view.
<writename>	Write view name. The view name is a string up to 20 characters long and is case sensitive.
notify	Configure notify view.
<notifysname>	Notify view name. The view name is a string up to 20 characters long and is case sensitive.

**Mode** Global Configuration

**Examples** To add SNMP group, for ordinary users, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server group usergroup noauth read
useraccess write useraccess
```

To delete SNMP group `usergroup`, use the following commands

```
awplus# configure terminal
awplus(config)# no snmp-server group usergroup noauth
```

**Related  
commands**

- snmp-server
- show snmp-server
- show snmp-server group
- show snmp-server user

# snmp-server host

**Overview** This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6),
- inform or trap messages,
- community name (SNMPv1 or SNMP v2c) or the authentication/encryption parameters and user name (SNMP v3).

**Syntax**

```
snmp-server host {<ipv4-address>/<ipv6-address>} [traps]
[version 1] <community-name>]

snmp-server host {<ipv4-address>/<ipv6-address>}
[informs|traps] version 2c <community-name>

snmp-server host {<ipv4-address>/<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>

no snmp-server host {<ipv4-address>/<ipv6-address>} [traps]
[version 1] <community-name>

no snmp-server host {<ipv4-address>/<ipv6-address>}
[informs|traps] version 2c <community-name>

no snmp-server host {<ipv4-address>/<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>
```

Parameter	Description
<ipv4-address>	IPv4 trap host address in the format A . B . C . D, for example, 192 . 0 . 2 . 2.
<ipv6-address>	IPv6 trap host address in the format x : x : : x : x for example, 2001 : db8 : : 8a2e : 7334.
informs	Send Inform messages to this host.
traps	Send Trap messages to this host (default).
version	SNMP version to use for notification messages. Default: version 1.
1	Use SNMPv1 (default).
2c	Use SNMPv2c.
3	Use SNMPv3.

Parameter	Description
auth	Authentication.
noauth	No authentication.
priv	Encryption.
<community-name>	The SNMPv1 or SNMPv2c community name.
<user-name>	SNMPv3 user name.

**Mode** Global Configuration

**Examples** To configure the device to send generated traps to the IPv4 host destination 192.0.2.5 with the SNMPv2c community name public, use the following command:

```
awplus# configure terminal
awplus(config)# snmp-server host version 2c public192.0.2.5
```

To configure the device to send generated traps to the IPv6 host destination 2001:db8::8a2e:7334 with the SNMPv2c community name private, use the following command:

```
awplus# configure terminal
awplus(config)# snmp-server host version 2c
private2001:db8::8a2e:7334
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name public, use the following command:

```
awplus# configure terminal
awplus(config)# no snmp-server host version 2c public192.0.2.5
```

**Related commands**

- [snmp trap link-status](#)
- [snmp-server enable trap](#)
- [snmp-server view](#)

# snmp-server legacy-ifadminstatus

**Overview** Use this command to set the ifAdminStatus to reflect the operational state of the interface, rather than the administrative state.

The **no** variant of this command sets the ifAdminStatus to reflect the administrative state of the interface.

**Syntax** `snmp-server legacy-ifadminstatus`  
`no snmp-server legacy-ifadminstatus`

**Default** Legacy ifAdminStatus is turned off by default, so by default the SNMP ifAdminStatus reflects the administrative state of the interface.

**Mode** Global Configuration

**Usage notes** Note that if you enable Legacy ifAdminStatus, the ifAdminStatus will report a link's status as Down when the link has been blocked by a process such as loop protection.

**Example** To turn on Legacy ifAdminStatus, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server legacy-ifadminstatus
```

**Related commands** [show interface](#)

# snmp-server location

**Overview** This command sets the location of the system. The location is:

- displayed in the output of the [show system](#) command
- stored in the MIB object sysLocation

The **no** variant of this command removes the configured location from the system.

**Syntax** `snmp-server location <location-name>`  
`no snmp-server location`

Parameter	Description
<code>&lt;location-name&gt;</code>	The location of the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

**Mode** Global Configuration

**Example** To set the location to “server room 523”, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server location server room 523
```

**Related commands** [show snmp-server](#)  
[show system](#)  
[snmp-server contact](#)

# snmp-server source-interface

**Overview** Use this command to specify the originating interface for SNMP traps or informs. An interface specified by this command must already have an IP address assigned to it.

Use the **no** variant of this command to reset the interface to its default value (the originating egress interface).

**Syntax** `snmp-server source-interface {traps|informs} <interface-name>`  
`no snmp-server source-interface {traps|informs}`

Parameter	Description
traps	SNMP traps.
informs	SNMP informs.
<interface-name>	Interface name (must already have an IP address assigned).

**Default** The originating egress interface of the traps and informs messages

**Mode** Global Configuration

**Usage notes** When an SNMP server sends an SNMP trap or inform message, the message carries the notification IP address of its originating interface. Use this command to assign this interface.

**Example** The following commands set vlan2 to be the interface whose IP address is used as the originating address in SNMP informs packets.

```
awplus# configure terminal
awplus(config)# snmp-server source-interface informs vlan2
```

The following commands reset the originating source interface for SNMP trap messages to be the default interface (the originating egress interface):

```
awplus# configure terminal
awplus(config)# no snmp-server source-interface traps
```

**Validation Commands** `show running-config`

# snmp-server startup-trap-delay

**Overview** Use this command to set the time in seconds after following completion of the device startup sequence before the device sends any SNMP traps (or SNMP notifications).

Use the no variant of this command to restore the default startup delay of 30 seconds.

**Syntax** `snmp-server startup-trap-delay <delay-time>`  
`no snmp-server startup-trap-delay`

Parameter	Description
<code>&lt;delay-time&gt;</code>	Specify an SNMP trap delay time in seconds in the range of 30 to 600 seconds.

**Default** The SNMP server trap delay time is 30 seconds. The no variant restores the default.

**Mode** Global Configuration

**Example** To delay the device sending SNMP traps until 60 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server startup-trap-delay 60
```

To restore the sending of SNMP traps to the default of 30 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server startup-trap-delay
```

**Validation Commands** `show snmp-server`

# snmp-server user

**Overview** Use this command to create or move users as members of specified groups. This command is used with SNMPv3 only.

The **no** variant of this command removes an SNMPv3 user. The specified user must already exist.

**Syntax** `snmp-server user <username> <groupname> [encrypted] [auth {md5|sha} <auth-password>] [priv {des|aes} <privacy-password>]`  
`no snmp-server user <username>`

Parameter	Description
<code>&lt;username&gt;</code>	User name. The user name is a string up to 20 characters long and is case sensitive.
<code>&lt;groupname&gt;</code>	Group name. The group name is a string up to 20 characters long and is case sensitive.
<code>encrypted</code>	Use the encrypted parameter when you want to enter encrypted passwords.
<code>auth</code>	Authentication protocol.
<code>md5</code>	MD5 Message Digest Algorithms.
<code>sha</code>	SHA Secure Hash Algorithm.
<code>&lt;auth-password&gt;</code>	Authentication password. The password is a string of 8 to 20 characters long and is case sensitive.
<code>priv</code>	Privacy protocol.
<code>des</code>	DES: Data Encryption Standard.
<code>aes</code>	AES: Advanced Encryption Standards.
<code>&lt;privacy-password&gt;</code>	Privacy password. The password is a string of 8 to 20 characters long and is case sensitive.

**Mode** Global Configuration

**Usage notes** Additionally this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

- Note that each SNMP user must be configured on both the manager and agent entities. Where passwords are used, these passwords must be the same for both entities.
- Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configs stored on the device. For example, you may need to move a user from one group to another group and keep the same passwords for the user instead of removing the user to apply new passwords.

- User passwords are entered using plaintext without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.
- User passwords are viewed as encrypted passwords in running and startup configs shown from **show running-config** and **show startup-config** commands respectively. Copy and paste encrypted passwords from running-configs or startup-configs to avoid entry errors.

**Examples** To add SNMP user authuser as a member of group 'usergroup', with authentication protocol MD5, authentication password 'Authpass', privacy protocol AES and privacy password 'Privpass' use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser usergroup auth md5
Authpass priv aes Privpass
```

Validate the user is assigned to the group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name                Group name          Auth                Privacy
-----            -
authuser            usergroup           md5                 aes
```

To enter existing SNMP user 'authuser' with existing passwords as a member of group 'newusergroup' with authentication protocol MD5 with the encrypted authentication password 0x1c74b9c22118291b0ce0cd883f8dab6b74, and privacy protocol AES with the encrypted privacy password 0x0e0133db5453ebd03822b004eeacb6608f, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser newusergroup
encrypted auth md5 0x1c74b9c22118291b0ce0cd883f8dab6b74 priv
aes 0x0e0133db5453ebd03822b004eeacb6608f
```

**NOTE:** Copy and paste the encrypted passwords from the **running-config** or the **startup-config** displayed, using the **show running-config** and **show startup-config** commands respectively, into the command line to avoid key stroke errors issuing this command.

Validate the user has been moved from the first group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name                Group name          Auth                Privacy
-----            -
authuser            newusergroup       md5                 aes
```

To delete SNMP user 'authuser', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server user authuser
```

**Related  
commands** [show snmp-server user](#)  
[snmp-server view](#)

# snmp-server view

**Overview** Use this command to create an SNMP view that specifies a sub-tree of the MIB. Further sub-trees can then be added by specifying a new OID to an existing view. Views can be used in SNMP communities or groups to control the remote manager's access.

**NOTE:** The object identifier must be specified in a sequence of integers separated by decimal points.

The **no** variant of this command removes the specified view on the device. The view must already exist.

**Syntax** `snmp-server view <view-name> <mib-name> {included|excluded}`  
`no snmp-server view <view-name>`

Parameter	Description
<view-name>	SNMP server view name. The view name is a string up to 20 characters long and is case sensitive.
<mib-name>	Object identifier of the MIB.
included	Include this OID in the view.
excluded	Exclude this OID in the view.

**Mode** Global Configuration

**Examples** The following command creates a view called "loc" that includes the system location MIB sub-tree.

```
awplus(config)# snmp-server view loc 1.3.6.1.2.1.1.6.0 included
```

To remove the view "loc" use the following command

```
awplus(config)# no snmp-server view loc
```

# undebbug snmp

**Overview** This command applies the functionality of the no `debug snmp` command.

# 59

# LLDP Commands

## Introduction

**Overview** LLDP and LLDP-MED can be configured using the commands in this chapter, or by using SNMP with the LLDP-MIB and LLDP-EXT-DOT1-MIB (see the [Support for Allied Telesis Enterprise MIBs in AlliedWare Plus](#)).

The Voice VLAN feature can be configured using commands in [VLAN Commands](#) chapter.

For more information about LLDP, see the [LLDP Feature Overview and Configuration Guide](#).

LLDP can transmit a lot of data about the network. Typically, the network information gathered using LLDP is transferred to a Network Management System by SNMP. For security reasons, we recommend using SNMPv3 for this purpose (see the [SNMP Feature Overview and Configuration Guide](#)).

LLDP operates over physical ports only. For example, it can be configured on switch ports that belong to static or dynamic channel groups, but not on the channel groups themselves.

# clear lldp statistics

**Overview** This command clears all LLDP statistics (packet and event counters) associated with specified ports. If no port list is supplied, LLDP statistics for all ports are cleared.

**Syntax** `clear lldp statistics [interface <port-list>]`

Parameter	Description
<code>&lt;port-list&gt;</code>	The ports for which the statistics are to be cleared.

**Mode** Privileged Exec

**Examples** To clear all LLDP statistics for all ports, use the command:

```
awplus# clear lldp statistics
```

**Related commands** [show lldp statistics](#)  
[show lldp statistics interface](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# clear lldp table

**Overview** This command clears the table of LLDP information received from neighbors through specified ports. If no port list is supplied, neighbor information is cleared for all ports.

**Syntax** `clear lldp table [interface <port-list>]`

Parameter	Description
<code>&lt;port-list&gt;</code>	The ports for which the neighbor information table is to be cleared.

**Mode** Privileged Exec

**Examples** To clear the entire table of neighbor information received through all ports, use the command:

```
awplus# clear lldp table
```

**Related commands** [show lldp neighbors](#)

# debug lldp

**Overview** This command enables specific LLDP debug for specified ports. When LLDP debugging is enabled, diagnostic messages are entered into the system log. If no port list is supplied, the specified debugging is enabled for all ports.

The **no** variant of this command disables specific LLDP debug for specified ports. If no port list is supplied, the specified debugging is disabled for all ports.

**Syntax** debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]  
debug lldp operation  
no debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]  
no debug lldp operation  
no debug lldp all

Parameter	Description
rx	LLDP receive debug.
rxpkt	Raw LLDPDUs received in hex format.
tx	LLDP transmit debug.
txpkt	Raw Tx LLDPDUs transmitted in hex format.
<port-list>	The ports for which debug is to be configured.
operation	Debug for LLDP internal operation on the switch.
all	Disables all LLDP debugging for all ports.

**Default** By default no debug is enabled for any ports.

**Mode** Privileged Exec

**Examples** To enable debugging of LLDP transmit with packet dump on all ports, use the command:

```
awplus# debug lldp tx txpkt
```

To turn off all LLDP debugging on all ports, use the command:

```
awplus# no debug lldp all
```

**Related commands** [show debugging lldp](#)  
[show running-config lldp](#)  
[terminal monitor](#)

# lldp faststart-count

**Overview** Use this command to set the fast start count for LLDP-MED. The fast start count determines how many fast start advertisements LLDP sends from a port when it starts sending LLDP-MED advertisements from the port, for instance, when it detects a new LLDP-MED capable device.

The **no** variant of this command resets the LLDP-MED fast start count to the default (3).

**Syntax** `lldp faststart-count <1-10>`  
`no lldp faststart-count`

Parameter	Description
<1-10>	The number of fast start advertisements to send.

**Default** The default fast start count is 3.

**Mode** Global Configuration

**Examples** To set the fast start count to 5, use the command:

```
awplus# configure terminal  
awplus(config)# lldp faststart-count 5
```

To reset the fast start count to the default setting (3), use the command:

```
awplus# configure terminal  
awplus(config)# no lldp faststart-count
```

**Related commands** [show lldp](#)

# Ildp holdtime-multiplier

**Overview** This command sets the holdtime multiplier value. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors.

The **no** variant of this command sets the multiplier back to its default.

**Syntax** `lldp holdtime-multiplier <2-10>`  
`no lldp holdtime-multiplier`

Parameter	Description
<2-10>	The multiplier factor.

**Default** The default holdtime multiplier value is 4.

**Mode** Global Configuration

**Usage** The Time-To-Live defines the period for which the information advertised to the neighbor is valid. If the Time-To-Live expires before the neighbor receives another update of the information, then the neighbor discards the information from its database.

**Examples** To set the holdtime multiplier to 2, use the commands:

```
awplus# configure terminal  
awplus(config)# lldp holdtime-multiplier 2
```

To set the holdtime multiplier back to its default, use the commands:

```
awplus# configure terminal  
awplus(config)# no lldp holdtime-multiplier 2
```

**Related commands** [show lldp](#)

# lldp management-address

**Overview** This command sets the IPv4 address to be advertised to neighbors (in the Management Address TLV) via the specified ports. This address will override the default address for these ports.

The **no** variant of this command clears the user-configured management IP address advertised to neighbors via the specified ports. The advertised address reverts to the default.

**Syntax** `lldp management-address <ipaddr>`  
`no lldp management-address`

Parameter	Description
<code>&lt;ipaddr&gt;</code>	The IPv4 address to be advertised to neighbors, in dotted decimal format. This must be one of the IP addresses already configured on the device.

**Default** The local loopback interface primary IPv4 address if set, else the primary IPv4 interface address of the lowest numbered VLAN the port belongs to, else the MAC address of the device's baseboard if no VLAN IP addresses are configured for the port.

**Mode** Interface Configuration

**Usage notes** To see the management address that will be advertised, use the [show lldp interface](#) command or [show lldp local-info](#) command.

**Examples** To set the management address advertised by port1.0.1 and port1.0.2, to be 192.168.1.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp management-address 192.168.1.6
```

To clear the user-configured management address advertised by port1.0.1 and port1.0.2, and revert to using the default address, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp management-address
```

**Related commands** [show lldp interface](#)  
[show lldp local-info](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp med-notifications

**Overview** Use this command to enable LLDP to send LLDP-MED Topology Change Detected SNMP notifications relating to the specified ports. The switch sends an SNMP event notification when a new LLDP-MED compliant IP Telephony device is connected to or disconnected from a port on the switch.

Use the **no** variant of this command to disable the sending of LLDP-MED Topology Change Detected notifications relating to the specified ports.

**Syntax** `lldp med-notifications`  
`no lldp med-notifications`

**Default** The sending of LLDP-MED notifications is disabled by default.

**Mode** Interface Configuration

**Examples** To enable the sending of LLDP-MED Topology Change Detected notifications relating to ports port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-notifications
```

To disable the sending of LLDP-MED notifications relating to port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-notifications
```

**Related commands** [lldp notification-interval](#)  
[lldp notifications](#)  
[snmp-server enable trap](#)  
[show lldp interface](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp med-tlv-select

**Overview** Use this command to enable LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via the specified ports. The LLDP-MED Capabilities TLV must be enabled before any of the other LLDP-MED Organizationally Specific TLVs are enabled.

Use the **no** variant of this command to disable the specified LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via these ports. In order to disable the LLDP-MED Capabilities TLV, you must also disable the rest of these TLVs. Disabling all these TLVs disables LLDP-MED advertisements.

**Syntax**

```
lldp med-tlv-select [capabilities] [network-policy] [location]
[inventory-management]

lldp med-tlv-select all

no lldp med-tlv-select [capabilities] [network-policy]
[location] [inventory-management]

no lldp med-tlv-select all
```

Parameter	Description
capabilities	LLDP-MED Capabilities TLV. When this is enabled, the MAC/PHY Configuration/Status TLV from IEEE 802.3 Organizationally Specific TLVs is also automatically included in LLDP-MED advertisements, whether or not it has been explicitly enabled by the <code>lldp tlv-select</code> command.
network-policy	Network Policy TLV. This TLV is transmitted if Voice VLAN parameters have been configured using the commands: <ul style="list-style-type: none"><li><code>switchport voice dscp</code></li><li><code>switchport voice vlan</code></li><li><code>switchport voice vlan priority</code></li></ul>
location	Location Identification TLV. This TLV is transmitted if location information has been configured using the commands: <ul style="list-style-type: none"><li><code>location elin-location-id</code></li><li><code>location civic-location identifier</code></li><li><code>location civic-location configuration</code></li><li><code>location coord-location identifier</code></li><li><code>location coord-location configuration</code></li><li><code>location elin-location</code></li></ul>

Parameter	Description
inventory-management	Inventory Management TLV Set, including the following TLVs: <ul style="list-style-type: none"> <li>• Hardware Revision</li> <li>• Firmware Revision</li> <li>• Software Revision</li> <li>• Serial Number</li> <li>• Manufacturer Name</li> <li>• Model Name</li> <li>• Asset ID</li> </ul>
all	All LLDP-MED Organizationally Specific TLVs.

**Default** By default LLDP-MED Capabilities, Network Policy, Location Identification and Extended Power-via-MDI TLVs are enabled. Therefore, if LLDP is enabled using the `lldp run` command, by default LLDP-MED advertisements are transmitted on ports that detect LLDP-MED neighbors connected to them.

**Mode** Interface Configuration

**Usage notes** LLDP-MED TLVs are only sent in advertisements via a port if there is an LLDP-MED-capable device connected to it. To see whether there are LLDP-MED capable devices connected to the ports, use the `show lldp neighbors` command.

**Examples** To enable inclusion of the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-tlv-select inventory-management
```

To exclude the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select inventory-management
```

To disable LLDP-MED advertisements transmitted via port1.0.1 and port1.0.2, disable all these TLVs using the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select all
```

**Related commands**

- lldp tlv-select
- location elin-location-id
- location civic-location identifier
- location civic-location configuration
- location coord-location identifier
- location coord-location configuration
- location elin-location
- show lldp interface
- switchport voice dscp
- switchport voice vlan
- switchport voice vlan priority

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp non-strict-med-tlv-order-check

**Overview** Use this command to enable non-strict order checking for LLDP-MED advertisements it receives. That is, use this command to enable LLDP to receive and store TLVs from LLDP-MED advertisements even if they do not use standard TLV order.

Use the **no** variant of this command to disable non-strict order checking for LLDP-MED advertisements, that is, to set strict TLV order checking, so that LLDP discards any LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement.

**Syntax** `lldp non-strict-med-tlv-order-check`  
`no lldp non-strict-med-tlv-order-check`

**Default** By default TLV non-strict order checking for LLDP-MED advertisements is disabled. That is, strict order checking is applied to LLDP-MED advertisements, according to ANSI/TIA-1057, and LLDP-MED TLVs in non-standard order are discarded.

**Mode** Global Configuration

**Usage notes** The ANSI/TIA-1057 specifies standard order for TLVs in LLDP-MED advertisements, and specifies that if LLDP receives LLDP advertisements with non-standard LLDP-MED TLV order, the TLVs in non-standard order should be discarded. This implementation of LLDP-MED follows the standard: it transmits TLVs in the standard order, and by default discards LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement. However, some implementations of LLDP transmit LLDP-MED advertisements with non-standard TLV order. To receive and store the data from these non-standard advertisements, enable non-strict order checking for LLDP-MED advertisements using this command.

**Examples** To enable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tlv-order-check
```

To disable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tlv-order-check
```

**Related commands** [show running-config lldp](#)

# Ildp notification-interval

**Overview** This command sets the notification interval. This is the minimum interval between LLDP SNMP notifications (traps) of each kind (LLDP Remote Tables Change Notification and LLDP-MED Topology Change Notification).

The **no** variant of this command sets the notification interval back to its default.

**Syntax** `lldp notification-interval <5-3600>`  
`no lldp notification-interval`

Parameter	Description
<5-3600>	The interval in seconds.

**Default** The default notification interval is 5 seconds.

**Mode** Global Configuration

**Examples** To set the notification interval to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp notification-interval 20
```

To set the notification interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp notification-interval
```

**Related commands** [lldp notifications](#)  
[show lldp](#)

# Ildp notifications

**Overview** This command enables the sending of LLDP SNMP notifications (traps) relating to specified ports.

The **no** variant of this command disables the sending of LLDP SNMP notifications for specified ports.

**Syntax** `lldp notifications`  
`no lldp notifications`

**Default** The sending of LLDP SNMP notifications is disabled by default.

**Mode** Interface Configuration

## Examples

**Related commands** `lldp notification-interval`  
`show lldp interface`  
`snmp-server enable trap`

# lldp port-number-type

**Overview** This command sets the type of port identifier used to enumerate, that is to count, the LLDP MIB local port entries. The LLDP MIB (IEEE Standard 802.1AB-2005, Section 12, LLDP MIB Definitions.) requires the port number value to count LLDP local port entries.

This command also enables you to optionally set an interface index to enumerate the LLDP MIB local port entries, if required by your management system.

The **no** variant of this command resets the type of port identifier back to the default setting (number).

**Syntax** `lldp port-number-type [number|ifindex]`  
`no lldp port-number-type`

Parameter	Description
number	Set the type of port identifier to a port number to enumerate the LLDP MIB local port entries.
ifindex	Set the type of port identifier to an interface index to enumerate the LLDP MIB local port entries.

**Default** The default port identifier type is number. The no variant of this command sets the port identifier type to the default.

**Mode** Global Configuration

**Examples** To set the type of port identifier used to enumerate LLDP MIB local port entries to port numbers, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type number
```

To set the type of port identifier used to enumerate LLDP MIB local port entries to interface indexes, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type ifindex
```

To reset the type of port identifier used to enumerate LLDP MIB local port entries the default (port numbers), use the commands:

```
awplus# configure terminal
awplus(config)# no lldp port-number-type
```

**Related commands** [show lldp](#)

# Ildp reinit

**Overview** This command sets the value of the reinitialization delay. This is the minimum time after disabling LLDP on a port before it can reinitialize.

The **no** variant of this command sets the reinitialization delay back to its default setting.

**Syntax** `lldp reinit <1-10>`  
`no lldp reinit`

Parameter	Description
<1-10>	The delay in seconds.

**Default** The default reinitialization delay is 2 seconds.

**Mode** Global Configuration

**Examples** To set the reinitialization delay to 3 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp reinit 3
```

To set the reinitialization delay back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp reinit
```

**Related commands** [show lldp](#)

# lldp run

**Overview** This command enables the operation of LLDP on the device.  
The **no** variant of this command disables the operation of LLDP on the device. The LLDP configuration remains unchanged.

**Syntax** `lldp run`  
`no lldp run`

**Default** LLDP is disabled by default.

**Mode** Global Configuration

**Examples** To enable LLDP operation, use the commands:

```
awplus# configure terminal  
awplus(config)# lldp run
```

To disable LLDP operation, use the commands:

```
awplus# configure terminal  
awplus(config)# no lldp run
```

**Related commands** [show lldp](#)

# lldp timer

**Overview** This command sets the value of the transmit interval. This is the interval between regular transmissions of LLDP advertisements.

The **no** variant of this command sets the transmit interval back to its default.

**Syntax** `lldp timer <5-32768>`  
`no lldp timer`

Parameter	Description
<code>&lt;5-32768&gt;</code>	The transmit interval in seconds. The transmit interval must be at least four times the transmission delay timer ( <a href="#">lldp tx-delay</a> command).

**Default** The default transmit interval is 30 seconds.

**Mode** Global Configuration

**Examples** To set the transmit interval to 90 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp timer 90
```

To set the transmit interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp timer
```

**Related commands** [lldp tx-delay](#)  
[show lldp](#)

# lldp tlv-select

**Overview** This command enables one or more optional TLVs, or all TLVs, for transmission in LLDP advertisements via the specified ports. The TLVs can be specified in any order; they are placed in LLDP frames in a fixed order (as described in IEEE 802.1AB). The mandatory TLVs (Chassis ID, Port ID, Time To Live, End of LLDPDU) are always included in LLDP advertisements.

In LLDP-MED advertisements the MAC/PHY Configuration/Status TLV will be always be included regardless of whether it is selected by this command.

The **no** variant of this command disables the specified optional TLVs, or all optional TLVs, for transmission in LLDP advertisements via the specified ports.

**Syntax**

```
lldp tlv-select { [<tlv>]... }
lldp tlv-select all
no lldp tlv-select { [<tlv>]... }
no lldp tlv-select all
```

Parameter	Description
<tlv>	The TLV to transmit in LLDP advertisements. One of these keywords: <ul style="list-style-type: none"> <li>port-description (specified by the <a href="#">description (interface)</a> command)</li> <li>system-name (specified by the <a href="#">hostname</a> command)</li> <li>system-description</li> <li>system-capabilities</li> <li>management-address</li> <li>port-vlan</li> <li>port-and-protocol-vlans</li> <li>vlan-names</li> <li>protocol-ids</li> <li>mac-phy-config</li> <li>power-management (Power Via MDI TLV)</li> <li>link-aggregation</li> <li>max-frame-size</li> </ul>
all	All TLVs.

**Default** By default no optional TLVs are included in LLDP advertisements. The MAC/PHY Configuration/Status TLV ( **mac-phy-config**) is included in LLDP-MED advertisements whether or not it is selected by this command.

**Mode** Interface Configuration

## Examples

**Related commands**

- description (interface)
- hostname
- lldp med-tlv-select
- show lldp interface
- show lldp local-info

# lldp transmit receive

**Overview** This command enables transmission and/or reception of LLDP advertisements to or from neighbors through the specified ports.

The **no** variant of this command disables transmission and/or reception of LLDP advertisements through specified ports.

**Syntax** `lldp {[transmit] [receive]}`  
`no lldp {[transmit] [receive]}`

Parameter	Description
transmit	Enable or disable transmission of LLDP advertisements via this port or ports.
receive	Enable or disable reception of LLDP advertisements via this port or ports.

**Default** LLDP advertisement transmission and reception are enabled on all ports by default.

**Mode** Interface Configuration

**Examples** To enable transmission of LLDP advertisements on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit
```

To enable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit receive
```

To disable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp transmit receive
```

**Related commands** [show lldp interface](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp tx-delay

**Overview** This command sets the value of the transmission delay timer. This is the minimum time interval between transmitting LLDP advertisements due to a change in LLDP local information.

The **no** variant of this command sets the transmission delay timer back to its default setting.

**Syntax** `lldp tx-delay <1-8192>`  
`no lldp tx-delay`

Parameter	Description
<code>&lt;1-8192&gt;</code>	The transmission delay in seconds. The transmission delay cannot be greater than a quarter of the transmit interval ( <a href="#">lldp timer</a> command).

**Default** The default transmission delay timer is 2 seconds.

**Mode** Global Configuration

**Examples** To set the transmission delay timer to 12 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tx-delay 12
```

To set the transmission delay timer back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tx-delay
```

**Related commands** [lldp timer](#)

# location civic-location configuration

**Overview** Use these commands to configure a civic address location. The country parameter must be specified first, and at least one of the other parameters must be configured before the location can be assigned to a port.

Use the **no** variants of this command to delete civic address parameters from the location.

**Syntax**

```
country <country>
state <state>
no state
county <county>
no county
city <city>
no city
division <division>
no division
neighborhood <neighborhood>
no neighborhood
street-group <street-group>
no street-group
leading-street-direction <leading-street-direction>
no leading-street-direction
trailing-street-suffix <trailing-street-suffix>
no trailing-street-suffix
street-suffix <street-suffix>
no street-suffix
house-number <house-number>
no house-number
house-number-suffix <house-number-suffix>
no house-number-suffix
landmark <landmark>
no landmark
additional-information <additional-information>
no additional-information
```

**Syntax (cont.)** name <name>  
no name  
postalcode <postalcode>  
no postalcode  
building <building>  
no building  
unit <unit>  
no unit  
floor <floor>  
no floor  
room <room>  
no room  
place-type <place-type>  
no place-type  
postal-community-name <postal-community-name>  
no postal-community-name  
post-office-box <post-office-box>  
no post-office-box  
additional-code <additional-code>  
no additional-code  
seat <seat>  
no seat  
primary-road-name <primary-road-name>  
no primary-road-name  
road-section <road-section>  
no road-section  
branch-road-name <branch-road-name>  
no branch-road-name  
sub-branch-road-name <sub-branch-road-name>  
no sub-branch-road-name  
street-name-pre-modifier <street-name-pre-modifier>  
no street-name-pre-modifier  
streetname-post-modifier <streetname-post-modifier>  
no streetname-post-modifier

Parameter	Description
<country>	Upper-case two-letter country code, as specified in ISO 3166.
<state>	State (Civic Address (CA) Type 1): national subdivisions (state, canton, region).
<county>	County (CA Type 2): County, parish, gun (JP), district (IN).
<city>	City (CA Type 3): city, township, shi (JP).
<division>	City division (CA Type 4): City division, borough, city district, ward, chou (JP).
<neighborhood>	Neighborhood (CA Type 5): neighborhood, block.
<street-group>	Street group (CA Type 6): group of streets below the neighborhood level.
<leading-street-direction>	Leading street direction (CA Type 16).
<trailing-street-suffix>	Trailing street suffix (CA Type 17).
<street-suffix>	Street suffix (CA Type 18): street suffix or type.
<house-number>	House number (CA Type 19).
<house-number-suffix>	House number suffix (CA Type 20).
<landmark>	Landmark or vanity address (CA Type 21).
<additional-information>	Additional location information (CA Type 22).
<name>	Name (CA Type 23): residence and office occupant.
<postal-code>	Postal/zip code (CA Type 24).
<building>	Building (CA Type 25): structure.
<unit>	Unit (CA Type 26): apartment, suite.
<floor>	Floor (CA Type 27).
<room>	Room (CA Type 28).
<place-type>	Type of place (CA Type 29).
<postal-community-name>	Postal community name (CA Type 30).
<post-office-box>	Post office box (P.O. Box) (CA Type 31).
<additional-code>	Additional code (CA Type 32).
<seat>	Seat (CA Type 33): seat (desk, cubicle, workstation).
<primary-road-name>	Primary road name (CA Type 34).
<road-section>	Road section (CA Type 35).

Parameter	Description
<branch-road-name>	Branch road name (CA Type 36).
<sub-branch-road-name>	Sub-branch road name (CA Type 37).
<street-name-pre-modifier>	Street name pre-modifier (CA Type 38).
<street-name-post-modifier>	Street name post-modifier (CA Type 39).

**Default** By default no civic address location information is configured.

**Mode** Civic Address Location Configuration

**Usage notes** The **country** parameter must be configured before any other parameters can be configured; this creates the location. The country parameter cannot be deleted. One or more of the other parameters must be configured before the location can be assigned to a port. The country parameter must be entered as an upper-case two-letter country code, as specified in ISO 3166. All other parameters are entered as alpha-numeric strings. Do not configure all the civic address parameters (this would generate TLVs that are too long). Configure a subset of these parameters—enough to consistently and precisely identify the location of the device. If the location is to be used for Emergency Call Service (ECS), the particular ECS application may have guidelines for configuring the civic address location. For more information about civic address format, see the [LLDP Feature Overview and Configuration Guide](#).

To specify the civic address location, use the [location civic-location identifier](#) command. To delete the civic address location, use the **no** variant of the **location civic-location identifier** command. To assign the civic address location to particular ports, so that it can be advertised in TLVs from those ports, use the command [location civic-location-id](#) command.

**Examples** To configure civic address location 1 with location "27 Nazareth Avenue, Christchurch, New Zealand" in civic-address format, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)# country NZ
awplus(config-civic)# city Christchurch
awplus(config-civic)# primary-road-name Nazareth
awplus(config-civic)# street-suffix Avenue
awplus(config-civic)# house-number 27
```

**Related commands**

- [location civic-location identifier](#)
- [show lldp local-info](#)
- [show location](#)

# location civic-location identifier

**Overview** Use this command to enter the Civic Address Location Configuration mode to configure the specified location.

Use the **no** variant of this command to delete a civic address location. This also removes the location from any ports it has been assigned to.

**Syntax** `location civic-location identifier <civic-loc-id>`  
`no location civic-location identifier <civic-loc-id>`

Parameter	Description
<code>&lt;civic-loc-id&gt;</code>	A unique civic address location ID, in the range 1 to 4095.

**Default** By default there are no civic address locations.

**Mode** Global Configuration

**Usage notes** To configure the location information for this civic address location identifier, use the [location civic-location configuration](#) command. To associate this civic location identifier with particular ports, use the [location elin-location-id](#) command.

Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

**Examples** To enter Civic Address Location Configuration mode for the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)#
```

To delete the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location civic-location identifier 1
```

**Related commands**

- [location civic-location-id](#)
- [location civic-location configuration](#)
- [show location](#)
- [show running-config lldp](#)

# location civic-location-id

**Overview** Use this command to assign a civic address location to the ports. The civic address location must already exist. This replaces any previous assignment of civic address location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

**Syntax** `location civic-location-id <civic-loc-id>`  
`no location civic-location-id [<civic-loc-id>]`

Parameter	Description
<code>&lt;civic-loc-id&gt;</code>	Civic address location ID, in the range 1 to 4095.

**Default** By default no civic address location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** The civic address location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, create the location using the following commands:

- [location civic-location identifier](#) command
- [location civic-location configuration](#) command

If a civic-address location is deleted using the **no** variant of the [location civic-location identifier](#) command, it is automatically removed from all ports.

**Examples** To assign the civic address location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location civic-location-id 1
```

To remove a civic address location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location civic-location-id
```

**Related commands** [lldp med-tlv-select](#)  
[location civic-location identifier](#)  
[location civic-location configuration](#)  
[show location](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# location coord-location configuration

**Overview** Use this command to configure a coordinate-based location. All parameters must be configured before assigning this location identifier to a port.

**Syntax**

```
latitude <latitude>  
lat-resolution <lat-resolution>  
longitude <longitude>  
long-resolution <long-resolution>  
altitude <altitude> {meters|floor}  
alt-resolution <alt-resolution>  
datum {wgs84|nad83-navd|nad83-mllw}
```

Parameter	Description
<lat-resolution>	Latitude resolution, as a number of valid bits, in the range 0 to 34.
<latitude>	Latitude value in degrees in the range -90.0 to 90.0
<long-resolution>	Longitude resolution, as a number of valid bits, in the range 0 to 34.
<longitude>	Longitude value in degrees, in the range -180.0 to 180.0.
<alt-resolution>	Altitude resolution, as a number of valid bits, in the range 0 to 30. A resolution of 0 can be used to indicate an unknown value.
<altitude>	Altitude value, in meters or floors.
meters	The altitude value is in meters.
floors	The altitude value is in floors.
datum	The geodetic system (or datum) that the specified coordinate values are based on.
wgs84	World Geodetic System 1984.
nad83-navd	North American Datum 1983 - North American Vertical Datum.
nad83-mllw	North American Datum 1983 - Mean Lower Low Water vertical datum.

**Default** By default no coordinate location information is configured.

**Mode** Coordinate Configuration

**Usage** Latitude and longitude values are always stored internally, and advertised in the Location Identification TLV, as 34-bit fixed-point binary numbers, with a 25-bit fractional part, irrespective of the number of digits entered by the user. Likewise

altitude is stored as a 30-bit fixed point binary number, with an 8-bit fractional part. Because the user-entered decimal values are stored as fixed point binary numbers, they cannot always be represented exactly—the stored binary number is converted to a decimal number for display in the output of the [show location](#) command. For example, a user-entered latitude value of “2.77” degrees is displayed as “2.7699999809265136718750000”.

The **lat-resolution**, **long-resolution**, and **alt-resolution** parameters allow the user to specify the resolution of each coordinate element as the number of valid bits in the internally-stored binary representation of the value. These resolution values can be used by emergency services to define a search area.

To specify the coordinate identifier, use the [location coord-location identifier](#) command. To remove coordinate information, delete the coordinate location by using the **no** variant of that command. To associate the coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the [location elin-location-id](#) command.

**Example** To configure the location for the White House in Washington DC, which has the coordinates based on the WGS84 datum of 38.89868 degrees North (with 22 bit resolution), 77.03723 degrees West (with 22 bit resolution), and 15 meters height (with 9 bit resolution), use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)# la-resolution 22
awplus(config-coord)# latitude 38.89868
awplus(config-coord)# lo-resolution 22
awplus(config-coord)# longitude -77.03723
awplus(config-coord)# alt-resolution 9
awplus(config-coord)# altitude 15 meters
awplus(config-coord)# datum wgs84
```

# location coord-location identifier

**Overview** Use this command to enter Coordinate Location Configuration mode for this coordinate location.

Use the **no** variant of this command to delete a coordinate location. This also removes the location from any ports it has been assigned to.

**Syntax** `location coord-location identifier <coord-loc-id>`  
`no location coord-location identifier <coord-loc-id>`

Parameter	Description
<code>&lt;coord-loc-id&gt;</code>	A unique coordinate location identifier, in the range 1 to 4095.

**Default** By default there are no coordinate locations.

**Mode** Global Configuration

**Usage** Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To configure this coordinate location, use the [location coord-location configuration](#) command. To associate this coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the [location coord-location-id](#) command.

**Examples** To enter Coordinate Location Configuration mode to configure the coordinate location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)#
```

To delete coordinate location 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location coord-location identifier 1
```

**Related commands** [location coord-location-id](#)

# location elin-location

**Overview** Use this command to create or modify an ELIN location.

Use the **no** variant of this command to delete an ELIN location, and remove it from any ports it has been assigned to.

**Syntax** location elin-location <elin> identifier <elin-loc-id>  
no location elin-location identifier <elin-loc-id>

Parameter	Description
<elin>	Emergency Location Identification Number (ELIN) for Emergency Call Service (ECS), in the range 10 to 25 digits long. In North America, ELINs are typically 10 digits long.
<elin-loc-id>	A unique ELIN location identifier, in the range 1 to 4095.

**Default** By default there are no ELIN location identifiers.

**Mode** Global Configuration

**Usage** Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To assign this ELIN location to particular ports, so that it can be advertised in TLVs from those ports, use the [location elin-location-id](#) command.

**Examples** To create a new ELIN location with ID 1, and configure it with ELIN "1234567890", use the commands:

```
awplus# configure terminal
awplus(config)# location elin-location 1234567890 identifier 1
```

To delete existing ELIN location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location elin-location identifier 1
```

**Related commands** [location elin-location-id](#)

# location elin-location-id

**Overview** Use this command to assign an ELIN location to the ports. The ELIN location must already exist. This replaces any previous assignment of ELIN location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

**Syntax** `location elin-location-id <elin-loc-id>`  
`no location elin-location-id [<elin-loc-id>]`

Parameter	Description
<code>&lt;elin-loc-id&gt;</code>	ELIN location identifier, in the range 1 to 4095.

**Default** By default no ELIN location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** An ELIN location associated with a port can be transmitted in Location Identification TLVs via the port.  
Before using this command, configure the location using the [location elin-location](#) command.

If an ELIN location is deleted using the **no** variant of one of the [location elin-location](#) command, it is automatically removed from all ports.

**Examples** To assign ELIN location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location elin-location-id 1
```

To remove ELIN location 1 from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location elin-location-id 1
```

# show debugging lldp

**Overview** This command displays LLDP debug settings for specified ports. If no port list is supplied, LLDP debug settings for all ports are displayed.

**Syntax** `show debugging lldp [interface <port-list>]`

Parameter	Description
<port-list>	The ports for which the LLDP debug settings are shown.

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP debug settings for all ports, use the command:

```
awplus# show debugging lldp
```

**Output** Figure 59-1: Example output from the **show debugging lldp** command

**Table 1:** Parameters in the output of the **show debugging lldp** command

Parameter	Description
Port	Port name.
Rx	Whether debugging of LLDP receive is enabled on the port.
RxPkt	Whether debugging of LLDP receive packet dump is enabled on the port.
Rx	Whether debugging of LLDP transmit is enabled on the port.
RxPkt	Whether debugging of LLDP transmit packet dump is enabled on the port.

**Related commands** [debug lldp](#)

# show lldp

**Overview** This command displays LLDP status and global configuration settings.

**Syntax** show lldp

**Mode** User Exec and Privileged Exec

**Example** To display LLDP status and global configuration settings, use the command:

```
awplus# show lldp
```

## Output

**Table 2:** Example output from the **show lldp** command

```
awplus# show lldp

LLDP Global Configuration:                [Default Values]
LLDP Status ..... Enabled                [Disabled]
Notification Interval ..... 5 secs       [5]
Tx Timer Interval ..... 30 secs          [30]
Hold-time Multiplier ..... 4             [4]
(Computed TTL value ..... 120 secs)
Reinitialization Delay .... 2 secs       [2]
Tx Delay ..... 2 secs                   [2]

Port Number Type..... Ifindex            [Port-Number]
Fast Start Count ..... 5                 [3]

LLDP Global Status:
Total Neighbor Count ..... 47
Neighbors table last updated 0 hrs 0 mins 43 secs ago
```

**Table 3:** Parameters in the output of the **show lldp** command

Parameter	Description
LLDP Status	Whether LLDP is enabled. Default is disabled.
Notification Interval	Minimum interval between LLDP notifications.
Tx Timer Interval	Transmit interval between regular transmissions of LLDP advertisements.
Hold-time Multiplier	The holdtime multiplier. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors.
Reinitialization Delay	The reinitialization delay. This is the minimum time after disabling LLDP transmit on a port before it can reinitialize again.

**Table 3:** Parameters in the output of the **show lldp** command (cont.)

Parameter	Description
Tx Delay	The transmission delay. This is the minimum time interval between transmitting advertisements due to a change in LLDP local information.
Port Number Type	The type of port identifier used to enumerate LLDP MIB local port entries, as set by the lldp port-number-type command.
Fast Start Count	The number of times fast start advertisements are sent for LLDP-MED.
Total Neighbor Count	Number of LLDP neighbors discovered on all ports.
Neighbors table last updated	The time since the LLDP neighbor table was last updated.

**Related commands** [show lldp interface](#)  
[show running-config lldp](#)

# show lldp interface

**Overview** This command displays LLDP configuration settings for specified ports. If no port list is specified, LLDP configuration for all ports is displayed.

**Syntax** `show lldp interface [<port-list>]`

Parameter	Description
<port-list>	The ports for which the LLDP configuration settings are to be shown.

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP configuration settings for all ports, use the command:

```
awplus# show lldp interface
```

**Output** Figure 59-2: Example output from the **show lldp interface** command

**Table 4:** Parameters in the output of the **show lldp interface** command

Parameter	Description
Port	Port name.
Rx	Whether reception of LLDP advertisements is enabled on the port.
Tx	Whether transmission of LLDP advertisements is enabled on the port.
Notif	Whether sending SNMP notification for LLDP is enabled on the port: <ul style="list-style-type: none"><li>• RM = Remote Tables Change Notification</li><li>• TP = LLDP-MED Topology Change Notification</li></ul>
Management Addr	Management address advertised to neighbors.
Base TLVs Enabled for Tx	List of optional Base TLVs enabled for transmission: <ul style="list-style-type: none"><li>• Pd = Port Description</li><li>• Sn =System Name</li><li>• Sd = System Description</li><li>• Sc =System Capabilities</li><li>• Ma = Management Address</li></ul>

**Table 4:** Parameters in the output of the **show lldp interface** command (cont.)

Parameter	Description
802.1 TLVs Enabled for Tx	List of optional 802.1 TLVs enabled for transmission: <ul style="list-style-type: none"><li>• Pv = Port VLAN ID</li><li>• Pp = Port And Protocol VLAN ID</li><li>• Vn = VLAN Name</li><li>• Pi =Protocol Identity</li></ul>
802.3 TLVs Enabled for Tx	List of optional 802.3 TLVs enabled for transmission: <ul style="list-style-type: none"><li>• Mp = MAC/PHY Configuration/Status</li><li>• Po = Power Via MDI (PoE)</li><li>• La = Link Aggregation</li><li>• Mf = Maximum Frame Size</li></ul>
MED TLVs Enabled for Tx	List of optional LLDP-MED TLVs enabled for transmission: <ul style="list-style-type: none"><li>• Mc = LLDP-MED Capabilities</li><li>• Np = Network Policy</li><li>• Lo = Location Information,</li><li>• Pe = Extended Power-Via-MDI</li><li>• In = Inventory</li></ul>

**Related commands** [show lldp](#)  
[show running-config lldp](#)

# show lldp local-info

**Overview** This command displays local LLDP information that can be transmitted through specified ports. If no port list is entered, local LLDP information for all ports is displayed.

**Syntax** `show lldp local-info [base] [dot1] [dot3] [med] [interface <port-list>]`

Parameter	Description
base	Information for base TLVs.
dot1	Information for 802.1 TLVs.
dot3	Information for 802.3 TLVs.
med	Information for LLDP-MED TLVs.
<port-list>	The ports for which the local information is to be shown.

**Mode** User Exec and Privileged Exec

**Usage notes** Whether and which local information is transmitted in advertisements via a port depends on:

- whether the port is set to transmit LLDP advertisements ([lldp transmit receive](#) command)
- which TLVs it is configured to send ([lldp tlv-select](#) command, [lldp med-tnv-select](#) command)

**Examples** To display local information transmitted via all ports, use the command:

```
awplus# show lldp local-info
```

**Output** Figure 59-3: Example output from **show lldp local-info**

```
LLDP Local Information:

Local port1.0.1:
  Chassis ID Type ..... MAC address
  Chassis ID ..... 0015.77c9.7453
  Port ID Type ..... Interface alias
  Port ID ..... port1.0.1
  TTL ..... 120
  Port Description ..... [not configured]
```

```
System Name ..... awplus
System Description ..... Allied Telesis router/switch, AW+
                          v5.4.6
System Capabilities - Supported .. Bridge, Router
                   - Enabled .... Bridge, Router
Management Address ..... 192.168.1.6
Port VLAN ID (PVID) ..... 1
Port & Protocol VLAN - Supported . Yes
                   - Enabled ... No
                   - VIDs ..... 0
VLAN Names ..... default
Protocol IDs ..... 9000, 0026424203000000, 888e01, aaaa03,
                   88090101, 00540000e302, 0800, 0806, 86dd
MAC/PHY Auto-negotiation ..... Supported, Enabled
  Advertised Capability ..... 1000BaseTFD, 100BaseTXFD, 100BaseTX,
                              10BaseTFD, 10BaseT
  Operational MAU Type ..... 1000BaseTFD (30)
Power Via MDI (PoE) ..... Supported, Enabled
  Port Class ..... PSE
  Pair Control Ability ..... Disabled
  Power Class ..... Unknown
Link Aggregation ..... Supported, Disabled
Maximum Frame Size ..... 1522
LLDP-MED Device Type ..... Network Connectivity
LLDP-MED Capabilities ..... LLDP-MED Capabilities, Network Policy,
                              Location Identification,
                              Extended Power - PSE, Inventory
Network Policy ..... [not configured]
Location Identification ..... Civic Address
  Country Code ..... NZ
  City ..... Christchurch
  Street Suffix ..... Avenue
  House Number ..... 27
  Primary Road Name ..... Nazareth
Location Identification ..... ELIN
  ELIN ..... 123456789012
LLDP-MED Device Type ..... Network Connectivity
LLDP-MED Capabilities ..... LLDP-MED Capabilities, Network Policy,
                              Location Identification,
                              Extended Power - PSE, Inventory
Extended Power Via MDI (PoE) ..... PSE
  Power Source ..... Primary Power
  Power Priority ..... Low
  Power Value ..... 4.4 Watts
Inventory Management:
  Hardware Revision ..... A-0
  Firmware Revision ..... 1.1.0
  Software Revision ..... v5.4.6
  Serial Number ..... G1Q78900B
  Manufacturer Name ..... Allied Telesis Inc.
  Model Name ..... AT-x930-52GPX
  Asset ID ..... [zero length]
```

Table 59-1: Parameters in the output of **show lldp local-info**

Parameter	Description
Chassis ID Type	Type of the Chassis ID.
Chassis ID	Chassis ID that uniquely identifies the local device.
Port ID Type	Type of the Port ID.
Port ID	Port ID of the local port through which advertisements are sent.
TTL	Number of seconds that the information advertised by the local port remains valid.
Port Description	Port description of the local port, as specified by the <a href="#">description (interface)</a> command.
System Name	System name, as specified by the <a href="#">hostname</a> command.
System Description	System description.
System Capabilities (Supported)	Capabilities that the local port supports.
System Capabilities (Enabled)	Enabled capabilities on the local port.
Management Addresses	Management address associated with the local port. To change this, use the <a href="#">lldp management-address</a> command.
Port VLAN ID (PVID)	VLAN identifier associated with untagged or priority tagged frames received via the local port.
Port & Protocol VLAN (Supported)	Whether Port & Protocol VLANs (PPV) is supported on the local port.
Port & Protocol VLAN (Enabled)	Whether the port is in one or more Port & Protocol VLANs.
Port & Protocol VLAN (VIDs)	List of identifiers for Port & Protocol VLANs that the port is in.
VLAN Names	List of VLAN names for VLANs that the local port is assigned to.
Protocol IDs	List of protocols that are accessible through the local port.
MAC/PHY Auto-negotiation	Auto-negotiation support and current status of the 802.3 LAN on the local port.

Table 59-1: Parameters in the output of **show lldp local-info** (cont.)

Parameter	Description
Power Via MDI (PoE)	PoE-capability and current status on the local port.
Port Class	Whether the device is a PSE (Power Sourcing Entity) or a PD (Powered Device)
Pair Control Ability	Whether power pair selection can be controlled
Power Pairs	Which power pairs are selected for power ("Signal Pairs" or "Spare Pairs") if pair selection can be controlled
Power Class	The power class of the PD device on the port (class 0, 1, 2, 3 or 4)
Link Aggregation	Whether the link is capable of being aggregated and it is currently in an aggregation.
Aggregated Port-ID	Aggregated port identifier.
Maximum Frame Size	The maximum frame size capability of the implemented MAC and PHY.
LLDP-MED Device Type	LLDP-MED device type
LLDP-MED Capabilities	Capabilities LLDP-MED capabilities supported on the local port.
Network Policy	List of network policies configured on the local port.
VLAN ID	VLAN identifier for the port for the specified application type
Tagged Flag	Whether the VLAN ID is to be used as tagged or untagged
Layer-2 Priority:	Layer 2 User Priority (in the range 0 to 7)
DSCP Value	Diffserv codepoint (in the range 0 to 63)
Location Identification	Location configured on the local port.
Extended Power Via MDI (PoE)	PoE-capability and current status of the PoE parameters for Extended Power-Via-MDI TLV on the local port.
Power Source	The power source the switch currently uses; either primary power or backup power.
Power Priority	The power priority configured on the port; either critical, high or low.

Table 59-1: Parameters in the output of **show lldp local-info** (cont.)

Parameter	Description
Power Value	The total power the switch can source over a maximum length cable to a PD device on the port. The value shows the power value in Watts from the PD side.
Inventory Management	Inventory information for the device.

- [hostname](#)
- [lldp transmit receive](#)

# show lldp neighbors

**Overview** This command displays a summary of information received from neighbors via specified ports. If no port list is supplied, neighbor information for all ports is displayed.

**Syntax** `show lldp neighbors [interface <port-list>]`

Parameter	Description
<port-list>	The ports for which the neighbor information is to be shown.

**Mode** User Exec and Privileged Exec

**Examples** To display neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors
```

**Output** Figure 59-4: Example output from the **show lldp neighbors** command

**Table 60:** Parameters in the output of the **show lldp neighbors** command

Parameter	Description
Local Port	Local port on which the neighbor information was received.
Neighbor Chassis ID	Chassis ID that uniquely identifies the neighbor.
Neighbor Port Name	Port ID of the neighbor.
Neighbor Sys Name	System name of the LLDP neighbor.
Neighbor Capability	Capabilities that are supported and enabled on the neighbor.
System Capability	System Capabilities of the LLDP neighbor.
MED Device Type	LLDP-MED Device class (Class I, II, III or Network Connectivity)
MED Power Source	LLDP-MED Power Source

**Related commands** [show lldp neighbors detail](#)

# show lldp neighbors detail

**Overview** This command displays in detail the information received from neighbors via specified ports. If no port list is supplied, detailed neighbor information for all ports is displayed.

**Syntax** `show lldp neighbors detail [base] [dot1] [dot3] [med] [interface <port-list>]`

Parameter	Description
base	Information for base TLVs.
dot1	Information for 802.1 TLVs.
dot3	Information for 803.1 TLVs.
med	Information for LLDP-MED TLVs.
<port-list>	The ports for which the neighbor information is to be shown.

**Mode** User Exec and Privileged Exec

**Examples** To display detailed neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors detail
```

**Output** Figure 59-5: Example output from the **show lldp neighbors detail** command

```
awplus#show lldp neighbors detail interface port1.0.1

**Table 61:** Parameters in the output of the **show lldp neighbors detail** command

Parameter	Description
Chassis ID Type	Type of the Chassis ID.
Chassis ID	Chassis ID that uniquely identifies the neighbor.
Port ID Type	Type of the Port ID.
Port ID	Port ID of the neighbor.
TTL	Number of seconds that the information advertised by the neighbor remains valid.
Port Description	Port description of the neighbor's port.
System Name	Neighbor's system name.
System Description	Neighbor's system description.
System Capabilities (Supported)	Capabilities that the neighbor supports.
System Capabilities (Enabled)	Capabilities that are enabled on the neighbor.
Management Addresses	List of neighbor's management addresses.
Port VLAN ID (PVID)	VLAN identifier associated with untagged or priority tagged frames for the neighbor port.
Port & Protocol VLAN (Supported)	Whether Port & Protocol VLAN is supported on the LLDP neighbor.
Port & Protocol VLAN (Enabled)	Whether Port & Protocol VLAN is enabled on the LLDP neighbor.
Port & Protocol VLAN (VIDs)	List of Port & Protocol VLAN identifiers.
VLAN Names	List of names of VLANs that the neighbor's port belongs to.
Protocol IDs	List of protocols that are accessible through the neighbor's port.
MAC/PHY Auto-negotiation	Auto-negotiation configuration and status
Power Via MDI (PoE)	PoE configuration and status of 802.3 Power-Via-MDI TLV
Link Aggregation	Link aggregation information

**Table 61:** Parameters in the output of the **show lldp neighbors detail** command (cont.)

Parameter	Description
Maximum Frame Size	The maximum frame size capability
LLDP-MED Device Type	LLDP-MED Device type
LLDP-MED Capabilities	LLDP-MED capabilities supported
Network Policy	List of network policies
Location Identification	Location information
Extended Power Via MDI (PoE)	PoE-capability and current status
Inventory Management	Inventory information

**Related commands** [show lldp neighbors](#)

# show lldp statistics

**Overview** This command displays the global LLDP statistics (packet and event counters).

**Syntax** show lldp statistics

**Mode** User Exec and Privileged Exec

**Example** To display global LLDP statistics information, use the command:

```
awplus# show lldp statistics
```

## Output

**Table 62:** Example output from the **show lldp statistics** command

```
awplus# show lldp statistics

Global LLDP Packet and Event counters:

Frames:   Out ..... 345
          In ..... 423
          In Errored ..... 0
          In Dropped ..... 0
TLVs:     Unrecognized ..... 0
          Discarded ..... 0
Neighbors: New Entries ..... 20
           Deleted Entries ..... 20
           Dropped Entries ..... 0
           Entry Age-outs ..... 20
```

**Table 63:** Parameters in the output of the **show lldp statistics** command

Parameter	Description
Frames Out	Number of LLDPDU frames transmitted.
Frames In	Number of LLDPDU frames received.
Frames In Errored	Number of invalid LLDPDU frames received.
Frames In Dropped	Number of LLDPDU frames received and discarded for any reason.
TLVs Unrecognized	Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types.
TLVs Discarded	Number of LLDP TLVs discarded for any reason.
Neighbors New Entries	Number of times the information advertised by neighbors has been inserted into the neighbor table.

**Table 63:** Parameters in the output of the **show lldp statistics** command (cont.)

Parameter	Description
Neighbors Deleted Entries	Number of times the information advertised by neighbors has been removed from the neighbor table.
Neighbors Dropped Entries	Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.
Neighbors Entry Age-outs Entries	Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired.

**Related commands**

- [clear lldp statistics](#)
- [show lldp statistics interface](#)

# show lldp statistics interface

**Overview** This command displays the LLDP statistics (packet and event counters) for specified ports. If no port list is supplied, LLDP statistics for all ports are displayed.

**Syntax** `show lldp statistics interface [<port-list>]`

Parameter	Description
<port-list>	The ports for which the statistics are to be shown.

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP statistics information for all ports, use the command:

```
awplus# show lldp statistics interface
```

## Output

**Table 64:** Example output from the **show lldp statistics interface** command

--

**Table 65:** Parameters in the output of the **show lldp statistics interface** command

Parameter	Description
Frames Out	Number of LLDPDU frames transmitted.
Frames In	Number of LLDPDU frames received.
Frames In Errored	Number of invalid LLDPDU frames received.
Frames In Dropped	Number of LLDPDU frames received and discarded for any reason.
TLVs Unrecognized	Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types.
TLVs Discarded	Number of LLDP TLVs discarded for any reason.
Neighbors New Entries	Number of times the information advertised by neighbors has been inserted into the neighbor table.
Neighbors Deleted Entries	Number of times the information advertised by neighbors has been removed from the neighbor table.

**Table 65:** Parameters in the output of the **show lldp statistics interface** command (cont.)

Parameter	Description
Neighbors Dropped Entries	Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.
Neighbors Entry Age-outs Entries	Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired.

**Related commands** [clear lldp statistics](#)  
[show lldp statistics](#)

# show location

**Overview** Use this command to display selected location information configured on the switch.

**Syntax** `show location {civic-location|coord-location|elin-location}`  
`show location {civic-location|coord-location|elin-location}`  
`identifier {<civic-loc-id>|<coord-loc-id>|<elin-loc-id>}`  
`show location {civic-location|coord-location|elin-location}`  
`interface <port-list>`

Parameter	Description
<code>civic-location</code>	Display civic location information.
<code>coord-location</code>	Display coordinate location information.
<code>elin-location</code>	Display ELIN (Emergency Location Identifier Number) information.
<code>&lt;civic-loc-id&gt;</code>	Civic address location identifier, in the range 1 to 4095.
<code>&lt;coord-loc-id&gt;</code>	Coordinate location identifier, in the range 1 to 4095.
<code>&lt;elin-loc-id&gt;</code>	ELIN location identifier, in the range 1 to 4095.
<code>&lt;port-list&gt;</code>	Ports to display information about.

**Mode** User Exec and Privileged Exec

**Examples** To display a civic address location configured on port 1.0.1, use the command:

```
awplus# show location civic-location interface port1.0.1
```

**Table 66:** Example output from the **show location** command

```
awplus# show location civic-location interface port1.0.1
Port      ID      Element Type      Element Value
-----
1.0.1     1      Country           NZ
          City           Christchurch
          Street-suffix  Avenue
          House-number   27
          Primary-road-name Nazareth
```

To display coordinate location information configured on the identifier 1, use the command:

```
awplus# show location coord-location identifier 1
```

**Table 67:** Example output from the **show location** command

```
awplus# show location coord-location identifier 1
  ID  Element Type                Element Value
-----
  1   Latitude Resolution         15 bits
      Latitude                    38.8986481130123138427734375 degrees
      Longitude Resolution        15 bits
      Longitude                    130.2323232293128967285156250 degrees
      Altitude Resolution          10 bits
      Altitude                     2.50000000 meters
      Map Datum                     WGS 84
```

The coordinate location information displayed may differ from the information entered because it is stored in binary format. For more information, see the [location coord-location configuration](#) command.

To display all ELIN location information configured on the switch, use the command:

```
awplus# show location elin-location
```

**Table 68:** Example output from the **show location elin-location** command

```
awplus# show location elin-location
  ID  ELIN
-----
  1   1234567890
  2   5432154321
```

# 60

# Mail (SMTP) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure mail. The mail feature uses Simple Mail Transfer Protocol (SMTP) to transfer mail from an internal email client operating within the AlliedWare Plus device. This feature is typically used to email event notifications to an external email server from the AlliedWare Plus device.

For information on using the mail feature, see the [Mail \(SMTP\) Feature Overview and Configuration Guide](#).

- Command List**
- [“debug mail”](#) on page 3135
  - [“delete mail”](#) on page 3136
  - [“mail”](#) on page 3137
  - [“mail from”](#) on page 3139
  - [“mail smtpserver”](#) on page 3140
  - [“mail smtpserver authentication”](#) on page 3141
  - [“mail smtpserver port”](#) on page 3143
  - [“show counter mail”](#) on page 3145
  - [“show mail”](#) on page 3146
  - [“undebug mail”](#) on page 3147

# debug mail

**Overview** This command turns on debugging for sending emails.  
The **no** variant of this command turns off debugging for sending emails.

**Syntax** debug mail  
no debug mail

**Mode** Privileged Exec

**Examples** To turn on debugging for sending emails, use the command:

```
awplus# debug mail
```

To turn off debugging for sending emails, use the command:

```
awplus# no debug mail
```

**Related commands**

- delete mail
- mail
- mail from
- mail smtpserver
- show counter mail
- show mail
- undebug mail

# delete mail

**Overview** This command deletes mail from the queue.

You need the *mail-id* from the **show mail** command output to delete specific emails, or use the **all** parameter to clear all messages in the queue completely.

**Syntax** `delete mail [mail-id <mail-id>|all]`

Parameter	Description
mail-id	Deletes a single mail from the mail queue.
	<mail-id> A unique mail ID number. Use the <a href="#">show mail</a> command to display this for an item of mail.
all	Delete all the mail in the queue.

**Mode** Privileged Exec

**Examples** To delete the unique mail item "20060912142356.1234" from the queue, use the command:

```
awplus# delete mail 20060912142356.1234
```

To delete all mail from the queue, use the command:

```
awplus# delete mail all
```

**Related commands**

- [debug mail](#)
- [mail](#)
- [mail from](#)
- [mail smtpserver](#)
- [show mail](#)

# mail

**Overview** This command sends an email using the SMTP protocol. If you specify a file the text inside the file is sent in the message body.

If you do not specify the **to**, **file**, or **subject** parameters, the CLI prompts you for the missing information.

Before you can send mail using this command, you must specify the sending email address using the [mail from](#) command and a mail server using the [mail smtpserver](#) command.

**Syntax** mail [to <to>] [subject <subject>] [file <filename>]

Parameter	Description
to	The email recipient.  <to> Email address.
subject	Description of the subject of this email. Use quote marks when the subject text contains spaces.  <subject> String.
file	File to insert as text into the message body.  <filename> String.

**Mode** Privileged Exec

**Usage notes** When you use the **mail** command you can use parameter substitutions in the subject field. The following table lists the parameters that can be substituted and their descriptions:

Parameter	Description
<%N>	When this parameter is specified, the %N is replaced by the host name of your device.
<%S>	When this parameter is specified, the %S is replaced by the serial number of your device.
<%D> <%L> <%T>	When any of these parameters is specified, they are replaced by the current date and time (local time) on your device.
<%U>	When this parameter is specified, the %U is replaced by the current date and time (UTC time) on your device.

**NOTE:** If no local time is configured, it will use UTC.

**Examples** To send an email to "admin@example.com" with the subject "test email" and with the message body inserted from the file "test.conf", use the command:

```
awplus# mail to admin@example.com subject "test email" filename  
test.conf
```

To send an email using parameter substitutions for the host name, serial number and date, use the commands:

```
awplus# mail to admin@example.com subject "Sending email from  
Hostname:%N Serial Number:%S Date:%T"
```

**Related  
commands**

[debug mail](#)

[delete mail](#)

[mail from](#)

[mail smtpserver](#)

[mail smtpserver authentication](#)

[mail smtpserver port](#)

[show counter mail](#)

[show mail](#)

# mail from

**Overview** This command sets an email address as the sender. You must specify a sending email address with this command before you can send email.

Use the **no** variant of this command to remove the “mail from” address.

**Syntax** mail from <from>  
no mail from

Parameter	Description
<from>	The email address that the mail is sent from (also known as the hostname).

**Mode** Global Configuration

**Example** To set up your email address as the sender “kaji@nerv.com”, use the command:

```
awplus(config)# mail from kaji@nerv.com
```

**Related commands**

- debug mail
- delete mail
- mail
- mail smtpserver
- show counter mail
- show mail
- undebug mail

# mail smtpserver

**Overview** This command specifies the IP address or domain name of the SMTP server that your device sends email to. You must specify a mail server with this command before you can send email.

Use the **no** variant of this command to remove the configured mail server.

**Syntax** mail smtpserver {<ip-address>|<name>}  
no mail smtpserver

Parameter	Description
<ip-address>	Internet Protocol (IP) address for the mail server.
<name>	Domain name (FQDN) for the mail server (also known as the host name).

**Mode** Global Configuration

**Usage notes** If you specify the server by specifying its domain name, you must also ensure that the DNS client on your device is enabled. It is enabled by default but if it has been disabled, you can re-enable it by using the [ip domain-lookup](#) command.

**Examples** To specify a mail server at "192.168.0.1", use the command:

```
awplus(config)# mail smtpserver 192.168.0.1
```

To specify a mail server that has a host name of "smtp.example.com", use the command:

```
awplus(config)# mail smtpserver smtp.example.com
```

To remove the configured mail server, use the command:

```
awplus(config)# no mail smtpserver
```

**Related commands**

- [debug mail](#)
- [delete mail](#)
- [mail](#)
- [mail from](#)
- [show counter mail](#)
- [show mail](#)

# mail smtpserver authentication

**Overview** Use this command to configure SMTP mail server authentication.

Use the **no** variant of this command to remove the configured SMTP mail server authentication.

**Syntax** mail smtpserver authentication {crammd5|login|plain} username <username> password [8] <password>  
no mail smtpserver authentication

Parameter	Description
crammd5	This is a Challenge Request Authentication Mechanism based on the HMAC-MD5 mechanism and is the most secure option.
login	A BASE64 encryption method
plain	A BASE64 encryption method
<username>	Registered user name
8	The registered user password is presented in an already encrypted format. This is how the running configuration stores the plain text password and is not for general use.
<password>	Registered user password

**Default** No authentication option is set by default.

**Mode** Global Configuration

**Usage notes** You cannot change the IP address or Domain Name of the SMTP server if authentication is configured. If you attempt to change it when authentication is configured, the following error message is displayed:

```
% Error: authentication configuration still exists
```

**Examples** To configure the SMTP mail server authentication to crammd5, use the commands:

```
awplus# configure terminal  
awplus(config)# mail smtpserver authentication crammd5 username  
admin password unguessablePassword
```

To remove SMTP mail server authentication, use the commands:

```
awplus# configure terminal  
awplus(config)# no mail smtpserver authentication
```

**Output** Figure 60-1: Example output from **show mail**:

```
awplus#show mail
Mail Settings
-----

changes**

Version 5.4.8-1.1: command added

# mail smtpserver port

**Overview** Use this command to configure the SMTP mail client/server communication port. Use the **no** variant of this command to remove the configured port and set it back to the default port 25.

**Syntax** mail smtpserver port <port>  
no mail smtpserver port

Parameter	Description
<port>	Port number from the range 1 to 65535

**Default** Port 25 is the default port.

**Mode** Global Configuration

**Examples** To configure the mail server communication over port 587, use the commands:

```
awplus# configure terminal  
awplus(config)# mail smtpserver port 587
```

To remove the configured port and set it back to the default port 25, use the commands:

```
awplus# configure terminal  
awplus(config)# no mail smtpserver port
```

**Output** Figure 60-2: Example output from **show mail**:

```
awplus#show mail

# show counter mail

**Overview** This command displays the mail counters.

**Syntax** show counter mail

**Mode** User Exec and Privileged Exec

**Example** To show the emails in the queue use the command:

```
awplus# show counter mail
```

**Output** Figure 60-3: Example output from the **show counter mail** command

```
Mail Client (SMTP) counters
Mails Sent           ..... 2
Mails Sent Fails     ..... 1
```

**Table 1:** Parameters in the output of the **show counter mail** command

Parameter	Description
Mails Sent	The number of emails sent successfully since the last device restart.
Mails Sent Fails	The number of emails the device failed to send since the last device restart.

# banner login (SSH)

**Overview** This command configures a login banner on the SSH server. This displays a message on the remote terminal of the SSH client before the login prompt. SSH client version 1 does not support this banner.

To add a banner, first enter the command **banner login**, and hit [Enter]. Write your message. You can use any character and spaces. Use Ctrl+D at the end of your message to save the text and re-enter the normal command line mode.

The banner message is preserved if the device restarts.

The **no** variant of this command deletes the login banner from the device.

**Syntax** banner login  
no banner login

**Default** No banner is defined by default.

**Mode** Global Configuration

**Examples** To set a login banner message, use the commands:

```
awplus# configure terminal  
awplus(config)# banner login
```

The screen will prompt you to enter the message:

Type CNTL/D to finish.

... banner message comes here ...

Enter the message. Use Ctrl+D to finish, like this:

```
^D  
awplus(config)#
```

To remove the login banner message, use the commands:

```
awplus# configure terminal  
awplus(config)# no banner login
```

**Related commands** [show banner login](#)

# clear ssh

**Overview** This command deletes Secure Shell sessions currently active on the device. This includes both incoming and outgoing sessions. The deleted sessions are closed. You can only delete an SSH session if you are a system manager or the user who initiated the session. If **all** is specified then all active SSH sessions are deleted.

**Syntax** `clear ssh {<1-65535>|all}`

Parameters	Description
<1-65535>	Specify a session ID in the range 1 to 65535 to delete a specific session.
all	Delete all SSH sessions.

**Mode** Privileged Exec

**Examples** To stop the current SSH session 123, use the command:

```
awplus# clear ssh 123
```

To stop all SSH sessions active on the device, use the command:

```
awplus# clear ssh all
```

**Related commands** [service ssh](#)  
[ssh](#)

# crypto key destroy hostkey

**Overview** This command deletes the existing public and private keys of the SSH server.

When you enable the SSH server, the server automatically generates an SSHv2 host key pair (public and private keys), using RSA with 1024-bit key generation. If you need a key with different parameters than this, you can use the [crypto key generate hostkey](#) command to generate that key before you enable the SSH server.

**Syntax** `crypto key destroy hostkey {dsa|ecdsa|rsa|rsa1}`

Parameters	Description
<code>dsa</code>	Deletes the existing DSA public and private keys.
<code>ecdsa</code>	Deletes the existing ECDSA public and private keys.
<code>rsa</code>	Deletes the existing RSA public and private keys configured for SSH version 2 connections.
<code>rsa1</code>	Deletes the existing RSA public and private keys configured for SSH version 1 connections.

**Mode** Global Configuration

**Example** To destroy the RSA host key used for SSH version 2 connections, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy hostkey rsa
```

**Related commands** [crypto key generate hostkey](#)  
[service ssh](#)

# crypto key destroy userkey

**Overview** This command destroys the existing public and private keys of an SSH user configured on the device.

**Syntax** `crypto key destroy userkey <username> {dsa|rsa|rsa1}`

Parameters	Description
<code>&lt;username&gt;</code>	Name of the user whose userkey you are destroying. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
<code>dsa</code>	Deletes the existing DSA userkey.
<code>rsa</code>	Deletes the existing RSA userkey configured for SSH version 2 connections.
<code>rsa1</code>	Deletes the existing RSA userkey for SSH version 1 connections.

**Mode** Global Configuration

**Example** To destroy the RSA user key for the SSH user `remoteuser`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy userkey remoteuser rsa
```

**Related commands**

- [crypto key generate hostkey](#)
- [show ssh](#)
- [show crypto key hostkey](#)

# crypto key generate hostkey

**Overview** This command generates public and private keys for the SSH server.

When you enable the SSH server, the server automatically generates an SSHv2 host key pair (public and private keys), using RSA with 1024-bit key generation.

If you need a key with different parameters than this, you can use this command to generate that key before you enable the SSH server. If a host key exists with the same cryptography algorithm, this command replaces the old host key with the new key.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

**Syntax** `crypto key generate hostkey {dsa} [<768-1024>]`  
`crypto key generate hostkey {rsa|rsa1} [<768-32768>]`  
`crypto key generate hostkey {ecdsa} [<256/384>]`

Parameters	Description
dsa	Creates a DSA hostkey. Both SSH version 1 and 2 connections can use the DSA hostkey.
rsa	Creates an RSA hostkey for SSH version 2 connections.
rsa1	Creates an RSA hostkey for SSH version 1 connections.
ecdsa	Creates an ECDSA hostkey. Both SSH version 1 and 2 connections can use the ECDSA hostkey.
<768-32768>	The length in bits of the generated key. The default is 1024 bits.
<256/384>	The ECDSA key size in bits. The default is 256, but it can be set to 384.

**Default** The default key length for RSA and DSA is 1024 bits.

The default key size for ECDSA is 256 bits.

**Mode** Global Configuration

**Examples** To generate an RSA host key for SSH version 2 connections that is 2048 bits in length, use the commands:

```
awplus# configure terminal  
awplus(config)# crypto key generate hostkey rsa 2048
```

To generate a DSA host key, use the commands:

```
awplus# configure terminal  
awplus(config)# crypto key generate dsa
```

To generate an ECDSA host key with an elliptic curve size of 384 bits, use the commands:

```
awplus# configure terminal  
awplus(config)# crypto key generate ecdsa 384
```

**Related  
commands**

[crypto key destroy hostkey](#)  
[service ssh](#)  
[show crypto key hostkey](#)

# crypto key generate userkey

**Overview** This command generates public and private keys for an SSH user using either an RSA or DSA cryptography algorithm. To use public key authentication, copy the public key of the user onto the remote SSH server.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

**Syntax** `crypto key generate userkey <username> {dsa} [<768-1024>]`  
`crypto key generate userkey <username> {rsa|rsa1} [<768-32768>]`  
`crypto key generate userkey <username> {ecdsa} [<256/384>]`

Parameters	Description
<username>	Name of the user that the user key is generated for. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
dsa	Creates a DSA userkey. Both SSH version 1 and 2 connections can use a key created with this command.
rsa	Creates an RSA userkey for SSH version 2 connections.
rsa1	Creates an RSA userkey for SSH version 1 connections.
ecdsa	Creates an ECDSA hostkey. Both SSH version 1 and 2 connections can use the ECDSA hostkey.
<768-32768>	The length in bits of the generated key. The default is 1024 bits.
<256/384>	The ECDSA key size in bits. The default is 256, but it can be set to 384.

**Mode** Global Configuration

**Examples** To generate a 2048-bits RSA user key for SSH version 2 connections for the user "bob", use the commands:

```
awplus# configure terminal  
awplus(config)# crypto key generate userkey bob rsa 2048
```

To generate a DSA user key for the user "lapo", use the commands:

```
awplus# configure terminal  
awplus(config)# crypto key generate userkey lapo dsa
```

**Related commands** [crypto key pubkey-chain userkey](#)  
[show crypto key userkey](#)

# crypto key pubkey-chain knownhosts

**Overview** This command adds a public key of the specified SSH server to the known host database on your device. The SSH client on your device uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

**Syntax** `crypto key pubkey-chain knownhosts [ip|ipv6] <hostname> [rsa|dsa|rsa1]`  
`no crypto key pubkey-chain knownhosts <1-65535>`

**Syntax (VRF-lite)** `crypto key pubkey-chain knownhosts [vrf <vrf-name>] [ip|ipv6] <hostname> [rsa|dsa|rsa1]`  
`no crypto key pubkey-chain knownhosts [vrf <vrf-name>] <1-65535>`

Parameter	Description
vrf	Apply this command to the specified VRF instance.
<vrf-name>	The VRF instance name
ip	Keyword used prior to specifying an IPv4 address
ipv6	Keyword used prior to specifying an IPv6 address
<hostname>	IPv4/IPv6 address or hostname of a remote server in the format a . b . c . d for an IPv4 address, or in the format x : x : : x : x for an IPv6 address.
rsa	Specify the RSA public key of the server to be added to the known host database.
dsa	Specify the DSA public key of the server to be added to the known host database.
rsa1	Specify the SSHv1 public key of the server to be added to the know host database.
<1-65535>	Specify a key identifier when removing a key using the <b>no</b> parameter.

**Default** If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

**Mode** Privilege Exec

**Usage notes** This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

**Examples** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

**Examples (VRF-lite)** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 in VRF red to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts vrf red 192.0.2.11
```

To delete the second entry in the known host database in VRF red, use the command:

```
awplus# no crypto key pubkey-chain knownhosts vrf red 2
```

**Validation Commands** [show crypto key pubkey-chain knownhosts](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# crypto key pubkey-chain userkey

**Overview** This command adds a public key for an SSH user on the SSH server. This allows the SSH server to support public key authentication for the SSH user. When configured, the SSH user can access the SSH server without providing a password from the remote host.

The **no** variant of this command removes a public key for the specified SSH user that has been added to the public key chain. When a SSH user's public key is removed, the SSH user can no longer login using public key authentication.

**Syntax** `crypto key pubkey-chain userkey <username> [<filename>]`  
`no crypto key pubkey-chain userkey <username> <1-65535>`

Parameters	Description
<username>	Name of the user that the SSH server associates the key with. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. Default: no default
<filename>	Filename of a key saved in flash. Valid characters are any printable character. You can add a key as a hexadecimal string directly into the terminal if you do not specify a filename.
<1-65535>	The key ID number of the user's key. Specify the key ID to delete a key.

**Mode** Global Configuration

**Usage notes** You should import the public key file from the client node. The device can read the data from a file on the flash or user terminal.

Or you can add a key as text into the terminal. To add a key as text into the terminal, first enter the command **crypto key pubkey-chain userkey <username>**, and hit [Enter]. Enter the key as text. Note that the key you enter as text must be a valid SSH RSA key, not random ASCII text. Use [Ctrl]+D after entering it to save the text and re-enter the normal command line mode.

Note you can generate a valid SSH RSA key on the device first using the **crypto key generate host rsa** command. View the SSH RSA key generated on the device using the **show crypto hostkey rsa** command. Copy and paste the displayed SSH RSA key after entering the **crypto key pubkey-chain userkey <username>** command. Use [Ctrl]+D after entering it to save it.

**Examples** To generate a valid SSH RSA key on the device and add the key, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto key generate host rsa
awplus(config)# exit

awplus# show crypto key hostkey
rsaAAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWluh

ZZfeITzvvyZW4/I4pbN8=control-D

awplus(config)#
```

To add a public key for the user `graydon` from the file `key.pub`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey graydon key.pub
```

To add a public key for the user `tamara` from the terminal, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey tamara
```

and enter the key. Use `Ctrl+D` to finish.

To remove the first key entry from the public key chain of the user `john`, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto key pubkey-chain userkey john 1
```

**Related commands** [show crypto key pubkey-chain userkey](#)

# debug ssh client

**Overview** This command enables the SSH client debugging facility. When enabled, any SSH, SCP and SFTP client sessions send diagnostic messages to the login terminal.

The **no** variant of this command disables the SSH client debugging facility. This stops the SSH client from generating diagnostic debugging message.

**Syntax** `debug ssh client [brief|full]`  
`no debug ssh client`

Parameter	Description
brief	Enables brief debug mode.
full	Enables full debug mode.

**Default** SSH client debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To start SSH client debugging, use the command:

```
awplus# debug ssh client
```

To start SSH client debugging with extended output, use the command:

```
awplus# debug ssh client full
```

To disable SSH client debugging, use the command:

```
awplus# no debug ssh client
```

**Related commands** [debug ssh server](#)  
[show ssh client](#)  
[undebug ssh client](#)

# debug ssh server

**Overview** This command enables the SSH server debugging facility. When enabled, the SSH server sends diagnostic messages to the system log. To display the debugging messages on the terminal, use the **terminal monitor** command.

The **no** variant of this command disables the SSH server debugging facility. This stops the SSH server from generating diagnostic debugging messages.

**Syntax** `debug ssh server [brief|full]`  
`no debug ssh server`

Parameter	Description
brief	Enables brief debug mode.
full	Enables full debug mode.

**Default** SSH server debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To start SSH server debugging, use the command:

```
awplus# debug ssh server
```

To start SSH server debugging with extended output, use the command:

```
awplus# debug ssh server full
```

To disable SSH server debugging, use the command:

```
awplus# no debug ssh server
```

**Related commands** [debug ssh client](#)  
[show ssh server](#)  
[undebug ssh server](#)

# service ssh

**Overview** Use this command to enable the Secure Shell server on the device. Once enabled, connections coming from SSH clients are accepted.

When you enable the SSH server, the server automatically generates an SSHv2 host key pair (public and private keys), using RSA with 1024-bit key generation. If you need a key with different parameters than this, you can use the [crypto key generate hostkey](#) command to generate that key before you enable the SSH server.

Use the **no** variant of this command disables the Secure Shell server. When the Secure Shell server is disabled, connections from SSH, SCP, and SFTP clients are not accepted. This command does not affect existing SSH sessions. To terminate existing sessions, use the [clear ssh](#) command.

**Syntax** `service ssh [ip|ipv6]`  
`no service ssh [ip|ipv6]`

**Default** The Secure Shell server is disabled by default. Both IPv4 and IPv6 Secure Shell server are enabled when you issue **service ssh** without specifying the optional **ip** or **ipv6** parameters.

**Mode** Global Configuration

**Examples** To enable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh
```

To enable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ip
```

To enable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ipv6
```

To disable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh
```

To disable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ip
```

To disable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ipv6
```

**Related commands**

- crypto key generate hostkey
- show running-config ssh
- show ssh server
- ssh server allow-users
- ssh server deny-users

# show banner login

**Overview** This command displays the banner message configured on the device. The banner message is displayed to the remote user before user authentication starts.

**Syntax** `show banner login`

**Mode** User Exec, Privileged Exec, Global Configuration, Interface Configuration, Line Configuration

**Example** To display the current login banner message, use the command:

```
awplus# show banner login
```

**Related commands** [banner login \(SSH\)](#)

# show crypto key hostkey

**Overview** This command displays the public keys generated on the device for the SSH server.

When you enable the SSH server, the server automatically generates an SSHv2 host key pair (public and private keys), using RSA with 1024-bit key generation. If you need a key with different parameters than this, you can use the [crypto key generate hostkey](#) command to generate that key before you enable the SSH server.

The private key remains on the device secretly. The public key is copied to SSH clients to identify the server. This command displays the public key.

**Syntax** `show crypto key hostkey [dsa|ecdsa|rsa|rsa1]`

Parameter	Description
dsa	Displays the DSA algorithm public key. Both SSH version 1 and 2 connections can use the DSA hostkey
ecdsa	Displays the ECDSA algorithm public key. Both SSH version 1 and 2 connections can use the ECDSA hostkey.
rsa	Displays the RSA algorithm public key for SSH version 2 connections.
rsa1	Displays the RSA algorithm public key for SSH version 1 connections.

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To show the public keys generated on the device for SSH server, use the command:

```
awplus# show crypto key hostkey
```

To display the RSA public key of the SSH server, use the command:

```
awplus# show crypto key hostkey rsa
```

**Output** Figure 61-1: Example output from the **show crypto key hostkey** command

Type	Bits	Fingerprint
rsa	2058	4e:7d:1d:00:75:79:c5:cb:c8:58:2e:f9:29:9c:1f:48
dsa	1024	fa:72:3d:78:35:14:cb:9a:1d:ca:1c:83:2c:7d:08:43
rsa1	1024	e2:1c:c8:8b:d8:6e:19:c8:f4:ec:00:a2:71:4e:85:8b

**Table 1:** Parameters in output of the **show crypto key hostkey** command

Parameter	Description
Type	Algorithm used to generate the key.
Bits	Length in bits of the key.
Fingerprint	Checksum value for the public key.

**Related commands** [crypto key destroy hostkey](#)  
[crypto key generate hostkey](#)

# show crypto key pubkey-chain knownhosts

**Overview** This command displays the list of public keys maintained in the known host database on the device.

**Syntax** `show crypto key pubkey-chain knownhosts [<1-65535>]`

**Syntax (VRF-lite)** `show crypto key pubkey-chain knownhosts [vrf <vrf-name> | global] [<1-65535>]`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<i>&lt;vrf-name&gt;</i>	The name of the VRF instance.
<i>&lt;1-65535&gt;</i>	Key identifier for a specific key. Displays the public key of the entry if specified.

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

**Usage** When VRF-lite is configured:

- If **vrf** is specified, this command displays the known host database from the specified VRF instance.
- If **global** is specified, this command displays the known host database from the global routing environment.
- If neither **vrf** nor **global** is specified, this command displays the known host database from the global routing environment and each configured VRF.

For more information about VRF, see the [VRF Lite Feature Overview and Configuration Guide](#).

**Examples** To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

**Output** Figure 61-2: Example output from the **show crypto key public-chain knownhosts** command

No	Hostname	Type	Fingerprint
1	172.16.23.1	rsa	c8:33:b1:fe:6f:d3:8c:81:4e:f7:2a:aa:a5:be:df:18
2	172.16.23.10	rsa	c4:79:86:65:ee:a0:1d:a5:6a:e8:fd:1d:d3:4e:37:bd
3	5ffe:1053:ac21:ff00:0101:bcd:f:ffff:0001	rsal	af:4e:b4:a2:26:24:6d:65:20:32:d9:6f:32:06:ba:57

**Table 2:** Parameters in the output of the **show crypto key public-chain knownhosts** command

Parameter	Description
No	Number ID of the key.
Hostname	Host name of the known SSH server.
Type	The algorithm used to generate the key.
Fingerprint	Checksum value for the public key.

**Related commands** [crypto key pubkey-chain knownhosts](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show crypto key pubkey-chain userkey

**Overview** This command displays the public keys registered with the SSH server for SSH users. These keys allow remote users to access the device using public key authentication. By using public key authentication, users can access the SSH server without providing password.

**Syntax** `show crypto key pubkey-chain userkey <username> [<1-65535>]`

Parameter	Description
<username>	User name of the remote SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
<1-65535>	Key identifier for a specific key.

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the public keys for the user `manager` that are registered with the SSH server, use the command:

```
awplus# show crypto key pubkey-chain userkey manager
```

**Output** Figure 61-3: Example output from the **show crypto key public-chain userkey** command

No	Type	Bits	Fingerprint
1	dsa	1024	2b:cc:df:a8:f8:2e:8f:a4:a5:4f:32:ea:67:29:78:fd
2	rsa	2048	6a:ba:22:84:c1:26:42:57:2c:d7:85:c8:06:32:49:0e

**Table 3:** Parameters in the output of the **show crypto key userkey** command

Parameter	Description
No	Number ID of the key.
Type	The algorithm used to generate the key.
Bits	Length in bits of the key.
Fingerprint	Checksum value for the key.

**Related commands** [crypto key pubkey-chain userkey](#)

# show crypto key userkey

**Overview** This command displays the public keys created on this device for the specified SSH user.

**Syntax** `show crypto key userkey <username> [dsa|rsa|rsa1]`

Parameter	Description
<username>	User name of the local SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
dsa	Displays the DSA public key.
rsa	Displays the RSA public key used for SSH version 2 connections.
rsa1	Displays the RSA key used for SSH version 1 connections.

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To show the public key generated for the user, use the command:

```
awplus# show crypto key userkey manager
```

To store the RSA public key generated for the user manager to the file "user.pub", use the command:

```
awplus# show crypto key userkey manager rsa > manager-rsa.pub
```

**Output** Figure 61-4: Example output from the **show crypto key userkey** command

Type	Bits	Fingerprint
rsa	2048	e8:d6:1b:c0:f4:b6:e6:7d:02:2e:a9:d4:a1:ca:3b:11
rsa1	1024	12:25:60:95:64:08:8e:a1:8c:3c:45:1b:44:b9:33:9b

**Table 4:** Parameters in the output of the **show crypto key userkey** command

Parameter	Description
Type	The algorithm used to generate the key.
Bits	Length in bits of the key.
Fingerprint	Checksum value for the key.

**Related commands** [crypto key generate userkey](#)

# show running-config ssh

**Overview** This command displays the current running configuration of Secure Shell (SSH).

**Syntax** show running-config ssh

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of SSH, use the command:

```
awplus# show running-config ssh
```

**Output** Figure 61-5: Example output from the **show running-config ssh** command

```
!  
ssh server session-timeout 600  
ssh server login-timeout 30  
ssh server allow-users manager 192.168.1.*  
ssh server allow-users john  
ssh server deny-user john*.a-company.com  
ssh server
```

**Table 5:** Parameters in the output of the **show running-config ssh** command

Parameter	Description
ssh server	SSH server is enabled.
ssh server v2	SSH server is enabled and only support SSHv2.
ssh server<port>	SSH server is enabled and listening on the specified TCP port.
no ssh server scp	SCP service is disabled.
no ssh server sftp	SFTP service is disabled.
ssh server session-timeout	Configure the server session timeout.
ssh server login-timeout	Configure the server login timeout.
ssh server max-startups	Configure the maximum number of concurrent sessions waiting authentication.
no ssh server authentication password	Password authentication is disabled.
no ssh server authentication publickey	Public key authentication is disabled.

**Table 5:** Parameters in the output of the **show running-config ssh** command

Parameter	Description
ssh server allow-users	Add the user (and hostname) to the allow list.
ssh server deny-users	Add the user (and hostname) to the deny list.

**Related commands**

- service ssh
- show ssh server

# show ssh

**Overview** This command displays the active SSH sessions on the device, both incoming and outgoing.

**Syntax** show ssh

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the current SSH sessions on the device, use the command:

```
awplus# show ssh
```

**Output** Figure 61-6: Example output from the **show ssh** command

```
Secure Shell Sessions:
ID  Type Mode   Peer Host      Username      State      Filename
-----
414 ssh  server 172.16.23.1   root         open
456 ssh  client 172.16.23.10 manager      user-auth
459 scp  client 172.16.23.12 root         download   example.awd
463 ssh  client 5ffe:33fe:5632:ffbb:bc35:ddee:0101:ac51
                                manager      user-auth
```

**Table 6:** Parameters in the output of the **show ssh** command

Parameter	Description
ID	Unique identifier for each SSH session.
Type	Session type; either SSH, SCP, or SFTP.
Mode	Whether the device is acting as an SSH client (client) or SSH server (server) for the specified session.
Peer Host	The hostname or IP address of the remote server or client.
Username	Login user name of the server.

**Table 6:** Parameters in the output of the **show ssh** command (cont.)

Parameter	Description	
State	The current state of the SSH session. One of:	
	connecting	The device is looking for a remote server.
	connected	The device is connected to the remote server.
	accepted	The device has accepted a new session.
	host-auth	host-to-host authentication is in progress.
	user-auth	User authentication is in progress.
	authenticated	User authentication is complete.
	open	The session is in progress.
	download	The user is downloading a file from the device.
	upload	The user is uploading a file from the device.
	closing	The user is terminating the session.
	closed	The session is closed.
Filename	Local filename of the file that the user is downloading or uploading.	

**Related commands** [clear ssh](#)

# show ssh client

**Overview** This command displays the current configuration of the Secure Shell client.

**Syntax** `show ssh client`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the current configuration for SSH clients on the login shell, use the command:

```
awplus# show ssh client
```

**Output** Figure 61-7: Example output from the **show ssh client** command

```
Secure Shell Client Configuration
-----
Port                : 22
Version             : 2,1
Connect Timeout    : 30 seconds
Session Timeout    : 0 (off)
Debug               : NONE
```

**Table 7:** Parameters in the output of the **show ssh client** command

Parameter	Description
Port	SSH server TCP port where the SSH client connects to. The default is port 22.
Version	SSH server version; either "1", "2" or "2,1".
Connect Timeout	Time in seconds that the SSH client waits for an SSH session to establish. If the value is 0, the connection is terminated when it reaches the TCP timeout.
Debug	Whether debugging is active on the client.

**Related commands** [show ssh server](#)

# show ssh server

**Overview** This command displays the current configuration of the Secure Shell server.

Note that changes to the SSH configuration affects only new SSH sessions coming from remote hosts, and does not affect existing sessions.

**Syntax** show ssh server

**Mode** User Exec, Privileged Exec, and Global Configuration

**Example** To display the current configuration of the Secure Shell server, use the command:

```
awplus# show ssh server
```

**Output** Figure 61-8: Example output from the **show ssh server** command

```
Secure Shell Server Configuration
-----
SSH Server           : Enabled
Port                 : 22
Version              : 2
Services             : scp, sftp
User Authentication  : publickey, password
Resolve Hosts        : Disabled
Session Timeout      : 0 (Off)
Login Timeout         : 60 seconds
Maximum Authentication Tries : 6
Maximum Startups     : 10
Debug                : NONE
Ciphers              : chacha20-poly1305@openssh.com,
aes128-ctr, aes192-ctr, aes256-ctr, aes128-gcm@openssh.com, aes256-gcm
@openssh.com
```

**Table 8:** Parameters in the output of the **show ssh server** command

Parameter	Description
SSH Server	Whether the Secure Shell server is enabled or disabled.
Port	TCP port where the Secure Shell server listens for connections. The default is port 22.
Version	SSH server version; either '1', '2' or '2,1'.
Services	List of the available Secure Shell service; one or more of SHELL, SCP or SFTP.
Authentication	List of available authentication methods.

**Table 8:** Parameters in the output of the **show ssh server** command (cont.)

Parameter	Description
Login Timeout	Time (in seconds) that the SSH server will wait the SSH session to establish. If the value is 0, the client login will be terminated when TCP timeout reaches.
Idle Timeout	Time (in seconds) that the SSH server will wait to receive data from the SSH client. The server disconnects if this timer limit is reached. If set at 0, the idle timer remains off.
Maximum Startups	The maximum number of concurrent connections that are waiting authentication. The default is 10.
Debug	Whether debugging is active on the server.
Ciphers	The current ciphers in use.

**Related commands** [show ssh](#)  
[show ssh client](#)

# show ssh server allow-users

**Overview** This command displays the user entries in the allow list of the SSH server.

**Syntax** `show ssh server allow-users`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the user entries in the allow list of the SSH server, use the command:

```
awplus# show ssh server allow-users
```

**Output** Figure 61-9: Example output from the **show ssh server allow-users** command

Username	Remote Hostname (pattern)
awplus	192.168.*
john	
manager	*.alliedtelesis.com

**Table 9:** Parameters in the output of the **show ssh server allow-users** command

Parameter	Description
Username	User name that is allowed to access the SSH server.
Remote Hostname (pattern)	IP address or hostname pattern of the remote client. The user is allowed requests from a host that matches this pattern. If no hostname is specified, the user is allowed from all hosts.

**Related commands** [ssh server allow-users](#)  
[ssh server deny-users](#)

# show ssh server deny-users

**Overview** This command displays the user entries in the deny list of the SSH server. The user in the deny list is rejected to access the SSH server. If a user is not included in the access list of the SSH server, the user is also rejected.

**Syntax** `show ssh server deny-users`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the user entries in the deny list of the SSH server, use the command:

```
awplus# show ssh server deny-users
```

**Output** Figure 61-10: Example output from the **show ssh server deny-users** command

Username	Remote Hostname (pattern)
john	*.b-company.com
manager	192.168.2.*

**Table 10:** Parameters in the output of the **show ssh server deny-user** command

Parameter	Description
Username	The user that this rule applies to.
Remote Hostname (pattern)	IP address or hostname pattern of the remote client. The user is denied requests from a host that matches this pattern. If no hostname is specified, the user is denied from all hosts.

**Related commands** [ssh server allow-users](#)  
[ssh server deny-users](#)

# ssh

**Overview** Use this command to initiate a Secure Shell connection to a remote SSH server.

If the server requests a password to login, you need to type in the correct password at the "Password:" prompt.

An SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

**NOTE:** A hostname specified with SSH cannot begin with a hyphen (-) character.

**Syntax** `ssh [ip|ipv6] [user <username>|port <1-65535>|version {1|2}] <remote-device> [<command>]`

**Syntax (VRF-lite)** If the platform supports multicast for VRFs then specifying a VRF name the command will take effect on that VRF and not specifying a VRF will do it for the global VRF.

`ssh vrf <vrf-name> [ip|ipv6] [user <username>|port <1-65535>|version {1|2}] <remote-device> [<command>]`

Parameter	Description
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
ip	Specify IPv4 SSH.
ipv6	Specify IPv6 SSH.
user	Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.  <username>      User name to login on the remote server.
port	SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Otherwise, the client port configured by "ssh client" command or the default TCP port (22) is used.  <1-65535>      TCP port.
version	SSH client version. If version is specified, the SSH client supports only the specified SSH version. By default, SSH client uses SSHv2 first. If the server does not support SSHv2, it will try SSHv1. The default version can be configured by "ssh client" command.  1                      Use SSH version 1. 2                      Use SSH version 2.

Parameter	Description
<code>&lt;remote-device&gt;</code>	IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character.
<code>&lt;command&gt;</code>	A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.

**Mode** User Exec and Privileged Exec

**Examples** To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user "manager", use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening on TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server with "example\_host" using an IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

**Example (VRF-lite)** To login to the remote SSH server at 192.168.1.1 on VRF "red", use the command:

```
awplus# ssh vrf red 192.168.1.1
```

**Related commands**

- [crypto key generate userkey](#)
- [crypto key pubkey-chain knownhosts](#)
- [debug ssh client](#)
- [ssh client](#)

**Command changes** Version 5.4.6-2.1: VRF-lite support added for AR-Series devices.

Version 5.4.8-1.2: secure mode syntax added for x220, x930, x550, XS900MX.

Version 5.4.8-2.1: secure mode syntax added for x950, SBx908 GEN2.

# ssh client

**Overview** This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the `ssh client` command, and restores the defaults.

This command does not affect the existing SSH sessions.

**Syntax**

```
ssh client {port <1-65535>|version {1|2}|session-timeout <0-3600>|connect-timeout <1-600>}
no ssh client {port|version|session-timeout|connect-timeout}
```

Parameter	Description
port	The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port. Default: 22
	<1-65535> TCP port number.
version	The SSH version used by the client for SSH sessions. The SSH client supports both version 2 and version 1 Default: version 2 Note: SSH version 2 is the default SSH version. SSH client supports SSH version 1 if SSH version 2 is not configured using a ssh version command.
	1 SSH clients on the device supports SSH version 1 only.
	2 SSH clients on the device supports SSH version 2 only
session-timeout	The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout. Default: 0 (session timer remains off)
	<0-3600> Timeout in seconds.

Parameter	Description
connect-timeout	The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established. Default: 30
	<hr/> <i>&lt;1-600&gt;</i> Timeout in seconds.

**Mode** Privileged Exec

**Examples** To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

**Related commands** [show ssh client](#)  
[ssh](#)

# ssh server

**Overview** Use this command to modify the configuration of the SSH server. Changing these parameters affects new SSH sessions connecting to the device.

Use the **no** variant of this command to restore the configuration of a specified parameter to its default. The change affects the SSH server immediately if the server is running. Otherwise, the configuration is used when the server starts.

To enable the SSH server, use the [service ssh](#) command.

**Syntax**

```
ssh server {[v1v2|v2only]|<1-65535>}
ssh server {[session-timeout <0-3600>] [login-timeout <1-600>]
[max-startups <1-128>]}
no ssh server {[session-timeout] [login-timeout]
[max-startups]}
```

Parameter	Description
v1v2	Supports both SSHv2 and SSHv1 client connections. Default: v1v2
v2only	Supports SSHv2 client connections only.
<1-65535>	The TCP port number that the server listens to for incoming SSH sessions. Default: 22
session-timeout	The maximum time period that the server waits before deciding that a session is inactive and should be terminated. The server considers the session inactive when it has not received any data from the client, and when the client does not respond to keep alive messages. Default: 0 (session timer remains off).
	<0-3600> Timeout in seconds.
login-timeout	The maximum time period the server waits before disconnecting an unauthenticated client. Default: 60
	<1-600> Timeout in seconds.
max-startups	The maximum number of concurrent unauthenticated connections the server accepts. When the number of SSH connections awaiting authentication reaches the limit, the server drops any additional connections until authentication succeeds or the login timer expires for a connection. Default: 10
	<1-128> Number of sessions.

**Mode** Global Configuration

**Examples** To configure the session timer of SSH server to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 600
```

To configure the login timeout of SSH server to 30 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 30
```

To limit the number of SSH client connections waiting for authentication from SSH server to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-startups 3
```

To set max-startups parameters of SSH server to the default configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server max-startups
```

To support the Secure Shell server with TCP port 2200, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server 2200
```

To force the Secure Shell server to support SSHv2 only, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server v2only
```

To support both SSHv2 and SSHv1, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server v1v2
```

**Related commands** [show ssh server](#)  
[ssh client](#)

# ssh server allow-users

**Overview** This command adds a username pattern to the allow list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is accepted.

When there are no registered users in the server's database of allowed users, the SSH server does not accept SSH sessions even when enabled.

SSH server also maintains the deny list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

The **no** variant of this command deletes a username pattern from the allow list of the SSH server. To delete an entry from the allow list, the username and hostname pattern should match exactly with the existing entry.

**Syntax** `ssh server allow-users <username-pattern> [<hostname-pattern>]`  
`no ssh server allow-users <username-pattern>`  
`[<hostname-pattern>]`

Parameter	Description
<code>&lt;username-pattern&gt;</code>	The username pattern that users can match to. An asterisk acts as a wildcard character that matches any string of characters.
<code>&lt;hostname-pattern&gt;</code>	The host name pattern that hosts can match to. If specified, the server allows the user to connect only from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

**Mode** Global Configuration

**Examples** To allow the user `john` to create an SSH session from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john
```

To allow the user `john` to create an SSH session from a range of IP address (from 192.168.1.1 to 192.168.1.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john 192.168.1.*
```

To allow the user `john` to create a SSH session from a `a-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john *.a-company.com
```

To delete the existing user entry `john 192.168.1.*` in the allow list, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server allow-users john 192.168.1.*
```

**Related commands**

# ssh server authentication

**Overview** This command enables RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **ssh server authentication** command to enable password authentication for users. Apply the **publickey** keyword with the **ssh server authentication** command to enable RSA public-key authentication for users.

Use the **no** variant of this command to disable RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **no ssh authentication** command to disable password authentication for users. Apply the required **publickey** keyword with the **no ssh authentication** command to disable RSA public-key authentication for users.

**Syntax** `ssh server authentication {password|publickey}`  
`no ssh server authentication {password|publickey}`

Parameter	Description
password	Specifies user password authentication for SSH server.
publickey	Specifies user publickey authentication for SSH server.

**Default** Both RSA public-key authentication and password authentication are enabled by default.

**Mode** Global Configuration

**Usage** For password authentication to authenticate a user, password authentication for a user must be registered in the local user database or on an external RADIUS server, before using the **ssh server authentication password** command.

For RSA public-key authentication to authenticate a user, a public key must be added for the user, before using the **ssh server authentication publickey** command.

**Examples** To enable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication password
```

To enable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication publickey
```

To disable password authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server authentication password
```

To disable publickey authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server authentication publickey
```

**Related  
commands**

[crypto key pubkey-chain userkey](#)

[service ssh](#)

[show ssh server](#)

# ssh server deny-users

**Overview** This command adds a username pattern to the deny list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is rejected.

SSH server also maintains the allow list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

If a hostname pattern is specified, the user is denied from the hosts matching the pattern.

The **no** variant of this command deletes a username pattern from the deny list of the SSH server. To delete an entry from the deny list, the username and hostname pattern should match exactly with the existing entry.

**Syntax** `ssh server deny-users <username-pattern> [<hostname-pattern>]`  
`no ssh server deny-users <username-pattern>`  
`[<hostname-pattern>]`

Parameter	Description
<code>&lt;username-pattern&gt;</code>	The username pattern that users can match to. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen, full stop and asterisk symbols. An asterisk acts as a wildcard character that matches any string of characters.
<code>&lt;hostname-pattern&gt;</code>	The host name pattern that hosts can match to. If specified, the server denies the user only when they connect from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

**Mode** Global Configuration

**Examples** To deny the user john to access SSH login from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john
```

To deny the user john to access SSH login from a range of IP address (from 192.168.2.1 to 192.168.2.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john 192.168.2.*
```

To deny the user john to access SSH login from b-company.com domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john*.b-company.com
```

To delete the existing user entry `john 192.168.2.*` in the deny list, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server deny-users john 192.168.2.*
```

**Related  
commands**

[show running-config ssh](#)

[show ssh server deny-users](#)

[ssh server allow-users](#)

# ssh server max-auth-tries

**Overview** Use this command to specify the maximum number of SSH authentication attempts that the device will allow.

Use the **no** variant of this command to return the maximum number of attempts to its default value of 6.

**Syntax** `ssh server max-auth-tries <1-32>`  
`no ssh server max-auth-tries`

Parameter	Description
<1-32>	Maximum number of SSH authentication attempts the device will allow.

**Default** 6 attempts

**Mode** Global Configuration

**Usage** By default, users must wait one second after a failed login attempt before trying again. You can increase this gap by using the command [aaa login fail-delay](#).

**Example** To set the maximum number of SSH authentication attempts to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-auth-tries 3
```

**Related commands** [show ssh server](#)

# ssh server resolve-host

**Overview** This command enables resolving an IP address from a host name using a DNS server for client host authentication.

The **no** variant of this command disables this feature.

**Syntax** `ssh server resolve-hosts`  
`no ssh server resolve-hosts`

**Default** This feature is disabled by default.

**Mode** Global Configuration

**Usage notes** Your device has a DNS Client that is enabled automatically when you add a DNS server to your device. Use the [ip name-server](#) command to add a DNS server to the list of servers that the device queries.

**Example** To resolve a host name using a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server resolve-hosts
```

**Related commands** [ip name-server](#)  
[show ssh server](#)  
[ssh server allow-users](#)  
[ssh server deny-users](#)

# ssh server scp

**Overview** This command enables the Secure Copy (SCP) service on the SSH server. Once enabled, the server accepts SCP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SCP connections. The SCP service is enabled by default as soon as the SSH server is enabled.

The **no** variant of this command disables the SCP service on the SSH server. Once disabled, SCP requests from remote clients are rejected.

**Syntax** `ssh server scp`  
`no ssh server scp`

**Mode** Global Configuration

**Examples** To enable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server scp
```

To disable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server scp
```

**Related commands** [show running-config ssh](#)  
[show ssh server](#)

# ssh server secure-ciphers

**Overview** Use this command to set the SSH server to only negotiate ciphers regarded as current-best-practice.

Use the **no** variant of this command to return to the default setting of not set.

**Syntax** `ssh server secure-ciphers`  
`no ssh server secure-ciphers`

Parameter	Description
<code>secure-ciphers</code>	Negotiate only with ciphers that are still considered current-best-practice and secure

**Default** Not set

**Mode** Global Configuration

**Usage notes** This command uses the same cipher string as the OpenSSH default, which excludes CBC, as CBC has been regarded as a weak cipher.

When the command is used, the ciphers included are:  
`chacha20-poly1305@openssh.com`, `aes128-ctr`, `aes192-ctr`, `aes256-ctr`,  
`aes128-gcm@openssh.com`, `aes256-gcm@openssh.com`

**Example** To configure the SSH server to only negotiate ciphers regarded as current best practice, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-ciphers
```

**Related commands** [show ssh server](#)

**Command changes** Version 5.5.0-1.1: command added

# ssh server sftp

**Overview** This command enables the Secure FTP (SFTP) service on the SSH server. Once enabled, the server accepts SFTP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SFTP connections. The SFTP service is enabled by default as soon as the SSH server is enabled. If the SSH server is disabled, SFTP service is unavailable.

The **no** variant of this command disables SFTP service on the SSH server. Once disabled, SFTP requests from remote clients are rejected.

**Syntax** ssh server sftp  
no ssh server sftp

**Mode** Global Configuration

**Examples** To enable the SFTP service, use the commands:

```
awplus# configure terminal  
awplus(config)# ssh server sftp
```

To disable the SFTP service, use the commands:

```
awplus# configure terminal  
awplus(config)# no ssh server sftp
```

# active (trigger)

**Overview** This command enables a trigger. This allows the trigger to activate when its trigger conditions are met.

The **no** variant of this command disables a trigger. While in this state the trigger cannot activate when its trigger conditions are met.

**Syntax** active  
no active

**Default** Active, which means that triggers are enabled by default

**Mode** Trigger Configuration

**Usage notes** Configure a trigger first before you use this command to activate it.

For information about configuring a trigger, see the [Triggers\\_Feature Overview and Configuration Guide](#).

**Examples** To enable trigger 172, so that it can activate when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 172
awplus(config-trigger)# active
```

To disable trigger 182, preventing it from activating when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 182
awplus(config-trigger)# no active
```

**Related commands** [show trigger](#)  
[trigger](#)  
[trigger activate](#)

# day

**Overview** This command specifies the days or date that the trigger can activate on. You can specify one of:

- A specific date
- A specific day of the week
- A list of days of the week
- A day of any month of any year
- A day of a specific month in any year
- Every day

By default, the trigger can activate on any day.

**Syntax** `day every-day`  
`day <1-31>`  
`day <1-31> <month>`  
`day <1-31> <month> <year>`  
`day <weekday>`

Parameter	Description
<code>every-day</code>	Sets the trigger so that it can activate on any day.
<code>&lt;1-31&gt;</code>	Day of the month the trigger is permitted to activate on.
<code>&lt;month&gt;</code>	Sets the month that the trigger is permitted to activate on. Valid keywords are: <b>january, february, march, april, may, june, july, august, september, october, november, and december.</b>
<code>&lt;year&gt;</code>	Sets the year that the trigger is permitted to activate in, between 2000 and 2035.
<code>&lt;weekday&gt;</code>	Sets the days of the week that the trigger can activate on. You can specify one or more week days in a space separated list. Valid keywords are: <b>monday, tuesday, wednesday, thursday, friday, saturday, and sunday.</b>

**Default** **every-day**, so by default, the trigger can activate on any day.

**Mode** Trigger Configuration

**Usage notes** For example trigger configurations that use the **day** command, see “Restrict Internet Access” and “Turn off Power to Port LEDs” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To permit trigger 55 to activate on the 1 June 2019, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 55
awplus(config-trigger)# day 1 jun 2019
```

To permit trigger 12 to activate on Mondays, Wednesdays and Fridays, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# day monday wednesday friday
```

To permit trigger 17 to activate on the 5th day of any month, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 17
awplus(config-trigger)# day 5
```

To permit trigger 6 to activate on the 20th day of September, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# day 20 september
```

To permit trigger 14 to activate on the 1st day of each month, in any year, at 11.00am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 14
awplus(config-trigger)# day 1
awplus(config-trigger)# type time 11:00
```

**Related commands** [show trigger](#)  
[type time](#)  
[trigger](#)

**Command changes** Version 5.4.8-2.1: day of the month functionality added

# debug trigger

**Overview** This command enables trigger debugging. This generates detailed messages about how your device is processing the trigger commands and activating the triggers.

The **no** variant of this command disables trigger debugging.

**Syntax** debug trigger  
no debug trigger

**Mode** Privilege Exec

**Examples** To start trigger debugging, use the command:

```
awplus# debug trigger
```

To stop trigger debugging, use the command:

```
awplus# no trigger
```

**Related commands** [show debugging trigger](#)  
[show trigger](#)  
[test](#)  
[trigger](#)  
[undebug trigger](#)

# description (trigger)

**Overview** This command adds an optional description to help you identify the trigger. This description is displayed in show command outputs and log messages.

The **no** variant of this command removes a trigger's description. The show command outputs and log messages stop displaying a description for this trigger.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	A word or phrase that uniquely identifies this trigger or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters.

**Mode** Trigger Configuration

**Examples** To give trigger 240 the description `daily status report`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 240
awplus(config-trigger)# description daily status report
```

To remove the description from trigger 36, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 36
awplus(config-trigger)# no description
```

**Related commands** [show trigger](#)  
[test](#)  
[trigger](#)

# repeat

**Overview** This command specifies the number of times that a trigger is permitted to activate. This allows you to specify whether you want the trigger to activate:

- only the first time that the trigger conditions are met
- a limited number of times that the trigger conditions are met
- an unlimited number of times

Once the trigger has reached the limit set with this command, the trigger remains in your configuration but cannot be activated. Use the **repeat** command again to reset the trigger so that it is activated when its trigger conditions are met.

By default, triggers can activate an unlimited number of times. To reset a trigger to this default, specify either **yes** or **forever**.

**Syntax** `repeat { forever | no | once | yes | <1-4294967294> }`

Parameter	Description
yes   forever	The trigger repeats indefinitely, or until disabled.
no   once	The trigger activates only once.
<1-4292967294>	The trigger repeats the specified number of times.

**Mode** Trigger Configuration

**Examples** To allow trigger 21 to activate only once, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 21
awplus(config-trigger)# repeat no
```

To allow trigger 22 to activate an unlimited number of times whenever its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 22
awplus(config-trigger)# repeat forever
```

To allow trigger 23 to activate only the first 10 times the conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 23
awplus(config-trigger)# repeat 10
```

**Related commands** [show trigger](#)  
[trigger](#)

# script

**Overview** This command specifies one or more scripts that are to be run when the trigger activates. You can add up to five scripts to a single trigger.

The sequence in which the trigger runs the scripts is specified by the number you set before the name of the script file. One script is executed completely before the next script begins.

Scripts may be either ASH shell scripts, indicated by a **.sh** filename extension suffix, or AlliedWare Plus™ scripts, indicated by a **.scp** filename extension suffix. AlliedWare Plus™ scripts only need to be readable.

The **no** variant of this command removes one or more scripts from the trigger's script list. The scripts are identified by either their name, or by specifying their position in the script list. The **all** parameter removes all scripts from the trigger.

**Syntax** `script <1-5> {<filename>}`  
`no script {<1-5>|<filename>|all}`

Parameter	Description
<1-5>	The position of the script in execution sequence. The trigger runs the lowest numbered script first.
<filename>	The path to the script file.

**Mode** Trigger Configuration

**Examples** To configure trigger 71 to run the script `flash:/cpu_trig.sh` in position 3 when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# script 3 flash:/cpu_trig.sh
```

To configure trigger 99 to run the scripts **flash:reconfig.scp**, **flash:cpu\_trig.sh** and **flash:email.scp** in positions 2, 3 and 5 when the trigger activates, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 99
awplus(config-trigger)# script 2 flash:/reconfig.scp 3
flash:/cpu_trig.sh 5 flash:/email.scp
```

To remove the scripts 1, 3 and 4 from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script 1 3 4
```

To remove the script flash:/cpu\_trig.sh from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script flash:/cpu_trig.sh
```

To remove all the scripts from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script all
```

**Related commands** [show trigger](#)  
[trigger](#)

# show debugging trigger

**Overview** This command displays the current status for trigger utility debugging. Use this command to show when trigger debugging has been turned on or off from the [debug trigger](#) command.

**Syntax** show debugging trigger

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of trigger debugging, use the command:  
awplus# show debugging trigger

**Output** Figure 62-1: Example output from the **show debugging trigger** command

```
awplus#debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is on

awplus#no debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is off
```

**Related commands** [debug trigger](#)

# show running-config trigger

**Overview** This command displays the current running configuration of the trigger utility.

**Syntax** `show running-config trigger`

**Mode** Privileged Exec

**Example** To display the current configuration of the trigger utility, use the command:

```
awplus# show running-config trigger
```

Figure 62-2: Example output from the **show running-config trigger** command

```
trigger 1
  type card in

type usb in
trigger 2

type usb out
!
```

**Related commands** [show trigger](#)

# show trigger

**Overview** This command displays configuration and diagnostic information about the triggers configured on the device. Specify the **show trigger** command without any options to display a summary of the configuration of all triggers.

**Syntax** `show trigger [<1-250>|counter|full]`

Parameter	Description
<1-250>	Displays detailed information about a specific trigger, identified by its trigger ID.
counter	Displays statistical information about all triggers.
full	Displays detailed information about all triggers.

**Mode** Privileged Exec

**Example** To get summary information about all triggers, use the following command:

```
awplus# show trigger
```

Table 62-1: Example output from **show trigger**

```
awplus#show trigger
TR# Type & Details      Name                Ac Te Repeat      #Scr Days/Date
-----
001 CPU (80% any)      Busy CPU            Y  N  5             1  smtwtfS
005 Periodic (30 min)  Regular status check Y  N  Continuous    1  -mtwtf-
007 Memory (85% up)   High mem usage      Y  N  8             1  smtwtfS

019 Ping-poll (5 up)   Connection to svr1  Y  N  Continuous    1  smtwtfS
-----
```

Table 62-2: Parameters in the output of **show trigger**

Parameter	Description
TR#	Trigger identifier (ID).
Type & Details	The trigger type, followed by the trigger details in brackets.
Name	Descriptive name of the trigger configured with the <a href="#">description (trigger)</a> command.
Ac	Whether the trigger is active (Y), or inactive (N).
Te	Whether the trigger is in test mode (Y) or not (N).

Table 62-2: Parameters in the output of **show trigger** (cont.)

Parameter	Description
Repeat	Whether the trigger repeats continuously, and if not, the configured repeat count for the trigger. To see the number of times a trigger has activated, use the <b>show trigger</b> <1-250> command.
#Scr	Number of scripts associated with the trigger.
Days/Date	Days or date when the trigger may be activated. For the days options, the days are shown as a seven character string representing Sunday to Saturday. A hyphen indicates days when the trigger cannot be activated.

To display detailed information about trigger 3, use the command:

```
awplus# show trigger 3
```

Table 63: Parameters in the output of **show trigger full** and **show trigger** for a specific trigger

Parameter	Description
Trigger	The ID of the trigger.
Name	Descriptive name of the trigger.
Type and details	The trigger type and its activation conditions.
Days	The days on which the trigger is permitted to activate.

**Table 63:** Parameters in the output of **show trigger full** and **show trigger** for a specific trigger (cont.)

Parameter	Description
Date	The date on which the trigger is permitted to activate. Only displayed if configured, in which case it replaces "Days".
Active	Whether or not the trigger is permitted to activate.
Test	Whether or not the trigger is operating in diagnostic mode.
Trap	Whether or not the trigger is enabled to send SNMP traps.
Repeat	Whether the trigger repeats an unlimited number of times (Continuous) or for a set number of times. When the trigger can repeat only a set number of times, then the number of times the trigger has been activated is displayed in brackets.
Modified	The date and time of the last time that the trigger was modified.
Number of activations	Number of times the trigger has been activated since the last restart of the device.
Last activation	The date and time of the last time that the trigger was activated.
Number of scripts	How many scripts are associated with the trigger, followed by the names of the script files in the order in which they run.

To display counter information about all triggers use the command:

```
awplus# show trigger counter
```

**Figure 62-4:** Example output from **show trigger counter**

```

**Related  
commands**    active (trigger)  
                  debug trigger  
                  script  
                  trigger  
                  trigger activate

# test

**Overview** This command puts the trigger into a diagnostic mode. In this mode the trigger may activate but when it does it will not run any of the trigger's scripts. A log message will be generated to indicate when the trigger has been activated.

The **no** variant of this command takes the trigger out of diagnostic mode, restoring normal operation. When the trigger activates the scripts associated with the trigger will be run, as normal.

**Syntax** test  
no test

**Mode** Trigger Configuration

**Usage notes** Configure a trigger first before you use this command to diagnose it. For information about configuring a trigger, see the [Triggers\\_Feature Overview and Configuration Guide](#).

**Examples** To put trigger 5 into diagnostic mode, where no scripts will be run when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# test
```

To take trigger 205 out of diagnostic mode, restoring normal operation, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no test
```

**Related commands** [show trigger](#)  
[trigger](#)

# time (trigger)

**Overview** This command specifies the time of day when the trigger is permitted to activate. The **after** parameter specifies the start of a time period that extends to midnight during which trigger may activate. By default the value of this parameter is 00:00:00 (am); that is, the trigger may activate at any time. The **before** parameter specifies the end of a time period beginning at midnight during which the trigger may activate. By default the value of this parameter is 23:59:59; that is, the trigger may activate at any time. If the value specified for **before** is later than the value specified for **after**, a time period from “after” to “before” is defined, during which the trigger may activate. This command is not applicable to time triggers (**type time**).

The following figure illustrates how the **before** and **after** parameters operate.

**Syntax** `time { [after <hh:mm:ss> ] [before <hh:mm:ss> ] }`

Parameter	Description
<code>after&lt;hh:mm:ss&gt;</code>	The earliest time of day when the trigger may be activated.
<code>before&lt;hh:mm:ss&gt;</code>	The latest time of day when the trigger may be activated.

**Mode** Trigger Configuration

**Usage notes** For example trigger configurations that use the **time (trigger)** command, see “Restrict Internet Access” and “Turn off Power to Port LEDs” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To allow trigger 63 to activate between midnight and 10:30am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 63
awplus(config-trigger)# time before 10:30:00
```

To allow trigger 64 to activate between 3:45pm and midnight, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 64
awplus(config-trigger)# time after 15:45:00
```

To allow trigger 65 to activate between 10:30am and 8:15pm, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 65
awplus(config-trigger)# time after 10:30:00 before 20:15:00
```

**Related commands** [show trigger](#)  
[trigger](#)

# trap

**Overview** This command enables the specified trigger to send SNMP traps.  
Use the **no** variant of this command to disable the sending of SNMP traps from the specified trigger.

**Syntax** trap  
no trap

**Default** SNMP traps are enabled by default for all defined triggers.

**Mode** Trigger Configuration

**Usage notes** You must configure SNMP before using traps with triggers. For more information, see:

- [Support for Allied Telesis Enterprise\\_MIBs\\_in\\_AlliedWare Plus](#), for information about which MIB objects are supported.
- the [SNMP Feature Overview and Configuration\\_Guide](#).
- the [SNMP Commands](#) chapter.

Since SNMP traps are enabled by default for all defined triggers, a common usage will be for the **no** variant of this command to disable SNMP traps from a specified trap if the trap is only periodic. Refer in particular to AT-TRIGGER-MIB in the [Support for Allied Telesis Enterprise\\_MIBs\\_in AlliedWare Plus](#) for further information about the relevant SNMP MIB.

**Examples** To enable SNMP traps to be sent from trigger 5, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# trap
```

To disable SNMP traps being sent from trigger 205, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no trap
```

**Related commands** trigger  
show trigger

# trigger

**Overview** This command is used to access the Trigger Configuration mode for the specified trigger. Once Trigger Configuration mode has been entered the trigger type information can be configured and the trigger scripts and other operational parameters can be specified. At a minimum the trigger type information must be specified before the trigger can become active.

The **no** variant of this command removes a specified trigger and all configuration associated with it.

**Syntax** trigger <1-250>  
no trigger <1-250>

Parameter	Description
<1-250>	A trigger ID.

**Mode** Global Configuration

**Examples** To enter trigger configuration mode for trigger 12, use the commands:

```
awplus# configure terminal  
awplus(config)# trigger 12
```

To completely remove all configuration associated with trigger 12, use the commands:

```
awplus# configure terminal  
awplus(config)# no trigger 12
```

**Related commands** [show trigger](#)  
[trigger activate](#)

# trigger activate

**Overview** This command is used to manually activate a specified trigger from the Privileged Exec mode, which has been configured with the **trigger** command from the Global Configuration mode.

**Syntax** `trigger activate <1-250>`

Parameter	Description
<1-250>	A trigger ID.

**Mode** Privileged Exec

**Usage notes** This command manually activates a trigger without the normal trigger conditions being met.

The trigger is activated even if it has been configured as inactive by using the command **no active**. The scripts associated with the trigger will be executed even if the trigger is in the diagnostic test mode.

Triggers activated manually do not have their repeat counts decremented or their 'last triggered' time updated, and do not result in updates to the '[type] triggers today' counters.

**Example** To manually activate trigger 12 use the command:

```
awplus# trigger activate 12
```

**Related commands**

- [active \(trigger\)](#)
- [show trigger](#)
- [trigger](#)

# type atmf node

**Overview** This command configures a trigger to be activated at an AMF node join event or leave event.

**Syntax** `type atmf node {join|leave}`

Parameter	Description
join	AMF node join event.
leave	AMF node leave event.

**Mode** Trigger Configuration

**CAUTION:** *Only configure this trigger on one device because it is a network wide event.*

**Example 1** To configure trigger 5 to activate at an AMF node leave event, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger) type atmf node leave
```

**Example 2** The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp  
AMF-Net[3](config-trigger)# end
```

Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=====  
node1:  
=====
```

TR#	Type & Details	Description	Ac	Te	Tr	Repeat	#Scr	Days/Date
001	Periodic (2 min)	Periodic Status Chk	Y	N	Y	Continuous	1	smtwtfs
005	ATMF node (leave)	E-mail on ATMF Exit	Y	N	Y	Continuous	1	smtwtfs

```
-----  
  
=====  
Node2, Node3,  
=====
```

TR#	Type & Details	Description	Ac	Te	Tr	Repeat	#Scr	Days/Date
005	ATMF node (leave)	E-mail on ATMF Exit	Y	N	Y	Continuous	1	smtwtfs

```
-----
```

Display the triggers configured on each of the nodes in the AMF Network.

```
AMF-Net[3]# show running-config trigger
```

This command returns the following display:

```
=====  
Node1:  
=====  
  
trigger 1  
  type periodic 2  
  script 1 atmf.scp  
trigger 5  
  type atmf node leave  
description "E-mail on ATMF Exit"  
  script 1 email_me.scp  
!  
  
=====  
Node2, Node3:  
=====  
  
trigger 5  
  type atmf node leave  
description "E-mail on ATMF Exit"  
  script 1 email_me.scp  
!
```

**Related commands** [show trigger](#)

# type card

**Overview** Use this command to configure a trigger that activates on either the removal or the insertion of a Secure Digital (SD) or Secure Digital High Capacity (SDHC) card.

**Syntax** `type card {in|out}`

Parameter	Description
in	Trigger activates on insertion of a card.
out	Trigger activates on removal of a card.

**Mode** Trigger Configuration

**Usage notes** Card triggers cannot execute script files from a card.

For example trigger configurations that use the **type card** command, see “Capture Show Output and Save to an SD Card” in the [Triggers Feature Overview and Configuration\\_Guide](#).

**Examples** To configure `trigger 1` to activate on the insertion of a card, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type card in
```

**Related commands**

- [trigger](#)
- [show running-config trigger](#)
- [show trigger](#)

# type cpu

**Overview** This command configures a trigger to activate based on CPU usage level. Selecting the **up** option causes the trigger to activate when the CPU usage exceeds the specified usage level. Selecting the **down** option causes the trigger to activate when CPU usage drops below the specified usage level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

**Syntax** `type cpu <1-100> [up|down|any]`

Parameter	Description
<1-100>	The percentage of CPU usage at which to trigger.
up	Activate when CPU usage exceeds the specified level.
down	Activate when CPU usage drops below the specified level
any	Activate when CPU usage passes the specified level in either direction

**Mode** Trigger Configuration

**Usage notes** For an example trigger configuration that uses the **type cpu** command, see “Capture Unusual CPU and RAM Activity” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To configure trigger 28 to be a CPU trigger that activates when CPU usage exceeds 80% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 28
awplus(config-trigger)# type cpu 80 up
```

To configure trigger 5 to be a CPU trigger that activates when CPU usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65

or

awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65 any
```

**Related commands** [show trigger](#)  
[trigger](#)

# type interface

**Overview** This command configures a trigger to activate based on the link status of an interface. The trigger can be activated when the interface becomes operational by using the **up** option, or when the interface closes by using the **down** option. The trigger can also be configured to activate when either one of these events occurs by using the **any** option.

**Syntax** `type interface <interface> {up|down|any}`

Parameter	Description
<interface>	Interface name.
up	Activate when interface becomes operational.
down	Activate when the interface closes.
any	Activate when any interface link status event occurs.

**Mode** Trigger Configuration

**Example** To configure trigger 19 to be an interface trigger that activates when port1.0.1 becomes operational, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 19
awplus(config-trigger)# type interface port1.0.1 up
```

**Related commands** [show trigger](#)  
[trigger](#)

# type linkmon-probe

**Overview** Use this command to create a trigger that will run a script when a Link Health Monitoring probe reports that a link becomes “good”, “bad”, or “unreachable”.

**Syntax** `type linkmon-probe <probename> <profilename>  
{good|bad|unreachable|any}`

Parameter	Description
<probename>	The name of the Link Health Monitoring probe that will be used for executing the trigger.
<profilename>	The name of the Link Health Monitoring performance profile that will be used for determine if the Link Health Monitoring probe is good, bad, or unreachable.
good	If the Link Health Monitoring probe becomes 'good' according to the Link Health Monitoring performance profile then the trigger will be executed.
bad	If the Link Health Monitoring probe goes 'bad' according to the Link Health Monitoring performance profile then the trigger will be executed.
unreachable	If the Link Health Monitoring probe becomes 'unreachable' according to the Link Health Monitoring performance profile then the trigger will be executed.
any	If the Link Health Monitoring probe changes state according to the Link Health Monitoring performance profile then the trigger will be executed.

**Mode** Trigger Configuration

**Example** When the Link Health Monitoring probes sent to the “test-probe” destination no longer meet the performance profile “test-profile” the link will be deemed “bad”. To create a trigger that will run a script when a Link Health Monitoring probe is deemed “bad”, use the following commands:

```
awplus# trigger 1  
awplus(config)# script 1 link-bad.scp  
awplus(config)# type linkmon-probe test-probe test-profile bad
```

To create a trigger that will run a script when the link is deemed “good” again, use the following commands:

```
awplus# trigger 2  
awplus(config)# script 1 link-good.scp  
awplus(config)# type linkmon-probe test-probe test-profile good
```

**Related commands** [trigger](#)

**Command changes** Version 5.4.8-1.1: command added

# type log

**Overview** Use this command to configure a trigger to activate based on the content of log messages matching a string or regular expression.

**Syntax** `type log <log-message-string>`

Parameter	Description
<code>&lt;log-message-string&gt;</code>	A string or a regular expression (PCRE) to match a log message or part of a log message.

**Default** There is no type or log message string set by default.

**Mode** Trigger Configuration

**Usage notes** Log type triggers fully support regular expressions using PCRE (Perl-Compatible Regular Expression) syntax.

Only log messages of severity level notice or higher can activate a trigger.

Note that any command executed by the script will generate a log message with level notice, and will include '[SCRIPT]' before the command string. Therefore, if something in the script matches the configured log message trigger string, it will retrigger indefinitely.

**Example** To configure trigger 6 to activate when a log message of level notice or higher indicates that any port has 'failed', use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# type log port.+ failed
```

**Related commands** [show trigger](#)  
[trigger](#)

**Command changes** Version 5.4.7-2.1: command added

# type memory

**Overview** This command configures a trigger to activate based on RAM usage level. Selecting the **up** option causes the trigger to activate when memory usage exceeds the specified level. Selecting the **down** option causes the trigger to activate when memory usage drops below the specified level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

**Syntax** `type memory <1-100> [up|down|any]`

Parameter	Description
<1-100>	The percentage of memory usage at which to trigger.
up	Activate when memory usage exceeds the specified level.
down	Activate when memory usage drops below the specified level.
any	Activate when memory usage passes the specified level in either direction.

**Mode** Trigger Configuration

**Examples** To configure trigger 12 to be a memory trigger that activates when memory usage exceeds 50% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# type memory 50 up
```

To configure trigger 40 to be a memory trigger that activates when memory usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65 any
```

**Related commands** [show trigger](#)  
[trigger](#)

# type periodic

**Overview** This command configures a trigger to be activated at regular intervals. The time period between activations is specified in minutes.

**Syntax** `type periodic <1-1440>`

Parameter	Description
<code>&lt;1-1440&gt;</code>	The number of minutes between activations.

**Mode** Trigger Configuration

**Usage notes** A combined limit of 10 triggers of the type periodic and time can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or  
periodic
```

For an example trigger configuration that uses the **type periodic** command, see "See Daily Statistics" in the [Triggers\\_Feature Overview and Configuration Guide](#).

**Example** To configure trigger 44 to activate periodically at 10 minute intervals use the following commands:

```
awplus# configure terminal  
awplus(config)# trigger 44  
awplus(config-trigger)# type periodic 10
```

**Related commands** [show trigger](#)  
[trigger](#)

# type ping-poll

**Overview** This command configures a trigger that activates when Ping Polling identifies that a target device's status has changed. This allows you to run a configuration script when a device becomes reachable or unreachable.

**Syntax** `type ping-poll <1-100> {up|down}`

Parameter	Description
<1-100>	The ping poll ID.
up	The trigger activates when ping polling detects that the target is reachable.
down	The trigger activates when ping polling detects that the target is unreachable.

**Mode** Trigger Configuration

**Example** To configure trigger 106 to activate when ping poll 12 detects that its target device is now unreachable, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 106
awplus(config-trigger)# type ping-poll 12 down
```

**Related commands** [show trigger](#)  
[trigger](#)

# type reboot

**Overview** This command configures a trigger that activates when your device is rebooted.

**Syntax** type reboot

**Mode** Trigger Configuration

**Example** To configure trigger 32 to activate when your device reboots, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 32
awplus(config-trigger)# type reboot
```

**Related commands** [show trigger](#)  
[trigger](#)

# type time

**Overview** This command configures a trigger that activates at a specified time of day.

**Syntax** `type time <hh:mm>`

Parameter	Description
<code>&lt;hh:mm&gt;</code>	The time to activate the trigger.

**Mode** Trigger Configuration

**Usage** A combined limit of 10 triggers of the type time and type periodic can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or  
periodic
```

**Example** To configure trigger 86 to activate at 15 : 53, use the following commands:

```
awplus# configure terminal  
awplus(config)# trigger 86  
awplus(config-trigger)# type time 15:53
```

**Related commands** [show trigger](#)  
[trigger](#)

# type usb

**Overview** Use this command to configure a trigger that activates on either the removal or the insertion of a USB storage device.

**Syntax** `type usb {in|out}`

Parameter	Description
in	Trigger activates on insertion of a USB storage device.
out	Trigger activates on removal of a USB storage device.

**Mode** Trigger Configuration

**Usage notes** USB triggers cannot execute script files from a USB storage device.

**Examples** To configure trigger 1 to activate on the insertion of a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type usb in
```

**Related commands** [trigger](#)  
[show running-config trigger](#)  
[show trigger](#)

# undebug trigger

**Overview** This command applies the functionality of the **no debug trigger** command.

# 63

# Ping-Polling Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Ping Polling. For more information, see the [Ping Polling Feature Overview and Configuration Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Table 63-1: The following table lists the default values when configuring a ping poll

Default	Value
Critical-interval	1 second
Description	No description
Fail-count	5
Length	32 bytes
Normal-interval	30 seconds
Sample-size	5
Source-ip	The IP address of the interface from which the ping packets are transmitted
Time-out	1 second
Up-count	30

- Command List**

# active (ping-polling)

**Overview** This command enables a ping-poll instance. The polling instance sends ICMP echo requests to the device with the IP address specified by the [ip \(ping-polling\)](#) command.

By default, polling instances are disabled. When a polling instance is enabled, it assumes that the device it is polling is unreachable.

The **no** variant of this command disables a ping-poll instance. The polling instance no longer sends ICMP echo requests to the polled device. This also resets all counters for this polling instance.

**Syntax** active  
no active

**Mode** Ping-Polling Configuration

**Examples** To activate the ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# active
```

To disable the ping-poll instance 43 and reset its counters, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no active
```

**Related commands** [debug ping-poll](#)  
[ip \(ping-polling\)](#)  
[ping-poll](#)  
[show ping-poll](#)

# clear ping-poll

**Overview** This command resets the specified ping poll, or all ping poll instances. This clears the ping counters, and changes the status of polled devices to unreachable. The polling instance changes to the polling frequency specified with the [critical-interval](#) command. The device status changes to reachable once the device responses have reached the [up-count](#).

**Syntax** `clear ping-poll {<1-100>|all}`

Parameter	Description
<1-100>	A ping poll ID number. The specified ping poll instance has its counters cleared, and the status of the device it polls is changed to unreachable.
all	Clears the counters and changes the device status of all polling instances.

**Mode** Privileged Exec

**Examples** To reset the ping poll instance 12, use the command:

```
awplus# clear ping-poll 12
```

To reset all ping poll instances, use the command:

```
awplus# clear ping-poll all
```

**Related commands** [active \(ping-polling\)](#)  
[ping-poll](#)  
[show ping-poll](#)

# critical-interval

**Overview** This command specifies the time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable.

This command enables the device to quickly observe changes in state, and should be set to a much lower value than the [normal-interval](#) command.

The **no** variant of this command sets the critical interval to the default of one second.

**Syntax** `critical-interval <1-65536>`  
`no critical-interval`

Parameter	Description
<code>&lt;1-65536&gt;</code>	Time in seconds between pings, when the device has failed to a ping, or the device is unreachable.

**Default** The default is 1 second.

**Mode** Ping-Polling Configuration

**Examples** To set the critical interval to 2 seconds for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# critical-interval 2
```

To reset the critical interval to the default of one second for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# no critical-interval
```

**Related commands**

- [fail-count](#)
- [normal-interval](#)
- [sample-size](#)
- [show ping-poll](#)
- [timeout \(ping polling\)](#)
- [up-count](#)

# debug ping-poll

**Overview** This command enables ping poll debugging for the specified ping-poll instance. This generates detailed messages about ping execution.

The **no** variant of this command disables ping-poll debugging for the specified ping-poll.

**Syntax** `debug ping-poll <1-100>`  
`no debug ping-poll {<1-100>|all}`

Parameter	Description
<1-100>	A unique ping poll ID number.
all	Turn off all ping-poll debugging.

**Mode** Privileged Exec

**Examples** To enable debugging for ping-poll instance 88, use the command:

```
awplus# debug ping-poll 88
```

To disable all ping poll debugging, use the command:

```
awplus# no debug ping-poll all
```

To disable debugging for ping-poll instance 88, use the command:

```
awplus# no debug ping-poll 88
```

**Related commands**

- [active \(ping-polling\)](#)
- [clear ping-poll](#)
- [ping-poll](#)
- [show ping-poll](#)
- [undebug ping-poll](#)

# description (ping-polling)

**Overview** This command specifies a string to describe the ping-polling instance. This allows the ping-polling instance to be recognized easily in show commands. Setting this command is optional.

By default ping-poll instances do not have a description.

Use the **no** variant of this command to delete the description set.

**Syntax** `description <description>`  
`no description`

Parameter	Description
<code>&lt;description&gt;</code>	The description of the target. Valid characters are any printable character and spaces. There is no maximum character length.

**Mode** Ping-Polling Configuration

**Examples** To add the text "Primary Gateway" to describe the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# description Primary Gateway
```

To delete the description set for the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no description
```

**Related commands** [ping-poll](#)  
[show ping-poll](#)

# fail-count

**Overview** This command specifies the number of pings that must be unanswered, within the total number of pings specified by the [sample-size](#) command, for the ping-polling instance to consider the device unreachable.

If the number set by the [sample-size](#) command and the **fail-count** commands are the same, then the unanswered pings must be consecutive. If the number set by the [sample-size](#) command is greater than the number set by the **fail-count** command, then a device that does not always reply to pings may be declared unreachable.

The **no** variant of this command resets the fail count to the default.

**Syntax** `fail-count <1-100>`  
`no fail-count`

Parameter	Description
<code>&lt;1-100&gt;</code>	The number of pings within the sample size that a reachable device must fail to respond to before it is classified as unreachable.

**Default** The default is 5.

**Mode** Ping-Polling Configuration

**Examples** To specify the number of pings that must fail within the sample size to determine that a device is unreachable for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# fail-count 5
```

To reset the fail-count to its default of 5 for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no fail-count
```

**Related commands**

# ip (ping-polling)

**Overview** This command specifies the IPv4 address of the device you are polling.

**Syntax** `ip {<ip-address>|<ipv6-address>}`

Parameter	Description
<code>&lt;ip-address&gt;</code>	An IPv4 address in dotted decimal notation A.B.C.D
<code>&lt;ipv6-address&gt;</code>	An IPv6 address in hexadecimal notation X:X::X:X

**Mode** Ping-Polling Configuration

**Examples** To set ping-poll instance 5 to poll the device with the IP address 192.168.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 5
awplus(config-ping-poll)# ip 192.168.0.1
```

To set ping-poll instance 10 to poll the device with the IPv6 address 2001:db8::, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 10
awplus(config-ping-poll)# ip 2001:db8::
```

**Related commands**

- [ping-poll](#)
- [source-ip](#)
- [show ping-poll](#)

# length (ping-poll data)

**Overview** This command specifies the number of data bytes to include in the data portion of the ping packet. This allows you to set the ping packets to a larger size if you find that larger packet types in your network are not reaching the polled device, while smaller packets are getting through. This encourages the polling instance to change the device's status to unreachable when the network is dropping packets of the size you are interested in.

The **no** variant of this command resets the data bytes to the default of 32 bytes.

**Syntax** length <4-1500>  
no length

Parameter	Description
<4-1500>	The number of data bytes to include in the data portion of the ping packet.

**Default** The default is 32.

**Mode** Ping-Polling Configuration

**Examples** To specify that ping-poll instance 12 sends ping packet with a data portion of 56 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length 56
```

To reset the number of data bytes in the ping packet to the default of 32 bytes for ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length
```

**Related commands** ping-poll  
show ping-poll

# normal-interval

**Overview** This command specifies the time period between pings when the device is reachable.

The **no** variant of this command resets the time period to the default of 30 seconds.

**Syntax** `normal-interval <1-65536>`  
`no normal-interval`

Parameter	Description
<code>&lt;1-65536&gt;</code>	Time in seconds between pings when the target is reachable.

**Default** The default is 30 seconds.

**Mode** Ping-Polling Configuration

**Examples** To specify a time period of 60 seconds between pings when the device is reachable for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# normal-interval 60
```

To reset the interval to the default of 30 seconds for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no normal-interval
```

- [sample-size](#)
- [show ping-poll](#)
- [timeout \(ping polling\)](#)
- [up-count](#)

# ping-poll

**Overview** This command enters the ping-poll configuration mode. If a ping-poll exists with the specified number, then this command enters its configuration mode. If no ping-poll exists with the specified number, then this command creates a new ping-poll with this ID number.

To configure a ping-poll, create a ping-poll using this command, and use the `ip (ping-polling)` command to specify the device you want the polling instance to poll. It is not necessary to specify any further commands unless you want to change a command's default.

The **no** variant of this command deletes the specified ping-poll.

**Syntax** `ping-poll <1-100>`  
`no ping-poll <1-100>`

Parameter	Description
<1-100>	A unique ping-poll ID number.

**Mode** Global Configuration

**Examples** To create ping-poll instance 3 and enter ping-poll configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 3
awplus(config-ping-poll)#
```

To delete ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# no ping-poll 3
```

**Related commands**

- [active \(ping-polling\)](#)

- [source-ip](#)

# sample-size

**Overview** This command sets the total number of pings that the polling instance inspects when determining whether a device is unreachable. If the number of pings specified by the **fail-count** command go unanswered within the inspected sample, then the device is declared unreachable.

If the numbers set in this command and **fail-count** command are the same, the unanswered pings must be consecutive. If the number set by this command is greater than that set with the **fail-count** command, a device that does not always reply to pings may be declared unreachable.

You cannot set this command's value lower than the **fail-count** value.

The polling instance uses the number of pings specified by the **up-count** command to determine when a device is reachable.

The **no** variant of this command resets this command to the default.

**Syntax** `sample-size <1-100>`  
`no sample size`

Parameter	Description
<1-100>	Number of pings that determines critical and up counts.

**Default** The default is 5.

**Mode** Ping-Polling Configuration

**Examples** To set the sample-size to 50 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# sample-size 50
```

To reset sample-size to the default of 5 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no sample-size
```

**Related commands**

- show ping-poll
- timeout (ping polling)
- up-count

# show counter ping-poll

**Overview** This command displays the counters for ping polling.

**Syntax** show counter ping-poll [*<1-100>*]

Parameter	Description
<i>&lt;1-100&gt;</i>	A unique ping poll ID number. This displays the counters for the specified ping poll only. If you do not specify a ping poll, then this command displays counters for all ping polls.

**Mode** User Exec and Privileged Exec

**Output** Figure 63-1: Example output from the **show counter ping-poll** command

```
Ping-polling counters
Ping-poll: 1
PingsSent          ..... 15
PingsFailedUpState ..... 0
PingsFailedDownState ..... 0
ErrorSendingPing   ..... 2
CurrentUpCount     ..... 13
CurrentFailCount   ..... 0
UpStateEntered     ..... 0
DownStateEntered   ..... 0

Ping-poll: 2
PingsSent          ..... 15
PingsFailedUpState ..... 0
PingsFailedDownState ..... 0
ErrorSendingPing   ..... 2
CurrentUpCount     ..... 13
CurrentFailCount   ..... 0
UpStateEntered     ..... 0
DownStateEntered   ..... 0

Ping-poll: 5
PingsSent          ..... 13
PingsFailedUpState ..... 0
PingsFailedDownState ..... 2
ErrorSendingPing   ..... 2
CurrentUpCount     ..... 9
CurrentFailCount   ..... 0
UpStateEntered     ..... 0
DownStateEntered   ..... 0
```

**Table 64:** Parameters in output of the **show counter ping-poll** command

Parameter	Description
Ping-poll	The ID number of the polling instance.
PingsSent	The total number of pings generated by the polling instance.
PingsFailedUpState	The number of unanswered pings while the target device is in the Up state. This is a cumulative counter for multiple occurrences of the Up state.
PingsFailedDownState	Number of unanswered pings while the target device is in the Down state. This is a cumulative counter for multiple occurrences of the Down state.
ErrorSendingPing	The number of pings that were not successfully sent to the target device. This error can occur when your device does not have a route to the destination.
CurrentUpCount	The current number of sequential ping replies.
CurrentFailCount	The number of ping requests that have not received a ping reply in the current sample-size window.
UpStateEntered	Number of times the target device has entered the Up state.
DownStateEntered	Number of times the target device has entered the Down state.

**Example** To display counters for the polling instances, use the command:

```
awplus# show counter ping-poll
```

**Related commands**

- [debug ping-poll](#)
- [ping-poll](#)
- [show ping-poll](#)

# show ping-poll

**Overview** This command displays the settings and status of ping polls.

**Syntax** `show ping-poll [<1-100>|state {up|down}] [brief]`

Parameter	Description	
<1-100>	Displays settings and status for the specified polling instance.	
state	Displays polling instances based on whether the device they are polling is currently reachable or unreachable.	
	up	Displays polling instance where the device state is reachable.
	down	Displays polling instances where the device state is unreachable.
brief	Displays a summary of the state of ping polls, and the devices they are polling.	

**Mode** User Exec and Privileged Exec

**Output** Figure 63-2: Example output from the **show ping-poll brief** command

```
Ping Poll Configuration
-----
Id Enabled State Destination
-----
1 Yes Down 192.168.0.1
2 Yes Up 192.168.0.100
```

**Table 65:** Parameters in output of the **show ping-poll brief** command

Parameter	Meaning
Id	The ID number of the polling instance, set when creating the polling instance with the <code>ping-poll</code> command.
Enabled	Whether the polling instance is enabled or disabled.

**Table 65:** Parameters in output of the **show ping-poll brief** command (cont.)

Parameter	Meaning
State	The current status of the device being polled:
Up	The device is reachable.
Down	The device is unreachable.
Critical Up	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.
Critical Down	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.
Destination	The IP address of the polled device, set with the <code>ip (ping-polling)</code> command.

**Figure 63-3:** Example output from the **show ping-poll** command

```

Ping Poll Configuration
-----

Poll 1:
Description                : Primary Gateway
Destination IP address     : 192.168.0.1
Status                     : Down
Enabled                    : Yes
Source IP address         : 192.168.0.10
Critical interval         : 1
Normal interval           : 30
Fail count                 : 10
Up count                   : 5
Sample size                : 50
Length                    : 32
Timeout                   : 1
Debugging                  : Enabled
    
```

```

Poll 2:
Description                : Secondary Gateway
Destination IP address     : 192.168.0.100
Status                     : Up
Enabled                    : Yes
Source IP address         : Default
Critical interval         : 5
Normal interval           : 60
Fail count                 : 20
Up count                  : 30
Sample size               : 100
Length                    : 56
Timeout                   : 2
Debugging                 : Enabled
    
```

**Table 66:** Parameters in output of the **show ping-poll** command

Parameter	Description	
Description	Optional description set for the polling instance with the <a href="#">description (ping-polling)</a> command.	
Destination IP address	The IP address of the polled device, set with the <a href="#">ip (ping-polling)</a> command.	
Status	The current status of the device being polled:	
	Up	The device is reachable.
	Down	The device is unreachable.
	Critical Up	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.
	Critical Down	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.
Enabled	Whether the polling instance is enabled or disabled. The <a href="#">active (ping-polling)</a> and <a href="#">active (ping-polling)</a> commands enable and disable a polling instance.	
Source IP address	The source IP address sent in the ping packets. This is set using the <a href="#">source-ip</a> command.	
Critical interval	The time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable. This is set with the <a href="#">critical-interval</a> command.	
Normal interval	The time period between pings when the device is reachable. This is set with the <a href="#">normal-interval</a> command.	

**Table 66:** Parameters in output of the **show ping-poll** command (cont.)

Parameter	Description
Fail count	The number of pings that must be unanswered, within the total number of pings specified by the <a href="#">sample-size</a> command, for the polling instance to consider the device unreachable. This is set using the <a href="#">fail-count</a> command.
Up count	The number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again. This is set using the <a href="#">up-count</a> command.
Sample size	The total number of pings that the polling instance inspects when determining whether a device is unreachable. This is set using the <a href="#">sample-size</a> command.
Length	The number of data bytes to include in the data portion of the ping packet. This is set using the <a href="#">length (ping-poll data)</a> command.
Timeout	The time in seconds that the polling instance waits for a response to a ping packet. This is set using the <a href="#">timeout (ping polling)</a> command.
Debugging	Indicates whether ping polling debugging is <b>Enabled</b> or <b>Disabled</b> . This is set using the <a href="#">debug ping-poll</a> command.

**Examples** To display the ping poll settings and the status of all the polls, use the command:

```
awplus# show ping-poll
```

To display a summary of the ping poll settings, use the command:

```
awplus# show ping-poll brief
```

To display the settings for ping poll 6, use the command:

```
awplus# show ping-poll 6
```

To display a summary of the state of ping poll 6, use the command:

```
awplus# show ping-poll 6 brief
```

To display the settings of ping polls that have reachable devices, use the command:

```
awplus# show ping-poll state up
```

To display a summary of ping polls that have unreachable devices, use the command:

```
awplus# show ping-poll state down brief
```

**Related commands** [debug ping-poll](#)  
[ping-poll](#)

# source-ip

**Overview** This command specifies the source IP address to use in ping packets.

By default, the polling instance uses the address of the interface through which it transmits the ping packets. It uses the device's local interface IP address when it is set. Otherwise, the IP address of the interface through which it transmits the ping packets is used.

The **no** variant of this command resets the source IP in the packets to the device's local interface IP address.

**Syntax** `source-ip {<ip-address>|<ipv6-address>}`  
`no source-ip`

Parameter	Description
<code>&lt;ip-address&gt;</code>	An IPv4 address in dotted decimal notation A.B.C.D
<code>&lt;ipv6-address&gt;</code>	An IPv6 address in hexadecimal notation X:X::X:X

**Mode** Ping-Polling Configuration

**Examples** To configure the ping-polling instance 43 to use the source IP address 192.168.0.1 in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 192.168.0.1
```

To configure the ping-polling instance 43 to use the source IPv6 address 2001:db8:: in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 2001:db8::
```

To reset the source IP address to the device's local interface IP address for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no source-ip
```

**Related commands**

- description (ping-polling)
- ip (ping-polling)
- length (ping-poll data)
- ping-poll
- show ping-poll

# timeout (ping polling)

**Overview** This command specifies the time in seconds that the polling instance waits for a response to a ping packet. You may find a higher time-out useful in networks where ping packets have a low priority.

The **no** variant of this command resets the set time out to the default of one second.

**Syntax** `timeout <1-30>`  
`no timeout`

Parameter	Description
<1-30>	Length of time, in seconds, that the polling instance waits for a response from the polled device.

**Default** The default is 1 second.

**Mode** Ping-Polling Configuration

**Examples** To specify the timeout as 5 seconds for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# timeout 5
```

To reset the timeout to its default of 1 second for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no timeout
```

**Related commands**

- [critical-interval](#)
- [fail-count](#)
- [normal-interval](#)
- [ping-poll](#)
- [sample-size](#)
- [show ping-poll](#)
- [up-count](#)

# up-count

**Overview** This command sets the number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again.

The **no** variant of this command resets the up count to the default of 30.

**Syntax** `up-count <1-100>`  
`no up-count`

Parameter	Description
<code>&lt;1-100&gt;</code>	Number of replied pings before an unreachable device is classified as reachable.

**Default** The default is 30.

**Mode** Ping-Polling Configuration

**Examples** To set the upcount to 5 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# up-count 5
```

To reset the upcount to the default value of 30 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no up-count
```

# undebbug ping-poll

**Overview** This command applies the functionality of the no `debug ping-poll` command.

# Part 8: Firewall and Network Address Translation (NAT)

# 64

# Firewall Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure AlliedWare Plus Firewall. For more information see the [Firewall\\_and Network Address Translation \(NAT\) Feature Overview and Configuration\\_Guide](#).

The table below lists the firewall commands and their applicable modes.

Figure 64-1: Firewall commands and applicable modes

Mode	Command
Privileged Exec	<code>clear firewall connections</code>
	<code>debug firewall</code>
	<code>show debugging firewall</code>
	<code>show firewall</code>
	<code>show firewall connections</code>
	<code>show firewall rule</code>
	<code>show firewall rule config-check</code>
	<code>show running-config firewall</code>
Global Configuration	<code>firewall</code>
Firewall Configuration	<code>protect (firewall)</code>
	<code>rule (firewall)</code>
	<code>move rule (firewall)</code>

- Command List**
- “[clear firewall connections](#)” on page 3267
  - “[connection-limit \(firewall\)](#)” on page 3268
  - “[connection-log events](#)” on page 3270

- [“firewall”](#) on page 3271
- [“debug firewall”](#) on page 3272
- [“ip tcp timeout established”](#) on page 3273
- [“move rule \(firewall\)”](#) on page 3274
- [“protect \(firewall\)”](#) on page 3275
- [“rule \(firewall\)”](#) on page 3276

- [“show firewall rule”](#) on page 3283
- [“show firewall rule config-check”](#) on page 3285
- [“show debugging firewall”](#) on page 3286
- [“show running-config firewall”](#) on page 3287

# clear firewall connections

**Overview** Use this command to clear firewall connections.

**Syntax** `clear firewall connections`

**Mode** Privileged Exec

**Usage notes** Removing the Network Address Translation (NAT) rule by using the **no nat rule** command for an actively translated flow does not stop translating immediately. This means subsequent packets in the flow are continued to be translated.

The continued translation after associated NAT rule is removed will only stop when:

- You use the **clear firewall connections** command to manually stop translations immediately, when the associated rule has been deleted regardless whether the firewall feature is actually configured with NAT or not.
- The traffic flow ends naturally, for example, when it is stopped from the source. If the flow is re-initiated from a host, it will not be translated by the firewall, as the rule is deleted after the first flow stopped.

**Examples** To clear firewall connections, use the command:

```
awplus# clear firewall connections
```

**Validation commands** [show firewall connections](#)

**Related commands** [rule \(nat\)](#)

# connection-limit (firewall)

**Overview** Use this command to limit firewall connections for an entity. The limit imposed by a connection-limit rule applies to the sum of TCP and UDP flows that match the rule.

Use the **no** variant of this command to remove the limit.

**Syntax** `connection-limit [<1-65535>] from <entity-name> with limit <0-100000>`  
`no connection-limit {<1-65535>|all}`

Parameter	Description
<1-65535>	Unique numeric identifier for the limit.
<entity-name>	An entity represents a logical grouping of subnets, hosts or interfaces. For more information about entity, see the <a href="#">Application and Entity Commands</a> .
<0-100000>	The maximum number of permitted connections for the entity.
all	Delete all limits.

**Default** The limiting is disabled by default and the number of connections will not be limited. However, the number is up to the maximum total number of allowed connections.

**Mode** Firewall Configuration

**Usage notes** This command allows you to limit the number of firewall sessions associated with a specific entity. The limit will be applied to each host on that entity. This means connection limits applied to an entity with multiple addresses will apply the limit to individual hosts, not the total connections for the entity. The limit applies to both IPv4 and IPv6.

If a connection limit rule is removed, any running connections are not stopped. Changes to limits only affect new connections. Adding a lower limit will not affect existing connections.

**Examples** To set a connection limit for entity DMZ, use the following command:

```
awplus(config-firewall)# connection-limit 1 from DMZ with limit 10000
```

To remove the connection limit, use the following command:

```
awplus(config-firewall)# no connection-limit 1
```

**Validation commands** [show firewall connections](#)  
[show firewall connections limits](#)

**Command changes** Version 5.5.0-1.1: Firewall session limiting rules apply to UDP connections, where previously the limiting rules only applied to TCP connections.

# connection-log events

**Overview** Use this command to enable extra logging for indicating the start and the end of connections passing through the firewall.

Use the **no** variant of this command to turn off the extra logging of connections passing through the firewall.

**Syntax** `connection-log events [new|end|all]`  
`no connection-log events [new|end|all]`

Parameter	Description
new	New connection
end	Connections closed
all	All new connections and connections closed. Default.

**Default** Connection logging is not enabled by default.

**Mode** Global Configuration.

**Usage notes** There are two types of messages you can log: new connections and connections that ended. You can control the amount of messages you log by choosing to log either type of message or all of the message types.

Messages contain the following information:

- time
- source and destination addresses (NATed and unNATed)
- protocol
- source and destination ports (NATed and unNATed)
- bytes and packets passed (found in the connection end message)

**Example** To log all of the new connections and all of the closed connections, use the commands:

```
awplus# configure terminal
awplus(config)# connection-log events all
```

**Related commands** [show connection-log events](#)

**Command changes** Version 5.4.7-1.1: command added.

# firewall

**Overview** Use this command to configure the firewall.  
Use the **no** variant of this command to remove all firewall configuration.

**Syntax** `firewall`  
`no firewall`

**Mode** Global Configuration

**Usage notes** This command allows you to enter the Firewall Configuration mode. The command prompt for this mode is **awplus(config-firewall)#**

In the Firewall Configuration mode, you can:

- Enable or disable firewall protection, see the [protect \(firewall\)](#) command.
- Create, move, or delete rules for the firewall, see the [rule \(firewall\)](#) command and the [move rule \(firewall\)](#) command.

**Examples** To configure the firewall, use the commands:

```
awplus# configure terminal
awplus(config)# firewall
awplus(config-firewall)#
```

To remove all firewall configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no firewall
```

**Validation commands** `show firewall`  
`show running-config firewall`

# debug firewall

**Overview** Use this command to enable firewall debugging and Network Address Translation (NAT) debugging. This will cause additional detailed debugging information to be logged at the “informational” and “debugging” levels.

Use the **no** variant of this command to disable firewall debugging and NAT debugging.

For more information about NAT, see the [Firewall\\_and Network Address Translation \(NAT\) Feature Overview and Configuration\\_Guide](#).

**Syntax** debug firewall  
no debug firewall

**Default** Firewall debugging and NAT debugging are disabled by default.

**Mode** Privileged Exec

**Examples** To enable firewall debugging and NAT debugging, use the command:

```
awplus# debug firewall
```

To disable firewall debugging and NAT debugging, use the command:

```
awplus# no debug firewall
```

**Validation commands** [show debugging firewall](#)

# ip tcp timeout established

**Overview** Use this command to set the idle timeout for all established TCP connections. Use the **no** variant of this command to set the idle timeout back to the default of 3600 seconds.

**Syntax** `ip tcp timeout established <1-31536000>`  
`no ip tcp timeout established`

Parameter	Description
<code>&lt;1-31536000&gt;</code>	Idle timeout for established TCP connections in seconds from 1 to 3153600.

**Default** 3600 seconds (1 hour)

**Mode** Global Configuration

**Usage notes** By default, when a TCP session is successfully established through the firewall, when the session goes idle, it automatically times out of the firewall connection tracking table after 3600 seconds. In some situations it may be beneficial to time out unused established TCP sessions earlier.

For example, in a busy environment where there is an excessive number of sessions being established, the firewall connection tracking table could become oversubscribed, with new connections being blocked until older sessions are timed out.

**Example** To set a non-default TCP session timeout for established idle sessions of 1800 seconds (30 minutes), use the commands:

```
awplus# configure terminal
awplus(config)# ip tcp timeout established 1800
```

**Example** To set the TCP session timeout for established idle sessions back to the default setting of 3600 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip tcp timeout established
```

**Related commands** [show running-config](#)

**Command changes** Version 5.4.6-1.1: command added

# move rule (firewall)

**Overview** Use this command to change the order of firewall rules.

Firewall rules are applied in rule ID order. When rules match the same application, source entity and destination entity, only the rule with the lowest ID is applied.

Note that you can move an existing rule ID only to an ID that is not assigned to any rule; otherwise you will be given an error message. Also note that a change to the rule order may change the rule results.

**Syntax** `move rule <1-65535> to <1-65535>`

Parameter	Description
<code>move rule &lt;1-65535&gt;</code>	Move the ID of a given rule. The rule ID of the given rule must exist. Each rule has an ID which is either designated by the user or automatically generated when the rule is created. The rule ID is an integer from 1 to 65535.
<code>to &lt;1-65535&gt;</code>	New rule ID to assign. The new rule ID must not be used by any existing rule.

**Mode** Firewall Configuration

**Examples** To change the rule ID from 20 to 10, use the commands:

```
awplus# configure terminal
awplus(config)# firewall
awplus(config-firewall)# move rule 20 to 10
```

**Validation commands** `show firewall rule`  
`show running-config firewall`

**Related commands** `rule (firewall)`

# protect (firewall)

**Overview** Use this command to enable firewall protection.

Use the **no** variant of this command to disable firewall protection without losing the existing firewall configuration.

**Syntax** `protect`  
`no protect`

**Default** Firewall protection is disabled by default.

**Mode** Firewall Configuration

**Usage notes** Firewall protection is disabled by default and all traffic can pass through the firewall. When the firewall is enabled and no rules are added, all traffic will be blocked by default. You can use the [rule \(firewall\)](#) command to configure rules to allow traffic to pass through the firewall.

**Examples** To enable firewall protection, use the commands:

```
awplus# configure terminal
awplus(config)# firewall
awplus(config-firewall)# protect
```

To disable firewall protection, use the commands:

```
awplus# configure terminal
awplus(config)# firewall
awplus(config-firewall)# no protect
```

**Validation commands** [show firewall](#)  
[show running-config firewall](#)

# rule (firewall)

**Overview** Use this command to create a rule for the firewall. Firewall security policy is specified in the form of firewall rules. Each rule defines the appropriate processing of a type of traffic passing through the firewall.

Use the **no** variant of this command to remove a rule.

**Syntax** rule [*<1-65535>*] {permit|deny|reject|log} *<application-name>*  
from *<source-entity>* to *<destination-entity>*  
[no-state-enforcement] [log]  
no rule {*<1-65535>*|all}

Parameter	Description
<i>&lt;1-65535&gt;</i>	Rule ID is an integer in the range <i>&lt;1-65535&gt;</i> . If you don't designate a rule ID, a rule ID will be automatically generated and it will be greater than the current highest rule ID.
permit	Permit connections that match the application, source entity and destination entity specified with this command.
deny	Drop connections that match the application, source entity and destination entity specified with this command. No error message is sent back to the source host.
reject	Reject connections that match the application, source entity and destination entity specified with this command. An error message (for instance, a TCP reset for a rejected TCP connection, or a destination unreachable message for an ICMP connection, etc.) is sent back to the source host.
log	When 'log' is the action for the rule, log an event each time the rule is hit. The traffic will also be processed by subsequent firewall rules which may permit, deny or reject the connection.
<i>&lt;application-name&gt;</i>	Application name. You can either specify an application name or use the word <i>any</i> , which stands for all applications. For more information about applications, see Application and Entity Commands.
<i>&lt;source-entity&gt;</i>	Source entity name. An entity represents a logical grouping of subnets, hosts or interfaces. For more information about entities, see Application and Entity Commands.
<i>&lt;destination-entity&gt;</i>	Destination entity name.

Parameter	Description
no-state-enforcement	Optionally disable state enforcement for this rule. Use this option with caution as it will allow reverse path connection initiation. It should be used only when the traffic forward and reverse paths must be different and there is no alternative approach available. This option is disabled by default.
log	When 'log' is appended to a rule, the action is applied and a log message is also generated each time the rule is hit.
all	Delete all rules.

**Mode** Firewall Configuration

**Usage notes** When the firewall is enabled and no rules are added, all traffic is blocked by default, you can use this command to create rules for permitting packets between entities.

The rule is not valid and cannot be hit if either the application, source entity or destination entity the rule applies to is not properly configured, for example, the application does not exist or does not have a protocol configured or the entity does not exist. To configure applications and entities, see Application and Entity Commands. You can also use the [show firewall rule config-check](#) command to check rule configuration validity.

You can change the rule order by using the [move rule \(firewall\)](#) command.

**Examples** To create a rule for permitting application ping between 'public' and 'private', use the command:

```
awplus(config-firewall)# rule 10 permit
ping from public to private
```

To create a rule for denying application http between 'public.wan' and 'private.lan', use the command:

```
awplus(config-firewall)# rule 20 deny
http from public.wan to private.lan
```

To create a firewall rule to permit application 'ping' between 'public' and 'dmz' entities and to log the results, use the commands:

```
awplus(config-firewall)# rule 30 permit
ping from public to dmz log
```

**Related commands**

- [move rule \(firewall\)](#)
- [show firewall rule](#)
- [show firewall rule config-check](#)

**Command changes** Version 5.4.7-0.1: **no-state-enforcement** option added.

# show connection-log events

**Overview** This command displays the configuration state (enabled or disabled) for the logging of connections passing through the firewall, as configured by the [connection-log events](#) command.

**Syntax** show connection-log events

**Mode** User Exec

**Example** To show the logging configuration state for the connections passing through the firewall, use the command:

```
awplus# show connection-log events
```

**Output** Figure 64-2: Example output from **show connection-log events**

```
awplus#show connection-log events
Log new connection events:      Disabled
Log connection end events:     Enabled
```

**Related commands** [connection-log events](#)

**Command changes** Version 5.4.7-1.1: command added.

# show firewall

**Overview** Use this command to show the protection state of the firewall and the number of active connections being handled by the firewall.

You can use the [protect \(firewall\)](#) command to enable firewall protection.

**Syntax** `show firewall`

**Mode** Privileged Exec

**Examples** To show the state of the firewall, use the command:

```
awplus# show firewall
```

**Output** Figure 64-3: Example output from the **show firewall** command

```
awplus#show firewall
Firewall protection is enabled
Active connections: 9
```

**Related commands** [protect \(firewall\)](#)

# show firewall connections

**Overview** Use this command to show the connections currently being tracked by the firewall.

**Syntax** show firewall connections

**Mode** Privileged Exec

**Examples** To show the connections currently being tracked by the firewall, use the command:

```
awplus# show firewall connections
```

**Output** Figure 64-4: Example output from the **show firewall connections** command

```
awplus#show firewall connections
tcp ESTABLISHED src=192.168.1.2 dst=172.16.1.2 sport=58616

```

**Related commands** [clear firewall connections](#)

# show firewall connections limits

**Overview** Use this command to show the configured firewall connection-limits for a given entity.

**Syntax** `show firewall connections limits`

**Mode** Privileged Exec

**Examples** To show the information about all the firewall connection limits, use the command:

```
awplus# show firewall connections limits
```

**Output** Figure 64-5: Example output from the **show firewall connections limits** command

```
awplus#show firewall connections limits
```

ID	Entity	Limit	Hit Count
10	DMZ	100	42

**Related commands** [show firewall connections limits config-check](#)

# show firewall connections limits config-check

**Overview** Use this command to check configuration validity of firewall connection limits.

An invalid rule will not be active and cannot be hit. This command also shows the reasons why a limit configuration is not valid.

**Syntax** `show firewall connections limits config-check`

**Mode** Privileged Exec

**Usage notes** Firewall limits are applied to entities only. A limit is not valid if the source entity (zone) is not configured properly. This command checks if the entity exists at all, and if it does it also checks if the entity (zone) has a valid subnet.

**Examples** To check configuration validity of connection-limit rules, use the command:

```
awplus# show firewall connections limits  
config-check
```

**Output** Figure 64-6: Example output from the **show firewall connections limits config-check** command on the console if rule configuration errors are detected. Connection-limit 10 uses an entity that exists; however no subnet has been specified. Connection-limit 20 uses an entity that doesn't exist.

```
awplus#show firewall connections limits config-check  
Connection-limit 10:  
  "From" entity has no subnet or host addresses  
Connection-limit 20:  
  "From" entity does not exist
```

**Output** Figure 64-7: Example output from the **show firewall connections limits config-check** command if all limit rules are valid

```
awplus#show firewall connection limits config-check  
All rules are valid
```

**Related commands** [show firewall connections limits](#)

# show firewall rule

**Overview** Use this command to show information about firewall rules.

**Syntax** show firewall rule [<1-65535>]

Parameter	Description
<1-65535>	Rule ID

**Mode** Privileged Exec

**Examples** To show information about all firewall rules, use the command:

```
awplus# show firewall rule
```

**Output** Figure 64-8: Example output from the **show firewall rule** command

```
awplus#show firewall rule

[* = Rule is not valid - see "show firewall rule config-check"]
  ID    Action App      From      To
Hits
-----
-----
  10    permit ping     public    private
  0
  20    permit ping     public    dmz
  0
  40    permit ping     private   dmz
  0
  * 50    permit voice    public    private
  0
```

To show information about a specific firewall rule, use the command:

```
awplus# show firewall rule 10
```

**Output** Figure 64-9: Example output from the **show firewall rule** command

```
awplus#show firewall rule 10

[* = Rule is not valid - see "show firewall rule config-check"]
  ID    Action App      From      To
Hits
-----
-----
  10    permit ping     public    private
  0
```

Output Parameter	Description
*	Indicates the rule is not valid and cannot be hit, see the <a href="#">show firewall rule config-check</a> command.
Action	The rule action set by the <a href="#">rule (firewall)</a> command.
App	Application name.
From	Source entity.
To	Destination entity.
Hits	The number of times the firewall rule has been hit.

**Related commands** [rule \(firewall\)](#)

# show firewall rule config-check

**Overview** Use this command to check configuration validity of firewall rules.  
An invalid rule will not be active and cannot be hit. This command also shows the reasons why a rule is not valid.

**Syntax** `show firewall rule config-check`

**Mode** Privileged Exec

**Usage notes** Firewall rules are applied to applications and entities. A rule is not valid if either the application, source entity or destination entity the rule applies to is not configured properly.

To configure applications and entities, see Application and Entity Commands.

**Examples** To check configuration validity of firewall rules, use the command:

```
awplus# show firewall rule config-check
```

**Output** Figure 64-10: Example output from the **show firewall rule config-check** command if rule configuration errors are detected

```
awplus#show firewall rule config-check
Rule 10:
  Application does not have a protocol configured
  "From" entity does not exist
  "To" entity has no subnet or host addresses
```

**Output** Figure 64-11: Example output from the **show firewall rule config-check** command if all rules are valid

```
awplus#show firewall rule config-check
All rules are valid
```

**Related commands** [rule \(firewall\)](#)  
[show firewall rule](#)

# show debugging firewall

**Overview** Use this command to see what debugging is turned on for firewall and Network Address Translation (NAT).

You can use the [debug firewall](#) command to enable firewall and NAT debugging.

For more information about NAT, see the [Firewall\\_and Network Address Translation \(NAT\) Feature Overview and Configuration\\_Guide](#).

**Syntax** show debugging firewall

**Mode** Privileged Exec

**Examples** To show the firewall and NAT debugging status, use the command:

```
awplus# show debugging firewall
```

**Output** Figure 64-12: Example output from the **show debugging firewall** command

```
awplus#show debugging firewall
Firewall Debugging Status: on
```

**Related commands** [debug firewall](#)

# show running-config firewall

**Overview** Use this command to show the configuration commands that have been used to configure the firewall.

**Syntax** `show running-config firewall`

**Mode** Privileged Exec

**Examples** To show the configuration commands that have been used to configure the firewall, use the command:

```
awplus# show running-config firewall
```

**Output** Figure 64-13: Example output from the **show running-config firewall** command

```
awplus#show running-config firewall
firewall
  rule 10 permit ping from public to private
  protect
!

# Application and Entity Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure application and entity. For more information, see the [Firewall\\_and Network Address Translation \(NAT\) Feature Overview and Configuration\\_Guide](#).

The table below lists the application commands and their applicable modes.

Figure 65-1: Application commands and applicable modes

Mode	Command
Privileged Exec	<code>show application</code>
	<code>show application detail</code>
Global Configuration	<code>application</code>
Application Mode	<code>protocol</code>
	<code>icmp-type</code>
	<code>icmp-code</code>
	<code>sport</code>
	<code>dport</code>

The table below lists the entity commands and their applicable modes.

Figure 65-2: Entity commands

Mode	Command
Privileged Exec	<code>show entity</code>
Global Configuration	<code>zone</code>
Zone Mode	<code>network (zone)</code>

Mode	Command
Network Mode	<code>ip subnet</code>
	<code>ipv6 subnet</code>
	<code>host (network)</code>
Host Mode	<code>ip address (host)</code>
	<code>ipv6 address (host)</code>

# application

**Overview** Use this command to create or modify a custom application.

An application is a high level abstraction of application packets being transported by network traffic. Traffic matching for applications can be achieved by using several techniques, for example, matching packets to port numbers or searching for application signatures in flows of packets.

Use the **no** variant of this command to delete a custom application.

**Syntax** `application <application-name>`  
`no application <application-name>`

Parameter	Description
<code>&lt;application-name&gt;</code>	Application name. You can use all alphanumeric ASCII characters, and the dash (-) and underscore (_) characters. The name can be 1 to 64 characters long. The application name is case-sensitive. If you create two application names with the same spelling but one in upper case and the other one in lower case, the last overwrites the first entry.

**Mode** Global Configuration

**Usage notes** Use this command to enter the Application Configuration mode, to create a custom application or configure an existing application. You can configure the source port, destination port, protocol, ICMP code and ICMP type for the application. An application is invalid if its protocol, source or destination are not properly configured, for example, if the application has no protocol configured, or source and destination ports are applied to protocols that are not TCP, UDP or SCTP.

There are 40 predefined applications with protocols, source and destinations ports.

You can change the protocol, source and destination ports of the predefined applications. You can only delete the predefined application when you change either its protocol, source or destination port.

Use the [show application](#) command to show all the custom and predefined applications.

**Examples** To create a custom application named 'isakmp', use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)#
```

To delete the custom application named 'isakmp', use the commands:

```
awplus# configure terminal  
awplus(config)# no application isakmp
```

**Related  
commands**

dport  
icmp-code  
icmp-type  
protocol  
show application  
sport

# dport

**Overview** Use this command to specify a destination port or port range for an application.

A port number is part of the addressing information used to identify a specific process to which a network message is to be forwarded between a sender and a receiver. For the full list of port numbers and their assignment, you can visit the Internet Assigned Numbers Authority (IANA) website at [www.iana.org](http://www.iana.org).

Use the **no** variant of this command to delete a port or a port range from an application. Note that the port or port range that you want to delete must match exactly the existing port or port range. You cannot remove a port range that is part of an existing port range.

**Syntax** `dport {<destination-port>|any|<start-range> to <end-range>}`  
`no dport {<destination-port>|any|<start-range> to <end-range>}`

Parameter	Description
<code>&lt;destination-port&gt;</code>	The destination port number, either TCP or UDP, specified as an integer in the range <1-65535>.
<code>any</code>	Any port number in the range <1-65535>. This equals to a range of 1 to 65535.
<code>&lt;start-range&gt;</code>	Starting port number in the range <1-65535>.
<code>to &lt;end-range&gt;</code>	Ending port number in the range <1-65535> or max.

**Mode** Application Mode

**Usage notes** You can create more than one destination port number or port range for an application.

**Examples** To specify destination port 500 for the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# dport 500
```

To specify destination port 500 and a range of ports for the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# dport 500
awplus(config-application)# dport 60000 to max
```

To specify the destination port any (a port number range of 1-65535) for the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# dport any
```

To remove destination port 500 from the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# no dport 500
```

To remove port **any** from the application isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# no dport 1 to 65535
```

**Related  
commands**

[application](#)  
[sport](#)  
[show application](#)

# dscp

**Overview** Use this command to specify one or more DSCP values used by an application.

Use the **no** variant of this command to remove one or more DSCP values from an application.

**Syntax** `dscp <dscp-list>`

`dscp {af11|af12|af13|af21|af22|af23|af31|af32|af33|af41|af42|af43|ef|be}`

`dscp {cs0|cs1|cs2|cs3|cs4|cs5|cs6|cs7}`

`no dscp`

`no dscp <dscp-list>`

`no dscp {af11|af12|af13|af21|af22|af23|af31|af32|af33|af41|af42|af43|ef|be}`

`no dscp {cs0|cs1|cs2|cs3|cs4|cs5|cs6|cs7}`

Parameter	Description
<code>&lt;dscp-list&gt;</code>	One or more DSCP values, in the range 0-63. Use spaces to separate values.
<code>af11 ... be</code>	One or more DSCP values specified according to the Assured Forwarding group, as defined in RFC 2597 and RFC 3260. See the table below for values. "ef" means expedited forwarding (DSCP 46) and "be" means best effort (DSCP 0). Voice traffic is typically given a value of ef.
<code>cs0 ... cs7</code>	One or more DSCP values specified according to the Class Selector group. This is equivalent to TOS IP precedence values, so that CS0 is equivalent to an IP precedence value of 0, CS1 is equivalent to an IP precedence value of 1, and so on.

Table 65-1: Assured Forwarding (AF) behavior group

	Class 1	Class 2	Class 3	Class 4
Low drop probability	AF11 (DSCP 10)	AF21 (DSCP 18)	AF31 (DSCP 26)	AF41 (DSCP 34)
Medium drop probability	AF12 (DSCP 12)	AF22 (DSCP 20)	AF32 (DSCP 28)	AF42 (DSCP 36)
High drop probability	AF13 (DSCP 14)	AF23 (DSCP 22)	AF33 (DSCP 30)	AF43 (DSCP 38)

**Mode** Application Mode

**Usage notes** You can specify only one set of DSCP values for an application. The newly specified list will replace the existing one; it will not be added to the existing one.

**Example** To specify a DSCP of **ef** for the application named **voice**, use the commands:

```
awplus# configure terminal
awplus(config)# application voice
awplus(config-application)# dscp ef
```

To specify DSCPs of 12 and 13 for the application named **test**, use the commands:

```
awplus# configure terminal
awplus(config)# application test
awplus(config-application)# dscp 12 13
```

To remove DSCP12 from the application named **test**, use the commands:

```
awplus# configure terminal
awplus(config)# application test
awplus(config-application)# no dscp 12
```

To stop the application named **test** from using DSCP values, use the commands:

```
awplus# configure terminal
awplus(config)# application test
awplus(config-application)# no dscp
```

**Related commands**

- [application](#)
- [show application](#)
- [show application detail](#)

# host (network)

**Overview** Use this command to add a host to a network entity or to configure an existing host.

Host is a high level abstraction of a single node in a network. This is commonly used if a particular device, for example a server, has a static IP address that needs to be specified in a firewall policy.

Use the **no** variant of this command to remove a host from a network entity.

**Syntax** `host <host-name>`  
`no host <host-name>`

Parameter	Description
<code>&lt;host-name&gt;</code>	Host name. You can use all alphanumeric ASCII characters, and the dash (-) and underscore (_) characters. The name can be 1 to 64 characters in long.

**Mode** Network Mode

**Usage notes** You can create multiple hosts for a network. A host entity is identified by its parent network using the dot notation, for example, `ZoneName.NetworkName.HostName`.

This commands allows you to enter the Host Mode with the prompt **awplus(config-host)#**. The Host Mode enables you to configure IPv4 address and IPv6 address for the host. For more information about host IPv4 address and IPv6 address, see [ip address \(host\)](#) command and [ipv6 address \(host\)](#) command respectively.

**Example** To create a host entity named `ftp` under network entity `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# host ftp
awplus(config-host)#
```

To remove host entity `ftp` and its IP address configuration from network entity `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# no host ftp
```

**Validation  
commands**    show entity

**Related  
commands**    ip address (host)  
                  ipv6 address (host)  
                  network (zone)

# icmp-code

**Overview** Use this command to configure an ICMP message code for an application.

ICMP has many messages that are identified by a “type” field and many of these ICMP types have a “code” field. Use the `icmp-type` command to specify the ICMP type. For the full list of the ICMP code assignments, you can visit the Internet Assigned Numbers Authority (IANA) website at [www.iana.org](http://www.iana.org).

Use the **no** variant of this command to restore the ICMP message code to its default, which is **any**.

**Syntax** `icmp-code {<code-number>|any}`  
`no icmp-code`

Parameter	Description
<code>&lt;code-number&gt;</code>	Specify an ICMP message code number in the range of 0 to 255.
<code>any</code>	Any ICMP message code in the range of 0 to 255.

**Default** The default ICMP code number is **any**.

**Mode** Application Mode

**Usage notes** You should configure the ICMP code only for applications that use protocol ICMP. To configure the application protocol, see the `protocol` command.

You can specify only one ICMP message code for an application. The newly specified code will replace the previous one.

**Examples** To specify ICMP code 5 (redirect) for the application named `icmp`, use the commands:

```
awplus# configure terminal
awplus(config)# application icmp
awplus(config-application)# icmp-code 5
```

To specify the ICMP code as **any** for the application named `icmp`, use the commands:

```
awplus# configure terminal
awplus(config)# application icmp
awplus(config-application)# icmp-code any
```

To restore the ICMP message code to its default of **any** for the application named `icmp`, use the commands:

```
awplus# configure terminal
awplus(config)# application icmp
awplus(config-application)# no icmp-code
```

# icmp-type

**Overview** Use this command to configure an ICMP message type for an application.

The ICMP protocol has many messages that are identified by a “type” field. For the full list of the ICMP type assignments, you can visit the Internet Assigned Numbers Authority (IANA) website at [www.iana.org](http://www.iana.org).

Use the **no** variant of this command to restore the ICMP message type to its default, which is **any**.

**Syntax** `icmp-type {<type-number>|any}`  
`no icmp-type`

Parameter	Description
<code>&lt;type-number&gt;</code>	Specify an ICMP message type number in the range of 0 to 255.
<code>any</code>	Any ICMP message type in the range of 0 to 255.

**Default** The default ICMP type is **any**.

**Mode** Application Mode

**Usage notes** You should configure the ICMP type only for applications that use protocol ICMP. To configure the application protocol, see the [protocol](#) command.

You can specify only one ICMP message type for an application. The newly specified type will replace the previous one.

**Examples** To specify ICMP message type 8 (echo) for the application named icmp, use the commands:

```
awplus# configure terminal
awplus(config)# application icmp
awplus(config-application)# icmp-type 8
```

To specify the ICMP message type as **any** for the application named icmp, use the commands:

```
awplus# configure terminal
awplus(config)# application icmp
awplus(config-application)# icmp-type any
```

To restore the ICMP message type to its default of **any** for the application named icmp, use the commands:

```
awplus# configure terminal
awplus(config)# application icmp
awplus(config-application)# no icmp-type
```

commands** application  
icmp-code  
network (zone)  
show application

# ip address (host)

**Overview** Use this command to assign an IPv4 address to a host entity.  
Use the **no** variant of this command to remove an IPv4 address from the host.

**Syntax**

```
ip address <ipv4-address>
ip address dynamic fqdn <domain_name>
ip address dynamic interface <interface_name>
no ip address <ipv4-address>
no ip address dynamic fqdn <domain_name>
no ip address dynamic interface <interface_name>
```

Parameter	Description
<ipv4-address>	The IPv4 address uses the format A.B.C.D.
dynamic	Dynamic IP address, for example, obtained from a DHCP server.
<domain_name>	The FQDN to resolve IP addresses for.
<interface_name>	Interface to acquire IP addresses from.

**Mode** Host

**Usage notes** You can add multiple IP addresses to a host entity. If the IP address is not in the scope of any of its parent network's IPv4 subnets, a warning message will be given. Such an IP address is still acceptable because in the future the user may assign a network subnet that contains the host's IP address. Firewall policy rules will not apply to an IP address that is not in at least one of the network's subnets.

If you are adding an FQDN, DNS Relay cache and **ip domain-lookup via-relay** must be enabled for this command to work. DNS requests passing through the router are inspected for matching FQDNs. Because of this, the DNS cache is cleared when this command is entered so that the IP addresses can be picked up.

You can add multiple dynamic FQDNs for a host entity.

**Examples** To add an IP address to host ftp, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.1.0/24
awplus(config-network)# host ftp
awplus(config-host)# ip address 192.168.1.5
```

To add multiple IP addresses to host `ftp`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.1.0/24
awplus(config-network)# host ftp
awplus(config-host)# ip address 192.168.1.8
awplus(config-host)# ip address 192.168.1.9
awplus(config-host)# ip address 192.168.1.10
```

To add the IPv4 addresses of the FQDN "google.com" to a zone, use the following commands:

```
awplus# configure terminal
awplus(config)# zone Public
awplus(config-zone)# network Router
awplus(config-network)# ip subnet 0.0.0.0/0
awplus(config-network)# host google
awplus(config-host)# ip address dynamic fqdn google.com
```

To remove an IP address from host `ftp`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# host ftp
awplus(config-host)# no ip address 192.168.1.5
```

**Command changes** Version 5.4.8-1.1: FQDN parameter and output added

# ip subnet

**Overview** Use this command to add an IPv4 subnet to a network entity.  
Use the **no** variant of this command to remove a subnet from a network entity.

**Syntax** `ip subnet <ip-network/m> [interface <interface-name>]`  
`no ip subnet <ip-network/m> [interface <interface-name>]`

Parameter	Description
<code>&lt;ip-network/m&gt;</code>	IP address of the network, entered in the form A.B.C.D/M. Dotted decimal notation followed by a forward slash, and then the subnet mask length.
<code>interface</code>	Specify an interface name. An interface may be specified to add a further restriction on the subnet. No interface configured indicates that any matching address from any interface is a member of this network.
<code>&lt;interface-name&gt;</code>	Interface name. Any AlliedWare Plus interface type (eth, vlan, ppp, tunnel, lo and so on). A warning message is given if the interface does not match an existing interface on the device.

**Mode** Network Mode

**Usage notes** You can create multiple subnets to a network entity.

**Examples** To add a subnet to network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.2.0/24
```

To add a subnet and an interface to network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.2.0/24 interface eth1
```

To add multiple subnets to network servers, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.2.0/24 interface eth1
awplus(config-network)# ip subnet 10.1.0.0/16 interface eth1
```

To remove a subnet from network servers, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# no ip subnet 192.168.2.0/24
```

# ipv6 address (host)

**Overview** Use this command to assign an IPv6 address to a host entity.  
Use the **no** variant of this command to remove an IPv6 address from an host entity.

**Syntax**

```
ipv6 address <ipv6-address>  
ipv6 address dynamic fqdn <domain_name>  
ipv6 address dynamic interface <interface_name>  
no ipv6 address <ipv6-address>  
no ipv6 address dynamic fqdn <domain_name>  
no ipv6 address dynamic interface <interface_name>
```

Parameter	Description
<ipv6-address>	The IPv6 address in the format x:x::x:x.
dynamic	Dynamic IPv6 address, for example, obtained from a DHCP server.
<domain_name>	The FQDN to resolve IP addresses for.
<interface_name>	Interface to acquire IP addresses from.

**Mode** Host Mode

**Usage notes** You can add multiple IPv6 addresses to a host entity. If the IPv6 address is not in the scope of any of its parent network's IPv6 subnets, a warning message will be given. Such an IP address is still acceptable because in the future the user may assign a network subnet that contains the host's IPv6 address. Firewall policy rules will not apply to an IPv6 address that is not in at least one of the network's subnets.

If you are adding an FQDN, DNS Relay cache and **ip domain-lookup via-relay** must be enabled for this command to work. DNS requests passing through the router are inspected for matching FQDNs. Because of this, the DNS cache is cleared when this command is entered so that the IPv6 addresses can be picked up.

You can add multiple dynamic FQDNs for a host entity.

**Examples** To add an IPv6 address to host `web-server`, use the commands:

```
awplus# configure terminal  
awplus(config)# zone dmz  
awplus(config-zone)# network servers  
awplus(config-network)# ipv6 subnet 2001:db8:24:100::/64  
awplus(config-network)# host web-server  
awplus(config-host)# ipv6 address 2001:db8:24:100::1
```

To add multiple IP addresses to host `web-server`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ipv6 subnet 2001:db8:24:100::/64
awplus(config-network)# host web-server
awplus(config-host)# ipv6 address 2001:db8:24:100::2
awplus(config-host)# ipv6 address 2001:db8:24:100::3
awplus(config-host)# ipv6 address 2001:db8:24:100::4
```

To add the IPv6 addresses of the FQDN "google.com" to a zone, use the following commands:

```
awplus# configure terminal
awplus(config)# zone Public
awplus(config-zone)# network Router
awplus(config-network)# ip subnet ::/0
awplus(config-network)# host google
awplus(config-host)# ip address dynamic fqdn google.com
```

To remove an IPv6 address from host `web-server`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# host web-server
awplus(config-host)# no ipv6 address 2001:db8:24:100::2
```

# ipv6 subnet

**Overview** Use this command to assign an IPv6 subnet to a network entity.  
Use the **no** variant of this command to remove a IPv6 subnet from a network entity.

**Syntax** `ipv6 subnet <ip-network/m> [interface <interface-name>]`  
`no ipv6 subnet <ip-network/m> [interface <interface-name>]`

Parameter	Description
<code>&lt;ip-network/m&gt;</code>	IPv6 address of the network, entered in the form X:X::X/M, followed by the prefix length in slash notation.
<code>interface</code>	Specify an interface name. An interface may be specified to add a further restriction on the subnet. No interface configured indicates that any matching address from any interface is a member of this network.
<code>&lt;interface-name&gt;</code>	Interface name. Any AlliedWare Plus interface type (eth, vlan, ppp, tunnel, lo and so on.) followed by any character. A warning message is given if the interface does not match an existing interface on the device.

**Mode** Network Mode

**Usage notes** You can create multiple subnets for a network entity.

**Examples** To add a subnet to network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ipv6 subnet 2001:db8::/32
```

To add a subnet and an interface to network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ipv6 subnet 2001:db8::/32 interface
eth1
```

To add multiple subnets to network servers, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ipv6 subnet 2001:db8::7/32 interface
eth1
awplus(config-network)# ipv6 subnet 2001:db8::8/32 interface
eth1
```

To remove a subnet from network servers, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# no ipv6 subnet 2001:db8::/32
```

**Validation  
commands**    [show entity](#)

**Related  
commands**    [network \(zone\)](#)

# network (zone)

**Overview** Use this command to add a network to a zone entity or configure an existing network.

A network is a high level abstraction of a logical network in a zone. This consists of the IP subnets and interfaces over which it is reachable. Subnets are grouped into networks to apply a common set of rules among the subnets.

Use the **no** variant of this command to destroy a network entity.

**Syntax** `network <network-name>`  
`no network <network-name>`

Parameter	Description
<code>&lt;network-name&gt;</code>	Network name. You can use all alphanumeric ASCII characters, and the dash (-) and underscore (_) characters. The name can be 1 to 64 characters in long.

**Mode** Zone Mode

**Usage notes** A network is a member of a zone. You can create multiple networks in a zone. A network entity is identified with its parent zone using the dot notation, for example, ZoneName.NetworkName.

This commands allows you to enter the Network Mode with the prompt **awplus(config-network)#**. In the Network Mode, you can:

- Configure subnets and interfaces for the network entity
- Create and delete host entities in the network

A network must have at least one valid network address for it to result in functioning rules using that network entity. For more information about how to add network address, see the [ip subnet](#) command and the [ipv6 subnet](#) command.

Note that if the network entity is destroyed, the subnets and hosts in the network entity will be destroyed as well.

**Example** To create a network entity named `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)#
```

To destroy a network entity named `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# no network servers
```

**Validation  
commands**    `show entity`

**Related  
commands**    `host (network)`  
                  `ip subnet`  
                  `ipv6 subnet`  
                  `zone`

# protocol

**Overview** Use this command to specify a protocol used by an application.

Protocol numbers are used to configure firewalls, routers, and proxy servers. The protocol number is in the protocol field of the IPv4 header and the next header field of IPv6 header. For the full list of the IP Protocol assignments, you can visit the Internet Assigned Numbers Authority (IANA) website at [www.iana.org](http://www.iana.org).

Use the **no** variant of this command to unset the protocol in an application.

**Syntax** `protocol {tcp|udp|icmp|ipv6-icmp|<protocol-number>}`  
`no protocol`

Parameter	Description
tcp	Transmission Control Protocol. The protocol number is 6.
udp	User Datagram Protocol. The protocol number is 17.
icmp	Internet Control Message Protocol for Internet Protocol version 4. The protocol number is 1.
ipv6-icmp	Internet Control Message Protocol for Internet Protocol version 6. The protocol number is 58.
<protocol-number>	Protocol number in the range of 0 to 255.

**Mode** Application Mode

**Usage notes** You can specify only one protocol for an application. The newly specified protocol will replace the previous one.

**Examples** To specify protocol udp for the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# protocol udp
```

To unset the protocol in the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# no protocol
```

**Related commands** [application](#)  
[show application](#)

# show application

**Overview** Use this command to show the custom and predefined applications currently configured.

You can use the [show application detail](#) command to show detailed information of the applications.

**Syntax** `show application`

**Mode** Privileged Exec

**Examples** To show all applications currently configured, use the command:

```
awplus# show application
```

**Output** Figure 65-3: Example output from **show application**

```
awplus#show application
aim          cvs          dns          ftp
http        https       icq          ident
imap        imaps       irc          jabber
l2tp        ldap        lisa        msn
mysql       news        nfs-tcp     nfs-udp
ntp         openvpn     pcanywhere  udp
...
```

**Related commands** [show application detail](#)

# show application detail

**Overview** Use this command to show detailed information about applications that the device is aware of. For custom and predefined applications, the protocol, destination port, source port, ICMP code, ICMP type, DSCP and the name of the applications will be displayed.

For applications defined by DPI, a description of the application is displayed.

**Syntax** `show application detail [<name>|custom|dpi]`

Parameter	Description
<name>	The name of a specific application.
custom	User-defined application.
dpi	DPI applications. For DPI applications to be displayed by this command, you must first enable DPI by using the <a href="#">enable (dpi)</a> command and the <a href="#">provider (dpi)</a> command.

**Mode** Privileged Exec

**Examples** To show the information about all applications, use the command:

```
awplus# show application detail
```

**Output** To show the information about the application ping, use the command:

```
awplus# show application detail ping
```

Figure 65-4: Example output from **show application detail** for an application

```

Table 65-2: Parameters in the output from **show application detail**

Parameter	Description
Name	Application name—the short name used when referenced from application-aware features (for instance firewall).
Mark	Application mark—the hexadecimal DPI application index representing each protocol or application. This value appears in Firewall log messages, indicating which application the packet or flow was identified as by DPI.
Detail	For custom and pre-defined applications—the IP protocol and port numbers associated with the application. For DPI applications— a longer description of the application.
Cat	Category—a general and high-level category for the application.
Prod	Productivity—an index value between 1 and 5 that rates the potential for each application to improve or increase the overall productivity of network users. For instance, applications with a low productivity index (e.g. games and social networking) can be expected to have a negative impact on productivity. (Procera only)
Risk	Risks—an index value between 1 and 5 that rates the potential for each protocol or application to allow undesirable content onto your network. The higher the risk index, the greater the chance of letting in something that could be dangerous or destructive. (Procera only)

**Related commands** [show application](#)

**Command changes** Version 5.4.7-2.1: More detail added to the output for DPI commands.  
Version 5.4.9-1.1: Category added to output for built-in provider

# show entity

**Overview** Use this command to show entity information.

Entity is a high level abstraction of a network device, a group of networks or subnets. It is the instance that firewall policy can be applied to. There are three types of entity:

- zone
- network
- host

**Syntax** `show entity [<entity>]`

Parameter	Description
<entity>	Specific entity in dot notation.

**Mode** Privileged Exec

**Examples** To show the information about all entities, use the command:

```
awplus# show entity
```

**Output** Figure 65-7: Example output from the **show entity** command

```
awplus#show entity
Zone:      zone1
Network:   zone1.network1
Subnet:    1:db8:24:100::/64
Subnet:    2001:db8:24:100::/64
Host:      zone1.network1.host1
Address:   2001:db8:24:100::1

Zone:      zone2
Network:   zone2.network2
Host:      zone2.network2.host1
```

To show information associated with the network entity `zone1.network1`, use the command:

```
awplus# show entity zone1.network1
```

**Output** Figure 65-8: Example output from the **show entity** command

```
awplus#show entity zone1.network1
Network:    zone1.network1
Subnet:     1:db8:24:100::/64
Subnet:     2001:db8:24:100::/64
Host:       zone1.network1.host1
Address:    2001:db8:24:100::1
```

To show information associated with the host entity `zone1.network1.host1`, use the command:

```
awplus# show entity zone1.network1.host1
```

**Output** Figure 65-9: Example output from the **show entity** command

```
awplus#show entity zone1.network1.host1
Host:       zone1.network1.host1
Address:    192.168.1.5
```

When the entity is using dynamic interface addresses, this will be shown in the output:

**Output** Figure 65-10: Example output from the **show entity** command

```
awplus#show entity Public
Zone:       Public
Network:    Public.Router
Subnet:     0.0.0.0/0 via ppp0
Host:       Public.Router.ppp0
Address:    10.0.6.1 (dynamic)
```

When the entity is using dynamic FQDN addresses, this will be shown in the output:

**Output** Figure 65-11: Example output from the **show entity** command using dynamic FQDN addresses on the console

```
awplus#show entity Public
Zone:       Public
Network:    Public.FQDNs
Subnet:     0.0.0.0/0
Subnet:     ::/0
Host:       Public.FQDNs.alliedtelesis
FQDN IPv4: alliedtelesis.com
FQDN IPv6: alliedtelesis.com

Address:   191.239.213.197 (dynamic)
```

**Command changes** Version 5.4.8-1.1: added output for dynamic interface and FQDN addresses.

# sport

**Overview** Use this command to specify a source port or a port range used for an application.

A port number is part of the addressing information used to identify a specific process to which a network message is to be forwarded between a sender and a receiver. For the full list of port numbers and their assignment, you can visit the Internet Assigned Numbers Authority (IANA) Web site: [www.iana.org](http://www.iana.org).

Use the **no** variant of this command to delete ports or port ranges from an application.

**NOTE:**

The port or port range that you want to delete must match exactly the existing port or port range. You cannot remove a port range that is part of an existing port range.

**Syntax** `sport {<source-port>|any|<start-range> to <end-range>}`  
`no sport {<source-port>|any|<start-range> to <end-range>}`

Parameter	Description
<source-port>	The source port number, either TCP or UDP, specified as an integer between 1 and 65535.
any	Any port number in the range <1-65535>. This equals to a range of 1 to 65535.
<start-range>	Starting port number in the range <1-65535>.
to <end-range>	Ending port number in the range <1-65535> or max.

**Mode** Application Mode

**Usage notes** You can create more than one source port number or port range for an application.

**Examples** To specify source port 500 for the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# sport 500
```

To specify source port 500 and a range of ports for the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# sport 500
awplus(config-application)# sport 60000 to max
```

To specify the source port **any** (a port number range of 1-65535) for the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# sport any
```

To remove source port 500 from the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# no sport 500
```

To remove all source ports from the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# no sport 1 to 65535
```

**Related  
commands**

[application](#)  
[dport](#)  
[show application](#)

# zone

**Overview** Use this command to create a zone entity or configure an existing zone.

Zone is a high level abstraction for a logical grouping or segmentation of physical networks. This is the highest level of partitioning that firewall policy can be applied to. Zone establishes the security border of your networks. A zone defines a boundary where traffic is subjected to policy restrictions as it crosses to another region of your networks. The minimum zones normally implemented would be a trusted zone for the private network behind the firewall and a untrusted zone for the Internet. Other common zones are a Demilitarized Zone (DMZ) for publicly visible web servers and a Virtual Private Network (VPN) zone for remote access users or tunnels to other networks.

Use the **no** variant of this command to destroy a zone entity.

**Syntax** `zone <zone-name>`  
`no zone <zone-name>`

Parameter	Description
<code>&lt;zone-name&gt;</code>	Zone name. You can use all alphanumeric ASCII characters, and the dash (-) and underscore (_) characters. The name can be 1 to 64 characters long.

**Mode** Global Configuration

**Usage notes** This command allows you to enter the Zone Mode with the prompt **awplus(config-category)#**. The Zone Mode enables you to create, configure and delete network entities. For more information about network entity, see the [network \(zone\)](#) command.

A zone entity must have at least one network entity for it to result in functioning rules using that zone entity. For more information about how to add network entities, see the [network \(zone\)](#) command.

Note that if the zone entity is destroyed, the networks and hosts of this zone will be destroyed as well.

**Examples** To create a zone named `private`, use the commands:

```
awplus# configure terminal
awplus(config)# zone private
awplus(config-zone)#
```

To destroy zone `private` and all its networks, subnets and hosts, use the commands:

```
awplus# configure terminal
awplus(config)# no zone private
```

# 66

# NAT Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Network Address Translation (NAT). For more information about NAT introduction and configuration example, see the [Firewall\\_and Network Address Translation \(NAT\) Feature Overview and Configuration\\_Guide](#).

The following figure lists the NAT commands and their applicable modes.

Figure 66-1: NAT commands and applicable modes

Mode	Command
Privileged Exec	<code>show nat</code>
	<code>show nat rule</code>
	<code>show nat rule config-check</code>
	<code>show running-config nat</code>
Global Configuration	<code>nat</code>
NAT Configuration	<code>enable (nat)</code>
	<code>move rule (nat)</code>
	<code>rule (nat)</code>

- Command List**
- [“enable \(nat\)”](#) on page 3326
  - [“ip limited-local-proxy-arp”](#) on page 3327
  - [“local-proxy-arp”](#) on page 3329
  - [“move rule \(nat\)”](#) on page 3330
  - [“nat”](#) on page 3331
  - [“rule \(nat\)”](#) on page 3332

- [“show nat”](#) on page 3336
- [“show nat rule”](#) on page 3337
- [“show nat rule config-check”](#) on page 3339
- [“show running-config nat”](#) on page 3340

# enable (nat)

**Overview** Use this command to enable NAT .

Use the **no** variant of this command to disable NAT without losing existing NAT configuration.

**Syntax** enable  
no enable

**Default** NAT is disabled by default.

**Mode** NAT Configuration

**Examples** To enable NAT, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# enable
```

To disable NAT, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# no enable
```

**Validation commands** show nat  
show running-config nat

# ip limited-local-proxy-arp

**Overview** Use this command to enable local proxy ARP, but only for a specified set of IP addresses. This makes the device respond to ARP requests for those IP addresses when the addresses are reachable via the interface you are configuring.

To specify the IP addresses, use the command [local-proxy-arp](#).

Use the **no** variant of this command to disable limited local proxy ARP. This stops your device from intercepting and responding to ARP requests for the specified hosts. This allows the hosts to use MAC address resolution to communicate directly with one another.

**Syntax** `ip limited-local-proxy-arp`  
`no ip limited-local-proxy-arp`

**Default** Limited local proxy ARP is disabled by default.

**Mode** Interface Configuration

**Usage** Limited local proxy ARP supports Static NAT configurations in which the NAT configuration's public address is different to the ethernet interface's address.

On such ethernet interfaces, the device needs to respond to ARP requests for the public address so that it will receive packets targeted at that address.

Limited local proxy ARP makes this possible. It is especially useful when you have a number of 1-1 NAT configurations and each public address falls within the public interface's subnet. If you enable limited local proxy ARP on the public interface and specify suitable addresses, the device will respond to ARP requests for those addresses, as long as the addresses are routed out the interface the ARP requests are received on. The device responds with its own MAC address.

**Example** The following configuration snippet shows how to use limited local proxy ARP, if you are using NAT for an HTTP server with an address of 172.22.0.3 connected via eth1, and eth1 has an address of 172.22.0.1:

```
! Create a private zone for the HTTP server with address 172.22.200.3:
zone private
network vlan1
ip subnet 172.22.200.0/24
host http_server
ip address 172.22.200.3
!
! Create a public zone for the HTTP server with address 172.22.0.3:
zone public
network eth1
ip subnet 0.0.0.0/0 interface eth1
host http_server
ip address 172.22.0.3
!
! Create a NAT rule to map from the public to the private zone:
nat
rule 10 portfwd http from public.eth1 to public.eth1.http_server with dst
private.vlan1.http_server
enable
!
! Configure eth1. It has a different public address than the HTTP server:
interface eth1
ip limited local-proxy-arp
ip address 172.22.0.1/24
!
! Configure vlan1:
interface vlan1
ip address 172.22.200.5/24
!
! Tell the device to respond to ARPs for the HTTP server public address:
local-proxy-arp 172.22.0.3/32
```

**Related commands** [ip local-proxy-arp](#)  
[local-proxy-arp](#)

# local-proxy-arp

**Overview** Use this command to specify an IP subnet for use with limited local proxy ARP. When limited local proxy ARP is enabled with the command [ip limited-local-proxy-arp](#), the device will respond to ARP requests for addresses in that subnet.

Use the **no** variant of this command to stop specifying a subnet for use with limited local proxy ARP.

**Syntax** `local-proxy-arp [<ip-add/mask>]`  
`no local-proxy-arp [<ip-add/mask>]`

Parameter	Description
<code>&lt;ip-add/mask&gt;</code>	The IP subnet to use with limited local proxy ARP, in dotted decimal format (A.B.C.D/M). To specify a single IP address, use a 32-bit mask.

**Default** No subnets are specified for use with limited local proxy ARP.

**Mode** Global Configuration

**Example** To specify limited local proxy ARP for the address 172.22.0.3, use the following commands:

```
awplus# configure terminal
awplus(config)# local-proxy-arp 172.22.0.3/32
```

This is part of a configuration snippet that shows how to use limited local proxy ARP with static NAT. See the command [ip limited-local-proxy-arp](#) for the whole example.

**Related commands** [ip limited-local-proxy-arp](#)

# move rule (nat)

**Overview** Use this command to change the order of a NAT rule.

You can move an existing rule ID only to an ID that is not assigned to any rule, otherwise you will receive an error message.

**Syntax** `move rule <1-65535> to <1-65535>`

Parameter	Description
<code>move rule &lt;1-65535&gt;</code>	Move the order of a given rule. The rule ID of the given rule must exist. Each rule has an ID which is either designated by the user or automatically generated when the rule is created. The rule ID is an integer from 1 to 65535.
<code>to &lt;1-65535&gt;</code>	New rule ID to assign. The new rule ID must not be used by any existing rule.

**Mode** NAT Configuration

**Examples** To change the ID of a rule from 10 to 30, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# move rule 10 to 30
```

**Validation commands** `show nat rule`  
`show running-config nat`

**Related commands** `rule (nat)`

# nat

**Overview** Use this command to configure NAT.

Use the **no** variant of this command to remove all NAT configuration.

**Syntax** nat  
no nat

**Mode** Global Configuration

**Usage notes** This command allows you to enter the NAT Configuration mode. The command prompt for this mode is **awplus(config-nat)#**.

In the NAT Configuration mode, you can:

- Enable NAT, see the [enable \(nat\)](#) command.
- Create NAT rules or change the order of NAT rules, see the [rule \(nat\)](#) command and the [move rule \(nat\)](#) command.

**Examples** To configure NAT, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)#
```

To remove all NAT configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no nat
```

**Validation commands** [show nat](#)

# rule (nat)

**Overview** Use this command to create a NAT rule.

Use the **no** variant of this command to remove a specified rule or all rules.

**Syntax**

```
rule [<1-65535>] masq <application-name> from <source-entity>  
to <destination-entity> [with src <source-host-entity>]  
  
rule [<1-65535>] portfw <application-name> from <source-entity>  
[to <destination-entity>] with dst <destination-host-entity>  
[dport <1-65535>]  
  
rule [<1-65535>] netmap <application-name> from  
<source-subnet-entity> to <destination-subnet-entity> with  
{src|dst} <translated-subnet-entity>  
  
no rule {<1-65535>|all}
```

Parameter	Description
<1-65535>	Rule ID is an integer in the range 1 to 65535. If you do not designate a rule ID, a rule ID will be automatically generated and it will be greater than the current highest rule ID.
masq	The type of NAT rule. NAT with IP Masquerade is a case where all or a range of addresses are mapped to a single address with source port translation to identify the association. This single address masquerades as the public source address for the private addresses.
portfw	The type of NAT rule. Port forwarding allows remote hosts to connect to a specific host or service within a private LAN. This will forward IPv4 packets on to another device, for example, forward HTTP traffic to an internal web server.
netmap	The type of NAT rule. Use subnet-based NAT to translate the subnet portion of IP addresses while leaving the host portion unchanged.
<application-name>	In all NAT rules, the application name, either one of the predefined applications or an application defined by using the <b>application</b> command.

Parameter	Description
<code>&lt;source-entity&gt;</code>	Source entity name. An entity represents a logical grouping of subnets, hosts or interfaces, created by the <b>zone</b> , <b>network (Entity)</b> , or <b>host (Entity)</b> commands. In a <b>masq</b> rule, the source entity defines the private side of the router. You assign private IP addresses (RFC 1918) to hosts on the private side of the router. When those hosts send traffic, the router translates the private addresses to one or more publicly valid addresses before routing the traffic. When the router receives traffic that is destined for those hosts, it translates the public addresses back to the appropriate private addresses. In a <b>portfw</b> rule, the source entity may be an entity outside your private network.
<code>&lt;destination-entity&gt;</code>	The destination entity name. The destination entity defines the pool of public-valid IP addresses. It can be a zone (created by the <b>zone</b> command), network ( <b>network (Entity)</b> command) or host ( <b>host (Entity)</b> command).
<code>&lt;source-host-entity&gt;</code>	In a <b>masq</b> rule, the specific source host address that the traffic will masquerade as. The source -host-entity must be a host with one IP address, created by using the <b>host (Entity)</b> command.
<code>&lt;destination-host-entity&gt;</code>	In a <b>portfw</b> rule, the target entity name of the specific destination host that the traffic will be port-forwarded to. The target entity must be a host with one IP address, created by using the <b>host (Entity)</b> command.
<code>dport &lt;1-65535&gt;</code>	In a <b>portfw</b> rule, modify the destination port to the specified port. (Only for protocols that have ports.)
<code>&lt;source-subnet-entity&gt;</code>	The source entity that the netmap rule will apply to, for instance a network created by the <b>network (Entity)</b> command. When the <b>with src</b> parameter is used, this source-subnet-entity is translated to the <code>&lt;translated-subnet-entity&gt;</code> specified.
<code>&lt;destination-subnet-entity&gt;</code>	The destination entity that the <b>netmap</b> rule applies to, for instance a network created by the <b>network (Entity)</b> command. When the <b>with dst</b> parameter is used, this destination subnet is translated to the <code>&lt;translated-subnet-entity&gt;</code> specified.

Parameter	Description
<code>&lt;translated-subnet-entity&gt;</code>	In a <b>netmap</b> rule: <b>with src:</b> Modify the source-subnet-entity to the specified translated-subnet-entity, for instance a network created by the <b>network (Entity)</b> command. Both network entities must contain one subnet with a matching subnet mask. <b>with dst:</b> Modify the destination-subnet-entity to the specified translated-subnet-entity, for instance a network created by the <b>network (Entity)</b> command. Both network entities must contain one subnet with a matching subnet mask.
all	Remove all rules.

**Mode** NAT Configuration

**Usage notes** You can change the rule order by using the [move rule \(nat\)](#) command.

Firewall is used in conjunction with NAT. Port forwarding (**portfw**) and masquerade (**masq**) rules do not implicitly permit packets. **Portfw** rules (actions) are applied before any other firewall and **masq** rules (actions) are applied after any other firewall rules. When firewall protection is enabled, all traffic is blocked by default. Use the [rule \(firewall\)](#) command to configure firewall rules which allow the same application, source and destination entities you configure for the NAT rules.

Netmap **dst** rules are applied to traffic before it reaches the firewall rules, and netmap **src** rules are applied after the firewall has permitted the traffic. Firewall rules must be written to permit the traffic after it has been translated by the netmap **dst** rules.

Entities should have valid interfaces on which inbound and outbound traffic can be properly translated. You can use the [ip subnet](#) command and the [ipv6 subnet](#) command to configure the interfaces.

Removing a NAT rule for an actively translated flow does not stop it translating immediately. This means subsequent packets in the flow continue to be translated.

The continued translation after the associated NAT rule is removed will only stop when:

- The [clear firewall connections](#) command is executed or the flow stops.
- One of the following actions occurs:
  - You can use the [clear firewall connections](#) command to manually stop translations immediately, when the associated rule has been deleted regardless whether the firewall feature is actually configured with NAT or not.
  - The NAT rule is cleared when the traffic flow ends naturally, for example, stopped from the source. If the flow is re-initiated from a host, it will not be translated by the firewall, as the rule is deleted after the first flow stopped.

**Examples** To perform network address translation and port forward application 'http' from entity 'public' to any with target destination dmz.servers.web\_server, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# rule 10 portfw
http from public with dst dmz.servers.web_server
```

To perform network address translation and masquerade application 'http' from entity 'private' to 'public', use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# rule 20 masq
http from private to public
```

To use subnet-based NAT to translate the source address of all traffic from 'private.lan' going to 'remote.lan' with the new subnet specified in 'private.global', use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# rule 30 netmap all from private.lan to
remote.lan with src private.global
```

To remove NAT rule 10, use the command:

```
awplus(config-nat)# no rule 10
```

**Related  
commands**

[application](#)  
[clear firewall connections](#)  
[host \(network\)](#)  
[move rule \(nat\)](#)  
[nat](#)  
[network \(zone\)](#)  
[show nat rule](#)  
[show nat rule config-check](#)  
[show running-config nat](#)  
[zone](#)

**Command  
changes** Version 5.4.7-0.1: **netmap** option added.

# show nat

**Overview** Use this command to show the configuration state of NAT.

**Syntax** show nat

**Mode** Privileged Exec

**Examples** To show the configuration state of NAT, use the commands:

```
awplus# show nat
```

**Output** Figure 66-2: Example output from the **show nat** command

```
awplus#show nat
NAT is enabled
```

**Related commands** [enable \(nat\)](#)

# show nat rule

**Overview** Use this command to show information about NAT rules.

**Syntax** show nat rule [<1-65535>]

Parameter	Description
<1-65535>	Rule ID

**Mode** Privileged Exec

**Examples** To show information about all NAT rules, use the command:

```
awplus# show nat rule
```

**Output** Figure 66-3: Example output from the **show nat rule** command

```
awplus#show nat rule

[* = Rule is not valid - see "show nat rule config-check"]
  ID      Action  App      From      To      With      Hits
-----
* 30     masq    any      private   public   -         0
  10     portfw  http     public    -        dmz.a.b   0
```

To show information about a specific NAT rule, use the command:

```
awplus# show nat rule 10
```

**Output** Figure 66-4: Example output from the **show nat rule** command

```
awplus#show nat rule 10

[* = Rule is not valid - see "show nat rule config-check"]
  ID      Action  App      From      To      With      Hits
-----
  10     portfw  http     public    -        dmz.a.b   0
```

Output Parameter	Description
*	Indicates the rule is not valid and cannot be hit, see the <a href="#">show nat rule config-check</a> command.
App	Application name.
From	Source entity.

Output Parameter	Description
with	Target entity name.
To	Destination entity.
Hits	The number of times the NAT rule has been hit.

**Related commands** [rule \(nat\)](#)  
[show nat rule config-check](#)

# show nat rule config-check

**Overview** Use this command to check configuration validity of NAT rules.

An invalid rule will not be active and cannot be hit.

This command also shows the reasons why a rule is not valid.

**Syntax** `show nat rule config-check`

**Mode** Privileged Exec

**Usage notes** NAT rules are applied to applications and entities. A rule is not valid if either the application, source entity or destination entity the rule applies to is not configured properly.

To configure applications and entities, see Application and Entity Commands.

**Examples** To check configuration validity of NAT rules, use the command:

```
awplus# show nat rule config-check
```

**Output** Figure 66-5: Example output from the **show nat rule config-check** command if rule configuration errors are detected

```
awplus#show nat rule config-check
Rule 10:
  Application does not have a protocol configured
  "From" entity does not exist
  "To" entity has no subnet or host addresses
```

**Output** Figure 66-6: Example output from the **show nat rule config-check** command if all rules are valid

```
awplus#show nat rule config-check
All rules are valid
```

# show running-config nat

**Overview** Use this command to show the configuration commands that have been used to configure NAT.

**Syntax** `show running-config nat`

**Mode** Privileged Exec

**Examples** To show the configuration commands that have been used to configure NAT, use the commands:

```
awplus# show running-config nat
```

**Output** Figure 66-7: Example output from the **show running-config nat** command

```
awplus#show running-config nat
nat
 rule 10 masq http from private to public
 rule 20 portfw http from public with dst dmz.servers.wb
 enable
!
```

# Part 9: Advanced Network Protection

# 67

# IPS Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Intrusion Prevention System (IPS). For more information, see the [IPS Feature Overview and Configuration\\_Guide](#).

The table below lists the IPS commands and their applicable modes.

Figure 67-1: IPS Commands and Applicable Modes

Mode	Command
Privileged Exec	<code>show ips</code>
	<code>show ips categories</code>
	<code>show running-config ips</code>
Global Configuration	<code>ips</code>
IPS Mode	<code>category action (IPS)</code>
	<code>protect (IPS)</code>

- Command List**
- [“category action \(IPS\)”](#) on page 3343
  - [“ips”](#) on page 3344
  - [“protect \(IPS\)”](#) on page 3345
  - [“show ips”](#) on page 3346
  - [“show ips categories”](#) on page 3347
  - [“show running-config ips”](#) on page 3349

# category action (IPS)

**Overview** Use this command to configure an action for a specified category.  
Use the **no** variant of this command to set the default action of alert for a specified category.

**Syntax** `category <category-name> action {alert|deny|disable}`  
`no category <category-name> action`

Parameter	Description
<code>&lt;category-name&gt;</code>	Category name. A category is a label that helps to classify the nature of traffic, for example, whether it is spammer, spot or spyware and so on. Once IPS protection is enabled, traffic will be categorized according to the available IPS categories. You can use the <a href="#">show ips categories</a> command to view the categories and their actions.
<code>alert</code>	Generate a log message. This is the default action.
<code>deny</code>	Drop the matching packets. No error message is sent back to the source host.
<code>disable</code>	Ignore a specified category. Ignored categories will not be used to categorize traffic.

**Default** The default action is alert.

**Mode** IPS Mode

**Examples** To drop packet categorized as checksum, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)# category checksum action deny
```

To set the default action for category checksum, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)# no category checksum action
```

**Validation Commands** [show ips categories](#)  
[show running-config ips](#)

# ips

**Overview** Use this command to configure IPS.  
Use the **no** variant of this command to remove all IPS configuration.

**Syntax** `ips`  
`no ips`

**Mode** Global Configuration

**Usage notes** This command allows you to enter the IPS mode. The command prompt for this mode is **awplus(config-ips)#**.

In the IPS mode, you can:

- Enable or disable IPS protection, see the [protect \(IPS\)](#) command.
- Configure an action for specified categories, see the [category action \(IPS\)](#) command.

**Examples** To configure IPS, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)#
```

To remove all IPS configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ips
```

# protect (IPS)

**Overview** Use this command to enable IPS protection .  
Use the **no** variant of this command to disable IPS protection.

**Syntax** protect  
no protect

**Usage notes** Once IPS protection is enabled, traffic will be categorized according to the available IPS categories. See the [show ips categories](#) command for the list of available IPS categories.

**Default** IPS is disabled by default.

**Mode** IPS Mode

**Examples** To enable IPS protection, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)# protect
```

To disable IPS protection, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)# no protect
```

**Validation Commands** [show ips](#)  
[show running-config ips](#)

# show ips

**Overview** Use this command to show the IPS configuration state and event count for the Intrusion Prevention System (IPS).

**Syntax** `show ips`

**Mode** Privileged Exec

**Examples** To display information about IPS, use the command:

```
awplus# show ips
```

**Output** Figure 67-2: Example output from the **show ips** command

```
awplus#show ips
Status:      Enabled (Active)
Events:      4
```

**Command changes** Version 5.4.7-0.1: Event count added to the command output.

# show ips categories

**Overview** Use this command to show the IPS categories and their actions.

Note that if the IPS database provider is configured, this commands shows only the provider's categories.

**Syntax** `show ips categories`

**Mode** Privileged Exec

**Examples** To show the IPS categories and their actions, use the command:

```
awplus# show ips categories
```

**Output** Figure 67-3: Example output of built-in categories from the **show ips categories** command

```
awplus#show ips categories
Category (* = invalid)      Action
-----
checksum                    alert
ftp-bounce                  alert
gre-decoder-events         alert
http-events                 alert
icmp-decoder-events        alert
ip-decoder-events          alert
ppp-decoder-events         alert
smtp-events                 alert
stream-events              alert
udp-decoder-events         alert
```

Parameter	Description
checksum	Invalid checksums, e.g. IPv4, TCPv4, UDPv4, ICMPv4, TCPv6, UDPv6, ICMPv6.
ftp-bounce	GPL FTP PORT bounce attempt.
gre-decoder-events	GRE anomalies, e.g. GRE packet too small, GRE wrong version, GRE v0 recursion control, GRE v0 flags, GRE v0 header too big, GRE v1 checksum present, GRE v1 routing present, GRE v1 strict source route, GRE v1 recursion control.
http-events	HTTP anomalies, e.g. HTTP unknown error, HTTP gzip decompression failed, HTTP request field missing colon, HTTP response field missing colon, HTTP invalid request chunk len, HTTP invalid response chunk len, HTTP status 100-Continue already seen, HTTP unable to match response to request, HTTP invalid server port in request.

Parameter	Description
icmp-decoder-events	ICMP anomalies, e.g. IPv6 with ICMPv4 header, ICMPv4 packet too small, ICMPv4 unknown type, ICMPv6 truncated packet, ICMPv6 unknown version.
ip-decoder-events	IPv4 & IPv6 anomalies, e.g. IPv4 packet too small, IPv4 header size too small, IPv4 wrong IP version, IPv6 packet too small, IPv6 duplicated Routing extension header, IPv6 duplicated Hop-By-Hop Options extension header, IPv6 DSTOPTS only padding, SLL packet too small, Ethernet packet too small, VLAN header too small, FRAG IPv4 Fragmentation overlap, FRAG IPv6 Packet size too large, IPv4-in-IPv6 invalid protocol, IPv6-in-IPv6 packet too short.
ppp-decoder-events	PPP anomalies, e.g. PPP packet too small, PPP IPv6 too small, PPP wrong type, PPPoE wrong code, PPPoE malformed tags.
smtp-events	SMTP anomalies, e.g. SMTP invalid reply, SMTP max reply line len exceeded, SMTP tls rejected, SMTP data command rejected.
stream-events	TCP anomalies, e.g. 3way handshake with ack in wrong dir, 3way handshake async wrong sequence, 3way handshake right seq wrong ack evasion, 4way handshake SYNACK with wrong ACK, STREAM CLOSEWAIT FIN out of window, STREAM ESTABLISHED SYNACK resend, STREAM FIN invalid ack, STREAM FIN1 ack with wrong seq, STREAM TIMEWAIT ACK with wrong seq, stream-events TCP packet too small, stream-events TCP duplicated option)
udp-decoder-events	UDP anomalies, e.g. UDP packet too small, UDP header length too small, UDP invalid header length

# show running-config ips

**Overview** Use this command to show the configuration commands that have been used to configure IPS.

**Syntax** `show running-config dpi`

**Mode** Privileged Exec

**Examples** To show the commands that have been used to configure IPS, use the command:

```
awplus# show running-config ips
```

**Output** Figure 67-4: Example output from the **show running-config ips** command

```
awplus#show running-config ips
ips
  protect
!
```

# 68

# Malware Protection Commands

## Introduction

This chapter provides an alphabetical reference of commands used to configure Malware Protection. For more information about Malware Protection and a configuration example, see the [Advanced Network Protection Feature Overview and Configuration Guide](#).

The table below lists the Malware Protection commands and their applicable modes.

Figure 68-1: Malware Protection commands and applicable modes

Mode	Command
Privileged Exec	<code>show malware-protection</code>
	<code>show running-config malware-protection</code>
Global Configuration	<code>malware-protection</code>
Malware Protection Mode	<code>protect (malware)</code>
	<code>provider kaspersky (malware)</code>
	<code>update-interval (malware)</code>

- Command List**
- “[malware-protection](#)” on page 3351
  - “[protect \(malware\)](#)” on page 3352
  - “[provider kaspersky \(malware\)](#)” on page 3353
  - “[show malware-protection](#)” on page 3354
  - “[show running-config malware-protection](#)” on page 3355
  - “[update-interval \(malware\)](#)” on page 3356

# malware-protection

**Overview** Use this command to configure Malware Protection.

Use the **no** variant of this command to remove all Malware Protection configuration.

**Syntax** `malware-protection`  
`no malware-protection`

**Mode** Global Configuration

**Usage notes** This command allows you to enter the Malware Protection Mode. The command prompt for this mode is **awplus(config-malware)#**.

In the Malware Protection Mode, you can:

- Set the Malware Protection provider, see the [provider kaspersky \(malware\)](#) command.
- Enable or disable Malware Protection, see the [protect \(malware\)](#) command.

**Examples** To configure Malware Protection settings, use the commands:

```
awplus# configure terminal
awplus(config)# malware-protection
awplus(config-malware)#
```

To remove all Malware Protection configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no malware-protection
```

**Validation Commands** [show malware-protection](#)

# protect (malware)

**Overview** Use this command to enable Malware Protection.

Use the **no** variant of this command to disable Malware Protection without losing existing Malware Protection configuration.

Note that you need to use the [provider kaspersky \(malware\)](#) command to set Malware Protection provider before issuing this command to enable Malware Protection.

**Syntax** protect  
no protect

**Default** Malware Protection is disabled by default.

**Mode** Malware Protection Mode

**Examples** To enable Malware Protection, use the commands:

```
awplus# configure terminal
awplus(config)# malware-protection
awplus(config-malware)# provider kaspersky
awplus(config-malware)# protect
```

To disable Malware Protection, use the commands:

```
awplus# configure terminal
awplus(config)# malware-protection
awplus(config-malware)# no protect
```

**Validation Commands** show malware-protection  
show running-config malware-protection

**Related commands** provider kaspersky (malware)

# provider kaspersky (malware)

**Overview** Use this command to set Malware Protection provider.

Malware Protection provider provides a signature database containing a list of known threat patterns. The database is kept up-to-date to ensure the effectiveness of the detection. You can use the [update-interval \(malware\)](#) command to configure the update check interval and update local database if needed.

Note that you need to set Malware Protection provider before issuing [protect \(malware\)](#) command to enable Malware Protection.

**Syntax** `provider kaspersky`

**Default** No Malware Protection provider is set.

**Mode** Malware Protection Mode

**Examples** To set Malware Protection provider, use the commands:

```
awplus# configure terminal
awplus(config)# malware-protection
awplus(config-malware)# provider kaspersky
```

**Validation Commands** [show malware-protection](#)  
[show running-config malware-protection](#)

**Related commands** [protect \(malware\)](#)

# show malware-protection

**Overview** Use this command to show the information about the operation of Malware Protection.

**Syntax** show malware-protection

**Mode** Privileged Exec

**Examples** To show the operation of Malware Protection, use the command:

```
awplus# show malware-protection
```

**Output** Figure 68-2: Example output from **show malware-protection** if the subscription license for Malware Protection is active.

```
awplus#show malware-protection
Status:      Enabled (Active)
Events:      0
Provider:    Kaspersky
Resource version:      1.0
Resource update interval: 1 hour
```

**Command changes** Version 5.4.7-0.1: Event count added to the command output.

# show running-config malware-protection

**Overview** Use this command to show the configuration information about Malware Protection.

**Syntax** `show running-config malware-protection`

**Mode** Privileged Exec

**Examples** To show the running configuration of Malware Protection, use the command:

```
awplus# show running-config malware-protection
```

**Output** Figure 68-3: Example output from the **show running-config malware-protection** command on the console

```
awplus#show running-config malware-protection
malware-protection
  provider kaspersky
  protect
!
```

# update-interval (malware)

**Overview** Use this command to configure an update check interval for the Malware Protection resource files.

Use the **no** variant of this command to restore the default update check interval to 1 hour.

**Syntax** `update-interval {minutes <10-525600>|hours <1-8760>|days <1-365>|weeks <1-52>|never}`

`no update-interval`

Parameter	Description
minutes <10-525600>	Update interval from 10 through 52600 minutes
hours <1-8760>	Update interval from 1 hour through 8760 hours
days <1-365>	Update interval from 1 day through 365 days
weeks <1-52>	Update interval from 1 week through 52 weeks
never	Never update the resource. If Malware Protection becomes enabled, the Update Manager will do update check and update the resource files if needed. Use the <a href="#">protect (malware)</a> command to enable Malware Protection.

**Default** The default update interval is 1 hour.

**Mode** Malware Protection Mode

**Usage notes** The Update Manager will perform an update check for a resource when triggered by an update check interval. It will request the current version number of the resource from the Update Server, then compare it with the current local version. If they are different, the Update Manager will initiate an update of the local resource.

The Update Manager will revert to last known good resource file if installation of an updated resource fails.

Note that when a feature is disabled, regular and manual update checks for its resources are disabled.

Also note that an update check for a resource will not proceed if an update of that resource is already in progress.

**Examples** To check and update the Malware Protection resource files once a week, use the command:

```
awplus(config-malware)# update-interval weeks 1
```

To disable updating of the resource, use the command:

```
awplus(config-malware)# update-interval never
```

To restore the default update interval, which is 1 hour, use the command:

```
awplus(config-malware)# no update-interval
```

# Antivirus Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Antivirus. For more information about Antivirus and its configuration, see the Antivirus sections contained within the [Advanced Network Protection Feature Overview and Configuration Guide](#).

The following table lists the Antivirus commands and their applicable modes.

Figure 69-1: Antivirus commands and applicable modes

Mode	Command
Privileged Exec	<code>show antivirus</code>
	<code>show antivirus statistics</code>
	<code>show running-config antivirus</code>
	<code>debug antivirus</code>
	<code>show debugging antivirus</code>
Global Configuration	<code>antivirus</code>
Antivirus Mode	<code>action (antivirus)</code>
	<code>protect (antivirus)</code>
	<code>provider kaspersky (antivirus)</code>
	<code>update-interval (antivirus)</code>

- Command List**
- `"action (antivirus)"` on page 3360
  - `"antivirus"` on page 3362
  - `"debug antivirus"` on page 3363
  - `"protect (antivirus)"` on page 3364

- “provider kaspersky (antivirus)” on page 3365
- “show antivirus” on page 3366
- “show antivirus statistics” on page 3367
- “show debugging antivirus” on page 3368
- “show running-config antivirus” on page 3369
- “update-interval (antivirus)” on page 3370

# action (antivirus)

**Overview** Use this command to set the action to take when a scan fails or when a scan limit is exceeded.

Use the **no** variant of this command to restore the default action, which is deny.

**Syntax** `action {scan-failed|limit-exceeded} {deny|permit}`  
`no action {scan-failed|limit-exceeded}`

Parameter	Description
scan-failed	Scan failed for a wide variety of possible reasons, for example, encrypted or corrupt file type, out of temporary memory, license expired.
limit-exceeded	Scan failed due to a nesting limit or memory limit being exceeded. Antivirus can extract and scan nested files up to 3 levels deep. The maximum size of a file object that can be sent for scanning is 10MB. The maximum total size of all objects that can be concurrently scanned is 100MB.
deny	Block HTTP request.
permit	Allow HTTP request.

**Default** The default action is deny when a scan failed or a scan limit is exceeded.

**Mode** Antivirus Mode

**Examples** To allow HTTP traffic when a scan fails, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# action scan-failed permit
```

To block HTTP request when a scan fails, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# action scan-failed deny
```

To allow HTTP request when a scan limit is exceeded, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# action limit-exceeded permit
```

To block HTTP traffic when a scan limit is exceeded, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# action limit-exceeded deny
```

To restore the default action when a scan fails, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# no action scan-failed
```

To restore the default action when a scan limit is exceeded, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# no action limit-exceeded
```

**Validation** `show antivirus`  
**Commands**

# antivirus

**Overview** Use this command to configure Antivirus.

Use the **no** variant of this command to remove all Antivirus configuration.

**Syntax** `antivirus`  
`no antivirus`

**Mode** Global Configuration

**Usage notes** This command allows you to enter the Antivirus Mode. The command prompt for this mode is **awplus(config-antivirus)#**.

In the Antivirus Mode, you can:

- Set the action to take if a scan failed or a scan limit is exceeded, see the [action \(antivirus\)](#) command.
- Enable or disable Antivirus protection, see the [protect \(antivirus\)](#) command.

**Examples** To configure Antivirus settings, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)#
```

To remove all Antivirus configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no antivirus
```

**Validation  
Commands** `show antivirus`

# debug antivirus

**Overview** Use this command to enable Antivirus debugging. This will cause additional detailed debugging information to be logged at the “informational” and “debugging” levels.

Use the **no** variant of this command to disable Antivirus debugging.

**Syntax** debug antivirus  
no debug antivirus

**Default** Antivirus debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable Antivirus debugging, use the command:

```
awplus# debug antivirus
```

To disable Antivirus debugging, use the command:

```
awplus# no debug antivirus
```

**Validation Commands** show debugging antivirus  
show antivirus

# protect (antivirus)

**Overview** Use this command to enable Antivirus protection.

Use the **no** variant of this command to disable Antivirus protection without losing existing Antivirus configuration.

Note that you need to use the [provider kaspersky \(antivirus\)](#) command to set Antivirus provider before issuing this command to enable Antivirus protection.

**Syntax** protect  
no protect

**Default** Antivirus is disabled by default.

**Mode** Antivirus Mode

**Examples** To enable Antivirus protection, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# provider kaspersky
awplus(config-antivirus)# protect
```

To disable Antivirus protection, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# no protect
```

**Validation Commands** [show antivirus](#)  
[show running-config antivirus](#)

**Related commands** [provider kaspersky \(antivirus\)](#)

# provider kaspersky (antivirus)

**Overview** Use this command to set Antivirus provider.

Antivirus provider provides a signature database containing a list of known threat patterns. The database is kept up-to-date to ensure the effectiveness of the detection. You can use the [update-interval \(antivirus\)](#) command to configure the update check interval and update local database if needed.

Note that you need to set Antivirus provider before issuing [protect \(antivirus\)](#) command to enable Antivirus protection.

**Syntax** `provider kaspersky`

**Default** No Antivirus provider is set.

**Mode** Antivirus Mode

**Examples** To set Antivirus provider, use the commands:

```
awplus# configure terminal
awplus(config)# antivirus
awplus(config-antivirus)# provider kaspersky
```

**Validation Commands** [show antivirus](#)  
[show running-config antivirus](#)

**Related commands** [protect \(antivirus\)](#)

# show antivirus

**Overview** Use this command to show the information about the operation of Antivirus.

**Syntax** show antivirus

**Mode** Privileged Exec

**Examples** To show the operation of Antivirus, use the command:

```
awplus# show antivirus
```

**Output** Figure 69-2: Example output from the **show antivirus** command on the console if the subscription license of Antivirus is active.

```
Status:      Enabled (Active)
Provider:    Kaspersky
Scan failed action:  block
Limit exceeded action: block
Resource version:    1.0
Resource update interval: 1 hour
```

Figure 69-3: Example output from the **show antivirus** command on the console if the subscription license of Antivirus is inactive.

```
awplus#show antivirus
Status:      Enabled (Inactive Unlicensed)
Provider:    Kaspersky
Scan failed action:  block
Limit exceeded action: block
Resource version:    not set
Resource update interval: 1 hour
```

# show antivirus statistics

**Overview** Use this command to show Antivirus statistics.

**Syntax** show antivirus statistics

**Mode** Privileged Exec

**Examples** To show Antivirus statistics, use the command:

```
awplus# show antivirus statistics
```

**Output** Figure 69-4: Example output from the **show antivirus statistics** command

```
awplus#show antivirus statistics
Proxy Antivirus Statistics:
Files scanned:      1572
Files skipped:      0
Viruses found:      3 (0.2%)
Scan failures:      0 (0.0%)
Limit exceeded:     0 (0.0%)
```

Output Parameter	Description
Files scanned	The number of files that have been scanned.
Files skipped	The number of files that could not be scanned.
Viruses found	The number of files that contain a virus. Also shown as a percentage of total number of scanned files.
Scan failures	The number of times a scan failed. Also shown as a total number of scans.
Limit exceeded	The number of times a scan limit is exceeded. Also shown as a total number of scans.

# show debugging antivirus

**Overview** Use this command to see what debugging is turned on for Antivirus.

**Syntax** show debugging antivirus

**Mode** Privileged Exec

**Examples** To show the Antivirus debugging setting, use the command:

```
awplus# show debugging antivirus
```

**Output** Figure 69-5: Example output from the **show debugging antivirus** command

```
awplus#show debugging antivirus
Antivirus Debugging Status: on
```

**Related commands** [debug antivirus](#)

# show running-config antivirus

**Overview** Use this command to show the configuration information about Antivirus.

**Syntax** show running-config antivirus

**Mode** Privileged Exec

**Examples** To show the running configuration of Antivirus, use the command:

```
awplus# show running-config antivirus
```

**Output** Figure 69-6: Example output from the **show running-config antivirus** command

```
awplus#show running-config antivirus
antivirus
  provider kaspersky
  action scan-failed permit
  update-interval weeks 1
  protect
!
```

# update-interval (antivirus)

**Overview** Use this command to configure an update check interval for the Antivirus resource files.

Use the **no** variant of this command to restore the default update check interval to 1 hour.

**Syntax** `update-interval {minutes <10-525600>|hours <1-8760>|days <1-365>|weeks <1-52>|never}`

`no update-interval`

Parameter	Description
<code>minutes &lt;10-525600&gt;</code>	Update interval from 10 through 52600 minutes
<code>hours &lt;1-8760&gt;</code>	Update interval from 1 hour through 8760 hours
<code>days &lt;1-365&gt;</code>	Update interval from 1 day through 365 days
<code>weeks &lt;1-52&gt;</code>	Update interval from 1 week through 52 weeks
<code>never</code>	Never update the resource. If Antivirus becomes enabled, the Update Manager will do update check and update the resource files if needed. Use the <a href="#">protect (antivirus)</a> command to enable Antivirus.

**Default** The default update interval is 1 hour.

**Mode** Antivirus Mode

**Usage notes** The Update Manager will perform an update check for a resource when triggered by an update check interval. It will request the current version number of the resource from the Update Server, then compare it with the current local version. If they are different, the Update Manager will initiate an update of the local resource.

The Update Manager will revert to last known good resource file if installation of an updated resource fails.

Note that when a feature is disabled, regular and manual update checks for its resources are disabled.

Also note that an update check for a resource will not proceed if an update of that resource is already in progress.

**Examples** To check and update the Antivirus resource files once a week, use the command:

```
awplus(config-antivirus)# update-interval weeks 1
```

To disable updating of the resource, use the command:

```
awplus(config-antivirus)# update-interval never
```

To restore the default update interval, which is 1 hour, use the command:

```
awplus(config-antivirus)# no update-interval
```

**Validation** show resource  
**Commands**

# 70

# URL Filtering Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure URL filtering.

URL filtering blocks all HTTP and HTTPS access to a list of websites. You can either specify a short list of websites to block (up to 1000 blacklist and 1000 whitelist rules), or subscribe to the blacklist service offered by Kaspersky. If you subscribe to the Kaspersky service, you can create custom blacklists to block additional URLs not in the Kaspersky blacklist or custom whitelists to allow URLs that the Kaspersky service blocks.

For more information, see the [URL Filtering Feature Overview\\_and Configuration Guide](#).

The following table lists the URL filtering commands and their applicable modes.

Figure 70-1: URL filtering commands and applicable modes

Mode	Command
Privileged Exec	<code>show running-config url-filter</code>
	<code>show url-filter</code>
	<code>url-filter reload custom-lists</code>
Global Configuration	<code>url-filter</code>
URL Filter Configuration	<code>blacklist</code>
	<code>protect (url-filter)</code>
	<code>provider kaspersky (url-filter)</code>
	<code>update-interval (url-filter)</code>
	<code>whitelist (url-filter)</code>

**Command List** • [“blacklist” on page 3374](#)

- [“log url-requests”](#) on page 3376
- [“protect \(url-filter\)”](#) on page 3377
- [“provider kaspersky \(url-filter\)”](#) on page 3378
- [“show running-config url-filter”](#) on page 3379
- [“show url-filter”](#) on page 3380
- [“update-interval \(url-filter\)”](#) on page 3381
- [“url-filter reload custom-lists”](#) on page 3383
- [“url-filter”](#) on page 3384
- [“whitelist \(url-filter\)”](#) on page 3385

# blacklist

**Overview** Use this command to add a custom blacklist file to the URL filtering configuration. Use the **no** variant of this command to remove a blacklist from the URL filtering configuration.

**Syntax** `blacklist <location_of_blacklist_file>`  
`no blacklist <location_of_blacklist_file>`

Parameter	Description
<code>&lt;location_of_blacklist_file&gt;</code>	Location of the blacklist file. The blacklist file can be located in flash, or on an SD card or a USB device.

**Mode** URL Filter Configuration

**Usage notes** You can use custom blacklists to specify URLs to be blocked.

If you are using the Kaspersky service, custom blacklists are processed before the Kaspersky blacklist.

For information about blacklist rule format, see the [URL Filtering Feature Overview and Configuration Guide](#).

You can use the [whitelist \(url-filter\)](#) command to add a whitelist that will override any corresponding blacklist entries.

**Examples** To add a blacklist that uses a custom file that is stored on an SD card, and then enable URL filtering, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# blacklist card:/my_blacklist.txt
awplus(config-url-filter)# protect
```

To remove that blacklist file from the URL filtering configuration, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# no blacklist card:/my_blacklist.txt
```

To add a blacklist that uses a custom file that is stored on a USB device, and then enable URL filtering, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# blacklist usb:/my_blacklist.txt
awplus(config-url-filter)# protect
```

To remove that blacklist file from the URL filtering configuration, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# no blacklist usb:/my_blacklist.txt
```

**Related  
commands**

[protect \(url-filter\)](#)

[show url-filter](#)

[url-filter reload custom-lists](#)

[whitelist \(url-filter\)](#)

# log url-requests

**Overview** If URL Filtering is enabled, then by default, black list hits and issues with match criteria and list files are logged.

Use this command to enable logging of all HTTP and HTTPS URL requests (both permitted and denied) passing through the firewall.

Use the **no** variant of this command to disable extra logging of HTTP and HTTPS URL requests passing through the firewall.

**Syntax** `log url-requests`  
`no log url-requests`

**Default** Disabled by default.

**Mode** URL Filter Configuration

**Usage notes** When enabled, additional log messages for HTTP and HTTPS URL requests passing through the firewall contain the:

- URL being accessed
- IP address of the user that requested the URL

**Example** To configure logging of all HTTP and HTTPS URL requests passing through the firewall (permitted as well as denied), use the following commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# log url-requests
```

**Related commands** [url-filter](#)

**Command changes** Version 5.4.7-1.1: command added

# protect (url-filter)

**Overview** Use this command to enable URL filter protection.

Use the **no** variant of this command to disable URL filter protection without losing the existing URL filter configuration.

**Syntax** protect  
no protect

**Default** URL filter protection is disabled by default and all HTTP and HTTPS traffic is allowed.

**Mode** URL Filter Configuration

**Usage notes** If you are subscribed to the Kaspersky service, you must enter the [provider kaspersky \(url-filter\)](#) command before entering this command.

**Examples** To enable URL filter protection, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# provider kaspersky
awplus(config-url-filter)# protect
```

To disable URL filter protection, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# no protect
```

**Related commands** [provider kaspersky \(url-filter\)](#)  
[show url-filter](#)

**Command changes** Version 5.4.7-1.1: HTTPS support added.

# provider kaspersky (url-filter)

**Overview** Use this command to set Kaspersky as the URL filter blacklist provider, and register Kaspersky's blacklist file with the update manager. This feature requires a Kaspersky subscription. For more information on Kaspersky see their website <https://support.kaspersky.com>

**Syntax** `provider kaspersky`

**Mode** URL Filter Configuration

**Usage notes** Kaspersky provides constantly updated blacklists that can be used for URL filtering. An HTTP or HTTPS request that includes a URL that matches an entry in the blacklist will be dropped.

**NOTE:** *that if you are using the Kaspersky service, you must enter this command before enabling URL filtering with the **protect** command.*

**Examples** To configure Kaspersky as the URL filter blacklist provider and then enable URL filtering, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# provider kaspersky
awplus(config-url-filter)# protect
```

**Related commands** [protect \(url-filter\)](#)  
[show url-filter](#)

**Command changes** Version 5.4.7-1.1: HTTPS support added.

# show running-config url-filter

**Overview** Use this command to show the running configuration information for URL filtering

**Syntax** show running-config url-filter

**Mode** Privileged Exec

**Examples** To show the running configuration of URL filtering, use the command:

```
awplus# show running-config url-filter
```

**Output** Figure 70-2: Example output from the **show running-config url-filter** command

```
awplus#show running-config url-filter
url-filter
  provider kaspersky
  protect
!
```

# show url-filter

**Overview** Use this command to show information about the configuration state of URL filtering.

**Syntax** show url-filter

**Mode** Privileged Exec

**Examples** To show information about the configuration state of URL filtering, use the command:

```
awplus# show url-filter
```

**Output** Figure 70-3: Example output from **show url-filter**

```
awplus#show url-filter
Status:      Enabled (Active)
Events:      104
Custom blacklists  Entries
blacklist-example.txt  365
Custom whitelists  Entries
whitelist-example.txt  4
```

**Output** Figure 70-4: Example output from **show url-filter** if the Kaspersky URL blacklist subscription license is active.

```
awplus#show url-filter
Status:      Enabled (Active)
Provider:    Kaspersky
Status:      Enabled (Active)
Events:      104
Resource version:  1.0
Update interval:  1 hour
Blacklist entries: 63457
Custom blacklists  Entries
blacklist-example.txt  3
Custom whitelists  Entries
whitelist-example.txt  1
```

**Command changes** Version 5.4.7-0.1: Event count added to the command output.

# update-interval (url-filter)

**Overview** Use this command to configure the update-interval for the URL filter provider blacklist resource file.

Use the **no** variant of this command to restore the default update check interval of 1 hour.

**Syntax** `update-interval {minutes <10-525600>|hours <1-8760>|days <1-365>|weeks <1-52>|never}`

`no update-interval`

Parameter	Description
minutes <10-525600>	Update interval from 10 through 52600 minutes
hours <1-8760>	Update interval from 1 hour through 8760 hours
days <1-365>	Update interval from 1 day through 365 days
weeks <1-52>	Update interval from 1 week through 52 weeks
never	Never update the resource. When URL filtering protection is enabled, the update manager will do an update check and update the resource files if necessary. Use the <a href="#">protect (url-filter)</a> command to enable URL filtering protection.

**Default** The default update interval is 1 hour.

**Mode** URL Filter Configuration

**Usage notes** The update manager will perform an update check for a resource when triggered by an update check interval. It will request the current version number of the resource from the update server, then compare it with the current local version. If they are different, the update manager will initiate an update of the local resource.

The update manager will revert to the last known good resource file if installation of an updated resource fails.

Note that when a feature is disabled, regular and manual update checks for its resources are also disabled.

Also note that an update check for a resource will not proceed if an update of that resource is already in progress.

**Examples** To check and update the URL filter provider blacklist every 3 hours, use the command:

```
awplus(config-url-filter)# update-interval hours 3
```

To disable updating of the provider blacklist, use the command:

```
awplus(config-url-filter)# update-interval never
```

To configure resource update checking for URL filter to the default interval, which is 1 hour, use the command:

```
awplus(config-url-filter)# no update-interval
```

**Related commands**

- [protect \(url-filter\)](#)
- [show resource](#)

# url-filter reload custom-lists

**Overview** Use this command to reload all custom blacklists and whitelists after editing one or more of them.

**Syntax** `url-filter reload custom-lists`

**Mode** Privileged Exec

**Examples** To reload all custom blacklists and whitelists, use the following command:

```
awplus# url-filter reload custom-lists
```

**Related commands** [blacklist](#)  
[whitelist \(url-filter\)](#)

# url-filter

**Overview** Use this command to enter URL Filter Configuration mode and configure URL filtering functionality.

Use the **no** variant of this command to remove all URL filtering configuration.

**Syntax** url-filter  
no url-filter

**Mode** Global Configuration

**Usage notes** This command allows you to enter the URL Filter Configuration mode and changes the command prompt to **awplus(config-url-filter)#**.

The URL Filter Configuration mode enables you to:

- Enable URL filtering protection; see the [protect \(url-filter\)](#) command.
- Configure the provider blacklist; see the [provider kaspersky \(url-filter\)](#) command.
- Configure custom blacklists; see the [blacklist](#) command.
- Configure custom whitelists; see the [whitelist \(url-filter\)](#) command.

**Examples** To enter the URL Filter Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)#
```

To remove all URL filter configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no url-filter
```

**Related commands** [blacklist](#)  
[protect \(url-filter\)](#)  
[provider kaspersky \(url-filter\)](#)  
[show running-config](#)  
[show url-filter](#)  
[whitelist \(url-filter\)](#)

# whitelist (url-filter)

**Overview** Use this command to add a custom whitelist file to the URL filtering configuration. Use the **no** variant of this command to remove a whitelist from the URL filter configuration.

**Syntax** `whitelist <url_of_whitelist_file>`  
`no whitelist <location_of_whitelist_file>`

Parameter	Description
<code>&lt;location_of_whitelist_file&gt;</code>	Location of the whitelist file. The whitelist file can be located in flash, or on an SD card or a USB device.

**Mode** URL Filter Configuration

**Usage notes** Whitelist matching precedes blacklist matching. You can use custom whitelists to override any corresponding blacklist entries. An HTTP or HTTPS request that includes a URL that matches an entry in a whitelist will be permitted.

For information about whitelist rule format, see the [URL Filtering Feature Overview and Configuration Guide](#).

**Examples** To add a whitelist that uses a custom file that is stored on an SD card, and then enable URL filtering, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# whitelist card:/my_whitelist.txt
awplus(config-url-filter)# protect
```

To remove that whitelist file from the URL filtering configuration, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# no whitelist card:/my_whitelist.txt
```

To add a whitelist that uses a custom file that is stored on a USB device, and then enable URL filtering, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# whitelist usb:/my_whitelist.txt
awplus(config-url-filter)# protect
```

To remove that whitelist file from the URL filtering configuration, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# no whitelist usb:/my_whitelist.txt
```

**Related  
commands**

# 71

# Web Control Commands

## Introduction

This chapter provides an alphabetical reference of commands used to configure Web Control. For more information, see the Web Control sections contained within the [Advanced Network Protection Feature Overview and Configuration\\_Guide](#).

The table lists the Web Control commands and their applicable modes.

Figure 71-1: Web Control commands and applicable modes

Mode	Command
Privileged Exec	<code>debug web-control</code>
	<code>show web-control</code>
	<code>show web-control categories</code>
	<code>show debugging web-control</code>
	<code>show running-config web-control</code>
	<code>show web-control rules</code>
Global Configuration	<code>web-control</code>
Web Control Configuration	<code>action (web-control)</code>
	<code>category (web-control)</code>
	<code>provider digitalarts (web-control)</code>
	<code>protect (web-control)</code>
	<code>rule (web-control)</code>
	<code>move rule (web-control)</code>
Web Control Category Configuration mode	<code>match (web-control)</code>

**Command List** • [“action \(web-control\)” on page 3389](#)

- ["bypass-web-control entity"](#) on page 3390
- ["category \(web-control\)"](#) on page 3392
- ["debug web-control"](#) on page 3394
- ["match \(web-control\)"](#) on page 3395
- ["move rule \(web-control\)"](#) on page 3397
- ["protect \(web-control\)"](#) on page 3398
- ["provider digitalarts \(web-control\)"](#) on page 3399
- ["rule \(web-control\)"](#) on page 3400
- ["show debugging web-control"](#) on page 3403
- ["show running-config web-control"](#) on page 3404
- ["show web-control"](#) on page 3405
- ["show web-control bypass"](#) on page 3407
- ["show web-control categories"](#) on page 3408
- ["show web-control rules"](#) on page 3410
- ["web-control"](#) on page 3411
- ["web-control categorize"](#) on page 3413

# action (web-control)

**Overview** Use this command to set the action to take on uncategorized websites and categorized websites that don't hit any rule.

Use the **no** variant of this command to restore the default action which is deny.

**Syntax** `action {permit|deny}`  
`no action`

Parameter	Description
permit	Allow access
deny	Block access

**Default** The default action is deny.

**Mode** Web Control Configuration

**Examples** To allow HTTP and HTTPS requests when no rules are hit, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# action permit
```

To restore the default action and block all HTTP and HTTPS requests when no rules are hit, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# no action
```

**Related commands** [show web-control](#)

**Command changes** Version 5.4.7-1.1: HTTPS support added.

# bypass-web-control entity

**Overview** Use this command to allow traffic from a specific entity to bypass all web-control processing.

Use the **no** variant of this command to remove the web-control bypass for a specific entity.

**Syntax** `bypass-web-control <entity>`  
`no bypass-web-control <entity>`

Parameter	Description
<code>&lt;entity&gt;</code>	The entity (zone, network, or host) which will not be processed by web-control.

**Default** All traffic is processed by web-control.

**Mode** Privileged Exec

**Usage notes** This command is useful, if you know that a specific server IP is safe for applications requiring this bypass feature to be configured.

For example, this command is useful to allow an application that connects using HTTPS port 443 but does not actually send HTTPS data over that port connection, leading to the connection being blocked, due to the suspect nature of the application data transported via that port. This command can therefore introduce security risk if used improperly, so should be used sparingly.

**Example** If the following **entity** has been configured:

```
!  
zone server  
  network my  
  host box  
  ip address 192.168.2.2  
!
```

Then, you can create a web-control bypass for the entity **server.my.box**, using the following commands:

```
awplus# configure terminal  
awplus(config)# web-control  
awplus(config-web-control)# bypass-web-control server.my.box
```

**Related commands** [show web-control bypass](#)

**Command changes** Version 5.4.7-1.1: command added.

# category (web-control)

**Overview** Use this command to configure a category.

A category is a text string that represents a logical grouping of websites. For example "Blog" is the category given to URLs that link to websites that are classified as being associated with blogging. There are two types of category: provider categories and custom categories. Provider categories are pre-defined categories. Digital Arts provides and constantly updates about 100 provider categories. Custom categories are defined by the users.

Use the **no** variant of this command to delete a custom category and delete all its match criteria.

**NOTE:** You cannot delete a provider category, but you can use the **no** variant of this command to delete the custom match criteria from the provider category.

**Syntax** `category <category-name>`  
`no category <category-name>`

Parameter	Description
<code>&lt;category-name&gt;</code>	Category name. Category names are case insensitive and can be up to 64 characters long composed of printable ASCII characters. Spaces are allowed in category names, but the category names must be enclosed in double quotes ("").

**Mode** Web Control Configuration

**Usage notes** You can use the to display both provider categories and custom categories.

You cannot delete the provider categories or modify their names, but you can configure custom match criteria for provider categories. Custom match criteria precede and override provider categorization. This means if a website matches the match criteria from custom categories, the website will not be further categorized by Digital Arts.

This command allows you to enter the Web Control Category Configuration mode with the prompt **awplus(config-category)#**. You can create a set of match criteria for a category in this sub-mode. The match criteria are applied to website URLs as a simple string comparison. For more information about match criteria, see the [match \(web-control\)](#) command.

You can also create a set of rules for a category. Rules set the action to take for an HTTP or HTTPS request from a specific entity. For more information about rules, see the [rule \(web-control\)](#) command. For more information about entities, see the [Application and Entity Commands](#) chapter.

**Examples** To create a custom category named `work` and create match criteria for this category, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# category work
awplus(config-category)# match alliedtelesis
awplus(config-category)# match example
awplus(config-category)# match www.ietf.org
```

To delete the custom category and its match criteria, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# no category work
```

**Related commands**

- [match \(web-control\)](#)
- [rule \(web-control\)](#)
- [show web-control categories](#)

**Command changes** Version 5.4.7-1.1: HTTPS support added.

# debug web-control

**Overview** Use this command to enable Web Control debugging. This will cause additional detailed debugging information to be logged at the “informational” and “debugging” levels.

Use the **no** variant of this command to disable Web Control debugging.

**Syntax** debug web-control  
no debug web-control

**Default** Web Control debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable Web Control debugging, use the commands:

```
awplus# debug web-control
```

To disable Web Control debugging, use the commands:

```
awplus# no debug web-control
```

**Related commands** [show debugging web-control](#)

# match (web-control)

**Overview** Use this command to add a match criterion for a category.

A match criterion is a static string that is compared to a website URL (domain name or IP address) for a partial or complete match. A URL will be searched to see if it contains the given match criterion string. If the URL contains the string, then the match criterion is matched.

Note that the match criterion is not applied to the web page content.

Use the **no** variant of this command to delete a match criterion.

**NOTE:** *If a custom category's last match criterion is deleted, then the category is automatically deleted.*

**Syntax** `match <word>`  
`no match <word>`

Parameter	Description
<code>&lt;word&gt;</code>	A string that is used to compare with IP addresses or domain names.

**Mode** Web Control Category Configuration

**Usage notes** Match criteria are case-insensitive and matched up to the first appearance of '?' (query string marker) or '#' (fragment identifier) in a website URL. For example, URL [www.alliedtelesis.com/search.aspx?keyword=routers](http://www.alliedtelesis.com/search.aspx?keyword=routers) does not match the match criterion `match router` but [www.alliedtelesis.com/routers](http://www.alliedtelesis.com/routers) does match that criterion.

When a URL matches a match criterion, the URL is categorized to the match criterion's category. A URL can be matched to more than one category. Custom match criteria override and precede provider categorization. If a URL or website matches custom criteria, then the URL will not be further sent for categorization by the provider criteria.

You can create up to 50 match criteria in total, so a category can have a maximum of 50 match criteria, or 50 categories can each have one match criterion, as long as the total number of the match criteria does not exceed 50.

For more information about categories, see the [category \(web-control\)](#) command.

**Examples** To create a match criterion with a string `ietf` for category `work`, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# category work
awplus(config-category)# match ietf
```

To delete a match criterion, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# category work
awplus(config-category)# no match ietf
```

To create a set of match criteria for category movie, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# category movie
awplus(config-category)# match youtube
awplus(config-category)# match imdb
awplus(config-category)# match rottentomatoes
```

**Related  
commands**

[category \(web-control\)](#)  
[show web-control categories](#)

# move rule (web-control)

**Overview** Use this command to change the order of the Web Control rules. Note that a change to the rule order may change the Web Control results.

**Syntax** `move rule <1-65535> to <1-65535>`

Parameter	Description
<code>move rule &lt;1-65535&gt;</code>	Move the ID of a given rule. The rule ID of the given rule must exist. Each rule has an ID which is either designated by the user or automatically generated when the rule is created. The rule ID is an integer from 1 to 65535.
<code>to &lt;1-65535&gt;</code>	New rule ID to assign. The new rule ID must not be used by any existing rule.

**Mode** Web Control Configuration

**Usage notes** If a website is categorized into multiple categories because they have overlapping match criteria that have associated rules, only the rule with the lowest ID is applied. For example, a website is categorized into both category A associated with rule ID 1 and category B associated with ID 2. In this case, only category A's rule with ID 1 is applied to the website. To see the rule IDs, use the [show web-control rules](#) command.

You can move an existing rule ID only to an ID that is not assigned to any rule, otherwise you will be given an error message.

**Examples** To change the ID of a rule from 20 to 10, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# move rule 20 to 10
```

**Related commands** [rule \(web-control\)](#)  
[show web-control rules](#)

# protect (web-control)

**Overview** Use this command to enable Web Control protection.

Use the **no** variant of this command to disable Web Control protection without losing existing Web Control configuration.

**Syntax** protect  
no protect

**Default** Web Control protection is disabled by default.

**Mode** Web Control Configuration

**Usage notes** Web Control protection is disabled and all HTTP and HTTPS traffic is allowed by default. You must issue the [provider digitalarts \(web-control\)](#) command to configure the categorization provider before using this command.

**Examples** To enable Web Protection protection, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# provider digitalarts
awplus(config-web-control)# protect
```

To disable Web Control protection, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# no protect
```

**Related commands** [provider digitalarts \(web-control\)](#)  
[show web-control](#)

**Command changes** Version 5.4.7-1.1: HTTPS support added.

# provider digitalarts (web-control)

**Overview** Use this command to set Digital Arts as the website categorization provider.

**Syntax** `provider digitalarts`

**Mode** Web Control Configuration

**Usage notes** Digital Arts provides about 100 pre-defined categories. You can use the [show web-control categories](#) command to display the list of categories. For more information about categories, see the [category \(web-control\)](#) command.

Note that Web Control protection cannot be enabled by using the [protect \(web-control\)](#) command until the provider is configured.

**Examples** To configure Digital Arts as the website categorization provider, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)# provider digitalarts
awplus(config-web-control)# protect
```

**Related commands** [protect \(web-control\)](#)  
[show web-control](#)

# rule (web-control)

**Overview** Use this command to create a Web Control rule for a category.

Use the **no** variant of this command to remove a rule.

**Syntax** `rule [<rule-ID>] {permit|deny} <category> from <entity>`  
`no rule <1-65535>`

Parameter	Description
<rule-ID>	Rule ID in the range from 1 through 65535. If you don't designate a rule ID, a rule ID will be automatically generated and it will be greater than the current highest rule ID.
permit	Set the rule's action to permit the access.
deny	Set the rule's action to block the access.
<category>	Website category the rule applies to.
<entity>	Source entity the rule applies to. Entity is a high level abstraction of a network device, a group of networks or subnets. For more information about entities, see <a href="#">Application and Entity Commands</a> .

**Mode** Web Control Configuration

**Usage notes** A rule sets the action to take if a website matches one or more of the match criteria of the rule's category and the request's source matches the entity the rule applies to. You may create multiple rules for a category. If the request does not hit the first rule, then the request is assessed against the next. If the request does not hit any rule, then the action set by the [action \(web-control\)](#) command is taken. The default action Web Control performs for uncategorized websites and categorized websites that do not match a rule is to deny.

A rule's action can either deny or permit an HTTP or HTTPS request. If a request hits a rule with a permit action, then the HTTP or HTTPS traffic of that website is allowed to pass through the device. If a request hits a rule with a deny action, then the HTTP or HTTPS traffic of that website is blocked and the client gets a notification page.

Entities represent logical groupings of subnets, hosts or interfaces. For more information about entities, see [Application and Entity Commands](#).

Rules are applied in order. Each rule has an ID which is either designated by the user or automatically generated. If a website is categorized into multiple categories because they have overlapping match criteria that have associated rules, only the rule with the lowest ID is applied. For example, a website is categorized into two categories: category A and category B. The rules for category A is allow, and for B is deny. If the rule ID of category A is lower than category B's,

then the action allow is applied. To see the rule IDs, use the [show web-control rules](#) command.

You can change the rule order by using the [move rule \(web-control\)](#) command. A change to the rule order may change the Web Control results.

A new reserved keyword **any** has been added to the parameter **<category>** from release 5.4.6-2 onwards. This new keyword allows you to apply Web Control on a per entity basis. See the [Web Control Feature Overview\\_and Configuration Guide](#) for configuration examples.

If a configuration with the reserved word **any** was configured by an old release, the following error message appears at boot time:

Figure 71-2: Example error message when the reserved keyword **any** was used prior to release 5.4.6-2.

```
*WARNING: Failed to execute the following commands:
43: category any - % Category "any" is a reserved keyword
44: match a - % Invalid command or arguments
45: match b - % Invalid command or arguments
46: match c - % Invalid command or arguments
done! *
```

**Examples** To create a rule that blocks engineer entity from accessing websites categorized as movie, use the commands:

```
awplus(config-web-control)# category movie
awplus(config-category)# match youtube
awplus(config-category)# match imdb
awplus(config-category)# exit
awplus(config-web-control)# rule 10 deny movie from engineer
```

To create a rule that allows entity engineer to access category work, use the commands:

```
awplus(config-web-control)# category work
awplus(config-category)# match alliedtelesis
awplus(config-category)# exit
awplus(config-web-control)# rule permit work from engineer
```

To delete a rule, use the commands:

```
awplus(config-web-control)#no rule 10
```

To create a rule using the reserved keyword any:

```
awplus(config-web-control)#rule deny badsites from private
awplus(config-web-control)# rule permit any from private
```

Rules are processed in order. In this example above the access to URLs associated with the named category "badsites" being accessed from the named firewall entity private will be blocked via the deny rule. Access to all other URLs originating from that specific firewall entity will be allowed via the subsequent permit any rule.

**Related commands** show running-config  
show running-config web-control  
show web-control categories  
show web-control rules

**Command changes** Version 5.4.7-1.1: HTTPS support added.  
Version 5.4.6-2.1: New category keyword 'any' added.

# show debugging web-control

**Overview** Use this command to show the Web Control debugging status.

**Syntax** show debugging web-control

**Mode** Privileged Exec

**Examples** To show the Web Control debugging status, use the command:

```
awplus# show debugging web-control
```

**Output** Figure 71-3: Example output from the **show debugging web-control** command

```
awplus#show debugging web-control
Web Control Debugging Status: on
```

**Related commands** [debug web-control](#)

# show running-config web-control

**Overview** Use this command to show the configuration information about Web Control.

**Syntax** `show running-config web-control`

**Mode** Privileged Exec

**Examples** To show the running configuration of Web Control, use the command:

```
awplus# show running-config web-control
```

**Output** Figure 71-4: Example output from **show running-config web-control**

```
awplus#show running-config web-control
web-control
  provider digitalarts
  protect
!
```

**Related commands**

- [rule \(web-control\)](#)
- [show running-config](#)
- [show web-control](#)
- [web-control](#)

# show web-control

**Overview** Use this command to display the information about the state of Web Control.

**Syntax** show web-control

**Mode** Privileged Exec

**Examples** To show the Web Control configuration, use the command:

```
awplus# show web-control
```

**Output** Figure 71-5: Example output from the **show web-control** command if the subscription license of Web Control is active.

```
awplus#show web-control
Web Control protection is enabled
Web Control default action is deny
Web Control is licensed
Categorization provider is Digital Arts
Statistics:
  Categorization hits: 40/40 (100.0%)
  Rule hits: 20/40 (50.0%)
  Cache hits: 30/40 (75.0%)
  Cache size: 40
```

Figure 71-6: Example output from the **show web-control** command if the subscription license of Web Control is inactive.

```
awplus#show web-control
Web Control protection is enabled
Web Control default action is deny
Web Control is unlicensed
Categorization provider is Digital Arts
Statistics:
  Categorization hits: 0/0 (0.0%)
  Rule hits: 0/0 (0.0%)
  Cache hits: 0/0 (0.0%)
  Cache size: 0
```

Output Parameter for Statistics	Description
Categorization hits	The number of times the categories have been hit divided by the total number of HTTP and HTTPS requests.
Rule hits	The number of times the rules have been hit divided by the total number of requests.

Output Parameter for Statistics	Description
Cache hits	The number of times the cached websites have been hit divided by the total number of request to the cache.
Cache size	The number of websites that are currently cached in the system.

**Related commands**

- [rule \(web-control\)](#)
- [show running-config](#)
- [show running-config web-control](#)
- [show web-control categories](#)
- [web-control](#)

# show web-control bypass

**Overview** Use this command to display information about all web-control bypasses.

**Syntax** show web-control bypass

**Mode** Privileged Exec

**Example** To display web-control bypass information, use the following commands:

```
awplus# configure terminal
awplus(config)# show web-control bypass
```

**Output** Figure 71-7: Example bypass configuration and output from **show web-control bypass**

```
!
zone server
network my
host box
ip address 192.168.2.2
!
!
web-control
action permit
provider digitalarts
bypass-web-control server.my.box
protect
!
awplus#show web-control bypass
Entity Name                               Bypass Hits
-----
server.my.box                             20
```

**Related commands** [bypass-web-control entity](#)

**Command changes** Version 5.4.7-1.1: command added.

# show web-control categories

**Overview** Use this command to display all Web Control categories, including custom and provider categories.  
For more information about categories, see the [category \(web-control\)](#) command.

**Syntax** show web-control categories

**Mode** Privileged Exec

**Examples** To show all Web Control categories, use the command:

```
awplus# show web-control categories
```

**Output** Figure 71-8: Example output from the **show web-control categories** command

Category	Category Hits	Custom
Custom Matches		
-----		
Advertisement	0	yes
AdWords		
YellowPages		
Advocacy	0	
"Alcohol, Tobacco"	0	
"Amusement Facilities"	0	
"Audio Streaming"	0	
Blogs	0	
"Browser Crashing Sites"	0	
"Celebrities, Entertainment"	0	
Chat	0	
"Comics, Animation"	0	
"Consumer Lending"	0	
"Coupon Sites"	0	
"Credit Cards, Online Payment, E-Money"	0	
"Crime, Weapons"	0	
--More--		

Output Parameter	Description
Category	Category names, including both provider categories and custom categories.
Custom Matches	Custom match criteria.
Category Hits	The number of times the category has been hit - that is, the number of times a website has been categorized into the category.
Custom	Indicate whether the category is custom category or not. Those that are not custom are provider categories.

**Related commands**

- rule (web-control)
- show running-config web-control
- show web-control rules
- web-control

# show web-control rules

**Overview** Use this command to display the Web Control rules.  
For more information about rules, see the [rule \(web-control\)](#) command.

**Syntax** show web-control rules

**Mode** Privileged Exec

**Examples** To show all Web Control rules, use the command:

```
awplus# show web-control rules
```

**Output** Figure 71-9: Example output from the **show web-control rules** command

```
#show web-control rules
ID      Action  Category                From                Hits
-----
10      deny    "Online Trading"       rd.test.qa          0
20      permit  "Browser Crashing Sites" market.sales         1
25      permit  suspicious_sites       rd                   2
```

Output Parameter	Description
ID	Rule ID.
Action	The action taken whenever the rule is hit.
Category	The category the rule applies to.
From	The source entity the rule applies to.
Hits	The number of times the rule has been hit.

**Related commands**

- [rule \(web-control\)](#)
- [show running-config web-control](#)
- [show web-control categories](#)
- [web-control](#)

# web-control

**Overview** Use this command to enter the Web Control Configuration mode and configure Web Control functionality.

Use the **no** variant of this command to remove all configuration for Web Control. Custom categories, rules and other configuration associated with Web Control will be deleted.

**Syntax** `web-control`  
`no web-control`

**Mode** Global Configuration

**Usage notes** This command allows you to enter the Web Control Configuration mode. This mode also contains the sub- mode of Web Control Category Configuration. For more information about the sub-mode, see the [category \(web-control\)](#) command.

The Web Control Configuration mode enables you to:

- Enable Web Control protection, see the [protect \(web-control\)](#) command.
- Configure the website categorization provider, see the [provider digitalarts \(web-control\)](#) command.
- Create categories and associated match criteria, see the [category \(web-control\)](#) command.
- Create, delete and move rules for categories, see the [rule \(web-control\)](#) command and the [move rule \(web-control\)](#) command.
- Configure the default action for HTTP and HTTPS requests that do not hit any rule, see the [action \(web-control\)](#) command.

If you want to disable Web Control protection without removing the configuration, you can use the **no** variant of the [protect \(web-control\)](#) command to do so.

**Examples** To enter the Web Control Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# web-control
awplus(config-web-control)#
```

To destroy all Web Control configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no web-control
```

**Related commands** [show running-config](#)  
[show running-config web-control](#)  
[show web-control](#)

**Command changes** Version 5.4.7-1.1: HTTPS support added.

# web-control categorize

**Overview** Use this command to inquire about which web control categories website URLs belong to.

**Syntax** `web-control categorize [<url-list>]`

Parameter	Description
<code>&lt;url-list&gt;</code>	One or more website HTTP or HTTPS URLs, separated by a space. If neither 'http://' nor 'https://' is specified in the URL, the default 'http://' is automatically added.

**Mode** Privileged Exec

**Usage notes** When you use this command, the device sends an inquiry to the web control provider's server. The server responds with a category for each URL.

You can use this information together with web control rules to permit or deny traffic for the particular categories.

For inquiries about HTTPS URLs, only the domain part of the URL is sent to the web control provider for categorization. This is the expected behaviour for HTTPS traffic, where only the domain name specified in TLS SNI is available for access.

**Example** To determine the category to which the following website URLs belong, use the command:

```
awplus# web-control categorize http://www.ebay.com  
http://www.amazon.com
```

For each URL in the inquiry, the server responds with a web control category. If it cannot categorize the URL, it displays 'unknown category'.

```
awplus#web-control categorize http://www.ebay.com http://www.amazon.com  
http://ebay.com ==> 54 (Online Auctions)  
http://www.amazon.com ==> 55 (Online Shopping)
```

**Related commands** [rule \(web-control\)](#)

**Command changes** Version 5.4.7-2.1: command added

# 72

# Application Awareness Commands

## Introduction

This chapter provides an alphabetical reference of commands used to configure application awareness, which uses Deep Packet Inspection (DPI). For more information about application awareness and a configuration example, see the [Application Awareness Feature Overview and Configuration\\_Guide](#).

- Command List**
- “counters detailed” on page 3415
  - “dpi” on page 3416
  - “enable (dpi)” on page 3417
  - “provider (dpi)” on page 3419
  - “show dpi” on page 3420
  - “show dpi statistics” on page 3422
  - “show running-config dpi” on page 3424
  - “update-interval (dpi)” on page 3425

# counters detailed

**Overview** Use this command to enable the display of transmit and receive counters for each entity in DPI mode.

Once you have enabled detailed counters, you can use the command **show dpi statistics <entity-name>** to display statistics for different applications on individual entities (zones, networks or hosts). This is called DPI statistics per entity.

Use the **no** variant of this command to disable DPI statistics per entity.

**Syntax** `counters detailed`  
`no counters detailed`

**Default** Disabled

**Mode** DPI Configuration

**Usage notes** These counters will require system resources and should only be configured when required. Use the **no** variant to turn them off when not required.

**Example** To configure DPI statistics per entity, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)# provider built-in
awplus(config-dpi)# enable
awplus(config-dpi)# counters detailed
```

To disable DPI statistics per entity, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)# no counters detailed
```

**Related commands** [show dpi statistics](#)

**Command changes** Version 5.4.9-1.1: command added

# dpi

**Overview** Use this command to enter DPI Configuration mode to configure DPI for application awareness.

Use the **no** variant of this command to remove all DPI configuration.

**Syntax** dpi  
no dpi

**Mode** Global Configuration

**Usage notes** In DPI Configuration mode, you can:

- Set the DPI provider, using the [provider \(dpi\)](#) command.
- Enable DPI, using the [enable \(dpi\)](#) command.

**Examples** To begin configuring DPI, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)#
```

To remove all DPI configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no dpi
```

# enable (dpi)

**Overview** Use this command to enable DPI for application awareness.

Use the **no** variant of this command to disable DPI without losing existing DPI configuration.

**Syntax** enable  
no enable

**Default** DPI is disabled by default.

**Mode** DPI Configuration

**Usage notes** Use the [provider \(dpi\)](#) command to configure the DPI provider before enabling DPI.

When DPI is enabled, it can classify network traffic and identify today's most common applications.

DPI itself does not control or apply rules to the traffic. You can use the application awareness provided by DPI for:

- Network visibility
- Application Control, using the [rule \(firewall\)](#) command to enforce security policy and apply rules to the DPI applications
- Traffic Control, using the traffic control rules
- Policy-based Routing (PBR), using the PBR rules.

You can use the [show dpi statistics](#) command to show statistics for the applications being inspected by DPI.

For more information about configuring and using DPI, see the [Application Awareness Feature\\_Overview and Configuration Guide](#) .

**Examples** To enable DPI to use the built-in library, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)# provider built-in
awplus(config-dpi)# enable
```

To disable DPI, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)# no enable
```

**Related  
commands**    provider (dpi)  
                  show dpi  
                  show running-config dpi

# provider (dpi)

**Overview** Use this command to set the DPI provider for the library of applications used for DPI. Application Awareness uses DPI, if enabled, to identify applications by matching packets to a library of application signatures—either the up-to-date Procera library or the built-in library predefined in device’s operating system.

**Syntax** `provider {procera|built-in}`

Parameter	Description
<code>procera</code>	Use the library provided and updated by Procera networks.
<code>built-in</code>	Use the library built into the device’s operating system.

**Default** No provider is set by default.

**Mode** DPI Configuration

**Usage notes** You can use the [show application](#) command and the [show application detail](#) command to view all applications that the device recognizes. If DPI is enabled, the show commands can include the commands in the library specified with this provider command.

Note that custom applications override DPI applications, which override AlliedWare Plus predefined applications. For more information about applications, see the [application](#) command.

Note that you need to use this command before using the [enable \(dpi\)](#) command to enable DPI.

You can use the [show dpi](#) command to view the provider’s current version.

**Examples** To set the DPI provider to the built-in library of application signatures, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)# provider built-in
awplus(config-dpi)# enable
```

**Related commands**

- [enable \(dpi\)](#)
- [show application detail](#)
- [show dpi](#)
- [show running-config dpi](#)

**Command changes** Version 5.4.7-2.1: **built-in** parameter added

# show dpi

**Overview** Use this command to show the DPI configuration state.

**Syntax** show dpi

**Mode** Privileged Exec

**Examples** To show information about the DPI configuration and provider's library, use the command:

```
awplus# show dpi
```

**Output** Figure 72-1: Example output from **show dpi** with DPI enabled and the provider set to **built-in**

```
awplus#show dpi
Status:      running
Provider:    built-in
```

Figure 72-2: Example output from **show dpi** with the provider set to **procera**, the subscription license active and DPI enabled

```
awplus#show dpi
Status:      running
Provider:    procera
Resource version:      1.0
Resource update interval: 1 hour
```

Figure 72-3: Example output from **show dpi** if the provider is set to **procera** but the subscription license is inactive

```
awplus#show dpi
Status:      unlicensed
Provider:    procera
Resource version:      not set
Resource update interval: 1 hour
```

Table 72-1: Parameters in the output from **show dpi**

Parameter	Description
Status	The status of DPI: <ul style="list-style-type: none"><li>• running—DPI is running — DPI is enabled, and the provided library is available</li><li>• disabled—DPI is disabled</li><li>• unlicensed—DPI is enabled, the provider is set to <b>procera</b>, but there is not a valid subscription license.</li></ul>
Provider	The provider for the library of application signatures used to identify applications.
Resource version	The version of the library supplied by the provider, if by subscription.
Resource update interval	The interval at which a check is made for a new version of the library of application signatures, updating it if a new version is available.

**Related commands** [enable \(dpi\)](#)  
[provider \(dpi\)](#)

# show dpi statistics

**Overview** Use this command to display statistics for each application being inspected by DPI. This command gives you counts of the total number of packets and bytes of the applications being inspected by DPI. You can use the [rule \(firewall\)](#) command, traffic control rules or PBR rules to apply rules to the DPI applications.

You can also use this command to display application DPI statistics for an individual entity (zone, network or host). Enable this with the [counters detailed](#) command.

**Syntax** `show dpi statistics [<entity-name>]`

Parameter	Description
<code>&lt;entity-name&gt;</code>	The name of an individual entity, for example the name of a zone, network or host.

**Mode** Privileged Exec

**Examples** To display the statistics for each application being inspected by DPI, use the command:

```
awplus# show dpi statistics
```

**Output** Figure 72-4: Example output from the **show dpi statistics** command on the console.

```
awplus#show dpi statistics
Application  Packets          Bytes
-----
http         30               2020
icmp        348             29232
telnet      45              2553
```

To show information about the DPI statistics for an individual entity, for example the entity "joeb", use the command:

```
awplus# show dpi statistics joeb
```

Figure 72-5: Examples output from **show dpi statistics**

```
awplus#show dpi statistics joeb
Statistics for entity: joeb
Application  TX Packets    RX Packets    TX Bytes    RX Bytes
-----
youtube     15413         16542         15412       45123645
google      15413          654          12205       451254
facebook    4115           8153          1100       123588
twitter     15413         4865          35459       24236
```

Table 72-2: Parameters in the output from **show dpi statistics**

Parameter	Description
Application	The application associated with the packet
TX Packets	Transmitted packets
RX Packets	Received packets
TX Bytes	Bytes transmitted
RX Bytes	Bytes received

**Related commands** [counters detailed](#)

**Command changes** Version 5.4.7-2.1: command added  
Version 5.4.9-1.1: entity parameter added

# show running-config dpi

**Overview** Use this command to show the configuration commands that have been used to configure DPI.

**Syntax** `show running-config dpi`

**Mode** Privileged Exec

**Examples** To show the configuration commands that have been used to configure DPI, use the command:

```
awplus# show running-config dpi
```

**Output** Figure 72-6: Example output from the **show running-config dpi** command

```
awplus#show running-config dpi
dpi
  provider built-in
  enable
!
```

# update-interval (dpi)

**Overview** Use this command to configure the update check interval for the DPI resource files if the provider is set to **procera**.

Use the **no** variant of this command to restore the default update check interval to 1 hour.

**Syntax** `update-interval {minutes <10-525600>|hours <1-8760>|days <1-365>|weeks <1-52>|never}`  
`no update-interval`

Parameter	Description
minutes <10-525600>	Update interval from 10 through 52600 minutes
hours <1-8760>	Update interval from 1 hour through 8760 hours
days <1-365>	Update interval from 1 day through 365 days
weeks <1-52>	Update interval from 1 week through 52 weeks
never	Never update the resource.

**Default** The default update interval is 1 hour.

**Mode** DPI Mode

**Usage notes** The Update Manager will perform an update check for a resource when triggered by an update check interval. It will request the current version number of the resource from the Update Server, then compare it with the current local version. If they are different, the Update Manager will initiate an update of the local resource.

Note that when a feature is disabled, regular and manual update checks for its resources are disabled.

Also note that an update check for a resource will not proceed if an update of that resource is already in progress.

**Examples** To check and update the DPI resource files once a week, use the following command:

```
awplus(config-dpi)# update-interval weeks 1
```

To disable updating of the resource, use the following command:

```
awplus(config-dpi)# update-interval never
```

To restore the default update interval (1 hour), use the following command:

```
awplus(config-dpi)# no update-interval
```

**Related Command** [provider \(dpi\)](#)  
[show resource](#)

# 73

# IP Reputation Commands

## Introduction

This chapter provides an alphabetical reference of commands used to configure AlliedWare Plus IP Reputation. For more information about IP Reputation and its configuration, see the IP Reputation sections contained within the [Advanced Network Protection Feature Overview and Configuration Guide](#).

The table below lists the IP Reputation commands and their applicable modes.

Figure 73-1: IP Reputation Commands and Applicable Modes

Mode	Command
Privileged Exec	<code>show ip-reputation</code>
	<code>show ip-reputation categories</code>
	<code>show running-config ip-reputation</code>
Global Configuration	<code>ip-reputation</code>
IP Reputation Mode	<code>category action (IP Reputation)</code>
	<code>protect (IP Reputation)</code>
	<code>provider proofpoint (IP Reputation)</code>
	<code>update-interval (IP Reputation)</code>

- Command List**
- “[category action \(IP Reputation\)](#)” on page 3428
  - “[ip-reputation](#)” on page 3430
  - “[protect \(IP Reputation\)](#)” on page 3431
  - “[provider proofpoint \(IP Reputation\)](#)” on page 3432
  - “[show ip-reputation](#)” on page 3433
  - “[show ip-reputation categories](#)” on page 3434

- [“show running-config ip-reputation”](#) on page 3436
- [“update-interval \(IP Reputation\)”](#) on page 3437
- [“whitelist \(IP Reputation\)”](#) on page 3439

# category action (IP Reputation)

**Overview** Use this command to configure an action for a specified category.  
Use the **no** variant of this command to set action for a specified category to default, which is alert.

**Syntax** `category <category-name> action {alert|deny|disable}`  
`no category <category-name> action`

Parameter	Description
<code>&lt;category-name&gt;</code>	Category name. A category contains a group of IP reputation criteria that are used to classify the nature of a host reputation. A host may have a reputation in multiple categories. You can use the <a href="#">show ip-reputation categories</a> command to view the categories and their status.
<code>alert</code>	Generate a log message. This is the default action.
<code>deny</code>	Drop matching packets. No error message is sent back to the source host.
<code>disable</code>	Ignore a specified category. Ignored categories will not be used to categorize traffic.

**Default** The default action is alert.

**Mode** IP Reputation Mode

**Usage notes** You can only configure the categories from the IP Reputation database provider, which is Proofpoint. You can use the [show ip-reputation categories](#) command to see the list of IP Reputation categories.

**NOTE:** Note that you should use the [provider proofpoint \(IP Reputation\)](#) command to configure the provider before configuring the action.

**Examples** To drop packets categorized as P2P, use the commands:

```
awplus# configure terminal
awplus(config)# ip-reputation
awplus(config-ip-reputation)# provider proofpoint
awplus(config-ip-reputation)# category P2P action deny
```

To set the action for category P2P to default, use the commands:

```
awplus# configure terminal
awplus(config)# ip-reputation
awplus(config-ip-reputation)# no category P2P action
```

**Related commands** `show ip-reputation categories`  
`show running-config ip-reputation`

# ip-reputation

**Overview** Use this command to configure IP Reputation.

Use the **no** variant of this command to remove all IP Reputation configuration.

**Syntax** ip-reputation  
no ip-reputation

**Mode** Global Configuration

**Usage notes** This command allows you to enter the IP Reputation mode. The command prompt for this mode is **awplus(config-ip-reputation)#**.

In the IP Reputation mode, you can:

- Set or remove the IP Reputation database provider, see the [provider proofpoint \(IP Reputation\)](#) command.
- Enable or disable IP Reputation protection, see the [protect \(IP Reputation\)](#) command.
- Configure the action for specified categories, see the [category action \(IP Reputation\)](#) command.

**Examples** To configure IP Reputation, use the commands:

```
awplus# configure terminal
awplus(config)# ip-reputation
awplus(config-ip-reputation)#
```

To remove all IP Reputation configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ip-reputation
```

**Related commands** [show ip-reputation](#)  
[show running-config ip-reputation](#)

# protect (IP Reputation)

**Overview** Use this command to enable IP Reputation protection.

Use the **no** variant of this command to disable IP Reputation protection without losing existing configuration.

Once IP Reputation protection is enabled, traffic will be categorized according to the available IP Reputation categories. See the [show ip-reputation categories](#) command for the list of available IP Reputation categories.

Note that you should use the [provider proofpoint \(IP Reputation\)](#) command to set the IP Reputation database provider before issuing this command.

**Syntax** protect  
no protect

**Default** IP Reputation protection is disabled by default.

**Mode** IP Reputation Mode

**Examples** To enable IP Reputation protection, use the commands:

```
awplus# configure terminal
awplus(config)# ip-reputation
awplus(config-ip-reputation)# provider proofpoint
awplus(config-ip-reputation)# protect
```

To disable IP Reputation protection, use the commands:

```
awplus# configure terminal
awplus(config)# ip-reputation
awplus(config-ip-reputation)# no protect
```

**Related commands** [show ip-reputation](#)  
[show running-config ip-reputation](#)

# provider proofpoint (IP Reputation)

**Overview** Use this command to set the IP Reputation database provider.

Proofpoint provides a database of IP reputation based on threat analysis. The database is regularly updated and can deliver the latest information of identified and potentially harmful IP addresses classified in categories.

If the provider is configured, you can use the [show ip-reputation categories](#) command to show the category details from the provider.

The default action for all categories is alert and you can use the [category action \(IP Reputation\)](#) command to set the action for a specified category.

**Syntax** `provider proofpoint`

**Mode** IP Reputation Mode

**Examples** To set the IP Reputation database provider, use the commands:

```
awplus# configure terminal
awplus(config)# ip-reputation
awplus(config-ip-reputation)# provider proofpoint
```

**Related commands**

- [show ip-reputation](#)
- [show running-config ip-reputation](#)
- [show ip-reputation categories](#)

# show ip-reputation

**Overview** Use this command to show the IP Reputation configuration state, including the IP Reputation database provider.

**Syntax** `show ip-reputation`

**Mode** Privileged Exec

**Examples** To show the IP Reputation configuration state, use the command:

```
awplus# show ip-reputation
```

**Output** Figure 73-2: Example output from **show ip-reputation** if the IP Reputation subscription license is active.

```
awplus#show ip-reputation
Status:      Enabled (Active)
Events:      23
Provider:    Proofpoint
  Resource version: 1.0
  Entry count:    148357
  Status:        Enabled
  Resource update interval: 1 hour
```

**Related commands** [ip-reputation](#)

**Command changes** Version 5.4.7-0.1: Event count added to the command output.

# show ip-reputation categories

**Overview** Use this command to show the IP Reputation category details.

Note that you need to use the [provider proofpoint \(IP Reputation\)](#) command to set the IP Reputation database provider before issuing this command.

**Syntax** `show ip-reputation categories`

**Mode** Privileged Exec

**Examples** To show the IP Reputation category details, use the command:

```
awplus# show ip-reputation categories
```

**Output** Figure 73-3: Example output from the **show ip-reputation categories** command

```
awplus#show ip-reputation categories

Category(* = invalid) Action      Description
-----
AbusedTLD                       alert      Abused or free TLD Related
Bitcoin_Related                  alert      Bitcoin Mining and related
Blackhole                         alert      Blackhole or Sinkhole systems
Bot                               alert      Known Infected Bot

CnC                              alert      Malware Command and Control Server
Compromised                       alert      Known compromised or Hostile
DDoSAttacker                      alert      DDoS Source
DriveBySrc                        alert      Driveby Source
Drop                              alert      Drop site for logs or stolen credentials
DynDNS                            alert      Domain or IP Related to a Dynamic DNS Entry
                                or Request
EXE_Source                        alert      Suspicious exe or dropper service
FakeAV                            alert      Fake AV and AS Products
IPCheck                           alert      IP Check Services
Mobile_CnC                        alert      Known CnC for Mobile specific Family
Mobile_Spyware_CnC               alert      Spyware CnC specific to mobile devices
OnlineGaming                      alert      Questionable Gaming Site
P2P                               alert      P2P Node
P2PCnC                           alert      Distributed CnC Nodes
Parking                           alert      Domain or SEO Parked
RemoteAccessService               alert      GoToMyPC and similar remote access services
Scanner                           alert      Host Performing Scanning
Skype_SuperNode                   alert      Observed Skype Bootstrap or Supernode
Spam                              alert      Known Spam Source
SpywareCNS                        alert      Spyware Reporting Server
TorNode                           alert      POLICY Tor Node
Undesirable                       alert      Undesirable but not illegal
Utility                           alert      Known Good Public Utility
VPN                               alert      VPN Server
```

**Related  
commands** [category action \(IP Reputation\)](#)

# show running-config ip-reputation

**Overview** Use this command to show the configuration commands that have been used to configure IP Reputation.

**Syntax** `show running-config ip-reputation`

**Mode** Privileged Exec

**Examples** To show the commands that have been used to configure IP Reputation, use the command:

```
awplus# show running-config ip-reputation
```

**Output** Figure 73-4: Example output from **show running-config ip-reputation**

```
awplus#show running-config ip-reputation
ip-reputation
  category Scanner action deny
  provider proofpoint
  whitelist 192.0.2.5
  protect
!
```

**Related commands**

- [ip-reputation](#)
- [show ip-reputation](#)
- [whitelist \(IP Reputation\)](#)

# update-interval (IP Reputation)

**Overview** Use this command to configure an update check interval for the IP Reputation resource files.

Use the **no** variant of this command to restore the default update check interval to 1 hour.

**Syntax** `update-interval {minutes <10-525600>|hours <1-8760>|days <1-365>|weeks <1-52>|never}`  
`no update-interval`

Parameter	Description
minutes <10-525600>	Update interval from 10 through 52600 minutes
hours <1-8760>	Update interval from 1 hour through 8760 hours
days <1-365>	Update interval from 1 day through 365 days
weeks <1-52>	Update interval from 1 week through 52 weeks
never	Never update the resource. If IP Reputation becomes enabled, the Update Manager will do update check and update the resource files if needed. Use the <a href="#">protect (IP Reputation)</a> command to enable IP Reputation.

**Default** The default update interval is 1 hour.

**Mode** IP Reputation Mode

**Usage notes** The Update Manager will perform an update check for a resource when triggered by an update check interval. It will request the current version number of the resource from the Update Server, then compare it with the current local version. If they are different, the Update Manager will initiate an update of the local resource.

Note that when a feature is disabled, regular and manual update checks for its resources are disabled.

Also note that an update check for a resource will not proceed if an update of that resource is already in progress.

**Examples** To check and update the IP Reputation resource files once a week, use the following command:

```
awplus(config-ip-reputation)# update-interval weeks 1
```

To disable updating of the resource, use the following command:

```
awplus(config-ip-reputation)# update-interval never
```

To restore the default update interval, which is 1 hour, use the following command:

```
awplus(config-ip-reputation)# no update-interval
```

**Related  
commands** [show resource](#)

# whitelist (IP Reputation)

**Overview** Use this command to add an IP address to the IP Reputation whitelist.  
Use the **no** variant of this command to remove an IP address from the whitelist.

**Syntax** `whitelist <ip-address>`  
`no whitelist <ip-address>`

Parameter	Description
<code>&lt;ip-address&gt;</code>	The IPv4 address to add to or remove from the IP reputation whitelist, in dotted-decimal format.

**Default** There are no IP addresses in the IP reputation whitelist by default.

**Mode** IP Reputation Configuration

**Usage notes** If an IP address has acquired a bad reputation but, in spite of the risk, you still wish to be able to send traffic to or receive traffic from that address without it being alerted or denied, you can add that address to the IP Reputation whitelist. Use this **whitelist** command.

When the address no longer needs to be in the whitelist, we recommend removing it. Use the **no** variant of this command.

**Example** To add IP address 192.0.2.5 to the IP reputation whitelist, use the commands:

```
awplus# configure terminal
awplus(config)# ip-reputation
awplus(config-ip-reputation)# whitelist 192.0.2.5
```

**Related commands** [ip-reputation](#)  
[show running-config ip-reputation](#)

**Command changes** Version 5.4.9-2.1: command added

# 74

# Unified Threat Management (UTM) Offload Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Unified Threat Management (UTM) Offload.

UTM Offload improves network forwarding performance by offloading some of the advanced security features to a second physical or virtual machine that is automatically managed by the AR4050S.

For more information, see the [UTM Offload Feature Overview and Configuration Guide](#).

- Command List**
- [“show resource”](#) on page 3441
  - [“show utm-offload”](#) on page 3443
  - [“utm-offload interface subnet”](#) on page 3444
  - [“utm-offload update-interval”](#) on page 3446

# show resource

**Overview** Use this command to show information about resources used by enabled features running either locally or offloaded.

**Syntax** `show resource [<resource_name>]`

Parameter	Description
<code>&lt;resource_name&gt;</code>	Specific resource to show

**Mode** Privileged Exec

**Examples** To show information about the resources of features that have been enabled, use the following command:

```
awplus#show resource
```

**Output** Figure 74-1: Example output for **show resource**

```
awplus#show resource
-----
Resource Name      Status      Version      Interval      Last Download
                   Next Download Check
-----
dpi_procera_app_db Sleeping    dpi_procera_app_db_v66
                   1           hour         Sun  1 Jul 2018 21:58:54
afa_offload        Sleeping    afa_main_offload_v51
                   1           hour         Sun  1 Jul 2018 21:47:41
iprep_et_rules     Sleeping    iprep_et_rules_v8582
                   1           hour         Mon  2 Jul 2018 04:05:06
                   Mon  2 Jul 2018 06:05:03
```

The parameters in the example output are explained in the following table.

Parameter	Description
Resource Name	Name of the updatable resource
Status	Resource status. There are five types of status: Sleeping, Checking, Starting, Downloading, Stopping.
Version	Current version of the resource
Interval	Configured update check interval for the resource
Last Download	Time stamp of last resource downloaded
Next Download Check	Time stamp of next download check for the resource

**Related commands**

- update-interval (antivirus)
- update-interval (dpi)
- update-interval (IP Reputation)
- update-interval (malware)
- update now
- update webgui now
- show utm-offload

# show utm-offload

**Overview** Use this command to display information about the status, interface, and configured subnet of the UTM Offload device.

**Syntax** `show utm-offload`

**Mode** Privileged Exec

**Example** To display the operation of UTM Offload, use the command:

```
awplus# show utm-offload
```

**Output** Figure 74-2: Example output from **show utm-offload**

```
awplus#show utm-offload
Status:      Enabled (Booted)
Interface:   eth2
Subnet:      192.168.100.0/24
Resource update interval: 1 hour
```

**Related commands** [utm-offload interface subnet](#)  
[show utm-offload](#)  
[show resource](#)

**Command changes** Version 5.4.8-1.1 command added.

# utm-offload interface subnet

**Overview** Use this command to enable UTM Offload on a device and configure the interface and subnet to boot and communicate with the offload device.

Use the **no** version of this command to disable UTM Offload on a device.

**Syntax** `utm-offload interface <interface-name> subnet <ip-address>`  
`no utm-offload`

Parameter	Description
<code>&lt;interface-name&gt;</code>	The interface that the off load device is connected to (i.e. eth2).
<code>&lt;ip-address&gt;</code>	The subnet to use for communicating with the off load device. IP address of the network, entered in the form A.B.C.D/M. Dotted decimal notation followed by a forward slash, and then the subnet mask length.

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** To use the UTM Offload feature, there must be a direct Ethernet connection from the forwarding device (router) to the offload device. The offload device must be configured to PXE boot (network boot) from the forwarding device.

When configured, the interface of the forwarding device, which connects to the UTM Offload device, is automatically assigned an IP address which is the lowest usable address in the subnet

The interface is reserved for communication with the UTM Offload device and you should not manually configure this interface. The configured IP subnet used for UTM Offload is visible in the **show utm-offload** command, However the assigned IP address is not visible

**Example** To enable UTM Offload and configure eth2 and subnet 192.0.2.0/24 to boot and communicate with, and manage the offload device, use the following commands:

```
awplus#configure terminal
awplus(config)#utm-offload interface eth2 subnet 192.0.2.0/24
```

To disable UTM Offload, use the following commands:

```
awplus#configure terminal
awplus(config)#no utm-offload
```

**Related commands** [utm-offload update-interval](#)

**Command changes** Version 5.4.8-1.1: command added

# utm-offload update-interval

**Overview** Use this command to configure the time interval at which the device checks for offload image updates.

**Syntax** `utm-offload update-interval {minutes <10-525600> | hours <1-8760> | days <1-365> | weeks <1-52> | never}`

Parameter	Description
minutes	Interval in minutes
hours	Interval in hours
days	Interval in days
weeks	Interval in weeks
never	Never check for updates

**Default** 60 minutes.

**Mode** Global Configuration

**Usage notes** New offload device images are automatically downloaded from the resource server by the forwarding device when detected. The offload resource is tied to the release of software that the forwarding device is running.

**Example** To configure a UTM Offload update-interval of 2 hours, use the following commands:

```
awplus# configure terminal
awplus(config)# utm-offload update-interval hours 2
```

**Related commands** [utm-offload interface subnet](#)  
[show utm-offload](#)  
[show resource](#)

**Command changes** Version 5.4.8-1.1: command added

# 75

# URL Offload Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure URL offload.

You can use these commands to bypass a VPN or proxy server for particular destinations, and then send this traffic direct to the Internet. Destinations to be bypassed (offloaded) are based on provided lists of endpoint URLs or IP addresses. You can both:

- manually configure particular endpoint URLs or IP entries that you want to offload, and
- configure a router to periodically fetch and filter URLs or IP entries from the Microsoft Office365 endpoint service.

The Microsoft Office endpoint service can then automatically update information about which URLs or IP addresses can be offloaded directly to the Internet. This speeds up access to Microsoft Office365 cloud services when your network architecture routes all traffic to a VPN or Proxy server by default.

For more information, see the [URL Offload Feature Overview and Configuration Guide](#).

- Command List**

- [“url-offload update-now”](#) on page 3493

# endpoint-source

**Overview** Use this command to add a new URL offload endpoint source, or to enter the configuration mode for an existing endpoint source.

Use the **no** variant of this command to remove a URL offload endpoint source.

**Syntax** `endpoint-source <name> type {office365|manual}`  
`no endpoint-source <name> type {office365|manual}`

Parameter	Description
<name>	This is the identifier name for the endpoint source. The identifier is unique to the source type. For example, it is possible to create two endpoints with the same name, as long as the type is different.
office365	Configure an endpoint source that uses the Microsoft office365 endpoint service.
manual	Configure an endpoint source that holds manually configured entries.

**Default** No endpoint source name identifier or type is set.

**Mode** URL Offload Configuration

**Usage notes** This command adds a new endpoint source for URL offload. The endpoint source types supported are 'office365' and 'manual'.

Use the 'office365' type to fetch endpoints from the Microsoft Office365 endpoints service.

Use the 'manual' type to manually specify include entries for use with URL offload (see the [entry \(endpoint-manual\)](#) command).

This command enters a new configuration mode. From here you can enter the configuration needed for a specific endpoint type. The mode is dependent on the type of endpoint source.

**Example** To configure an office365 endpoint source using the name identifier 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)#
```

To configure a manual endpoint source using the name identifier 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type manual
awplus(config-endpoint-manual)#
```

**Related  
commands**

[show running-config url-offload](#)  
[show url-offload endpoint-source](#)  
[show url-offload endpoint-source manual entries](#)  
[show url-offload endpoint-source office365 entries](#)  
[show url-offload endpoint-source office365 raw-data](#)

**Command  
changes**

Version 5.5.0-0.1: command added

# entry (endpoint-manual)

**Overview** Use this command to manually add endpoint entries to be included for URL offload. These entries are added to the '%%INCLUDE\_CONDITION%%' section of the PAC file along with any other include entries from either manual or automatic sources.

Use the **no** variant of this command to remove the include entry from the endpoint entry list.

**Syntax** entry {ip|ipv6|url} <value>  
no entry {ip|ipv6|url} <value>

Parameter	Description
ip	IPv4 prefix to include for URL offload
ipv6	IPv6 prefix to include for URL offload
url	URL to include for URL offload
<value>	IPv4 prefix, IPv6 prefix, or URL to include for URL offload

**Default** No addresses are included for URL offload

**Mode** URL Offload Endpoint Manual Configuration

**Usage notes** To show the entries that are included for URL offload in the PAC file, use the **show url-offload pack-file** command. You will see the entries listed in the '%%INCLUDE\_CONDITION%%' section of the PAC file.

**Examples** To include the endpoint entry URL 'test.example.com' in the inclusion list for URL offload under manual endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type manual
awplus(config-endpoint-manual)# entry url test.example.com
```

To remove the endpoint entry URL 'test.example.com', from the inclusion list for URL offload under manual endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type manual
awplus(config-endpoint-manual)# entry url test.example.com
```

To add the endpoint entry IP address '192.168.1.0/24' to the inclusion list for URL offload under manual endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type manual
awplus(config-endpoint-manual)# entry ip 192.168.0.1/24
```

**Related  
commands**

[exclude-entry \(endpoint-manual\)](#)  
[show running-config url-offload](#)  
[show url-offload endpoint-source manual entries](#)  
[show url-offload pac-file](#)

**Command  
changes**

Version 5.5.0-0.1: command added

# exclude-entry (endpoint-manual)

**Overview** Use this command to exclude endpoint entries for URL offload. These entries are added to the '%%EXCLUDE\_CONDITION%%' section of the PAC file to be processed before the include entries.

Use the **no** variant of this command to remove endpoint entries from the inclusion list for URL offload.

**Syntax** `exclude-entry {ip|ipv6|url} <value>`  
`no exclude-entry {ip|ipv6|url} <value>`

Parameter	Description
ip	IPv4 prefix to exclude from URL offload
ipv6	IPv6 prefix to exclude from URL offload
url	URL to exclude from URL offload
<value>	IPv4 prefix, IPv6 prefix, or URL to exclude from URL offload

**Default** No entries are excluded

**Mode** URL Offload Endpoint Manual Configuration

**Usage notes** The primary use for this command is if you want to exclude a specific entry that is part of a larger wildcard or subnet entry.

**Examples** To explicitly exclude 'example.facebook.com' from URL offload under manual endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type manual
awplus(config-endpoint-manual)# exclude-entry url
example.facebook.com
```

To remove the exclude entry that prevents 'example.facebook.com' from bypassing the VPN or proxy via URL offload under manual endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type manual
awplus(config-endpoint-manual)# no exclude-entry url
example.facebook.com
```

To include all entries for subnet 192.168.1.0/24 for URL offload except 192.168.1.2 under manual endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type manual
awplus(config-endpoint-manual)# entry ip 192.168.1.0/24
awplus(config-endpoint-manual)# exclude-entry ip
192.168.1.2/32
```

**Related  
commands**

[exclude-entry \(endpoint-office365\)](#)  
[entry \(endpoint-manual\)](#)  
[show url-offload endpoint-source manual entries](#)  
[show url-offload pac-file](#)  
[show running-config url-offload](#)

**Command  
changes**

Version 5.5.0-0.1: command added

# exclude-entry (endpoint-office365)

**Overview** Use this command to explicitly exclude particular endpoint entries for URL offload. These entries are added to the '%%EXCLUDE\_CONDITION%%' section of the PAC file to be processed before the include entries.

Use the **no** variant of this command to remove endpoint entries from the inclusion list for URL offload.

**Syntax** `exclude-entry {ip|ipv6|url} <value>`  
`no exclude-entry {ip|ipv6|url} <value>`

Parameter	Description
ip	IPv4 prefix to exclude from URL offload
ipv6	IPv6 prefix to exclude from URL offload
url	URL to exclude from URL offload
<value>	IPv4 prefix, IPv6 prefix, or URL to exclude from URL offload

**Default** No entries are excluded

**Mode** URL Offload Endpoint Office365 Configuration

**Usage notes** The primary use for this command is to exclude a specific endpoint entry from an endpoint that is included. This command is functionally equivalent to creating an exclude entry as part of a manual source, but is included in the office365 configuration mode to logically group related entries.

**Examples** To explicitly exclude 'example.facebook.com' from URL offload under office365 endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# exclude-entry url
example.facebook.com
```

To remove the exclude entry that prevents 'example.facebook.com' from bypassing the VPN or proxy via URL offload under office365 endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# no exclude-entry url
example.facebook.com
```

**Related commands**

- exclude-entry (endpoint-manual)
- entry (endpoint-manual)
- filter-endpoint include all
- filter-entry exclude
- filter-entry exclude type
- show running-config url-offload
- show url-offload endpoint-source manual entries
- show url-offload endpoint-source office365 entries
- show url-offload pac-file

**Command changes**

- Version 5.5.0-0.1: command added

# filter-endpoint

**Overview** Use this command to filter the endpoints retrieved from the office365 endpoints service.

Use the **no** variant of this command to remove all filtering.

**Syntax**

```
filter-endpoint {include|exclude} key <key> boolean  
{true|false}  
filter-endpoint {include|exclude} key <key> string <value>  
filter-endpoint {include|exclude} key <key> integer <value>  
no filter-endpoint
```

Parameter	Description
include	Include endpoints that have this key-value pair.
exclude	Exclude endpoints that have this key-value pair.
key <key>	The name of the key to filter on. The key that you use must exactly match the key in the Microsoft Endpoint data.
boolean {true false}	Specify that the key value is a boolean, and whether it is <b>true</b> or <b>false</b> .
string <value>	Specify that the key value is a string, and what the string is (for example 'Optimize').
integer <value>	Specify that the key value is an integer, and what the integer is (for example 32).

**Default** No filter entries are included

**Mode** URL Offload Endpoint Office365 Configuration

**Usage notes** The endpoints entries retrieved via this service are grouped into endpoints for a particular service and categorized using various 'key-value' pairs. These values are used to filter which endpoints are included for URL offload.

An example of a single endpoint is shown in the output below. At the time of this example the 'worldwide' endpoints list contained 146 endpoints.

Figure 75-1: Example output from **show url-offload endpoint-source office365 entries**

```
{
  "id": 1,
  "serviceArea": "Exchange",
  "serviceAreaDisplayName": "Exchange Online",
  "urls": [
    "outlook.office.com",
    "outlook.office365.com"
  ],
  "ips": [
    "13.107.6.152/31",
    "13.107.18.10/31",
    "...",
    "2603:1006::/40",
    "2603:1016::/40",
    "2603:1026::/40",
    "...",
    "2a01:111:f400::/48"
  ],
  "tcpPorts": "80,443",
  "expressRoute": true,
  "category": "Optimize",
  "required": true
},
```

You can use include and exclude filters. Use include filters to include whole endpoints in the list (like the example above). Use exclude filters to remove whole endpoints from the list. Exclude filters override include filters.

In this feature, an office365 endpoint is a block like the one shown in the example above. An endpoint entry is a single URL or IP address. This command operates at the level of include or exclude whole endpoints.

**Examples** To include entries marked as required: true for endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# filter-endpoint include key
required boolean true
```

To include all entries except the entry with id: 32 for endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# filter-endpoint exclude key
id integer 32
```

To include entries marked as category: Optimize for endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# filter-endpoint include key
category string Optimize
```

**Command  
changes**

Version 5.5.0-0.1: command added

# filter-endpoint include all

**Overview** Use this command to include all endpoints from the office365 source. See the Usage notes below before using this command.

Use the **no** variant of this command to disable the inclusion of all endpoints from the office365 source.

**Syntax** filter-endpoint include all  
no filter-endpoint include all

**Default** No endpoints are included

**Mode** URL Offload Endpoint Office365 Configuration

**Usage notes** Using this command without examining the result and explicitly excluding endpoint entries is not recommended. This is because this command includes URLs for a number of third-party services, for example, Facebook, Google and Dropbox.

Without this command or at least one other include filter, no endpoints will be included.

**Example** To use all endpoints in the office365 endpoint information for the endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# filter-endpoint include all
```

To disable including all endpoints in the office365 endpoint information for the endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# no filter-endpoint include all
```

**Related commands** [exclude-entry \(endpoint-office365\)](#)

**Command changes** Version 5.5.0-0.1: command added

# filter-entry exclude

**Overview** Use this command to filter out specific endpoint entries from the list of entries included for URL offload for an office365 endpoint source. The entries are removed from the list of entries stored for the source.

Use the **no** variant of this command to remove an entry from the list.

**Syntax** `filter-entry exclude {ip|ipv6|url} <value>`  
`no filter-entry exclude {ip|ipv6|url} <value>`

Parameter	Description
ip	Filter out entries with the given IPv4 prefix
ipv6	Filter out entries with the given IPv6 prefix
url	Filter out entries with the given URL
<value>	The IPv4 prefix, IPv6 prefix, or URL to exclude.

**Default** There is no default

**Mode** URL Offload Endpoint Office365 Configuration

**Examples** To filter out entries for 'www.example.com' from URL offload under office365 endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-url-offload-office365)# filter-entry exclude url
www.example.com
```

To remove the filter entry 'www.example.com', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-url-offload-office365)# no filter-entry exclude
url www.example.com
```

show url-offload pac-file

**Command changes** Version 5.5.0-0.1: command added

# filter-entry exclude type

**Overview** Use this command to explicitly exclude a particular endpoint entry type for URL offload. Entries of this type are removed from the entry list.

Use the **no** variant of this command to stop excluding entry types.

**Syntax** `filter-entry exclude type {url|ip|ipv6}`  
`no filter-entry exclude type {url|ip|ipv6}`

Parameter	Description
url	Filter out URL entries
ip	Filter out IPv4 entries
ipv6	Filter out IPv6 entries

**Default** All types are included

**Mode** URL Offload Endpoint Office365 Configuration

**Example** To exclude IP entries from being stored and included in the PAC file for office365 endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-url-offload-office365)# filter-entry exclude ip
```

To stop excluding IP entries from being stored and included in the PAC file for office365 endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-url-offload-office365)# no filter-entry exclude ip
```

**Command changes** Version 5.5.0-0.1: command added

# pac-file http-server port

**Overview** Use this command to set the HTTP port to use for serving URL offload PAC files. Use the **no** variant of this command to disable serving URL offload PAC files.

**Syntax** `pac-file http-server port <port>`  
`no pac-file http-server`

Parameter	Description
<port>	The port number you want to use to serve the PAC file, in the range 1 to 65535.

**Default** Disabled

**Mode** URL Offload Configuration

**Usage notes** Use this command to configure the router to serve Proxy Auto-Configuration (PAC) files that are generated by the URL offload feature. If configured, an HTTP service is provided on the configured port that serves a PAC file with the name extension 'wpad.dat'.

The port number may be the same as the main management HTTP web server, but if it is, requests may be redirected to the HTTPS secure port.

The main reason for choosing a non-default port number is to allow locking down access to the management HTTP server, to specific hosts without blocking the access that all clients need to download the PAC file.

**NOTE:** Attempting to assign a port that is bound to another service may cause your device to restart.

**Examples** To serve the PAC file on port 80, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# pac-file http-server port 80
```

To disable serving the PAC file on port 80, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# no pac-file http-server
```

**Related commands**

- [pac-file proxy-address](#)
- [show running-config url-offload](#)
- [show url-offload pac-file](#)
- [show url-offload pac-file template](#)

**Command changes** Version 5.5.0-0.1: command added

# pac-file proxy-address

**Overview** Use this command to configure a proxy address to use in the Proxy Auto-Configuration (PAC) file generated by URL offload.  
Use the **no** variant of this command to remove the configured proxy address.

**Syntax** `pac-file proxy-address <address>`  
`no pac-file proxy-address`

Parameter	Description
<code>&lt;address&gt;</code>	Proxy address to use in the generated PAC file. We recommend to use an IP address, but you can also use a host name or URL.

**Default** No proxy address is set

**Mode** URL Offload Configuration

**Usage notes** Use this command to configure the proxy address to use in the PAC file generated by URL offload. This address is a text string. If you use a non-default PAC file template, it replaces the placeholder '%%PROXY\_ADDRESS%%' in the template.  
The proxy address can be a host name, URL, or IP address with a port number.

**Example** To configure the proxy address 10.10.10.10 on port 8080, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# pac-file proxy-address
10.10.10.10:8080
```

To unset the proxy address 10.10.10.10 on port 8080, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# no pac-file proxy-address
```

**Related commands** [show running-config url-offload](#)  
[show url-offload pac-file](#)  
[show url-offload pac-file template](#)

**Command changes** Version 5.5.0-0.1: command added

# pac-file template

**Overview** Use this command to configure a custom (instead of the default) template to use for URL offload.

Use the **no** variant of this command to revert back to the default template to use for URL offload.

**Syntax** `pac-file template {local|remote} <url>`  
`no pac-file template`

Parameter	Description
local	Use a template file stored on the local file system of your device
remote	Use a template file fetched via HTTP
<url>	For the local option, URLs must start with 'flash','usb' or 'card'. The file must exist at one of these locations. For the remote option, a URL is used. No validation is performed on the URL, but the URL should point to a PAC file template with the required placeholders.

**Default** Default PAC file template

**Mode** URL Offload Configuration

**Usage notes** The template can be stored in the file system of your device, or fetched from a remote server using HTTP. Both of these options cause the URL offload feature to fetch the template when updating the PAC file. A cached version of the template is used if multiple updates occur within a 1 minute time period.

The template must include two placeholders '%%EXCLUDE\_MATCHES%%' and '%%INCLUDE\_MATCHES%%'. These are replaced by the relevant condition statements. The template may also include the '%%PROXY\_ADDRESS%%' placeholder. If it does, this is replaced by the proxy address configured using the command **pac-file proxy-address** in URL Offload Configuration mode.

**NOTE:** *Exclude conditions should always be processed before include conditions.*

Using the command **show url-offload pac-file template** shows the contents of the template that is being used. Running this command before configuring a template shows the default template. The default template has an example of how to write a template.

**Example** To use the file 'pac\_template.pac' in the device flash as the template, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# pac-file template local
flash:/pac_template.pac
```

To use the PAC file template 'remote\_pac\_template.pac' stored on a (reachable) HTTP server at 192.168.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# pac-file template remote
http://192.168.1.2/remote_pac_template.pac
```

To revert back to the default template, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# no pac-file template
```

Version 5.5.0-0.1: command added

# parser-updates enable

**Overview** Use this command to enable automatic updates of the parsing functionality used by URL offload via the Allied Telesis Update Server.

Use the **no** variant of this command to disable automatic updates of the parsing functionality used by URL offload via the Allied Telesis Update Server.

**Syntax** `parser-updates enable`  
`no parser-updates enable`

**Default** Disabled

**Mode** URL Offload Configuration

**Example** To enable the automatic updates, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# parser-updates enable
```

To disable the automatic updates, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# no parser-updates enable
```

**Related commands** [parser-updates interval](#)  
[show running-config url-offload](#)

**Command changes** Version 5.5.0-0.1: command added

# parser-updates interval

**Overview** Use this command to configure the parsing interval for periodic updates via the Allied Telesis update server.

Use the **no** variant of this command to set the interval back to the default (60 minutes).

**Syntax** `parser-updates interval {minutes <10-525600>/hours <1-8760>/days <1-365>/weeks <1-52>}`  
`no parser-updates interval`

Parameter	Description
minutes <10-525600>	Configure the interval in minutes, in the range 10 to 525600
hours <1-8760>	Configure the interval in hours, in the range 1 to 8760
days <1-365>	Configure the interval in days, in the range 1 to 365
weeks <1-52>	Configure the interval in weeks, in the range 1 to 52

**Default** 60 minutes

**Mode** URL Offload Configuration

**Examples** To set the parser updates interval to 180 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# parser-updates interval minutes 180
```

To set the parser updates interval back to the default value (60 minutes), use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# no parser-updates interval
```

**Related commands** [parser-updates enable](#)

**Command changes** Version 5.5.0-0.1: command added

# service url-offload

**Overview** Use this command to enable the URL offload service.

Use the **no** version of the command to disable the URL offload service if it is unused.

**Syntax** `service url-offload`  
`no service url-offload`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Sometimes it may be desirable to disable unused services, in order to reduce memory use. This command lets you disable the URL offload service.

**Example** To disable the URL offload service, use the commands:

```
awplus# configure terminal
awplus(config)# no service url-offload
```

**Command changes** Version 5.5.0-0.1: command added

# show running-config url-offload

**Overview** Use this command to show the current configuration for the URL offload feature.

**Syntax** `show running-config url-offload`

**Mode** Privileged Exec

**Example** To show the current URL offload configuration, use the command:

```
awplus# show running-config url-offload
```

**Output** Figure 75-2: Example output from **show running-config url-offload**

```
url-offload
endpoint-source test type office365
  url https://endpoints.office.com/endpoints/worldwide
  update-interval hours 1
  filter-endpoint include key category string Optimize
  filter-entry exclude type ip
pac-file proxy-address 10.10.10.10:8080
pac-file http-server port 80
pac-file template local flash:/wpad.template
!
```

**Command changes** Version 5.5.0-0.1: command added

# show url-offload endpoint-source

**Overview** Use this command to show information about configured URL offload endpoint sources.

**Syntax** `show url-offload endpoint-source`

**Mode** Privileged Exec

**Usage notes** For Office365 type sources, the name, URL, update interval and last update time are shown. For manual type sources, only the name is shown.

**Example** To show information about configured URL offload endpoint sources, use the commands:

```
awplus# show url-offload endpoint-source
```

**Output** Figure 75-3: Example output from **show url-offload endpoint-source**

```
awplus#show url-offload endpoint-source

Microsoft Office365 endpoint sources:

Name: test
URL: https://endpoints.office.com/endpoints/worldwide
Update interval: 1 hours
Update time: 2019-10-02T12:56:21Z

Manual endpoint sources:

Name: manual_test
```

**Related commands** [endpoint-source](#)

**Command changes** Version 5.5.0-0.1: command added

# show url-offload endpoint-source manual entries

**Overview** Use this command to show endpoint entries for a URL offload manual endpoint source. Manually configured entries attached to an endpoint source are displayed.

**Syntax** `show url-offload endpoint-source manual entries`  
`show url-offload endpoint-source manual <name> entries`

Parameter	Description
<name>	The name of the manual endpoint source, for example 'test'.

**Mode** Privileged Exec

**Usage notes** Use the optional parameter to display a specific endpoint source by its <name>. If no parameter is used, then all endpoint entries for all manual endpoint sources are displayed.

**Examples** To show endpoint entries for manual endpoint source 'test', use the command:

```
awplus# show url-offload endpoint-source manual test entries
```

To show endpoint entries for all manual endpoint sources, use the command:

```
awplus# show url-offload endpoint-source manual entries
```

**Output** Figure 75-4: Example output from **show url-offload endpoint-source manual test entries**

```
awplus#show url-offload endpoint-source manual test entries
Name: test

Include Entries:
  Type: url
  Value: *.example.com

  Type: ip
  Value: 192.168.1.0/24

Exclude Entries:
  Type: url
  Value: test.example.com

  Type: ip
  Value: 192.168.1.1/32
```

**Related commands** [entry \(endpoint-manual\)](#)

**Command changes** Version 5.5.0-0.1: command added

# show url-offload endpoint-source office365 entries

**Overview** Use this command to show endpoint entries for office365 endpoints.

**Syntax** `show url-offload endpoint-source office365 <name> entries [filtered|unusable]`

`show url-offload endpoint-source office365 entries [filtered|unusable]`

Parameter	Description
<name>	This is the name of an endpoint source, for example 'test'. If you do not use this parameter, then all endpoint sources are displayed.
filtered	Use this parameter to show entries that are included, or explicitly excluded, for this source.
unusable	Use this parameter to show URLs and IPs from the endpoint information that can not be used to create entries. For example, this is usually because there is a missing full stop after a wildcard.

**Mode** Privileged Exec

**Usage notes** Entries that are displayed using this command are parsed from the information fetched from the endpoint service. You can show all parsed entries, or only entries that are included or excluded using the **filtered** parameter.

**Examples** To show all the parsed endpoint entries for the endpoint source 'test', use the command:

```
awplus# show url-offload endpoint-source office365 test entries
```

To show endpoint entries specifically included or excluded for the endpoint source 'test', use the command:

```
awplus# show url-offload endpoint-source office365 test entries filtered
```

To show endpoint entries that can't be parsed for the endpoint source 'test', use the command:

```
awplus# show url-offload endpoint-source office365 test entries unusable
```

**Output** Figure 75-5: Example output from **show url-offload endpoint-source office365 test entries filtered**

```
awplus#show url-offload endpoint-source office365 test entries filtered
Endpoint source: test
Include entries:
Type  Value
-----
ip    13.107.6.152/31
ip    13.107.18.10/31
...
ip    150.171.40.0/22
ip    191.234.140.0/22
ip    204.79.197.215/32
ipv6  2603:1006::/40
...
ipv6  2a01:111:f402::/48
url   *.sharepoint.com
url   outlook.office.com
url   outlook.office365.com

Exclude entries:
Type  Value
-----
url   mobile.facebook.com
```

Figure 75-6: Example output from **show url-offload endpoint-source office365 test entries unusable**

```
awplus#show url-offload endpoint-source office365 test entries unusable
Endpoint source: test
Unusable entries

**Command changes** Version 5.5.0-0.1: command added

# show url-offload endpoint-source office365 raw-data

**Overview** Use this command to show the raw JSON data fetched from the Microsoft Office365 endpoint service for diagnostic and configuration debug purposes.

**Syntax** `show url-offload endpoint-source office365 <name> raw-data`

Parameter	Description
<code>&lt;name&gt;</code>	This is the name of an endpoint source, for example 'test'. If you do not use this parameter, then all endpoint sources are displayed.

**Mode** Privileged Exec

**Usage notes** Use this command to work out what filtering you require. The output is quite long.

**Example** To show raw JSON data fetched from the office365 endpoint source 'test', use the command:

```
awplus# show url-offload endpoint-source office365 test  
raw-data
```

**Output** Figure 75-7: Example output from **show url-offload endpoint-source office365 raw-data**

```
awplus#show url-offload endpoint-source office365 test raw-data

**Command changes** Version 5.5.0-0.1: command added

# show url-offload pac-file template

**Overview** Use this command to show the template that is currently used to generate the Proxy Auto-Configuration (PAC) file for the URL offload feature.

**Syntax** `show url-offload pac-file template`

**Mode** Privileged Exec

**Usage notes** The template must include two placeholders '%%EXCLUDE\_MATCHES%%' and '%%INCLUDE\_MATCHES%%'. These are replaced by the relevant condition statements. The template may also include the '%%PROXY\_ADDRESS%%' placeholder. If it does, this is replaced by the proxy address configured using the command **pac-file proxy address** in URL Offload Configuration mode.

**NOTE:** *Exclude conditions should always be processed before include conditions.*

The default template can be shown, and then used as an example when writing a different template.

**Example** To display the default template that is currently in use, use the command:

```
awplus# show url-offload pac-file template
```

**Output** Figure 75-9: Example output from **show url-offload pac-file template**

```
awplus#show url-offload pac-file template

function FindProxyForURLEx(url, host)
{
    var direct = "DIRECT";
    var proxyServer = "PROXY %%PROXY_ADDRESS%%";

    /* Host is on local network (no dots in name) */
    if (isPlainHostName (host))
    {
        return direct;
    }

    /* Exclude matches */
    if (%%EXCLUDE_MATCHES%%)
    {
        return proxyServer;
    }

    /* Include matches */
    if (%%INCLUDE_MATCHES%%)
    {
        return direct;
    }

    return proxyServer;
}

function FindProxyForURL(url, host)
{
    return FindProxyForURLEx (url, host);
}
```

# update-interval (endpoint-office365)

**Overview** Use this command to configure the update interval for URL offload office365 endpoints.

Use the **no** variant of this command to disable automatic updating for URL offload office365 endpoints. You can use the **url-offload update-now** command to update the endpoints if you want to.

**Syntax** `update-interval {days <1-30>|hours <1-720>|minutes <1-43200>}`  
`no update-interval`

Parameter	Description
<code>days &lt;1-30&gt;</code>	Specify the update interval in days, in the range 1 to 30
<code>hours &lt;1-720&gt;</code>	Specify the update interval in hours, in the range 1 to 720
<code>minutes &lt;1-43200&gt;</code>	Specify the update interval in minutes, in the range 1 to 43200

**Default** Disabled

**Mode** URL Offload Endpoint Office365 Configuration

**Examples** To update the endpoint source 'test' at hourly intervals, use the commands:

```
awplus# configure terminal
awplus(config)# url offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# update-interval hours 1
```

To disable automatic updates, use the commands:

```
awplus# configure terminal
awplus(config)# url offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# no update-interval
```

**Related commands** [show running-config url-offload](#)

**Command changes** Version 5.5.0-0.1: command added

# url (endpoint office365)

**Overview** Use this command to set the URL to use as the source for the office365 endpoint service.

Use the **no** variant of this command to remove the configured URL as the source for the office365 endpoints service.

**Syntax** url <url>  
no url

Parameter	Description
<url>	The URL address to use to fetch the JSON data from the office365 endpoints service.

**Default** No URL is configured

**Mode** URL Offload Endpoint Office365 Configuration

**Examples** To configure the URL so you can use the office365 endpoint service, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# url
https://endpoints.office.com/endpoints/worldwide
```

To remove the configured URL for the office365 endpoint service, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# no url
```

**Related commands** [show running-config url-offload](#)  
[show url-offload endpoint-source](#)

**Command changes** Version 5.5.0-0.1: command added

# url-offload

**Overview** Use this command to enter configuration mode for the URL offload feature.

**Syntax** url-offload

**Mode** Global Configuration

**Usage notes** URL offload allows you to divert particular URL traffic directly to the Internet, rather than sending it to a proxy server or VPN.

**Example** To enter configuration mode for the URL offload feature, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)#
```

**Related commands** [show running-config url-offload](#)

**Command changes** Version 5.5.0-0.1: command added

# url-offload update-now

**Overview** Use this command to trigger an immediate update of all URL offload endpoints. The latest endpoint data is fetched and the PAC file is regenerated.

**Syntax** `url-offload update-now`

**Mode** Privileged Exec

**Example** To trigger an immediate update of all URL offload endpoint data, use the command:

```
awplus# url-offload update-now
```

**Related commands** [show running-config url-offload](#)  
[show url-offload pac-file](#)

# clear isakmp sa

**Overview** Use this command to delete Internet Security Association Key Management Protocol (ISAKMP) Security Associations (SAs). SAs specify the Security Parameter Index (SPI), protocols, algorithms and keys for protecting a single flow of traffic between two IPsec peers. For more information about SA, see the [Internet Protocol Security \(IPSec\) Feature Overview and Configuration Guide](#).

**Syntax** `clear [crypto] isakmp sa [peer <ipv4-addr>|<ipv6-addr>|<hostname>] [force]`

Parameter	Description
<ipv4-addr>	Destination IPv4 address. The IPv4 address uses the format A.B.C.D.
<ipv6-addr>	Destination IPv6 address. The IPv4 address uses the format X:X::X:X.
<hostname>	Destination host name.
force	Force to clear ISAKMP SAs without negotiating with the peer.

**Mode** Privileged Exec

**Examples** To delete the ISAKMP security associations at the peer for an IPv6 address, use the command:

```
awplus# clear isakmp sa peer 2001:0db8::1
```

To delete the ISAKMP security associations at the peer for an IPv4 address, use the command:

```
awplus# clear isakmp sa peer 192.168.2.1
```

To delete the ISAKMP security associations at the peer for a host name, use the command:

```
awplus# clear isakmp sa peer remote.example.com
```

**Related commands** [crypto isakmp key](#)  
[show isakmp sa](#)

**Command Changes** Version 5.4.7-0.1: Parameter <hostname> added for DDNS feature.

# crypto ipsec profile

**Overview** Use this command to configure a custom IPsec profile.

An IPsec profile comprises one or more transforms that can be configured by using the [transform \(IPsec Profile\)](#) command.

Use the **no** variant to delete a previously created profile.

**Syntax** `crypto ipsec profile <profile_name>`  
`no crypto ipsec profile <profile_name>`

Parameter	Description
<code>&lt;profile_name&gt;</code>	Profile name. Profile names are case insensitive and can be up to 64 characters long composed of printable ASCII characters. Profile names can have only letters from a to z and A to Z, numbers from 0 to 9, - (dash), or _ (underscore).

**Default** The default IPsec profile with transforms in order of preference is listed in the following table. Which IPsec profile will actually be used depends on how the negotiation between the peers is carried out when establishing the connection. Note that you cannot delete or edit the default profile. Expiry time of 8 hours applies to the default IPsec profile.

Table 76-1: IPsec default profile

Attribute	Transform 1	Transform 2	Transform 3	Transform 4	Transform 5	Transform 6
Protocol	ESP	ESP	ESP	ESP	ESP	ESP
Encryption (all CBC)	AES256	AES256	AES128	AES128	3DES	3DES
Integrity (all HMAC)	SHA256	SHA1	SHA256	SHA1	SHA256	SHA1

**Mode** Global Configuration

**Examples** To configure a custom IPsec profile for establishing IPsec SAs with a remote peer, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto ipsec profile my_profile
awplus(config-ipsec-profile)# transform 2 protocol esp
integrity sha1 encryption 3des
```

To delete a custom profile, use the following commands:

```
awplus# configure terminal
awplus(config)# no crypto ipsec profile my_profile
```

**Related  
commands**    lifetime (IPsec Profile)  
                  show ipsec profile  
                  transform (IPsec Profile)

# crypto isakmp key

**Overview** Use this command to configure a pre-shared authentication key.

Pre-shared key authentication uses optionally-encrypted shared keys identified by hostname, IPv4 or IPv6 address. Pre-shared keys are not viewable and are stored encrypted in the running-configuration.

You must configure this key whenever you specify pre-shared keys in an (Internet Key Exchange) IKE policy and at both peers.

This command specifies both the value of the pre-shared key and also an identifier (the hostname, address or policy parameters). This identifier is used to decide which pre-shared key to use for a particular ISAKMP message exchange.

See the Usage section below for more information, and see the following guides for examples:

- [Internet Protocol Security \(IPsec\) Feature Overview and Configuration Guide](#)
- [GRE and Multipoint VPNs Feature Overview and Configuration Guide](#)

Use the **no** variant to remove a pre-shared key.

**Syntax**

```
crypto isakmp key [8] <key> hostname <hostname> [type {eap|psk}]
no crypto isakmp key [8] <key> hostname <hostname> [type
{eap|psk}]
crypto isakmp key [8] <key> address {<ipv4-addr>|<ipv6-addr>}
[type {eap|psk}]
no crypto isakmp key [8] <key> address
{<ipv4-addr>|<ipv6-addr>} [type {eap|psk}]
crypto isakmp key [8] <key> policy <policy-name> [type
{eap|psk}]
no crypto isakmp key [8] <key> policy <policy-name> [type
{eap|psk}]
```

Parameter	Description
crypto	Security specific command.
isakmp	Internet Security Association Key Management Protocol provides a common framework for key management implementations.
key	Pre-shared key.
<key>	Specify the pre-shared key. Use any combination of alphanumeric characters up to 128 bytes.
8	Specifies that an encrypted key follows.
<hostname>	A hostname (e.g. example.com).
<ipv4-addr>	IPv4 address. The IPv4 address uses the format A.B.C.D.

Parameter	Description
<code>&lt;ipv6-addr&gt;</code>	IPv6 address. The IPv6 address uses the format X:X::X:X.
<code>&lt;policy-name&gt;</code>	The local policy name. This is the name of the tunnel (e.g. tunnel2).
<code>type</code>	ISAKMP key type
<code>eap</code>	Extensible Authentication Protocol. This can be used with multipoint VPN when performing RADIUS authentication. See the <a href="#">GRE and Multipoint VPNs Feature Overview and Configuration Guide</a> for more information.
<code>psk</code>	Pre-shared Key (default)

**Default** ISAKMP keys do not exist.

**Mode** Global Configuration

**Usage notes** Use this command to configure a pre-shared authentication key for use with the ISAKMP protocol.

Before a tunnel can be protected by IPsec, each endpoint of the tunnel must verify that they are communicating with an authorized entity. ISAKMP uses pre-shared keys in the initial handshake between peers to ensure both endpoints are allowed to communicate.

This command specifies both the value of the pre-shared key and also an identifier which is used to decide which pre-shared key to use for a particular ISAKMP message exchange. Because the responding endpoint does not identify itself to the local device until after the pre-shared key is used, it is important that the key identifier is part of the tunnel configuration on the initiating device.

The tunnel configuration parameter used to select which pre-shared key to use when negotiating IPsec protection for that tunnel is in priority order:

- 1) **tunnel remote name**
- 2) **tunnel destination <ipv4-address>|<ipv6-address>** (if the remote name is not specified)
- 3) **tunnel local name**
- 4) **tunnel source <ipv4-address>|<ipv6-address>** (if the remote name is not specified)

For point-to-point tunnels, we recommend you configure local and remote names on the tunnels. Then use the remote name of the other device to identify the pre-shared keys on the local device.

For point-to-multipoint tunnels, it may be necessary to identify the pre-shared key by the local name of the tunnel, if the ISAKMP negotiation is to be initiated by that tunnel. This is because it is not possible to configure multiple remote names. However, it is possible to use the expected remote addresses or names of the remote initiating tunnels to identify keys. This is because the remote tunnel will identify itself when it initiates a connection.

**Examples** To configure a pre-shared authentication key of “friend”, using a hostname, use the commands below:

```
awplus# configure terminal
awplus(config)# crypto isakmp key friend hostname
mypeer@my.domain.com
```

To remove that pre-shared key, use the commands below:

```
awplus# configure terminal
awplus(config)# no crypto isakmp key friend hostname
mypeer@my.domain.com
```

To configure a pre-shared already-encrypted authentication key, using an IPv4 address, use the commands below:

```
awplus# configure terminal
awplus(config)# crypto isakmp key 8 Nhe6ioQmzbysQaJr6Du+cA==
address 192.168.1.2
```

To configure a pre-shared key, using the local policy “tunnel2”, use the commands:

```
awplus# configure terminal
awplus(config)# crypto isakmp key friend policy tunnel2
```

To remove that key, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto isakmp key friend policy tunnel2
```

To configure an ISAKMP key using EAP, enter the commands:

```
awplus# configure terminal
awplus(config)# crypto isakmp key friend hostname example.com
type eap
```

**Related commands**

**Command changes**

- Version 5.4.9-0.1: **type** parameter added
- Version 5.4.9-1.1: **policy** parameter added

# crypto isakmp peer

**Overview** Use this command to configure a peer to use a specific ISAKMP profile.

Use the **no** variant to set the peer back to using the default profile.

**Syntax**

```
crypto isakmp peer address {<ipv4-addr>|<ipv6-addr>} profile <profile-name>
no crypto isakmp peer address {<ipv4-addr>|<ipv6-addr>} profile
crypto isakmp peer dynamic profile <profile-name>
no crypto isakmp peer dynamic profile
crypto isakmp peer hostname <hostname> profile <profile-name>
no crypto isakmp peer hostname <hostname> profile
crypto isakmp peer policy <policy-name> profile <profile-name>
no crypto isakmp peer policy <policy-name> profile
```

Parameter	Description
<ipv4-addr>	IPv4 address. The IPv4 address uses the format A.B.C.D.
<ipv6-addr>	IPv6 address. The IPv6 address uses the format X:X::X:X.
dynamic	Remote endpoint with a dynamic IP address.
<hostname>	Remote endpoint with a host name as the destination.
<policy-name>	The name of a local policy. This is the name of the tunnel (e.g. tunnel2).
<profile-name>	Profile name.

**Default** By default, all peers use the default profile.

**Mode** Global Configuration

**Usage notes** Use this command to configure a peer to use a specific ISAKMP profile.

When IPsec protection is applied to a tunnel, an ISAKMP profile is selected for use when IPsec parameters need to be negotiated. This profile is chosen when the tunnel first becomes active, and so must be selected based on local configuration only.

The tunnel configuration parameter used to select which ISAKMP profile to use when negotiating IPsec protection for that tunnel is in the following priority order:

- 1) **tunnel destination dynamic** (if a dynamic profile has been configured)
- 2) **tunnel endpoint dynamic** (if a dynamic profile has been configured)
- 3) **tunnel remote name**

- 4) **tunnel destination** <ipv4-address>|<ipv6-address> (if the remote name is not specified)
- 5) **tunnel endpoint** <ipv4-address>
- 6) **tunnel local name**
- 7) **tunnel source** <ipv4-address>|<ipv6-address> (if the remote name is not specified)
- 8) **tunnel destination** <hostname> (if the hostname is not specified)
- 9) **tunnel endpoint** <hostname> (if the hostname is not specified)

**Examples** To configure a profile for a peer, using a dynamic IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto isakmp peer dynamic profile peer_profile
```

To set the profile for the peer back to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# no crypto isakmp peer dynamic profile
```

To configure a profile for a peer, using a local policy name of "tunnel2", use the commands:

```
awplus# configure terminal
awplus(config)# crypto isakmp peer policy tunnel2 profile
peer-profile
```

To set the profile for the peer back to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto isakmp peer policy tunnel2 profile
```

**Related commands**

**Command Changes**

- Version 5.4.7-0.1: **hostname** parameter added.
- Version 5.4.9-1.1: **policy** parameter added.

# crypto isakmp profile

**Overview** Use this command to configure a custom ISAKMP profile.

An ISAKMP profile comprises one or more transforms that can be configured by using the [transform \(ISAKMP Profile\)](#) command.

Use the **no** variant to delete a previously created profile.

**Syntax** `crypto isakmp profile <profile_name>`  
`no crypto isakmp profile <profile_name>`

Parameter	Description
<code>&lt;profile_name&gt;</code>	Profile name. Profile names are case insensitive and can be up to 64 characters long composed of printable ASCII characters. Profile names can have only letters from a to z and A to Z, numbers from 0 to 9, - (dash), or _ (underscore).

**Default** Which ISAKMP profile transform will actually be used depends on how the negotiation between the peers is carried out when establishing the connection. For more information about default ISAKMP profiles, see the following table. Note that you cannot delete or edit the default profile. Expiry time of 24 hours applies to the default profile.

Table 76-2: ISAKMP default profile

Attribute	Encryption	Integrity	Group	Authentication
Transform 1	AES256	SHA256	14	Pre-shared
Transform 2	AES256	SHA256	16	Pre-shared
Transform 3	AES256	SHA1	14	Pre-shared
Transform 4	AES256	SHA1	16	Pre-shared
Transform 5	AES128	SHA256	14	Pre-shared
Transform 6	AES128	SHA256	16	Pre-shared
Transform 7	AES128	SHA1	14	Pre-shared
Transform 8	AES128	SHA1	16	Pre-shared
Transform 9	3DES	SHA256	14	Pre-shared
Transform 10	3DES	SHA256	16	Pre-shared
Transform 11	3DES	SHA1	14	Pre-shared
Transform 12	3DES	SHA1	16	Pre-shared

**Mode** Global Configuration

**Examples** To configure a custom ISAKMP profile for establishing ISAKMP SAs with a remote peer, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto isakmp profile my_profile
awplus(config-isakmp-profile)# transform 2 integrity sha1
encryption 3des group 5
```

To delete a custom profile, use the following commands:

```
awplus# configure terminal
awplus(config)# no crypto isakmp profile my_profile
```

# dpd-interval

**Overview** Use this command to specify the Dead Peer Detection (DPD) interval for an ISAKMP profile.

DPD is an IKE mechanism using a form of keep-alive to determine if a tunnel peer is still active.

The interval parameter specifies the amount of time the device waits for traffic from its peer before sending a DPD acknowledgment message.

Use the **no** variant to set the interval to its default (30 seconds).

**Syntax** `dpd-interval <10-86400>`  
`no dpd-interval`

Parameter	Description
<code>&lt;10-86400&gt;</code>	Interval expressed in seconds.

**Default** If you do not specify an interval, the default interval of 30 seconds applies.

**Mode** ISAKMP Profile Configuration

**Examples** To specify a DPD interval, use the following commands:

```
awplus(config)# crypto isakmp profile my_profile  
awplus(config-isakmp-profile)# dpd-interval 20
```

To set the interval to its default, use the following commands:

```
awplus(config-isakmp-profile)# no dpd-interval
```

**Related commands** [crypto isakmp profile](#)

**Validation Commands** [show isakmp profile](#)

# dpd-timeout

**Overview** Use this command to specify a Dead Peer Detection (DPD) timeout for IKEv1. DPD is an IKE mechanism using a form of keep-alive to determine if a tunnel peer is still active. DPD timeout defines the timeout interval after which all connections to a peer are deleted in case of inactivity. This only applies to IKEv1, in IKEv2 the default retransmission timeout applies as every exchange is used to detect dead peers. Use the **no** variant to set the timeout to its default (150 seconds).

**Syntax** `dpd-timeout <10-86400>`  
`no dpd-timeout`

Parameter	Description
<code>&lt;10-86400&gt;</code>	Timeout in seconds.

**Default** If you do not specify a timeout, the default timeout of 150 seconds applies.

**Mode** ISAKMP Profile Configuration

**Examples** To specify a DPD timeout for IKEv1, use the following commands:

```
awplus(config)# crypto isakmp profile my_profile  
awplus(config-isakmp-profile)# dpd-timeout 200
```

To set the timeout to its default, use the following command:

```
awplus(config-isakmp-profile)# no dpd-timeout
```

**Related commands** [crypto isakmp profile](#)

**Related commands** [show isakmp profile](#)

# interface tunnel (IPsec)

**Overview** Use this command to create a tunnel interface or to enter Interface mode to configure an existing tunnel. Tunnel interfaces are identified by an index identifier that is an integer in the range from 0 through 65535.

Use the **no** variant of this command to remove a previously created tunnel interface.

**Syntax** `interface tunnel<0-65535>`  
`no interface tunnel<tunnel-index>`

Parameter	Description
<0-65535>	Specify a tunnel interface index identifier in the range from 0 to 65535.

**Default** Tunnel interfaces do not exist.

**Mode** Global Configuration

**Usage notes** After you have created the tunnel interface, use the **tunnel mode** command to enable the tunnel.

Note that you need to designate a tunnel mode, tunnel source address, tunnel destination address, IP address of tunnel interface and use [tunnel protection ipsec \(IPsec\)](#) command to encrypt and authenticate the packets travelling though the tunnel.

**Examples** To configure an IPsec tunnel interface with index 100, enter the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel100
awplus(config-if)# tunnel mode ipsec ipv4
```

To remove the IPsec tunnel interface tunnel100, enter the commands below:

```
awplus# configure terminal
awplus(config)# no interface tunnel100
```

**Command changes** Version 5.4.7-2.1: increased range for **tunnel** index identifier.

# lifetime (IPsec Profile)

**Overview** Use this command to specify a lifetime for an IPsec SA.  
Lifetime measures how long the IPsec SA can be maintained before it expires. Lifetime prevents a connection from being used too long.  
Use the **no** variant to set the lifetime to default (28800 seconds).

**Syntax** `lifetime seconds <300-31449600>`  
`no lifetime seconds`

Parameter	Description
<code>&lt;300-31449600&gt;</code>	Lifetime in seconds.

**Default** If you do not specify a lifetime, the default lifetime of 28800 seconds (8 hours) applies.

**Mode** IPsec Profile Configuration

**Examples** To specify a lifetime for an IPsec SA, use the following commands:

```
awplus(config)# crypto ipsec profile my_profile  
awplus(config-ipsec-profile)# lifetime seconds 400
```

To set the lifetime to its default, use the following commands:

```
awplus(config)# crypto ipsec profile my_profile  
awplus(config-ipsec-profile)# no lifetime seconds
```

**Related commands** [crypto ipsec profile](#)

# lifetime (ISAKMP Profile)

**Overview** Use this command to specify a lifetime for an ISAKMP SA.  
Lifetime measures how long the ISAKMP SA can be maintained before it expires. Lifetime prevents a connection from being used too long.  
Use the **no** variant to set the lifetime to default (86400 seconds).

**Syntax** `lifetime <600-31449600>`  
`no lifetime`

Parameter	Description
<code>&lt;600-31449600&gt;</code>	Lifetime in seconds.

**Default** If you do not specify a lifetime, the default lifetime of 86400 seconds (8 hours) applies.

**Mode** ISAKMP Profile Configuration

**Examples** To specify a lifetime for an ISAKMP SA, use the following commands:

```
awplus(config)# configure isakmp profile my_profile  
awplus(config-isakmp-profile)# lifetime 700
```

To set the lifetime to its default, use the following commands:

```
awplus(config-isakmp-profile)# no lifetime
```

**Related commands** [crypto isakmp profile](#)

# no debug isakmp

**Overview** Use this command to disable debugging ISAKMP.

To enable debugging ISAKMP, see [debug isakmp](#).

**Syntax** no [crypto] isakmp [info|trace|all]

Parameter	Description
no	Disable debugging function.
crypto	Security specific.
isakmp	Internet Security Association Key Management Protocol provides a common framework for key management implementations.
info	Informational debug messages such as protocol events.
trace	Verbose debug messages including protocol events and message traces.
all	All debug enabled.

**Mode** Privileged Exec

**Related commands** [debug isakmp](#)  
[undebug isakmp](#)

# pfs

**Overview** Use this command to enable PFS and set a Diffie-Hellman group for PFS in an IPsec profile.

Use the **no** variant to disable PFS.

**Syntax** `pfs {2|5|14|15|16|18}`  
`no pfs`

Parameter	Description
2	1024-bit MODP Group
5	1536-bit MODP Group
14	2048-bit MODP Group
15	3072-bit MODP Group
16	4096-bit MODP Group
18	8192-bit MODP Group

**Default** PFS is disabled.

**Mode** IPsec Profile Configuration

**Usage notes** Perfect Forward Secrecy (PFS) ensures generated keys, for example IPsec SA keys are not compromised if any other keys, for example, ISAKMP SA keys are compromised.

The specified PFS group must match the PFS group setting on the peer - especially when IKEv2 is used for ISAKMP SA negotiation. With IKEv2, if there is a PFS group mismatch an IPsec SA will be established and the tunnel will come up because PFS is not required for the initial child SA negotiation. However, when the IPsec SA rekeys it will fail due to the PFS group mismatch, and upon IPsec SA expiry the tunnel will no longer be able to carry traffic.

**Examples** To enable PFS and set a Diffie-Hellman group for PFS, use the following commands:

```
awplus(config)# crypto ipsec profile my_profile  
awplus(config-ipsec-profile)# pfs 15
```

To disable PFS, use the following command:

```
awplus(config-ipsec-profile)# no pfs
```

**Related commands** [crypto ipsec profile](#)

**Validation** show ipsec profile  
**Commands**

# rekey

**Overview** Use this command to set the rekey policy for an IPsec profile. This policy will be used to make a decision or whether the SA will rekey at its expiry.

The options are **always**, **never**, and **on-demand**. The **on-demand** option makes its decision based on whether the link has seen any traffic since the SA's last rekey.

Use the **no** variant of this command to set the rekey policy back to its default of **always**.

**Syntax** rekey {always|never|on-demand}  
no rekey

Parameter	Description
always	Always rekey this SA (default)
never	Never rekey this SA
on-demand	Only rekey this SA if it has been used since the last rekey

**Default** By default, an IPsec SA will always rekey.

**Mode** IPsec Profile Configuration

**Usage notes** These options may be useful if you have a hub and spoke VPN topology and need to provision more than the maximum number of concurrent active VPNs supported by your device. **Never** and **on-demand** allow unused VPNs to be aged out, making more efficient use of the number of available VPNs.

**Example** To only rekey when traffic is detected over the interface, for the profile named 'myprofile', use the commands:

```
awplus# configure terminal
awplus(config)# crypto ipsec profile myprofile
awplus(config-ipsec-profile)# rekey on-demand
```

To reset the rekey policy back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# crypto ipsec profile myprofile
awplus(config-ipsec-profile)# no rekey
```

**Related commands** [crypto ipsec profile](#)  
[show ipsec profile](#)

**Command changes** Version 5.4.9-2.1: command added

# show debugging isakmp

**Overview** Use this command to show if debugging ISAKMP is enabled.

**Syntax** show debugging [crypto] isakmp

Parameter	Description
debugging	Debugging information.
crypto	Security specific command.
isakmp	Internet Security Association Key Management Protocol provides a common framework for key management implementations.

**Mode** Privileged Exec

**Examples** To show if debugging ISAKMP is enabled, enter the command below:

```
awplus# show debugging isakmp
```

**Output** Figure 76-2: Example output from the **show debugging isakmp** command

```
awplus#show debugging isakmp
ISAKMP Debugging status:
  ISAKMP Informational debugging is enabled
  ISAKMP Trace debugging is disabled
```

# show interface tunnel (IPsec)

**Overview** Use this command to display status information of tunnels.

The tunnel remains inactive if no valid tunnel source or tunnel destination is configured.

**Syntax** `show interface tunnel< tunnel-index >`

Parameter	Description
tunnel	Specify this parameter to display tunnel status information of a given tunnel identified by the < tunnel-index > parameter.
< tunnel-index >	Specify a tunnel index in the range from 0 through 65535.

**Mode** Privileged Exec

**Examples** To display status information for IPsec tunnel "tunnel2", use the command:

```
awplus# show interface tunnel2
```

**Output** Figure 76-3: Example output from the **show interface tunnel** command

```
awplus#show interface tunnel2
Interface tunnel2

```

# show ipsec peer

**Overview** Use this command to show IPsec information on a per peer basis.

**Syntax** show [crypto] ipsec peer [<hostname>|<ipv4-addr>|<ipv6-addr>]

Parameter	Description
crypto	Security specific command.
peer	Remote endpoint.
<hostname>	Destination hostname.
<ipv4-addr>	Destination IPv4 address. The IPv4 address uses the format A.B.C.D.
<ipv6-addr>	Destination IPv6 address. The IPv6 address uses the format X:X::X:X.

**Mode** Privileged Exec

**Examples** To show IPsec information on a per peer basis, enter the command below:

```
awplus# show ipsec peer 172.16.0.1
```

**Output** Figure 76-5: Example output from the **show ipsec peer** command

```
awplus#show ipsec peer 172.16.0.1
172.16.0.2
IPsec

# show ipsec policy

**Overview** Use this command to show IPsec policies.

**Syntax** show [crypto] ipsec policy

Parameter	Description
crypto	Security specific command.
ipsec	Internet Protocol Security defines the protection of IP packets using encryption and authentication.
policy	Policy.

**Mode** Privileged Exec

**Examples** To show IPsec policies, enter the command below:

```
awplus# show ipsec policy
```

**Output** Figure 76-6: Example output from the **show ipsec policy** command

```
awplus#show ipsec policy

  default          10.2.0.10
```

# show ipsec profile

**Overview** Use this command to show IPsec default and custom profiles.

An IPsec profile consists of a set of parameters that are used by IPsec when establishing IPsec SAs with a remote peer. AlliedWare Plus provides default ISAKMP and IPsec profiles that contain a priority ordered set of transforms that are considered secure by the security community.

**Syntax** `show [crypto] ipsec profile [<profile_name>]`

Parameter	Description
crypto	Security specific.
ipsec	Internet Protocol Security defines the protection of IP packets using encryption and authentication.
profile	An IPsec profile consists of a set of parameters that are used by IPsec SAs with a remote peer.
<profile_name>	Custom profile name.

**Mode** Privileged Exec

**Examples** To show all IPsec profiles, including the default profile, use the following command:

```
awplus# show ipsec profile
```

**Output** Figure 76-7: Example output from the **show ipsec profile** command

```
awplus#show ipsec profile
IPsec Profile: default
  Replay-window: 32
  Rekey: Always
  Expiry: 8h
  PFS group: disabled
  Transforms:
  Protocol Integrity Encryption
    1 ESP SHA256 AES256
    2 ESP SHA1 AES256
    3 ESP SHA256 AES128
    4 ESP SHA1 AES128
    5 ESP SHA256 3DES
    6 ESP SHA1 3DES

IPsec Profile: my_profile
  Replay-window: 32
  Rekey: On Demand
  Expiry: 8h
  PFS group: disabled
  Transforms:
  Protocol Integrity Encryption
    2 ESP SHA1 3DES
```

**Examples** To show IPsec profile "my\_profile", use the command:

```
awplus# show ipsec profile my_profile
```

**Output** Figure 76-8: Example output from the **show ipsec profile** command

```
awplus#show ipsec profile my_profile
IPsec Profile: my_profile
  Replay-window: 32
  Rekey: On Demand
  Expiry: 8h
  PFS group: disabled
  Transforms:
  Protocol Integrity Encryption
    2 ESP SHA1 3DES
```

**Related commands** [crypto ipsec profile](#)

# show ipsec sa

**Overview** Use this command to view the settings used by current security associations. SAs specify the Security Parameter Index (SPI), protocols, algorithms and keys for protecting a single flow of traffic between two IPsec peers. For more information about SA, see the [Internet Protocol Security \(IPSec\) Feature Overview and Configuration Guide](#).

**Syntax** show [crypto] ipsec sa

Parameter	Description
crypto	Security specific command.
ipsec	Internet Protocol Security defines the protection of IP packets using encryption and authentication.
sa	Security Association.

**Mode** Privileged Exec

**Examples** To view the settings used by current security associations, enter the command below:

```
awplus# show ipsec sa
```

**Output** Figure 76-9: Example output from the **show ipsec sa** command

```
awplus#show ipsec sa
```

Peer	SPI (in:out) Encryption	Mode Integrity	Proto PFS	Expires

# show isakmp counters

**Overview** Use this command to show ISAKMP counters.

**Syntax** show [crypto] isakmp counters

Parameter	Description
crypto	Security specific command.
isakmp	Internet Security Association Key Management Protocol provides a common framework for key management implementations.
counters	Show ISAKMP counters.

**Mode** Privileged Exec

**Examples** To show ISAKMP counters, enter the command below:

```
awplus# show isakmp counters
```

**Output** Figure 76-10: Example output from the **show isakmp counters** command

```

# show isakmp key (IPsec)

**Overview** Use this command to show the ISAKMP pre-shared key. Pre-shared key authentication using optionally encrypted shared keys identified by hostname, IPv4 or IPv6 address. Pre-shared keys are not viewable and stored encrypted in the running-configuration.

**Syntax** `show [crypto] isakmp key`

Parameter	Description
crypto	Security specific command.
isakmp	Internet Security Association Key Management Protocol provides a common framework for key management implementations.
key	Pre-shared key.

**Mode** Privileged Exec

**Examples** To show ISAKMP pre-shared key, enter the command below:

```
awplus# show isakmp key
```

**Output** Figure 76-11: Example output from the **show isakmp key** command

```
awplus#show isakmp key

```

# show isakmp peer

**Overview** Use this command to show ISAKMP profile and key status for ISAKMP peers.

**Syntax** `show isakmp peer [<hostname>|<ipv4-addr>|<ipv6-addr>]`

Parameter	Description
<hostname>	Destination hostname.
<ipv4-addr>	Destination IPv4 address. The IPv4 address uses the format A.B.C.D.
<ipv6-addr>	Destination IPv6 address. The IPv6 address uses the format X:X::X:X.

**Mode** Privileged Exec

**Examples** To show ISAKMP profile and key status for ISAKMP peers, use the following command:

```
awplus# show isakmp peer
```

**Output** Figure 76-12: Example output from the **show isakmp peer** command

```
awplus#show isakmp peer
```

Peer	Profile (* incomplete)	Key
example.com	LEGACY	Not Found
2.2.2.2	default	PSK
1.1.1.1	SECURE	PSK

**Related commands** [crypto isakmp peer](#)

**Command changes** Version 5.4.7-0.1: Parameter <hostname> added for DDNS feature.

# show isakmp profile

**Overview** Use this command to show ISAKMP default and custom profiles.

**Syntax** show [crypto] isakmp profile [<profile\_name>]

Parameter	Description
<profile_name>	Custom profile name.

**Mode** Privileged Exec

**Examples** To show ISAKMP profiles, including the default profile, use the command:

```
awplus# show isakmp profile
```

**Output** Figure 76-13: Example output from the **show isakmp profile** command

```
awplus#show isakmp profile

# transform (IPsec Profile)

**Overview** Use this command to create an IPsec profile transform, which specifies the encryption and authentication algorithms used to protect data.

Use the **no** variant to delete a previously created transform.

**Syntax** `transform <1-255> protocol esp integrity {sha1|sha256|sha512}  
encryption {3des|aes128|aes192|aes256|null}`  
`no transform <1-255>`

Parameter	Description
<1-255>	Transform priority (1 is the highest)
sha1	Secure Hash Standard with 160-bit digest size
sha256	Secure Hash Standard with 256-bit digest size
sha512	Secure Hash Standard with 512 bit digest size
3des	Triple DES symmetric key block cipher with a 168-bit key
aes128	Advanced Encryption Standard symmetric key block cipher with a 128-bit key
aes192	Advanced Encryption Standard symmetric key block cipher with a 192-bit key
aes256	Advanced Encryption Standard symmetric key block cipher with a 256-bit key
null	No encryption. This option is not intended for use in a live network. It should only be used for testing purposes.

**Default** By default, an IPsec profile has no transforms and so will not be active.

**Mode** IPsec Profile Configuration

**Examples** To configure an IPsec profile transform, use the following commands:

```
awplus(config)# crypto ipsec profile my_profile  
awplus(config-ipsec-profile)# transform 2 protocol esp  
integrity sha1 encryption 3des
```

To delete a created transform, use the following command:

```
awplus(config-ipsec-profile)# no transform 2
```

**Related commands** [crypto ipsec profile](#)

**Validation Commands** [show ipsec profile](#)

# transform (ISAKMP Profile)

**Overview** Use this command to create an ISAKMP profile transform which specifies the encryption and authentication algorithms used to protect data in the tunnel.

Use the **no** variant to delete a previously created transform.

**Syntax** transform <1-255> integrity {sha1|sha256|sha512} encryption {3des|aes128|aes192|aes256} group {2|5|14|15|16|18}  
no transform <1-255>

Parameter	Description
<1-255>	Transform priority (1 is the highest)
sha1	Secure Hash Standard with 160-bit digest size
sha256	Secure Hash Standard with 256-bit digest size
sha512	Secure Hash Standard with 512 bit digest size
3des	Triple DES symmetric key block cipher with a 168-bit key
aes128	Advanced Encryption Standard symmetric key block cipher with a 128-bit key
aes192	Advanced Encryption Standard symmetric key block cipher with a 192-bit key
aes256	Advanced Encryption Standard symmetric key block cipher with a 256-bit key
group	Diffie-Hellman group
2	1024-bit MODP Group
5	1536-bit MODP Group
14	2048-bit MODP Group
15	3072-bit MODP Group
16	4096-bit MODP Group
18	8192-bit MODP Group

**Default** By default, an ISASMP profile has no transforms and so will not be active.

**Mode** ISAKMP Profile Configuration

**Examples** To create an ISAKMP profile transform, use the following commands:

```
awplus(config)# crypto isakmp profile my_profile  
awplus(config-isakmp-profile)# transform 2 integrity sha1  
encryption 3des group 5
```

To delete a created transform, use the following command:

```
awplus(config-isakmp-profile)# no transform 2
```

**Related  
commands** [crypto isakmp profile](#)

# tunnel destination (IPsec)

**Overview** Use this command to specify a destination IPv4 or IPv6 address or destination network name for the remote end of the tunnel.

Use the **no** variant of this command to remove a configured tunnel destination address.

**Syntax** tunnel destination {<WORD>|<ipv4-address>|<ipv6-address>}  
no tunnel destination {<WORD>|<ipv4-address>|<ipv6-address>}

Parameter	Description
<WORD>	Destination network name or "dynamic". The "dynamic" parameter allows you to specify a dynamic IP address for the remote endpoint. The dynamic IP address can be obtained, for example, via DHCP.
<ipv4-address>	Destination IPv4 address. The IPv4 address uses the format A.B.C.D.
<ipv6-address>	Destination IPv6 address. The IPv6 address uses the format X:X::X:X.

**Mode** Interface Configuration

**Examples** To configure a destination IPv4 address for IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel destination 192.0.3.1
```

To configure a destination IPv6 address for IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# tunnel mode ipsec ipv6
awplus(config-if)# tunnel destination 2001:0db8::
```

To configure a destination network name for IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel destination www.example.com
```

To configure a dynamic IP address for the tunnel destination, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel destination dynamic
```

To remove the destination address of IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# no tunnel destination 192.0.3.1
```

**Related commands** [tunnel source \(IPsec\)](#)

# tunnel local name (IPsec)

**Overview** Use this command to specify an IPsec tunnel hostname to send to the peer for authentication when you apply [tunnel protection ipsec \(IPsec\)](#) to encrypt the packets and configure an ISAKMP key.

Use the **no** variant of this command to remove a previously configured IPsec tunnel hostname.

**Syntax** tunnel local name *<local-name>*  
no tunnel local name

Parameter	Description
<i>&lt;local-name&gt;</i>	Source tunnel hostname.

**Default** The default tunnel local name is the IP address of tunnel source.

**Mode** Interface Configuration

**Examples** To configure the tunnel local name office1 for tunnel6, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel local name office1
```

To remove a configured tunnel local name for tunnel6, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel local name
```

**Related commands** [tunnel remote name \(IPsec\)](#)

# tunnel local selector

**Overview** Use this command to specify a local subnet for a traffic selector pair.

Use the **no** variant of this command to unset the local subnet for the traffic selector pair so that it matches all sources, i.e. 0.0.0.0/0 or ::/0 for IPv4 and IPv6, respectively. When local and remote subnets for a traffic selector pair are both unset, the traffic selector pair is removed.

**Syntax** tunnel local selector [*<traffic-selector-ID>*]  
{*<ipv4-subnet>* | *<ipv6-subnet>*}  
no tunnel local selector [*<traffic-selector-ID>*]

Parameter	Description
<i>&lt;traffic-selector-ID&gt;</i>	Optional traffic selector ID from 1 through 65535. The default is 1.
<i>&lt;ipv4-subnet&gt;</i>	IPv4 subnet in the format A.B.C.D/M.
<i>&lt;ipv6-subnet&gt;</i>	IPv6 subnet in the format of X:X::X:X/M

**Default** When no traffic selector pairs are configured there is an implicit traffic selector pair, where the local and remote subnets are 0.0.0.0/0 or ::/0 depending on the tunnel IPsec mode.

**Mode** Interface configuration

**Usage notes** A traffic selector pair is an agreement between IKE peers to permit traffic through a tunnel if the traffic matches a specified pair of local and remote subnets. When the local selector is specified but the remote selector is not, the selector pair implicitly matches all destinations.

**Examples** To specify an IPv4 destination address as the traffic selector for the traffic to match for tunnel0, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel source eth1
awplus(config-if)# tunnel destination 10.0.0.2
awplus(config-if)# tunnel local name office
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel local selector 192.168.1.0/24
awplus(config-if)# tunnel remote selector 192.168.2.0/24
```

To configure an additional source and destination traffic selector pair for the traffic to match for tunnel0, use the commands:

```
awplus(config-if)# tunnel local selector 5 192.168.1.0/24  
awplus(config-if)# tunnel remote selector 5 192.168.2.0/24
```

To specify an IPv6 source address as the traffic selector for the traffic to match for tunnel0, use the commands:

```
awplus# configure terminal  
awplus(config)# interface tunnel0  
awplus(config-if)# tunnel source eth1  
awplus(config-if)# tunnel destination 2001:db8:10::1  
awplus(config-if)# tunnel local name office  
awplus(config-if)# tunnel mode ipsec ipv6  
awplus(config-if)# tunnel local selector 2001:db8:1::/64  
awplus(config-if)# tunnel remote selector 2001:db8:2::/64
```

To configure an additional source and destination traffic selector pair for the traffic to match for tunnel0, use the commands:

```
awplus(config-if)# tunnel local selector 5 2001:db8:1::/64  
awplus(config-if)# tunnel remote selector 5 2001:db8:2::/64
```

To unset the destination traffic selector for the traffic selector pair with ID 1, for tunnel 6, use the commands:

```
awplus# configure terminal  
awplus(config)# interface tunnel6  
awplus(config-if)# no tunnel remote selector  
  
or  
  
awplus(config-if)# no tunnel remote selector 1
```

**Related commands**

- [tunnel remote selector](#)
- [tunnel selector paired](#)
- [show interface tunnel \(IPsec\)](#)

# tunnel mode ipsec

**Overview** Use this command to configure the encapsulation tunneling mode to use.  
Use the **no** variant of this command to remove an established tunnel.

**Syntax** tunnel mode ipsec {ipv4|ipv6}  
no tunnel mode

Parameter	Description
ipsec ipv4	IPv4 IPsec tunnel
ipsec ipv6	IPv6 IPsec tunnel

**Default** Virtual tunnel interfaces have no mode set.

**Mode** Interface Configuration

**Usage notes** A tunnel will not become operational until it is configured with this command.

**Examples** To configure IPsec in IPv4 tunnel mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel mode ipsec ipv4
```

To remove the configured IPsec tunnel mode for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel mode
```

# tunnel protection ipsec (IPsec)

**Overview** Use this command to enable IPsec protection for packets encapsulated by this tunnel.

Use the **no** variant to disable IPsec protection.

**Syntax** tunnel protection ipsec [profile <profile\_name>]  
no tunnel protection ipsec

**Default** IPsec protection for packets encapsulated by tunnel is disabled. If no custom profile is specified, the default profile is used.

Parameter	Description
<profile_name>	Custom profile name. You can use the <a href="#">crypto ipsec profile</a> command to create custom profiles.

**Mode** Interface Configuration

**Usage notes** IPsec mode tunnels (IPv4 and IPv6) require this command for them to work. GRE IPv6 and L2TPv3 IPv6 tunnel have IPsec protection as an option.

**Examples** To enable IPsec protection by using default profile, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel14
awplus(config-if)# tunnel protection ipsec
```

To enable IPsec protection by using a custom profile, use the following commands:

```
awplus(config)# interface tunnel14
awplus(config-if)# tunnel protection ipsec profile
my_profile
```

To disable IPsec protection for packets encapsulated by tunnel14, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel14
awplus(config-if)# no tunnel protection ipsec
```

**Related commands** [crypto ipsec profile](#)

# tunnel remote name (IPsec)

**Overview** Use this command to specify a tunnel remote name to authenticate the tunnel's remote peer device when you apply [tunnel protection ipsec \(IPsec\)](#) to encrypt the packets and configure an ISAKMP key.

Use the **no** variant of this command to remove a previously configured tunnel remote name.

**Syntax** tunnel remote name *<remote-name>*  
no tunnel local name

Parameter	Description
<i>&lt;remote-name&gt;</i>	Destination tunnel hostname

**Default** The default tunnel remote name is the IP address of tunnel destination.

**Mode** Interface Configuration

**Examples** To configure tunnel remote name office2 for tunnel6, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel remote name office2
```

To remove a configured tunnel local name for tunnel6, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel remote name
```

**Related commands** [tunnel local name \(IPsec\)](#)

# tunnel remote selector

**Overview** Use this command to specify a destination subnet for a traffic selector pair.

Use the **no** variant of this command to unset the remote subnet for a traffic selector pair so that it matches all destinations, i.e. 0.0.0.0/0 or ::/0 for IPv4 and IPv6, respectively. When local and remote subnets for a traffic selector pair are both unset, the traffic selector pair is removed.

**Syntax** tunnel remote selector [*<traffic-selector-ID>*]  
{*<IPv4-subnet>* | *<IPv6-subnet>*}  
no tunnel remote selector [*<traffic-selector-ID>*]

Parameter	Description
<i>&lt;traffic-selector-ID&gt;</i>	Traffic selector ID from 1 through 65535. If not specified the default value 1 is used.
<i>&lt;ipv4-subnet&gt;</i>	IPv4 subnet in the format A.B.C.D/M.
<i>&lt;ipv6-subnet&gt;</i>	IPv6 subnet in the format of X::X::X/M

**Default** When no traffic selector pairs are configured there is an implicit traffic selector pair, where the local and remote subnets are 0.0.0.0/0 or ::/0 depending on the tunnel IPsec mode.

**Mode** Interface configuration

**Usage notes** A traffic selector pair is an agreement between IKE peers to permit traffic through a tunnel if the traffic matches a specified pair of local and remote subnets. When the remote selector is specified but the local selector is not, the selector pair implicitly matches all sources.

**Examples** To specify an IPv4 destination address as the traffic selector for the traffic to match for tunnel0, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel source eth1
awplus(config-if)# tunnel destination 10.0.0.2
awplus(config-if)# tunnel local name office
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel local selector 192.168.1.0/24
awplus(config-if)# tunnel remote selector 192.168.2.0/24
```

When no traffic selector ID is specified the default ID value is used. By specifying a traffic selector ID, additional selector pairs can be configured.

To configure an additional source and destination traffic selector pair for the traffic to match for tunnel0, use the commands:

```
awplus(config-if)# tunnel local selector 5 192.168.1.0/24  
awplus(config-if)# tunnel remote selector 5 192.168.2.0/24
```

To specify an IPv6 source address as the traffic selector for the traffic to match for tunnel0, use the commands:

```
awplus# configure terminal  
awplus(config)# interface tunnel0  
awplus(config-if)# tunnel source eth1  
awplus(config-if)# tunnel destination 2001:db8:10::1  
awplus(config-if)# tunnel local name office  
awplus(config-if)# tunnel mode ipsec ipv6  
awplus(config-if)# tunnel local selector 2001:db8:1::/64  
awplus(config-if)# tunnel remote selector 2001:db8:2::/64
```

To configure an additional source and destination traffic selector pair for the traffic to match for tunnel0, use the commands:

```
awplus(config-if)# tunnel local selector 5 2001:db8:1::/64  
awplus(config-if)# tunnel remote selector 5 2001:db8:2::/64
```

To unset the destination traffic selector for the traffic selector pair with ID 1, for tunnel6, use the commands:

```
awplus# configure terminal  
awplus(config)# interface tunnel6  
awplus(config-if)# no tunnel remote selector
```

or

```
awplus(config-if)# no tunnel remote selector 5
```

**Related commands**

- [tunnel local selector](#)
- [tunnel selector paired](#)
- [show interface tunnel \(IPsec\)](#)

# tunnel security-reprocessing

**Overview** Use this command to enable stream security reprocessing on all tunnel interfaces.

Use the **no** variant of this command to disable security reprocessing on all tunnel interfaces.

Note that tunnel security reprocessing increases the load on your device and reduces throughput. This is because traffic is processed twice through the DPI engine. Therefore, it should only be enabled if your solution requires it.

**Syntax** tunnel security-reprocessing  
no tunnel security-reprocessing

**Default** Security reprocessing is disabled by default.

**Mode** Global Configuration

**Usage notes** Use this command when you need to reinspect the traffic in a tunnel terminating on the device using stream UTM features after tunnel headers and encryption have been removed. For a configuration example using this command, see the [Internet Protocol Security \(IPsec\) Feature Overview and Configuration Guide](#).

**Example** To enable security reprocessing, use the commands:

```
awplus# configure terminal
awplus(config)# tunnel security-reprocessing
```

To disable security reprocessing, use the commands:

```
awplus# configure terminal
awplus(config)# no tunnel security-reprocessing
```

**Related commands** [show interface tunnel \(GRE\)](#)  
[show interface tunnel \(IPsec\)](#)  
[show interface tunnel \(L2TPv3\)](#)  
[show interface tunnel \(OpenVPN\)](#)

**Command changes** Version 5.4.8-0.2: command added

# tunnel selector paired

**Overview** Use this command when multiple selector pairs are configured. This command forces ISAKMP to use strict pairing and therefore create separate Phase 2 IPsec SAs between pairs of source and destination selectors, based on selector ID.

Use the **no** variant of this command to stop forcing strict selector ID pairing.

**Syntax** tunnel selector paired

**Default** Disabled

**Mode** Interface mode for a tunnel

**Usage notes** When this command is disabled, if you specify address selectors, the tunnel can permit any combination of matching sources and/or destinations. While this conforms to the RFC, it may not be the expected behavior and may cause the IPsec SA to either fail negotiation or fail to pass traffic correctly.

This command forces ISAKMP to create individual IPsec SAs for each pair of source and destination selectors that have the same selector ID. Only traffic that matches a selector pair is permitted to flow via the associated SA.

**Example** To create a tunnel between 172.16.1.0/24 and 172.16.2.0/24, and also between 172.16.1.0/24 and any other destination, use the following tunnel selector commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel local selector 2 172.16.1.0/24
awplus(config-if)# tunnel remote selector 2 172.16.2.0/24
awplus(config-if)# tunnel local selector 3 172.16.1.0/24
awplus(config-if)# tunnel remote selector 3 0.0.0.0/0
awplus(config-if)# tunnel selector paired
```

**Related commands** [tunnel local selector](#)  
[tunnel remote selector](#)  
[show interface tunnel \(IPsec\)](#)

**Command changes** Version 5.4.8-1.1: command added

# tunnel source (IPsec)

**Overview** Use this command to specify an IPv4 or IPv6 source address or interface name for packets being encapsulated in the IPsec tunnel. The source address should be an existing IPv4 address or IPv6 address or interface name configured for an interface.

Note that if the tunnel source interface has multiple IP addresses, for example, one primary and one or more secondary IP addresses, the lowest IP address on the interface is used for transporting the tunnel encapsulated traffic.

Use the **no** variant of this command to remove a tunnel source address for a tunnel interface.

**Syntax** `tunnel source {<interface-name> | <ipv4-address> | <ipv6-address>}`  
`no tunnel source`  
`{<interface-name> | <ipv4-address> | <ipv6-address>}`

Parameter	Description
<code>&lt;interface-name&gt;</code>	Interface name.
<code>&lt;ipv4-address&gt;</code>	The IPv4 address uses the format A.B.C.D.
<code>&lt;ipv6-address&gt;</code>	The IPv6 address uses the format X:X::X:X.

**Mode** Interface Configuration

**Examples** To configure a source IPv4 address for IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel source 192.168.1.1
```

To configure a source IPv6 address for IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# tunnel mode ipsec ipv6
awplus(config-if)# tunnel source 2001:db8::
```

To configure a source interface for IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel source eth1
```

To remove the source address of IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# no tunnel source 192.168.1.1
```

**Related commands** [tunnel destination \(IPsec\)](#)

# undebg isakmp

**Overview** Use this command to disable debugging ISAKMP.  
To enable debugging ISAKMP, see [debug isakmp](#).

**Syntax** undebg [crypto] isakmp [info|trace|all]

Parameter	Description
undebg	Disable debugging function.
crypto	Security specific command.
isakmp	Internet Security Association Key Management Protocol provides a common framework for key management implementations.
info	Informational debug messages such as protocol events.
trace	Verbose debug messages including protocol events and message traces.
all	All debug enabled.

**Mode** Privileged Exec

**Related commands** [debug isakmp](#)  
[no debug isakmp](#)

# version (ISAKMP)

**Overview** Use this command to set the ISAKMP protocol version.  
Use the **no** variant to set the protocol version to default (IKEv2).

**Syntax** `version {1 mode {aggressive|main} | 2}`  
`no version`

Parameter	Description
1	IKEv1
main	IKEv1 Main mode. An IKE session begins with the initiator and recipient sending three two-way exchanges to define what encryption and authentication protocols are acceptable, how long keys should remain active, and whether perfect forward secrecy should be enforced. Main mode uses more packets for the process than Aggressive mode, but Main mode is considered more secure.
aggressive	IKEv1 Aggressive mode. The initiator and recipient accomplish the same objectives, but in only two exchanges.
2	IKEv2

**Default** If you do not specify the version, the default version is IKEv2

**Mode** IPsec ISAKMP Configuration

**Examples** To set the ISAKMP protocol version of profile "my\_profile" to IKEv1 main mode, use the following commands:

```
awplus(config)# configure isakmp profile my_profile  
awplus(config-isakmp-profile)# version 1 mode main
```

To set the version to its default, use the following command:

```
awplus# no version
```

# interface tunnel (GRE)

**Overview** Use this command to create a tunnel interface or to enter Interface mode to configure an existing tunnel. Tunnel interfaces are identified by an index identifier that is an integer in the range from 0 through 65535.

Use the **no** variant of this command to remove a previously created tunnel interface.

**Syntax** `interface tunnel<0-65535>`  
`no interface tunnel<tunnel-index>`

Parameter	Description
<code>&lt;0-65535&gt;</code>	Specify a tunnel interface index identifier in the range from 0 through 65535.

**Default** Tunnel interfaces do not exist.

**Mode** Global Configuration

**Usage notes** After you have created the tunnel interface, use the **tunnel mode** command to enable the tunnel.

**Examples** To configure a tunnel interface with index 30 and enable GRE, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel30
awplus(config-if)# tunnel mode gre
```

To remove the GRE tunnel interface tunnel30, use the commands:

```
awplus# configure terminal
awplus(config)# no interface tunnel30
```

**Command changes** Version 5.4.7-2.1: increased range for **tunnel** index identifiers.

# local authentication

**Overview** Use this command to specify the authentication method for the local device for a GRE Multipoint tunnel.

Use the **no** variant of this command to set the local authentication for an ISAKMP profile back to the default pre-shared.

**Syntax** local authentication [pre-shared|eap-radius]  
no local authentication

Parameter	Description
pre-shared	Authenticate using pre-shared keys (default)
eap-radius	Authenticate using a radius server

**Default** Pre-shared

**Mode** ISAKMP Profile configuration

**Usage notes** This command allows you to choose between pre-shared, where a fixed key is known by both ends and eap-radius, where a key is stored on a radius server.

- Local authentication can be reset back to pre-shared (the default) for the device to authenticate using pre-shared keys.
- Local authentication can be set to eap-radius for the device to authenticate using a radius server.

**Examples** To configure local authentication for an ISAKMP profile, use the commands:

```
awplus# configure terminal
awplus(config)# configure isakmp profile my_profile
awplus(config-isakmp-profile)# local authentication eap-radius
```

To set the local authentication for an ISAKMP profile back to the default (pre-shared), use the commands:

```
awplus# configure terminal
awplus(config)# configure isakmp profile my_profile
awplus(config-isakmp-profile)# no local authentication
```

**Related commands**

**Command changes** Version 5.4.9-0.1: command added

# remote authentication

**Overview** Use this command to specify the authentication method for the remote device for a GRE Multipoint tunnel.

Use the **no** variant of this command to set the remote authentication back to the default (pre-shared).

**Syntax** `remote authentication [pre-shared|eap-radius]`  
`no remote authentication`

Parameter	Description
pre-shared	Authenticate using pre-shared keys (default)
eap-radius	Authenticate using a radius server

**Default** Pre-shared

**Mode** ISAKMP profile configuration

**Usage notes** This command allows you to choose between pre-shared, where a fixed key is known by both ends and eap-radius, where a key is stored on a radius server.

- Remote authentication can be reset back to pre-shared (the default) for the device to authenticate using pre-shared keys.
- Remote authentication can be set to eap-radius for the device to authenticate using a radius server.

**Examples** To configure remote authentication for an ISAKMP profile, use the following commands:

```
awplus# configure terminal
awplus(config)# configure isakmp profile my_profile
awplus(config-isakmp-profile)# remote authentication
eap-radius
```

To configure remote authentication for an ISAKMP profile back to the default (pre-shared), use the following commands:

```
awplus# configure terminal
awplus(config)# configure isakmp profile my_profile
awplus(config-isakmp-profile)# no remote authentication
```

**Related commands** [local authentication](#)

[show interface tunnel \(GRE\)](#)

[show isakmp profile](#)

[tunnel endpoint](#)

tunnel mode gre multipoint

**Command changes** Version 5.4.9-0.1: command added

# show interface tunnel (GRE)

**Overview** Use this command to display status information of tunnels.

The tunnel remains inactive if no valid tunnel source or tunnel destination is configured.

**Syntax** `show interface tunnel<tunnel-index>`

Parameter	Description
tunnel	Specify this parameter to display tunnel status information of a given tunnel identified by the <0-65535> parameter.
<0-65535>	Specify a tunnel index in the range from 0 through 65535.

**Mode** Privileged Exec

**Example** To display status information for GRE tunnel tunnel20, use the command:

```
awplus# show interface tunnel20
```

Figure 77-1: Example output from the **show interface tunnel** command

```
awplus#show interface tunnel20
Interface tunnel20
  Link is UP, administrative state is UP
  Hardware is Tunnel
  IPv4 address 172.16.1.1/24 pointopoint 172.16.1.255
  index 4750 metric 1 mtu 1480
  arp ageing timeout 300
  <UP,POINTOPOINT,RUNNING,MULTICAST>
  SNMP link-status traps: Disabled
  Tunnel source 192.168.1.1, destination 192.168.2.1
  Tunnel local 192.168.1.1, remote 192.168.2.1
  Tunnel protocol/transport gre, key disabled, sequencing disabled
  Tunnel TTL inherit
  Checksumming of packets disabled, path MTU discovery disabled
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0 broadcast
  packets 0
  Time since last state change: 0 days 00:05:25
```

# tunnel checksum

**Overview** Use this command to enable GRE tunnel checksum insertion and checking. This results in the first two bytes after the protocol field in the IPv4 header containing the checksum. The tunnel checksum is used to detect packet corruption.

Use the **no** variant of this command to disable checksum insertion and checking.

**Syntax** tunnel checksum  
no tunnel checksum

**Default** Checksum insertion and checking is disabled.

**Mode** Interface Configuration

**Examples** To enable checksum insertion and checking, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel checksum
```

To disable checksum insertion and checking, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel checksum
```

# tunnel dscp

**Overview** Use this command to configure the Differentiated Services Code Point (DSCP) value for the DSCP field in the packet header that encapsulates the tunneled packets.

Use the **no** variant of this command to reset the DSCP field to its default value.

**Syntax** tunnel dscp <0-63>  
no tunnel dscp

Parameter	Description
<0-63>	Specify the DSCP value in the range from 0 through 63 for the DSCP field in the packet header that encapsulates the tunneled packets.

**Default** The IPv4 DSCP field value is inherited from the inner header to the outer header.

**Mode** Interface Configuration

**Examples** To configure the DSCP value to 10 for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel dscp 10
```

To remove a configured DSCP value for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel dscp
```

**Related commands** [interface tunnel \(IPv6\)](#)  
[interface tunnel \(GRE\)](#)

# tunnel destination (GRE)

**Overview** Use this command to specify a tunnel destination for the remote end of the tunnel. Tunnel destination can be specified by using a destination network name or an IPv4 address.

Use the **no** variant of this command to remove a configured tunnel destination.

**Syntax** tunnel destination {<ipv4-addr>|<destination-network-name>}  
no tunnel destination

Parameter	Description
<ipv4-addr>	Specify the tunnel destination IPv4 address in the dotted decimal format A.B.C.D. The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint.
<destination-network-name>	Destination network name. If the destination network name cannot be resolved, then the GRE tunnel remains inactive.

**Mode** Interface Configuration

**Examples** To configure an IPv4 tunnel destination by using an IPv4 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel destination 2.2.2.2
```

To configure a GRE tunnel destination by using a destination network name, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel destination
corporate_lan.example.com
```

To remove a GRE tunnel destination, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# no tunnel destination
```

**Related  
commands** interface tunnel (GRE)  
tunnel mode gre  
tunnel source (GRE)

# tunnel endpoint

**Overview** Use this command to set an endpoint to a GRE Multipoint tunnel interface.  
Use the **no** variant of this command to remove an existing configured endpoint.

**Syntax** tunnel endpoint {<ipv4-addr>|<network-name>|dynamic}  
no tunnel endpoint {<ipv4-addr>|<network-name>|dynamic}

Parameter	Description
<ipv4-address>	Specify the tunnel endpoint IPv4 address in the dotted decimal format A.B.C.D.
<network-name>	Specify the endpoint network name.
dynamic	Dynamically learn tunnel endpoints.

**Default** Virtual tunnel interfaces have no endpoints set.

**Mode** Interface Configuration

**Examples** To configure an IPv4 tunnel endpoint for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel endpoint 192.168.100.1
```

To remove the IPv4 tunnel endpoint for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel endpoint 192.168.100.1
```

To configure a tunnel endpoint network name "example\_lan.com" for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel endpoint example_lan.com
```

To remove the tunnel endpoint network name "example\_lan.com" for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel endpoint example_lan.com
```

To configure a dynamic tunnel endpoint for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel endpoint dynamic
```

To remove the dynamic tunnel endpoint for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel endpoint dynamic
```

**Related  
commands**

[local authentication](#)  
[remote authentication](#)  
[show interface tunnel \(GRE\)](#)  
[tunnel mode gre multipoint](#)

**Command  
changes**

Version 5.4.9-0.1: command added

# tunnel local name (GRE)

**Overview** Use this command to specify an IPsec tunnel hostname to send to the peer for authentication when you apply [tunnel protection ipsec \(GRE\)](#) to encrypt the packets and configure an ISAKMP key.

Use the **no** variant of this command to remove a previously configured IPsec tunnel hostname.

**Syntax** tunnel local name *<local-name>*  
no tunnel local name

Parameter	Description
<i>&lt;local-name&gt;</i>	Source tunnel hostname.

**Default** The default tunnel local name is the IP address of tunnel source.

**Mode** Interface Configuration

**Examples** To configure the tunnel local name office1 for tunnel6, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel local name office1
```

To remove a configured tunnel local name for tunnel6, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel local name
```

**Related commands** [tunnel remote name \(GRE\)](#)

# tunnel mode gre

**Overview** Use this command to configure the encapsulation tunneling mode to use. This command sets GRE IPv4 or IPv6 as the payload over IPv4 or IPv6 tunneling.

Use the **no** variant of this command to remove an established tunnel.

**Syntax** tunnel mode gre [ipv6]  
no tunnel mode

Parameter	Description
gre ipv6	Specify GRE IPv4 or IPv6 as the payload over IPv6 tunneling. IPv6 is the delivery protocol.

**Default** Virtual tunnel interfaces have no mode set by default. If you specify a mode of **gre**, the delivery protocol is IPv4 unless you specify IPv6.

**Mode** Interface Configuration

**Usage notes** A tunnel will not become operational until it is configured with this command.

**Examples** To configure GRE as the encapsulation mode for tunnel2, use the commands:

```
awplus# configure terminal  
awplus(config)# interface tunnel2  
awplus(config-if)# tunnel mode gre
```

To remove a configured GRE tunnel mode for tunnel2, use the commands:

```
awplus# configure terminal  
awplus(config)# interface tunnel2  
awplus(config-if)# no tunnel mode
```

**Related commands** [interface tunnel \(GRE\)](#)

# tunnel mode gre multipoint

**Overview** Use this command to set the tunnel mode to GRE Multipoint.  
Use the **no** variant of this command to unconfigure this tunnel mode.

**Syntax** tunnel mode gre multipoint  
no tunnel mode

**Default** Virtual tunnel interfaces have no mode set.

**Mode** Interface Configuration

**Examples** To configure gre multipoint tunnel mode for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel mode gre multipoint
```

To remove the configured gre multipoint tunnel mode for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel mode
```

**Related commands** [aaa authentication isakmp](#)

[tunnel endpoint](#)

**Command changes** Version 5.4.9-0.1: command added

# tunnel protection ipsec (GRE)

**Overview** Use this command to optionally enable IPsec protection for packets encapsulated by this tunnel.

Use the **no** variant to disable IPsec protection.

**Syntax** tunnel protection ipsec [profile <ipsec-profile>]  
no tunnel protection ipsec

Parameter	Description
<ipsec-profile>	The name of an optional custom IPsec profile ( <a href="#">crypto ipsec profile</a> command) to use to protect this tunnel.

**Default** IPsec protection for packets encapsulated by tunnel is disabled.

**Mode** Interface Configuration

**Usage notes** You also need to configure a pre-shared key in conjunction with this command. See the [crypto isakmp key](#) command for more information about configuring the pre-shared key.

**Examples** To enable IPsec protection for packets encapsulated by tunnel14, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel14
awplus(config-if)# tunnel protection ipsec
```

To disable IPsec protection for packets encapsulated by tunnel14, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel14
awplus(config-if)# no tunnel protection ipsec
```

**Related commands** [crypto ipsec profile](#)  
[crypto isakmp key](#)

# tunnel remote name (GRE)

**Overview** Use this command to specify a tunnel remote name to authenticate the tunnel's remote peer device when you apply [tunnel protection ipsec \(GRE\)](#) to encrypt the packets and configure an ISAKMP key.

Use the **no** variant of this command to remove a previously configured tunnel remote name.

**Syntax** tunnel remote name *<remote-name>*  
no tunnel local name

Parameter	Description
<i>&lt;remote-name&gt;</i>	Destination tunnel hostname

**Default** The default tunnel remote name is the IP address of tunnel destination.

**Mode** Interface Configuration

**Examples** To configure tunnel remote name *office2* for *tunnel6*, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel remote name office2
```

To remove a configured tunnel local name for *tunnel6*, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel remote name
```

**Related commands** [tunnel local name \(GRE\)](#)

# tunnel security-reprocessing

**Overview** Use this command to enable stream security reprocessing on all tunnel interfaces.

Use the **no** variant of this command to disable security reprocessing on all tunnel interfaces.

Note that tunnel security reprocessing increases the load on your device and reduces throughput. This is because traffic is processed twice through the DPI engine. Therefore, it should only be enabled if your solution requires it.

**Syntax** tunnel security-reprocessing  
no tunnel security-reprocessing

**Default** Security reprocessing is disabled by default.

**Mode** Global Configuration

**Usage notes** Use this command when you need to reinspect the traffic in a tunnel terminating on the device using stream UTM features after tunnel headers and encryption have been removed. For a configuration example using this command, see the [Internet Protocol Security \(IPsec\) Feature Overview and Configuration Guide](#).

**Example** To enable security reprocessing, use the commands:

```
awplus# configure terminal
awplus(config)# tunnel security-reprocessing
```

To disable security reprocessing, use the commands:

```
awplus# configure terminal
awplus(config)# no tunnel security-reprocessing
```

**Related commands** [show interface tunnel \(GRE\)](#)  
[show interface tunnel \(IPsec\)](#)  
[show interface tunnel \(L2TPv3\)](#)  
[show interface tunnel \(OpenVPN\)](#)

**Command changes** Version 5.4.8-0.2: command added

# tunnel source (GRE)

**Overview** Use this command to specify a tunnel source for the tunnel interface. Tunnel source can be specified by using an interface name or an IPv4 address. The source address must be an existing IPv4 address configured for an interface.

Use the **no** variant of this command to remove a tunnel source for a tunnel interface.

**Syntax** tunnel source {<ipv4-addr>|<interface-name>}  
no tunnel source

Parameter	Description
<ipv4-addr>	Specify the tunnel source IPv4 address for the GRE tunnel interface in the dotted decimal format A.B.C.D. The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint.
<interface-name>	Available interface name. Any AlliedWare Plus interface type (eth, vlan, ppp, tunnel, lo and so on). Using interface name can minimize the number of user-configured IP addresses and allow the tunnel source IP address to be dynamically issued via, for example, DHCP.

**Mode** Interface Configuration

**Examples** To configure a GRE tunnel source IPv4 address, use the commands:

```
awplus# configure terminal
awplus# interface eth1
awplus(config-if)# ip address 1.1.1.1/24
awplus(config-if)# interface tunnel1
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel source 1.1.1.1
```

To use an interface name as the tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel source eth2
```

To remove a GRE tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel1
awplus(config-if)# no tunnel source
```

**Related commands** interface tunnel (GRE)  
tunnel destination (GRE)  
tunnel mode gre

# tunnel ttl

**Overview** Use this command to configure the value to use for the Time to Live (TTL) field in the IPv4 header that encapsulates the tunneled IPv4 or IPv6 packets.

Use the **no** variant of this command to set the TTL value to its default.

**Syntax** tunnel ttl <1-255>  
no tunnel ttl

Parameter	Description
<1-255>	TTL value from 1 through 255.

**Default** The default TTL value is inherited from the encapsulated packet.

**Mode** Interface Configuration

**Example** To set the TTL value of the packet to 255, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel20
awplus(config-if)# tunnel ttl 255
```

To remove the configured TTL value of the packet, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel20
awplus(config-if)# no tunnel ttl
```

**Related commands** [interface tunnel \(IPv6\)](#)  
[interface tunnel \(GRE\)](#)

# OpenVPN Commands

## Introduction

This chapter provides an alphabetical reference of commands used to configure AlliedWare Plus OpenVPN.

For introductory information about AlliedWare Plus OpenVPN, including overview and configuration information, see the [OpenVPN Feature Overview and Configuration\\_Guide](#).

The table below lists the OpenVPN commands and their applicable modes.

Figure 78-1: OpenVPN commands and applicable modes

Mode	Command
Privileged Exec	<code>show openvpn connections</code>
	<code>show openvpn connections detail</code>
Interface Configuration	<code>tunnel mode openvpn tap</code>
	<code>tunnel mode openvpn tun</code>
	<code>tunnel openvpn port</code>
	<code>tunnel openvpn tagging</code>

- Command List**
- `"ip tcp adjust-mss"` on page 3575
  - `"ipv6 tcp adjust-mss"` on page 3577
  - `"show interface tunnel (OpenVPN)"` on page 3579
  - `"show openvpn connections"` on page 3580
  - `"show openvpn connections detail"` on page 3581
  - `"tunnel openvpn authentication"` on page 3582
  - `"tunnel openvpn cipher"` on page 3583

- [“tunnel mode openvpn tap”](#) on page 3585
- [“tunnel mode openvpn tun”](#) on page 3586
- [“tunnel openvpn expiry-bytes”](#) on page 3587
- [“tunnel openvpn expiry-seconds”](#) on page 3588
- [“tunnel openvpn port”](#) on page 3589
- [“tunnel openvpn tagging”](#) on page 3590
- [“tunnel security-reprocessing”](#) on page 3591

# ip tcp adjust-mss

**Overview** Use this command to set the Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

**Syntax** `ip tcp adjust-mss {<mss-size>|pmtu}`  
`no ip tcp adjust-mss`

Parameter	Description
<code>&lt;mss-size&gt;</code>	<code>&lt;64-1460&gt;</code> Specifies the MSS size in bytes.
<code>pmtu</code>	Adjust TCP MSS automatically with respect to the MTU on the interface.

**Default** The default setting allows a TCP server or a TCP client to set the MSS value for itself.

**Mode** Interface Configuration

**Usage notes** When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

**Examples** To configure an MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip tcp adjust-mss 1452
```

To configure an MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip tcp adjust-mss 1452
```

To configure an MSS size of 1452 bytes on interface tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# ip tcp adjust-mss 1452
```

To restore the MSS size to the default size on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip tcp adjust-mss
```

**Related  
commands**

[mtu \(PPP\)](#)  
[show interface](#)  
[show interface \(PPP\)](#)  
[show interface tunnel \(GRE\)](#)

**Command  
changes**

Version 5.4.8-2.1: interface tunnel example added

# ipv6 tcp adjust-mss

**Overview** Use this command to set the IPv6 Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

**Syntax** `ipv6 tcp adjust-mss {<mss-size>|pmtu}`  
`no ipv6 tcp adjust-mss`

Parameter	Description
<code>&lt;mss-size&gt;</code>	<code>&lt;64-1460&gt;</code> Specifies the MSS size in bytes.
<code>pmtu</code>	Adjust TCP MSS automatically with respect to the MTU on the interface.

**Default** The default setting allows a TCP server or a TCP client to set the MSS value for itself.

**Mode** Interface Configuration

**Usage notes** When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

**Examples** To configure an IPv6 MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 tcp adjust-mss 1452
```

To configure an IPv6 MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 tcp adjust-mss 1452
```

To adjust IPv6 TCP MSS automatically with respect to the MTU on interface tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# ipv6 tcp adjust-mss pmtu
```

To restore the MSS size to the default size on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 tcp adjust-mss
```

**Related  
commands**

[mtu \(PPP\)](#)  
[show interface](#)  
[show interface \(PPP\)](#)  
[show interface tunnel \(GRE\)](#)

**Command  
changes**

Version 5.4.8-2.1: interface tunnel example added

# show interface tunnel (OpenVPN)

**Overview** Use this command to display status information of a tunnel.

The tunnel remains inactive if no valid tunnel source or tunnel destination is configured.

**Syntax** `show interface tunnel<tunnel-index>`

Parameter	Description
<code>&lt;tunnel-index&gt;</code>	The tunnel index in the range from 0 to 65535.

**Mode** Privileged Exec

**Examples** To display brief status information for OpenVPN tunnel0, enter the command below:

```
awplus# show interface tunnel0
```

**Output** Figure 78-2: Example output from the **show interface tunnel** command

```
awplus#show interface tunnel0
Interface tunnel0
  Link is UP, administrative state is UP
  Hardware is Tunnel
  IPv4 address 192.168.1.1/24 pointopoint 192.168.1.255
  IPv6 address 2001:db8:1::1/64
  IPv6 address fe80::200:cdf:fe38:111/64
  index 12 metric 1 mtu 1500
  <UP,POINTOPOINT,RUNNING,MULTICAST>
  SNMP link-status traps: Disabled
  Tunnel source UNKNOWN, destination UNKNOWN
  Tunnel name local AR3050S, remote UNKNOWN
  Tunnel ID local (not set), remote (not set)
  Tunnel protocol/transport openvpn tun, key disabled, sequencing disabled
  Tunnel TTL -
  Checksumming of packets disabled, path MTU discovery disabled
  input packets 0, bytes 0, dropped 0, multicast packets 0
  output packets 8, bytes 488, multicast packets 0 broadcast packets 0
  Time since last state change: 0 days 00:00:36
```

# show openvpn connections

**Overview** Use this command to show information about connected OpenVPN users.

**Syntax** show openvpn connections

**Mode** Privileged Exec

**Examples** To show information about connected OpenVPN users, use the command:

```
awplus# show openvpn connections
```

**Output** Figure 78-3: Example output from the **show openvpn connections** command

```
awplus#show openvpn connections

Maximum connections: 100

Interface: tunnel0

Username      Real Address      Rx      Tx
              Bytes      Bytes      Connected Since
-----
foo           ::ffff:192.168.1.2  3553    3906    Wed Aug 13 01:09:07 2014
```

**Related commands** [show openvpn connections detail](#)

# show openvpn connections detail

**Overview** Use this command to show detailed information about connected OpenVPN users.

Note that in the output parameters (such as Route, Address, DNS Server) for a specific user may vary because the parameters depend on the configuration information of the RADIUS server associated with the user.

**Syntax** `show openvpn connections detail`

**Mode** Privileged Exec

**Examples** To show detailed information about connected OpenVPN users, use the command:

```
awplus# show openvpn connections detail
```

**Output** Figure 78-4: Example output from the **show openvpn connections detail** command

```
awplus#show openvpn connections detail

Interface: tunnel0
Username: user1
Route:      192.168.20.0 255.255.255.0 192.168.10.2
Address:    192.168.10.3 255.255.255.0
DNS Server: 192.168.10.253
DNS Server: 192.168.10.254
VID:       20
Username: user2
Route:      192.168.20.0 255.255.255.0 192.168.10.2
Address:    192.168.10.4 255.255.255.0
DNS Server: 192.168.10.253
DNS Server: 192.168.10.254
VID:       20
```

**Related commands** [show openvpn connections](#)

# tunnel openvpn authentication

**Overview** Use this command to configure the data channel authentication digest for an OpenVPN tunnel.

Use the **no** variant of this command to set the data channel authentication digest for an OpenVPN tunnel to its default value of SHA1.

**Syntax** tunnel openvpn authentication {sha1|sha256}  
no tunnel openvpn authentication

Parameter	Description
sha1	Use Secure Hash Standard with 160-bit digest size as the data channel authentication digest.
sha256	Use Secure Hash Standard with 256-bit digest size as the data channel authentication digest.

**Default** SHA1

**Mode** Interface configuration

**Usage notes** You need to configure the client to use the same setting as the server. To do this, include one of the following lines in your client's OpenVPN configuration (.ovpn) file:

Setting	Line
SHA1	auth SHA1
SHA256	auth SHA256

**Example** To configure tunnel 5, which is an OpenVPN tunnel, to use SHA256 data channel authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# tunnel openvpn authentication SHA256
```

**Related commands** [tunnel openvpn cipher](#)

**Command changes** Version 5.4.7-0.1: command added

# tunnel openvpn cipher

**Overview** Use this command to configure the data channel encryption cipher for an OpenVPN tunnel.

Use the **no** variant of this command to set the data channel encryption cipher for an OpenVPN tunnel to its default value of AES-128.

**Syntax** tunnel openvpn cipher {aes128|aes256}  
no tunnel openvpn cipher

Parameter	Description
aes128	Use Advanced Encryption Standard symmetric key block cipher with a 128-bit key as the data channel encryption cipher.
aes256	Use Advanced Encryption Standard symmetric key block cipher with a 256-bit key as the data channel encryption cipher.

**Default** AES-128

**Mode** Interface configuration

**Usage notes** You need to configure the client to use the same setting as the server. To do this, include one of the following lines in your client's OpenVPN configuration (.ovpn) file:

Setting	Line
AES-128	cipher AES-128-CBC
AES-256	cipher AES-256-CBC

For example, consider a client file tun.ovpn that has the following settings:

```
# tun.ovpn
client
auth-user-pass
cipher AES-128-CBC
dev tap
proto udp
remote 192.168.1.1
ca c:/users/support/cacert.pem
verb 7
```

To change the client to AES-256, replace the line "cipher AES-128-CBC" with "cipher AES-256-CBC".

**Example** To configure tunnel 5, which is an OpenVPN tunnel, to use AES-256 data channel encryption, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# tunnel openvpn cipher aes256
```

**Related commands** [tunnel openvpn authentication](#)

**Command changes** Version 5.4.7-0.1: command added

# tunnel mode openvpn tap

**Overview** Use this command to set the tunnel mode to OpenVPN TAP for a tunnel interface.

Use the **no** variant of this command to remove the mode.

TAP is a virtual network device. TAP creates a Virtual Tunnel Interface (VTI) that carries layer 2 frames. You may want to use TAP in the following scenarios:

- You want to use bridges to transport Ethernet frames
- You want to transport any network protocol, such as IPv4, IPv6, IPX

Note that TAP will cause broadcast overhead on the VPN tunnel and add the overhead of Ethernet headers on all packets transported over the VPN tunnel.

Note that the distribution of client IP addresses through DHCP is only supported in TAP mode.

**Syntax** tunnel mode openvpn tap  
no tunnel mode

**Mode** Interface Configuration

**Examples** To set tunnel5 to be an OpenVPN tunnel in TAP mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# tunnel mode openvpn tap
```

To remove the configured mode for tunnel5, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# no tunnel mode
```

**Related commands** [tunnel mode openvpn tun](#)

# tunnel mode openvpn tun

**Overview** Use this command to set the tunnel mode to OpenVPN TUN for a tunnel interface.

Use the **no** variant of this command to remove the mode.

TUN is a virtual network device. TUN creates a Virtual Tunnel Interface (VTI) that carries layer 3 packets. You may want to use TUN in the following scenarios:

- You want to transport traffic that is destined for the VPN client
- You want to transport only layer 3 packets
- You want to support VPN on mobile devices

Note that TUN cannot be used in bridges and broadcast traffic is not transported in TUN mode.

**Syntax** tunnel mode openvpn tun  
no tunnel mode

**Mode** Interface Configuration

**Examples** To set tunnel5 to be an OpenVPN tunnel in TUN mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# tunnel mode openvpn tun
```

To remove the configured mode for tunnel5, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# no tunnel mode
```

**Related commands** [tunnel mode openvpn tap](#)

# tunnel openvpn expiry-bytes

**Overview** Use this command to change how the firewall decides when to renegotiate client keys. By default, client keys are renegotiated after an hour; you can use this command to base rekeying on data usage instead of time.

Use the **no** variant of this command to return to time-based rekeying instead.

**Syntax** tunnel openvpn expiry-bytes <0-4294967295>  
no tunnel openvpn expiry-bytes

Parameter	Description
expiry-bytes <0-4294967295>	The number of bytes of traffic after which the firewall renegotiates client keys. A value of 0 bytes means that keys are not renegotiated after the VPN is formed. Otherwise, setting the expiry-bytes to a non-zero value will cause a rekey when the firewall has received that many bytes of traffic.

**Default** Not configured - the firewall renegotiates keys every hour instead.

**Mode** Interface mode for a tunnel

**Usage notes** If you intend to use more than 100 concurrent tunnels, we recommend you use this command to change to rekeying based on data usage per VPN tunnel instead of timer-based rekeying. Each VPN tunnel will then independently rekey once it reaches the data limit. This prevents all tunnels from rekeying at the same time.

**Example** To configure tunnel2 to rekey after 1Gbyte of traffic, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel openvpn expiry-bytes 1000000000
```

To return tunnel2 to the default of rekeying hourly, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel openvpn expiry-bytes
```

**Related commands** [tunnel openvpn expiry-seconds](#)

**Command changes** Version 5.4.7-0.1: command added

# tunnel openvpn expiry-seconds

**Overview** Use this command to change when client keys are renegotiated. By default, client keys are renegotiated after an hour; you can use this command to turn off renegotiation or to change that time period.

Use the **no** variant of this command to return to the default of 1 hour.

**Syntax** tunnel openvpn expiry-seconds <0-4294967295>  
no tunnel openvpn expiry-seconds

Parameter	Description
expiry-seconds <0-4294967295>	The length of time after which the firewall renegotiates client keys. A value of 0 seconds means that keys are not renegotiated after the VPN is formed. Otherwise, setting the expiry-seconds to a non-zero timer value will cause a rekey when that time is exceeded.

**Default** 3600 seconds (1 hour).

**Mode** Interface mode for a tunnel

**Usage notes** If you intend to use more than 100 concurrent tunnels, we recommend you change to rekeying based on data usage per VPN tunnel instead of timer-based rekeying. Each VPN tunnel will then independently rekey once it reaches the data limit. This prevents all tunnels from rekeying at the same time. To rekey based on data usage per VPN, use the [tunnel openvpn expiry-bytes](#) command.

**Example** To configure tunnel2 to rekey every 30 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel openvpn expiry-seconds 1800
```

To return tunnel2 to the default of rekeying hourly, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel openvpn expiry-seconds
```

**Related commands** [tunnel openvpn expiry-bytes](#)

**Command changes** Version 5.4.7-0.1: command added

# tunnel openvpn port

**Overview** Use this command to specify the UDP listening port that is used to receive OpenVPN tunnel connections.

Use the **no** variant to set the port number to its default value which is 1194.

**Syntax** tunnel openvpn port <1-65535>  
no tunnel openvpn port

Parameter	Description
<1-65535>	Port number from 1 through 65535.

**Default** The default UDP port number is 1194.

**Mode** Interface Configuration

**Usage notes** If firewall protection is enabled, you need to create a firewall rule that allows the OpenVPN application traffic to traverse the firewall. OpenVPN is a pre-defined application with destination port number 1194. You can use the [show application detail](#) command to see the application details. If you specify a UDP number that is different to the default port number, you need to create an application with the same specified UDP port number for OpenVPN, and then create a firewall rule to allow the application to traverse the firewall. For more information about firewall rules, see the [rule \(firewall\)](#) command.

**Examples** To configure tunnel tunnel5 to receive incoming tunnel connections on UDP port 4567, use the commands:

```
awplus(config)# interface tunnel5  
awplus(config-if)# tunnel openvpn port 4567
```

To remove the specified UDP port for tunnel tunnel5 and set the UDP port to its default value, use the commands:

```
awplus# configure terminal  
awplus(config)# interface tunnel5  
awplus(config-if)# no tunnel openvpn port
```

# tunnel openvpn tagging

**Overview** This command configures an OpenVPN tunnel to add an 802.1Q tag (a VLAN ID) to traffic received over the tunnel. VLAN ID (VID) is a VLAN identifier that is used to determine which VLAN the traffic belongs to. The VID is determined from information received from the RADIUS server during the authentication process. If no VID information is received from the RADIUS server, the value specified in this command is used.

Use the **no** variant of this command to remove the VID over the tunnel.

Note that you can add an 802.1Q tag in the TAP mode only.

**Syntax** tunnel openvpn tagging <1-4094>  
no tunnel openvpn tagging

Parameter	Description
<1-4094>	VLAN ID from 1 through 4094

**Mode** Interface Configuration

**Examples** To add a 802.1Q tag to packets received over tunnel tunnel5, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# tunnel openvpn tagging 1
```

To remove the 802.1Q tag over tunnel tunnel5, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# no tunnel openvpn tagging
```

# tunnel security-reprocessing

**Overview** Use this command to enable stream security reprocessing on all tunnel interfaces.

Use the **no** variant of this command to disable security reprocessing on all tunnel interfaces.

Note that tunnel security reprocessing increases the load on your device and reduces throughput. This is because traffic is processed twice through the DPI engine. Therefore, it should only be enabled if your solution requires it.

**Syntax** tunnel security-reprocessing  
no tunnel security-reprocessing

**Default** Security reprocessing is disabled by default.

**Mode** Global Configuration

**Usage notes** Use this command when you need to reinspect the traffic in a tunnel terminating on the device using stream UTM features after tunnel headers and encryption have been removed. For a configuration example using this command, see the [Internet Protocol Security \(IPsec\) Feature Overview and Configuration Guide](#).

**Example** To enable security reprocessing, use the commands:

```
awplus# configure terminal  
awplus(config)# tunnel security-reprocessing
```

To disable security reprocessing, use the commands:

```
awplus# configure terminal  
awplus(config)# no tunnel security-reprocessing
```

**Related commands** [show interface tunnel \(GRE\)](#)  
[show interface tunnel \(IPsec\)](#)  
[show interface tunnel \(L2TPv3\)](#)  
[show interface tunnel \(OpenVPN\)](#)

**Command changes** Version 5.4.8-0.2: command added

# debug l2tp

**Overview** Use this command to enable debugging of L2TPv2 tunnels.  
Use the **no** variant of this command to disable debugging of L2TPv2 tunnels.

**Syntax** debug l2tp  
no debug l2tp  
undebug l2tp

**Default** Debugging of L2TPv2 tunnels is disabled by default.

**Mode** Privileged Exec

**Example** To enable debugging for L2TPv2 tunnels, use the commands:

```
awplus# debug l2tp
awplus# terminal monitor
% Warning: Console logging enabled
```

To disable debugging of L2TPv2 tunnels, use the command:

```
awplus# no debug l2tp
or the command:
awplus# undebug l2tp
```

**Related commands** [debug pppoe-ac](#)  
[show debugging l2tp](#)

# destination

**Overview** Use this command to set the destination of an L2TP tunnel.

Use the **no** variant of this command to remove the destination from the L2TP tunnel.

**Syntax** `destination [<ipv4-addr> | <ipv6-addr> | <domain-name>]`  
`no destination`

Parameter	Description
<code>&lt;ipv4-addr&gt;</code>	The destination of the L2TP tunnel as an IPv4 address.
<code>&lt;ipv6-addr&gt;</code>	The destination of the L2TP tunnel as an IPv6 address.
<code>&lt;domain-name&gt;</code>	The destination of the L2TP tunnel as a fully-qualified domain name.

**Default** No destination is set by default.

**Mode** L2TP Tunnel Configuration

**Example** To set the destination IP address for tunnel1 to 10.1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# destination 10.1.1.1
```

To remove the destination IP address from tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no destination
```

# encapsulation ppp

**Overview** Use this command to enable PPP encapsulation and create one or more PPP interfaces over Ethernet, a cellular interface, or an L2TPv2 managed VPN.

Use the **no** variant of this command to disable PPP encapsulation and remove the specified PPP interface.

**Syntax** encapsulation ppp <index>  
no encapsulation ppp <index>

Parameter	Description
<index>	The PPP interface index number in the range from 0 to 255.

**Default** No PPP encapsulation or interfaces are configured by default.

**Mode** Interface Configuration mode for an Ethernet interface (e.g. **interface eth1**), or an Ethernet sub-interface (e.g. **interface eth1.1**), or a cellular interface (e.g. **interface cellular0**).

L2TP Tunnel Configuration mode for an L2TP tunnel (e.g. **l2tp tunnel tunnel0**).

**Examples** To configure a PPP interface with index 0 for Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# encapsulation ppp 0
```

To shut down the ppp0 interface and remove it from Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# shutdown
awplus(config-if)# interface eth1
awplus(config-if)# no encapsulation ppp 0
```

To set the L2TP tunnel tunnel1 to encapsulate the PPP interface with index 1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# encapsulation ppp 1
```

To remove the PPP interface with index 1 from L2TP tunnel tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no encapsulation ppp 1
```

# ip-version

**Overview** Use this command to set the IP version for the L2TP tunnel.  
The IP version must be set to the same value at both ends of the tunnel.

**Syntax** `ip-version [4|6]`

Parameter	Description
4	IPv4
6	IPv6

**Default** The IP version is set to IPv4 by default.

**Mode** L2TP Tunnel Configuration

**Example** To set the IP version for tunnel1 to IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# ip-version 6
```

To set the IP version for tunnel1 to the default (IPv4), use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# ip-version 4
```

# l2tp tunnel

**Overview** Use this command to create a named L2TP tunnel, and to enter L2TP Tunnel Configuration mode to configure it.

Use the **no** variant of this command to remove the named tunnel and all of its configuration.

**Syntax** `l2tp tunnel <tunnel-name>`  
`no l2tp tunnel <tunnel-name>`

Parameter	Description
<code>&lt;tunnel-name&gt;</code>	The name of the tunnel to create, change or delete.

**Default** No L2TP tunnel is configured by default.

**Mode** Global Configuration

**Example** To create and begin configuring a new L2TP tunnel named 'tunnel1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)#
```

To remove the tunnel 'tunnel1' and its configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no l2tp tunnel tunnel1
```

# l2tp unmanaged port

**Overview** Use this command to set the UDP port for an (IPv4 and IPv6) unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires).

This command can only change the UDP port when there is no unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires) configured.

Use the **no** variant of this command to reset the UDP port to the default (1701).

**Syntax** `l2tp unmanaged port [<1-65535>]`  
`no l2tp unmanaged port`

Parameter	Description
<1-65535>	The number of the UDP port to use for an unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires).

**Default** The UDP port is 1701 by default.

**Mode** Global Configuration

**Usage notes** The default UDP port for both unmanaged and managed L2TP tunnels is 1701. If both kinds of tunnel will be configured, the UDP port for the unmanaged tunnel must be changed to a different port by using the **l2tp unmanaged port** command.

Be aware of potential clashes with other UDP port users. Unless it is likely to be used for other purposes, we recommend configuring UDP port 1702 as a suitable alternative.

**Example** To set the UDP port for an L2TP unmanaged tunnel (L2TPv3 Ethernet Pseudowires) to 1702, use the following commands:

```
awplus# configure terminal
awplus(config)# l2tp unmanaged port 1702
```

**Related commands** [tunnel mode l2tp v3](#)  
[show running-config](#)

# l2tp-profile

**Overview** Use this command to create an L2TP profile and to enter the L2TP Profile Configuration mode.

Use the **no** variant of this command to remove the L2TP profile and all its configuration.

**Syntax** `l2tp-profile <name>`  
`no l2tp-profile <name>`

Parameter	Description
<code>&lt;name&gt;</code>	The name of the L2TP profile being created or configured.

**Default** No L2TP profile is configured by default. This command is not configured by default.

**Mode** Global Configuration

**Example** To create a L2TP profile named "public", use the commands:

```
awplus# configure terminal
awplus(config)# l2tp-profile public
awplus(config-l2tp-profile)#
```

To remove all configuration of this L2TP profile, use the commands:

```
awplus# configure terminal
awplus(config)# no l2tp-profile public
```

**Related commands** [l2tp profile](#)  
[pppoe-ac](#)  
[shared-secret](#)  
[show running-config l2tp-profile](#)  
[version](#)

# local-subaddress

**Overview** Use this command to set the local sub-address for L2TPv2 tunnel authentication. Use the **no** variant of this command to remove the configured local sub-address.

**Syntax** `local-subaddress [<sub-address>]`  
`no local-subaddress`

Parameter	Description
<code>&lt;sub-address&gt;</code>	The local sub-address for the tunnel.

**Default** The local sub-address is not set by default; by default, the received L2TPv2 sub-address AVP will not be checked before establishing the tunnel.

**Mode** L2TP Tunnel Configuration

**Usage notes** If a local sub-address is set, this is checked against incoming the sub-address AVP as a requirement for tunnel establishment. The received sub-address AVP content must match the configured local sub-address.

**Example** To set the local-sub address of tunnel1 to 'office1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# local-subaddress office1
```

To remove the local sub-address configuration from tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no local-subaddress
```

**Related commands**

- [l2tp tunnel](#)
- [remote-subaddress](#)
- [show l2tp tunnel config-check](#)
- [show running-config l2tp-tunnel](#)

# protection ipsec

**Overview** Use this command to enable IPsec protection on the L2TP tunnel.  
Use the **no** variant of this command to disable IPsec on the tunnel.

**Syntax** protection ipsec  
no protection ipsec

**Default** IPsec protection is disabled by default.

**Mode** L2TP Tunnel Configuration

**Example** To protect tunnel1 with IPsec, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# protection ipsec
```

To disable IPsec protection for tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no protection ipsec
```

**Related commands**

- [l2tp tunnel](#)
- [protection ipsec](#)
- [protection local-name](#)
- [protection profile](#)
- [protection remote-name](#)
- [show l2tp tunnel config-check](#)
- [show running-config l2tp-tunnel](#)

# protection local-name

**Overview** Use this command to set the IPsec local name for the L2TP tunnel. This is the local identifier for IKE.

Use the **no** variant of this command to reset the local name to the default—the source IP address of the L2TP tunnel.

**Syntax** protection local-name [*<ipsec-local-name>*]  
no protection local-name

Parameter	Description
<i>&lt;ipsec-local-name&gt;</i>	The IPsec local name for the tunnel.

**Default** By default, the IPsec local name is set to the source IP address of the L2TP tunnel.

**Mode** L2TP Tunnel Configuration

**Usage notes** If no local name is configured with this command, the source IP address of the tunnel is used. If a local name is configured with this command, the **crypto isakmp key** command is required to configure a preshared authentication key using this local name as the hostname.

**Example** To set the IPsec local name for tunnel1 to office1 and set the key to 'friend', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# protection ipsec
awplus(config-l2tp-tunnel)# protection local-name office1
awplus(config)# crypto isakmp key friend hostname office1
```

To remove the IPsec local name for tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no protection local-name
```

**Related commands**

# protection profile

**Overview** Use this command to set the IPsec profile to use for this L2TP tunnel.  
Use the **no** variant of this command to set it back to the default IPsec profile: the profile named 'default'.

**Syntax** `protection profile [<profile-name>]`  
`no protection profile`

Parameter	Description
<code>&lt;profile-name&gt;</code>	The name of the IPsec profile to use. This is the profile created by the <b>crypto ipsec profile</b> command.

**Default** The L2TP tunnel protection profile is set to the IPsec profile named 'default' by default.

**Mode** L2TP Tunnel Configuration

**Example** To set up tunnel1 with IPsec protection using IPsec profile 'profile1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# protection ipsec
awplus(config-l2tp-tunnel)# protection profile profile1
```

To reset tunnel1 to use IPsec protection with IPsec profile 'default', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no protection profile
```

**Related commands**

- [protection ipsec](#)
- [protection local-name](#)
- [protection remote-name](#)
- [show l2tp tunnel config-check](#)
- [show running-config l2tp-tunnel](#)

# protection remote-name

**Overview** Use this command to set the L2TP tunnel IPsec remote name. This is the remote identifier for IKE.

Use the **no** variant of this command to reset the remote name to the default—the destination IP address of the tunnel.

**Syntax** `protection remote-name [<ipsec-remote-name>]`  
`no protection remote-name`

Parameter	Description
<code>&lt;ipsec-remote-name&gt;</code>	The IPsec remote name for the tunnel.

**Default** By default, the IPsec remote name is set to the destination IP address of the tunnel.

**Mode** L2TP Tunnel Configuration

**Usage notes** In order to set the IPsec remote name for the tunnel and add a corresponding ISAKMP key for the tunnel, set the IPsec remote name with this command (**protection remote-name**) and set the key for this by using the **crypto isakmp key** command with this remote name as the hostname.

**Example** To set the IPsec remote name for tunnel1 to 'office2' and set the key to 'friend', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# protection ipsec
awplus(config-l2tp-tunnel)# protection remote-name office2
awplus(config)# crypto isakmp key friend hostname office2
```

To reset the IPsec remote name for tunnel1 to default (destination IP address of the tunnel), use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no protection remote-name
```

# remote-subaddress

**Overview** Use this command to set the remote sub-address for L2TPv2 tunnel authentication.

Use the **no** variant of this command to remove the sub-address from the tunnel configuration.

**Syntax** `remote-subaddress [<sub-address>]`  
`no remote-subaddress`

Parameter	Description
<code>&lt;sub-address&gt;</code>	The remote sub-address for the tunnel.

**Default** The remote sub-address is not set by default; the outgoing L2TP sub-address AVP for the tunnel will not be populated.

**Mode** L2TP Tunnel Configuration

**Usage notes** If the L2TP peer is also an AR-Series firewall, the remote-subaddress must match the local sub-address configured at the other end of the tunnel.

If a remote sub-address is configured for the tunnel, this value is placed in the outgoing sub-address AVP. The other tunnel end point can check this value against its configured local sub-address for the tunnel before establishing the tunnel.

**Example** To set the remote sub-address of tunnel1 to 'office1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# remote-subaddress office1
```

To remove the remote sub-address configuration from tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no remote-subaddress
```

**Related commands**

# shared-secret

**Overview** Use this command to set the secret password that is shared with L2TP tunnel peers. Use the **no** variant of this command to remove the shared secret.

**Syntax** shared-secret <secret>  
no shared-secret

Parameter	Description
<secret>	The password shared with the tunnel peer.

**Default** No shared secret is configured by default.

**Mode** L2TP Profile Configuration and L2TP Tunnel Configuration

**Example** To set tunnel secret to "my\_password" for tunnel profile "public", use the commands:

```
awplus# configure terminal
awplus(config)# l2tp-profile public
awplus(config-l2tp-profile)# shared-secret my_password
```

To set tunnel secret to "my\_password" for tunnel "tunnelone", use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnelone
awplus(config-l2tp-tunnel)# shared-secret my_password
```

To remove the tunnel secret for the tunnel profile, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp-profile public
awplus(config-l2tp-profile)# no shared-secret
```

To remove the tunnel secret for the tunnel 'tunnelone', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnelone
awplus(config-l2tp-tunnel)# no shared-secret
```

# show debugging l2tp

**Overview** Use this command to see what debugging is turned on for L2TP tunnels.

**Syntax** show debugging l2tp

**Mode** Privileged Exec

**Example** To display whether debugging of L2TP tunnels is on or off, use the command:

```
awplus# show debugging l2tp
```

**Output** Figure 79-1: Example output from **show debugging l2tp**

```
awplus#show debugging l2tp
L2TP Tunnel Debugging is on
```

**Related commands** [debug l2tp](#)

# show l2tp session

**Overview** Use this command to display a summary or detailed list of information about L2TP sessions.

**Syntax** `show l2tp session [detail]`

Parameter	Description
detail	Displays more detailed information about L2TP sessions.

**Mode** Privileged Exec

**Example** To display summary information about all L2TPv2 sessions, use the command:

```
awplus# show l2tp session
```

**Output** Figure 79-2: Example output from **show l2tp session**

```
awplus#show l2tp session

L2TP Session Information

-----
Session ID:                59400
Tunnel ID:                 25351
State:                     RETRY
Type:                      LAIC
Created At:                May 31 20:03:04 2016
Interface Name:           ppp1
Remote Session ID:        61156
Establish Timeout:        120
```

Table 79-1: Parameters in the output from **show l2tp session**

Parameter	Description
Session ID	L2TP session ID.
Tunnel ID	The ID of the L2TP tunnel for this session.

Table 79-1: Parameters in the output from **show l2tp session** (cont.)

Parameter	Description
State	The current state of the L2TP session: <ul style="list-style-type: none"> <li>idle—Idle</li> <li>wait-tunnel—Await tunnel</li> <li>wait-reply—Await reply</li> <li>wait-connect—Await connect</li> <li>wait-cs-answer—Await circuit switched answer</li> <li>established—Successful connection</li> <li>retry—Retrying connection</li> </ul>
Type	The type of the L2TP session: <ul style="list-style-type: none"> <li>LAIC—LAC incoming call</li> <li>LAOC—LAC outgoing call</li> <li>LNIC—LNS incoming call</li> <li>LNOC—LNS outgoing call</li> <li>UNSPEC—unspecified call type</li> </ul>
Created At	The date and time when the session was created.
Interface Name	The name of the interface for this session.
Remote Session ID	The ID of the session on the peer.
Establish Timeout	The time (in seconds) that a session will wait for the peer to complete the session setup message exchange.

**Related commands** [l2tp tunnel](#)  
[show l2tp tunnel](#)

# show l2tp tunnel

**Overview** Use this command to display information about all the current L2TP tunnels.

**Syntax** show l2tp tunnel [detail]

Parameter	Description
detail	Display additional detailed information about the tunnels.

**Mode** Privileged Exec

**Usage notes** The output from this command depends on whether it won the tiebreaker and took the LAC role for the tunnel, or lost the tiebreaker and took the LNS role. In the latter case, a corresponding idle LAC tunnel is also displayed.

**Example** To display information about all L2TPv2 tunnels, use the command:

```
awplus# show l2tp tunnel
```

**Output** Figure 79-3: Example output from **show l2tp tunnel**

```
AWP-2#show l2tp tunnel

**Table 80:** Parameters in the output from **show l2tp tunnel** .

Parameter	Description
Tunnel ID	The L2TP tunnel ID, (assigned automatically by the device).
Tunnel Name	The name of the L2TP tunnel as specified by the <b>l2tp tunnel</b> command.
Local IP Address	The IPv4 or IPv6 address of the tunnel on this device. This is either specified by the configuration if the device is in LAC mode, or assigned automatically by the device if it is in LNS mode. This may be specified directly by the <b>source</b> command, or derived from the interface set by that command.
Remote IP Address	The IPv4 or IPv6 address of the device at the remote end of the tunnel. This may be specified directly by the <b>destination</b> command, or derived from a domain name set by that command.
State	The current state of the tunnel: <ul style="list-style-type: none"> <li>idle—Idle</li> <li>wait-ctl-reply—Await control reply</li> <li>wait-ctl-conn—Await connect reply</li> <li>established—Successful connection</li> <li>closing—Closing connection</li> <li>retry—Tie breaker lost, retrying connection</li> </ul>
Created at	The date and time when the tunnel was created.
Tunnel Mode	The tunnel mode: <ul style="list-style-type: none"> <li>LAC—L2TP Access Concentrator—the initiating end of the tunnel</li> <li>LNS—L2TP Network Server—the other end of the tunnel, authenticates the user and starts the PPP negotiation.</li> </ul>
Remote Tunnel ID	The tunnel ID on the L2TP peer.
Remote Host Name	The host name of the L2TP peer.
Remote Vendor Name	The name of the vendor for the L2TP peer device. E.g. Allied Telesis International.
Local UDP Port	By default the local UDP port used for both L2TPv2 managed tunnels and L2TPv3 unmanaged tunnels (Ethernet Pseudowires) is 1701. If both are configured, change the UDP port for the unmanaged tunnel ( <b>l2tp unmanaged port</b> command).
Remote UDP Port	The UPD port used by the remote device for this L2TP tunnel.

**Table 80:** Parameters in the output from **show l2tp tunnel** . (cont.)

Parameter	Description
Hello Timeout	The period between sending L2TP Hello messages (in seconds).
Retry Timeout	The delay (in seconds) before sending the first retry of unacknowledged control frames.
Idle Timeout	The time (in seconds) that a tunnel will remain after its last session has been torn down.
Establish Timeout	The time (in seconds) that a tunnel will wait for the peer to complete the tunnel setup message exchange.

**Related commands** [l2tp tunnel](#)

# show l2tp tunnel config-check

**Overview** Use this command to check the configuration of the specified L2TP tunnel or all L2TP tunnels for errors or missing required configuration.

**Syntax** `show l2tp tunnel [<tunnel-name>] config-check`

Parameter	Description
<i>&lt;tunnel-name&gt;</i>	The name of the L2TP tunnel to check. If not specified, all tunnels are checked.

**Mode** Privileged Exec

**Usage notes** Only tunnels that have a complete configuration may appear in the **show l2tp tunnel** commands. For details of the configuration in the system, use the **show running-config l2tp-tunnel** command.

**Example** To check for missing L2TP tunnel configuration for the tunnel 'tunnel1', use the command:

```
awplus# show l2tp tunnel config-check
```

**Output** Figure 79-5: Example output from **show l2tp tunnel config-check**

```
awplus#show l2tp tunnel config-check

L2TP Tunnel tunnel1:
  Complete Configuration

L2TP Tunnel tunnel2:
  Incomplete Configuration
  Missing tunnel name or tunnel name mismatch
  Required: PPP interface
  Required: destination
  Source IP address required when IPsec protection on
```

Table 79-1: Parameters in the output from **show l2tp tunnel config-check**

Parameter	Description
Complete configuration	The tunnel has a complete and valid configuration.
Incomplete configuration	There is configuration still required or invalid for this tunnel, as specified. Examples of possible messages indicating missing or invalid configuration include: <ul style="list-style-type: none"><li>• Missing tunnel name or tunnel name mismatch</li><li>• Required: PPP interface</li><li>• Required: destination</li><li>• Required: IP version</li><li>• Destination IP address does not match the configured IP version</li><li>• Source IP address does not match the configured IP version</li><li>• Source IP address required when IPSec protection on</li></ul>

**Related commands** [show running-config l2tp-tunnel](#)

# show running-config l2tp-profile

**Overview** Use this command to display the running configuration for L2Tp profiles.

**Syntax** show running-config l2tp-profile

**Mode** Privileged Exec

**Example** To display the running configuration of L2TP profiles, use the command:

```
awplus# show running-config l2tp-profile
```

**Output** Figure 79-6: Example output from **show running-config l2tp-profile**

```
awplus#show running-config l2tp-profile

l2tp-profile public
version 2
secret "my_password"
```

**Related commands** [l2tp-profile](#)

[version](#)

# show running-config l2tp-tunnel

**Overview** Use this command to display the current details for L2TP tunnel configuration.

**Syntax** `show running-config l2tp-tunnel`

**Mode** Privileged Exec

**Example** To display the L2TP tunnel running configuration, use the command:

```
awplus# show running-config l2tp-tunnel
```

**Output** Figure 79-7: Example output from **show running-config l2tp-tunnel**

```
awplus#show running-config l2tp-tunnel
l2tp tunnel example
  version 2
  ip-version 4
  encapsulation ppp 0
  source 1.0.0.2
  destination 1.0.0.1
  local-subaddress TUNNEL2
  remote-subaddress TUNNEL1
!
```

## source

**Overview** Use this command to set the source address or interface for an L2TP tunnel.  
Use the **no** variant of this command to remove the source address or interface from an L2TP tunnel.

**Syntax** `source [<interface-name> | <ipv4-addr> | <ipv6-addr>]`  
`no source`

Parameter	Description
<code>&lt;interface-name&gt;</code>	The name of the interface to be used as the tunnel starting point.
<code>&lt;ipv4-addr&gt;</code>	The IPv4 address to be used as the tunnel starting point.
<code>&lt;ipv6-addr&gt;</code>	The IPv6 address to be used as the tunnel starting point.

**Default** If no source address or interface is configured, the source address used will be calculated based on the route to the tunnel destination.

**Mode** L2TP Tunnel Configuration

**Example** To configure IP address 10.1.1.2 as the source address for the tunnel named 'tunnel1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# source 10.1.1.2
```

To remove the configured source address from 'tunnel1', so that it uses the default source, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no source
```

**Related commands** [destination](#)  
[l2tp tunnel](#)  
[show l2tp tunnel](#)

# version

**Overview** Use this command to specify the protocol version of a L2TP tunnel.

**Syntax** `version [<version>]`

Parameter	Description
<code>&lt;version&gt;</code>	The protocol version of the L2TP tunnel. Version 2 is supported.

**Default** The L2TP version is 2 by default.

**Mode** L2TP Profile Configuration and L2TP Tunnel Configuration

**Example** To use L2TPv2 for L2TP tunnel profile 'public', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp-profile public
awplus(config-l2tp-profile)# version 2
```

To use L2TPv2 for L2TP tunnel 'tunnelone', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnelone
awplus(config-l2tp-tunnel)# version 2
```

# L2TPv3 Ethernet Pseudowire Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure L2TPv3 Ethernet pseudowires.

For introductory information about L2TPv3 in AlliedWare Plus, including overview and configuration information, see the [L2TPv3 Ethernet Pseudowire Feature Overview and Configuration Guide](#).

- Command List**
- “[interface tunnel \(L2TPv3\)](#)” on page 3626
  - “[l2tp unmanaged port](#)” on page 3627
  - “[show interface tunnel \(L2TPv3\)](#)” on page 3628
  - “[tunnel destination \(L2TPv3\)](#)” on page 3629
  - “[tunnel df](#)” on page 3631
  - “[tunnel local id](#)” on page 3632
  - “[tunnel mode l2tp v3](#)” on page 3633
  - “[tunnel protection ipsec](#)” on page 3634
  - “[tunnel remote id](#)” on page 3635
  - “[tunnel security-reprocessing](#)” on page 3636
  - “[tunnel source \(L2TPv3\)](#)” on page 3637

# interface tunnel (L2TPv3)

**Overview** Use this command to create a tunnel interface or to enter Interface mode to configure an existing tunnel. Tunnel interfaces are identified by an index identifier that is an integer in the range from 0 through 65535.

Use the **no** variant of this command to remove a previously created tunnel interface.

**Syntax** `interface tunnel<0-65535>`  
`no interface tunnel<tunnel-index>`

Parameter	Description
<0-65535>	Specify a tunnel interface index identifier in the range from 0 through 65535.

**Default** Tunnel interfaces do not exist.

**Mode** Global Configuration

**Usage notes** After you have created the tunnel interface, use the **tunnel mode** command to enable the tunnel.

**Examples** To configure a tunnel interface with index 30 and enable L2TPv3 mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel30
awplus(config-if)# tunnel mode l2tp v3
```

To remove the tunnel interface tunnel30, use the commands:

```
awplus# configure terminal
awplus(config)# no interface tunnel30
```

**Related commands** [show interface tunnel \(L2TPv3\)](#)  
[tunnel mode l2tp v3](#)

**Command changes** Version 5.4.7-2.1: increased range for **tunnel** index identifiers.

# l2tp unmanaged port

**Overview** Use this command to set the UDP port for an (IPv4 and IPv6) unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires).

This command can only change the UDP port when there is no unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires) configured.

Use the **no** variant of this command to reset the UDP port to the default (1701).

**Syntax** `l2tp unmanaged port [<1-65535>]`  
`no l2tp unmanaged port`

Parameter	Description
<1-65535>	The number of the UDP port to use for an unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires).

**Default** The UDP port is 1701 by default.

**Mode** Global Configuration

**Usage notes** The default UDP port for both unmanaged and managed L2TP tunnels is 1701. If both kinds of tunnel will be configured, the UDP port for the unmanaged tunnel must be changed to a different port by using the **l2tp unmanaged port** command.

Be aware of potential clashes with other UDP port users. Unless it is likely to be used for other purposes, we recommend configuring UDP port 1702 as a suitable alternative.

**Example** To set the UDP port for an L2TP unmanaged tunnel (L2TPv3 Ethernet Pseudowires) to 1702, use the following commands:

```
awplus# configure terminal
awplus(config)# l2tp unmanaged port 1702
```

**Related commands** [tunnel mode l2tp v3](#)  
[show running-config](#)

# show interface tunnel (L2TPv3)

**Overview** Use this command to display status information of a tunnel.

**Syntax** show interface tunnel<0-65535>

Parameter	Description
<0-65535>	Specify a tunnel index in the range from 0 through 65535.

**Mode** Privileged Exec

**Examples** To display status information for L2TPv3 tunnel tunnel20, use the command.

```
awplus#show interface tunnel20
```

**Output** Figure 80-1: Example output from **show tunnel interface** on the console.

```
awplus#show interface tunnel20
Interface tunnel20
  Link is UP, administrative state is UP
  Hardware is Tunnel
  IPv4 address 192.168.10.1/24 broadcast 192.168.10.255
  IPv6 address 2001:db8:10::1/64
  IPv6 address fe80::5054:d4ff:fe84:d1aa/64
  index 16795714 metric 1 mtu 1480
  arp ageing timeout 300
  <UP,BROADCAST,RUNNING,MULTICAST>
  SNMP link-status traps: Disabled
  Tunnel source 192.168.1.1, destination 192.168.1.2
  Tunnel name local 192.168.1.1, remote 192.168.1.2
  Tunnel ID local 66, remote 77
  Tunnel protocol/transport l2tp v3, key disabled, sequencing
  disabled
  Tunnel TTL inherit
  Checksumming of packets disabled, path MTU discovery disabled
  input packets 0, bytes 0, dropped 0, multicast packets 0
  output packets 5, bytes 366, multicast packets 0 broadcast
  packets 0
  Time since last state change: 0 days 00:00:24
```

**Related commands** [interface tunnel \(L2TPv3\)](#)

# tunnel destination (L2TPv3)

**Overview** Use this command to specify a tunnel destination for the remote end of the tunnel. Tunnel destination can be specified by using a destination network name or an IPv4 address.

Use the **no** variant of this command to remove a configured tunnel destination.

**Syntax** tunnel destination {<ipv4-addr>|<destination-network-name>}  
no tunnel destination

Parameter	Description
<ipv4-addr>	Specify the tunnel destination IPv4 address in the dotted decimal format A.B.C.D. The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint.
<destination-network-name>	Destination network name. If the destination network name cannot be resolved, then the L2TPv3 tunnel remains inactive.

**Mode** Interface Configuration

**Examples** To configure an IPv4 tunnel destination by using an IPv4 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode l2tp v3
awplus(config-if)# tunnel destination 2.2.2.2
```

To configure an L2TPv3 tunnel destination by using a destination network name, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode l2tp v3
awplus(config-if)# tunnel destination
corporate_lan.example.com
```

To remove a tunnel destination, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# no tunnel destination
```

**Related commands** [interface tunnel \(L2TPv3\)](#)  
[tunnel mode l2tp v3](#)  
[tunnel source \(L2TPv3\)](#)

# tunnel df

**Overview** Use this command to specify whether the DF (Don't Fragment) bit in the IP header should be set or not on outgoing packets from L2TPv3 tunnels.

Use the **no** variant of this command to return to the default setting.

**Syntax** tunnel df {set|clear}  
no tunnel df

Parameter	Description
set	Set the DF bit in the outer header
clear	Clear the DF bit in the outer header

**Default** The DF bit is **set** on all outgoing packets.

**Mode** Interface Configuration

**Usage notes** This command gives you the opportunity to clear the DF bit allowing packets greater than the MTU to be fragmented and transmitted via the L2TPv3 Ethernet pseudo-wire. This may be necessary if an L2TPv3 tunnel is connected to a bridge and MTU-exceeded messages cannot be sent back to clients.

**NOTE:** *If fragmentation of larger packets occurs as a result of setting the tunnel Do Not Fragment bit to clear, this may slightly increase latency of the associated traffic flow traversing the VPN, due to the fragmentation and re-assembly that occurs.*

**Example** To specify the DF bit on the L2TPv3 tunnel (tunnel2), use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode l2tp v3
awplus(config-if)# tunnel df clear
```

To set the DF bit on the L2TPv3 tunnel (tunnel2) back to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel df
```

**Related commands** [tunnel mode l2tp v3](#)

**Command changes** Version 5.4.9-1.1: command added

# tunnel local id

**Overview** This command specifies a tunnel local identifier sent to the peer to match. Use the **no** variant of this command to remove the tunnel local ID.

**Syntax** tunnel local id <1-2147483647>  
no tunnel local id

Parameter	Description
<1-2147483647>	Tunnel ID from 1 through 2147483647

**Default** No tunnel local ID is set.

**Mode** Interface Configuration

**Usage notes** The endpoints of the tunnel must be configured by mirroring tunnel IDs, that is, the tunnel local ID on one endpoint must be specified as the tunnel remote ID on the other endpoint.

The local session ID defaults to the tunnel local ID and the local session ID is not configurable. A session provides the data channel in L2TPv3. There is a single pseudowire per L2TP session.

**Examples** To specify a tunnel local ID, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#tunnel mode l2tp v3
awplus(config-if)#tunnel local id 22
```

To remove the tunnel local ID, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#no tunnel local id
```

**Related commands** [tunnel remote id](#)

**Validation Commands** [show interface tunnel \(L2TPv3\)](#)

# tunnel mode l2tp v3

**Overview** Use this command to configure the encapsulation tunneling mode.  
Use the **no** variant of this command to remove an established tunnel.

**Syntax** tunnel mode l2tp v3 [ipv6]  
no tunnel mode

Parameter	Description
ipv6	Specify IPv6 as the delivery protocol.

**Default** Virtual tunnel interfaces have no mode set by default. If you specify a mode of **l2tp v3**, the delivery protocol is IPv4 unless you specify IPv6.

**Mode** Interface Configuration

**Usage notes** A tunnel will not become operational until it is configured with this command.

**Examples** To configure L2TPv3 as the encapsulation tunneling mode for tunnel20, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#tunnel mode l2tp v3
```

To remove the established tunnel20, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#no tunnel mode
```

**Related commands** [interface tunnel \(L2TPv3\)](#)  
[show interface tunnel \(L2TPv3\)](#)  
[tunnel df](#)

# tunnel protection ipsec

**Overview** Use this command to optionally enable IPsec protection for packets encapsulated by this tunnel.

Use the **no** variant of this command to disable IPsec protection.

**Syntax** tunnel protection ipsec [profile <ipsec-profile>]  
no tunnel protection ipsec

Parameter	Description
<ipsec-profile>	The name of an optional custom IPsec profile ( <a href="#">crypto ipsec profile</a> command) to use to protect this tunnel.

**Default** IPsec protection for packets encapsulated by tunnel is disabled.

**Mode** Interface Configuration

**Usage notes** You also need to configure a pre-shared key in conjunction with this command. See the [crypto isakmp key](#) command for more information about configuring the pre-shared key.

**Examples** To enable IPsec protection for packets encapsulated by tunnel114, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel114
awplus(config-if)#tunnel protection ipsec
```

To disable IPsec protection for packets encapsulated by tunnel114, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel114
awplus(config-if)#no tunnel protection ipsec
```

**Related commands** [crypto ipsec profile](#)  
[crypto isakmp key](#)  
[show isakmp key \(IPsec\)](#)

# tunnel remote id

**Overview** This command specifies a tunnel remote identifier sent to the peer for match. Use the **no** variant of this command to remove the tunnel remote ID.

**Syntax** tunnel remote id <1-2147483647>  
no tunnel remote id

Parameter	Description
<1-2147483647>	Tunnel ID from 1 through 2147483647

**Default** No tunnel remote ID is set.

**Mode** Interface Configuration

**Usage notes** The endpoints of the tunnel must be configured by mirroring tunnel IDs, that is, the tunnel remote ID on one endpoint must be specified as the tunnel local ID on the other endpoint.

The remote session ID defaults to the tunnel remote ID and the remote session ID is not configurable. A session provides the data channel in L2TPv3. There is a single pseudowire per L2TP session.

**Examples** To specify a tunnel remote ID, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#tunnel mode l2tp v3
awplus(config-if)#tunnel remote id 22
```

To remove the tunnel remote ID, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#no tunnel remote id
```

**Related commands** [tunnel local id](#)

**Validation Commands** [show interface tunnel \(L2TPv3\)](#)

# tunnel security-reprocessing

**Overview** Use this command to enable stream security reprocessing on all tunnel interfaces.

Use the **no** variant of this command to disable security reprocessing on all tunnel interfaces.

Note that tunnel security reprocessing increases the load on your device and reduces throughput. This is because traffic is processed twice through the DPI engine. Therefore, it should only be enabled if your solution requires it.

**Syntax** tunnel security-reprocessing  
no tunnel security-reprocessing

**Default** Security reprocessing is disabled by default.

**Mode** Global Configuration

**Usage notes** Use this command when you need to reinspect the traffic in a tunnel terminating on the device using stream UTM features after tunnel headers and encryption have been removed. For a configuration example using this command, see the [Internet Protocol Security \(IPsec\) Feature Overview and Configuration Guide](#).

**Example** To enable security reprocessing, use the commands:

```
awplus# configure terminal  
awplus(config)# tunnel security-reprocessing
```

To disable security reprocessing, use the commands:

```
awplus# configure terminal  
awplus(config)# no tunnel security-reprocessing
```

**Related commands** [show interface tunnel \(GRE\)](#)  
[show interface tunnel \(IPsec\)](#)  
[show interface tunnel \(L2TPv3\)](#)  
[show interface tunnel \(OpenVPN\)](#)

**Command changes** Version 5.4.8-0.2: command added

# tunnel source (L2TPv3)

**Overview** Use this command to specify a tunnel source for the tunnel interface. The tunnel source can be specified by using an interface name or an IPv4 address. The source address must be an existing IPv4 address configured for an interface.

Use the **no** variant of this command to remove a tunnel source for a tunnel interface.

**Syntax** tunnel source {<ipv4-addr>|<interface-name>}  
no tunnel source

Parameter	Description
<ipv4-addr>	Specify the tunnel source IPv4 address for the tunnel interface in the dotted decimal format A.B.C.D. The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint.
<interface-name>	Available interface name. Any AlliedWare Plus interface type (eth, vlan, ppp, tunnel, lo and so on). Using interface name can minimize the number of user-configured IP addresses and allow the tunnel source IP address to be dynamically issued via, for example, DHCP.

**Mode** Interface Configuration

**Examples** To configure an L2TPv3 tunnel source IPv4 address, use the commands:

```
awplus# configure terminal
awplus# interface eth1
awplus(config-if)# ip address 1.1.1.1/24
awplus(config-if)# interface tunnel1
awplus(config-if)# tunnel mode l2tp v3
awplus(config-if)# tunnel source 1.1.1.1
```

To use an interface name as the tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode l2tp v3
awplus(config-if)# tunnel source eth2
```

To remove a tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel1
awplus(config-if)# no tunnel source
```

**Related commands** [interface tunnel \(L2TPv3\)](#)  
[tunnel destination \(L2TPv3\)](#)  
[tunnel mode l2tp v3](#)

# 81

# Transitioning IPv4 to IPv6 Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Light Weight 4 over 6 and MAP E.

Many ISPs have migrated from IPv4 to IPv6 networks. However, many customers are still using IPv4 facilities. IPv6 transition technologies, such as Light Weight 4 over 6 (LW4o6) and MAP-E, provide interoperability between IPv4 and IPv6 networks. This enables ISPs with IPv6 networks to provide Internet connectivity to customers with IPv4 facilities.

MAP-E provides a mechanism for mapping between an IPv4 prefix or IPv4 address or IPv4 shared address and an IPv6 address. It also uses the encapsulation mode described in RFC 2473 (IPv6 Tunneling) to transport IPv4 packets over an IPv6 network.

Dual-Stack Lite (DS-Lite) (RFC 6333) describes an architecture for transporting IPv4 packets over an IPv6 network. This chapter describes an extension to DS-Lite called **Lightweight 4over6**, which moves the Network Address and Port Translation (NAPT) function from the centralized DS-Lite tunnel concentrator to the tunnel client located in the Customer Premises Equipment (CPE).

This removes the requirement for a Carrier Grade NAT function in the tunnel concentrator and reduces the amount of centralized state that must be held to a per-subscriber level. In order to delegate the NAPT function and make IPv4 address sharing possible, port-restricted IPv4 addresses are allocated to the CPEs.

- Useful Terms**
- **Softwire:** A tunnel between two IPv6 end-points to carry IPv4 packets or two IPv4 end-points to carry IPV6 packets.
  - **B4:** Softwire at the customer end that encapsulates native packets and tunnels them to a softwire concentrator (AFTR) at the service provider.
  - **AFTR:** Softwire that decapsulates the packets received from a softwire B4 and sends them to their destination.

For more information, see the [Transitioning IPv4 to IPv6 Feature Overview and Configuration Guide](#).

- Command List**
- `br-address (software)` on page 3641
  - `mesh-mode` on page 3642
  - `method (software)` on page 3643
  - `rule (software)` on page 3644
  - `show running-config software-configuration` on page 3646
  - `show software-configuration` on page 3647
  - `software-configuration` on page 3649
  - `tunnel security-reprocessing` on page 3650
  - `tunnel destination (DS-Lite)` on page 3651
  - `tunnel mode ds-lite` on page 3652
  - `tunnel mode lw4o6` on page 3653
  - `tunnel mode map-e` on page 3654
  - `tunnel software` on page 3655
  - `upstream-interface` on page 3656

# br-address (software)

**Overview** Use this command to specify the IPv6 address of the MAP-E Border Router. Note, before using this command you must configure the command **method (Software Configuration)** with the **static** parameter.

Use the **no** variant of this command to remove the MAP-E Border Router address configuration.

**Syntax** `br-address <ipv6-address>`  
`no br-address`

Parameter	Description
<code>&lt;ipv6-address&gt;</code>	IPv6 address of MAP-E Border Router

**Default** Not set.

**Mode** SoftWire Configuration

**Example** To configure 'swconfig' to the software configuration MAP-E Border Router IPv6 address, use the following commands:

```
awplus# configure terminal
awplus(config)# software-configuration swconfig
awplus(config-software)# br-address 2001::1
```

To remove the MAP-E Border Router IPv6 address configuration for 'swconfig', use the following commands:

```
awplus# configure terminal
awplus(config)# software-configuration swconfig
awplus(config-software)# no br-address
```

**Related commands** [show software-configuration](#)

**Command changes** Version 5.4.9-0.1: command added

# mesh-mode

**Overview** Use this command to enable mesh-mode. Mesh-mode enables softwire tunnels to work with devices that share the same IP address at the tunnel endpoint.

Use the **no** variant of this command to disable mesh-mode.

**Syntax** mesh-mode  
no mesh-mode

**Default** No mesh-mode.

**Mode** SoftWire Configuration

**Usage notes** Softwire tunnels may require communication with endpoints sharing the same IP address. The CPU resource required to support this is significant, so this command enables this support.

**Example** To configure a softwire named 'demo' to communicate with endpoints that share the same IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# softwire-configuration demo
awplus(config-softwire)# mesh-mode
```

**Related commands** show softwire-configuration  
softwire-configuration

**Command changes** Version 5.4.9-0.1: command added

# method (software)

**Overview** Use this command to specify the configuration method (or source) for a software configuration. The configuration method can be either static or DHCP.

Use the **no** variant of this command to remove a configured method.

**Syntax** `method {static|dhcp}`  
`no method`

Parameter	Description
<code>static</code>	Software configuration is statically configured
<code>dhcp</code>	Software configuration is acquired through DHCP

**Default** Not set.

**Mode** SoftWire Configuration

**Example** To set the 'swconfig' software configuration method to **static**, use the commands:

```
awplus# configure terminal
awplus(config)# software-configuration swconfig
awplus(config-software)# method static
```

To set the 'swconfig' software configuration method to **DHCP**, use the commands:

```
awplus# configure terminal
awplus(config)# software-configuration swconfig
awplus(config-software)# method dhcp
```

To remove the software configuration method from 'swconfig', use the commands:

```
awplus# configure terminal
awplus(config)# software-configuration swconfig
awplus(config-software)# no method
```

**Related commands** [show software-configuration](#)  
[rule \(software\)](#)

**Command changes** Version 5.4.9-0.1: command added

# rule (software)

**Overview** Use this command to statically configure a MAP rule. Note, before using this command you must configure the command **method (Software Configuration)** with the **static** parameter.

You would normally obtain the values to use in this command from your ISP.

Use the **no** variant of this command to remove a MAP rule configuration.

**Syntax**

```
rule <0-65535> ipv4-prefix <ipv4-prefix> ipv6-prefix  
<ipv6-prefix> psid-length <0-15> psid <psid-value> [offset  
<0-16>] [forwarding]  
  
rule <0-65535> ipv4-prefix <ipv4-prefix> ipv6-prefix  
<ipv6-prefix> ea-length <0-48> [offset <0-16>] [forwarding]  
  
no rule <0-65535>
```

Parameter	Description
rule <0-65535>	Rule ID is an integer in the range <1-65535>
ipv4-prefix <ipv4-prefix>	IPv4 prefix (e.g. 192.0.2.0/24)
ipv6-prefix <ipv6-prefix>	IPv6 prefix (e.g. 2001:db8::/32)
ea-length <0-48>	Embedded address length is an integer in the range <0-48>.
psid-length <0-15>	Port Set ID (PSID) length is an integer in the range <0-15>, the default length is 0.
psid <psid-value>	Port Set ID (PSID) value is either decimal <0-65535> or hexadecimal with a leading 0x. Different PSID values guarantee non-overlapping port sets.
offset <0-16>	Port Set ID (PSID) offset is an integer in the range <0-16>.
forwarding	Indicates if this rule is a Forwarding Mapping Rule (FMR). Otherwise, this is only used as a Basic Mapping Rule (BMR)

**Default** Not set.

**Mode** SoftWire Configuration

**Example** To configure a MAP rule 1 and MAP rule 2 in Software Configuration 'swconfig', use the following commands:

```
awplus# configure terminal
awplus(config)# software-configuration swconfig
awplus(config-software)# rule 1 ipv4-prefix 192.0.2.0/24
ipv6-prefix 2001:db8:1::/48 ea-length 16 forwarding
awplus(config-software)# rule 2 ipv4-prefix 192.0.2.23/32
ipv6-prefix 2001:db8:1:1781::/64 psid-length 8 psid 129
```

These two example rules above produce the same resulting IPv4 address and PSID if the IPv6 subnet on the upstream interface is 2001:db8:1:1781::/64.

To the remove rule 1 in Software Configuration 'swconfig', use the following commands:

```
awplus# configure terminal
awplus(config)# software-configuration swconfig
awplus(config-software)# no rule 1
```

**Related commands** [method \(software\)](#)

# show running-config software-configuration

**Overview** Use this command to display the running configuration information for a software configuration.

**Syntax** `show running-config software-configuration`  
`<software-config-name>`  
`show running-config software-configuration`

Parameter	Description
<code>&lt;software-config-name&gt;</code>	The name assigned for the Software Configuration

**Mode** Privileged Exec

**Example** To show the running configuration for **all** software configuration, use the following command:

```
awplus# show running-config software-configuration
```

To show the running configuration for software configuration 'swconfig1', use the following command:

```
awplus# show running-config software-configuration swconfig1
```

**Output** Figure 81-1: Example output from **show running-config software-configuration**

```
awplus#show running-config software-configuration
software-configuration swconfig1

# show software-configuration

**Overview** Use this command to show information about the configuration state of software configuration. You can show information for all software configurations or define a specific configuration for display.

**Syntax** `show software-configuration <software-config-name>`  
`show software-configuration`

Parameter	Description
<code>&lt;software-config-name&gt;</code>	Name assigned to the Software Configuration

**Mode** Privileged Exec

**Example** To show information about the configuration state of **all** software configuration, use the command:

```
awplus# show software-configuration
```

To show information about the configuration state of software configuration 'swconfig1', use the command:

```
awplus# show software-configuration swconfig1
```

**Output** Figure 81-2: Example output for a Static MAP-E software configuration

```
awplus#show software-configuration swconfig1

Software Configuration: swconfig1

Configuration Source: static
Upstream Interface: eth1
MAP-E Version: rfc
No LW4o6 Configuration

Border Relay Device: 2001:db8::1
Rule 0
  IPv4-prefix: 192.0.2.0/24
  IPv6-prefix: 2001:db8::/32
  Embedded address length: 16
  Forwarding: enabled
  PSID offset: default
  PSID length: default
  PSID: default (0x0)
```

Figure 81-3: Example output for LW4o6 (config method DHCP)

```
awplus#show software-configuration

# software-configuration

**Overview** Use this command to enter the Software Configuration mode. This mode allows you to configure software settings.

In computer networking, a software is a type of tunneling protocol that creates a virtual "wire" that transparently encapsulates another protocol. Softwares are used for various purposes, one of which is to carry IPv4 traffic over IPv6 and vice versa, in order to support IPv6 transition mechanisms.

Use the **no** variant of this command to remove a software configuration.

**Syntax** `software-configuration <software-config-name>`  
`no software-configuration <software-config-name>`

Parameter	Description
<code>&lt;software-config-name&gt;</code>	The name assigned for this software configuration

**Mode** Global Configuration

**Example** To configure software settings for 'software1', use the following commands:

```
awplus# configure terminal
awplus(config)# software-configuration software1
awplus(config-software)#
```

To remove software 'software1', MAP Rules configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# no software-configuration software1
```

**Related commands** [show software-configuration](#)

**Command changes** Version 5.4.9-0.1: command added

# tunnel security-reprocessing

**Overview** Use this command to enable stream security reprocessing on all tunnel interfaces.

Use the **no** variant of this command to disable security reprocessing on all tunnel interfaces.

Note that tunnel security reprocessing increases the load on your device and reduces throughput. This is because traffic is processed twice through the DPI engine. Therefore, it should only be enabled if your solution requires it.

**Syntax** tunnel security-reprocessing  
no tunnel security-reprocessing

**Default** Security reprocessing is disabled by default.

**Mode** Global Configuration

**Usage notes** Use this command when you need to reinspect the traffic in a tunnel terminating on the device using stream UTM features after tunnel headers and encryption have been removed. For a configuration example using this command, see the [Internet Protocol Security \(IPsec\) Feature Overview and Configuration Guide](#).

**Example** To enable security reprocessing, use the commands:

```
awplus# configure terminal  
awplus(config)# tunnel security-reprocessing
```

To disable security reprocessing, use the commands:

```
awplus# configure terminal  
awplus(config)# no tunnel security-reprocessing
```

[show interface tunnel \(IPsec\)](#)  
[show interface tunnel \(L2TPv3\)](#)  
[show interface tunnel \(OpenVPN\)](#)

**Command changes** Version 5.4.8-0.2: command added

# tunnel destination (DS-Lite)

**Overview** Use this command to specify the tunnel destination for a DS-Lite tunnel.  
Use the **no** variant of this command to remove a configured tunnel destination.

**Syntax** tunnel destination dhcp interface <interface-name>  
no tunnel destination

Parameter	Description
<interface-name>	The interface which receives the DHCP reply.

**Mode** Interface Configuration

**Example** To configure a DS-Lite tunnel destination, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel mode ds-lite
awplus(config-if)# tunnel destination dhcp interface eth1
```

To remove the tunnel destination, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# no tunnel mode destination
```

**Related commands** [tunnel mode ds-lite](#)

**Command changes** Version 5.4.9-0.1: command added

# tunnel mode ds-lite

**Overview** Use this command to set the tunnel mode to DS-Lite for a tunnel interface.  
Use the **no** variant of this command to remove the tunnel mode.

**Syntax** tunnel mode ds-lite  
no tunnel mode

**Default** Not set.

**Mode** Interface Configuration

**Example** To configure the DS-Lite tunnel mode on interface 'tunnel0', use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel mode ds-lite
```

To remove the configured DS-Lite tunnel mode for 'tunnel0', use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# no tunnel mode
```

**Related commands** [tunnel mode \(IPv6\)](#)

**Command changes** Version 5.4.9-0.1: command added

# tunnel mode lw4o6

**Overview** Use this command to set the tunnel mode to Light Weight 4over6 (lw4o6) for a tunnel interface.

Use the **no** variant of this command to remove an established lw4o6 tunnel.

**Syntax** tunnel mode lw4o6  
no tunnel mode

**Default** Not set.

**Mode** Interface Configuration

**Example** To configure lw4o6 tunnel mode for tunnel6, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel mode lw4o6
```

To removed the configured lw4o6 tunnel mode for tunnel6, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel mode
```

**Related commands** tunnel mode (IPv6)

**Command changes** Version 5.4.9-0.1: command added

# tunnel mode map-e

**Overview** Use this command to set the tunnel mode to MAP-E for a tunnel interface.  
Use the **no** variant of this command to remove the MAP-E mode from a tunnel interface.

**Syntax** tunnel mode map-e  
no tunnel mode

**Default** Not set.

**Mode** User Exec and Privileged Exec

**Example** To configure the MAP-E tunnel mode on interface 'tunnel6', use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel mode map-e
```

To remove the configured MAP-E tunnel mode for 'tunnel6', use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel mode
```

**Related commands** [show software-configuration](#)

**Command changes** Version 5.4.9-0.1: command added

# tunnel software

**Overview** Use this command to configure the software configuration to use for a tunnel interface.

Note that **tunnel-mode map-e** or **tunnel mode lw4o6** must be configured in order for the command **tunnel software** to be valid.

Use the **no** variant of this command to remove a tunnel software configuration.

**Syntax** tunnel software <software-config-name>  
no tunnel software

Parameter	Description
<software-config-name>	The software configuration used for a tunnel interface

**Default** Not set.

**Mode** Interface Configuration

**Example** To set the software configuration called 'swconfig' to an interface called 'tunnel6', use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel software swconfig
```

To remove the software configuration for interface 'tunnel6', use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel software
```

**Related commands** tunnel mode map-e  
tunnel mode lw4o6

**Command changes** Version 5.4.9-0.1: command added

# upstream-interface

**Overview** Use this command to assign a software configuration to an upstream interface configured with a globally scoped IPv6 address.  
Use the **no** variant of this command to remove a configured upstream interface.

**Syntax** `upstream-interface <interface-name>`  
`no upstream-interface`

Parameter	Description
<code>&lt;interface-name&gt;</code>	Name of the interface connected to upstream (e.g. eth1, br1, vlan1)

**Default** Not set.

**Mode** SoftWire Configuration

**Example** To configure the software configuration ('swconfig') upstream-interface to eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# software-configuration swconfig
awplus(config-software)# upstream-interface eth1
```

To remove the software configuration ('swconfig') upstream-interface configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# software-configuration swconfig
awplus(config-software)# no upstream-interface
```

# interface tunnel (IPv6)

**Overview** Use this command to create a tunnel interface or to enter Interface mode to configure an existing tunnel. Tunnel interfaces are identified by an index identifier that is an integer in the range from 0 through 65535.

Use the **no** variant of this command to remove a previously created tunnel interface.

**Syntax** `interface tunnel< tunnel-index >`  
`no interface tunnel< tunnel-index >`

Parameter	Description
<code>&lt; tunnel-index &gt;</code>	Specify a tunnel interface index identifier in the range from 0 through 65535.

**Default** Tunnel interfaces do not exist.

**Mode** Global Configuration

**Usage notes** After you have created the tunnel interface, use the **tunnel mode** command to enable the tunnel.

**Examples** To configure a tunnel interface with index 30 and use IPv6 tunneling, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel30
awplus(config-if)# tunnel mode ipv6
```

To remove the IPv6 tunnel interface tunnel30, use the commands:

```
awplus# configure terminal
awplus(config)# no interface tunnel30
```

**Command changes** Version 5.4.8-2.1: command added

# ip address (IP Addressing and Protocol)

**Overview** This command sets a static IP address on an interface.

The **no** variant of this command removes the IP address from the interface.

You cannot remove the primary address when a secondary address is present.

**Syntax** `ip address <ip-addr/prefix-length> [secondary] [label <label>]`  
`no ip address [<ip-addr/prefix-length>] [secondary]`

Parameter	Description
<ip-addr/prefix-length>	The IPv4 address and prefix length you are assigning to the interface.
secondary	Secondary IP address.
label	Adds a user-defined description of the secondary IP address.
<label>	A user-defined description of the secondary IP address. Valid characters are any printable character and spaces.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** To set the primary IP address on the interface, specify only **ip address** <ip-addr/prefix-length>. This overwrites any configured primary IP address. To add additional IP addresses on this interface, use the **secondary** parameter. You must configure a primary address on the interface before configuring a secondary address.

**NOTE:** Use **show running-config interface**, instead of **show ip interface brief**, when you need to view a secondary address configured on an interface. **show ip interface brief** will only show the primary address, not a secondary address for an interface.

**Examples** To add the IP address 10.10.10.50/24 to the interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address 10.10.10.50/24
```

To add the secondary IP address 10.10.11.50/24 to the same interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address 10.10.11.50/24 secondary
```

To add the IP address 10.10.11.50/24 to the local loopback interface lo, use the following commands:

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.11.50/24
```

To add the IP address 10.10.11.50/24 to the PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip address 10.10.11.50/24
```

To add the IP address 10.10.11.50/24 to the tunnel tunnel0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# ip address 10.10.11.50/24
```

**Related  
commands**

[interface \(to configure\)](#)  
[show ip interface](#)  
[show running-config interface](#)

# ip tcp adjust-mss

**Overview** Use this command to set the Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

**Syntax** `ip tcp adjust-mss {<mss-size>|pmtu}`  
`no ip tcp adjust-mss`

Parameter	Description
<code>&lt;mss-size&gt;</code>	<code>&lt;64-1460&gt;</code> Specifies the MSS size in bytes.
<code>pmtu</code>	Adjust TCP MSS automatically with respect to the MTU on the interface.

**Default** The default setting allows a TCP server or a TCP client to set the MSS value for itself.

**Mode** Interface Configuration

**Usage notes** When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

**Examples** To configure an MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip tcp adjust-mss 1452
```

To configure an MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip tcp adjust-mss 1452
```

To configure an MSS size of 1452 bytes on interface tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# ip tcp adjust-mss 1452
```

To restore the MSS size to the default size on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip tcp adjust-mss
```

**Related  
commands**

**Command  
changes**

Version 5.4.8-2.1: interface tunnel example added

# ipv6 address

**Overview** Use this command to set the IPv6 address of an interface. The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

To stop the device from processing prefix information (routes and addresses from the received Router Advertisements) use the command **no ipv6 nd accept-ra-pinfo**.

To remove the EUI-64 link-local address, use the command **no ipv6 eui64-linklocal**.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

**Syntax** `ipv6 address <ipv6-addr/prefix-length>`  
`no ipv6 address <ipv6-addr/prefix-length>`

Parameter	Description
<code>&lt;ipv6-addr/prefix-length&gt;</code>	Specifies the IPv6 address to be set. The IPv6 address uses the format X:X::X:Prefix-Length. The prefix-length is usually set between 0 and 64.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** Note that the device keeps link-local addresses until you remove them with the **no** variant of the command that established them. See the [ipv6 enable](#) command for more information.

Also note that the device keeps the link-local address if the global address is removed using a command other than the command that was used to establish the link-local address. For example, if a link local address is established with the [ipv6 enable](#) command then it will not be removed using a **no ipv6 address** command.

**Examples** To assign the IPv6 address 2001:0db8::a2/64 to the VLAN interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address 2001:0db8::a2/64 from the VLAN interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

To assign the IPv6 address to the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-fr-subif)# ipv6 address 2001:0db8::a2/64
```

To assign the IPv6 address to the tunnel tunnel0, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-fr-subif)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address 2001:0db8::a2/64 from the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

# ipv6 tcp adjust-mss

**Overview** Use this command to set the IPv6 Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

**Syntax** `ipv6 tcp adjust-mss {<mss-size>|pmtu}`  
`no ipv6 tcp adjust-mss`

Parameter	Description
<code>&lt;mss-size&gt;</code>	<code>&lt;64-1460&gt;</code> Specifies the MSS size in bytes.
<code>pmtu</code>	Adjust TCP MSS automatically with respect to the MTU on the interface.

**Default** The default setting allows a TCP server or a TCP client to set the MSS value for itself.

**Mode** Interface Configuration

**Usage notes** When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

**Examples** To configure an IPv6 MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 tcp adjust-mss 1452
```

To configure an IPv6 MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 tcp adjust-mss 1452
```

To adjust IPv6 TCP MSS automatically with respect to the MTU on interface tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# ipv6 tcp adjust-mss pmtu
```

To restore the MSS size to the default size on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 tcp adjust-mss
```

**Command  
changes**

Version 5.4.8-2.1: interface tunnel example added

## mtu

**Overview** Use this command to set the Maximum Transmission Unit (MTU) size for interfaces, where MTU is the maximum packet size that interfaces can transmit. The MTU size setting is applied to both IPv4 and IPv6 packet transmission.

Use the **no** variant of this command to remove a previously specified Maximum Transmission Unit (MTU) size, and restore the default MTU size. For example the VLAN interface default is 1500 bytes.

**Syntax** `mtu <68-1582>`  
`no mtu`

**Default** The default MTU size, for example 1500 bytes for VLAN interfaces.

**Mode** Interface Configuration

**Usage notes** If a device receives an IPv4 packet for Layer 3 switching to another interface with an MTU size smaller than the packet size, and if the packet has the **'don't fragment'** bit set, then the device will send an ICMP **'destination unreachable'** (3) packet type and a **'fragmentation needed and DF set'** (4) code back to the source. For IPv6 packets bigger than the MTU size of the transmitting interface, an ICMP **'packet too big'** (ICMP type 2 code 0) message is sent to the source.

You can set an MTU value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

Note that you cannot configure MTU on bridge interfaces. The MTU of the bridge interface is determined by the member interface of the bridge which has the lowest MTU. For example, if you attach eth1 with MTU 1200, ppp1 with MTU 1400, and vlan1 with MTU 1500 to a bridge interface, the MTU for that interface will be 1200.

Note that [show interface](#) output will only show MTU size for VLAN interfaces.

**Examples** To configure an MTU size of 1555 bytes on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# mtu 1555
```

To configure an MTU size of 1555 bytes for tunnel 'tunnel2', use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# mtu 1555
```

To restore the MTU size to the default MTU size of 1500 bytes on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no mtu
```

**Related commands** [show interface](#)

# show interface tunnel (IPv6)

**Overview** Use this command to display status information of tunnels.

The tunnel remains inactive if no valid tunnel source or tunnel destination is configured.

**Syntax** `show interface tunnel<tunnel-index>`

Parameter	Description
tunnel	Specify this parameter to display tunnel status information of a given tunnel identified by the <0-255> parameter.
<0-255>	Specify a tunnel index in the range from 0 through 255.

**Mode** Privileged Exec

**Example** To display status information for IPv6 tunnel tunnel120, use the command:

```
awplus# show interface tunnel120
```

Figure 82-1: Example output from the **show interface tunnel** command

```
awplus#show interface tunnel120
Interface tunnel120
  Link is UP, administrative state is UP
  Hardware is Tunnel
  IPv4 address 192.168.10.1/24 pointopoint 192.168.10.255
  index 4751 metric 1 mtu 1480
  arp ageing timeout 300
  <UP,POINTOPOINT,RUNNING,MULTICAST>
  SNMP link-status traps: Disabled
  Tunnel source 2001:db8::1:1, destination 2001:db8::2:1
  Tunnel name local 2001:db8::1:1, remote 2001:db8::2:1
  Tunnel ID local (not set), remote (not set)
  Tunnel protocol/transport ipv6, key disabled, sequencing disabled
  Tunnel TTL 64
  Checksumming of packets disabled, path MTU discovery disabled
  input packets 0, bytes 0, dropped 0, multicast packets 0
  output packets 0, bytes 0, multicast packets 0 broadcast packets 0
  Time since last state change: 0 days 22:38:35
```

**Command changes** Version 5.4.8-2.1: command added

# tunnel destination (IPv6)

**Overview** Use this command to specify a tunnel destination for the remote end of the tunnel. Tunnel destination can be specified by using a destination network name or an IPv6 address.

Use the **no** variant of this command to remove a configured tunnel destination.

**Syntax** tunnel destination {<ipv6-addr>|<destination-network-name>}  
no tunnel destination

Parameter	Description
<ipv6-addr>	Specify the tunnel destination IPv6 address in the dotted decimal format x:x::x:x. The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint.
<destination-network-name>	Destination network name. If the destination network name cannot be resolved, then the IPv6 tunnel remains inactive.

**Mode** Interface Configuration

**Examples** To configure an IPv6 tunnel destination by using an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode ipv6
awplus(config-if)# tunnel destination 2001:db8::1:1
```

To configure an IPv6 tunnel destination by using a destination network name, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode ipv6
awplus(config-if)# tunnel destination
corporate_lan.example.com
```

To remove a IPv6 tunnel destination, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# no tunnel destination
```

**Related commands** [interface tunnel \(IPv6\)](#)  
[tunnel mode \(IPv6\)](#)

tunnel source (IPv6)

**Command changes** Version 5.4.8-2.1: command added

# tunnel dscp

**Overview** Use this command to configure the Differentiated Services Code Point (DSCP) value for the DSCP field in the packet header that encapsulates the tunneled packets.

Use the **no** variant of this command to reset the DSCP field to its default value.

**Syntax** tunnel dscp <0-63>  
no tunnel dscp

Parameter	Description
<0-63>	Specify the DSCP value in the range from 0 through 63 for the DSCP field in the packet header that encapsulates the tunneled packets.

**Default** The IPv4 DSCP field value is inherited from the inner header to the outer header.

**Mode** Interface Configuration

**Examples** To configure the DSCP value to 10 for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel dscp 10
```

To remove a configured DSCP value for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel dscp
```

**Related commands** [interface tunnel \(IPv6\)](#)  
[interface tunnel \(GRE\)](#)

# tunnel mode (IPv6)

**Overview** Use this command to configure the encapsulation tunneling mode to use. This command sets IPv6 tunneling.

Use the **no** variant of this command to remove an established tunnel.

**Syntax** `tunnel mode ipv6`  
`no tunnel mode`

**Default** Virtual tunnel interfaces have no mode set by default.

**Mode** Interface Configuration

**Usage notes** A tunnel will not become operational until it is configured with this command.

**Examples** To configure IPv6 as the encapsulation mode for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode ipv6
```

To remove a configured IPv6 tunnel mode for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel mode
```

**Related commands** [interface tunnel \(IPv6\)](#)

**Command changes** Version 5.4.8-2.1: command added

# tunnel source (IPv6)

**Overview** Use this command to specify a tunnel source for the tunnel interface. Tunnel source can be specified by using an interface name or an IPv6 address. The source address must be an existing IPv6 address configured for an interface.

Use the **no** variant of this command to remove a tunnel source for a tunnel interface.

**Syntax** tunnel source {<ipv6-addr>|<interface-name>}  
no tunnel source

Parameter	Description
<ipv6-addr>	Specify the tunnel source IPv6 address for the IPv6 tunnel interface in the dotted decimal format x:x::x:x. The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint.
<interface-name>	Available interface name. Any AlliedWare Plus interface type (eth, vlan, ppp, tunnel, lo and so on). Using interface name can minimize the number of user-configured IP addresses and allow the tunnel source IP address to be dynamically issued via, for example, DHCP.

**Mode** Interface Configuration

**Examples** To configure an IPv6 tunnel source IPv6 address, use the commands:

```
awplus# configure terminal
awplus# interface eth1
awplus(config-if)# ip address 2001:db8::1:1/48
awplus(config-if)# interface tunnel1
awplus(config-if)# tunnel mode ipv6
awplus(config-if)# tunnel source 2001:db8::1:1
```

To use an interface name as the tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode ipv6
awplus(config-if)# tunnel source eth1
```

To remove an IPv6 tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel1
awplus(config-if)# no tunnel source
```

**Related commands** [interface tunnel \(IPv6\)](#)

[tunnel mode \(IPv6\)](#)

**Command changes** Version 5.4.8-2.1: command added

# tunnel ttl

**Overview** Use this command to configure the value to use for the Time to Live (TTL) field in the IPv4 header that encapsulates the tunneled IPv4 or IPv6 packets.

Use the **no** variant of this command to set the TTL value to its default.

**Syntax** tunnel ttl <1-255>  
no tunnel ttl

Parameter	Description
<1-255>	TTL value from 1 through 255.

**Default** The default TTL value is inherited from the encapsulated packet.

**Mode** Interface Configuration

**Example** To set the TTL value of the packet to 255, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel20
awplus(config-if)# tunnel ttl 255
```

To remove the configured TTL value of the packet, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel20
awplus(config-if)# no tunnel ttl
```
