Getting the most from this manual

Although you can view this document using Acrobat version 5, to get the best from this manual, we recommend using Adobe Acrobat Reader version 8. You can download Acrobat Reader 8 free from **http://www.adobe.com/**.

New features in this software version

For a list of new and enhanced features and commands in this version, see **Appendix B: Changes in Version 5.4.4** (with links to corresponding sections in this Software Reference), or the Software Release Note for Version 5.4.4-0.4. Documentation can be downloaded from the Support area of our website at **http://www.alliedtelesis.com**. Note that to download software files, you need a valid user account.

Part 1: Setting up the Switch

Chapter 1: Getting Started

Introduction

This chapter introduces a number of commonly-used management features of the AlliedWare Plus™ Operating System (OS).

How to Login

Step 1: Set the console baud rate

The default baud rate is 9600.

By default the AlliedWare Plus™ OS supports VT100 compatible terminals on the console port. This means that the terminal size is 80 columns by 24 rows.

Step 2: Login with manager/friend

The defaults are:

```
username: manager
password: friend
```

The switch logs you into User Exec mode. From User Exec mode, you can perform high-level diagnostics (some **show** commands, ping, traceroute etc), start sessions (Telnet, SSH), and change mode.

How to get Command Help

The following kinds of command help are available:

- lists of valid parameters with brief descriptions (the ? key)
- completion of keywords (the Tab key)
- error messages for incomplete or incorrect syntax

Command Abbreviations

The AlliedWare Plus™ CLI contains a number of abbreviations for its commands. For example, the **show interface** command can be entered in the abbreviated form shown below:

```
awplus# sh in vlan100
```

Viewing a List of Valid Parameters

To get syntax help, type ? (i.e. "space question mark") after:

- the prompt. This will list all commands available in the mode you are in.
- one or more parameters. This will list parameters that can come next in the partial command.
- one or more letters of a parameter. This will list matching parameters.

Note

The AlliedWare Plus™ OS only displays one screenful of text at a time, with the prompt "--More--" at the end of each screenful. Press the space bar to display the next screenful or the Q key to return to the command prompt.

Example

To see which commands are available in Privileged Exec mode, enter "?" at the Privileged Exec mode command prompt:

```
awplus# ?
```

This results in output like the following output:

Figure 1-1: Example output from the ? command

```
Exec commands:
activate        Activate a script
cd              Change the current working directory
clear           Reset functions
clock           Manage clock
configure       Enter configuration mode
copy            Copy from one file to another
.
.
.
```

Example

To see which **show** commands that start with "i" are available in Privileged Exec mode, enter "?" after **show i**:

```
awplus# show i?
```

This results in the following output:

Figure 1-2: Example output from the show i? command

```
interface          Select an interface to configure
ip                 Internet Protoc6ol (IP)
ipv6               Internet Protocol version 6 (IPv6)
```

Examples To use the ? help to work out the syntax for the **clock timezone** command, enter the following sequence of commands:

```
awplus(config)# clock ?
```

```
summer-time  Manage summer-time
timezone     Set clock timezone
```

```
awplus(config)# clock timezone ?
```

```
TIMEZONE  Timezone name, up to 5 characters
```

```
awplus(config)# clock timezone NZST ?
```

```
minus  negative offset
plus   positive offset
```

```
awplus(config)# clock timezone NZST plus ?
```

```
<0-12>  Time zone offset to UTC
```

```
awplus(config)# clock timezone NZST plus 12
```

The above example demonstrates that the ? help only indicates what you can type **next**. For commands that have a series of parameters, like **clock timezone**, the ? help does not make the number of parameters obvious.

Completing Keywords

To complete keywords, type the Tab key after part of the command.

If only one keyword matches the partial command, the AlliedWare Plus™ OS fills in that keyword. If multiple keywords match, it lists them.

Examples In this example we use Tab completion in successive steps to build the complete command **show ip dhcp server summary**. We have included "<Tab>" to show where to type the Tab key - this is not displayed on screen.

```
awplus# show ip <Tab>
```

Figure 1-3: Example output after entering the command, show ip <Tab>

```
as-path-access-list  bgp                  community-list
dhcp                 dhcp-relay           domain-list
domain-name          extcommunity-list    filter
forwarding           igmp                 interface
irdp                 mroute               mvif
name-server          nat                  ospf
pim                  protocols            rip
route                rpf
```

```
awplus# show ip d<Tab>
```

Figure 1-4: Example output after entering the command, show ip d<Tab>

```
dhcp         dhcp-relay       domain-list      domain-name
```

```
awplus# show ip dhcp <Tab>
```

Figure 1-5: Example output from the show ip dhcp <Tab> command

```
binding  pool        server
```

```
awplus# show ip dhcp server s<Tab>
```

Figure 1-6: Example output from the show ip dhcp s<Tab> command

```
statistics           summary
```

Viewing Command Error Messages

The switch displays the following generic error messages about command input:

% Incomplete command—this message indicates that the command requires more parameters. Use the ? help to find out what other parameters are available.

```
awplus# interface
```

```
% Incomplete command.
```

% Invalid input detected at '^' marker—this indicates that the switch could not process the command you entered. The switch also prints the command and marks the first invalid character by putting a '^' under it. Note that you may get this error if you enter a command in the wrong mode, as the following output shows.

```
awplus# interface port1.0.1
```

```
interface port1.0.1
          ^
% Invalid input detected at '^' marker.
```

% Unrecognized command—when you try to use ? help and get this message, it indicates that the switch can not provide help on the command because it does not recognize it. This means the command does not exist, or that you have entered it in the wrong mode, as the following output shows.

```
awplus# interface ?
```

```
% Unrecognized command
```

Note

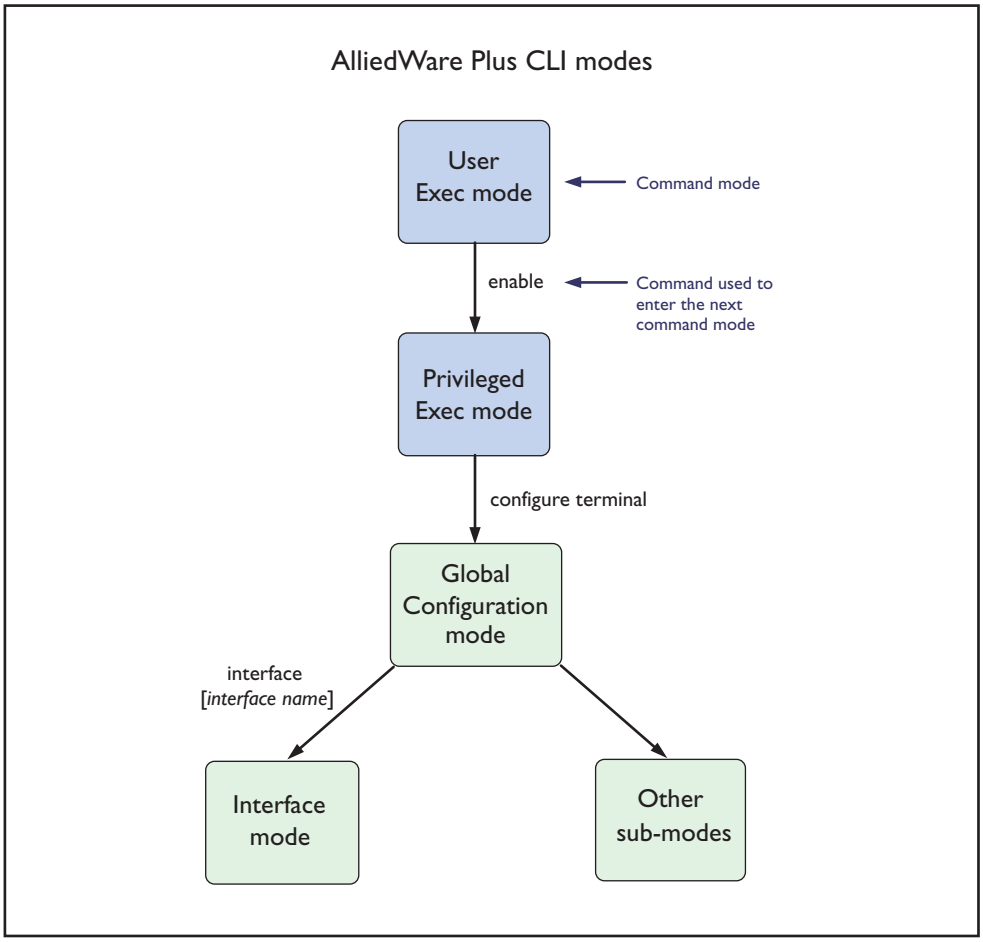
The AlliedWare Plus™ OS does not tell you when commands are successful. If it does not display an error message, you can assume the command was successful.

How to Work with Command Modes

The following figure shows the command mode hierarchy and the commands you use to move to lower-level modes.

Multiple users can telnet and issue commands using the User Exec mode and the Privileged Exec mode. However, only one user is allowed to use the Configure mode at a time. This prevents multiple users from issuing configuration commands simultaneously.

Figure 1-7: AlliedWare Plus™ CLI modes



User Exec mode

User Exec mode is the mode you log into on the switch.

It lets you perform high-level diagnostics (**show** commands, ping, traceroute etc), start sessions (Telnet, SSH), and change mode.

The default User Exec mode prompt is **awplus>**.

Privileged Exec mode

To change from User Exec to Privileged Exec mode, enter the command:

```
awplus># enable
```

Privileged Exec mode is the main mode for monitoring—for example, running **show** commands and debugging. From Privileged Exec mode, you can do all the commands from User Exec mode plus many system commands.

The default Privileged Exec mode prompt is **awplus#.**

Global Configuration mode

To change from Privileged Exec to Global Configuration mode, enter the command:

```
awplus# configure terminal
```

From Global Configuration mode, you can configure most aspects of the switch.

The default Global Configuration mode prompt is **awplus(config)#**.

Lower-level configuration modes

A number of features are configured by entering a lower-level mode from Global Configuration mode.

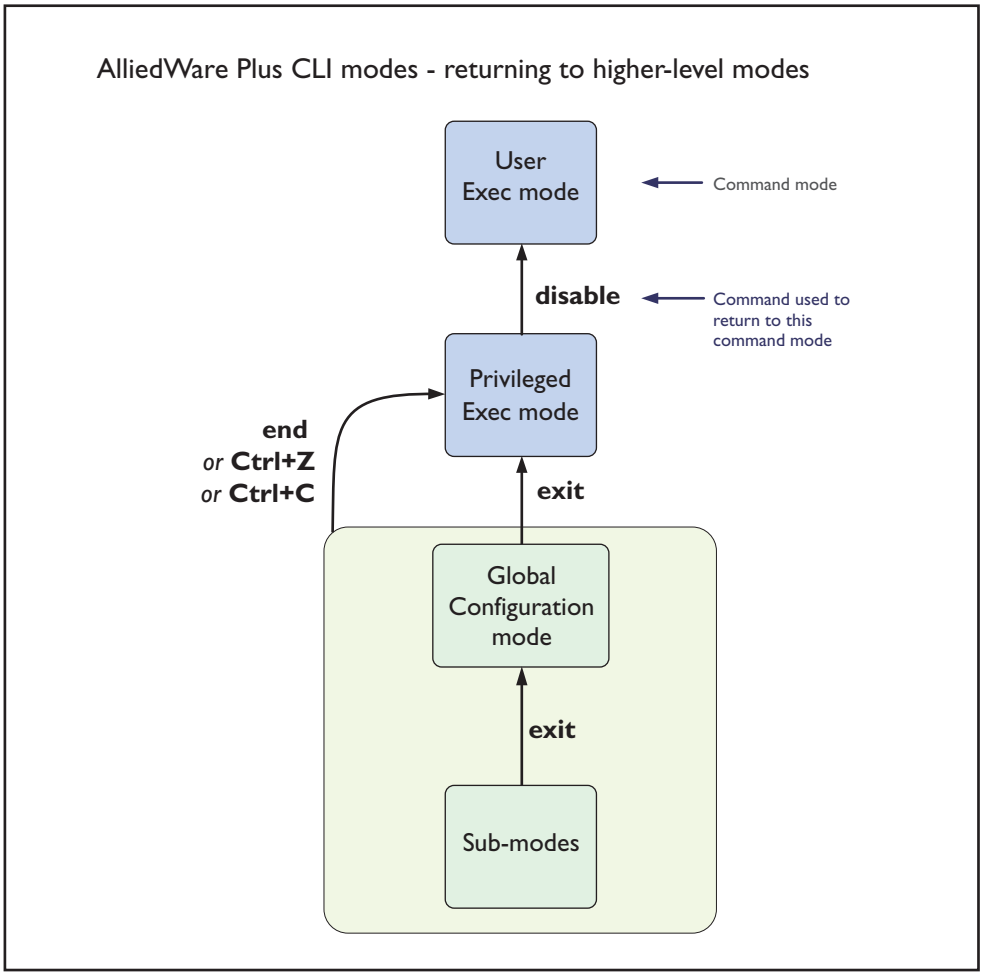
Some protocols have commands in both Global Configuration mode and lower-level configuration modes. For example, to configure MSTP, you use:

- Global Configuration mode to select MSTP as the spanning tree mode
- MST mode to create instances and specify other MSTP settings
- Interface Configuration mode to associate the instances with the appropriate ports.

Returning to higher-level modes

The following figure shows the commands to use to move from a lower-level mode to a higher-level mode.

Figure 1-8: Returning to higher-level modes



Examples To go from Interface Configuration to Global Configuration mode:

```
awplus(config-if)# exit
   awplus(config)#
```

To go from Interface Configuration to Privileged Exec mode:

```
awplus(config-if)# end
          awplus#
```

To go from Privileged Exec to User Exec:

```
          awplus# exit
          awplus#
```

Entering Privileged Exec Commands When in a Configuration Mode

As you configure the switch you will be constantly entering various **show** commands to confirm your configuration. This requires constantly changing between configuration modes and Privileged Exec mode.

However, you can run Privileged Exec commands without changing mode, by using the command:

```
do <command you want to run>
```

You cannot use the ? help to find out command syntax when using the **do** command.

Example To display information about the IP interfaces when in Global Configuration mode, enter the command:

This results in the following output:

```
awplus(config)# do show ip int brief
```

Figure 1-9: Example output after entering the command "do show ip int brief"

```
Interface          IP-Address      Status          Protocol
vlan1              unassigned      admin up        running
vlan2              unassigned      admin up        running
```

How to See the Current Configuration

The current configuration is called the running-config. To see it, enter the following command in either Privileged Exec mode or any configuration mode:

```
awplus# show running-config
```

To see only part of the current configuration, enter the command:

```
awplus# show running-config|include <word>
```

This displays only the lines that contain *word*.

To start the display at a particular place, enter the command:

```
awplus# show running-config |begin <word>
```

This searches the running-config for the first instance of *word* and begins the display with that line.

Note The **show running-config** command works in all modes except User Exec mode.

Default Settings

When the switch first starts up with the AlliedWare Plus™ OS, it applies default settings and copies these defaults dynamically into its running-config.

These default settings mean that the AlliedWare Plus™ OS:

- encrypts passwords, such as user passwords
- records log message priority in log messages
- turns on the telnet server so that you can telnet to the switch
- enables the switch to look up domain names (but for domain name lookups to work, you have to configure a DNS server)
- turns off L3 multicast packet switching in the switch's hardware. This prevents L3 multicast from flooding the switch's CPU in its default state as an L2 switch
- sets the maximum number of ECMP routes to 4
- turns on RSTP on all ports. Note that the ports are not set to be edge ports
- sets all the switch ports to access mode. This means they are untagged ports, suitable for connecting to hosts
- creates VLAN 1and adds all the switch ports to it
- allows logins on the serial console port
- allows logins on VTY sessions (for telnet etc)
- has switching enabled, so Layer 2 traffic is forwarded appropriately without further configuration
- allocates all the routing table memory space to IPv4 and IPv6 routes
- has ports set to autonegotiate their speed and duplex mode
- has copper ports set to auto MDI/MDI-X mode

The Default Configuration Script

Most of the above default settings are in the form of commands, which the switch copies to its running-config when it first boots up.

The switch stores a copy of the default configuration commands in the file, **default.cfg** and uses this as its default start-up file.

For more information about start-up files, see **"How to Save and Boot from the Current Configuration" on page 1.17**.

How to Change the Password

To change the password for the manager account, enter Global Configuration mode and enter the following command:

```
awplus(config)# username manager password <new-password>
```

The password can be up to 23 characters in length and include characters from up to four categories. The password categories are:

- uppercase letters: A to Z
- lowercase letters: a to z
- digits: 0 to 9
- special symbols: all printable ASCII characters not included in the previous three categories.The question mark ? cannot be used as it is reserved for help functionality.

How to Set Strong Passwords

The password security rules are disabled by default. To set password security rules for users with administrative rights, or privilege level 15, enter Global Configuration mode.

You can then either specify whether the user is forced to change an expired password at the next login, or specify whether the user is not allowed to login with an expired password. You will need to specify a password lifetime greater than 0 before selecting either of these features. Note that the **security-password forced-change** and the **security-password reject-expired-pwd** commands cannot be enabled concurrently.

Password lifetime

Enter the following command to specify the password lifetime in days:

```
awplus(config)# security-password lifetime <0-1000>
```

Note that the value 0 will disable lifetime functionality and passwords will never expire. If lifetime functionality is disabled, the **security-password forced-change** command and the **security-password warning** command are also disabled.

Password forced change

To specify that a user is forced to change an expired password at the next login, enter the following command:

```
awplus(config)# security-password forced-change
```

If the **security-password forced-change** command is enabled, users with expired passwords are forced to change to a password that must comply with the current password security rules at the next login.

Reject expired password

To specify that a user is not allowed to login with an expired password, enter the following command:

```
awplus(config)# security-password reject-expired-pwd
```

If the **security-password reject-expired-pwd** command is enabled, users with expired passwords are rejected at login. Users then have to contact the Network Administrator to change their password.

Caution

Once all users' passwords are expired you are unable to login to the device again if the security-password reject-expired-pwd command has been executed. You will have to reboot the device with a default configuration file, or load an earlier software version that does not have the security password feature.

We recommend you never have the command line "security-password reject-expired-pwd" in a default config file.

Use other password security rules to further configure password security settings.

Password warning

To specify the number of days before the password expires that the user will receive a warning message specifying the remaining lifetime of the password, enter the command:

```
awplus(config)# security-password warning <0-1000>
```

The value 0 will disable warning functionality and the warning period must be less than, or equal to, the password lifetime.

Password history

To specify the number of previous passwords that are unable to be reused enter the command:

```
awplus(config)# security-password history <0-15>
```

The value 0 will disable history functionality. If history functionality is disabled, all users' password history is reset and all password history is lost. A new password is invalid if it matches a password retained in the password history.

Password minimum length

To specify the minimum allowable password length, enter the command:

```
awplus(config)# security-password minimum-length <1-23>
```

Password minimum categories

To specify the minimum number of categories that the password must contain in order to be considered valid, enter the command:

```
awplus(config)# security-password minimum-categories <1-4>
```

The password categories are:

- uppercase letters: A to Z
- lowercase letters: a to z
- digits: 0 to 9
- special symbols: all printable ASCII characters not included in the previous three categories. The question mark ? cannot be used as it is reserved for help functionality

To ensure password security, the minimum number of categories should align with the lifetime selected, i.e. the fewer categories specified the shorter the lifetime specified.

How to add a user is described in **"How to Add and Remove Users" on page 1.27**.

Display security password settings

To list the configuration settings for the various security password rules, enter the command:

```
awplus(config)# show security-password configuration
```

To list users remaining lifetime or last password change, enter the command:

```
awplus(config)# show security-password user
```

How to Set an IP Address on VLAN 1

This section describes how to set an IP address on the default VLAN (**vlan1**).

Step 1: If desired, check the current configuration

After logging in, enter Privileged Exec mode by using the command:

```
awplus# enable
```

Then check the current configuration by using one of the following commands:

```
awplus# show ip interface vlan1 brief
```

This results in the following output:

```
Interface              IP-Address      Status          Protocol
vlan1                  172.28.8.200    admin up        running
```

```
awplus# show running-config interface vlan1
```

This results in the following output:

```
!
interface vlan1
 ip address 172.28.8.200/16
!
```

Step 2: Enter Interface Configuration mode for the vlan1 interface

Enter Global Configuration mode and enter the command:

```
awplus(config)# interface vlan1
```

Step 3: Enter the IP address and mask

Enter the command:

```
awplus(config-if)# ip address <address/mask>
```

For example, to set the address to 172.28.8.210/16, enter the command:

```
awplus(config-if)# ip address 172.28.8.210/16
```

How to Save and Boot from the Current Configuration

This section tells you how to save your configuration and run the saved configuration when the switch starts up.

You can either:

- save the configuration to the switch's default configuration file (called "default.cfg"). By default, the switch uses that file at start-up.
- create a new configuration file and set the switch to use the new configuration file at start-up.

How to Save to the Default Configuration File

Enter Privileged Exec mode and enter the command:

```
awplus# copy running-config startup-config
```

The parameter **startup-config** is a short-cut for the current boot configuration file, which will be the default configuration file unless you have changed it, as described in the next section.

How to Create and Use a New Configuration File

Step 1: Copy the current configuration to a new file

Enter Privileged Exec mode and enter the command:

```
awplus# copy running-config <destination-url>
```

Example To save the current configuration in a file called `example.cfg`, enter the command

```
awplus# copy running-config example.cfg
```

Step 2: Set the switch to use the new file at startup

To run the new file's configuration when the switch starts up, enter Global Configuration mode and enter the command:

```
awplus(config)# boot config-file <filepath-filename>
```

Note that you can set the switch to use a configuration file on a USB storage device if you have saved the configuration file to a USB storage device. You can only specify that the configuration file is on a USB storage device if there is a backup configuration file already specified in Flash.

To set a backup configuration file to load if the main configuration file cannot be loaded, enter the command:

```
awplus(config)# boot config-file backup <filepath-filename>
```

For an explanation of the configuration fallback order, see **"The configuration file fallback order" on page 6.10**.

Example To run the commands in `example.cfg` on startup, enter the command:

```
awplus(config)# boot config-file flash:/example.cfg
```

To set `backup.cfg` as the backup to the main configuration file, enter the command:

```
awplus(config)# boot config-file backup flash:/backup.cfg
```

Step 3: Display the new settings

To see the files that the switch uses at startup, enter Privileged Exec mode and enter the command:

```
awplus# show boot
```

The output looks like this:

```
Boot configuration
-----------------------------------------------------------------
Current software   : x510-5.4.4-0.4.rel
Current boot image : flash:/x510-5.4.4-0.4.rel
Backup  boot image : flash:/x510-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: usb:/example.cfg (file exists)
Backup  boot config: flash:/backup.cfg (file exists)
```

Step 4: Continue updating the file when you change the configuration

When you next want to save the current configuration, enter Privileged Exec mode and enter the command:

```
awplus# copy running-config startup-config
```

The parameter **startup-config** is a short-cut for the current boot configuration file.

How to Return to the Factory Defaults

The switch dynamically adds the default settings to the running-config at start-up if the default file is not present. This section describes how to use this feature to return to the factory defaults.

Note

After reboot the show running-config output will show the default factory settings for your switch once you have removed the default.cfg file. To recreate the default.cfg file enter copy running-config startup-config. When you enter copy running-config startup-config commands the default.cfg file is updated with the startup-config.

Completely restore defaults

To completely remove your configuration and return to the factory default configuration, delete or rename the default file and make sure no other file is set as the start-up configuration file.

To find the location of the default boot configuration file, enter Privileged Exec mode and enter the command:

```
awplus# show boot
```

To delete the default file when it is the current boot configuration file, enter Privileged Exec mode and enter either of the commands:

```
awplus# delete force <filename>
```

or:

```
awplus# erase startup-config
```

Note that erasing startup-config deletes the current boot configuration file—it does not simply stop the file from being the boot file.

To make sure that no other file is loaded at start-up, enter Global Configuration mode and enter the command:

```
awplus(config)# no boot config-file
```

Partially restore defaults

To partially restore the default settings, make a configuration file that contains the settings you want to keep and set this as the start-up configuration file. On start-up, the switch will add the missing settings to the running-config.

How to See System Information

This section describes how to view the following system information:

- overview information
- details of temperature and voltage
- serial number

Viewing Overall System Information

To display an overview of the switch hardware, software, and system settings, enter User Exec or Privileged Exec mode and enter the command:

```
awplus# show system
```

The output looks like this:

```
Switch System Status                                    Tue Aug 14 14:30:08 2012
Board       ID  Bay   Board Name                              Rev  Serial number
-------------------------------------------------------------------------------
Base       369        x510-28GTX                            X2-1  A04736H120500033
-------------------------------------------------------------------------------
RAM:  Total: 485460 kB Free: 394104 kB
Flash: 63.0MB Used: 20.1MB Available: 42.9MB
-------------------------------------------------------------------------------
Environment Status : Normal
Uptime             : 17 days 19:00:46
Bootloader version : 2.0.9-devel

Current software   : x510-5.4.4-0.4.rel
Software version   : 5.4.3
Build date         : Tue Apr 24 13:42:56 NZST 2012

Current boot config: flash:/default.cfg (file exists)
User Configured Territory: usa

System Name
 awplus
```

Viewing Temperature, Voltage, and Fan Status

The switch monitors the environmental status of the switch and its power supplies and fan. To display this information, enter User Exec or Privileged Exec mode and enter the command:

```
awplus# show system environment
```

The output looks like the following figure.

```
awplus#show system environment
Stack Environment Monitoring Status

Stack member 1:

Overall Status: Normal

Resource ID: 1  Name: x510-28GTX
ID  Sensor (Units)                    Reading  Low Limit High Limit Status
1   Fan: Fan 1 (Rpm)                     4344       3000          -     Ok
2   Voltage: 1.8V (Volts)               1.804      1.617      1.978     Ok
3   Voltage: 1.0V (Volts)               0.995      0.896      1.099     Ok
4   Voltage: 3.3V (Volts)               3.291      2.960      3.613     Ok
5   Voltage: 5.0V (Volts)               5.066      4.477      5.498     Ok
6   Voltage: 1.2V (Volts)               1.187      1.072      1.318     Ok
7   Temp: CPU (Degrees C)                  50        -10         90     Ok
```

Viewing the Serial Number

The switch's serial number is displayed in the output of the **show system** command on page 10.49, but for convenience, you can also display it by itself. To do this, enter User Exec or Privileged Exec mode and enter the command:

```
awplus# show system serialnumber
```

The output looks like this:

```
P1FY7502C
```

How to Set System Parameters

You can set system parameters to personalize the switch and make it easy to identify it when troubleshooting. This section describes how to configure the following system parameters:

- telnet session timeout
- switch name
- login banner

How to Change the Telnet Session Timeout

By default, telnet sessions time out after 10 minutes of idle time. If desired, you can change this.

To change the timeout for all telnet sessions, enter Global Configuration mode and enter the commands:

```
awplus(config)# line vty 0 32
awplus(config-line)# exec-timeout <new-timeout>
```

The new timeout value only applies to new sessions, not current sessions.

Examples To set the timeout to 30 minutes, enter the command:

```
awplus(config-line)# exec-timeout 30
```

To set the timeout to 30 seconds, enter the command:

```
awplus(config-line)# exec-timeout 0 30
```

To set the timeout to infinity, so that sessions never time out, enter either of the commands:

```
awplus(config-line)# no exec-timeout
awplus(config-line)# exec-timeout 0 0
```

How to Name the Switch

To give the switch a name, enter Global Configuration mode and enter the command:

```
awplus(config)# hostname <name>
```

For example, to name the switch “mycompany”:

```
awplus(config)# hostname mycompany
```

The prompt displays the new name:

```
mycompany(config)#
```

The name can contain hyphens and underscore characters, for example:

```
mycompany(config)#hostname mycompany_more_words
mycompany_more_words(config)#hostname mycompany-hyphenated
mycompany-hyphenated(config)
```

However, the name must be a single word, as the following example shows.

```
mycompany(config)#hostname mycompany more words
                                   ^
% Invalid input detected at '^' marker.
```

It also cannot be surrounded by quote marks, as the following example shows.

```
awplus(config)#hostname "mycompany more words"
% hostname contains invalid characters
```

Removing the name

To remove the hostname, enter the command:

```
mycompany(config)# no hostname
```

The prompt changes back to the default prompt:

```
awplus(config)#
```

How to Display a Text Banner at Login

By default, the switch displays the AlliedWare Plus™ OS version and build date before login. You can customize this by changing the Message of the Day (MOTD) banner.

To enter a new MOTD banner, enter Global Configuration mode and enter the command:

```
awplus(config)# banner motd <banner-text>
```

The text can contain spaces and other printable characters. You do not have to surround words with quote marks.

Example

To display "this is a new banner" when someone logs in, enter the command:

```
awplus(config)# banner motd this is a new banner
```

This results in the following output at login:

```
awplus login: manager
Password:
this is a new banner
awplus>
```

Removing the banner

To return to the default banner (AlliedWare Plus™ OS version and build date), enter the command:

```
awplus(config)# banner motd default
```

To remove the banner instead of replacing it, enter the command:

```
awplus(config)# no banner motd
```

How to Set the Time and Date

There are three aspects to setting the time and date:

- setting the current time and date (**"How to Set the Time and Date" on page 1.25**)
- setting the timezone (**"How to Set the Timezone" on page 1.25**)
- configuring the switch to automatically change the time when summer-time begins and ends (**"How to Configure Summer-time" on page 1.26**)

Instead of manually setting the time, you can use NTP to automatically get the time from another device.

How to Show Current Settings

To display the current time, timezone and date, enter Privileged Exec mode and enter the command:

```
awplus# show clock
```

The output looks like this:

```
UTC Time:   Wed,  16 May 2013 16:08:14 +0000
Timezone: UTC
Timezone Offset: +00:00
Summer time zone: None
```

How to Set the Time and Date

To set the time and date, enter Privileged Exec mode and enter the **clock set** command:

```
clock set <hh:mm:ss> <day> <month> <year>
```

:where:

- *hh* is two digits giving the hours in 24-hour format (e.g. **14**)
- *mm* is two digits giving the minutes
- *ss* is two digits giving the seconds
- *day* is two digits giving the day of the month
- *month* is the first three letters of the month name (e.g. **sep**)
- *year* is four digits giving the year

Example To set the time to 14:00:00 on 25 January 2012, use the command:

```
awplus# clock set 14:00:00 25 jan 2012
```

How to Set the Timezone

To set the timezone, enter Global Configuration mode and enter the **clock timezone** command:

```
clock timezone <timezone-name> {plus|minus} <0-12>
```

The <*timezone-name*> can be any string up to 6 characters long.

To return the timezone to UTC+0, enter the command:

```
awplus(config)# no clock timezone
```

Example To set the timezone to Eastern Standard Time, use the command:

```
awplus(config)# clock timezone EST minus 5
```

How to Configure Summer-time

There are two approaches for setting summer-time:

- *recurring*, when you specify the week when summer-time starts and ends and each year the switch changes the time at those weeks. For example, Eastern Daylight Time (EDT) starts at 2 am on the second Sunday in March and ends at 2 am on the first Sunday in November.
- *date-based*, when you specify the start and end dates for summer-time for a particular year. For example, Eastern Daylight Time (EDT) starts at 2 am on Sunday, 8 March 2008 and ends at 2 am on Sunday, 2 November 2008.

Recurring To set summer-time with recurring dates, enter Global Configuration mode and enter the **clock summer-time recurring** command:

```
clock summer-time <zone-name> recurring <start-week> <start-
day> <start-month> <start-time> <end-week> <end-day>
<end-month> <end-time> <1-180>
```

The <*zone-name*> can be any string up to 6 characters long.

The <*start-time*> and <*end-time*> are in the form `hh:mm`, in 24-hour time.

Note that if you specify 5 for the week, this changes the time on the last day of the month, not the 5th week.

Example To configure EDT, enter the command:

```
awplus(config)# clock summer-time EDT recurring 2 Sun Mar 02:00
                1 Sun Nov 02:00 60
```

Date-based To set summer-time for a single year, enter Global Configuration mode and enter the **clock summer-time date** command:

```
clock summer-time <zone-name> date <start-day> <start-month>
<start-year> <start-time> <end-day> <end-month> <end-year>
<end-time> <1-180>
```

The <*zone-name*> can be any string up to 6 characters long.

The <*start-time*> and <*end-time*> are in the form `hh:mm`, in 24-hour time.

Example For example, to configure EDT for 2008 enter the command:

```
awplus(config)# clock summer-time EDT date 8 Mar 2008 02:00 2
                Nov 2008 02:00 60
```

How to Add and Remove Users

Adding users

To add a new user with administrative rights, enter Global Configuration mode and enter the command:

```
awplus(config)# username <name> privilege 15 password
                <password>
```

Both <*name*> and <*password*> can contain any printable character and are case sensitive.

When you add a user with administrative rights, <*password*> will have to conform to the rules specified by the **security-password minimum-categories** command on page 5.20 and the **security-password minimum-length** command on page 5.21. If the **security-password history** command on page 5.17 is enabled, <*password*> is invalid if it matches a password retained in the password history.

The AlliedWare Plus™ OS gives you a choice of **1** or **15** for the privilege level. Level **1** users are limited to User Exec mode so you need to set most users to level **15**.

For example, to add user Bob with password 123$%^, enter the command:

```
awplus(config)# username Bob privilege 15 password 123$%^
```

Removing users

To remove a user, enter Global Configuration mode and enter the command:

```
no username <name>
```

For example, to remove user Bob, enter the command:

```
awplus(config)# no username Bob
```

Note that you can delete all users, including the user called “manager” and the user you are logged in as. If all privilege **15** user accounts are deleted, a warning message is generated:

```
% Warning: No privileged users exist.
```

If all privilege level **15** user accounts are deleted, and there are no other users configured for the device, you may have to reboot with the default configuration file.

If there is a user account on the device with a lower privilege level and a password has already been set with the **enable password** command on page 5.4, you can login and still enter privileged mode. When executing the **enable** command, enter the password created with the **enable password** command. For example, if the password is mypassword:

```
awplus> enable mypassword

awplus#
```

Displaying users

To list the currently logged-in users, enter User Exec or Privileged Exec mode and enter the command:

```
awplus# show users
```

The output looks like this:

```
Line    User            Host(s)  Idle      Location        Priv Idletime Timeout
con 0   manager         idle     00:00:00  ttyS0           15   10       N/A
vty 0   bob             idle     00:00:03  172.16.11.3     1    0        5
```

To list all configured users, enter User Exec or Privileged Exec mode and enter the command:

```
awplus# show running-config |include username
```

The output looks like this:

```
username manager privilege 15 password 8 $1$bJoVec4D$JwOJGPr7YqoExA0GVasdE0
username Bob privilege 15 password 8 $1$gXJLY8dw$iqkMXLgQxbzSOutNUa5E2.
```

Pre-encrypted Passwords

The running-config output above includes the number 8 after the **password** parameter. This indicates that the password is displayed in its encrypted form.

You can enter the number 8 and a pre-encrypted password on the command line. You may want to pre-encrypt passwords if you need to load them onto switches via an insecure method (such as HTTP, or by emailing them to remote users).

Caution Only enter the number 8 if you are entering a pre-encrypted password—otherwise, you will be unable to log in using the password and will be unable to access the switch through that username. The next section describes why.

Testing this feature

If you want to test the effect of this, *create a new user* for the test instead of using the manager user. The test stops you from logging in as the test user, so you need to have the manager user available to log in as.

The following output shows how specifying the number 8 puts the password into the running-config exactly as you typed it:

```
awplus(config)#username Bob privilege 15 password 8 friend
awplus(config)#show running-config |include username Bob
username Bob privilege 15 password 8 friend
```

After entering the command above, logging in as “Bob” with a password of “friend” does not work. This is because the switch takes the password you enter (“friend”), hashes it, and compares the hash with the string in the running-config (“friend”). The hashed value and “friend” are not the same, so the switch rejects the login.

How to Undo Settings

There are two possibilities for undoing settings: the **no** parameter and the **default** parameter.

How to Use the *no* Parameter

To undo most settings, simply re-enter the first parameters of the configuration command with the parameter **no** before them.

Example You can set the timezone to Eastern Standard Time by entering the command:

```
awplus(config)# clock timezone EST minus 5
```

To remove the timezone setting, enter the command:

```
awplus(config)# no clock timezone
```

How to Use the *default* Parameter

Some commands have a **default** parameter that returns the feature to its default setting.

Example You can change the login banner to “this is a new banner” by entering the command:

```
awplus(config)# banner motd this is a new banner
```

To return to the default banner, enter the command:

```
awplus(config)# banner motd default
```

Note that this command also has a **no** parameter that lets you remove the banner altogether.

How to Upgrade the Firmware

New releases of the AlliedWare Plus™ OS become available regularly. Contact your customer support representative for more information.

Step 1: Put the new release onto your TFTP server or your USB drive.

Step 2: If necessary, create space in the switch's Flash memory for the new release

Note that you cannot delete the current release file.

To see how much space is free, use the command:

```
awplus# show file systems
```

Step 3: Copy the new release from your TFTP server or your USB drive onto the switch

Follow the relevant instructions in **"Copying with Trivial File Transfer Protocol (TFTP)" on page 6.16**, or **"Copying to and from NVS or USB storage device" on page 6.14**, as appropriate.

Step 4: Set the switch to boot from the new release

Enter Global Configuration mode and enter the command:

```
awplus(config)# boot system backup <filepath-
                filename>
```

You can set a backup release file to load if the main release file cannot be loaded. Enter the command:

```
awplus(config)# boot system backup backup <filepath-
                filename>
```

Step 5: Check the boot settings

Enter Privileged Exec mode and enter the command:

```
awplus# show boot
```

Step 6: Reboot

Enter Privileged Exec mode and enter the command:

```
awplus# reboot
```

Save Power With the Eco-Friendly Feature

Eco-Friendly

You can conserve power by enabling the eco-friendly LED (Light Emitting Diode) feature either by entering the **ecofriendly led** command on page 10.15 or by pressing the **eco**-friendly button on the front panel. This feature disables power to the port LEDs, but not the power indicator LED. In the eco-friendly mode, one of the horizontal segments of the seven segment display will glow permanently. If the device is a stack master, the upper segment will glow; if the device is a stack member or a stand alone unit, the center segment will glow.

When the eco-friendly LED feature is enabled, a change of port status will not affect the display of the associated LED. When the eco-friendly feature is disabled and power is returned to port LEDs, the LEDs will correctly show the current state of the ports.

In a stack environment, enabling the eco-friendly LED feature on the stack master will apply the feature to every member of the stack.

The eco-friendly LED feature is disabled by default. To globally enable the feature for all LED ports on the switch, either push the eco-switch button or enter the commands:

```
awplus# configure terminal
awplus(config)# ecofriendly led
```

For an example of how to configure a trigger to enable the eco-friendly LED feature, see **"Turn Off Power to Port LEDs" on page 102.7**.

You can also conserve power by enabling the eco-friendly LPI (Low Power Idle) feature with the **ecofriendly lpi** command on page 10.16. This feature reduces the power supplied to the ports by the switch whenever the ports are idle and are connected to IEEE 802.3az Energy Efficient Ethernet compliant host devices. All ports configured for LPI must support LPI in hardware and must be configured to autonegotiate by default or by using the **speed** and **duplex** commands as needed.

LPI is a feature of the IEEE 802.3az Energy Efficient Ethernet (EEE) standard. LPI lowers power consumption of switch ports during periods of low link utilization when connected to IEEE 802.3az compliant host devices. If no data is sent then the switch port can enter a sleep state, called Low Power Idle (LPI), to conserve power used by the switch.

The eco-friendly LPI (Low Power Idle) feature is disabled by default. To enable the feature for a switch port, or for a range of switch ports in the example below, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.22
awplus(config-if)# ecofriendly lpi
```

For an example of how to configure a trigger to enable the eco-friendly LPI feature, see **"Reduce Power Supplied to Ports" on page 102.9**.

Trouble-shoot fiber and pluggable issues

Digital Diagnostics Monitoring (DDM) for SFP (1 Gigabit Small Form-factor Pluggable) and SFP+ (10 Gigabit Small Form-factor Pluggable) transceivers allows you to measure optical parameters for pluggables installed in a switch and trouble shoot fiber issues.

Fiber cable can be vulnerable to damage. Patch panels and patch cables can be connected with the wrong type of fiber, fiber splices can become faulty and fiber cables can be cut accidentally. Trouble shooting fiber issues has required special equipment and expertise to find the source of a problem causing signal attenuation. Digital monitoring features help find fiber issues.

Different types of transceivers are supported in different models of switch. See your Allied Telesis dealer for more information about the particular models of pluggables that your switch supports, and if these transceivers also support digital monitoring.

To display information about transceivers installed on your switch, enter the following command:

```
awplus# show system pluggable diagnostics
```

The following parameters are measured and are displayed in **show system pluggable diagnostics** command output:

- Temperature (Centigrade) inside the transceiver
- Vcc (Volts) voltage supplied to the transceiver
- Tx Bias (mA) current to the Laser Diode in the transceiver
- Tx Power (mW) the amount of light transmitted from the transceiver
- Rx Power (mW) the amount of light received in the transceiver

You can track Tx Bias to find out how the Laser Diode in the transceiver is aging by comparing the Tx Bias for one transceiver against Tx Bias for others. You can use this information to see if any transceivers may need replacement.

You can trouble shoot fiber connectivity issues by checking the Tx Power at one end of the fiber link against the Rx Power at the other end of the fiber link to measure the attenuation. Knowing the attenuation enables you to determine if there are anomalies in the fiber cable.

Note that Tx Power differences between the same type of transceivers installed on a switch may indicate that a transceiver is not seated or locked. Ensuring transceivers are seated and locked in place with the retaining clip will keep the fiber link up if there is any vibration or movement that can dislodge a fiber cable. Rx Power differences may indicate poor fiber patch cables, poor connectors or poor splices. Tracking Tx Bias for installed transceivers and measuring attenuation for fiber links allows you to perform periodic preventative maintenance, instead of reacting to a failure. Tracking Tx Power differences can be used as an indicator of failure in an which may need replacing.

Using the Find Me feature

The Find Me feature enables you to physically locate a specific device from a group of similar devices.

Running the **findme** command on page 10.18 causes the device's LEDs to alternately flash green and amber at a rate of 1 Hz. If the switch has no amber LED, then the green LED will flash on/off at a rate of 1 Hz.

An optional **interface** parameter specifies one or more interfaces to flash, while an optional **member** parameter specifies a particular stack member. Both these parameters are mutually exclusive. If no **interface** or **member** parameter is specified, then all ports on the device or stack are flashed.

An optional **timeout** parameter specifies the flash behavior **duration**. The default time is one minute (60 seconds). Normal LED behavior is restored automatically after either the default time, or a specified time, has elapsed or a **no findme** command is used.

Note At the time of writing, the AT-x510-28GPX and AT-x510-52GPX switches do not have the Find Me feature.

Continuous Reboot Prevention

Occasionally, due to network conditions or to recover from a software failure, the recovery mechanism of the switch is to reboot to resume normal operation. Provided the same error condition does not recur within a short period of time this is acceptable behavior. However, if the error condition repeatedly occurs within a short time period, the switch will go into a cycle of continuous reboots, causing network problems.

Although a switch continuously rebooting will come to the attention of a network administrator who can then resolve the issue, it is likely that in the meantime network problems have arisen. For example, a broadcast storm due to STP becoming unstable and trying to continually reconverge could cause the switch to reboot continuously.

In a VCStack situation, a continually rebooting switch will destabilize the stack and may cause the master and member devices to continually swap roles as they both reboot. This can seriously affect the network, because both devices will become too busy rebooting and forming the stack to forward traffic.

The continuous reboot prevention feature, enabled with the **continuous-reboot-prevention** command on page 10.13, allows the user to configure a switch to stop rebooting if the device gets into a cycle of continuous rebooting. The user can configure the time period, the maximum number of times the switch can reboot within the specified time period, referred to as the threshold, and the action to take if the threshold is exceeded.

There are three actions you can specify:

- linkdown

  The reboot procedure continues and all switch ports and stack ports stay link down. This is the default action.

- logonly

  The reboot procedure continues normally.

- stopreboot

  The reboot procedure stops and the user is prompted to enter the key "c" via the CLI. Normal reboot procedure then continues.

Note that when the continuous reboot prevention feature is enabled on the switch, user initiated reboots via the CLI and software version auto-synchronization reboots (VCStack implementation) are not counted toward the threshold value.

The continuous reboot prevention feature is disabled by default. To enable the feature, enter the following commands:

```
awplus# configure terminal
awplus(config)# continuous-reboot-prevention enable
```

Unless the **period**, **threshold** and **action** parameter values are explicitly set, the defaults are used:

- period - 600 seconds
- threshold - 1 reboot event
- action - linkdown

To configure the **period**, **threshold** and the **action** to take if the number of reboots exceeds the specified threshold, enter the following commands:

```
awplus# configure terminal
awplus(config)# continuous-reboot-prevention [period <60-
604800>] [threshold <1-10>]
[action [linkdown|logonly|stopreboot]]
```

If the action **stopreboot** is specified, the reboot procedure stops and the following message is displayed:

```
Please input key 'c' if you want to continue processing.
```

When the user has input “c” via the CLI, the reboot procedure continues.

To disable the continuous reboot prevention feature, enter the following commands:

```
awplus# configure terminal
awplus(config)# no continuous-reboot-prevention enable
```

To return either one or more of the **period**, **threshold** and the **action** parameters to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no continuous-reboot-prevention [period]
[threshold] [action]
```

To display the current continuous reboot prevention configuration, enter the command:

```
awplus# show continuous-reboot-prevention
```

To display the reboot history of the switch, enter the command:

```
awplus# show reboot history
```

Controlling “show” Command Output

You can control the output of **show** commands by using the | and > or >> tokens in the following ways:

- To display only part of the output, follow the command with **|** and then other keywords (see **Output Modifiers** below)
- To save the output to a file, follow the command with **> *filename***
- To append the output to an existing file, follow the command with **>> *filename***

Using the ? after typing the **show** command displays the following information about these tokens:

```
awplus#  show users
```

```
| Output modifiers
> Output redirection
>> Output redirection (append)
```

Output Modifiers

Type the | (vertical bar) to use **Output modifiers**.

```
append    Append output
begin     Begin with the first line that contains
          matching output
exclude   Exclude lines that contain matching output
include   Include lines that contain matching output
redirect  Redirect output
```

Begin

The **begin** parameter causes the display to begin at the first line that contains the input string.

```
awplus#  show run | begin vlan1
```

```
...skipping
interface vlan1
 ip address 192.168.14.1
!!
line con 0
 login
line vty 0 4
 login
!
end
```

Exclude The **exclude** parameter excludes all lines of output that contain the input string. In the following output all lines containing the word "input" are excluded:

```
awplus#  show interface vlan1 | exclude input
```

```
Interface vlan1
  Scope: both
  Hardware is Ethernet, address is 192.168.14.1
  index 3 metric 1 mtu 1500 <UP,BROADCAST,RUNNING,MULTICAST>
  Label switching is disabled
  No Virtual Circuit configured
  Administrative Group(s): None
  DSTE Bandwidth Constraint Mode is MAM
    output packets 4438, bytes 394940, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0,
window 0
    collisions 0
```

Include The include parameter includes only those lines of output that contain the input string. In the output below, all lines containing the word "input" are included:

```
awplus#  show interface vlan1 | include input
```

```
input packets 80434552, bytes 2147483647, dropped 0, multicast packets 0
input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 1, missed 0
```

Redirect The **redirect** parameter puts the lines of output into the specified file. If the file already exists, the new output overwrites the file's contents; the new output is not appended to the existing file contents.

| **redirect** and > are synonyms.

```
awplus#  show history | redirect history.txt
```

Output Redirection The output redirection token > puts the lines of output into the specified file. If the file already exists, the new output overwrites the file's contents; the new output is not appended to the existing file contents.

| **redirect** and > are synonyms.

```
awplus#  show history > history.txt
```

Append Output The append output token >> adds the lines of output into the specified file. The file must already exist, for the new output to be added to the end of the file's contents; the new output is appended to the existing file contents.

| **append** and >> are synonyms.

```
awplus#  show history >> history.txt
```

AlliedWare Plus GUI

Information on loading and using the AlliedWare Plus™ GUI is outside the scope of the main body of this reference manual. This topic is covered in a separate appendix to this document. See **"Appendix C: GUI Reference"**.

Chapter 2: Command Syntax Conventions in this Software Reference

The following table describes how command line interface syntax is shown in this Software Reference.

Syntax element	Example	What to enter in the command line

Keywords are shown in lowercase fixed-width font or bold variable-width font.	`show spanning-tree mst`
	or
	`show ip route`
		Some keywords are required, and others are optional parameters. Type keywords exactly as they appear in the command syntax.

Number ranges are enclosed in angle-brackets < > and separated by a hyphen.	`<0-255>`	Enter a number from the range. Do not enter the angle brackets.

Placeholders are shown in lowercase italics within angle-brackets < >, or in uppercase italics.	`<port-list>`
	or
	`ip dhcp pool NAME`
		Replace the placeholder with the value you require. The placeholder may be an IP address, a text string, or some other value. See the parameter table for the command for information about the type of value to enter.
		Do not enter the angle-brackets.

Repeats are shown with ellipsis.	`param1...`	Enter the parameter one or more times.
Optional elements are shown in brackets: [ ]	`vlan <vid> [name <vlan-name>]`	If you need the optional parameter, enter it. Do not enter the brackets.
Required choices are enclosed in braces and separated by a vertical bar (pipe) : {|}.	`spanning-tree {mstp|rstp|stp} enable`	Enter one only of the options. Do not enter the braces or vertical bar.
Optional choices are enclosed in or brackets and separated by a vertical bar (pipe): [|]	`[param1|param2]`	If needed, enter one only of the options. Do not enter the brackets or vertical bar.
Inclusive options are enclosed in braces, and separated by brackets: {[ ] [ ]}.	`{[param1] [param2] [param3]}`	Enter one or more of the options and separate them with a space. Do not enter the braces or brackets.

Chapter 3: Start-up Sequence

AlliedWare Plus Start-up

Every switch has a start-up process. A specified version of product software must be loaded and executed. The bootloader is the executable code responsible for setting up the system and loading the release software.

The bootloader is the software that runs the unit when it first powers up, performing basic initialization and executing the product software release. As part of the start-up process of the switch, the bootloader allows you various options before running the product release software.

Previous versions of AlliedWare provide the option to boot to EPROM if a software release cannot be loaded, is unlicensed, or if selected by the user. The EPROM provides enough basic functionality to get a working software release loaded and operational on the switch. In AlliedWare Plus™ this task is handled by the bootloader.

As AlliedWare Plus™ begins its start-up process; there are two options that allow you to access either the diagnostic menu, or the bootloader menu. The following prompt is displayed when these options are temporarily available:

```
Bootloader 1.0.9 loaded
Press <Ctrl+B> for the Boot Menu
```

You can now enter one of the following two options to determine how the start-up process proceeds:

- Enter Ctrl+D to display the diagnostic menu.
- Enter Ctrl+B to display the bootloader menu.

Diagnostic Menu

Enter Ctrl+D during start-up to access the bootloader diagnostic menu, and provide options for performing various hardware tests. This can be useful as a tool for confirming a suspected hardware problem at the direction of network engineering personnel. When you enter Ctrl+D, the stage 1 diagnostics menu is displayed:

```
Bootup Stage 1 Diagnostics Menu:
  0. Restart
  1. Full RAM test
  2. Quick RAM test
  3. Battery backed RAM (NVS) test
  4. Bootloader ROM checksum test
  ---------------------------------
  7. Bootup stage 2 diagnostics menu
  ---------------------------------
  8. Quit to U-Boot shell
  9. Quit and continue booting
Enter selection ==>
```

The options in the stage 1 diagnostics menu allow you to initiate the following tests:

- RAM
  The Bootloader fully tests any/all SDRAM installed in the system.
- NVS
  The Bootloader fully tests any/all non-volatile (battery backed) SRAM installed in the system.
- checksum
  The Bootloader checksum ROM memory for error detection.

For example, enter “2” to select a Quick RAM test:

```
Quick RAM test - press Q to quit, S to skip when failing
Writing pattern  ..............................
Checking pattern ..............................
Writing complemented pattern ..................
Checking complemented pattern ..................
Pass 1  total errors 0
```

Enter “7” to display the stage 2 diagnostics menu:

```
Entering stage 2...
Bootup Stage 2 Diagnostics Menu:
  0. Restart
  2. Test FLASH (Filesystem only)
  4. Erase FLASH (Filesystem only)
  5. Card slot test
  ---------------------------------
  8. Quit to U-Boot shell
  9. Quit and continue booting
```

The options in the stage 2 diagnostics menu allow you to initiate the following tests:

- Flash
  The Bootloader tests the user file system area of Flash. The bootloader is stored in a protected area of Flash that is not accessed by the user file system.
- Flash Erase
  The Bootloader erases the user file system area of Flash only.

Once any required tests are completed from the diagnostics menu, enter “9” to quit the diagnostic menu and continue the switch boot-up process.

Bootloader Menu

Enter Ctrl+B during start-up to access the bootloader menu where boot options can be set. The boot options shown are explained in detail under this example.

```
Boot Menu:

  ------------------------------------------------------
  B. Boot backup software
  ------------------------------------------------------
  0. Restart
  1. Perform one-off boot from alternate source
  2. Change the default boot source (for advanced users)
  3. Update Bootloader
  4. Adjust the console baud rate
  5. Special boot options
  6. System information
  7. Restore Bootloader factory settings
  ------------------------------------------------------
  9. Quit and continue booting
```

Boot options

A powerful feature of AlliedWare Plus™ is the ability to boot from a variety of sources. Previously the switch was constrained to just booting off the release loaded into Flash memory. The only software release upgrade path being to load a new release into Flash memory and then set this release to be loaded at the next restart.

Details of the bootloader menu options are as follows:

1. Perform one-off boot from alternate source

Enter "1" to provide the following one-off boot options:

Note These settings are specific to the Bootloader. They are not related in any way to what may be configured by the main software release.

When the switch is booted up using the 'one-off' selected source for the software release, it provides the option to copy the release just used to Flash for further/ permanent use:

```
login: manager
Password: ******
The system has been booted using the one off boot/recovery
mechanism.
Bootup has successfully completed.
Write this release to flash? (y/n):
```

2. Change the default boot source (for advanced users)

Entering "2" provides the option to set the boot source permanently.

3. Update Bootloader

This option allows for the bootloader code to be updated. It is not detailed here, as it is envisioned that this would rarely need to be done, and only at the request of (and with support from) Allied Telesis engineering.

4. Adjust the console baud rate

The baud rate of the console session is set here to match the terminal program being used for management of the switch when connected directly to the asynchronous port. The switches default value is 9600. The baud rate selected can be set as the 'new' default for future use if preferred.

```
Select baud rate:

  0. Return to previous menu
  ------------------------------------------------------
  1. 9600
  2. 19200
  3. 38400
  4. 57600
  5. 115200
  6. 230400 (Setting can't be made permanent)
  7. 460800 (Setting can't be made permanent)

Enter selection ==>  1

Change your terminal program baud rate to 9600 and press
enter...  if for some reason you are unable to do this,
power cycle the device and the existing baud rate will be
restored.
Use this baud rate by default? (Y/N) ==> n
```

5. Special boot options

The special boot options allow for system recovery in the event of a forgotten password or to the default configuration.

```
Special boot options menu:

  0. Return to previous menu
  ------------------------------------------------------
  1. Skip startup script (Use system defaults)

Enter selection ==>
```

6. System information

The system information option provides some details on the hardware platform in use, such as CPU, memory, hardware (MAC) address and so on.

7. Restore Bootloader factory settings

This option allows the bootloader to be set back to factory defaults.

Caution 

This option erases any settings that may have been configured by this menu
Are you sure? (Y/N) ==>

The bootloader menu provides a powerful set of options for flexibility in the way software releases are upgraded on the switch, and system recovery is performed.

Start-up Sequence

The start-up sequence for a device running AlliedWare Plus™ under normal circumstances will be as seen in the following pages - this sequence will be seen when everything loads and runs as expected.

Note

To enter the bootloader or diagnostic menus discussed previously, Ctrl+B or Ctrl+D must be entered when prompted before the software modules start loading.

There are three possible status results displayed for each module loaded - OK, INFO, ERROR:

- OK means that the module has loaded correctly.
- INFO means that an error occurred, but the device is usable.
- ERROR means that an error occurred and device operation may be affected.

Additional specific information accompanies an INFO or ERROR status result. For example, if a corrupt release file was set as the startup release, the following error message would be seen:

Whether an error message results in a case of the device being unusable will depend on the specific error and message, so will need to be dealt with on a case by case basis. If a software release has been corrupted, as shown on start-up, a new release may need to be loaded.

Chapter 4: CLI Navigation Commands

Command List

This chapter provides an alphabetical reference for the commands used to navigate between different modes. This chapter also provides a reference for the help and show commands used to help navigate within the CLI.

configure terminal

This command enters the Global Configuration command mode.

Syntax `configure terminal`

Mode Privileged Exec

Example To enter the Global Configuration command mode (note the change in the command prompt), enter the command:

```
awplus# configure terminal
awplus(config)#
```

disable (Privileged Exec mode)

This command exits the Privileged Exec mode, returning the prompt to the User Exec mode. To end a session, use the **exit** command.

Syntax `disable`

Mode Privileged Exec

Example To exit the Privileged Exec mode, enter the command:

```
awplus# disable
awplus>
```

Related Commands **enable (Privileged Exec mode)**
end
exit

do

This command lets you to run User Exec and Privileged Exec mode commands when you are in a Configuration mode.

Syntax `do <command>`

Parameter	Description
<command>	Specify the command and its parameters.

Mode Any configuration mode

Example

```
awplus# configure terminal
awplus(config)# do ping 192.0.2.23
```

enable (Privileged Exec mode)

This command enters the Privileged Exec mode and optionally changes the privilege level for a session. If a privilege level is not specified then the maximum privilege level (15) is applied to the session. If the optional privilege level is omitted then only users with the maximum privilege level can access Privileged Exec mode without providing the password as specified by the **enable password** or **enable secret** commands. If no password is specified then only users with the maximum privilege level set with the **username** command can assess Privileged Exec mode.

Syntax `enable [<privilege-level>]`

Parameter	Description
<privilege-level>	Specify the privilege level for a CLI session in the range <1-15>, where 15 is the maximum privilege level, 7 is the intermediate privilege level and 1 is the minimum privilege level. The privilege level for a user must match or exceed the privilege level set for the CLI session for the user to access Privileged Exec mode. Privilege level for a user is configured by **username**.

Mode User Exec

Usage Many commands are available from the Privileged Exec mode that configure operating parameters for the switch, so you should apply password protection to the Privileged Exec mode to prevent unauthorized use. Passwords can be encrypted but then cannot be recovered. Note that un-encrypted passwords are shown in plain text in configurations.

The **username** command sets the privilege level for the user. After login, users are given access to privilege level 1. Users access higher privilege levels with the **enable (Privileged Exec mode)** command. If the privilege level specified is higher than the users configured privilege level specified by the **username** command, then the user is prompted for the password for that level.

Note that a separate password can be configured for each privilege level using the **enable password** and the **enable secret** commands from the Global Configuration mode. The **service password-encryption** command encrypts passwords configured by the **enable password** and the **enable secret** commands, so passwords are not shown in plain text in configurations.

Example The following example shows the use of the **enable** command to enter the Privileged Exec mode (note the change in the command prompt).

```
awplus> enable

awplus#
```

The following example shows the **enable** command enabling access the Privileged Exec mode for users with a privilege level of 7 or greater. Users with a privilege level of 7 or greater do not need to enter a password to access Privileged Exec mode. Users with a privilege level 6 or less need to enter a password to access Privilege Exec mode. Use the **enable password** command or the **enable secret** commands to set the password to enable access to Privileged Exec mode.

```
awplus> enable 7

awplus#
```

Related Commands

disable (Privileged Exec mode)
enable password
enable secret
exit
service password-encryption
username

end

This command returns the prompt to the Privileged Exec command mode from any other advanced command mode.

Syntax `end`

Mode All advanced command modes, including Global Configuration and Interface Configuration modes.

Example The following example shows the use of the `end` command to return to the Privileged Exec mode directly from Interface mode.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# end
awplus#
```

Related Commands **disable (Privileged Exec mode)**
enable (Privileged Exec mode)
exit

exit

This command exits the current mode, and returns the prompt to the mode at the previous level. When used in User Exec mode, the **exit** command terminates the session.

Syntax `exit`

Mode All command modes, including Global Configuration and Interface Configuration modes.

Example The following example shows the use of `exit` command to exit Interface mode, and return to Configure mode.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# exit
awplus(config)#
```

Related Commands **disable (Privileged Exec mode)**
enable (Privileged Exec mode)
end

help

This command displays a description of the AlliedWare Plus™ OS help system.

Syntax `help`

Mode All command modes

Example To display a description on how to use the system help, use the command:

```
awplus# help
```

Output **Figure 4-1: Example output from the help command**

```
When you need help at the command line, press '?'.

If nothing matches, the help list will be empty. Delete
characters until entering a '?' shows the available options.

Enter '?' after a complete parameter to show remaining valid
command parameters (e.g. 'show ?').

Enter '?' after part of a parameter to show parameters that
complete the typed letters (e.g. 'show ip?').
```

logout

This command exits the User Exec or Privileged Exec modes and ends the session.

Syntax `logout`

Mode User Exec and Privileged Exec

Example To exit the User Exec mode, use the command:

```
awplus# logout
```

show history

This command lists the commands entered in the current session. The history buffer is cleared automatically upon reboot.

The output lists all command line entries, including commands that returned an error.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show history`

Mode User Exec and Privileged Exec

Example To display the commands entered during the current session, use the command:

```
awplus# show history
```

Output **Figure 4-2: Example output from the show history command**

```
1 en
2 show ru
3 con t
4 route-map er deny 3
5 exit
6 ex
7 di
```

Chapter 5: User Access Commands

Introduction

This chapter provides an alphabetical reference of commands used to configure user access.

Command List

clear line console

This command resets a console line. If a terminal session exists on the line then the terminal session is terminated. If console line settings have changed then the new settings are applied.

Syntax `clear line console 0`

Mode Privileged Exec

Example To reset the console line (asyn), use the command:

```
awplus# clear line console 0

        % The new settings for console line 0 have been
        applied
```

Related Commands
clear line vty
flowcontrol hardware (asyn/console)
line
show users

clear line vty

This command resets a VTY line. If a session exists on the line then it is closed.

Syntax `clear line vty <0-32>`

Parameter	Description
<0-32>	Line number

Mode Privileged Exec

Example To reset the first vty line, use the command:

```
awplus# clear line vty 1
```

Related Commands
privilege level
line
show telnet
show users

enable password

To set a local password to control access to various privilege levels, use the **enable password** Global Configuration command. Use the **enable password** command to modify or create a password to be used, and use the **no enable password** command to remove the password.

Note that the **enable secret** command is an alias for the **enable password** command, and the **no enable secret** command is an alias for the **no enable password** command. Issuing a **no enable password** command removes a password configured with the **enable secret** command. The **enable password** command is shown in the running and startup configurations. Note that if the **enable secret** command is entered then **enable password** is shown in the configuration.

Note Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option `8` for GUI users.

Syntax

```
enable password [<plain>|8 <hidden>|level <1-15> 8 <hidden>]
no enable password [level <1-15>]
```

Parameter	Description
<plain>	Specifies the unencrypted password.
`8`	Specifies a hidden password will follow.
<hidden>	Specifies the hidden encrypted password. Use an encrypted password for better security where a password crosses the network or is stored on a TFTP server.
`level`	Privilege level <1-15>. Level for which the password applies. You can specify up to 16 privilege levels, using numbers 1 through 15. Level 1 is normal EXEC-mode user privileges for **User Exec** mode. If this argument is not specified in the command or the **no** variant of the command, the privilege level defaults to 15 (enable mode privileges) for **Privileged Exec** mode. A privilege level of 7 can be set for intermediate CLI security.

Default The privilege level for enable password is level 15 by default. Previously the default was level 1.

Mode Global Configuration

Usage This command enables the Network Administrator to set a password for entering the Privileged Exec mode when using the **enable (Privileged Exec mode)** command. There are three methods to enable a password. In the examples below, for each method, note that the configuration is different and the configuration file output is different, but the password string to be used to enter the Privileged Exec mode with the **enable** command is the same (**mypasswd**).

A user can now have an intermediate CLI security level set with this command for privilege level 7 to access all the show commands in Privileged Exec mode and all the commands in User Exec mode, but not any configuration commands in Privileged Exec mode.

Note that the **enable password** command is an alias for the **enable secret** command and one password per privilege level is allowed using these commands. Do not assign one password to a privilege level with **enable password** and another password to a privilege level with **enable secret**. Use **enable password** or **enable secret** commands. Do not use both on the same level.

Using Plain Passwords

The plain password is a clear text string that appears in the configuration file as configured.

```
awplus#  configure terminal
awplus(config)#  enable password mypasswd
awplus(config)#  end
```

This results in the following show output

```
awplus#show run
Current configuration:
hostname awplus
enable password mypasswd
!
interface lo
```

Using Encrypted Passwords

Configure an encrypted password using the **service password-encryption** command. First, use the enable password command to specify the string that you want to use as a password (**mypasswd**). Then, use the **service password-encryption** command to encrypt the specified string (**mypasswd**). The advantage of using an encrypted password is that the configuration file does not show **mypasswd**, it will only show the encrypted string **fU7zHzuutY2SA**.

Note

Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option `8` for GUI users.

```
awplus#  configure terminal
awplus(config)#  enable password mypasswd
awplus(config)#  service password-encryption
awplus(config)#  end
```

This results in the following show output.

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
service password-encryption
!
interface lo
```

Using Hidden Passwords

Configure an encrypted password using the **HIDDEN** parameter (**8**) with the **enable password** command. Use this method if you already know the encrypted string corresponding to the plain text string that you want to use as a password. It is not required to use the **service password-encryption** command for this method. The output in the configuration file will show only the encrypted string, and not the text string

```
awplus#  configure terminal
awplus(config)#  enable password 8 fU7zHzuutY2SA
awplus(config)#  end
```

This results in the following show output.

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
!
interface lo
```

Related Commands

enable (Privileged Exec mode)
enable secret
service password-encryption
privilege level
show privilege
username
show running-config

enable secret

To set a local password to control access to various privilege levels, use the **enable secret** Global Configuration command. Use the **enable secret** command to modify or create a password to be used, and use the **no enable secret** command to remove the password.

Note that the **enable secret** command is an alias for the **enable password** command, and the **no enable secret** command is an alias for the **no enable password** command. Issuing a **no enable password** command removes a password configured with the **enable secret** command. The **enable password** command is shown in the running and startup configurations. Note that if the **enable secret** command is entered then **enable password** is shown in the configuration.

Note Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option `8` for GUI users.

Syntax

```
enable secret [<plain>|8 <hidden>|level <0-15> 8 <hidden>]
no enable secret [level <1-15>]
```

Parameter	Description
<plain>	Specifies the unencrypted password.
`8`	Specifies a hidden password will follow.
<hidden>	Specifies the hidden encrypted password. Use an encrypted password for better security where a password crosses the network or is stored on a TFTP server.
`level`	Privilege level <1-15>. Level for which the password applies. You can specify up to 16 privilege levels, using numbers 1 through 15. Level 1 is normal EXEC-mode user privileges for **User Exec** mode. If this argument is not specified in the command or the **no** variant of the command, the privilege level defaults to 15 (enable mode privileges) for **Privileged Exec** mode. A privilege level of 7 can be set for intermediate CLI security.

Default The privilege level for enable secret is level 15 by default.

Mode Global Configuration

Usage This command enables the Network Administrator to set a password for entering the Privileged Exec mode when using the **enable (Privileged Exec mode)** command. There are three methods to enable a password. In the examples below, for each method, note that the configuration is different and the configuration file output is different, but the password string to be used to enter the Privileged Exec mode with the **enable** command is the same (**mypasswd**).

A user can have an intermediate CLI security level set with this command for privilege level 7 to access all the show commands in Privileged Exec mode and all the commands in User Exec mode, but not any configuration commands in Privileged Exec mode.

Note that the **enable secret** command is an alias for the **enable password** command and one password per privilege level is allowed using these commands. Do not assign one password to a privilege level with **enable password** and another password to a privilege level with **enable secret**. Use **enable password** or **enable secret** commands. Do not use both on the same level.

Using Plain Passwords

The plain password is a clear text string that appears in the configuration file as configured.

```
awplus#  configure terminal
awplus(config)#  enable secret mypasswd
awplus(config)#  end
```

This results in the following show output

```
awplus#show run
Current configuration:
hostname awplus
enable password mypasswd
!
interface lo
```

Using Encrypted Passwords

Configure an encrypted password using the **service password-encryption** command. First, use the enable password command to specify the string that you want to use as a password (**mypasswd**). Then, use the **service password-encryption** command to encrypt the specified string (**mypasswd**). The advantage of using an encrypted password is that the configuration file does not show **mypasswd**, it will only show the encrypted string **fU7zHzuutY2SA**.

Note

Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option `8` for GUI users.

```
awplus#  configure terminal
awplus(config)#  enable secret mypasswd
awplus(config)#  service password-encryption
awplus(config)#  end
```

This results in the following show output:

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
service password-encryption
!
interface lo
```

Using Hidden Passwords

Configure an encrypted password using the **HIDDEN** parameter (**8**) with the **enable password** command. Use this method if you already know the encrypted string corresponding to the plain text string that you want to use as a password. It is not required to use the **service password-encryption** command for this method. The output in the configuration file will show only the encrypted string, and not the text string:

```
awplus#  configure terminal
awplus(config)#  enable secret 8 fU7zHzuutY2SA
awplus(config)#  end
```

This results in the following show output.

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
!
interface lo
```

show privilege
username
show running-config

exec-timeout

This command sets the interval your device waits for user input from either a console or VTY connection. Once the timeout interval is reached, the connection is dropped. This command sets the time limit when the console or VTY connection automatically logs off after no activity.

The **no** variant of this command removes a specified timeout and resets to the default timeout (10 minutes).

Syntax

```
exec-timeout {<minutes>} [<seconds>]
no exec-timeout
```

Parameter	Description
<minutes>	<0-35791> Required integer timeout value in minutes
<seconds>	<0-2147483> Optional integer timeout value in seconds

Default The default for the **exec-timeout** command is 10 minutes and 0 seconds (**exec-timeout 10 0**)

Mode Line Configuration

Usage This command is used set the time the telnet session waits for an idle VTY session, before it times out. An **exec-timeout 0 0** setting will cause the telnet session to wait indefinitely. The command **exec-timeout 0 0** is useful while configuring a device, but reduces device security.

If no input is detected during the interval then the current connection resumes. If no connections exist then the terminal returns to an idle state and disconnects incoming sessions.

Examples To set VTY connections to timeout after 2 minutes, 30 seconds if there is no response from the user, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# exec-timeout 2 30
```

To reset the console connection to the default timeout of 10 minutes 0 seconds if there is no response from the user, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no exec-timeout
```

Validation Commands **show running-config**

Related Commands **line**
service telnet

flowcontrol hardware (asyn/console)

Use this command to enable RTS/CTS (Ready To Send/Clear To Send) hardware flow control on a terminal console line (asyn port) between the DTE (Data Terminal Equipment) and the DCE (Data Communications Equipment).

Syntax

```
flowcontrol hardware
no flowcontrol hardware
```

Mode Line Configuration

Default Hardware flow control is disabled by default.

Usage Hardware flow control makes use of the RTS and CTS control signals between the DTE and DCE where the rate of transmitted data is faster than the rate of received data. Flow control is a technique for ensuring that a transmitting entity does not overwhelm a receiving entity with data. When the buffers on the receiving device are full, a message is sent to the sending device to suspend the transmission until the data in the buffers has been processed.

Hardware flow control can be configured on terminal console lines (e.g. asyn0). For Reverse Telnet connections, hardware flow control must be configured to match on both the Access Server and the Remote Device. For terminal console sessions, hardware flow control must be configured to match on both the DTE and the DCE. Settings are saved in the running configuration. Changes are applied after reboot, clear line console, or after closing the session.

Use **show running-config** and **show startup-config** commands to view hardware flow control settings that take effect after reboot for a terminal console line. See the **show running-config** command output:

```
awplus#show running-config
!
line con 1
  speed 9600
  mode out 2001
  flowcontrol hardware
!
```

Note that line configuration commands do not take effect immediately. Line configuration commands take effect after one of the following commands or events:

- issuing a **clear line console** command
- issuing a **reboot** command
- logging out of the current session

Examples To enable hardware flow control on terminal console line asyn0, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# flowcontrol hardware
```

To disable hardware flow control on terminal console line asyn0, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no flowcontrol hardware
```

Related Commands

clear line console
show running-config
speed (asyn)

length (asyn)

Use this command to specify the number of rows of output that the device will display before pausing, for the console or VTY line that you are configuring.

The **no** variant of this command restores the length of a line (terminal session) attached to a console port or to a VTY to its default length of 22 rows.

Syntax

```
length <0-512>
no length
```

Parameter	Description
<0-512>	Number of lines on screen. Specify 0 for no pausing.

Mode Line Configuration

Default The length of a terminal session is 22 rows. The **no length** command restores the default.

Usage If the output from a command is longer than the length of the line the output will be paused and the '–More–' prompt allows you to move to the next screen full of data.

A length of 0 will turn off pausing and data will be displayed to the console as long as there is data to display.

Examples To set the terminal session length on the console to 10 rows, use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# length 10
```

To reset the terminal session length on the console to the default (22 rows), use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no length
```

To display output to the console continuously, use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# length 0
```

Related Commands
service terminal-length
terminal length
terminal resize

line

Use this command to enter line configuration mode for the specified VTYs or the console. The command prompt changes to show that the switch is in Line Configuration mode.

Syntax `line vty <first-line> [<last-line>]`

Parameter	Description
<first-line>	<0-32> Specify the first line number.
<last-line>	<0-32> Specify the last line number.
console	The console terminal line(s) for local access.
vty	Virtual terminal for remote console access.

Mode Global Configuration

Usage In Line Configuration mode, you can configure console and virtual terminal settings, including setting **speed (asyn)**, **length (asyn)**, **privilege level**, and authentication (**login authentication**) or accounting (**accounting login**) method lists.

To change the console (asyn) port speed, use this **line** command to enter Line Configuration mode before using the **speed (asyn)** command on page 10.70. Set the console speed (Baud rate) to match the transmission rate of the device connected to the console (asyn) port on your switch.

Note that line configuration commands do not take effect immediately. Line configuration commands take effect after one of the following commands or events:

- issuing a **clear line console** command
- issuing a **reboot** command
- logging out of the current session

Examples To enter Line Configuration mode in order to configure all VTYs, use the commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)#
```

To enter Line Configuration mode to configure the console (asyn 0) port terminal line, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)#
```

Related Commands

accounting login

clear line vty
flowcontrol hardware (asyn/console)
length (asyn)
login authentication
privilege level
speed (asyn)

privilege level

This command sets a privilege level for VTY or console connections. The configured privilege level from this command overrides a specific user's initial privilege level at the console login.

Syntax `privilege level <1-15>`

Mode Line Configuration

Usage You can set an intermediate CLI security level for a console user with this command by applying privilege level 7 to access all show commands in Privileged Exec and all User Exec commands. However, intermediate CLI security will not show configuration commands in Privileged Exec.

Examples To set the console connection to have the maximum privilege level, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# privilege level 15
```

To set all vty connections to have the minimum privilege level, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# privilege level 1
```

To set all vty connections to have an intermediate CLI security level, to access all show commands, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# privilege level 7
```

Related Commands **enable password**
line
show privilege
username

security-password history

This command specifies the number of previous passwords that are unable to be reused. A new password is invalid if it matches a password retained in the password history.

The **no security-password history** command disables the security password history functionality.

Syntax

```
security-password history <0-15>
```

no security-password history

Parameter	Description
<0-15>	The allowable range of previous passwords to match against. A value of *0* will disable the history functionality and is equivalent to the **no security-password history** command. If the history functionality is disabled, all users' password history is reset and all password history is lost.

Default The default history value is `0`, which will disable the history functionality.

Mode Global Configuration

Examples To restrict reuse of the three most recent passwords, use the command:

```
awplus# configure terminal
awplus(config)# security-password history 3
```

To allow the reuse of recent passwords, use the command:

```
awplus# configure terminal
awplus(config)# no security-password history
```

Validation Commands

show security-password configuration

Related Commands
security-password forced-change
security-password lifetime
security-password minimum-categories
security-password minimum-length
security-password reject-expired-pwd
security-password warning

security-password forced-change

This command specifies whether or not a user is forced to change an expired password at the next login. If this feature is enabled, users whose passwords have expired are forced to change to a password that must comply with the current password security rules at the next login.

Note that to use this command, the lifetime feature must be enabled with the **security-password lifetime** command and the reject-expired-pwd feature must be disabled with the **security-password reject-expired-pwd** command.

The **no security-password forced-change** command disables the forced-change feature.

Syntax

```
security-password forced-change
```

no security-password forced-change

Default The forced-change feature is disabled by default.

Mode Global Configuration

Example To force a user to change their expired password at the next login, use the command:

```
awplus# configure terminal
awplus(config)# security-password forced-change
```

Validation Commands
show running-config security-password
show security-password configuration

Related Commands
security-password history
security-password lifetime
security-password minimum-categories
security-password minimum-length
security-password reject-expired-pwd
security-password warning

security-password lifetime

This command enables password expiry by specifying a password lifetime in days.

Note that when the password lifetime feature is disabled, it also disables the **security-password forced-change** command and the **security-password warning** command.

The **no security-password lifetime** command disables the password lifetime feature.

Syntax

```
security-password lifetime <0-1000>
no security-password lifetime
```

Parameter	Description
<0-1000>	Password lifetime specified in days. A value of *0* will disable lifetime functionality and the password will never expire. This is equivalent to the **no security-password lifetime** command.

Default The default password lifetime is `0`, which will disable the lifetime functionality.

Mode Global Configuration

Example To configure the password lifetime to 10 days, use the command:

```
awplus# configure terminal
awplus(config)# security-password lifetime 10
```

Validation Commands
show running-config security-password
show security-password configuration

Related Commands
security-password history
security-password forced-change
security-password minimum-categories
security-password minimum-length
security-password reject-expired-pwd
security-password warning
show security-password user

security-password minimum-categories

This command specifies the minimum number of categories that the password must contain in order to be considered valid. The password categories are:

- uppercase letters: A to Z
- lowercase letters: a to z
- digits: 0 to 9
- special symbols: all printable ASCII characters not included in the previous three categories. The question mark ? cannot be used as it is reserved for help functionality.

Note that to ensure password security, the minimum number of categories should align with the lifetime selected, i.e. the fewer categories specified the shorter the lifetime specified.

Syntax

```
security-password minimum-categories <1-4>
```

Parameter	Description
<1-4>	Number of categories the password must satisfy, in the range *1* to *4*.

Default The default number of categories that the password must satisfy is `1`.

Mode Global Configuration

Example To configure the required minimum number of character categories to be *3*, use the command:

```
awplus# configure terminal
awplus(config)# security-password minimum-categories 3
```

Validation Commands
show running-config security-password
show security-password configuration

Related Commands
security-password history
security-password forced-change
security-password lifetime
security-password minimum-length
security-password reject-expired-pwd
security-password warning
username

security-password minimum-length

This command specifies the minimum allowable password length. This value is checked against when there is a password change or a user account is created.

Syntax `security-password minimum-length <1-23>`

Parameter	Description
<1-23>	Minimum password length in the range from 1 to 23.

Default The default minimum password length is `1`.

Mode Global Configuration

Example To configure the required minimum password length as `8`, use the command:

```
awplus# configure terminal
awplus(config)# security-password minimum-length 8
```

Validation Commands
show running-config security-password
show security-password configuration

Related Commands
security-password history
security-password forced-change
security-password lifetime
security-password minimum-categories
security-password reject-expired-pwd
security-password warning
username

security-password reject-expired-pwd

This command specifies whether or not a user is allowed to login with an expired password. Users with expired passwords are rejected at login if this functionality is enabled. Users then have to contact the Network Administrator to change their password.

Caution 

Once all users' passwords are expired you are unable to login to the device again if the security-password reject-expired-pwd command has been executed. You will have to reboot the device with a default configuration file, or load an earlier software version that does not have the security password feature.

We recommend you never have the command line "security-password reject-expired-pwd" in a default config file.

Note that when the reject-expired-pwd functionality is disabled and a user logs on with an expired password, if the forced-change feature is enabled with **security-password forced-change** command, a user may have to change the password during login depending on the password lifetime specified by the **security-password lifetime** command.

The **no security-password reject-expired-pwd** command disables the reject-expired-pwd feature.

Syntax

```
security-password reject-expired-pwd
```

no security-password reject-expired-pwd

Default The reject-expired-pwd feature is disabled by default.

Mode Global Configuration

Example To configure the system to reject users with an expired password, use the command:

```
awplus# configure terminal
awplus(config)# security-password reject-expired-pwd
```

Validation Commands
show running-config security-password
show security-password configuration

Related Commands
security-password history
security-password forced-change
security-password lifetime
security-password minimum-categories
security-password minimum-length
security-password warning
show security-password user

security-password warning

This command specifies the number of days before the password expires that the user will receive a warning message specifying the remaining lifetime of the password.

Note that the warning period cannot be set unless the lifetime feature is enabled with the **security-password lifetime** command.

The **no security-password warning** command disables this feature.

Syntax

```
security-password warning <0-1000>
no security-password warning
```

Parameter	Description
<0-1000>	Warning period in the range from *0* to *1000* days. A value *0* disables the warning functionality and no warning message is displayed for expiring passwords. This is equivalent to the **no security-password warning** command. The warning period must be less than, or equal to, the password lifetime set with the **security-password lifetime** command.

Default The default warning period is 0, which disables warning functionality.

Mode Global Configuration

Example To configure a warning period of three days, use the command:

```
awplus# configure terminal
awplus(config)# security-password warning 3
```

Validation Commands
show running-config security-password
show security-password configuration

Related Commands

service advanced-vty

This command enables the advanced-vty help feature. This allows you to use TAB completion for commands. Where multiple options are possible, the help feature displays the possible options.

The **no service advanced-vty** command disables the advanced-vty help feature.

Syntax

```
service advanced-vty
no service advanced-vty
```

Default The advanced-vty help feature is enabled by default.

Mode Global Configuration

Examples To disable the advanced-vty help feature, use the command:

```
awplus# configure terminal
awplus(config)# no service advanced-vty
```

To re-enable the advanced-vty help feature after it has been disabled, use the following commands:

```
awplus# configure terminal
awplus(config)# service advanced-vty
```

service http

This command enables the HTTP (Hypertext Transfer Protocol) service. The HTTP service is enabled by default and is required to support the AlliedWare Plus™ GUI Java applet on a Java enabled browser. See **Appendix C: GUI Reference** for further information about installing and using the AlliedWare Plus™ GUI.

The **no service http** command disables the HTTP feature.

Syntax

```
service http
no service http
```

Default The HTTP service is enabled by default.

Mode Global Configuration

Examples To disable the HTTP service, use the command:

```
awplus# configure terminal
awplus(config)# no service http
```

To re-enable the HTTP service after it has been disabled, use the following commands:

```
awplus# configure terminal
awplus(config)# service http
```

service password-encryption

Use this command to enable password encryption. This is enabled by default. When password encryption is enabled, the device displays passwords in the running config in encrypted form instead of in plain text.

Use the **no service password-encryption** command to stop the device from displaying newly-entered passwords in encrypted form. This does not change the display of existing passwords.

Note Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option `8` for GUI users.

Syntax

```
service password-encryption
no service password-encryption
```

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# service password-encryption
```

Validation Commands **show running-config**

Related Commands **enable password**

service telnet

Use this command to enable the telnet server. The server is enabled by default. Enabling the telnet server starts the switch listening for incoming telnet sessions on the configured port.

The server listens on port 23, unless you have changed the port by using the **privilege level** command on page 5.16.

Use the **no** variant of this command to disable the telnet server. Disabling the telnet server will stop the switch listening for new incoming telnet sessions. However, existing telnet sessions will still be active.

Syntax

```
service telnet [ip|ipv6]
no service telnet [ip|ipv6]
```

Default The IPv4 and IPv6 telnet servers are enabled by default.

The configured telnet port is TCP port 23 by default.

Mode Global Configuration

Examples To enable both the IPv4 and IPv6 telnet servers, use the following commands:

```
awplus# configure terminal
awplus(config)# service telnet
```

To enable the IPv6 telnet server only, use the following commands:

```
awplus# configure terminal
awplus(config)# service telnet ipv6
```

To disable both the IPv4 and IPv6 telnet servers, use the following commands:

```
awplus# configure terminal
awplus(config)# no service telnet
```

To disable the IPv6 telnet server only, use the following commands:

```
awplus# configure terminal
awplus(config)# no service telnet ipv6
```

Related Commands

clear line vty
show telnet
telnet server

service terminal-length

Use this command to specify the number of rows of output that the device will display before pausing, for all console and VTY lines.

Use the **no** variant of this command to remove the length specified by this command. The default length will apply unless you have changed the length for some or all lines by using the **length (asyn)** command on page 5.13.

Syntax

```
service terminal-length <lines>
no service terminal-length <lines>
```

Parameter	Description
`terminal-length`	Establish system-wide terminal length configuration.
<lines>	<0-512> Number of rows that the device will display before pausing.

Mode Global Configuration

Usage This command overrides any lengths set by using the **length (asyn)** command on page 5.13 in Line mode.

Example To display 60 rows of text before pausing, use the following command:

```
awplus# configure terminal
awplus(config)# service terminal-length 60
```

Related Commands

service terminal-length
terminal length
terminal resize

show security-password configuration

This command displays the configuration settings for the various security password rules.

Syntax `show security-password configuration`

Mode Privileged Exec

Example To display the current security-password rule configuration settings, use the command:

```
awplus# show security-password configuration
```

Output **Figure 5-1: Example output from the show security-password configuration command**

```
Security Password Configuration
Minimum password length ............................ 8
Minimum password character categories to match ..... 3
Number of previously used passwords to restrict..... 4
Password lifetime .................................. 30 day(s)
  Warning period before password expires ........... 3 day(s)
Reject expired password at login ................... Disabled
  Force changing expired password at login ......... Enabled
```

Related Commands **show running-config security-password**
show security-password user

show security-password user

This command displays user account and password information for all users.

Syntax `show security-password user`

Mode Privileged Exec

Example To display the system users' remaining lifetime or last password change, use the command:

```
awplus# show security-password user
```

Output **Figure 5-2: Example output from the show security-password user command**

```
User account and password information

UserName          Privilege Last-PWD-Change   Remaining-lifetime
------------------------------------------------------------------------------
manager           15          4625 day(s) ago   No Expiry
bob15             15             0 day(s) ago   30 days
ted7              7              0 day(s) ago   No Expiry
mike1             1              0 day(s) ago   No Expiry
```

Related Commands **show running-config security-password**
show security-password configuration

show privilege

This command displays the current user privilege level, which can be any privilege level in the range <1-15>. Privilege levels <1-6> allow limited user access (all User Exec commands), privilege levels <7-14> allow restricted user access (all User Exec commands plus Privileged Exec show commands). Privilege level 15 gives full user access to all Privileged Exec commands.

Syntax `show privilege`

Mode User Exec and Privileged Exec

Usage A user can have an intermediate CLI security level set with this command for privilege levels <7-14> to access all show commands in Privileged Exec mode and all commands in User Exec mode, but no configuration commands in Privileged Exec mode.

Example To show the current privilege level of the user, use the command:

```
awplus# show privilege
```

Output **Figure 5-3: Example output from the show privilege command**

```
awplus#show privilege
Current privilege level is 15
awplus#disable
awplus>show privilege
Current privilege level is 1
```

Related Commands privilege level

show telnet

This command shows the Telnet server settings.

Syntax `show telnet`

Mode User Exec and Privileged Exec

Example To show the Telnet server settings, use the command:

```
awplus# show telnet
```

Output **Figure 5-4: Example output from the show telnet command**

```
Telnet Server Configuration
-------------------------------------------------------------
Telnet server                : Enabled
Protocol                     : IPv4,IPv6
Port                         : 23
```

Related Commands
clear line vty
service telnet
show users
telnet server

show users

This command shows information about the users who are currently logged into the device.

Syntax `show users`

Mode User Exec and Privileged Exec

Example To show the users currently connected to the device, use the command:

```
awplus# show users
```

Output **Figure 5-5: Example output from the show users command**

```
Line    User            Host(s)  Idle      Location        Priv Idletime Timeout
con 0   manager         idle     00:00:00  ttyS0           15   10       N/A
vty 0   bob             idle     00:00:03  172.16.11.3     1    0        5
```

Table 5-1: Parameters in the output of the show users command

Parameter	Description
`Line`	Console port user is connected to.
`User`	Login name of user.
`Host(s)`	Status of the host the user is connected to.
`Idle`	How long the host has been idle.
`Location`	URL location of user.
`Priv`	The privilege level in the range 1 to 15, with 15 being the highest.
`Idletime`	The time interval the device waits for user input from either a console or VTY connection.
`Timeout`	The time interval before a server is considered unreachable.

telnet

Use this command to open a telnet session to a remote device.

Syntax

```
telnet {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [<port>]
```

Parameter	Description
<hostname>	The host name of the remote system.
ip	Keyword used to specify the IPv4 address or host name of a remote system.
<ipv4-addr>	An IPv4 address of the remote system.
ipv6	Keyword used to specify the IPv6 address of a remote system
<ipv6-addr>	Placeholder for an IPv6 address in the format `x:x::x:x`, for example, `2001:db8::8a2e:7334`
<port>	Specify a TCP port number (well known ports are in the range 1-1023, registered ports are 1024-49151, and private ports are 49152-65535).

Mode User Exec and Privileged Exec

Examples To connect to TCP port `2602` on the device at `10.2.2.2`, use the command:

```
awplus# telnet 10.2.2.2 2602
```

To connect to the telnet server `host.example`, use the command:

```
awplus# telnet host.example
```

To connect to the telnet server `host.example` on TCP port `100`, use the command:

```
awplus# telnet host.example 100
```

telnet server

This command enables the telnet server on the specified TCP port. If the server is already enabled then it will be restarted on the new port. Changing the port number does not affect the port used by existing sessions.

Syntax `telnet server {<1-65535>|default}`

Parameter	Description
<1-65535>	The TCP port to listen on.
`default`	Use the default TCP port number 23.

Mode Global Configuration

Example To enable the telnet server on TCP port 2323, use the following commands:

```
awplus# configure terminal
awplus(config)# telnet server 2323
```

Related Commands show telnet

terminal length

Use the **terminal length** command to specify the number of rows of output that the device will display before pausing, for the currently-active terminal only.

Use the **terminal no length** command to remove the length specified by this command. The default length will apply unless you have changed the length for some or all lines by using the **length (asyn)** command on page 5.13.

Syntax

```
terminal length <length>
terminal no length [<length>]
```

Parameter	Description
<length>	<0-512> Number of rows that the device will display on the currently-active terminal before pausing.

Mode User Exec and Privileged Exec

Examples The following example sets the number of lines to 15.

```
awplus# terminal length 15
```

The following example removes terminal length set previously.

```
awplus# terminal no length
```

Related Commands

length (asyn)
service terminal-length
terminal resize

terminal resize

Use this command to automatically adjust the number of rows of output on the console, which the device will display before pausing, to the number of rows configured on the user's terminal.

Syntax `terminal resize`

Mode User Exec and Privileged Exec

Usage When the user's terminal size is changed, then a remote session via SSH or TELNET adjusts the terminal size automatically. However, this cannot normally be done automatically for a serial or console port. This command automatically adjusts the terminal size for a serial or console port.

Examples The following example automatically adjusts the number of rows shown on the console:

```
awplus# terminal resize
```

Related Commands **length (asyn)**
service terminal-length
terminal length

username

This command creates or modifies a user to assign a privilege level and a password.

Note The default username privilege level of 1 is not shown in running-config output. Any username privilege level that has been modified from the default is shown.

Syntax

```
username <name> privilege <0-15>password [8] <password>]
username <name> password [8] <password>
no username <name>
```

Parameter	Description	
<name>	The login name for the user. Do not use punctuation marks such as single quotes (‘ ‘), double quotes (“ “), or colons (:) with the user login name.	
`privilege`	The user’s privilege level. Use the privilege levels to set the access rights for each user.	
	<0-15>	A privilege level: either 0 (no access), 1-14 (limited access) or 15 (full access). A user with privilege level 1-14 can only access higher privilege levels if an **enable password** has been configured for the level the user tries to access and the user enters that password. A user at privilege level 1 can access the majority of show commands. A user at privilege level 7 can access the majority of show commands including platform show commands. Privilege Level 15 (to access the Privileged Exec command mode) is required to access configuration commands as well as show commands in Privileged Exec.
`password`	A password that the user must enter when logging in.	
	`8`	Specifies that you are entering a password as a string that has already been encrypted, instead of entering a plain-text password. The running-config displays the new password as an encrypted string even if password encryption is turned off. Note that the user enters the plain-text version of the password when logging in.
	<password>	The user’s password. The password can be up to 23 characters in length and include characters from up to four categories. The password categories are: ■ uppercase letters: A to Z ■ lowercase letters: a to z ■ digits: 0 to 9 ■ special symbols: all printable ASCII characters not included in the previous three categories. The question mark ? cannot be used as it is reserved for help functionality.

Mode Global Configuration

Default The privilege level is 1 by default. Note the default is not shown in running-config output.

Usage An intermediate CLI security level (privilege level 7 to privilege level 14) allows a CLI user access to the majority of show commands, including the platform show commands that are available at privilege level 1 to privilege level 6). Note that some show commands, such as show running-configuration and show startup-configuration, are only available at privilege level 15.

A privilege level of 0 can be set for port authentication purposes from a RADIUS server.

Examples To create the user `bob` with a privilege level of `15`, for all show commands including show running-configuration and show startup-configuration and to access configuration commands in Privileged Exec command mode, and the password `bobs_secret`, use the commands:

```
awplus# configure terminal
awplus(config)# username bob privilege 15 password bobs_secret
```

To create a user `junior_admin` with a privilege level of `7`, for intermediate CLI security level access for most show commands, and the password `show_only`, use the commands:

```
awplus# configure terminal
awplus(config)# username junior_admin privilege 7 password
show_only
```

security-password minimum-length

Chapter 6: Creating and Managing Files

Introduction

This chapter provides information on:

- **USB support**
- **Working With Files**
- **Creating and Using Configuration Files**
- **Copying Files To and From Your Device**

USB support

Your switch supports both standard and secure USB storage devices.

USB storage devices used as backup memory can be easily pulled out of a switch. You can use Secure USB storage devices to protect this data in the event that it is mislaid or in unauthorized hands. Secure USB devices provide password (PIN)-protected encryption to the data they store.

Note that if the switch reboots, the Secure USB key will be locked. After a VCStack failover, when a stack member recovers, the Secure USB device cannot be accessed until it is unlocked.

Working With Files

The AlliedWare Plus™ OS lets you create directory trees for file storage. This section shows:

- **"Listing files" on page 6.2**—listing files and seeing how much free space you have
- **"Displaying the contents of configuration and text files" on page 6.4**
- **"Navigating through the filesystem" on page 6.4**—identifying the current directory, changing directories, and creating and deleting directories
- **"Using the editor" on page 6.6**

Flash compaction

The Flash memory on the switch automatically compacts itself to recover space available from deleted files. The switch only does this when necessary, and not every file deletion causes Flash compaction. Flash compaction can occur after a file of any size is added to or deleted from the switch.

Caution While Flash is compacting, the console is unresponsive. Do not restart the switch, as interrupting Flash compaction can damage files.

Listing files

To list files, enter Privileged Exec mode and enter the command:

```
awplus# dir
```

The output lists files and directories in order of modification date, descending. It looks like this:

```
-rw-      534 Jul 12 2011 17:52:50  stp.cfg
-rw-      534 Jul 12 2011 17:12:50  example.cfg
-rw- 12429011 Jul 12 2011 16:26:06  x510-5.4.4-0.4.rel
```

Listing files including hidden system files

The **dir** command does not list all files—it hides system files and directories because users generally do not need to create or edit them. To list all files including system files, enter Privileged Exec mode and enter the command:

```
awplus# dir all
```

The output looks like this:

```
drwx        0 Jul 12 2011 17:16:32  ./
-rw-      401 Jul 12 2011 17:16:32  example.cfg
-rw-      534 Jul 12 2011 17:52:50  stp.cfg
-rw- 12429011 Jul 12 2011 16:26:06  x510-5.4.4-0.4.rel
drwx      216 Jul  9 2011 11:31:18  ../
drwx        0 Jun 13 2011 04:31:51  .configs/
-rw-       17 Jun 13 2011 04:27:27  .release
drwx        0 Jul 10 2011 23:40:00  .ssh/
```

The hidden files and directories begin with a dot.

Seeing information about the filesystem

To display information about the different memory types on the switch, enter Privileged Exec mode and enter the command:

```
awplus# show file systems
```

The output includes the amount of free memory and the prefix you type to access that memory type, and looks like this:

```
 Size(b)  Free(b)  Type    Flags  Prefixes   S/D/V    Lcl/Ntwk  Avail
-------------------------------------------------------------------
 126.0M   106.4M   flash     rw   flash:     static   local       Y
      -        -   system    rw   system:    virtual  local       -
  10.0M     9.8M   debug     rw   debug:     static   local       Y
 499.0K   404.0K   nvs       rw   nvs:       static   local       Y
      -        -   usbstick  rw   usb:       dynamic  local       N
      -        -   tftp      rw   tftp:      -        network     -
      -        -   scp       rw   scp:       -        network     -
      -        -   sftp      ro   sftp:      -        network     -
      -        -   http      ro   http:      -        network     -
```

Listing files in a subdirectory

To list the contents of a directory, enter Privileged Exec mode and enter the command:

```
awplus# dir <directory-name>
```

Tip You can specify the directory with or without a / after the directory name.

Example To display the contents of a directory called “example”, enter the command:

```
awplus# dir example
```

Listing files in NVS memory or on a USB storage device

To list the contents of a directory in NVS, enter Privileged Exec mode and enter the command:

```
awplus# dir nvs:<directory-name>
```

To list the contents of a directory on a USB storage device, enter the command:

```
awplus# dir usb:<directory-name>
```

Example To display the contents of a directory in NVS called “example”, enter the command:

```
awplus# dir nvs:example
```

Displaying the contents of configuration and text files

To display the contents of a file, enter Privileged Exec mode and enter the command:

```
awplus# show file <filename>
```

Example To display the contents of the file called “example.cfg”, enter the command:

```
awplus# show file example.cfg
```

Navigating through the filesystem

Showing the current directory

To see which directory you are currently in, enter Privileged Exec mode and enter the command:

```
awplus# pwd
```

For the top-level directory, the output looks like this:

```
flash:/
```

Changing directories

To change to another directory, enter Privileged Exec mode and enter the command:

```
awplus# cd <directory-name>
```

To go to a directory one level higher in the directory tree, enter the command:

```
awplus# cd ..
```

Example To change to a directory called “example”, enter the command:

```
awplus# cd example
```

To go up one level, which returns you to the top level directory, enter the command:

```
awplus# cd ..
```

Changing to a directory in NVS memory or on a USB storage device

To change to the top-level directory in the NVS memory filesystem, enter Privileged Exec mode and enter the command:

```
awplus# cd nvs:
```

To change to the top-level directory on a USB storage device, enter the command:

```
awplus# cd usb:/
```

Next, you can change to other directories by entering the command:

```
awplus# cd <directory-name>
```

Alternatively, you can go straight from Flash to a subdirectory in the alternative filesystem, by entering one of the commands:

```
awplus# cd nvs:<directory-name>
```

```
awplus# cd usb:/<directory-name>
```

To return to the Flash filesystem, enter the command:

```
awplus# cd flash:/
```

Example To change to the directory within NVS called “example”, enter the command:

```
awplus# cd nvs:example
```

To go up one level, which returns you to the top-level directory of NVS memory, enter the command:

```
awplus# cd ..
```

Creating new directories

To create a directory, enter Privileged Exec mode and enter the command:

```
awplus# mkdir <directory-name>
```

Example To make a directory called “example” within the Flash filesystem, enter the command:

```
awplus# mkdir example
```

Deleting directories

To delete an empty directory, enter Privileged Exec mode and enter the command:

```
awplus# rmdir <directory-name>
```

To delete a directory and all its contents, enter Privileged Exec mode and enter the command:

```
awplus# delete recursive <directory-name>
```

The switch prompts you for confirmation.

Example To delete an empty directory called “example” from within the Flash filesystem, enter the command:

```
awplus# rmdir example
```

Using the editor

The inbuilt editor is JOE (Joe’s Own Editor).

To edit an existing file, enter Privileged Exec mode and enter the command:

```
awplus# edit <filename>
```

To open the editor with an empty file, enter the command:

```
awplus# edit
```

When you save the new file, you may need to specify the filesystem to store it on. For Flash, use **flash:/<filename>**.

Using JOE

To format and manipulate text in JOE, you use control-character sequences. The following table summarizes a few useful sequences—for details, see: **joe-editor.sourceforge.net/manpage.html.**

Function	Control-character sequence
Access the help	Ctrl-K-H
Save the file without exiting (for new files, this prompts for a filename)	Ctrl-K-D
Save the file and exit (this prompts for a filename)	Ctrl-K-X
Exit without saving the file	Ctrl-C
Go to the beginning of the file	Ctrl-K-U
Go to the end of the file	Ctrl-K-V
Go up one full screen of text in the file	Ctrl-U
Go down one full screen of text in the file	Ctrl-V
Select a block of text:	
Mark the beginning of the block	Ctrl-K-B
Mark the end of the block	Ctrl-K-K
Copy and paste a selected block of text	Place cursor at destination then enter Ctrl-K-C
Move a selected block of text	Place cursor at destination then enter Ctrl-K-M
Delete a selected block of text	Ctrl-K-Y

Creating and Using Configuration Files

This section provides instructions on:

- **Creating a configuration file**
- **Specifying the start-up configuration script**
- **Working with configuration files**

Creating a configuration file

A ***configuration file*** is a text file that contains a sequence of standard commands for a specific purpose. Configuration files have a **.cfg** extension. Your device has a default configuration script called ***default.cfg***.

You can create and edit configuration files on your device by:

- saving the dynamic configuration on the device, known as the ***running-config*** (see **"Working with configuration files"**). Use the command:

```
awplus# copy running-config (destination-URL)
```

  Where URL specifies a file in Flash.

- using the device's text editor. Use the command:

```
awplus# edit (source-URL)
```

  where **source-URL** is the name of the copied file in Flash memory.

- creating a file on a remote PC, then copying it to onto your device. See **"Copying files"** for more information about using the **copy** commands.

Once you have created a configuration file, you can use it as the ***startup-config*** file. See **"Specifying the start-up configuration script"** for more information.

Specifying the start-up configuration script

When you restart your device, or when it automatically restarts, it executes the pre-configured commands in a configuration script known as the ***boot config*** or ***startup-config*** file.

When you first start your device, the script set as the startup-config file is ***default.cfg***. If desired, you can overwrite ***default.cfg*** with another configuration. Alternatively, you can change the startup-config by specifying a new file as the startup-config. Use the command:

```
awplus(config)# boot config-file backup URL
```

where **URL** specifies the name and location of a configuration file. At the next restart, the device executes the commands in the specified file.

You can specify that the configuration file is either in the Flash or USB storage device filesystem. However, if you specify that the configuration file is on a USB storage device then you must first create a backup configuration file stored in Flash.

To specify a backup configuration file, use the command:

```
awplus(config)# boot config-file backup backup URL
```

where **URL** specifies the name and location of a configuration file.

You can change the content of the file set as the startup-config file by:

- entering commands directly into the CLI, then saving this configuration using the command:

  ```
  awplus# copy running-config startup-config
  ```

  This command saves the device's dynamic configuration into the file that is currently configured as the startup-config file.

- writing commands into a configuration file (see **"Creating a configuration file"** below), then using the command:

  ```
  awplus# copy SOURCE-URL startup-config
  ```

  This command saves the script from the source file into the file that is currently configured as the startup-config file.

To display the name of the configuration file that is set to execute when the device restarts, enter the command:

```
awplus# show boot
```

To see the commands in the startup-config file, use the command:

```
awplus# show startup-config
```

To erase the file set as the startup-config file, use the command:

```
awplus# erase startup-config
```

At the next restart that occurs after you've erased the file, the device loads the configuration in the file ***default.cfg***. This file is set on the system as a backup configuration file that loads if no other file is set as the startup-config file.

Working with configuration files

When you use the CLI or GUI to configure your device, it stores this dynamic configuration as a list of commands called the ***running-config***. To view the device's running-config, use the command:

```
awplus# show running-config
```

If you turn off the device or restart it, any unsaved changes to the running-config are lost. To save the running-config as a configuration script, use the command:

```
awplus# copy running-config destination-url
```

You may have many configuration files. Storing them on a device allows you to keep a backup device with configuration scripts for every device in the network to speed up network recovery time. Multiple scripts also let you test new configuration scripts before

setting them as the startup-config. For example, to test a new script named test.cfg, enter the command:

```
awplus# copy flash:/test.cfg running-config
```

This allows you to run a configuration file any time without restarting the device, by replacing the system's current dynamic configuration with the script in the configuration file. However, note that some commands require you to restart the device before they can take effect, such as the **platform** commands.

You can also set a trigger to automatically execute a configuration script when a predetermined event occurs. For information about creating triggers, see **Chapter 101, Triggers Introduction**.

The configuration file fallback order

The configuration fallback order is: configuration file, backup configuration file, default configuration file and then the factory default configuration. It is important to note the there is a distinction in system behavior between when writing to the startup-config file and when the system boots up.

When you copy a configuration script from a source file into the startup-config file the system will write to the first file that is configured. Potentially, this means that if a configuration file and a backup configuration file are not set you will write to the default.cfg.

At system startup the device goes through the fallback sequence until it finds a file that exists. For example, if the configuration file is not found then the backup configuration file becomes the current boot configuration, or startup-config, and so on. In the output displayed by the **show boot** command, the **Current boot config** parameter shows the startup-config file that the switch will load during the next boot cycle. The fallback sequence when configuration files are deleted is shown below in output from the **show boot** command.

In the example output below, the current boot configuration file, **my.cfg**, is set on the USB storage device. This is the startup-config file that the device loads at the next boot cycle.

```
awplus#show boot
Boot configuration
-----------------------------------------------------------------
Current software   : x510-5.4.4-0.4.rel
Current boot image : usb:/x510-5.4.4-0.4.rel
Backup  boot image : flash:/x510-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: usb:/my.cfg (file exists)
Backup  boot config: flash:/backup.cfg (file exists)
```

In the example output below, the **no boot-config** command has been used to delete the configuration file **my.cfg** on the USB storage device. The backup configuration file **backup.cfg** in Flash then becomes the current boot config.

```
awplus#show boot
Boot configuration
-----------------------------------------------------------------
Current software   : x510-5.4.4-0.4.rel
Current boot image : usb:/x510-5.4.4-0.4.rel
Backup  boot image : flash:/x510-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: flash:/backup.cfg (file exists)
Backup  boot config: flash:/backup.cfg (file exists)
```

In the example output below, the **no boot-config backup** command has been used to delete the backup configuration file **backup.cfg**. The default configuration file **default.cfg** then becomes the current boot config.

```
awplus#show boot
Boot configuration
-----------------------------------------------------------------
Current software   : x510-5.4.4-0.4.rell
Current boot image : usb:/x510-5.4.4-0.4.rel
Backup  boot image : flash:/x510-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: flash:/default.cfg (file exists)
Backup  boot config: Not set
```

If the current boot configuration file is set on a USB storage device and then this device has been removed from the switch, the **Current boot config** parameter field indicates that this file cannot be found, as shown in the following example output.

```
awplus#show boot
Boot configuration
-----------------------------------------------------------------
Current software   : x510-5.4.4-0.4.rel
Current boot image : usb:/x510-5.4.4-0.4.rel
Backup  boot image : flash:/x510-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: usb:/my.cfg (file not found)
Backup  boot config: flash:/backup.cfg (file exists)
```

At system startup the switch will load the backup configuration file as the startup-config.

Copying Files To and From Your Device

This section provides instructions on:

- **URL syntax**
- **Copying files**

URL syntax

Many of the file management commands use the placeholder "URL" to represent the name and location of the file that you want to act on. The following table explains the syntax of this URL for each different type of file location.

When you copy a file...	Use this syntax:
In local Flash memory	`flash:[/][<directory>/] <filename>`
To or from a USB storage device	`usb:[/][<directory>/] <filename>`
Copying with Hypertext Transfer Protocol (HTTP)	`http://[[<username>:<password>]@] {<hostname>|<host-ip>}[/<filepath>]/<filename>`
Copying with Trivial File Transfer Protocol (TFTP)	`tftp://[[<location>]/<directory>]/<filename>`
Copying with Secure Copy (SCP)	`scp://<username>@<location>[/<directory>][/<filename>]`
Copying with SSH File Transfer Protocol (SFTP)	`sftp://[[<location>]/<directory>]/<filename>`
To or from stack member Flash	`<hostname>-<stack_ID>/flash:[/][<directory>] <stack_member_filename>`

The URL can include characters from up to four categories. The URL categories are:

1. uppercase letters: A to Z
2. lowercase letters: a to z
3. digits: 0 to 9

4. special symbols: all printable ASCII characters not included in the previous three categories. Including the following characters:

   « -

   « /

   « .

   « _

   « @

   « "

   « '

   « *

   « :

   « ~

   « ?

Do not use spaces or parentheses within filenames. Use hyphens or underlines instead.

Copying files

To copy files, use the **copy** commands. These commands allow you to copy files:

- between different memory types attached to your device. Use the command:

  ```
  awplus# copy <local-source> <local-destination> <filename>
  ```

  See **"Copying within a filesystem"** and **""** for further details.

- across a serial connection using ZMODEM. Use the command:

  ```
  awplus# copy zmodem
  ```

  See **"Copying with ZMODEM"** for further details.

- from your device onto a remote device, or to your device from a remote device. To copy a file across an interface with IP configured, use the command:

  ```
  awplus# copy SOURCE-URL DESTINATION-URL
  ```

  To copy files across these interfaces you can use the following protocols:

  « **"Copying with Hypertext Transfer Protocol (HTTP)"**

  « **"Copying with Trivial File Transfer Protocol (TFTP)"**

  « **"Copying with Secure Copy (SCP)"**

  « **"Copying with SSH File Transfer Protocol (SFTP)"**

Copying within a filesystem

Within a directory

To copy a file within the same directory, enter Privileged Exec mode and enter the command:

```
awplus# copy <source-filename> <destination-filename>
```

If the file already exists, the switch asks whether to overwrite it, with a message like this:

```
Overwrite flash:/example.cfg? (y/n)[n]:
```

To overwrite, press the "y" key then the Enter key.

Between directories

To copy a file to another directory within the same filesystem, enter the command:

```
awplus# copy <source-filename> <directory-name>
```

The / after the directory name is required. Otherwise the switch displays an error ("37: Destination file is a directory").

The switch then prompts you for the destination filename. To give the copy a new name, type the name at the prompt. You can include directory names in the path.

To use the same filename as the original, press the Enter key (do not press the "y" key—that names the copy "y").

Example

To put a copy of example.cfg into the example directory, enter the command:

```
awplus# copy example.cfg example/
```

The prompt and messages look like this:

```
Enter destination file name [example.cfg]:
Copying from source file, please wait...
Copying to destination file, please wait...
0: Successful operation
```

Copying to and from NVS or USB storage device

In a stacked environment you can only access `flash` and `nvs` using the stack member file path. To access a USB storage device on a backup stack member, use the **remote-login** command on page 109.6.

To copy between filesystems, you need to specify the filesystem prefix (`nvs:` or `usb:`).

For example, to copy from Flash to NVS when your current directory is the top-level Flash directory, enter Privileged Exec mode and enter the command:

```
awplus# copy <source-filename> nvs:
```

For example, to copy from Flash to the USB storage device when your current directory is the top-level Flash directory, enter Privileged Exec mode and enter the command:

```
awplus# copy <source-filename> usb:
```

The switch prompts you for the filename, as described in the previous section.

To copy from NVS to Flash when your current directory is the top-level Flash directory, enter the command:

```
awplus# copy nvs:<source-filename> <destination-filename>
```

Example To copy the file "example.txt" from the directory in NVS called "example" to the top level of Flash, enter the command:

```
awplus# copy nvs:example/example.txt example.txt
```

Copying with ZMODEM

ZMODEM allows you to copy files from a network host over an asynchronous port. Use the command:

```
awplus# copy zmodem
```

to open Minicom and transfer a file. Alternatively you can specify the file name within the command:

```
awplus# copy SOURCE-URL zmodem
```

For example, to copy the file “july.cfg” from Flash memory using ZMODEM, use the command:

```
awplus# copy flash:/july.cfg zmodem
```

Copying with Hypertext Transfer Protocol (HTTP)

You device has a built-in HTTP client. The HTTP client enables the device to act as a browser by sending HTTP “get” or “post” requests to an HTTP server. The client is enabled by default.

For example, to load the file “bob.key” onto Flash from the security directory on the web server at www.company.com, use the command:

```
awplus# copy http://www.company.com/security/bob.key
       flash:/bob.key
```

Copying with Trivial File Transfer Protocol (TFTP)

TFTP runs over User Datagram Protocol (UDP). It is simpler and faster than FTP but has minimal capability, such as no provisions for user authentication.

To copy a file from a TFTP server to Flash memory, enter Privileged Exec mode and enter the command:

```
awplus# copy tftp flash
```

Note You can specify the server and filename in the command instead of waiting for prompts. Use a format like the following:

```
copy tftp://172.1.1.1/example.cfg flash
```

The switch prompts you for the:

- TFTP server hostname (you can enter its IP address instead)
- source filename on the TFTP server
- destination filename in Flash on the switch

To copy a file from Flash to a TFTP server, enter the command:

```
awplus# copy flash tftp
```

Follow the prompts for source filename, server, and destination filename.

If the file is not in the top level of the TFTP server, include the path as part of the filename.

Example To copy example.cfg to the TFTP server at 172.1.1.1, enter the command:

```
awplus# copy flash tftp
```

The prompts, responses, and messages look like this:

```
Enter source file name []:example.cfg
Enter destination host name []:172.1.1.1
Enter destination file name [example.cfg]:
Copying from source file, please wait...
Copying to destination file, please wait...
0: Successful operation
```

To load the file “bob.key” from a TFTP server, where the file is in the folder “security”, use the command:

```
awplus# copy tftp://security/bob.key flash:/bob.key
```

Copying with Secure Copy (SCP)

Secure Copy (SCP) provides a secure way to copy files to and from a remote device using SSH. The AlliedWare Plus™ OS includes both a SSH server and a SSH client. You must enable the SSH server before your device accepts connections from SCP clients. See the **Chapter 76, Secure Shell (SSH) Introduction** for more information.

For example, to load the file “beth.key” onto Flash from the key directory on a remote SSH server at 10.10.0.12, using the username “bob”, use the command:

```
awplus# copy scp://bob@10.10.0.12/key/beth.key
       flash:/beth.key
```

Copying with SSH File Transfer Protocol (SFTP)

SSH File Transfer Protocol (SFTP) provides a secure way to copy files onto your device from a remote device. The AlliedWare Plus™ OS includes both a SSH server and a SSH client. SFTP provides additional features from SCP, such as allowing you to manipulate the remote files, and halt or resume file transfers without closing the session.

For example, to load the file “rei.cfg” onto Flash memory from the remote server at 10.0.0.5, use the command:

```
awplus# copy sftp://10.0.0.5/rei.cfg flash:/rei.cfg
```

Copying from a Server to Running Configuration

Use the **copy tftp** variant of the **copy running-config** command on page 7.14 to load a configuration file from a server to the running configuration of the switch.

The configuration will be added to the running configuration as if the commands were typed in the command line interface.

The resulting configuration file will be a combination of the previous running configuration and the loaded configuration file. The loaded configuration file has precedence.

The Autoboot Feature

The Autoboot feature enables your switch to automatically load a specific release file and/or configuration file from external media, such as USB storage device, into Flash memory, providing there is enough free space available.

If there is not enough free space, the Autoboot feature will exit and booting will revert to what was previously set by the CLI. This feature is enabled only the first time the device is powered up in the field. Subsequently, the Autoboot feature is disabled by default.

The Autoboot feature minimizes network downtime by avoiding the need for manual configuration of a replacement device.

If you use prepared external media for the first time boot, the Autoboot feature gives you the ability to easily ensure the device boots with your desired release and configuration files. You must prepare the external media for this purpose using an initiation file, `autoboot.txt`, and accompanying release and configuration files.

Use the **create autoboot** command to create an `autoboot.txt` file on external media. This command will automatically ensure that the keys and values that are expected in this file are correct. After the file is created the command will copy the current release and configuration files across to the external media. The `autoboot.txt` file is read/writable by any desktop operating system currently supported by the AlliedWare Plus™ Operating System. Note that the external media file system is not case sensitive.

When the Autoboot feature is enabled, the device on boot-up:

- checks for a special file called `autoboot.txt` on external media, and if this file exists,
- checks in the file for the "key=value" pair "`Copy_from_external_media_enabled=yes`", and if this enable flag is set,
- loads the release file and/or configuration file from external media.

We recommend that no directories are present on external media used to hold the `autoboot.txt` file. In addition, large numbers of files on external media may slow the booting process.

Note The Autoboot feature is not supported in a stacked configuration.

Do not remove external media part way through the copy process as this may leave the device in an unstable state.

Configuration files placed on external media reduce security. Therefore, ensure adequate security precautions are taken with external media holding configuration files.

Configuration commands that rely on the presence of a feature license will fail when executed in the replacement switch if the replacement switch does not have the same feature license present.

Restoring a Switch Using Autoboot from External Media

The example below describes the sequence of events when a switch in the field fails and is restored using this feature:

1. Using the **create autoboot** command, a network engineer has previously manually created a restore external media device, such as a USB storage device. The external media device contains the following components:
   - An `autoboot.txt` file with required contents
   - An appropriate release file
   - A configuration file
2. A switch fails in the field.
3. A replacement switch of same model is installed.
4. The previously created external media device is placed into the replacement switch.
5. The switch powers up using its pre-installed release if present. It automatically checks the external media device for the `autoboot.txt` file.
6. The switch finds a valid `autoboot.txt` file on the external media device, with the value “Copy_from_external_media_enabled” set. The release file and configuration file both exist on the external media device.
7. The MD5sum of pre-installed Flash release file is compared to the MD5sum of the release file stored in the external media device. If they do not match, because the release file in the replacement switch is either missing or different, then the release is restored from the external media device. If the release files already match, then the release file is not copied from the external media device.
8. The MD5sum of the Flash configuration file `default.cfg` (if pre-installed in the replacement switch) is compared to the MD5sum of the configuration file stored in the external media device. If they do not match, because the configuration file in the replacement switch is either missing or different, then the configuration file is restored from the external media device. If the configuration files already match, then the configuration file is not copied from the external media device.
9. The memory space available in the switch Flash is checked to ensure the release and configuration files stored in the external media device will fit. If there is not enough space the Autoboot feature will exit.
10. The release file and configuration files are automatically copied from the external media device to switch Flash memory. The switch release and configuration files are updated to contain the appropriate names.
11. The switch is automatically rebooted.
12. The replacement switch is now running the restored release and configuration files. Subsequent reboots are based on the restored release and configuration files stored in the switch Flash memory.

13. If you want to Autoboot from external media on this specific switch in the future, you must now manually enable the Autoboot feature in the configuration menu via the **autoboot enable** command. This command resets the enable flag stored internally in the switch NVS memory.

Configure Autoboot

This section describes the commands used to configure the Autoboot feature.

Table 6-1: Configuration procedures for the Autoboot feature

Create an Autoboot file (autoboot.txt)	
`awplus#`	
`create autoboot [usb]`	Create an **autoboot.txt** file on external media.
Enable the Autoboot feature	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`autoboot enable`	The Autoboot feature is enabled by default the first time the device is powered up in the field. Use this command to enable the feature subsequently.
Disable the Autoboot feature	
`awplus(config)#`	
`no autoboot enable`	Use this command to disable the Autoboot feature.
Display Autoboot configuration and status	
`awplus#`	
`show autoboot`	Display detailed information about the current Autoboot configuration and status.
`awplus#`	
`show boot`	Display the status of the Autoboot feature; either enabled or disabled.

Chapter 7: File Management Commands

Introduction

This chapter provides an alphabetical reference of AlliedWare Plus™ OS file management commands.

URL Syntax and Keyword Usage

Many of the commands in this chapter use the placeholder "URL" to represent the name and location of the file that you want to act on. The following table explains the syntax of this URL for each different type of file location.

When you copy a file...	Use this syntax:
In local Flash memory	`flash:[/][<directory>/] <filename>`
To or from a USB storage device	`usb:[/][<directory>/] <filename>`
Copying with Hypertext Transfer Protocol (HTTP)	`http://[[<username>:<password>]@] {<hostname>|<host-ip>}[/<filepath>]/<filename>`
Copying with Trivial File Transfer Protocol (TFTP)	`tftp://[[<location>]/<directory>]/<filename>`
Copying with Secure Copy (SCP)	`scp://<username>@<location>[/<directory>][/<filename>]`
Copying with SSH File Transfer Protocol (SFTP)	`sftp://[[<location>]/<directory>]/<filename>`
To or from stack member Flash	`<hostname>-<stack_ID>/flash:[/][<directory>] <stack_member_filename>`

The URL can include characters from up to four categories. The URL categories are:

1. uppercase letters: A to Z
2. lowercase letters: a to z
3. digits: 0 to 9

4. special symbols: all printable ASCII characters not included in the previous three categories. Including the following characters:

   « -
   « /
   « .
   « _
   « @
   « "
   « '
   « *
   « :
   « ~
   « ?

Do not use spaces or parentheses within filenames. Use hyphens or underlines instead.

In a stacked environment you can only access `flash` and `nvs` using the stack member filepath. To access a USB storage device on a backup stack member, use the **remote-login** command on page 109.6.

Note

When the Flash base directory is required for local filesystems you may use **flash** or **flash:** or **flash:/**. Similarly, when the USB storage device base directory is required you may use **usb** or **usb:** or **usb:/**.

The keywords **flash**, **nvs**, **usb**, **tftp**, **scp**, **sftp** and **http** are reserved for tab completion when using the **copy**, **move**, **delete**, **cd**, and **dir** commands.

The keywords **flash**, **nvs**, **usb**, **tftp**, **scp**, **sftp** and **http** cannot be applied as directory or subdirectory names when using a **mkdir** command.

A leading slash (/) indicates the root of the current filesystem location.

Command List

autoboot enable

This command enables the device to restore a release file and/or a configuration file from external media, such as a USB storage device.

When the Autoboot feature is enabled, the device looks for a special file called `autoboot.txt` on the external media. If this file exists, the device will check the key and values in the file and recover the device with a new release file and/or configuration file from the external media. An example of a valid `autoboot.txt` file is shown in Figure 7-1 below.

Figure 7-1: Example autoboot.txt file

```
[AlliedWare Plus]
Copy_from_external_media_enabled=yes
Boot_Release=x510-5.4.4-0.4.rel
Boot_Config=network1.cfg
```

Use the **no** variant of this command to disable the Autoboot feature.

Note This command is not supported in a stacked configuration.

Syntax

```
autoboot enable
no autoboot enable
```

Default The Autoboot feature operates the first time the device is powered up in the field, after which the feature is disabled by default.

Mode Global Configuration

Example To enable the Autoboot feature, use the command:

```
awplus# configure terminal
awplus(config)# autoboot enable
```

To disable the Autoboot feature, use the command:

```
awplus# configure terminal
awplus(config)# no autoboot enable
```

Related Commands

create autoboot
show autoboot
show boot

boot config-file

Use this command to set the configuration file to use during the next boot cycle.

Use the **no** variant of this command to remove the configuration file.

Note To ensure correct operation of the chassis and in particular of any cards inserted after issuing this command, the chassis should be rebooted.

Syntax

```
boot config-file <filepath-filename>
no boot config-file
```

Parameter	Description
<filepath-filename>	Filepath and name of a configuration file. The specified configuration file must exist in the Flash or USB filesystem. Valid configuration files must have a **.cfg** extension.

Mode Global Configuration

Usage You can only specify that the configuration file is on a USB storage device if there is a backup configuration file already specified in Flash. If you attempt to set the configuration file on a USB storage device and a backup configuration file is not specified in Flash, the following error message is displayed:

```
% Backup configuration files must be stored in the flash
filesystem
```

In a VCStack configuration you can only specify that the configuration file is on an SD card if there is a card inserted in all stack members. If a stack member has a card removed an error message is displayed. For example, if stack member 2 does not have a card inserted the following message is displayed:

```
% Stack member 2 has no card inserted
```

For an explanation of the configuration fallback order, see **"The configuration file fallback order" on page 6.10**.

Examples To run the configuration file `branch.cfg` stored on the switch's Flash filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file flash:/branch.cfg
```

To remove the configuration file `branch.cfg` stored on the switch's Flash filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file flash:/branch.cfg
```

To run the configuration file `branch.cfg` stored on the switch's USB storage device filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file usb:/branch.cfg
```

To remove the configuration file `branch.cfg` stored on the switch's USB storage device filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file usb:/branch.cfg
```

Related Commands

boot config-file backup
boot system
boot system backup
show boot

boot config-file backup

Use this command to set a backup configuration file to use if the main configuration file cannot be accessed.

Use the **no** variant of this command to remove the backup configuration file.

Syntax

```
boot config-file backup <filepath-filename>
no boot config-file backup
```

Parameter	Description
<filepath-filename>	Filepath and name of a backup configuration file. Backup configuration files must be in the Flash filesystem. Valid backup configuration files must have a **.cfg** extension.
`backup`	The specified file is a backup configuration file.

Mode Global Configuration

Usage For an explanation of the configuration fallback order, see **"The configuration file fallback order" on page 6.10**.

Examples To set the configuration file `backup.cfg` as the backup to the main configuration file, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file backup flash:/backup.cfg
```

To remove the configuration file `backup.cfg` as the backup to the main configuration file, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file backup flash:/backup.cfg
```

Related Commands

boot config-file
boot system
boot system backup
show boot

boot system

Use this command to set the release file to load during the next boot cycle.

Use the **no** variant of this command to remove the release file as the boot file.

Syntax

```
boot system <filepath-filename>
no boot system
```

Parameter	Description
<filepath-filename>	Filepath and name of a release file. The specified release file must exist and must be stored in the root directory of the Flash or USB filesystem. Valid release files must have a **.rel** extension.

Mode Global Configuration

Usage You can only specify that the release file is on a USB storage device if there is a backup release file already specified in Flash. If you attempt to set the release file on a USB storage device and a backup release file is not specified in Flash, the following error message is displayed:

```
% A backup boot image must be set before setting a current boot
image on USB storage device
```

In a VCStack configuration, a release file on a USB storage device is accepted only if a card is inserted in all stack members and all stack members have a bootloader version that supports booting from card. If a stack member has a card removed an error message is displayed. For example, if stack member 2 does not have a card inserted the following message is displayed:

```
% Stack member 2 has no card inserted
```

Examples To run the release file `x510-5.4.4-0.4.rel` stored on the switch's Flash filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# boot system flash:/x510-5.4.4-0.4.rel
```

To remove the release file `x510-5.4.4-0.4.rel` stored on the switch's Flash filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# no boot system flash:/x510-5.4.4-0.4.rel
```

To run the release file `x510-5.4.4-0.4.rel` stored on the switch's USB storage device filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# boot system usb:/x510-5.4.4-0.4.rel
```

To remove the release file `x510-5.4.4-0.4.rel` stored on the switch's USB storage device filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# boot system usb:/x510-5.4.4-0.4.rel
```

In a VCStack configuration, if there is not enough space to synchronize the new release across the stack, the boot system command has an interactive mode that prompts you to delete old releases.

```
awplus# configure terminal
awplus(config)# boot system x510-5.4.4-0.4.rel
```

```
Insufficient flash available on stack member-2 (11370496)
 to synchronize file x510-5.4.4-0.4.rel (14821895).

 List of release files on stack member-2
        x510-5.4.4-0.4.rel (14822400)

 Select files to free up space,
 Delete awplus-2/flash:/x510-5.4.4-0.4.rel? (y/n)[n]:y
```

```
awplus(config)# y
```

```
 Deleting selected files, please
wait.................................
 Successful operation
 VCS synchronizing file across the stack, please
wait.....................................
 File synchronization with stack member-2 successfully completed
 [DONE]
```

Related Commands

boot config-file
boot config-file backup
boot system backup
show boot

boot system backup

Use this command to set a backup release file to load if the main release file cannot be loaded.

Use the **no** variant of this command to remove the backup release file as the backup boot file.

Syntax

```
boot system backup <filepath-filename>
no boot system backup
```

Parameter	Description
<filepath-filename>	Filepath and name of a backup release file. Backup release files must be in the Flash filesystem. Valid release files must have a **.rel** extension.
`backup`	The specified file is a backup release file.

Mode Global Configuration

Examples To specify the file `x510-5.4.4-0.4.rel` as the backup to the main release file, use the commands:

```
awplus# configure terminal
awplus(config)# boot system backup flash:/x510-5.4.4-0.4.rel
```

To remove the file `x510-5.4.4-0.4.rel` as the backup to the main release file, use the commands:

```
awplus# configure terminal
awplus(config)# no boot system backup flash:/x510-5.4.4-
0.4.rel
```

Related Commands

boot config-file
boot config-file backup
boot system
show boot

cd

This command changes the current working directory.

Syntax `cd <directory-url>`

Parameter	Description
<directory-url>	URL of the directory.

Mode Privileged Exec

Example To change to the directory called `images`, use the command:

```
awplus# cd images
```

Related Commands **dir**
pwd
show file systems

copy current-software

This command copies the AlliedWare Plus™ OS software that the device has booted from to a destination file. Specify whether the destination is Flash or card when saving the software to the local filesystem.

This command copies the AlliedWare Plus™ OS software that the device has booted from to a destination file. Specify whether the destination is Flash or USB when saving the software to the local filesystem.

Syntax `copy current-software <destination-url>`

Parameter	Description
<destination-url>	The URL where you would like the current running-release saved. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Example To copy the current software as installed in the working directory with the file name `my-release.rel`, use the command:

```
awplus# copy current-software my-release.rel
```

Related Commands **boot system backup**
show boot

copy debug

This command copies a specified debug file to a destination file. Specify whether the destination is Flash or Card when saving the software to the local filesystem.

This command copies a specified debug file to a destination file. Specify whether the destination is Flash or USB when saving the software to the local filesystem.

Syntax

```
copy debug {<destination-url>|card|debug|flash|nvs|scp|tftp|usb}
   {<source-url>|card|debug|flash|nvs|scp|tftp|usb}
```

Parameter	Description
<destination-url>	The URL where you would like the debug output saved. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.
<source-url>	The URL where the debug output originates. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Example To copy debug output to an SD (or SDHC) card with a filename `my-debug`, use the following command:

```
awplus# copy debug card:mydebug
```

To copy debug output to a USB storage device with a filename `my-debug`, use the following command:

```
awplus# copy debug usb:mydebug
```

Output **Figure 7-2: CLI prompt after entering the copy debug command**

```
Enter source file name []:
```

Related Commands

delete debug
move debug

copy running-config

This command copies the running-config to a destination file, or copies a source file into the running-config. Commands entered in the running-config do not survive a device reboot unless they are saved in a configuration file.

Syntax

```
copy <source-url> running-config
copy running-config <destination-url>
copy running-config startup-config
```

Parameter	Description
<source-url>	The URL of a configuration file. This must be a valid configuration file with a **.cfg** filename extension. Specify this when you want the script in the file to become the new running-config. The URL can contain the following protocols or location words. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.
<destination-url>	The URL where you would like the current running-config saved. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.
`startup-config`	Copies the running-config into the file set as the current startup-config file.

Mode Privileged Exec

Examples To copy the `running-config` into the startup-config, use the command:

```
awplus# copy running-config startup-config
```

To copy the file `layer3.cfg` into the `running-config`, use the command:

```
awplus# copy layer3.cfg running-config
```

To use SCP to copy the running-config as `current.cfg` to the remote server listening on TCP port 2000, use the command:

```
awplus# copy running-config scp://user@server:2000/
       config_files/current.cfg
```

Related Commands

copy startup-config
write file
write memory

copy startup-config

This command copies the startup-config script into a destination file, or alternatively copies a configuration script from a source file into the startup-config file. Specify whether the destination is Flash or USB when loading from the local filesystem.

Syntax

```
copy <source-url> startup-config
copy startup-config <destination-url>
```

Parameter	Description
<source-url>	The URL of a configuration file. This must be a valid configuration file with a **.cfg** filename extension. Specify this to copy the script in the file into the *startup-config* file. Note that this does not make the copied file the new startup file, so any further changes made in the configuration file are not added to the startup-config file unless you reuse this command. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.
<destination-url>	The destination and filename that you are saving the startup-config as. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Examples To copy the file Layer3.cfg to the startup-config, use the command:

```
awplus# copy Layer3.cfg startup-config
```

To copy the startup-config as the file oldconfig.cfg in the current directory, use the command:

```
awplus# copy startup-config oldconfig.cfg
```

Related Commands **copy running-config**

copy (URL)

This command copies a file. This allows you to:

- copy files from your device to a remote device
- copy files from a remote device to your device
- copy files stored on Flash memory to or from a different memory type, such as a USB storage device
- create two copies of the same file on your device

Syntax `copy <source-url> <destination-url>`

Parameter	Description
<source-url>	The URL of the source file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.
<destination-url>	The URL for the destination file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Usage The URL can include characters from up to four categories. The URL categories are:

1. uppercase letters: A to Z
2. lowercase letters: a to z
3. digits: 0 to 9

4. special symbols: all printable ASCII characters not included in the previous three categories. Including the following characters:

   « -
   « /
   « .
   « _
   « @
   « "
   « '
   « *
   « :
   « ~
   « ?

Do not use spaces or parentheses within filenames. Use hyphens or underlines instead.

Examples To use TFTP to copy the file `bob.key` into the current directory from the remote server at `10.0.0.1`, use the command:

```
awplus# copy tftp://10.0.0.1/bob.key bob.key
```

To use SFTP to copy the file `new.cfg` into the current directory from a remote server at `10.0.1.2`, use the command:

```
awplus# copy sftp://10.0.1.2/new.cfg bob.key
```

To use SCP with the username `beth` to copy the file `old.cfg` into the directory `config_files` on a remote server that is listening on TCP port 2000, use the command:

```
awplus# copy scp://beth@serv:2000/config_files/old.cfg old.cfg
```

To copy the file `config.cfg` into the current directory from a USB storage device, and rename it to `configtest.cfg`, use the command:

```
awplus# copy usb:/config.cfg configtest.cfg
```

To copy the file `test.txt` from the top level of Flash on stack member 4 to the current directory in the stack master, use the command:

```
awplus# copy awplus-4/flash:/test.txt test.txt
```

Note that you must specify either the NVS or Flash filesystem on the (backup) stack member (`flash:` in this example).

Related Commands **copy zmodem**
edit (URL)
show file systems

copy zmodem

This command allows you to copy files using ZMODEM using Minicom. ZMODEM works over a serial connection and does not need any interfaces configured to do a file transfer.

Syntax

```
copy <source-url> zmodem
```

```
copy zmodem
```

Parameter	Description
<source-url>	The URL of the source file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Example To copy the local file `asuka.key` using ZMODEM, use the command:

```
awplus# copy asuka.key zmodem
```

Related Commands

copy (URL)
show file systems

create autoboot

Use this command to create an `autoboot.txt` file on external media. This command will automatically ensure that the keys and values that are expected in this file are correct. After the file is created the **create autoboot** command will copy the current release and configuration files across to the external media. The external media is then available to restore a release file and/or a configuration file to the device.

Syntax `create autoboot [usb]`

Mode Privileged Exec

Example To create an `autoboot.txt` on external media, use the command:

```
awplus# create autoboot usb
```

Related Commands
autoboot enable
show autoboot
show boot

delete

This command deletes files or directories.

Syntax `delete [force] [recursive] <url>`

Parameter	Description
`force`	Ignore nonexistent filenames and never prompt before deletion.
`recursive`	Remove the contents of directories recursively.
<url>	URL of the file to delete. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Examples To delete the file `temp.cfg` from the current directory, use the command:

```
awplus# delete temp.cfg
```

To delete the read-only file `one.cfg` from the current directory, use the command:

```
awplus# delete force one.cfg
```

To delete the directory `old_configs`, which is not empty, use the command:

```
awplus# delete recursive old_configs
```

To delete the directory `new_configs`, which is not empty, without prompting if any read-only files are being deleted, use the command:

```
awplus# delete force recursive new_configs
```

Related Commands **erase startup-config**
rmdir

delete debug

Use this command to delete a specified debug output file.

Syntax `delete debug <source-url>`

Parameter	Description
<source-url>	The URL where the debug output originates. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Example To delete debug output, use the following command:

```
awplus# delete debug
```

Output **Figure 7-3: CLI prompt after entering the delete debug command**

```
Enter source file name []:
```

Related Commands **copy debug**
move debug

dir

This command lists the files on a filesystem. If no directory or file is specified then this command lists the files in the current working directory.

Syntax `dir [all] [recursive] [sort [reverse] [name|size|time]] [<url>|debug|flash|nvs|usb]`

Parameter	Description
`all`	List all files.
`recursive`	List the contents of directories recursively.
`sort`	Sort directory listing.
`reverse`	Sort using reverse order.
`name`	Sort by name.
`size`	Sort by size.
`time`	Sort by modification time (default).
<url>	URL of the directory or file. If no directory or file is specified, then this command lists the files in the current working directory.
`debug`	Debug root directory
`flash`	Flash memory root directory
`nvs`	NVS memory root directory
`usb`	USB storage device root directory

Mode Privileged Exec

Usage In a stacked environment you can use the CLI on a stack master to access filesystems that are located on another stack member. Refer to the **URL Syntax and Keyword Usage**.

Examples To list the files in the current working directory, use the command:

```
awplus# dir
```

To list the non-hidden files in the root of the Flash filesystem, use the command:

```
awplus# dir flash
```

To list all the files in the root of the Flash filesystem, use the command:

```
awplus# dir all flash:
```

To list recursively the files in the Flash filesystem, use the command:

```
awplus# dir recursive flash:
```

To list the files in alphabetical order, use the command:

```
awplus# dir sort name
```

To list the files by size, smallest to largest, use the command:

```
awplus# dir sort reverse size
```

To sort the files by modification time, oldest to newest, use the command:

```
awplus# dir sort reverse time
```

To list the files within the Flash filesystem for stack member 3, use the command:

```
awplus# dir awplus-3/flash:/
```

Note that you must specify the filesystem, on the stack member (`flash` in this example).

Related Commands **cd**
pwd

edit

This command opens a text file in the AlliedWare Plus™ text editor. Once opened you can use the editor to alter to the file.

If a filename is specified and it already exists, then the editor opens it in the text editor.

If no filename is specified, the editor prompts you for one when you exit it.

Before starting the editor make sure your terminal, terminal emulation program, or Telnet client is 100% compatible with a VT100 terminal. The editor uses VT100 control sequences to display text on the terminal.

For more information about using the editor, including control sequences, see **"Using the editor" on page 6.6**.

Syntax `edit [<filename>]`

Parameter	Description
<filename>	Name of a file in the local Flash filesystem.

Mode Privileged Exec

Examples To create and edit a new text file, use the command:

```
awplus# edit
```

To edit the existing configuration file `myconfig.cfg` stored on your device's Flash memory, use the command:

```
awplus# edit myconfig.cfg
```

Related Commands **edit (URL)**
show file

edit (URL)

This command opens a remote text file as read-only in the AlliedWare Plus™ text editor.

Before starting the editor make sure your terminal, terminal emulation program, or Telnet client is 100% compatible with a VT100 terminal. The editor uses VT100 control sequences to display text on the terminal.

Syntax `edit <url>`

Parameter	Description
<url>	The URL of the remote file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Usage The URL can include characters from up to four categories. The URL categories are:

1. uppercase letters: A to Z
2. lowercase letters: a to z
3. digits: 0 to 9
4. special symbols: all printable ASCII characters not included in the previous three categories. Including the following characters:
   - « -
   - « /
   - « .
   - « _
   - « @
   - « "
   - « '
   - « *
   - « :
   - « ~
   - « ?

Do not use spaces or parentheses within filenames. Use hyphens or underlines instead.

Example To view the file `bob.key` stored in the security directory of a TFTP server, use the command:

```
awplus# edit tftp://security/bob.key
```

Related Commands
copy (URL)
edit
show file

erase startup-config

This command deletes the file that is set as the startup-config file, which is the configuration file that the system runs when it boots up.

At the next restart, the device loads the default configuration file, default.cfg. If default.cfg no longer exists, then the device loads with the factory default configuration. This provides a mechanism for you to return the device to the factory default settings.

Syntax

```
erase startup-config
```

Mode

Privileged Exec

Example

To delete the file currently set as the startup-config, use the command:

```
awplus# erase startup-config
```

Related Commands

boot config-file backup
copy running-config
copy startup-config
show boot

mkdir

This command makes a new directory.

Syntax `mkdir <url>`

Parameter	Description
<url>	URL of the directory that you are creating.

Mode Privileged Exec

Usage The keywords **flash**, **nvs**, **usb**, **tftp**, **scp**, **sftp** and **http** are reserved for tab completion when using the **copy**, **move**, **delete**, **cd** and **dir** command. Keywords **flash**, **nvs**, **usb**, **tftp**, **scp**, **sftp** and **http** cannot be applied as directory or subdirectory names when using a **mkdir** command.

Example To make a new directory called `images` in the current directory, use the command:

```
awplus# mkdir images
```

Related Commands **cd**
dir
pwd

move

This command renames or moves a file.

Syntax `move <source-url> <destination-url>`

Parameter	Description
<source-url>	The URL of the source file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.
<destination-url>	The URL of the destination file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Examples To rename the file `temp.cfg` to `startup.cfg`, use the command:

```
awplus# move temp.cfg startup.cfg
```

To move the file `temp.cfg` from the root of the Flash filesystem to the directory `myconfigs`, use the command:

```
awplus# move temp.cfg myconfigs/temp.cfg
```

Related Commands

delete
edit
show file
show file systems

move debug

This command moves a specified debug file to a destination debug file.

Specify whether the destination is Flash or USB when saving the software to the local filesystem.

Syntax

```
move debug {<destination-url>|debug|flash|nvs|usb}
   {<source-url>|debug|flash|nvs|usb}
```

Parameter	Description
<destination-url>	The URL where you would like the debug output moved to. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.
<source-url>	The URL where the debug output originates. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Example To move debug output onto a USB storage device with a filename `my-debug`, use the following command:

```
awplus# move debug usb:my-debug
```

Output **Figure 7-4: CLI prompt after entering the move debug command**

```
Enter source file name []:
```

Related Commands

copy debug
delete debug

pwd

This command prints the current working directory.

Syntax `pwd`

Mode Privileged Exec

Example To print the current working directory, use the command:

```
awplus# pwd
```

Related Commands cd

rmdir

This command removes a directory. The directory must be empty for the command to work unless the optional **force** keyword is used to remove all subdirectories or files in a directory.

Syntax `rmdir [force] <url>`

Parameter	Description
`force`	Optional keyword that allows you to delete any directories that are not empty and may contain files or subdirectories.
`<url>`	The URL of the directory.

Mode Privileged Exec

Usage In a stacked environment you can use the CLI on a stack master to access filesystems that are located on another stack member. Refer to the **URL Syntax and Keyword Usage**.

Examples To remove the directory `images` from the top level of the Flash filesystem, use the command:

```
awplus# rmdir flash:/images
```

To force the removal of directory `level1` containing subdirectory `level2`, use the command:

```
awplus# mkdir level1
awplus# mkdir level1/level2
awplus# rmdir force level1
```

To remove a directory called `test` from the top level of the Flash filesystem, in stack member 3, use the command:

```
awplus# rmdir awplus-3/flash:/test
```

Note that you must specify the filesystem, ("flash:" in this example).

Related Commands
cd
dir
mkdir
pwd

show autoboot

This command displays the Autoboot configuration and status.

Syntax `show autoboot`

Mode Privileged Exec

Example To show the Autoboot configuration and status, use the command:

```
awplus# show autoboot
```

Output **Figure 7-5: Example output from the show autoboot command**

```
awplus#show autoboot
Autoboot configuration
------------------------------------------------------------------------------
Autoboot status                  : enabled
USB file autoboot.txt exists     : yes

Restore information on USB
Autoboot enable in autoboot.txt  : yes
Restore release file             : x510-5.4.4-0.4.rel (file exists)
Restore configuration file       : network_1.cfg (file exists)
```

Figure 7-6: Example output from the show autoboot command when an external media source is not present

```
awplus#show autoboot
Autoboot configuration
------------------------------------------------------------------------------
Autoboot status                  : enabled
External media source            : USB not found.
```

Related Commands **autoboot enable**
create autoboot
show boot

show boot

This command displays the current boot configuration.

Syntax `show boot`

Mode Privileged Exec

Example To show the current boot configuration, use the command:

```
awplus# show boot
```

Output **Figure 7-7: Example output from the show boot command with the current boot config set on a USB storage device**

```
awplus#show boot
Boot configuration
-----------------------------------------------------------------
Current software   : x510-5.4.4-0.4.rel
Current boot image : usb:/x510-5.4.4-0.4.rel
Backup  boot image : flash:/x510-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: usb:/my.cfg (file exists)
Backup  boot config: flash:/backup.cfg (file not found)
Autoboot status    : enabled
```

Figure 7-8: Example output from the show boot command

```
awplus#show boot
Boot configuration
-----------------------------------------------------------------
Current software   : x510-5.4.4-0.4.rel
Current boot image : flash:/x510-5.4.4-0.4.rel
Backup  boot image : flash:/x510-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: flash:/my.cfg (file exists)
Backup  boot config: flash:/backup.cfg (file not found)
Autoboot status    : enabled
```

Table 7-1: Parameters in the output of the show boot command

Parameter	Description
`Current software`	The current software release that the device is using.
`Current boot image`	The boot image currently configured for use during the next boot cycle.
`Backup boot image`	The boot image to use during the next boot cycle if the device cannot load the main image.
`Default boot config`	The default startup configuration file. The device loads this configuration script if no file is set as the startup-config file.
`Current boot config`	The configuration file currently configured as the startup-config file. The device loads this configuration file during the next boot cycle if this file exists.
Backup boot config	The configuration file to use during the next boot cycle if the main configuration file cannot be loaded.
Autoboot status	The status of the Autoboot feature; either enabled or disabled.

Related Commands

autoboot enable
boot config-file backup
boot system backup
show autoboot

show file

This command displays the contents of a specified file.

Syntax `show file {<filename>|<url>}`

Parameter	Description
<filename>	Name of a file on the local Flash filesystem.
<url>	URL of a file.

Mode Privileged Exec

Example To display the contents of the file `oldconfig.cfg`, which is in the current directory, use the command:

```
awplus# show file oldconfig.cfg
```

Related Commands **edit**
edit (URL)
show file systems

show file systems

This command lists the filesystems and their utilization information where appropriate.

If this command is entered on the stack master, it will list the filesystems for all the stack members. A stack member heading is displayed to distinguish the different lists shown for each stack member.

Syntax `show file systems`

Mode Privileged Exec

Examples To display the filesystems for either a standalone device, or a complete stack, use the command:

```
awplus# show file systems
```

Output **Figure 7-9: Example output from the show file systems command**

```
awplus#show file systems
 Size(b)  Free(b)  Type   Flags  Prefixes   S/D/V   Lcl/Ntwk  Avail
-------------------------------------------------------------------
  63.0M    29.4M   flash     rw  flash:     static  local      Y
     -        -   system    rw  system:    virtual local      -
  10.0M     9.9M   debug     rw  debug:     static  local      Y
 499.0K   404.0K   nvs       rw  nvs:       static  local      Y
     -        -   usbstick  rw  usb:       dynamic local      N
     -        -   tftp      rw  tftp:      -       network    -
     -        -   scp       rw  scp:       -       network    -
     -        -   sftp      ro  sftp:      -       network    -
     -        -   http      ro  http:      -       network    -
     -        -   rsync     rw  rsync:     -       network    -
```

Table 7-2: Parameters in the output of the show file systems command

Parameter	Description
`Size (B)` `Available`	The total memory available to this filesystem. The units are given after the value and are M for Megabytes or k for kilobytes.
`Free (B)`	The total memory free within this filesystem. The units are given after the value and are M for Megabytes or k for kilobytes.
`Type`	The memory type used for this filesystem: flash, system, nvs, usbstick, tftp, scp, sftp, or http.
`Flags`	The file setting options: rw (read write), ro (read only).
`Prefixes`	The prefixes used when entering commands to access the filesystems: flash, system, nvs, usb, tftp, scp, sftp, or http.
`S/V/D`	The memory type: static, virtual, dynamic.
`Lcl / Ntwk`	Whether the memory is located locally or via a network connection.
`Avail`	Whether the memory is accessible: Y (yes), N (no), - (not appropriate)

Related Commands **edit**
edit (URL)
show file

show running-config

This command displays the current configuration of the device. The output includes all non-default configuration; default settings are not displayed.

You can control the output in any one of the following ways:

- To display only lines that contain a particular word, follow the command with **| include word**
- To start the display at the first line that contains a particular word, follow the command with **| begin word**
- To save the output to a file, follow the command with **> filename**

For more information, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show running-config`

Mode Privileged Exec and Global Configuration

Example To display the current dynamic configuration of your device, use the command:

```
awplus# show running-config
```

Output **Figure 7-10: Example output from the show running-config command**

```

Related Commands **copy running-config**
show running-config

show running-config full

Use this command to show the complete status and configuration of the running system.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show running-config full`

Mode Privileged Exec and Global Configuration

Example To display the complete status and configuration of the running system, use the command:

```
awplus# show running-config full
```

Related Commands **copy running-config**
show running-config

show running-config interface

This command displays the current configuration of one or more interfaces on the switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show running-config interface [<interface-list>]
   [dot1x|ip igmp|ip multicast|ip pim dense-mode|ip pim sparse-mode|
   ipv6 rip|lacp|mstp|ospf|rip|rstp|stp]
```

Parameter	Description
<interface-list>	The interfaces or ports to display information about. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.1.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.1.1-1.1.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.1.1,port1.1.8-1.1.24`. Do not mix interface types in a list The specified interfaces must exist.
`dot1x`	Displays running configuration for 802.1X port authentication for the specified interfaces.
`lacp`	Displays running configuration for LACP (Link Aggregation Control Protocol) for the specified interfaces.
`ip igmp`	Displays running configuration for IGMP (Internet Group Management Protocol) for the specified interfaces.
`ip multicast`	Displays running configuration for general multicast settings for the specified interfaces.
`ip pim sparse-mode`	Displays running configuration for PIM-SM (Protocol Independent Multicast - Sparse Mode) for the specified interfaces.
`ip pim dense-mode`	Displays running configuration for PIM-DM (Protocol Independent Multicasting - Dense Mode) for the specified interfaces.
`mstp`	Displays running configuration for MSTP (Multiple Spanning Tree Protocol) for the specified interfaces.
`ospf`	Displays running configuration for OSPF (Open Shortest Path First) for the specified interfaces.
`rip`	Displays running configuration for RIP (Routing Information Protocol) for the specified interfaces.
`ipv6 rip`	Displays running configuration for RIPng (RIP for IPv6) for the specified interfaces.

Parameter	Description
rstp	Displays running configuration for RSTP (Rapid Spanning Tree Protocol) for the specified interfaces.
stp	Displays running configuration for STP (Spanning Tree Protocol) for the specified interfaces.

Mode Privileged Exec and Global Configuration

Examples To display the current running configuration of your switch for ports 1 to 24, use the command:

```
awplus# show running-config interface port1.0.1-port1.0.24
```

To display the current running configuration of a switch for VLAN 1, use the command:

```
awplus# show running-config interface vlan1
```

To display the current running configuration of a switch for VLANs 1 and 3-5, use the command:

```
awplus# show running-config interface vlan1,vlan3-vlan5
```

To display the current OSPF configuration of your switch for ports 1 to 24, use the command:

```
awplus# show running-config interface port1.0.1-port1.0.24
       ospf
```

Output **Figure 7-15: Example output from a show running-config interface port1.0.2 command**

```

Use this command to show the running system status and configuration details for IPv6 prefix lists.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show running-config ipv6 prefix-list
```

Mode

Privileged Exec and Global Configuration

Example

To display show the running system status and configuration details for IPv6 prefix lists, use the command:

```
awplus# show running-config ipv6 prefix-list
```

Output

Figure 7-22: Example output from the show running-config ipv6 prefix-list command

```
!
ipv6 prefix-list sde seq 5 permit any
!
```

Related Commands

copy running-config
show running-config

show running-config ipv6 route

Use this command to show the running system static IPv6 route configuration.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show running-config ipv6 route
```

Mode

Privileged Exec and Global Configuration

Example

To display the running system static IPv6 route configuration, use the command:

```
awplus# show running-config ipv6 route
```

Output

Figure 7-23: Example output from the show running-config ipv6 route command

```
!
ipv6 route 3e11::/64 lo
ipv6 route 3e11::/64 vlan2
ipv6 route fe80::/64 vlan3
!
```

Related Commands

copy running-config
show running-config

show running-config key chain

Use this command to show the running system key-chain related configuration.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show running-config key chain
```

Mode

Privileged Exec and Global Configuration

Example

To display the running system key-chain related configuration, use the command:

```
awplus# show running-config key chain
```

Output

Figure 7-24: Example output from the show running-config key chain command

```
!
key chain 12
key 2
key-string 234
!
key chain 123
key 3
key-string 345
!
```

Related Commands

copy running-config
show running-config

show running-config lldp

This command shows the current running configuration of LLDP.

Syntax `show running-config lldp`

Mode Privileged Exec and Global Configuration

Example To display the current configuration of LLDP, use the command:

```
awplus# show running-config lldp
```

Output **Figure 7-25: Example output from the show running-config lldp command**

```
awplus#show running-config lldp

lldp notification-interval 10
lldp timer 20
!
interface port1.0.1
 lldp notifications
 lldp tlv-select port-description
 lldp tlv-select system-name
 lldp tlv-select system-description
 lldp tlv-select management-address
 lldp transmit receive
```

Related Commands **show lldp**
show lldp interface

show running-config prefix-list

Use this command to show the running system status and configuration details for prefix-list.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show running-config prefix-list
```

Mode

Privileged Exec and Global Configuration

Example

To display the running system status and configuration details for prefix-list, use the command:

```
awplus# show running-config prefix-list
```

Output

Figure 7-26: Example output from the show running-config prefix-list command

```
!
ip prefix-list abc seq 5 permit any
ip prefix-list as description annai
ip prefix-list wer seq 45 permit any
!
```

Related Commands

copy running-config
show running-config

show running-config power-inline

Use this command to show the Power over Ethernet (PoE) running system status and configuration details. The PoE usage-threshold percentage as specified by the **power-inline usage-threshold** command is displayed in the **running-config** using this command.

See **Chapter 24, Power over Ethernet Introduction** and **Chapter 25, Power over Ethernet Commands** for more information about PoE.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show running-config power-inline
```

Mode

Privileged Exec and Global Configuration

Example

To display the PoE running system status and configuration details, use the command:

```
awplus# show running-config power-inline
```

Output

Figure 7-27: Example output from the show running-config power-inline command

```
!
power-inline usage-threshold 90
!
```

Related Commands

power-inline usage-threshold
show power-inline

show running-config route-map

Use this command to show the running system status and configuration details for route-map.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show running-config route-map
```

Mode

Privileged Exec and Global Configuration

Example

To display the running system status and configuration details for route-map, use the command:

```
awplus# show running-config route-map
```

Output

Figure 7-28: Example output from the show running-config route-map command

```
!
route-map abc deny 2
match community 2
!
route-map abc permit 3
match route-type external type-2
set metric-type type-1
!
```

Related Commands

copy running-config
show running-config

show running-config router

Use the show running-config router command to display the current running configuration for a given router.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show running-config router <protocol>
```

Parameter	Description
<protocol>	ospf | rip |ipv6 rip | vrrp
bgp	Border Gateway Protocol (BGP)
ospf	Open Shortest Path First (OSPF)
rip	Routing Information Protocol (RIP)
ipv6 rip	IPv6 RIP
vrrp	Virtual Redundancy Routing Protocol (VRRP)

Mode Privileged Exec and Global Configuration

Example To display the current running configuration for a given router, use the command:

```
awplus# show running-config router ospf
```

Output **Figure 7-29: Example output from the show running-config router command**

```
!
router ospf
 network 192.168.1.0/24 area 0.0.0.0
 network 192.168.3.0/24 area 0.0.0.0
!
```

Related Commands **copy running-config**
show running-config

show running-config router-id

Use this command to show the running system global router ID configuration.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show running-config router-id`

Mode Privileged Exec and Global Configuration

Example To display the running system global router ID configuration, use the command:

```
awplus# show running-config router-id
```

Output **Figure 7-30: Example output from the show running-config router-id command**

```
!
router-id 3.3.3.3
!
```

Related Commands **copy running-config**
show running-config

show running-config security-password

This command displays the configuration settings for the various security-password rules. If a default parameter is used for a security-password rule, therefore disabling that rule, no output is displayed for that feature.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show running-config security-password
```

Mode

Privileged Exec and Global Configuration

Example

To display the current security-password rule settings in the running-config, use the command:

```
awplus# show running-config security-password
```

Output

Figure 7-31: Example output from the show running-config security-password command

```
security-password minimum-length 8
security-password minimum-categories 3
security-password history 4
security-password lifetime 30
security-password warning 3
security-password forced-change
```

Related Commands

show security-password configuration
show security-password user

show startup-config

This command displays the contents of the start-up configuration file, which is the file that the device runs on start-up.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show startup-config`

Mode Privileged Exec

Example To display the contents of the current start-up configuration file, use the command:

```
awplus# show startup-config
```

Output **Figure 7-32: Example output from the show startup-config command**

```
awplus#show startup-config
!
service password-encryption
!
username manager privilege 15 password 8 $1$bJoVec4D$JwOJGPr7YqoExA0GVasdE0
!
no service ssh
!
service telnet
!
service http
!
no clock timezone
.
.
.
line con 0
line vty 0 4
!
end
```

Related Commands
boot config-file backup

show version

This command displays the version number and copyright details of the current AlliedWare Plus™ OS your device is running.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show version`

Mode User Exec and Privileged Exec

Example To display the version details of your currently installed software, use the command:

```
awplus# show version
```

Output **Figure 7-33: Example output from the show version command**

```
awplus#show version

write terminal

This command displays the current configuration of the device. This command is a synonym of the **show running-config** command.

Syntax `write terminal`

Mode Privileged Exec

Example To display the current configuration of your device, use the command:

```
awplus# write terminal
```

Related Commands **show running-config**

Chapter 8: Licensing Introduction and Configuration

Introduction

Licensing

Allied Telesis devices running AlliedWare Plus software can have base and feature software licensing. These licenses enable default and additional software features.

A base license enables default software features. The default features are determined by region. The region is shown as the OEM Territory in console output.

Feature license keys enable additional software features not included with a base license.

Feature licenses are used to run advanced features, such as Layer 3 routing and IPv6 protocols.

See **Licensing Terminology** for definitions of licensing terms used through this chapter.

About licensing VCStack

In order for a stack to form, each switch in the stack needs to be running the same version of a software release.

Switches will not form a stack unless they have exactly the same features licensed and activated. Switches with different OEM Territories may not form a stack, because features may vary by OEM Territory.

For step-by-step instructions for licensing on stacked switches, see the section **VCStack Licensing Configuration**.

Licensing Terminology

See the below table for descriptions of Licensing terms used through this chapter:

Term	Description
Activation	A process by which a feature is enabled. A set of base features is available on a given device. Activated devices do not show console or log messages requesting activation. Unlicensed devices display console messages requesting activation and are unsupported.
Feature	A software feature or protocol that is enabled with a valid software license. A software feature license key enables a feature on a device. A license is valid if it is appropriate for a software feature or protocol. For example, an IPv6 feature license will only enable IPv6 not ESPR.
License	A software object that enables features on a device. A license is a combination of an identifying license label and a license key.
License Key	An encrypted string of characters associated with a particular license that when added to a device enable a feature on the device.
License Label	A descriptive name associated with a license. This name may be chosen by a user, though license generation provides a default label for each license. This may also be called a license name.

Applying a new feature license on a stand-alone switch

Feature licenses are applied with the **license** command and validated with the **show license** and **show license brief** commands. Follow these steps to apply feature licenses:

- **Purchase a feature license for a switch**
- **Apply a feature license on a switch**
- **Confirm feature license application on a switch**

Step 1: Purchase a feature license for a switch

Purchase a feature license from your authorized distributor or reseller.

See the AlliedWare Plus datasheet for a list of licenses available by device.

Step 2: Apply a feature license on a switch

Use the **license** command to apply a feature license to your switch.

Note that if the feature license contains a license for a protocol, then that protocol will restart. This action may result in the loss of network traffic. We advise that you should only install licenses during scheduled maintenance for devices operating in a live environment. When you add a feature license you are warned on the console before that feature restarts.

Step 3: Confirm feature license application on a switch

On a stand-alone switch, use the commands **show license** or **show license brief** to confirm feature license application.

AlliedWare Plus switches and chassis have a base feature license applied, which is shown in **show license** and **show license brief** command output.

Figure 8-1: Example show license brief command output showing a base feature license:

```
awplus#show license brief

OEM Territory : ATI USA
Software Licenses
-------------------------------------------------------------------------
1     Base License    1            Base License
      Full                         N/A

Current enabled features for displayed licenses:
 EPSR-MASTER, IPv6Basic, LAG-FULL, MLDSnoop, OSPF-64, RADIUS-100, RIP, VRRP
```

.

VCStack Licensing Configuration

This section describes licensing configuration for stacked switches. Stacking requires all switches that form a stack to have matching feature licenses. A stack that does not meet this requirement is an unbalanced stack, and an unbalanced stack will not form on reboot. Perform the following tasks to modify a stack:

- **Adding a new switch to a VCStack**
- **Adding a new feature license to a VCStack**

See the **VCStack Introduction** chapter section **Stack Formation** for stack formation information, and see section **VCStack Introduction** for stacking overview information.

Note that to maintain consistent behavior across the stack, all member switches must have the same licenses enabled.

Adding a new switch to a VCStack

Follow this section to add a new switch to a VCStack. If you need to add a new feature to an existing VCStack then follow the section **Adding a new feature license to a VCStack**.

The same feature licenses that are applied to the existing stack members must be applied to a new switch. This section assumes a new switch is installed, but it is not licensed.

Perform the following tasks to add a new switch to a VCStack:

- **Apply a feature license to a VCStack**
- **Obtain license information from a new switch**
- **Apply the feature licenses to the new switch**
- **Connect the new switch to the stack and reboot the new switch**

Step 1: Obtain existing VCStack license information

Use the **show license member all** command to display full list output of all licenses per stack member. Use the **show license brief member all** command for brief table output per stack member.

Note that the **show license** command will display licenses applied to a stack master only. If there is an existing stack, then the master and the members will all have the same feature licenses.

Step 2: Obtain license information from a new switch

Use the **show license** command to display full output of licenses applied to the new switch. Use the **show license brief** command to display brief table output instead of full list output.

Step 3: Apply the feature licenses to the new switch

Use the **license** command to apply the required feature licenses to the new switch.

Figure 8-2: Example license command entry to add a feature license to a member:

```
awplus#license IPv6 Qd0NvZJ8DutyLAYbsM8pCpY1d8Ho9mzygweBp+paBqVu7By1bTZ+Jipo57
A restart of affected modules may be required.
Would you like to continue? (y/n): y

Stack member 1 installed 1 license

1 license installed.
```

Step 4: Connect the new switch to the stack and reboot the new switch

Use either the **reboot** command or the **reload** command to reboot the new switch. The stack will form on reboot with matching feature licenses on all stack members.

Figure 8-3: Example reboot entry output showing a valid license console message:

```
reboot system? (y/n): y

URGENT: broadcast message:
System going down IMMEDIATELY!

        ... Rebooting at user request ...

```

If feature licenses differ between stack members the stack will not form and the new switch will become a disabled master. See the **Disabled Master** section in the **VCStack Introduction** chapter for further information.

See console messages displayed at startup indicating disabled master and stack formation.

Figure 8-4: Example startup indicating the disabled master and no stack formation:

```
12:37:06 awplus-2 VCS[1869]: Stack Virtual MAC is 0000.cd37.01e0
12:37:16 awplus-2 VCS[1869]: Software feature licensing incompatible, Member 2
will boot as a standalone system.
12:37:16 awplus-2 VCS[1869]: Member 2 (eccd.6d5a.b85a) has become the Disabled
Master
12:37:16 awplus VCS[1869]: Member 1 (eccd.6d48.e560) has left the stack
12:37:16 awplus VCS[1869]: Member 3 (eccd.6d5e.2614) has left the stack
```

See the **show stack** output for the disabled master without stack formation

Figure 8-5: Example show stack output for disabled master without stack formation:

```
awplus#show stack
Virtual Chassis Stacking summary information

ID    Pending ID  MAC address         Priority  Status  Role
1     -           -                   -         -       Provisioned
2     -           eccd.6d5a.b85a      128       Ready   Disabled Master
3     -           -                   -         -       Provisioned

Operational Status                 Operating in failover mode
Stack MAC address                  eccd.6d5a.b85a
```

If there is a feature license mismatch then wait until the new switch boots and becomes a disabled master. Login to the disabled master and repeat this procedure to apply the feature license to it.

Adding a new feature license to a VCStack

Follow this section to add a new feature license to a VCStack. If you need to add a new switch to a VCStack then follow the section **Adding a new switch to a VCStack**.

Perform the following tasks to add a new feature license to a VCStack:

- **Apply a feature license to a VCStack**
- **Reboot the stack**

Step 1: Apply a feature license to a VCStack

Use the **license** command to apply the required feature license to the VCStack. In a stacked configuration, the **license** command will add a license to all stack members and the **no license** command will remove a license from all stack members.

Previously, feature licenses were applied to each stack member using the **license member** command. Since version 5.4.4, the **license** command applies feature licenses to all stack members. You do not need to use the **remote-login** command to login to stack members from a master.

Figure 8-6: Example license command entry to add a feature license to a member:

```
awplus#license IPv6 Qd0NvZJ8DutyLAYbsM8pCpY1d8Ho9mzygweBp+paBqVu7By1bTZ+Jipo57
A restart of affected modules may be required.
Would you like to continue? (y/n): y

Stack member 1 installed 1 license

1 license installed.
```

Step 2: Reboot the stack

Use either the **reboot** command or the **reload** command to reboot the stack after the feature has restarted on all stack members. The stack will form on reboot with matching feature licenses on all stack members. Note this is optional, but it is good practice to check the stack.

Figure 8-7: Example reboot entry output showing a valid license console message:

```
reboot system? (y/n): y

URGENT: broadcast message:
System going down IMMEDIATELY!

        ... Rebooting at user request ...

Flushing file system buffers...
Unmounting any remaining filesystems...
Restarting system.

Bootloader 2.0.13 loaded
Press <Ctrl+B> for the Boot Menu

Verifying release... OK
Booting...
Starting base/first...                                  [  OK  ]
Mounting virtual filesystems...                         [  OK  ]

          _________________  ____
        /\ \               / /_______\

12:37:16 awplus VCS[1869]: Member 3 (eccd.6d5e.2614) has left the stack
```

See the **show stack** output for the disabled master without stack formation

Figure 8-9: Example show stack output for disabled master without stack formation:

```
awplus#show stack
Virtual Chassis Stacking summary information

ID    Pending ID  MAC address         Priority  Status  Role
1     -           -                   -         -       Provisioned
2     -           eccd.6d5a.b85a      128       Ready   Disabled Master
3     -           -                   -         -       Provisioned

Operational Status                 Operating in failover mode
Stack MAC address                  eccd.6d5a.b85a
```

Login to the disabled master and repeat this procedure to apply the feature license to it.

Chapter 9: Licensing Commands

Command List

This chapter provides an alphabetical reference for each of the License commands.

license

This command activates the licensed software feature set on a standalone switch, or a stack of switches.

Use the **no** variant of this command to deactivate the licensed software feature set on a standalone switch, or a stack of switches.

For feature licenses, contact your authorized distributor or reseller. If a license key expires or is incorrect so the license key is invalid, then some software features will be unavailable.

Note

See the AlliedWare Plus™ datasheet for a list of current feature licenses available by product, and the AlliedWare Plus™ How To notes for information on obtaining them. Purchase licenses from your authorized dealer or reseller.

Only install feature licences during scheduled maintenance for any devices in a live environment. For example, if a feature license includes EPSR, EPSR is restarted with a temporary loss of EPSR network traffic.

Syntax

```
license <label> <key>
no license <label>
```

Parameter	Description
<label>	A name for the feature license. To determine names already in use, use the **show license** command. This can be the default name supplied for the feature, or a renamed feature name.
<key>	The encrypted license key to enable a set of software features.

Mode Privileged Exec

Usage You can change the license label using this command to make it specific to you when you initially add a license. Once a license is added, any change to the license label first requires removal of the license before adding a license again with a new license label .

The default feature license labels are issued along with encrypted license keys by e-mail for you to apply using this command to activate features. You can change default feature license labels, but they must be 15 characters or less to be accepted with the issued keys.

For example, you may want to change the label of the premium license to “premium-license”. You can check your new license label by using the **show license** command.

In a stacked configuration, the **license** command will add a license to all stack members and the **no license** command will remove a license from all stack members.

You can add a license to a specified stack member after first using the **remote-login** command from the stack master. Adding or deleting licenses on individual switches can cause different members of the stack to have different features enabled, which may cause the stack to fail to operate correctly. Unbalanced stack members will not form a stack. Stack members require the same feature licenses to be balanced.

If you add a feature license you will be prompted at the console that the feature needs to restart. For example, if the feature license contains a license for the EPSR protocol, then that protocol will restart. This action may result in the loss of network traffic. Only install licenses in scheduled maintenance periods for devices in a live environment.

Note that operating the following features require an x510 Premium License (AT-FL-x510-01):

- RIP
- OSPF
- PIMv4-SM, DM, & SSM
- EPSR Master
- VLAN Double Tagging (Q in Q)
- RIPng
- OSPFv3
- MLDv1 & v2
- PIMv6-SM

Examples To activate the license `name1` with the key `12345678ABCDE123456789ABCDE`, use the command:

```
awplus# license name1 12345678ABCDE123456789ABCDE
```

To deactivate the license `name1`, use the command:

```
awplus# no license name1
```

Output **Figure 9-1: Example license command entry to remove a feature license:**

```
awplus#no license IPv6
Stack member 1: Removal of "IPv6" will disable the following features:
 IPv6

INFO: Uninstalling license key will disable the affected modules immediately.
Would you like to continue? (y/n): y

Stack member 1 removed 1 license

1 license removed.
```

Validation Command **show license**

license member (deleted)

This command has been deleted. Use the **license** command to apply licenses to members

In a stacked configuration, the **license** command will add a license to all stack members and the **no license** command will remove a license from all stack members.

show license

This command displays information about a specific software feature license, or all enabled software feature licenses on the device.

Syntax `show license [feature] [<label>|index <index-number>]`

Parameter	Description
`feature`	Only display license information for any applied feature licenses.
`<label>`	The license name of the software feature to show information about. The license name can be used instead of the index number to identify a specific license.
`index <index-number>`	The index number of the software feature license to show information about. The index number can be used instead of the license name to identify a specific license.

Mode User Exec and Privileged Exec

Usage In a stacked configuration, use the **show license member** command to display license information about either a specific licensed software feature, or all software feature enabled on a specific stack member or on all stack members.

Note that the **show license** command will display licenses applied to a stack master only.

Examples To display full information about all enabled licenses, use the command:

```
awplus# show license
```

To display full information about the licenses with index number 1, use the command:

```
awplus# show license index 1
```

Output **Figure 9-2: Example output from the show license command showing a base license with index 1:**

```
awplus#show license
OEM Territory : ATI Europe
Software Licenses
------------------------------------------------------------------------
Index                          : 1
License name                   : Base License
Customer name                  : Base License
Quantity of licenses           : 1
Type of license                : Full
License issue date             : 12-Dec-2013
License expiry date            : N/A
Features included              : IPv6Basic, LAG-FULL, MLDSnoop, RADIUS-100, VCS,
                                 VRRP
```

Table 9-1: Parameters in the output of the show license command:

Parameter	Description
`OEM Territory`	Name of the region for the Base License features.
`Index`	Index identifying entry. The index is assigned automatically by the software. It is not configured.
`License name`	Name of the license key bundle (case-sensitive).
`Customer name`	Customer name.
`Quantity of licenses`	Quantity of licensed installations.
`Type of license`	Full or Trial.
`License issue date`	Date the license was generated.
`License expiry date`	Expiry date for trial license.
`Features included`	List of features included in the feature license.

Related Commands

license
show license brief
show license member

show license brief

This command displays information about a specific software feature license, or all enabled software feature licenses on the device.

In a stacked configuration, use the **show license member** command to display license information about either a specific licensed software feature, or all software feature licenses enabled on a specific stack member or on all stack members.

Syntax `show license [feature] [<label>|index <index-number>] brief`

Parameter	Description
`feature`	Only display license information for any applied feature licenses.
<label>	The license name of the software feature to show information about. The license name can be used instead of the index number to identify a specific license.
`index` *<index-number>*	The index number of the software feature license to show information about. The index number can be used instead of the license name to identify a specific license.
`brief`	Displays a brief summary of feature license information.

Mode User Exec and Privileged Exec

Examples To display a brief summary of information about all feature licenses, use the command:

```
awplus# show license feature brief
```

Output **Figure 9-3: Example output from the show license brief command:**

```
awplus#show license brief
OEM Territory : ATI Europe
Software Licenses
-------------------------------------------------------------------------
Index License name    Quantity     Customer name
      Type            Version      Period
-------------------------------------------------------------------------
1     Base License    1            Base License
      Full                         N/A

Current enabled features for displayed licenses:
 IPv6Basic, LAG-FULL, MLDSnoop, RADIUS-100, VCS, VRRP
```

Table 9-2: Parameters in the output of the show license brief command:

Parameter	Description
`OEM Territory`	Name of the region for the Base License features.
`Index`	Index identifying entry. The index is assigned automatically by the software. It is not configured.
`License name`	Name of the license key bundle (case-sensitive).
`Quantity`	Quantity of licensed installations.
`Customer name`	Customer name.
`Type`	Full or Trial.
`Period`	Expiry date for trial license.
`Current enabled features for displayed licenses`	List of features included in the license.

Related Commands

license
show license
show license member

show license member

Use this command to display information about either a specific software license, or all software feature licenses enabled on either a specific stack member or all stack members.

Syntax `show license [<label>] member [<1-8>|all]`

Parameter	Description
<label>	The name of the license to show information about.
<1-8>	The ID of the stack member to show information about.
`all`	Display information about all stack members.

Mode User Exec and Privileged Exec

Usage Use the **show license member all** command to display full list output of all licenses per stack member.

Examples To display full information about all enabled licenses on all stack members, use the command:

```
awplus# show license member all
```

To display full information about all enabled licenses on stack member 2, use the command:

```
awplus# show license member 2
```

To display full information about the license `name1` on all stack members, use the command:

```
awplus# show license name1 member all
```

Output **Figure 9-4: Example output from the show license member command:**

```
awplus#show license member all
OEM Territory : ATI Europe
Software Feature Licenses
----------------------------------------------------------------------
Index                          : 1
License name                   : Base License
Customer name                  : Base License
Quantity of licenses           : 1
Type of license                : Full
License issue date             : 12-Dec-2013
License expiry date            : N/A
Features included              : IPv6Basic, LAG-FULL, MLDSnoop, RADIUS-100, VCS,
                                 VRRP

Index                          : 2
License name                   : PIM Trial
Customer name                  : PIM Trial
Quantity of licenses           : 10
Type of license                : 30 day trial
License issue date             : 12-Dec-2013
License expiry date            : 12-Dec-2013
Features included              : PIM PIM-100
```

Table 9-3: Parameters in the output of the show license member command:

Parameter	Description
`OEM Territory`	Name of the region for the Base License features.
`Index`	Index identifying entry. The index is assigned automatically by the software. It is not configured.
`License name`	Name of the license key bundle (case-sensitive).
`Customer name`	Customer name.
`Quantity of licenses`	Quantity of licensed installations.
`Type of license`	Full or Trial.
`License issue date`	Date the license was generated.
`License expiry date`	Expiry date for trial license.
`Features included`	List of features included in the license.

Related Commands

license
show license
show license brief member

show license brief member

Use this command to display information about either a specific software license, or all software feature licenses enabled on either a specific stack member or all stack members.

Syntax `show license [<label>] brief member [<1-8>|all]`

Parameter	Description
<label>	The name of the license to show information about.
`brief`	Display a brief summary of license information.
<1-8>	The ID of the stack member to show information about.
`all`	Display information about all stack members.

Mode User Exec and Privileged Exec

Usage Use the **show license brief member all** command for brief table output of all licenses per stack member.

Examples To display a brief summary of information about all enabled licenses on stack member 2, use the command:

```
awplus# show license brief member 2
```

To display a brief summary about all enabled licenses on all stack members, use the command:

```
awplus# show license brief member all
```

To display a brief summary about the license `name1` on all stack members, use the command:

```
awplus# show license name1 brief member all
```

Output **Figure 9-5: Example output from the show license brief member command:**

```
awplus#show license brief member 1
OEM Territory : ATI Europe
Software Licenses
-------------------------------------------------------------------------
1     Base License    1            Base License
      Full                         N/A

Current enabled features for displayed licenses:
 IPv6Basic, LAG-FULL, MLDSnoop, RADIUS-100, VCS, VRRP
```

Table 9-4: Parameters in the output of the show license brief member command:

Parameter	Description
`OEM Territory`	Name of the region for the Base License features.
`Index`	Index identifying entry. The index is assigned automatically by the software. It is not configured.
`License name`	Name of the license key bundle (case-sensitive).
`Quantity`	Quantity of licensed installations.
`Customer name`	Customer name.
`Type`	Full or Trial.
`Period`	Expiry date for trial license.
`Current enabled features for displayed licenses`	List of features included in the license.

Chapter 10: System Configuration and Monitoring Commands

Command List

This chapter provides an alphabetical reference of commands for configuring and monitoring the system.

banner exec

This command configures the User Exec mode banner that is displayed on the console after you login. The **banner exec default** command restores the User Exec banner to the default banner. Use the **no banner exec** command to disable the User Exec banner and remove the default User Exec banner.

Syntax

```
banner exec <banner-text>
banner exec default
no banner exec
```

Default By default, the AlliedWare Plus™ version and build date is displayed at console login, such as:

```
AlliedWare Plus (TM) 5.4.1 07/27/10 00:44:25
```

Mode Global Configuration

Examples To configure a User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner exec enable to move to Priv Exec mode
awplus(config)#exit
awplus#exit

awplus login: manager
Password:
enable to move to Priv Exec mode
awplus>
```

To restore the default User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner exec default
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.4.1 11/14/10 13:03:59

awplus>
```

To remove the User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal
awplus(config)#no banner exec
awplus(config)#exit
awplus#exit

awplus login: manager
Password:
awplus>
```

Related Commands **banner login (system)**
banner motd

banner login (system)

This command configures the login banner that is displayed on the console when you login. The login banner is displayed on all connected terminals. The login banner is displayed after the MOTD (Message-of-the-Day) banner and before the login username and password prompts.

Use the **no banner login** command to disable the login banner.

Syntax

```
banner login
no banner login
```

Default By default, no login banner is displayed at console login.

Mode Global Configuration

Examples To configure a login banner to be displayed when you login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner login
Type CNTL/D to finish.
authorised users only
awplus(config)#exit
awplus#exit

authorised users only
awplus login: manager
Password:

AlliedWare Plus (TM) 5.4.1 11/14/10 13:03:59

awplus>
```

To remove the login banner, enter the following commands:

```
awplus#configure terminal
awplus(config)#no banner login
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

awplus>
```

Related Commands **banner exec**
banner motd

banner motd

Use this command to change the text MOTD (Message-of-the-Day) banner displayed before login. The MOTD banner is displayed on all connected terminals. The MOTD banner is useful for sending messages that affect all network users, for example, any imminent system shutdowns.

Use the **no** variant of this command to not display a text MOTD (Message-of-the-Day) banner on login.

Syntax

```
banner motd <motd-text>
no banner motd
```

Default By default, the switch displays the AlliedWare Plus™ OS version and build date before login.

Mode Global Configuration

Examples To configure a MOTD banner to be displayed when you login, enter the following commands:

```
awplus>enable
awplus#configure terminal
awplus(config)#banner motd system shutdown at 6pm
awplus(config)#exit
awplus#exit

system shutdown at 6pm
awplus login: manager
Password:

AlliedWare Plus (TM) 5.4.1 11/14/10 13:03:59
```

To remove the login banner, enter the following commands:

```
awplus>enable
awplus#configure terminal
awplus(config)#no banner motd
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.4.1 11/14/10 13:03:59

awplus>
```

Related Commands **banner exec**
banner login (system)

clock set

This command sets the time and date for the system clock.

Syntax `clock set <hh:mm:ss> <day> <month> <year>`

Parameter	Description
<hh:mm:ss>	Local time in 24-hour format
<day>	Day of the current month <1-31>
<month>	The first three letters of the current month.
<year>	Current year <2000-2035>

Mode Privileged Exec

Usage Configure the timezone before setting the local time. Otherwise, when you change the timezone, the device applies the new offset to the local time.

Note If Network Time Protocol (NTP) is enabled, then you cannot change the time or date using this command. NTP maintains the clock automatically using an external time source. If you wish to manually alter the time or date, you must first disable NTP.

Example To set the time and date on your system to 2pm on the 2nd of April 2007, use the command:

```
awplus# clock set 14:00:00 2 apr 2007
```

Related Commands clock timezone

clock summer-time date

This command defines the start and end of summertime for a specific year only, and specifies summertime's offset value to Standard Time for that year.

The **no** variant of this command removes the device's summertime setting. This clears both specific summertime dates and recurring dates (set with the **clock summer-time recurring** command on page 10.9).

By default, the device has no summertime definitions set.

Syntax

```
clock summer-time <timezone-name> date <start-day> <start-month>
   <start-year> <start-time> <end-day> <end-month> <end-year>
   <end-time> <1-180>

no clock summer-time
```

Parameter	Description
<timezone-name>	A description of the summertime zone, up to 6 characters long.
date	Specifies that this is a date-based summertime setting for just the specified year.
<start-day>	Day that the summertime starts, in the range 1-31.
<start-month>	First three letters of the name of the month that the summertime starts.
<start-year>	Year that summertime starts, in the range 2000-2035.
<start-time>	Time of the day that summertime starts, in the 24-hour time format HH:MM.
<end-day>	Day that summertime ends, in the range 1-31.
<end-month>	First three letters of the name of the month that the summertime ends.
<end-year>	Year that summertime ends, in the range 2000-2035.
<end-time>	Time of the day that summertime ends, in the 24-hour time format HH:MM.
<1-180>	The offset in minutes.

Mode Global Configuration

Examples To set a summertime definition for New Zealand using NZST (UTC+12:00) as the standard time, and NZDT (UTC+13:00) as summertime, with the summertime set to begin on the 1st October 2007 and end on the 18th of March 2008:

```
awplus(config)# clock summer-time NZDT date 1 oct 2:00 2007 18
                mar 2:00 2008 60
```

To remove any summertime settings on the system, use the command:

```
awplus(config)# no clock summer-time
```

Related Commands
clock summer-time recurring
clock timezone

clock summer-time recurring

This command defines the start and end of summertime for every year, and specifies summertime's offset value to Standard Time.

The **no** variant of this command removes the device's summertime setting. This clears both specific summertime dates (set with the **clock summer-time date** command on page 10.7) and recurring dates.

By default, the device has no summertime definitions set.

Syntax

```
clock summer-time <timezone-name> recurring <start-week> <start-day>
   <start-month> <start-time> <end-week> <end-day> <end-month>
   <end-time> <1-180>

no clock summer-time
```

Parameter	Description
<timezone-name>	A description of the summertime zone, up to 6 characters long.
`recurring`	Specifies that this summertime setting applies every year from now on.
<start-week>	Week of the month when summertime starts, in the range 1-5. The value 5 indicates the last week that has the specified day in it for the specified month. For example, to start summertime on the last Sunday of the month, enter **5** for *<start-week>* and **sun** for *<start-day>*.
<start-day>	Day of the week when summertime starts. Valid values are **mon**, **tue**, **wed**, **thu**, **fri**, **sat** or **sun**.
<start-month>	First three letters of the name of the month that summertime starts.
<start-time>	Time of the day that summertime starts, in the 24-hour time format HH:MM.
<end-week>	Week of the month when summertime ends, in the range 1-5. The value 5 indicates the last week that has the specified day in it for the specified month. For example, to end summertime on the last Sunday of the month, enter **5** for *<end-week>* and **sun** for *<end-day>*.
<end-day>	Day of the week when summertime ends. Valid values are **mon**, **tue**, **wed**, **thu**, **fri**, **sat** or **sun**.
<end-month>	First three letters of the name of the month that summertime ends.
<end-time>	Time of the day that summertime ends, in the 24-hour time format HH:MM.
<1-180>	The offset in minutes.

Mode Global Configuration

Examples To set a summertime definition for New Zealand using NZST (UTC+12:00) as the standard time, and NZDT (UTC+13:00) as summertime, with summertime set to start on the 1st Sunday in October, and end on the 3rd Sunday in March, use the command:

```
awplus(config)# clock summer-time NZDT recurring 1 sun oct 2:00
                3 sun mar 2:00 60
```

To remove any summertime settings on the system, use the command:

```
awplus(config)# no clock summer-time
```

Related Commands **clock summer-time date**
clock timezone

clock timezone

This command defines the device's clock timezone. The timezone is set as a offset to the UTC.

The **no** variant of this command resets the system time to UTC.

By default, the system time is set to UTC.

Syntax

```
clock timezone <timezone-name> {minus|plus} [<0-13>|<0-12>:<00-59>]
no clock timezone
```

Parameter	Description
<timezone-name>	A description of the timezone, up to 6 characters long.
`minus` or `plus`	The direction of offset from UTC. The **minus** option indicates that the timezone is behind UTC. The **plus** option indicates that the timezone is ahead of UTC.
<0-13>	The offset in hours or from UTC.
<0-12>:<00-59>	The offset in hours or from UTC.

Mode Global Configuration

Usage Configure the timezone before setting the local time. Otherwise, when you change the timezone, the device applies the new offset to the local time.

Examples To set the timezone to New Zealand Standard Time with an offset from UTC of +12 hours, use the command:

```
awplus(config)# clock timezone NZST plus 12
```

To set the timezone to Indian Standard Time with an offset from UTC of +5:30 hours, use the command:

```
awplus(config)# clock timezone IST plus 5:30
```

To set the timezone back to UTC with no offsets, use the command:

```
awplus(config)# no clock timezone
```

Related Commands
clock set
clock summer-time date
clock summer-time recurring

continuous-reboot-prevention

Use this command to enable and to configure the continuous reboot prevention feature. Continuous reboot prevention allows the user to configure the time period during which reboot events are counted, the maximum number of times the switch can reboot within the specified time period, referred to as the threshold, and the action to take if the threshold is exceeded.

Use the **no** variant of this command to disable the continuous reboot prevention feature or to return the **period**, **threshold** and **action** parameters to the defaults.

Syntax

```
continuous-reboot-prevention enable

continuous-reboot-prevention [period <0-604800>] [threshold <1-10>]
   [action [linkdown|logonly|stopreboot]]

no continuous-reboot-prevention enable

no continuous-reboot-prevention [period] [threshold] [action]}
```

Parameter	Description	
`enable`	Enable the continuous reboot prevention feature.	
`period`	Set the period of time in which reboot events are counted.	
	<0-604800>	Period value in seconds. The default is 600.
`threshold`	Set the maximum number of reboot events allowed in the specified period.	
	<1-10>	Threshold value. The default is 1.
`action`	Set the action taken if the threshold is exceeded.	
	`linkdown`	Reboot procedure continues and all switch ports and stack ports stay link-down. The reboot event is logged. This is the default action
	`logonly`	Reboot procedure continues normally and the reboot event is logged.
	`stopreboot`	Reboot procedure stops until the user enters the key "c" via the CLI. Normal reboot procedure then continues and the reboot event is logged.

Default Continuous reboot prevention is disabled by default. The default `period` value is `600`, the default `threshold` value is `1` and the default `action` is `linkdown`.

Mode Global Configuration

Examples To enable continuous reboot prevention, use the commands:

```
awplus# configure terminal
awplus(config)# continuous-reboot-prevention enable
```

To set the `period` to `500` and `action` to `stopreboot`, use the commands:

```
awplus# configure terminal
awplus(config)# continuous-reboot-prevention period 500
action stopreboot
```

To return the `period` and `action` to the defaults and keep the continuous reboot prevention feature enabled, use the commands:

```
awplus# configure terminal
awplus(config)# no continuous-reboot-prevention period action
```

To disable continuous reboot prevention, use the commands:

```
awplus# configure terminal
awplus(config)# no continuous-reboot-prevention enable
```

Related Commands

show continuous-reboot-prevention
show reboot history
show tech-support

ecofriendly led

Use this command to enable the eco-friendly LED (Light Emitting Diode) feature, which turns off power to the port LEDs, including the stack port status LEDs. Power to the system status, SD and stack management LEDs is not disabled.

Use the **no** variant of this command to disable the eco-friendly LED feature.

Syntax

```
ecofriendly led
no ecofriendly led
```

Default The eco-friendly LED feature is disabled by default.

Mode Global Configuration

Usage When the eco-friendly LED feature is enabled, a change in port status will not affect the display of the associated LED. When the eco-friendly LED feature is disabled and power is returned to port LEDs, the LEDs will correctly show the current state of the ports.

In a stack environment, enabling the eco-friendly LED feature on the stack master will apply the feature to every member of the stack.

For an example of how to configure a trigger to enable the eco-friendly LED feature, see **"Turn Off Power to Port LEDs" on page 102.7**. See also the section **"Save Power With the Eco-Friendly Feature" on page 1.31**.

Examples To enable the eco-friendly LED feature which turns off power to all port LEDs, use the following commands:

```
awplus# configure terminal
awplus(config)# ecofriendly led
```

To disable the eco-friendly LED feature, use the following command:

```
awplus# configure terminal
awplus(config)# no ecofriendly led
```

Related Commands

ecofriendly lpi
show ecofriendly

ecofriendly lpi

Use this command to conserve power by enabling the eco-friendly LPI (Low Power Idle) feature. This feature reduces the power supplied to the ports by the switch whenever the ports are idle and are connected to IEEE 802.3az Energy Efficient Ethernet compliant host devices. See the section **"Save Power With the Eco-Friendly Feature" on page 1.31**.

LPI is a feature of the IEEE 802.3az Energy Efficient Ethernet (EEE) standard. LPI lowers power consumption of switch ports during periods of low link utilization when connected to IEEE 802.3az compliant host devices. If no data is sent then the switch port can enter a sleep state, called Low Power Idle (LPI), to conserve power used by the switch.

Use the **no** variant of this command to disable the eco-friendly LPI feature.

Syntax

```
ecofriendly lpi
no ecofriendly lpi
```

Default The eco-friendly LPI feature is disabled by default.

Mode Interface Configuration for a switch port, or Interface Configuration for a range of switch ports.

Usage For an example of how to configure a trigger to enable the eco-friendly LPI feature, see **"Reduce Power Supplied to Ports" on page 102.9**.

All ports configured for LPI must support LPI in hardware and must be configured to auto negotiate by default or by using the **speed** and **duplex** commands as needed.

Examples To enable the eco-friendly LPI feature on a switch port, `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# ecofriendly lpi
```

To enable the eco-friendly LPI feature on a range of switch ports, `port1.0.2-port1.0.20`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.20
awplus(config-if)# ecofriendly lpi
```

To disable the eco-friendly feature on `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no ecofriendly lpi
```

To disable the eco-friendly feature on a range of switch ports, `port1.0.2-port1.0.20`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.20
awplus(config-if)# no ecofriendly lpi
```

findme

Use this command to physically locate a specific device from a group of similar devices. Activating the command causes a selected number of port LEDs to alternately flash green then amber (if that device has amber LEDs) at a rate of 1 Hz.

Use the **no** variant of this command to deactivate the Find Me feature prior to the timeout expiring.

Syntax

```
findme [interface <port-list>|member <stack-ID>] [timeout <duration>]
no findme
```

Parameter	Description
<port-list>	The ports to flash. The port list can be: ■ a switch port e.g. `port1.0.12` ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.1.1-1.2.24`.
<stack-ID>	Stack member number, from 1 to 8.
<duration>	Specify the duration in seconds within the range of 5-3600 seconds.

Default Flashes all port LEDs for 60 seconds.

Mode Privileged Exec

Usage Running the **findme** command causes the device's port LEDs to flash. An optional **timeout** parameter specifies the flash behavior duration. Normal LED behavior is restored automatically after either the default time, or a specified time has elapsed, or a **no findme** command is used. You can specify which interface or interfaces are flashed with the optional **interface** parameter.

You can specify a particular stack member with the optional **member** parameter. All available interfaces are flashed by default.

Note The **interface** and **member** parameters are mutually exclusive.

Example To activate the Find Me feature for the default duration on all ports, use the following command:

```
awplus# findme
```

To activate the Find Me feature for 120 seconds on all ports, use the following command:

```
awplus# findme timeout 120
```

To activate the Find Me feature for the default duration on switch port interfaces `port1.0.2` through `port1.0.12`, use the following command:

```
awplus# findme interface port1.0.2-1.0.12
```

In the example above, ports 2 to 12 will flash 4 times and then all ports will flash twice. Each alternate flash will be amber (if that device has amber LEDs). This pattern will repeat until **timeout** or **no findme** commands are used.

To deactivate the Find Me feature, use the following command:

```
awplus# no findme
```

To activate the Find Me feature for the default duration on stack member 2, use the following command:

```
awplus# findme member 2
```

In the example above, all ports on member 2 will flash 4 times and then all ports in the stack will flash twice. Each alternate flash will be amber (if that device has amber LEDs). This pattern will repeat until the **timeout** expires or the **no findme** commands is used.

hostname

This command sets the name applied to the device as shown at the prompt. The hostname is:

- displayed in the output of the **show system** command
- displayed in the CLI prompt so you know which device you are configuring
- stored in the MIB object sysName

On a stack, after the stack master is elected, the master will have a host name: `awplus` by default, and this also becomes the name of the stack. Individual stack members (excluding the master) will have a host name that is the stack name hyphenated with a numeric suffix. For example, `awplus-1`, `awplus-2` and so on.

The hostname command can then be used to change the stack name and the stack master's host name. For example, for the hostname `Lab` the stack master's host name will be `Lab` and the other stack members will have host names `Lab-1`, `Lab-2` and so on.

In case of stack master fail-over, or stack split, the new stack will use the previous stack name as its host name and the stack name, unless it is changed by executing the hostname command on the new stack master.

Use the **no** variant of this command to revert the hostname setting to its default (`awplus`).

Syntax

```
hostname <hostname>
no hostname [<hostname>]
```

Parameter	Description
<hostname>	Specifies the name given to a specific switch. Also referred to as the Node Name in ATMF output screens.

Default `awplus`

Mode Global Configuration

Usage The name must also follow the rules for ARPANET host names. The name must start with a letter, end with a letter or digit, and use only letters, digits, and hyphens. Refer to RFC 1035.

Note

Within an ATMF network, any switch without a hostname applied will automatically be assigned a name based on its MAC address.

To efficiently manage your network using ATMF, we strongly advise that you devise a naming convention for your network switches and accordingly apply an appropriate hostname to each switch.

Example To set the system name to `HQ-Sales`, use the command:

```
awplus# configure terminal
awplus(config)# hostname HQ-Sales
```

This changes the prompt to:

```
awplusHQ-Sales(config)#
```

To revert to the default hostname `awplus`, use the command:

```
HQ-Sales(config)#no hostname
```

This changes the prompt to:

awplus(config)#

Note When ATMF is configured, running the **no hostname** command will apply a hostname that is based on the MAC address of the switch node. For example, **node_0016_76b1_7a5e**.

Related Commands **show system**

max-fib-routes

This command enables you to control the maximum number of FIB routes configured. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds. The operation of these parameters is explained in the Parameter / Descriptions table shown below

Note To set static routes, use the **max-static-routes** command on page 10.23.

Use the **no** variant of this command to set the maximum number of fib routes to the default of 4294967294 fib routes.

Syntax `max-fib-routes <1-4294967294> [<1-100>|warning-only]`

no max-fib-routes

Parameter	Description
`max-fib-routes`	This is a the maximum number of routes that can be stored in the switch's Forwarding Information dataBase. In practice, other practical system limits would prevent this maximum being reached.
<1-4294967294>	The allowable configurable range for setting the maximum number of FIB-routes.
<1-100>	This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached.
`warning-only`	This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value is reached. Routes can continue to be added until your switch reaches either the maximum capacity value of 4294967294, or a practical system limit.

Default The default number of fib routes is the maximum number of fib routes (4294967294).

Mode Global Configuration

Examples To set the maximum number of dynamic routes to 2000 and warning threshold of 75%, use the following commands:

```
awplus# config terminal
awplus(config)# max-fib-routes 2000 75
```

max-static-routes

Use this command to set the maximum number of static routes, excluding FIB (Forwarding Information Base) routes. Note that FIB routes are set and reset using **max-fib-routes**.

Use the **no** variant of this command to set the maximum number of static routes to the default of 1000 static route

.

Note To set dynamic FIB routes, use the **max-fib-routes** command on page 10.22.

Syntax

```
max-static-routes <1-1000>
no max-static-routes
```

Default The default number of static routes is the maximum number of static routes (1000).

Mode Global Configuration

Example To reset the maximum number of static routes to the default maximum, use the command:

```
awplus# configure terminal
awplus(config)# no max-static-routes
```

Note Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

Related Commands max-fib-routes

no debug all

This command disables the debugging facility for all features on your device. This stops the device from generating any diagnostic debugging messages.

The debugging facility is disabled by default.

Syntax `no debug all [dot1x|ipv6|nsm|ospf|vrrp]`

Parameter	Description
`dot1x`	Turns off all debugging for IEEE 802.1X port-based network access-control.
`ipv6`	Turns off all debugging for IPv6 (Internet Protocol version 6).
`nsm`	Turns off all debugging for the NSM (Network Services Module).
`ospf`	Turns off all debugging for OSPF (Open Path Shortest First).
`vrrp`	Turns off all debugging for VRRP (Virtual Router Redundancy Protocol).

Mode Global Configuration and Privileged Exec

Example To disable debugging for all features, use the command:

```
awplus# no debug all
```

To disable all 802.1X debugging, use the command:

```
awplus# no debug all
```

To disable all IPv6 debugging, use the command:

```
awplus# no debug all
```

To disable all NSM debugging, use the command:

```
awplus# no debug all
```

To disable all OSPF debugging, use the command:

```
awplus# no debug all ospf
```

To disable all VRRP debugging, use the command:

```
awplus# no debug all vrrp
```

Related Commands **undebug all**

reboot

This command halts the device and performs a cold restart (also known as reload). It displays a confirmation request before restarting.

You can reboot a stand-alone device, a stack, or a specified stack member.

Syntax

```
reboot <stack-ID>
reload <stack-ID>
reboot
reload
```

Mode Privileged Exec

Usage The **reboot** and **reload** commands perform the same action.

When restarting the whole stack, you can either use this **reboot** command to reboot all stack members immediately, or to minimize downtime, reboot the stack members in a rolling sequence by using the **reboot rolling** command on page 109.5.

Examples To restart the stand-alone device, use the command:

```
awplus# reboot
      reboot system? (y/n): y#
```

To restart all devices in the stack, use the command:

```
awplus# reboot
      Are you sure you want to reboot the whole stack? (y/n):# y
```

To restart stack member 3, use the command:

```
awplus# reboot stack-member 3
      reboot stack-member 3 system? (y/n):# y
```

If the specified stack member ID does not exist in the current stack, the command is rejected.

Related Commands

reboot rolling
reload rolling

reload

This command performs the same function as the **reboot** command on page 10.25.

show clock

This command displays the system's current configured local time and date. It also displays other clock related information such as timezone and summertime configuration.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show clock`

Mode User Exec and Privileged Exec

Example To display the system's current local time, use the command:

```
awplus# show clock
```

Output **Figure 10-1: Example output from the show clock command for a switch using New Zealand time**

```
Local Time: Mon,  6 Aug 2007 13:56:06 +1200
UTC Time:   Mon,  6 Aug 2007 01:56:06 +0000
Timezone: NZST
Timezone Offset: +12:00
Summer time zone: NZDT
Summer time starts: Last Sunday in September at 02:00:00
Summer time ends: First Sunday in April at 02:00:00
Summer time offset: 60 mins
Summer time recurring: Yes
```

Table 10-1: Parameters in the output of the show clock command

Parameter	Description
`Local Time`	Current local time.
`UTC Time`	Current UTC time.
`Timezone`	The current configured timezone name.
`Timezone Offset`	Number of hours offset to UTC.
`Summer time zone`	The current configured summertime zone name.
`Summer time starts`	Date and time set as the start of summer time.
`Summer time ends`	Date and time set as the end of summer time.
`Summer time offset`	Number of minutes that summer time is offset from the system's timezone.
`Summer time recurring`	Whether the device will apply the summer time settings every year or only once.

Related Commands
clock set
clock summer-time date
clock summer-time recurring
clock timezone

show continuous-reboot-prevention

This command displays the current continuous reboot prevention configuration.

Syntax `show continuous-reboot-prevention`

Mode User Exec and Privileged Exec

Examples To show the current continuous reboot prevention configuration, use the command:

```
awplus# show continuous-reboot-prevention
```

Output **Figure 10-2: Example output from the show continuous-reboot-prevention command**

```
-------------------------------------------
Continuous reboot prevention
-------------------------------------------
status=disabled
period=600
threshold=1
action=linkdown
-------------------------------------------
```

Related Commands **continuous-reboot-prevention**
show reboot history

show cpu

This command displays a list of running processes with their CPU utilization.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show cpu [<stack-ID>] [sort {thrds|pri|sleep|runtime}]`

Parameter	Description	
<stack-ID>	Stack member number, from 1 to 8.	
`sort`	Changes the sorting order using the following fields. If you do not specify a field, then the list is sorted by percentage CPU utilization.	
	`thrds`	Sort by the number of threads.
	`pri`	Sort by the process priority.
	`sleep`	Sort by the average time sleeping.
	`runtime`	Sort by the runtime of the process.

Mode User Exec and Privileged Exec

Usage Entering this command on the stack master will display the information for all the stack members. A stack member heading will distinguish the different information for every stack member device.

Examples To show the CPU utilization of current processes, sorting them by the number of threads the processes are using, use the command:

```
awplus# show cpu sort thrds
```

Note that in a stack environment, executing this command on the stack master will show CPU utilization for all stack members.

To show CPU utilization for a specific stack member (in this case stack member 2), use the following command:

```
awplus# show cpu 2
```

Output **Figure 10-3: Example output from the show cpu command**

```
Stack member 2:

CPU averages:
 1 second: 12%, 20 seconds: 2%, 60 seconds: 2%
System load averages:
 1 minute: 0.03, 5 minutes: 0.02, 15 minutes: 0.00
Current CPU load:
 userspace: 6%, kernel: 4%, interrupts: 1% iowaits: 0%

Table 10-2: Parameters in the output of the show cpu command

Parameter	Description
Stack member	Stack member number.
`CPU averages`	Average CPU utilization for the periods stated.
`System load averages`	The average number of processes waiting for CPU time for the periods stated.
`Current CPU load`	Current CPU utilization specified by load types.
`pid`	Identifier number of the process.

Table 10-2: Parameters in the output of the show cpu command

Parameter	Description
`name`	A shortened name for the process
`thrds`	Number of threads in the process.
`cpu%`	Percentage of CPU utilization that this process is consuming.
`pri`	Process priority state.
`state`	Process state; one of “run”, “sleep”, “zombie”, and “dead”.
`sleep%`	Percentage of time that the process is in the sleep state.
`runtime`	The time that the process has been running for, measured in jiffies. A jiffy is the duration of one tick of the system timer interrupt.

show cpu history

This command prints a graph showing the historical CPU utilization.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show [<stack-ID>]cpu history`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.

Mode User Exec and Privileged Exec

Usage This command's output displays three graphs of the percentage CPU utilization:

- per second for the last minute, then
- per minute for the last hour, then
- per 30 minutes for the last 30 hours.

If this command is entered on the stack master, it will print graphs for all the stack members. A stack member heading will be displayed to distinguish the different graphs for every stack member.

Examples To display a graph showing the historical CPU utilization of the device, use the command:

```
awplus# show cpu history
```

To display the CPU utilization history graph for stack member 2, use the command:

```
awplus# show 2 cpu history
```

where 2 is the node id of the stack member.

Output **Figure 10-4: Example output from the show cpu history command**

show debugging

This command displays information for all debugging options.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show debugging`

Default This command runs all the **show debugging** commands in alphabetical order.

Mode User Exec and Privileged Exec

Usage This command displays all debugging information, similar to the way the **show tech-support** command displays all show output for use by Allied Telesis authorized service personnel only.

Example To display all debugging information, use the command:

```
awplus# show debugging
```

show ecofriendly

This command displays the switch's eco-friendly configuration status. The **ecofriendly led** and **ecofriendly lpi** configuration status are shown in the **show ecofriendly** output.

Syntax `show ecofriendly`

Mode Privileged Exec and Global Configuration

Example To display the switch's eco-friendly configuration status, use the following command:

```
awplus# show ecofriendly
```

Output **Figure 10-6: Example output from the show ecofriendly command**

```
awplus#show ecofriendly
Front panel port LEDs          normal
Energy efficient ethernet
Port          Name             Configured  Status
port1.0.1     Port 1           lpi         lpi
port1.0.2                      lpi         lpi
port1.0.3                      lpi         lpi
port1.0.4                      off         off
port1.0.5                      lpi         off

port1.0.9                      off         -
port1.0.10                     off         -
```

Table 10-3: Parameters in the output of the show ecofriendly command

Parameter	Description
`normal`	The eco-friendly LED feature is disabled and port LEDs show the current state of the ports. This is the default setting.
`off`	The eco-friendly LED feature is enabled and power to the port LEDs is disabled.
`normal (configuration overridden by eco button)`	The eco-friendly LED feature has been disabled with the eco-switch button, overriding the configuration set with the **ecofriendly led** command. The port LEDs show the current state of the ports.
`off (configuration overridden by eco button)`	The eco-friendly LED feature has been enabled with the eco-switch button, overriding the configuration set with the **ecofriendly led** command. Power to the port LEDs is disabled.
`Port`	Displays the port number as assigned by the switch.
`Name`	Displays the port name if a name is configured for a port number.
`Configured`	The eco-friendly LPI feature is configured on the port. Either lpi or off is displayed.
`Status`	The eco-friendly LPI feature is active on the port. Either lpi or off is displayed. Ports that are not running show -

show interface memory

This command displays the shared memory used by either all interfaces, or the specified interface or interfaces. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show interface memory
show interface <port-list> memory
```

Parameter	Description
<port-list>	The ports to display information about. The port list can be: ■ a switch port (e.g. `port1.0.12`) a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po3`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24`, or `sa1-2`, or `po1-4` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.4-1.2.24`. Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list

Mode User Exec and Privileged Exec

Example To display the shared memory used by all interfaces, use the command:

```
awplus# show interface memory
```

To display the shared memory used by `port1.0.1` and `port1.0.5 to port1.0.8`, use the command:

```
awplus# show interface port1.0.1,port1.0.5-1.0.8 memory
```

Output **Figure 10-7: Example output from the show interface <port-list> memory command**

```
awplus#show interface port1.0.1,port1.0.5-1.0.8 memory
Vlan blocking state shared memory usage
---------------------------------------------
Interface     shmid        Bytes Used     nattch     Status

show memory

This command displays the memory used by each process that is currently running

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show memory [<stack-ID>] [sort {size|peak|stk}]`

Parameter	Description	
`<stack-ID>`	Stack member number, from 1 to 8.	
`sort`	Changes the sorting order for the list of processes. If you do not specify this, then the list is sorted by percentage memory utilization.	
	`size`	Sort by the amount of memory the process is currently using.
	`peak`	Sort by the amount of memory the process is currently using.
	`stk`	Sort by the stack size of the process.

Mode User Exec and Privileged Exec

Usage If this command is entered on the stack master, it will display corresponding memory utilization information for all the stack members. A stack member heading will display the information for every stack member device.

Example To display the memory used by the current running processes, use the command:

```
awplus# show memory
```

Output **Figure 10-9: Example output from the show memory command**

```
awplus#show memory

Stack member 1:

RAM total: 514920 kB; free: 382716; buffers: 16368 kB

user processes
==============
pid name            mem%   size   peak   data   stk
962 pss                6  33112  36260  27696   244

797 syslog-ng          0    816   2152    752    84
803 klogd              0    184   1244    124    84
843 inetd              0    256   1256    136    84
.
.
.
```

Table 10-4: Parameters in the output of the show memory command

Parameter	Description
Stack member	Stack member number.
`RAM total`	Total amount of RAM memory free.
`free`	Available memory size.
`buffers`	Memory allocated kernel buffers.
`pid`	Identifier number for the process.
`name`	Short name used to describe the process.
`mem%`	Percentage of memory utilization the process is currently using.
`size`	Amount of memory currently used by the process.
`peak`	Greatest amount of memory ever used by the process.
`data`	Amount of memory used for data.
`stk`	The stack size.

Related Commands

show memory allocations

show memory allocations

This command displays the memory allocations used by processes.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show memory allocations [<process>]`

Parameter	Description
<process>	Displays the memory allocation used by the specified process.

Mode User Exec and Privileged Exec

Example To display the memory allocations used by all processes on your device, use the command:

```
awplus# show memory allocations
```

Output **Figure 10-10: Example output from the show memory allocations command**

```
awplus#show memory allocations
Memory allocations for imi
----------------------------

Current 15093760 (peak 15093760)

show memory history

This command prints a graph showing the historical memory usage.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show memory history <stack-ID>`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.

Mode User Exec and Privileged Exec

Usage This command's output displays three graphs of the percentage memory utilization:

- per second for the last minute, then
- per minute for the last hour, then
- per 30 minutes for the last 30 hours.

If entered on the stack master, this command will display corresponding memory utilization information for all the stack members. A stack member heading will be displayed to distinguish the different lists for every stack member.

Examples To show a graph displaying the historical memory usage for either a single unstacked device, or a complete stack, use the command:

```
awplus# show memory history
```

To show a graph displaying the historical memory usage for specific stack member (stack member 2 in this example) within a stack, use the command:

```
awplus# show memory history 2
```

Output **Figure 10-11: Example output from the show memory history command**

```

show memory pools

This command shows the memory pools used by processes.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show memory pools [<process>]`

Parameter	Description
<process>	Displays the memory pools used by the specified process.

Mode User Exec and Privileged Exec

Example To shows the memory pools used by processes, use the command:

```
awplus# show memory pools
```

Output **Figure 10-12: Example output from the show memory pools command**

```
awplus#show memory pools
Memory pools for imi
----------------------

Current 15290368 (peak 15290368)

Statically allocated memory:

show memory shared

This command displays shared memory allocation information. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show memory shared`

Mode User Exec and Privileged Exec

Example To display information about the shared memory allocation used on the switch, use the command:

```
awplus# show memory shared
```

Output **Figure 10-13: Example output from the show memory shared command**

```
awplus#show memory shared
Shared Memory Status
--------------------------
Segment allocated  = 39
Pages allocated    = 39
Pages resident     = 11

-------------------------
Maximum number of segments          = 4096
Maximum segment size (kbytes)       = 32768
Maximum total shared memory (pages) = 2097152
Minimum segment size (bytes)        = 1
```

Related Commands
show memory allocations
show memory history
show memory sort

show process

This command lists a summary of the current running processes.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax show process [<*stack-ID*>] [sort {cpu|mem}]

Parameter	Description	
`<stack-ID>`	Stack member number, from 1 to 8.	
`sort`	Changes the sorting order for the list of processes.	
	`cpu`	Sorts the list by the percentage of CPU utilization.
	`mem`	Sorts the list by the percentage of memory utilization.

Mode User Exec and Privileged Exec

Usage For a stacked configuration, if this command is entered on the stack master, it will display the information for all the stack members. A stack member heading will be displayed to distinguish the different information for every stack member.

Example To display a summary of the current running processes, use the command:

```
awplus# show process
```

To display a summary of the current running processes on stack member 3, use the command:

```
awplus# show process 3
```

Output **Figure 10-14: Example output from the show process command**

```
Stack member 3:

CPU load for 1 minute: 0%; 5 minutes: 3%; 15 minutes: 0%
RAM total: 514920 kB; free: 382600 kB; buffers: 16368 kB

.
.
.
```

Table 10-5: Parameters in the output from the show process command

Parameter	Description
Stack member	Stack member number.
`CPU load`	Average CPU load for the given period.
`RAM total`	Total memory size.
`free`	Available memory.
`buffers`	Memory allocated to kernel buffers.
`pid`	Identifier for the process.
`name`	Short name to describe the process.
`thrds`	Number of threads in the process.
`cpu%`	Percentage of CPU utilization that this process is consuming.
`mem%`	Percentage of memory utilization that this process is consuming.
`pri`	Process priority.
`state`	Process state; one of “run”, “sleep”, “stop”, “zombie”, or “dead”.
`sleep%`	Percentage of time the process is in the sleep state.

Related Commands **show cpu**
show cpu history

show reboot history

Use this command to display the switch's reboot history.

Syntax `show reboot history [<stack-ID>]`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.

Mode User Exec and Privileged Exec

Example To show the reboot history of stack member 2, use the command:

```
awplus# show reboot history 2
```

Output **Figure 10-15: Example output from the show reboot history command**

```
awplus#show reboot history 2

Stack member 2:

<date>     <time>    <type>      <description>
------------------------
2014-01-10 01:42:04  Expected    User Request
2014-01-10 01:35:31  Expected    User Request
2014-01-10 01:16:25  Unexpected Rebooting due to critical process (network/nsm)
failure!
2014-01-10 01:11:04  Unexpected Rebooting due to critical process (network/nsm)
failure!
2014-01-09 20:46:40  Unexpected Rebooting due to VCS duplicate member-ID
2014-01-09 19:56:16  Expected    User Request
2010-01-09 20:36:06  Unexpected Rebooting due to VCS duplicate master (Continuous
reboot prevention)
2014-01-09 19:51:20  Expected    User Request
```

Table 10-6: Parameters in the output from the show reboot history command

Parameter	Description
`Unexpected`	Reboot is counted by the continuous reboot prevention feature if the reboot event occurs in the time period specified for continuous reboot prevention.
`Expected`	Reboot is not counted by continuous reboot prevention feature.
Continuous reboot prevention	A continuous reboot prevention event has occurred. The action taken is configured with the **continuous-reboot-prevention** command. The next time period during which reboot events are counted begins from this event.
user request	User initiated reboot via the CLI.

Related Commands **show continuous-reboot-prevention**
show tech-support

show router-id

Use this command to show the Router ID of the current system.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show router-id`

Mode User Exec and Privileged Exec

Example To display the Router ID of the current system, use the command:

```
awplus# show router-id
```

Output **Figure 10-16: Example output from the show router-id command**

```
awplus>show router-id
Router ID: 10.55.0.2 (automatic)
```

show system

This command displays general system information about the device, including the hardware installed, memory, and software versions loaded. It also displays location and contact details when these have been set.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show system`

Mode User Exec and Privileged Exec

Usage For a stacked configuration, if this command is entered on the stack master, it will display the information for all the stack members. A stack member heading will be displayed to distinguish the different information for every stack member.

Example To display the system information, use the command:

```
awplus# show system
```

Output **Figure 10-17: Example output from the show system command**

```

Related Commands **show system**

show system interrupts

Use this command to display the number of interrupts for each IRQ (Interrupt Request) used to interrupt input lines on a PIC (Programmable Interrupt Controller) on your switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show system interrupts`

Mode User Exec and Privileged Exec

Example To display information about the number of interrupts for each IRQ in your device, use the command:

```
awplus# show system interrupts
```

Output **Example output from the show system interrupts command**

```
awplus>show system interrupts
           CPU0
  1:          2   CPM2 SIU  Level Enabled   0     i2c-mpc
  2:        145   CPM2 SIU  Level Enabled   0     spi-mpc
 77:          0   OpenPIC   Level Enabled   0     enet_tx
 78:          2   OpenPIC   Level Enabled   0     enet_rx
 82:          0   OpenPIC   Level Enabled   0     enet_error

Related Commands **show system environment**

show system mac

This command displays the physical MAC address available on a standalone switch, or a stack. This command also shows the virtual MAC address for a for a stack if the stack virtual MAC address feature is enabled with the **stack virtual-mac** or the **stack enable** command.

Syntax `show system mac`

Mode User Exec and Privileged Exec

Usage This command also displays the virtual MAC address, if the VCStack Plus virtual MAC address feature is enabled with the **stack virtual-mac** command.

For information about this VCStack Plus feature, see the section **Fixed or Virtual MAC Addressing** in the **VCStack Introduction** chapter.

Example To display the physical MAC address on a standalone switch, enter the following command:

```
awplus# show system mac
```

Output **Figure 10-19: Example output from the show system mac command**

```
awplus#show system mac
eccd.6d9d.4eed
```

Output **Figure 10-20: Example output showing how to use the stack virtual-mac command and the show system mac command:**

```
awplus#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
awplus(config)#stack virtual-mac
% Please check that the new MAC 0000.cd37.0065 is unique within
the network.
% Save the config and restart the system for this change to take
effect.

Related Commands **stack virtual-mac**

show system pci device

Use this command to display the PCI devices on your switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show system pci device Mode`

Mode User Exec and Privileged Exec

Example To display information about the PCI devices on your switch, use the command:

```
awplus# show system pci device
```

Output **Example output from the show system pci device command**

```
awplus>show system pci device
00:0c.0 Class 0200: 11ab:00d1 (rev 01)
        Flags: bus master, 66Mhz, medium devsel, latency 128, IRQ 113
        Memory at 5ffff000 (32-bit, non-prefetchable) [size=4K]
        Memory at 58000000 (32-bit, non-prefetchable) [size=64M]

00:0d.0 Class 0200: 11ab:00d1 (rev 01)
        Flags: bus master, 66Mhz, medium devsel, latency 128, IRQ 116
        Memory at 57fff000 (32-bit, non-prefetchable) [size=4K]
        Memory at 50000000 (32-bit, non-prefetchable) [size=64M]
```

Related Commands **show system environment**
show system pci tree

show system pci tree

Use this command to display the PCI tree on your switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show system pci tree
```

Mode

User Exec and Privileged Exec

Example

To display information about the PCI tree on your switch, use the command:

```
awplus# show system pci tree
```

Output

Figure 10-21: Example output from the show system pci tree command

```
awplus>show system pci tree
-[00]-+-0c.0  11ab:00d1
      \-0d.0  11ab:00d1
```

show system pci device

show system pluggable

This command displays brief pluggable transceiver information showing the pluggable type, the pluggable serial number, and the pluggable port on the switch. Different types of pluggable transceivers are supported in different models of switch. See your Allied Telesis dealer for more information about the models of pluggables that your switch supports.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show system pluggable [<port-list>]`

Parameter	Description
<port-list>	The ports to display information about. The port list can be: ■ a switch port (e.g. `port1.0.12`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.4-1.2.24`.

Mode User Exec and Privileged Exec

Usage Entering this command will display the information for all pluggable transceivers in the system. In a stack, a separate heading will be displayed to distinguish each stack member's information.

Example To display brief information about pluggable transceivers installed in `port1.0.21` through `port1.0.24`, use the command:

```
awplus# show system pluggable port1.0.21-1.0.24
```

Output **Figure 10-22: Example output from the show system pluggable port1.0.21-1.0.24 command**

```
System Pluggable Information
Port   Manufacturer     Device           Serial Number    Datecode Type

-------------------------------------------------------------------------------
```

Table 10-7: Parameters in the output from the show system pluggables command

Parameter	Description
Stack member	The stack member number.
Port	Specifies the vendor's name for the installed pluggable transceiver.
Vendor Name:	Specifies the vendor's name for the installed pluggable transceiver.
Device Name:	Specifies the device name for the installed pluggable transceiver.
Device Type:	Specifies the device type for the installed pluggable transceiver.
Serial Number	Specifies the serial number for the installed pluggable transceiver.
Manufacturing Datecode	Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. See the **Trouble-shoot fiber and pluggable issues** section in the **System Configuration and Monitoring Commands** chapter.
SFP Laser Wavelength:	Specifies the laser wavelength of the installed pluggable transceiver.
Datecode	Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. See the **Trouble-shoot fiber and pluggable issues** section in the **System Configuration and Monitoring Commands** chapter.
Device Type:	Specifies the device type for the installed pluggable transceiver

Related Commands
show system environment
show system pluggable detail
show system pluggable diagnostics

show system pluggable detail

This command displays detailed pluggable transceiver information showing the pluggable type, the pluggable serial number, and the pluggable port on the switch. Different types of pluggable transceivers are supported in different models of switch. See your Allied Telesis dealer for more information about the models of pluggables that your switch supports.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show system pluggable [<port-list>] detail`

Parameter	Description
<port-list>	The ports to display information about. The port list can be: ■ a switch port (e.g. `port1.0.12`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.4-1.2.24`.

Mode User Exec and Privileged Exec

Usage For a stacked configuration, if this command is entered on the stack master, it will display detailed information about the pluggable transceivers for all the stack members. A stack member heading will be displayed to distinguish the different pluggable transceiver information for every stack member.

In addition to the information about pluggable transceivers displayed using the **show system pluggable** command (port, manufacturer, serial number, manufacturing datecode, and type information), the **show system pluggable detail** command displays the following information:

- **SFP Laser Wavelength**: Specifies the laser wavelength of the installed pluggable transceiver
- **Single mode Fiber**: Specifies the link length supported by the pluggable transceiver using single mode fiber
- **OM1 (62.5µm) Fiber**: Specifies the link length (in µm - micron) supported by the pluggable transceiver using 62.5 micron multi-mode fiber.
- **OM2 (50 µm) Fiber**: Specifies the link length (in µm - micron) supported by the pluggable transceiver using 50 micron multi-mode fiber.
- **Diagnostic Calibration**: Specifies whether the pluggable transceiver supports DDM or DOM Internal or External Calibration.
  - « **Internal** is displayed if the pluggable transceiver supports DDM or DOM Internal Calibration.
  - « **External** is displayed if the pluggable transceiver supports DDM or DOM External Calibration.
  - « - is displayed if SFP or SFP+ DDM Internal Calibration or External Calibration is not supported.
- **Power Monitoring**: Displays the received power measurement type, which can be either **OMA** (Optical Module Amplitude) or **Avg** (Average Power) measured in µW.

Note For parameters that are not supported or not specified, a hyphen is displayed instead.

Example To display detailed information about the pluggable transceivers installed on a switch, use the command:

```
awplus# show system pluggable port1.0.24 detail
```

To display detailed information about the pluggable transceivers installed on the switch, use the command:

```
awplus# show system pluggable detail
```

Output **Figure 10-24: Example output from the show system pluggable detail command on a switch**

```
awplus#show system pluggable port1.0.24 detail
System Pluggable Information Detail

Table 10-8: Parameters in the output from the show system pluggables detail command:

Parameter	Description
Stack member	The stack member number..
Port	Specifies the port the pluggable transceiver is installed in.
Vendor Name:	Specifies the vendor's name for the installed pluggable transceiver.
Device Name:	Specifies the device name for the installed pluggable transceiver.
Device Type:	Specifies the device type for the installed pluggable transceiver..
Serial Number:	Specifies the serial number for the installed pluggable transceiver.
Manufacturing Datecode:	Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. See the **Trouble-shoot fiber and pluggable issues** section in the **System Configuration and Monitoring Commands** chapter.
SFP Laser Wavelength:	Specifies the laser wavelength of the installed pluggable transceiver.
Single Mode Fiber:	Specifies the link length supported by the pluggable transceiver using single mode fiber.
OM1 (62.5um) Fiber:	Specifies the link length (in µm - micron) supported by the pluggable transceiver using 62.5 micron multi-mode fiber.
OM2 (50um) Fiber:	Specifies the link length (in µm - micron) supported by the pluggable transceiver using 50 micron multi-mode fiber.
Diagnostic Calibration:	Specifies whether the pluggable transceiver supports DDM or DOM Internal or External Calibration: **Internal** is displayed if the pluggable transceiver supports DDM or DOM Internal Calibration. **External** is displayed if the pluggable transceiver supports DDM or DOM External Calibration. - is displayed if SFP or SFP+ DDM Internal Calibration or External Calibration is not supported.
Power Monitoring:	Displays the received power measurement type, which can be either **OMA** (Optical Module Amplitude) or **Avg** (Average Power) measured in µW.

Related Commands

show system environment
show system pluggable
show system pluggable diagnostics

show system pluggable diagnostics

This command displays diagnostic information about SFP and SFP+ pluggable transceivers, which support Digital Diagnostic Monitoring (DDM).

Different types of pluggable transceivers are supported in different models of switch. See your switch's Datasheet for more information about the models of pluggables that your switch supports.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show system pluggable [<port-list>] diagnostics`

Parameter	Description
<port-list>	The ports to display information about. The port list can be: ■ a switch port (e.g. `port1.0.12`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.4-1.2.24`.

Mode User Exec and Privileged Exec

Usage For a stacked configuration, if this command is entered on the stack master, it will display information about the pluggable transceivers for all the stack members. A stack member heading will be displayed to distinguish different pluggable transceiver information for every stack member.

Modern optical SFP and SFP+ transceivers support Digital Diagnostics Monitoring (DDM) functions.

Diagnostic monitoring features allow you to monitor real-time parameters of the pluggable transceiver, such as optical output power, optical input power, temperature, laser bias current, and transceiver supply voltage. Additionally, RX LOS (Loss of Signal) is shown when the received optical level is below a preset threshold. Monitor these parameters to check on the health of all transceivers, selected transceivers or a specific transceiver installed in a switch.

Examples To display detailed information about all pluggable transceivers installed on a standalone switch, use the command:

```
awplus# show system pluggable diagnostics
```

Output **Figure 10-26: Example output from the show system pluggable diagnostics command on a switch**

```
awplus#show system pluggable diagnostics

show system pluggable detail

show system serialnumber

This command shows the serial number information for the switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show system serialnumber`

Mode User Exec and Privileged Exec

Example To display the serial number information for the switch, use the command:

```
awplus# show system serialnumber
```

Output **Figure 10-28: Example output from the show system serialnumber command**

```
awplus#show system serialnumber
45AX5300X
```

show tech-support

This command generates system and debugging information for the switch and saves it to a file. You can optionally limit the command output to display only information for a given protocol or feature.

The command generates a large amount of output, which is saved to a file in compressed format. The output file name can be specified by outfile option. If the output file already exists, a new file name is generated with the current time stamp. If the output filename does not end with ".gz", then ".gz" is appended to the filename. Since output files may be too large for Flash on the switch we recommend saving files to either an SD card or a USB storage device whenever possible to avoid switch lockup. This method is not likely to be appropriate when running the working set option of ATMF across a range of physically separated switches.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

The output of this command may include the result of the following commands:

Syntax `show tech-support {all|[dhcpsn|epsr|igmp|ip|rp|ospf|pim|stack|stp|system|ipv6|rip|ripng|mld|tacacs+|ospf|atmf|]|[outfile <filename>]}`

Parameter	Description
`all`	Output full troubleshooting information for all protocols and the device.
`dhcpsn`	Displays troubleshooting information specific to DHCPSN
`epsr`	Displays troubleshooting information specific to EPSR
`igmp`	Displays troubleshooting information specific to IGMP
`ip`	Displays troubleshooting information specific to IP
`rip`	Displays troubleshooting information specific to RIP
`ospf`	Displays troubleshooting information specific to OSPF
`pim`	Displays troubleshooting information specific to PIM
`stack`	Displays troubleshooting information specific to VCStack
`stp`	Displays troubleshooting information specific to STP
`system`	Displays troubleshooting general system information (not protocol) troubleshooting information for the device
`ipv6`	Displays troubleshooting information specific to IPv6
`ripng`	Displays troubleshooting information specific to RIPNG
`mld`	Displays troubleshooting information specific to MLD
`tacacs+`	Displays troubleshooting information specific to TACACS PLUS
`ospf`	Displays troubleshooting information specific to OSPF
`atmf`	Displays information specific to ATMF
`outfile`	The output file that will be created. By default, this file is saved to the current directory.
`<filename>`	Specifies a name for the output file. If no name is specified, this file will be saved as: tech-support.txt.gz.

Default Captures **all** information for the switch.

By default the output is saved to the file '`tech-support.txt.gz`' in the current directory. If this file already exists in the current directory then a new file is generated with the time stamp appended to the file name, for example '`tech-support20080109.txt.gz`', so the last saved file is retained.

Usage This command is useful for collecting a large amount of information about all protocols or specific protocols on your switch so that it can then be analyzed for troubleshooting purposes. The output of this command can be provided to technical support staff when reporting a problem.

Mode Privileged Exec

Examples show tech-support

```
awplus# show tech-support
```

Note You can manage your show output, or make it a more selective, by using a command modifier. For information on using show-command modifiers, see: **"Controlling "show" Command Output" on page 1.36**.

Output The output of this command may include the result of the following commands:

show arp
show arp security
show arp security interface
show arp security statistics
show boot
show counter dhcp-client
show counter dhcp-relay
show counter dhcp-server
show counter log
show counter mail
show counter ntp
show counter ping-poll

show system environment
show system pluggable
show users
show vlan brief (see the **show vlan** command)
show vrrp

speed (asyn)

This command changes the console speed from the switch. Note that a change in console speed is applied for subsequent console sessions. Exit the current session to enable the console speed change using the **clear line console** command.

Syntax `speed <console-speed-in-bps>`

Parameter	Description
<console-speed-in-bps>	Console speed Baud rate in bps (bits per second).
1200	1200 Baud
2400	2400 Baud
9600	9600 Baud
19200	19200 Baud
38400	38400 Baud
57600	57600 Baud
115200	115200 Baud

Default The default console speed baud rate is 9600 bps.

Mode Line Configuration

Usage This command is used to change the console (asyn) port speed. Set the console speed to match the transmission rate of the device connected to the console (asyn) port on your switch.

Example To set the terminal console (asyn0) port speed from the switch to 57600 bps, then exit the session, and log in again to enable the change, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# speed 57600
awplus(config-line)# exit
awplus(config)# exit
awplus# exit
```

The new console speed of 57600 bps is applied after exiting the session and before login.

```
awplus login:
Password:

awplus>
```

speed

system territory

This command sets the territory of the system.

Use the **no** variant of this command to return the territory to its default setting of `japan`.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
system territory {australia|nz|europe|japan|usa|china|korea}
no system territory
```

Parameter	Description
`australia`	Australia
`nz`	New Zealand
`europe`	Europe
`japan`	Japan
`usa`	USA
`china`	China
`korea`	Korea

Mode Global Configuration

Example To set the territory to USA, enter the command:

```
awplus(config)# system territory usa
```

Validation Commands **show system**

terminal monitor

Use this command to display debugging output on a terminal.

To display the cursor after a line of debugging output, press the Enter key.

Use the command **terminal no monitor** to stop displaying debugging output on the terminal, or use the timeout option to stop displaying debugging output on the terminal after a set time.

Syntax

```
terminal monitor [<1-60>]
terminal no monitor
```

Parameter	Description
<1-60>	Set a timeout between 1 and 60 seconds for terminal output.

Default Disabled

Mode User Exec and Privileged Exec

Examples To display debugging output on a terminal, enter the command:

```
awplus# terminal monitor
```

To specify timeout of debugging output after 60 seconds, enter the command:

```
awplus# terminal monitor 60
```

To stop displaying debugging output on the terminal, use the command:

```
awplus# terminal no monitor
```

Related Commands All debug commands

undebug all

This command applies the functionality of the **no debug all** command.

Chapter 11: Debugging and Logging

Introduction

AlliedWare Plus™ has a comprehensive debugging and logging facility in various protocols and components. This chapter describes how to start/stop debugging and logging. For detailed descriptions of the commands used to configure logging, see **Chapter 12, Logging Commands**.

Debugging

Many protocols have debug commands. Debug commands, when used with the parameters, log protocol-specific information. For example, using the **debug mstp protocol** command, results in the device writing all debugging messages generated by the MSTP algorithm to the logging system.

On using a debug command, the protocol continues to generate output until the **no** parameter is used with the command. To specify where logging output is sent, and the level of events to log, use the **log** commands in **Chapter 12, Logging Commands**.

Logging to terminal

To start debugging to the terminal:

Step 1: Turn on the debug options by using the relevant debug command.

Step 2: Run the terminal monitor command.

```
awplus> enable
awplus# configure terminal
awplus(config)# debug <protocol> (parameter)
awplus(config)# exit
awplus# terminal monitor
```

Sample Output This is a sample output of the **debug rsvp events** command displayed on the terminal:

```
awplus#terminal monitor
Dec  2 16:41:49 localhost RSVP[6518]: RSVP: RSVP message sent to
10.10.23.60/32 via interface vlan2
Dec  2 16:41:57 localhost RSVP[6518]: RSVP: Received an RSVP message
of type RSVP Reservation from 192.168.0.60 via interface vlan2
Dec  2 16:41:57 localhost RSVP[6518]: RSVP: Received a RESV message
from 10.10.23.60/32
```

Turning off debugging

To turn off debugging, use the `no debug` or `undebug` command. When a protocol is specified with the `no debug` or `undebug` commands, debugging is stopped for the specified protocol. To stop all debugging, use the `all` parameter with these commands.

```
awplus(config)# no debug rstp
```

or

```
awplus#undebug all
```

Logging

Protocols generate important debugging messages by default, and send them to the logging system. Additional more detailed messages can be generated by enabling debugging (**"Debugging" on page 11.2**).

Messages can be filtered based on: the program that generated the message, the severity level of the message, the type of facility that generated the message, substrings within the message text. The severity levels in order are:

- emergencies
- alerts
- critical
- errors
- warnings
- notifications
- informational
- debugging

The facility categories are:

- auth Security/authorization messages
- authpriv Security/authorization messages (private)
- cron Clock daemon
- daemon System daemons
- ftp FTP daemon
- kern Kernel messages
- lpr Line printer subsystem
- mail Mail system
- news Network news subsystem
- syslog Messages generated internally by syslogd
- user Random user-level messages
- uucp UUCP subsystem

Log Outputs

The following types of logging output are available:

- buffered
- permanent
- terminal
- console
- host
- email

Buffered log

The buffered log is a file stored in RAM on the device. Because it is stored in RAM its content does not survive a reboot of the device. A device can only have one instance of the buffered log. The buffered log is enabled by default and has a filter to include messages with a severity level of 'notifications' and above. The buffered log can be enabled or disabled using the commands:

```
awplus# configure terminal
awplus(config)# log buffered
awplus(config)# no log buffered
```

Additional filters can be added and removed using the commands described in **log buffered (filter)** command on page 12.9:

```
awplus(config)# log buffered {facility|level|msgtext|program}
awplus(config)# no log buffered {facility|level|msgtext|
program}
```

The following log buffered commands are available:

`show log`	Displays the entire contents of the buffered log
`show log tail`	Displays the 10 most recent entries in the buffered log.
`show log tail <10-250>`	Displays a specified number of the most recent entries in the buffered log.
`show log config`	Displays the configuration of all log outputs
`log buffered size`	Specify the amount of memory the buffered log may use.
`clear log`	Remove the contents of the buffered log (and permanent log if it exists)
`clear log buffered`	Remove the contents of the buffered log only
`default log buffered`	Restore the buffered log to its default configuration

Permanent log

The permanent log is a file stored in NVS on the device. This output type is only available on devices that have NVS. The contents on the permanent log is retained over a reboot. A device can only have one instance of the permanent log. The permanent log is enabled by default and has a filter to include messages with a severity level of 'warning' and above. The permanent log can be disabled using the command:

```
awplus# configure terminal
awplus(config)# no log permanent
```

Additional filters can be added and removed using the commands described in **log permanent (filter)**:

```
awplus# configure terminal
awplus(config)# log permanent {facility|level|msgtext|
program}
awplus(config)# no log permanent {facility|level|msgtext|
program}
```

Table 11-1: Permanent log commands

Command	Description
`show log permanent`	Display the entire contents of the permanent log
show log permanent tail	Display the 10 most recent entries in the permanent log
`show log permanent tail <10-250>`	Display a specified number of the most recent entries in the permanent log
`show log config`	Display the configuration of all log outputs
`log permanent size`	Specify the amount of memory the permanent log may use
`clear log`	Remove the contents of the buffered log and permanent log
`clear log permanent`	Remove the contents of the permanent log only
`default log permanent`	Restore the permanent log to its default configuration

Host log

A host log sends log messages to a remote syslog server. A device may have many syslog hosts configured. To configure or remove a host use the commands:

```
awplus# configure terminal
awplus(config)# log host <ip-addr>9
awplus(config)# no log host <ip-addr>9
```

where `<ip-addr>` is the IP address of the remote syslog server.

There are no default filters associated with host outputs when they are created. Filters can be added and removed with the **log host (filter)** command on page 12.23.

It is not possible to view the log messages sent to this type of output as they are not retained on the device. They must be viewed on the remote device. The other host log commands are:

`show log config`	Displays the configuration of all log outputs
`log host time`	Adjust the time information in messages to a time zone other than the one configured on this device
`default log host <ip-address>`	Restores the device default settings for log sent to a remote syslog server.

Email log

An email log sends log messages to an email address. A device may have many email logs configured. To configure or remove an email log use the commands:

```
awplus# configure terminal
awplus(config)# log email <email-address>
awplus(config)# no log email <email-address>
```

where `<email-address>` is the destination email address.

There are no default filters associated with email outputs when they are created. Filters can be added and removed with the commands described in **log email (filter)**:

```
awplus# configure terminal
awplus(config)# log email <email-address> {facility|level|
msgtext|program}
awplus(config)# no log email <email-address> {facility|
level|msgtext|program}
```

It is not possible to view the log messages sent to this type of output as they are not retained on the device. They must be viewed by the email recipient.

The other email log commands are:

`show log config`	Displays the configuration of all log outputs
`log email time`	Adjust the time information in messages to a time zone other than the one configured on this device
`default log email`	Restores the device default settings for log messages sent to an email address.

Note

An email server and "from" address must be configured on the device in order for email logs to work:

- mail from <*email-address*>
- mail smtpserver <*ip-address*>

where the <*email-address*> is the 'From:' field on the sent email, and the <*ip-address*> is the email's destination SMTP server.

Email logs are sent in batches of approximately 20 messages and have the subject line "Log messages"

Chapter 12: Logging Commands

Command List

This chapter provides an alphabetical reference of commands used to configure logging.

clear exception log

This command resets the contents of the exception log, but does not remove the associated core files.

Note When this command is used within a stacked environment, it will remove the contents of the exception logs in all stack members.

Syntax `clear exception log`

Mode Privileged Exec

Example

```
awplus# clear exception log
```

clear log

This command removes the contents of the buffered and permanent logs.

Note When this command is used within a stacked environment, it will remove the contents of the buffered and permanent logs in all stack members.

Syntax `clear log`

Mode Privileged Exec

Example To delete the contents of the buffered and permanent log use the command:

```
awplus# clear log
```

Validation Commands **show log**

Related Commands **clear log buffered**
clear log permanent

clear log buffered

This command removes the contents of the buffered log.

Note When this command is used within a stacked environment, it will remove the contents of the buffered logs in all stack members.

Syntax `clear log buffered`

Mode Privileged Exec

Example To delete the contents of the buffered log use the following commands:

```
awplus# clear log buffered
```

Validation Commands show log

Related Commands clear log
clear log permanent

clear log permanent

This command removes the contents of the permanent log.

Note When this command is used within a stacked environment, it will remove the contents of the buffered logs in all stack members.

Syntax `clear log permanent`

Mode Privileged Exec

Example To delete the contents of the permanent log use the following commands:

```
awplus# clear log permanent
```

Validation Commands show log

Related Commands clear log
clear log buffered

default log buffered

This command restores the default settings for the buffered log stored in RAM. By default the size of the buffered log is 50 kB and it accepts messages with the severity level of "warnings" and above.

Syntax `default log buffered`

Default The buffered log is enabled by default.

Mode Global Configuration

Example To restore the buffered log to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log buffered
```

Validation Commands **show log config**

Related Commands **log buffered**
log buffered size

default log console

This command restores the default settings for log messages sent to the terminal when a **log console** command is issued. By default all messages are sent to the console when a **log console** command is issued.

Syntax `default log console`

Mode Global Configuration

Example To restore the log console to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log console
```

Validation Commands **show log config**

Related Commands **log console**
log console (filter)

default log email

This command restores the default settings for log messages sent to an email address. By default no filters are defined for email addresses. Filters must be defined before messages will be sent. This command also restores the remote syslog server time offset value to local (no offset).

Syntax `default log email <email-address>`

Parameter	Description
<email-address>	The email address to send log messages to

Mode Global Configuration

Example To restore the default settings for log messages sent to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# default log email admin@alliedtelesis.com
```

Related Commands show log config

default log host

This command restores the default settings for log sent to a remote syslog server. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent. This command also restores the remote syslog server time offset value to local (no offset).

Syntax `default log host <ip-addr>`

Parameter	Description
<ip-addr>	The IP address of a remote syslog server

Mode Global Configuration

Example To restore the default settings for messages sent to the remote syslog server with IP address `10.32.16.21` use the following commands:

```
awplus# configure terminal
awplus(config)# default log host 10.32.16.21
```

Validation Commands show log config

Related Commands log email

default log monitor

This command restores the default settings for log messages sent to the terminal when a **terminal monitor** command is used.

Syntax `default log monitor`

Default All messages are sent to the terminal when a **terminal monitor** command is used.

Mode Global Configuration

Example To restore the log monitor to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log monitor
```

Related Commands
log monitor (filter)
show log config

default log permanent

This command restores the default settings for the permanent log stored in NVS. By default, the size of the permanent log is 50 kB and it accepts messages with the severity level of `warnings` and above.

Syntax `default log permanent`

Default The permanent log is enabled by default.

Mode Global Configuration

Example To restore the permanent log to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log permanent
```

Related Commands
log permanent
log permanent size
show log config

exception coredump size (deprecated)

This command has been deprecated in the 5.4.4 release, and will be removed in a later release. There are no alternative commands.

This command sets the size of core files, and can also be used to stop core files being created.

Use the **no** variant of this command to restore the core file size to its default (unlimited).

This setting only applies to processes created after this command has been executed, to ensure this is applied to all processes the system will need to be restarted.

Syntax

```
exception coredump size {none|small|medium|large|unlimited}
no exception coredump size
```

Parameter	Description
`none`	Don't create corefiles
`small`	Create small corefiles
`medium`	Create medium corefiles
`large`	Create large corefiles
`unlimited`	Create corefiles as large as necessary (default)

Default Unlimited

Mode Global Configuration

Usage Core files are generated when a process crashes. The size of a core file can vary, its upper limit is controlled by this command. Files larger than this limit will be truncated by reducing the amount of stack and variable information stored.

Truncated core files may make debugging the failure difficult if not impossible. Reducing the amount of data stored in a core file is not recommended, however the facility is provided to reduce the amount of flash used.

Examples To restrict the size of the core file created, use the command:

```
awplus# configure terminal
awplus(config)# exception coredump size small
```

To restore the size of the core files created to the default of `unlimited`, use the command:

```
awplus# configure terminal
awplus(config)# no exception coredump size
```

log buffered

This command configures the device to store log messages in RAM. Messages stored in RAM are not retained on the device over a restart. Once the buffered log reaches its configured maximum allowable size old messages will be deleted to make way for new ones.

Syntax

```
log buffered
no log buffered
```

Default The buffered log is configured by default.

Mode Global Configuration

Examples To configured the device to store log messages in RAM use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered
```

To configure the device to not store log messages in a RAM buffer use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered
```

Validation Commands **show log config**

Related Commands **default log buffered**
log buffered (filter)
log buffered size

log buffered (filter)

Use this command to create a filter to select messages to be sent to the buffered log. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the buffered log.

Syntax

```
log buffered [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]

no log buffered [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]
```

Parameter	Description
`level`	Filter messages to the buffered log by severity level.
<level>	The minimum severity of message to send to the buffered log. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: 0 emergencies: System is unusable 1 alertsAction must be taken immediately 2 criticalCritical conditions 3 errorsError conditions 4 warningsWarning conditions 5 noticesNormal, but significant, conditions 6 informationalInformational messages 7 debuggingDebug-level messages
`program`	Filter messages to the buffered log by program. Include messages from a specified program in the buffered log.

Parameter	Description
<program-name>	The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case-sensitive) that you find in the log output. ripRouting Information Protocol (RIP) ripngRouting Information Protocol - next generation (RIPng) ospfOpen Shortest Path First (OSPF) ospfv3Open Shortest Path First (OSPF) version 3 (OSPFv3) rsvpResource Reservation Protocol (RSVP) pim-dmProtocol Independent Multicast - Dense Mode (PIM-DM) pim-smProtocol Independent Multicast - Sparse Mode (PIM-SM) dot1xIEEE 802.1X Port-Based Access Control lacpLink Aggregation Control Protocol (LACP) stpSpanning Tree Protocol (STP) rstpRapid Spanning Tree Protocol (RSTP) mstpMultiple Spanning Tree Protocol (MSTP) imiIntegrated Management Interface (IMI) imishIntegrated Management Interface Shell (IMISH) epsrEthernet Protection Switched Rings (EPSR) irdpICMP Router Discovery Protocol (IRDP) rmonRemote Monitoring loopprotLoop Protection poePower-inline (Power over Ethernet) dhcpsnDHCP snooping (DHCPSN)
`facility`	Filter messages to the buffered log by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from in the buffered log: kernKernel messages userRandom user-level messages mailMail system daemonSystem daemons authSecurity/authorization messages syslogMessages generated internally by syslogd lprLine printer subsystem newsNetwork news subsystem uucpUUCP subsystem cronClock daemon authprivSecurity/authorization messages (private) ftp FTP daemon
`msgtext`	Select messages containing a certain text string (maximum 128 characters).
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

Default By default the buffered log has a filter to select messages whose severity level is "notices (5)" or higher. This filter may be removed using the **no** variant of this command.

Mode Global Configuration

Examples To add a filter to send all messages generated by EPSR that have a severity of `notices` or higher to the buffered log use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered level notices program epsr
```

To add a filter to send all messages containing the text "`Bridging initialization`", to the buffered log use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered msgtext Bridging initialization
```

To remove a filter that sends all messages generated by EPSR that have a severity of `notices` or higher to the buffered log use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered level notices program epsr
```

To remove a filter that sends all messages containing the text "`Bridging initialization`", to the buffered log use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered msgtext Bridging initialization
```

Validation Commands **show log config**

Related Commands **default log buffered**
log buffered
log buffered size

log buffered size

This command configures the amount of memory that the buffered log is permitted to use. Once this memory allocation has been filled old messages will be deleted to make room for new messages.

Syntax `log buffered size <50-250>`

Parameter	Description
<50-250>	Size of the RAM log in kilobytes

Mode Global Configuration

Example To allow the buffered log to use up to 100 kB of RAM use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered size 100
```

Validation Commands **show log config**

Related Commands **default log buffered**
log buffered

log console

This command configures the device to send log messages to consoles. The console log is configured by default to send messages to the devices main console port.

Use the **no** variant of this command to configure the device not to send log messages to consoles.

Syntax

```
log console
no log console
```

Mode Global Configuration

Examples To configure the device to send log messages use the following commands:

```
awplus# configure terminal
awplus(config)# log console
```

To configure the device not to send log messages in all consoles use the following commands:

```
awplus# configure terminal
awplus(config)# no log console
```

Validation Commands show log config

Related Commands log console (filter)

log console (filter)

This command creates a filter to select messages to be sent to all consoles when the log console command is given. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

Syntax

```
log console [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]

no log console [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]
```

Parameter	Description
`level`	Filter messages by severity level.
<level>	The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: 0 emergencies: System is unusable 1|alertsAction must be taken immediately 2|criticalCritical conditions 3|errorsError conditions 4|warningsWarning conditions 5|noticesNormal, but significant, conditions 6|informationalInformational messages 7|debuggingDebug-level messages
`program`	Filter messages by program. Include messages from a specified program.

Parameter	Description
<program-name>	The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case-sensitive) that you find in the log output. ripRouting Information Protocol (RIP) ripngRouting Information Protocol - next generation (RIPng) ospfOpen Shortest Path First (OSPF) ospfv3Open Shortest Path First (OSPF) version 3 (OSPFv3) rsvpResource Reservation Protocol (RSVP) pim-dmProtocol Independent Multicast - Dense Mode (PIM-DM) pim-smProtocol Independent Multicast - Sparse Mode (PIM-SM) dot1xIEEE 802.1X Port-Based Access Control lacpLink Aggregation Control Protocol (LACP) stpSpanning Tree Protocol (STP) rstpRapid Spanning Tree Protocol (RSTP) mstpMultiple Spanning Tree Protocol (MSTP) imiIntegrated Management Interface (IMI) imishIntegrated Management Interface Shell (IMISH) epsrEthernet Protection Switched Rings (EPSR) irdpICMP Router Discovery Protocol (IRDP) rmonRemote Monitoring loopprot Loop Protection poe Power-inline (Power over Ethernet) dhcpsn DHCP snooping (DHCPSN)
`facility`	Filter messages to the buffered log by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from: kernKernel messages userRandom user-level messages mailMail system daemonSystem daemons authSecurity/authorization messages syslogMessages generated internally by syslogd lprLine printer subsystem newsNetwork news subsystem uucpUUCP subsystem cronClock daemon authprivSecurity/authorization messages (private) ftp FTP daemon
`msgtext`	Select messages containing a certain text string
<text-string>	A text string to match. This is case sensitive, and must be the last text on the command line.

Default By default the buffered log has a filter to select messages whose severity level is `critical` or higher. This filter may be removed using the **no** variant of this command. This filter may be removed and replaced by filters that are more selective.

Mode Global Configuration

Examples To create a filter to send all messages generated by MSTP that have a severity of `info` or higher to console instances where the log console command has been given, remove the default filter that includes everything use the following commands:

```
awplus# configure terminal
awplus(config)# log console level info program mstp
```

and then use the command:

```
awplus(config)# log console level info program mstp
```

To create a filter to send all messages containing the text "`Bridging initialization`" to console instances where the log console command has been given use the following commands:

```
awplus# configure terminal
awplus(config)# log console msgtext "Bridging initialization"
```

To remove a filter that sends all messages generated by EPSR that have a severity of `notices` or higher to consoles use the following commands:

```
awplus# configure terminal
awplus(config)# no log console level notices program epsr
```

To remove a default filter that includes sending `critical`, `alert` and `emergency` level messages to the console use the following commands:

```
awplus# configure terminal
awplus(config)# no log console level critical
```

Validation Commands **show log config**

Related Commands **log console**

log email

This command configures the device to send log messages to an email address. The email address is specified in this command.

Syntax `log email <email-address>`

Parameter	Description
<email-address>	The email address to send log messages to

Default By default no filters are defined for email log targets. Filters must be defined before messages will be sent.

Mode Global Configuration

Example To have log messages emailed to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@alliedtelesis.com
```

Validation Commands **show log config**

Related Commands **default log email**
log email

log email (filter)

This command creates a filter to select messages to be sent to an email address. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a specified email address. All configuration relating to this log target will be removed.

Syntax

```
log email <email-address> [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]

no log email <email-address> [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]
```

Parameter	Description
<email-address>	The email address to send logging messages to
`level`	Filter messages by severity level.
<level>	The minimum severity of messages to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: 0 emergencies: System is unusable 1 alertsAction must be taken immediately 2 criticalCritical conditions 3 errorsError conditions 4 warningsWarning conditions 5 noticesNormal, but significant, conditions 6 informationalInformational messages 7 debuggingDebug-level messages
`program`	Filter messages by program. Include messages from a specified program in the log.

Parameter	Description
<program-name>	The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case -sensitive) that you find in the log output. ripRouting Information Protocol (RIP) ripngRouting Information Protocol - next generation (RIPng) ospfOpen Shortest Path First (OSPF) ospfv3Open Shortest Path First (OSPF) version 3 (OSPFv3) rsvpResource Reservation Protocol (RSVP) pim-dmProtocol Independent Multicast - Dense Mode (PIM-DM) pim-smProtocol Independent Multicast - Sparse Mode (PIM-SM) dot1xIEEE 802.1X Port-Based Access Control lacpLink Aggregation Control Protocol (LACP) stpSpanning Tree Protocol (STP) rstpRapid Spanning Tree Protocol (RSTP) mstpMultiple Spanning Tree Protocol (MSTP) imiIntegrated Management Interface (IMI) imishIntegrated Management Interface Shell (IMISH) epsrEthernet Protection Switched Rings (EPSR) irdpICMP Router Discovery Protocol (IRDP) rmonRemote Monitoring loopprotLoop Protection poePower-inline (Power over Ethernet) dhcpsnDHCP snooping (DHCPSN)
`facility`	Filter messages to the log by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from in the log: kernKernel messages userRandom user-level messages mailMail system daemonSystem daemons authSecurity/authorization messages syslogMessages generated internally by syslogd lprLine printer subsystem newsNetwork news subsystem uucpUUCP subsystem cronClock daemon authprivSecurity/authorization messages (private) ftp FTP daemon
`msgtext`	Select messages containing a certain text string
<text-string>	A text string to match. This is case sensitive, and must be the last text on the command line.

Mode Global Configuration

Examples To create a filter to send all messages generated by EPSR that have a severity of `notices` or higher to the email address `admin@homebase.com` use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@homebase.com level notices
program epsr
```

To create a filter to send all messages containing the text "`Bridging initialization`", to the email address `admin@homebase.com` use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@homebase.com msgtext
"Bridging initialization"
```

To create a filter to send messages with a severity level of `informational` and above to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@alliedtelesis.com level
informational
```

To stop the device emailing log messages emailed to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@homebase.com
```

To remove a filter that sends all messages generated by EPSR that have a severity of `notices` or higher to the email address `admin@homebase.com` use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@homebase.com level
notices program epsr
```

To remove a filter that sends messages with a severity level of `informational` and above to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@alliedtelesis.com level
informational
```

Related Commands **default log email**
log email
show log config

log email time

This command configures the time used in messages sent to an email address. If the syslog server is in a different time zone to your switch then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

Syntax

```
log email <email-address> time {local|local-offset|utc-offset
   {plus|minus}<0-24>}
```

Parameter	Description
<email-address>	The email address to send log messages to
`time`	Specify the time difference between the email recipient and the switch you are configuring.
`local`	The switch is in the same time zone as the email recipient
`local-offset`	The switch is in a different time zone to the email recipient. Use the **plus** or **minus** keywords and specify the difference (offset) from local time of the switch to the email recipient in hours.
`utc-offset`	The switch is in a different time zone to the email recipient. Use the **plus** or **minus** keywords and specify the difference (offset) from UTC time of the switch to the email recipient in hours.
`plus`	Negative offset (difference) from the switch to the email recipient.
`minus`	Positive offset (difference) from the switch to the email recipient.
<0-24>	World Time zone offset in hours

Default The default is **local** time.

Mode Global Configuration

Usage Use the **local** option if the email recipient is in the same time zone as this device. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the email recipient in hours. Messages will display the time they were generated on this device but converted to the time zone of the email recipient.

Examples To send messages to the email address `test@home.com` in the same time zone as the switch's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@base.com time local 0
```

To send messages to the email address `admin@base.com` with the time information converted to the time zone of the email recipient, which is 3 hours ahead of the switch's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@base.com time local-offset
                plus 3
```

To send messages to the email address `user@remote.com` with the time information converted to the time zone of the email recipient, which is 3 hours behind the switch's UTC time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email user@remote.com time utc-offset
minus 3
```

Validation Commands **show log config**

Related Commands **default log buffered**

log host

This command configures the device to send log messages to a remote syslog server via UDP port 514. The IP address of the remote server must be specified. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent.

Syntax

```
log host <ip-addr>
no log host <ip-addr>
```

Parameter	Description
<ip-addr>	The IP address of a remote syslog server in dotted decimal format A.B.C.D

Mode Global Configuration

Examples To configure the device to send log messages to a remote syslog server with IP address `10.32.16.99` use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.99
```

To stop the device from sending log messages to the remote syslog server with IP address `10.32.16.99` use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.99
```

Validation Commands **show log config**

Related Commands **default log host**

log host (filter)

This command creates a filter to select messages to be sent to a remote syslog server. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a substring within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a remote syslog server. The IP address of the syslog server must be specified. All configuration relating to this log target will be removed.

Syntax

```
log host <ip-addr> [level <level>] [program <program-name>]
    [facility <facility>] [msgtext <text-string>]

no log host <ip-addr> [level <level>] [program <program-name>]
    [facility <facility>] [msgtext <text-string>]
```

Parameter	Description
`<ip-addr>`	The IP address of a remote syslog server
`level`	Filter messages by severity level.
`<level>`	The minimum severity of messages to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: 0|emergencies: System is unusable 1|alertsAction must be taken immediately 2|criticalCritical conditions 3|errorsError conditions 4|warningsWarning conditions 5|noticesNormal, but significant, conditions 6|informationalInformational messages 7|debuggingDebug-level messages
`program`	Filter messages by program. Include messages from a specified program in the log.
`<program-name>`	The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case -sensitive) that you find in the log output. ripRouting Information Protocol (RIP) ripngRouting Information Protocol - next generation (RIPng) ospfOpen Shortest Path First (OSPF) ospfv3Open Shortest Path First (OSPF) version 3 (OSPFv3) rsvpResource Reservation Protocol (RSVP) pim-dmProtocol Independent Multicast - Dense Mode (PIM-DM) pim-smProtocol Independent Multicast - Sparse Mode (PIM-SM) dot1xIEEE 802.1X Port-Based Access Control

Parameter	Description
<program-name> (cont.)	lacpLink Aggregation Control Protocol (LACP) stpSpanning Tree Protocol (STP) rstpRapid Spanning Tree Protocol (RSTP) mstpMultiple Spanning Tree Protocol (MSTP) imiIntegrated Management Interface (IMI) imishIntegrated Management Interface Shell (IMISH) epsrEthernet Protection Switched Rings (EPSR) irdpICMP Router Discovery Protocol (IRDP) rmonRemote Monitoring loopprotLoop Protection poePower-inline (Power over Ethernet) dhcpsnDHCP snooping (DHCPSN)
`facility`	Filter messages to the log by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from in the log: kernKernel messages userRandom user-level messages mailMail system daemonSystem daemons authSecurity/authorization messages syslogMessages generated internally by syslogd lprLine printer subsystem newsNetwork news subsystem uucpUUCP subsystem cronClock daemon authprivSecurity/authorization messages (private) ftp FTP daemon
`msgtext`	Select messages containing a certain text string
<text-string>	A text string to match. This is case sensitive, and must be the last text on the command line.

Mode Global Configuration

Examples To create a filter to send all messages generated by EPSR that have a severity of `notices` or higher to a remote syslog server with IP address `10.32.16.21` use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level notices program epsr
```

To create a filter to send all messages containing the text "`Bridging initialization`", to a remote syslog server with IP address `10.32.16.21` use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 msgtext "Bridging
initialization"
```

To create a filter to send messages with a severity level of `informational` and above to the syslog server with IP address `10.32.16.21` use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level informational
```

To remove a filter that sends all messages generated by EPSR that have a severity of `notices` or higher to a remote syslog server with IP address `10.32.16.21` use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 level notices program
epsr
```

To remove a filter that sends all messages containing the text "`Bridging initialization`", to a remote syslog server with IP address `10.32.16.21` use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 msgtext "Bridging
initialization"
```

To remove a filter that sends messages with a severity level of `informational` and above to the syslog server with IP address `10.32.16.21` use the following commands:

```
awplusawpluls# configure terminal
awplus(config)# no log host 10.32.16.21 level informational
```

Related Commands

default log host
show log config

log host time

This command configures the time used in messages sent to a remote syslog server. If the syslog server is in a different time zone to your switch then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

Syntax

```
log host <email-address> time {local|local-offset|utc-offset
   {plus|minus} <0-24>}
```

Parameter	Description
<email-address>	The email address to send log messages to
`time`	Specify the time difference between the email recipient and the switch you are configuring.
`local`	The switch is in the same time zone as the email recipient
`local-offset`	The switch is in a different time zone to the email recipient. Use the **plus** or **minus** keywords and specify the difference (offset) from local time of the switch to the email recipient in hours.
`utc-offset`	The switch is in a different time zone to the email recipient. Use the **plus** or **minus** keywords and specify the difference (offset) from UTC time of the switch to the email recipient in hours.
`plus`	Negative offset (difference) from the switch to the syslog server.
`minus`	Positive offset (difference) from the switch to the syslog server.
<0-24>	World Time zone offset in hours

Default The default is **local** time.

Mode Global Configuration

Usage Use the **local** option if the remote syslog server is in the same time zone as the switch. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the remote syslog server in hours. Messages will display the time they were generated on this device but converted to the time zone of the remote syslog server.

Examples To send messages to the remote syslog server with the IP address `10.32.16.21` in the same time zone as the switch's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 time local 0
```

To send messages to the remote syslog server with the IP address `10.32.16.12` with the time information converted to the time zone of the remote syslog server, which is 3 hours ahead of the switch's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.12 time local-offset plus 3
```

To send messages to the remote syslog server with the IP address `10.32.16.02` with the time information converted to the time zone of the email recipient, which is 3 hours behind the switch's UTC time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.02 time utc-offset minus 3
```

Validation Commands **show log config**

Related Commands **default log buffered**

log monitor (filter)

This command creates a filter to select messages to be sent to the terminal when the terminal monitor command is given. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

Syntax

```
log monitor [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]

no log monitor [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]
```

Parameter	Description
`level`	Filter messages to the permanent log by severity level.
<level>	The minimum severity of message to send to the log. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: 0|emergencies: System is unusable 1|alertsAction must be taken immediately 2|criticalCritical conditions 3|errorsError conditions 4|warningsWarning conditions 5|noticesNormal, but significant, conditions 6|informationalInformational messages 7|debuggingDebug-level messages
`program`	Filter messages to the permanent log by program. Include messages from a specified program in the log.
<program-name>	The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case -sensitive) that you find in the log output. ripRouting Information Protocol (RIP) ripngRouting Information Protocol - next generation (RIPng) ospfOpen Shortest Path First (OSPF) ospfv3Open Shortest Path First (OSPF) version 3 (OSPFv3) rsvpResource Reservation Protocol (RSVP) pim-dmProtocol Independent Multicast - Dense Mode (PIM-DM) pim-smProtocol Independent Multicast - Sparse Mode (PIM-SM) dot1xIEEE 802.1X Port-Based Access Control lacpLink Aggregation Control Protocol (LACP) stpSpanning Tree Protocol (STP) rstpRapid Spanning Tree Protocol (RSTP) mstpMultiple Spanning Tree Protocol (MSTP) imiIntegrated Management Interface (IMI)

Parameter	Description
<program-name> (cont.)	imishIntegrated Management Interface Shell (IMISH) epsrEthernet Protection Switched Rings (EPSR) irdpICMP Router Discovery Protocol (IRDP) rmonRemote Monitoring loopprotLoop Protection poePower-inline (Power over Ethernet) dhcpsnDHCP snooping (DHCPSN)
`facility`	Filter messages to the permanent log by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from in the log: kernKernel messages userRandom user-level messages mailMail system daemonSystem daemons authSecurity/authorization messages syslogMessages generated internally by syslogd lprLine printer subsystem newsNetwork news subsystem uucpUUCP subsystem cronClock daemon authprivSecurity/authorization messages (private) ftp FTP daemon
`msgtext`	Select messages containing a certain text string
<text-string>	A text string to match. This is case sensitive, and must be the last text on the command line.

Default By default there is a filter to select all messages. This filter may be removed and replaced by filters that are more selective.

Mode Global Configuration

Examples To create a filter to send all messages generated by MSTP that have a severity of `info` or higher to terminal instances where the terminal monitor command has been given use the following commands:

```
awplus# configure terminal
awplus(config)# log monitor level info program mstp
```

To remove a filter that sends all messages generated by EPSR that have a severity of `notices` or higher to the terminal use the following commands:

```
awplus# configure terminal
awplus(config)# no log monitor level notices program epsr
```

To remove a default filter that includes sending everything to the terminal use the following commands:

```
awplus# configure terminal
awplus(config)# no log monitor level debugging
```

Validation Commands **show log config**

Related Commands **terminal monitor**

log permanent

This command configures the device to send log messages to non-volatile storage (NVS) on the device. Log messages sent to NVS are retained on the device over a restart, that is they are permanent. Once the permanent log reaches its configured maximum allowable size old messages will be deleted to make way for new ones.

The **no** variant of this command configures the device not to send any messages to the permanent log. Log messages will not be retained over a restart.

Syntax

```
log permanent
no log permanent
```

Mode Global Configuration

Examples To enable permanent logging use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent
```

To disable permanent logging use the following commands:

```
awplus# configure terminal
awplus(config)# no log permanent
```

Validation Commands show log config

Related Commands default log permanent
log permanent (filter)
log permanent size
show log permanent

log permanent (filter)

This command creates a filter to select messages to be sent to the permanent log. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the permanent log.

Syntax

```
log permanent [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]

no log permanent [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]
```

Parameter	Description
`level`	Filter messages to the permanent log by severity level.
<level>	The minimum severity of message to send to the log. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: 0|emergencies: System is unusable 1|alertsAction must be taken immediately 2|criticalCritical conditions 3|errorsError conditions 4|warningsWarning conditions 5|noticesNormal, but significant, conditions 6|informationalInformational messages 7|debuggingDebug-level messages
`program`	Filter messages to the permanent log by program. Include messages from a specified program in the log.

Parameter	Description
<program-name>	The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case -sensitive) that you find in the log output. ripRouting Information Protocol (RIP) ripngRouting Information Protocol - next generation (RIPng) ospfOpen Shortest Path First (OSPF) ospfv3Open Shortest Path First (OSPF) version 3 (OSPFv3) rsvpResource Reservation Protocol (RSVP) pim-dmProtocol Independent Multicast - Dense Mode (PIM-DM) pim-smProtocol Independent Multicast - Sparse Mode (PIM-SM) dot1xIEEE 802.1X Port-Based Access Control lacpLink Aggregation Control Protocol (LACP) stpSpanning Tree Protocol (STP) rstpRapid Spanning Tree Protocol (RSTP) mstpMultiple Spanning Tree Protocol (MSTP) imiIntegrated Management Interface (IMI) imishIntegrated Management Interface Shell (IMISH) epsrEthernet Protection Switched Rings (EPSR) irdpICMP Router Discovery Protocol (IRDP) rmonRemote Monitoring loopprotLoop Protection poePower-inline (Power over Ethernet) dhcpsnDHCP snooping (DHCPSN)
`facility`	Filter messages to the permanent log by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from in the log: kernKernel messages userRandom user-level messages mailMail system daemonSystem daemons authSecurity/authorization messages syslogMessages generated internally by syslogd lprLine printer subsystem newsNetwork news subsystem uucpUUCP subsystem cronClock daemon authprivSecurity/authorization messages (private) ftp FTP daemon
`msgtext`	Select messages containing a certain text string
<text-string>	A text string to match. This is case sensitive, and must be the last text on the command line.

Default By default the buffered log has a filter to select messages whose severity level is `notices (5)` or higher. This filter may be removed using the **no** variant of this command.

Mode Global Configuration

Examples To create a filter to send all messages generated by EPSR that have a severity of `notices` or higher to the permanent log use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent level notices program epsr
```

To create a filter to send all messages containing the text "`Bridging initialization`", to the permanent log use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent msgtext Bridging initialization
```

Validation Commands **show log config**

Related Commands **default log permanent**
log permanent
log permanent size
show log permanent

log permanent size

This command configures the amount of memory that the permanent log is permitted to use. Once this memory allocation has been filled old messages will be deleted to make room for new messages.

Syntax `log permanent size <50-250>`

Parameter	Description
<50-250>	Size of the permanent log in kilobytes

Mode Global Configuration

Example To allow the permanent log to use up to 100 kB of NVS use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent size 100
```

Validation Commands **show log config**

Related Commands **default log permanent**
log permanent

log-rate-limit nsm

This command limits the number of log messages generated by the switch for a given interval.

Use the **no** variant of this command to revert to the default number of log messages generated by the switch of up to 200 log messages per second.

Syntax

```
log-rate-limit nsm messages <message-limit> interval <time-interval>
no log-rate-limit nsm
```

Parameter	Description
<message-limit>	<1-65535> The number of log messages generated by the switch.
<time-interval>	<0-65535> The time period for log message generation in 1/100 seconds. If an interval of 0 is specified then no log message rate limiting is applied.

Default By default, the switch will allow 200 log messages to be generated per second.

Mode Global Configuration

Usage Previously, if the switch received a continuous stream of IGMP packets with errors, such as when a packet storm occurs because of a network loop, then the switch generates a lot of log messages using more and more memory, which may ultimately cause the switch to shutdown. This log rate limiting feature constrains the rate that log messages are generated by the switch.

Note that if within the given time interval, the number of log messages exceeds the limit, then any excess log messages are discarded. At the end of the time interval, a single log message is generated indicating that log messages were discarded due to the log rate limit being exceeded.

Thus if the expectation is that there will be a lot of discarded log messages due to log rate limiting, then it is advisable to set the time interval to no less than 100, which means that there would only be one log message, indicating log excessive log messages have been discarded.

Examples To limit the switch to generate up to 300 log messages per second, use the following commands:

```
awplus# configure terminal
awplus(config)# log-rate-limit nsm messages 300 interval 100
```

To return the switch the default setting, to generate up to 200 log messages per second, use the following commands:

```
awplus# configure terminal
awplus(config)# no log-rate-limit nsm
```

show counter log

This command displays log counter information.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show counter log`

Mode User Exec and Privileged Exec

Example To display the log counter information, use the command:

```
awplus# show counter log
```

Output **Figure 12-1: Example output from the show counter log command**

```
Log counters
Total Received          ......... 2328
Total Received P0       ......... 0
Total Received P1       ......... 0
Total Received P2       ......... 1
Total Received P3       ......... 9
Total Received P4       ......... 32
Total Received P5       ......... 312
Total Received P6       ......... 1602
Total Received P7       ......... 372
```

Table 12-1: Parameters in output of the show counter log command

Parameter	Description
`Total Received`	Total number of messages received by the log
`Total Received P0`	Total number of Priority 0 (Emergency) messages received
`Total Received P1`	Total number of Priority 1 (Alert) messages received
`Total Received P2`	Total number of Priority 2 (Critical) messages received
`Total Received P3`	Total number of Priority 3 (Error) messages received
`Total Received P4`	Total number of Priority 4 (Warning) messages received
`Total Received P5`	Total number of Priority 5 (Notice) messages received
`Total Received P6`	Total number of Priority 6 (Info) messages received
`Total Received P7`	Total number of Priority 7 (Debug) messages received

Related Commands **show log config**

show exception log

This command displays the contents of the exception log. When used within a stacked environment, this command will display the contents of the exception log for all the stack members.

Syntax `show exception log`

Mode User Exec and Privileged Exec

Example To display the exception log, use the command:

```
awplus# show exception log
```

Output **Figure 12-2: Example output from the show exception log command on a switch**

```
awplus#show exception log

show log

This command displays the contents of the buffered log.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show log [tail [<10-250>]]`

Parameter	Description
`tail`	Display only the latest log entries.
<10-250>	Specify the number of log entries to display.

Default By default the entire contents of the buffered log is displayed.

Mode User Exec, Privileged Exec and Global Configuration

Usage If the optional **tail** parameter is specified only the latest 10 messages in the buffered log are displayed. A numerical value can be specified after the **tail** parameter to select how many of the latest messages should be displayed.

Examples To display the contents of the buffered log use the command:

```
awplus# show log
```

To display the 10 latest entries in the buffered log use the command:

```
awplus# show log tail 10
```

Output **Figure 12-3: Example output from the show log command**

```
awplus#show log

Related Commands **show log config**
show log permanent

show log config

This command displays information about the logging system. This includes the configuration of the various log destinations, buffered, permanent, syslog servers (hosts) and email addresses. This also displays the latest status information for each of these destinations.

Syntax `show log config`

Mode User Exec, Privileged Exec and Global Configuration

Example To display the logging configuration use the command:

```
awplus# show log config
```

Output **Figure 12-5: Example output from the show log config command**

```
Buffered log:
Status ......... enabled
  Maximum size ... 100kb
  Filters:
 *1 Level ........ notices
    Program ...... any
    Facility ..... any
    Message text . any
  2 Level ........ informational
    Program ...... mstp
    Facility ..... daemon
    Message text . any
  Statistics ..... 1327 messages received, 821 accepted by filter (2006 Dec 11
10:36:16)
Permanent log:
  Status ......... enabled

    Message text . any
  Statistics ..... 1327 messages received, 1 accepted by filter (2006 Dec 11
10:36:16)
Email admin@alliedtelesis.com:
  Time offset .... +0:00
  Offset type .... Local
  Filters:
  1 Level ........ emergencies
    Program ...... any
    Facility ..... any
    Message text . any
  Statistics ..... 1327 messages received, 0 accepted by filter (2006 Dec 11
10:36:16)
Monitor log:
  Filters:
 *1   Level ...... debugging
      Program .... any
      Facility ... any
      Msg text ... any
  Statistics ..... Not available
Console log:
  Status ......... enabled
  List of consoles:
  1 .............. ttyS0
  Filters:
 *1   Level ...... critical
      Program .... any
      Facility ... any
      Msg text ... any
  Statistics ..... 1327 messages received, 1 accepted by filter (2006 Dec 11
10:36:16)
```

In the above example the '*' next to filter 1 in the buffered log configuration indicates that this is the default filter. The permanent log has had its default filter removed, so none of the filters are marked with "*'.

Note Terminal log and console log cannot be set at the same time. If console logging is enabled then the terminal logging is turned off.

Related Commands

show counter log
show log
show log permanent

show log permanent

This command displays the contents of the permanent log.

When used within a stacked environment, this command will display the contents of the permanent log for all the stack members.

Syntax `show log permanent[<stack-ID>][tail [<10-250>]]`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.
`tail`	Display only the latest log entries.
<10-250>	Specify the number of log entries to display.

Default If the optional `tail` parameter is specified only the latest 10 messages in the permanent log are displayed. A numerical value can be specified after the `tail` parameter to select how many of the latest messages should be displayed.

Mode User Exec, Privileged Exec and Global Configuration

Example To display the permanent log of stack member 2, use the command:

```
awplus# show log permanent 2
```

Output **Figure 12-6: Example output from the show log permanent command**

```
awplus#show log permanent 2

Stack member 2:

Related Commands show log

show running-config log

This command displays the current running configuration of the Log utility.

Syntax `show running-config log`

Mode Privileged Exec and Global Configuration

Example To display the current configuration of the log utility, use the command:

```
awplus# show running-config log
```

Related Commands **show log**
show log config

Chapter 13: Scripting Commands

Command List

This chapter provides commands used for command scripts.

activate

This command activates a script file.

Syntax `activate [background] <script>`

Parameter	Description
`background`	Activate a script to run in the background. A process that is running in the background will operate as a separate task, and will not interrupt foreground processing. Generally, we recommend running short, interactive scripts in the foreground and longer scripts in the background. The default is to run the script in the foreground.
<script>	The file name of the script to activate. The script is a command script consisting of commands documented in this software reference. Note that you must use either a **.scp** or a **.sh** filename extension for a valid script text file, as described below in the usage section for this command.

Mode Privileged Exec

Usage In a stacked environment you can use the CLI on a stack master to access file systems that are located on a stack backup member. In this case the command specifies a file on the backup member. The stack member's file system will be denoted by: *<hostname>-<member-id>* For example, **awplus-1** for member 1, **awplus-2** for member 2 etc.

When a script is activated, the privilege level is set to 1 enabling User Exec commands to run in the script. If you need to run Privileged Exec commands in your script you need to add an **enable (Privileged Exec mode)** command to the start of your script. If you need to run Global Configuration commands in your script you need to add a **configure terminal** command after the **enable** command at the start of your script.

The **activate** command executes the script in a new shell. A **terminal length** shell command, such as **terminal length 0** may also be required to disable a delay that would pause the display.

A script must be a text file with a filename extension of either **.sh** or **.scp** only for the AlliedWare Plus™ CLI to activate the script file. The **.sh** filename extension indicates the file is an ASH script, and the **.scp** filename extension indicates the file is an AlliedWare Plus™ script.

Examples To activate a command script to run as a background process, use the command:

```
awplus# activate background test.scp
```

To activate a script `/flash:/test.scp` in stack member 2, use the command:

```
awplus-2# activate awplus-2/flash:/test.scp
```

Related Commands
configure terminal
echo
enable (Privileged Exec mode)
wait

echo

This command echoes a string to the terminal, followed by a blank line.

Syntax `echo <line>`

Parameter	Description
<line>	The string to echo

Mode User Exec and Privileged Exec

Usage This command may be useful in CLI scripts, to make the script print user-visible comments.

Example To echo the string `Hello World` to the console, use the command:

```
awplus# echo Hello World
```

```
Hello World
```

Related Commands
activate
wait

wait

This command pauses execution of the active script for the specified period of time.

Syntax `wait <delay>`

Parameter	Description
<delay>	<1-65335> Specify the time delay in seconds

Default No wait delay is specified by default to pause script execution.

Mode Privileged Exec (when executed from a script not directly from the command line)

Usage Use this command to pause script execution in an **.scp** (AlliedWare Plus™ script) or an **.sh** (ASH script) file executed by the **activate** command. The script must contain an **enable (Privileged Exec mode)** command since the **wait** command is only executed in the Privileged Exec mode.When a script is activated, the privilege level is set to 1 enabling User Exec commands to run in the script. If you need to run Privileged Exec commands in your script you need to add an **enable (Privileged Exec mode)** command to the start of your script.

Example See an example **.scp** script file extract below that will show port counters for interface `port1.0.1` over a 10 second interval:

Related Commands
activate
echo
enable (Privileged Exec mode)

Chapter 14: Interface Commands

Command List

This chapter provides an alphabetical reference of commands used to configure and display interfaces.

description (interface)

Use this command to add a description to a specific port or interface.

Syntax `description <description>`

Parameter	Description
<description>	Text describing the specific interface.

Mode Interface Configuration

Example The following example uses this command to describe the device that a switch port is connected to.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# description Boardroom PC
```

interface (to configure)

Use this command to select one or more interfaces to configure.

Syntax

```
interface <interface-list>
interface lo
```

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.
`lo`	The local loopback interface.

Usage

A local loopback interface is one that is always available for higher layer protocols to use and advertise to the network. Although a local loopback interface is assigned an IP address, it does not have the usual requirement of connecting to a lower layer physical entity. This lack of physical attachment creates the perception of a local loopback interface always being accessible via the network.

Local loopback interfaces can be utilized by a number of protocols for various purposes. They can be used to improve access to the switch and also increase its reliability, security, scalability and protection. In addition, local loopback interfaces can add flexibility and simplify management, information gathering and filtering.

One example of this increased reliability is for OSPF to advertise a local loopback interface as an interface-route into the network irrespective of the physical links that may be “up” or “down” at the time. This provides a higher probability that the routing traffic will be received and subsequently forwarded.

Mode

Global Configuration

Example

The following example shows how to enter Interface mode to configure `vlan1`. Note how the prompt changes.

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)#
```

The following example shows how to enter Interface mode to configure the local loopback interface.

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)#
```

Related Commands

ip address
show interface
show interface brief

mru

Use this command to set the Maximum Receive Unit (MRU) size for switch ports, where MRU is the maximum frame size (excluding headers) that switch ports can receive. For more information, see **"Support for Jumbo Frames" on page 16.14**.

Use the **no** variant of this command to remove a previously specified Maximum Receive Unit (MRU) size for switch ports, and restore the default MRU size (1500 bytes) for switch ports.

Note

The figure of 1500 bytes specifies the payload only. For an IEEE 802.1q frame, provision is made (internally) for the following additional components:

- Source and Destination addresses
- EtherType field
- Priority and VLAN tag fields
- FCS

These additional components increase the frame size internally to 1522 bytes.

Syntax

```
mru <mru-size>
no mru
```

Parameter	Description
<mru-size>	<68-16357> Specifies the Maximum Receive Unit (MRU) size in bytes, where: ■ 1500 bytes is the default Ethernet MRU size for an interface.

Default The default MRU size is 1500 bytes for switch ports.

Mode Interface Configuration for switch ports.

Usage Note that **show interface** output will only show MRU size for switch ports.

Examples To configure an MRU of 16357 bytes on `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# mru 16357
```

To configure an MRU of 1500 bytes on `port1.0.2` to `port1.0.4` use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.4
awplus(config-if)# mru 1500
```

To restore the MRU size of 1500 bytes on `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no mru
```

Related Commands **show interface**

mtu

Use this command to set the Maximum Transmission Unit (MTU) size for VLANs, where MTU is the maximum packet size that VLANs can transmit. The MTU size setting is applied to both IPv4 and IPv6 packet transmission.

Use the **no** variant of this command to remove a previously specified Maximum Transmission Unit (MTU) size for VLANs, and restore the default MTU size (1500 bytes) for VLANs.

Syntax

```
mtu <mtu-size>
no mtu
```

Parameter	Description
<mtu-size>	<68-1500> Specifies the Maximum Transmission Unit (MTU) size in bytes, where 1500 bytes is the default Ethernet MTU size for an interface.

Default The default MTU size is 1500 bytes for VLAN interfaces.

Mode Interface Configuration for VLAN interfaces.

Usage If a switch receives an IPv4 packet for Layer 3 switching to another VLAN with an MTU size smaller than the packet size, and if the packet has the '**don't fragment**' bit set, then the switch will send an ICMP '**destination unreachable**' (3) packet type and a '**fragmentation needed and DF set**' (4) code back to the source. For IPv6 packets bigger than the MTU size of the transmitting VLAN interface, an ICMP '**packet too big**' (ICMP type 2 code 0) message is sent to the source.

Note that **show interface** output will only show MTU size for VLAN interfaces.

Examples To configure an MTU size of 1500 bytes on interface `vlan2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# mtu 1500
```

To configure an MTU size of 1500 bytes on interfaces `vlan2` to `vlan4`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# mtu 1500
```

To restore the MTU size to the default MTU size of 1500 bytes on `vlan2`, use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no mtu
```

To restore the MTU size to the default MTU size of 1500 bytes on `vlan2` and `vlan4`, use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no mtu
```

Related Commands **show interface**

show interface

Use this command to display interface configuration and status.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show interface [<interface-list>]
show interface lo
```

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.
`lo`	The local loopback interface.

Mode User Exec and Privileged Exec

Usage Note that the output displayed with this command will show MTU (Maximum Transmission Unit) size for VLAN interfaces, and MRU (Maximum Received Unit) size for switch ports.

Example To display configuration and status information for interfaces `port1.0.1` and `port1.0.4`, use the command:

```
awplus# show interface port1.0.1,port1.0.4
```

Figure 14-1: Example output from the show interface command

```

  Time since last state change: 69 days 01:28:47
```

To display configuration and status information for interfaces `vlan1` and `vlan2`, use the command:

```
awplus# show interface vlan1,vlan2
```

Figure 14-3: Example output from the show interface vlan1,vlan2 command

```
awplus#show interface vlan1,vlan2
Interface vlan1
  Scope: both
  Link is UP, administrative state is UP
  Hardware is VLAN, address is 0015.77e9.5c50
  IPv4 address 192.168.1.1/24 broadcast 192.168.1.255
  index 201 metric 1 mtu 1500
  arp ageing timeout 300
  <UP,BROADCAST,RUNNING,MULTICAST>
  SNMP link-status traps: Disabled
  Bandwidth 1g

show interface brief

show interface brief

Use this command to display brief interface, configuration, and status information, including provisioning information.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show interface brief`

Mode User Exec and Privileged Exec

Output **Figure 14-4: Example output from the show interface brief command**

```
awplus#show int brief
Interface              Status          Protocol
port1.0.1              admin up        down
port1.0.2              admin up        down
port1.0.3              admin up        down
port1.0.4              admin up        down
.
.
port1.0.23             admin up        down
port1.0.24             admin up        running
lo                     admin up        running
vlan1                  admin up        down
vlan2                  admin up        down
```

Table 14-1: Parameters in the output of the show interface brief command

Parameter	Description
`Interface`	The name or type of interface.
`Status`	The administrative state. This can be either **admin up** or **admin down**
`Protocol`	The link state. This can be either **down**, **running**, or **provisioned**

Related Commands **show interface**
show interface memory

show interface status

Use this command to display the status of the specified interface or interfaces. Note that when no interface or interfaces are specified then the status of all interfaces on the switch are shown.

Syntax `show interface [<port-list>] status`

Parameter	Description
<port-list>	The ports to display information about. The port list can be: ■ a switch port (e.g. `port1.0.12`) a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po3`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24`, or `sa1-2`, or `po1-4` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.4-1.2.24`. Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list

Examples

Figure 14-5: Example output from the show interface <port-list> status command

```
awplus#show interface port1.0.1 -1.0.5 status
Port       Name               Status            Vlan Duplex   Speed Type
port1.0.1                     notconnect           1 auto      auto 1000BASE-T
port1.0.2                     notconnect           1 auto      auto 1000BASE-T
port1.0.3                     notconnect           1 auto      auto 1000BASE-T
port1.0.4                     notconnect           1 auto      auto 1000BASE-T
port1.0.5                     notconnect           1 auto      auto 1000BASE-T
```

To display the status of all ports, use the commands:

```
awplus# show interface status
```

Figure 14-6: Example output from the show interface status command

```
awplus#sho int status
Port      Name               Status             Vlan Duplex   Speed Type
port1.0.1 Trunk_Net          connected         trunk a-full  a-1000 1000BaseTX
port1.0.2 Access_Net1        connected             5 full     100 1000BaseTX
port1.0.3 Access_Net1        disabled              5 auto      auto 1000BaseTX
port1.0.4 Access_Net2        connected             6 a-half   a-100 1000BaseTX
port1.0.5 Private_Prom       connected            10 a-full   a-100 1000BaseTX
port1.0.6 Private_Net1       connected         10,11 a-full   a-100 1000BaseTX
port1.0.7 Private_Net2       connected         10,12 a-full   a-100 1000BaseTX
port1.0.8                    notconnect            1 auto      auto 1000BaseTX
.
.
port1.0.23                   disabled              1 auto      auto not present
port1.0.24                   notconnect            1 auto      auto unknown
sa1                          notconnect       trunk auto      auto
```

Table 14-2: Parameters in the output from the show interface status command

Parameter	Description
`Port`	Name/Type of the interface.
`Name`	Description of the interface.
`Status`	The administrative and operational status of the interface; one of: ■ disabled: the interface is administratively down. ■ connect: the interface is operationally up. ■ notconnect: the interface is operationally down.
`Vlan`	VLAN type or VLAN IDs associated with the port: ■ When the VLAN mode is trunk, it displays **trunk** (it does not display the VLAN IDs). ■ When the VLAN mode is access, it displays the VLAN ID. ■ When the VLAN mode is private promiscuous, it displays the primary VLAN ID if it has one, and **promiscuous** if it does not have a VLAN ID. ■ When the VLAN mode is private host, it displays the primary and secondary VLAN IDs. ■ When the port is an Eth port, it displays **none**: there is no VLAN associated with it. ■ When the VLAN is dynamically assigned, it displays the current dynamically assigned VLAN ID (not the access VLAN ID), or **dynamic** if it has multiple VLANs dynamically assigned.
`Duplex`	The actual duplex mode of the interface, preceded by **a-** if it has autonegotiated this duplex mode. If the port is disabled or not connected, it displays the configured duplex setting.
`Speed`	The actual link speed of the interface, preceded by **a-** if it has autonegotiated this speed. If the port is disabled or not connected, it displays the configured speed setting.
`Type`	The type of interface, e.g., 1000BaseTX. For SFP bays, it displays **Unknown** if it does not recognize the type of SFP installed, or **Not present** if an SFP is not installed or is faulty.

Related Commands

show interface
show interface memory

shutdown

This command shuts down the selected interface. This administratively disables the link and takes the link down at the physical (electrical) layer.

Use the **no** variant of this command to disable this function and therefore to bring the link back up again.

Syntax

```
shutdown
no shutdown
```

Mode Interface Configuration

Example The following example shows the use of the `shutdown` command to shut down `port1.0.20`.

```
awplus# configure terminal
awplus(config)# interface port1.0.20
awplus(config-if)# shutdown
```

The following example shows the use of the `no shutdown` command to bring up `port1.0.12`.

```
awplus# configure terminal
awplus(config)# interface port1.0.12
awplus(config-if)# no shutdown
```

The following example shows the use of the `shutdown` command to shut down `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# shutdown
```

The following example shows the use of the `no shutdown` command to bring up `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no shutdown
```

Chapter 15: Interface Testing Commands

Command List

This chapter provides an alphabetical reference of commands used for testing interfaces.

clear test interface

This command clears test results and counters after issuing a test interface command. Test results and counters must be cleared to issue subsequent test interface commands later on.

Syntax `clear test interface {<port-list>|all}`

Parameter	Description
<port-list>	The ports to test. A port-list can be: ■ a switch port (e.g. `port1.0.12`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-port1.0.24` ■ a comma-separated list of the above, e.g. `port1.0.1,port1.0.5-1.0.24` The specified ports must exist.
`all`	All interfaces

Mode Privileged Exec

Examples To clear the counters for `port1.0.1` use the command:

```
awplus# clear test interface port1.0.1
```

To clear the counters for all interfaces use the command:

```
awplus# clear test interface all
```

Related Commands test interface

service test

This command puts the device into the interface testing state, ready to begin testing. After entering this command, enter Interface Configuration mode for the desired interfaces and enter the command **test interface**.

Do not test interfaces on a device that is part of a live network—disconnect the device first.

Use the **no** variant of this command to stop the test service.

Syntax

```
service test
no service test
```

Mode Global Configuration

Example To put the device into a test state, use the command:

```
awplus(config)# service test
```

Related Commands **test interface**

test interface

This command starts a test on a port or all ports or a selected range or list of ports.

Use the **no** variant of this command to disable this function. The test duration can be configured by specifying the time in minutes after specifying a port or ports to test.

For an example of all the commands required to test switch ports, see the Examples section in this command. To test the Eth port, set its speed to 100 by using the command **speed 100.**

Note Do not run test interface on live networks because this will degrade network performance.

Syntax

```
test interface {<port-list>|all} [time{<1-60>|cont}]
no test interface {<port-list>|all}
```

Parameter	Description
<port-list>	The ports to test. A port-list can be: ■ a switch port (e.g. `port1.0.12`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-port1.0.24` ■ a comma-separated list of the above, e.g. `port1.0.1,port1.0.5-1.0.24` The specified ports must exist.
`all`	All ports
`time`	Keyword entered prior to the value for the time duration of the interface test.
<1-60>	Specifies duration of time to test the interface or interfaces in minutes (from a minimum of 1 minute to a maximum of 60 minutes). The default is 4 minutes.
`cont`	Specifies continuous interface testing until cancelled with command negation.

Mode Privileged Exec

Example To test the switch ports in VLAN 1, install loopbacks in the ports, and enter the following commands:

```
awplus(config)# service test
awplus(config)# no spanning-tree rstp enable bridge-forward
awplus(config)# interface vlan1
awplus(config-if)# shutdown
awplus(config-if)# end
awplus# test interface all
```

To see the output, use the commands:

```
awplus# show test
```

```
awplus# show test count
```

To start the test on all interfaces for 1 minute use the command:

```
awplus# test interface all time 1
```

Related Commands **clear test interface**

Part 2: Layer Two Switching

Chapter 16: Switching Introduction

Introduction

This chapter gives an overview of Layer 1 and 2 switching.

Layer 2 switches are used to connect multiple Local Area Network (LAN) segments together to form an extended LAN. Stations connected to different LANs can be configured to communicate with one another as if they were on the same LAN. They can also divide one physical LAN into multiple Virtual LANs (VLANs). Stations connected to each other on the same extended LAN can be grouped in separate VLANs, so that a station in one VLAN can communicate directly with other stations in the same VLAN, but must go through higher layer routing protocols to communicate with those stations in other VLANs.

Layer 2 switches appear transparent to higher layer protocols, transferring frames between the data link layers of the networks to which they are attached. A Layer 2 switch accesses each physical link according to the rules for that particular network. Access may not always be instant, so the switch must be capable of storing and forwarding frames.

Storing and forwarding enables the switch to examine both the VLAN tag fields and Ethernet MAC address fields in order to forward the frames to their appropriate destination. In this way, the switch can act as an intelligent filtering device, redirecting or blocking the movement of frames between networks.

Because switch ports can sometimes receive frames faster than it can forward them, the switch has Quality of Service (QoS) queues in which frames await transmission according to their priority. Such a situation could occur where data enters a number of input ports all destined for the same output port.

The switch can be used to:

- Increase both the physical extent and the maximum number of stations on a LAN. LANs are limited in their physical extent by the signal distortion and propagation delay characteristics of the media. The switch overcomes this limitation by receiving a frame on one LAN and then retransmitting it to another. The physical characteristics of the LAN media also place a practical limit on the number of stations that can be connected to a single LAN segment. The switch overcomes this limitation by joining LAN segments to form an extended LAN capable of supporting more stations than either of the individual LAN segments.
- Connect LANs that have a common data link layer protocol but different physical media, for example, Ethernet 10BASET, 100BASET, and 10BASEF.
- Increase the availability of LANs by allowing multiple redundant paths to be physically configured and selected dynamically, using the Spanning Tree algorithm.
- Reduce the load on a LAN or increase the effective bandwidth of a LAN, by filtering traffic.
- Prioritize the transmission of data with high Quality of Service requirements.

By using Virtual LANs (VLANs), a single physical LAN can be separated into multiple Virtual LANs. VLANs can be used to:

- Further improve LAN performance, as broadcast traffic is limited to LAN segments serving members of the VLAN to which the sender belongs.
- Provide security, as frames are forwarded to those stations belonging to the sender's VLAN, and not to stations in other VLANs on the same physical LAN.
- Reduce the cost of moving or adding stations to function or security based LANs, as this generally requires only a change in the VLAN configuration.

Physical Layer Information

Switch Ports

A unique port number identifies each switch port. The software supports a number of features at the physical level that allow it to be connected in a variety of physical networks. This physical layer (Layer 1) versatility includes:

- Enabling and disabling of ports
- Auto negotiation of port speed and duplex mode for all 10/100 BASE ports
- Manual setting of port speed and duplex mode for all 10/100 BASE ports
- Link up and link down triggers
- Packet storm protection
- Port mirroring
- Support for SNMP management

Port Numbering

Ports are numbered using a 3 digit format `x.y.z` where `x` is the device number (within a stacked configuration), `y` is the module number within the device, and `z` is the port number within the module. Ports connected directly to the switch chassis or baseboard (rather than a pluggable module) are given the module number `0`. In an unstacked configuration all device numbers are `1`. For example, `port1.2.6` represents device `1`, module `2`, port `6`.

Adding a description

You can add a description to an interface to help identify its purpose or position. For example, to add the description "connected to Nerv" to `port1.0.3`, use the commands:

```
awplus(config)# interface port1.0.3
awplus(config-if)# description connected to Nerv
```

Port ranges

Continuous

To configure a continuous range of ports at the same time, enter the range in the format:

`portx.y.z-portx.y.z`

For example, to configure the same interface setting on `port1.0.10` to `port1.0.20`, enter the Global Configuration mode command:

```
awplus(config)# interface port1.0.10-port1.0.20
```

Non-continuous

To configure a non-continuous set of ports at the same time, enter a comma-separated list:

`portx.y.z,portx.y.z`

For example, to configure the same interface setting on `port1.0.1` and `port1.0.5`, enter the Global Configuration mode command:

```
awplus(config)# interface port1.0.1,port1.0.5
```

You can combine a hyphen-separated range and a comma-separated list. To configure the same setting on `port1.0.1` to `port1.0.3` and `port1.0.5`, enter the Global Configuration mode command:

```
awplus(config)# interface port1.0.1-port1.0.3,port1.0.5
```

Activating and Deactivating Switch Ports

An active switch port is one that is available for packet reception and transmission. Disabling a switch port does not affect the STP operation on the port. By default ports and VLANs are activated.

To shutdown a port or VLAN use the **shutdown** command on page 14.14. Use the **no** variant of this command to reactivate it.

Autonegotiation

Autonegotiation lets the port adjust its speed and duplex mode to accommodate the device connected to it. When the port connects to another autonegotiating device, they negotiate the highest possible speed and duplex mode for both of them.

By default, all ports autonegotiate. Setting the port to a fixed speed and duplex mode may be necessary when connecting to a device that cannot autonegotiate.

Duplex mode

Ports can operate in full duplex or half duplex mode depending on the type of port it is. When in full duplex mode, a port transmits and receives data simultaneously. When in half duplex mode, the port transmits or receives but not both at the same time.

You can set a port to use either of these options, or allow it to autonegotiate the duplex mode with the device at the other end of the link. To configure the duplex mode, use these commands:

`awplus#`	
`configure terminal`	Enter Global Configuration mode
`awplus(config)#`	
`interface port1.0.1`	Enter Interface Configuration mode for port 1.0.1
`awplus(config-if)#`	
`duplex {auto|full|half}`	Enter the Duplex mode for port 1.0.1

Speed options

Before configuring a port's speed, check the hardware limit for the particular port type. The following list can be used as a guide:

- non-SFP RJ-45 copper switch ports: 10, 100 or 1000 Mbps
- supported tri-speed copper SFPs: 10, 100 or 1000 Mbps
- fibre SFPs: 100 Mbps to 1000 Mbps, depending on the SFP type
- SFP+ / XFP modules: 10 Gbps

For the latest list of approved SFP transceivers either contact your authorized distributor or reseller, or visit **http://www.alliedtelesis.com**.

You can set a port to use one of these speed options, or allow it to autonegotiate the speed with the device at the other end of the link.

Most types of switch port can operate in either full duplex or half duplex mode. In full duplex mode a port can transmit and receive data simultaneously. In half duplex mode the port can either transmit or receive, but not at the same time.

Make sure that the configuration of the switch matches the configuration of the device at the far end of the link. In particular, avoid having one end autonegotiate duplex mode while the other end is fixed. For example, if you set one end of a link to autonegotiate and fix the other end at full duplex, the autonegotiating end cannot determine that the fixed end is full duplex capable. Therefore, the autonegotiating end selects half-duplex operation. This results in a duplex mismatch and packet loss. To avoid this, either fix the mode at both ends, or use autonegotiation at both ends.

Configuring the port speed

To set the port speed to 1000 kbps on port 1.0.1, use the commands:

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`interface port1.0.1`	Enter Interface Configuration mode for port 1.0.1
`awplus(config-if)#`	
`speed 1000`	Set the port speed for port 1.0.1 to 1000 Mbps.

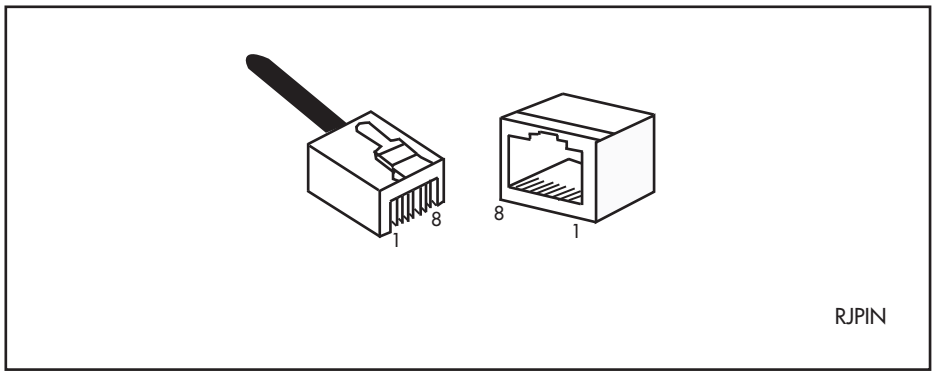
MDI/MDIX Connection Modes

By default, copper 10Base-T, 100Base-T, and 1000Base-T ports on the switch automatically set the Media Dependant Interface mode to MDI or MDIX for successful physical connections. We recommend using this default setting. However, you can configure them to have either fixed MDI mode or fixed MDIX mode by using the **polarity** command on page 17.29. MDI/MDIX mode polarity does not apply to fibre ports.

Connections to 10BASE-T, 100BASE-T, and 1000BASE-T networks may either be straight though (MDI) or crossover (MDIX). The crossover connection can be achieved by using either a crossover cable or by integrating the crossover function within the device. In the latter situation, the connector is referred to as an MDIX connection. Refer to your switch's Hardware Reference for more detailed information on physical connections cabling.

The IEEE 802.3 standard defines a series of Media Dependant Interface types and their physical connections. For twisted pair (10BASE-T) networking, the standard defines that connectors that conform to the IEC 60603-7 standard. The **Figure 16-1**f shows a connector of this type.

Figure 16-1: Connector used for 10BASE-T networks



The Layer 2 Switching Process

The Layer 2 switching process comprises these related but separate processes:

- **The Ingress Rules**
- **The Learning Process**
- **The Forwarding Process**
- **The Egress Rules**

Ingress rules admit or discard frames based on their VLAN tagging.

The Learning process learns the MAC addresses and VLAN membership of frames admitted on each port.

The Forwarding process determines which ports the frames are forwarded to, and the Quality of Service priority with which they are transmitted.

Finally, Egress rules determine for each frame whether VLAN tags are included in the Ethernet frames that are transmitted.

These processes assume that each station on the extended LAN has a unique data link layer address, and that all data link layer frames have a header which includes the source (sender's) MAC address and destination (recipient's) MAC address.

The Ingress Rules

All frames, tagged and untagged, that a VLAN-aware switch receives must be classified into a VLAN. Each received frame is mapped to exactly one VLAN. If an incoming frame is tagged with a valid VLAN identifier (VID) then that VID is used. If an incoming frame is untagged or is priority tagged (a tagged frame with a VID of all zeros), then the switch uses internal VLAN association rules to determine the VLAN it belongs to. The default settings for the ingress rules are to Admit All Frames, and for Ingress Filtering to be on.

Every port belongs to one or more VLANs so every incoming frame has a VID to show which VLAN it belongs. The final part of the Ingress Rules depends on whether Ingress Filtering is enabled for the port. If Ingress Filtering is disabled, all frames are passed on to the Learning process, regardless of which VLAN they belong to. If Ingress Filtering is enabled (by default), frame are admitted only when they have the VID of a VLAN to which the port belongs. Frames are discarded when they do not have an associated VID matching the VLAN assigned to a port.

The possible association rules, in order of precedence, are:

- IP subnet/IPX network classification
- protocol classification
- port classification

The default VLAN classification is based upon the port on which the incoming frame (untagged, or priority tagged) was received. It is possible for an incoming untagged, or priority tagged, frame to match more than one of the association rules.

Each port on the switch can be configured to be one of two modes:

- only untagged frames - access mode
- only VLAN-tagged frames - trunk mode

Access Mode

This mode can be used to connect to VLAN unaware devices. Frames to and from access mode ports carry no VLAN tagging information.

Trunk Mode

This mode is used to connect VLAN capable devices. All devices that connect using trunk mode ports must be VLAN aware.

The Learning Process

The learning process uses an adaptive learning algorithm, sometimes called ***backward learning***, to discover the location of each station on the extended LAN.

All frames admitted by the ingress rules on any port are passed on to the forwarding process when they are for destinations in the same VLAN. Frames destined for other VLANs are passed to a Layer 3 protocol, such as IP. For every frame admitted, the frame's source MAC address and VID are compared with entries in the forwarding database for the VLAN (also known as a ***MAC Address table***) maintained by the switch. When the frame's source address is not in the forwarding database for the VLAN, the address is added and an ageing timer for that entry is started. When the frame's source address is already in the forwarding database, the ageing timer for that entry is restarted.

By default, switch learning is enabled. It can be disabled with the **no mac address-table acquire** command, and re-enabled using the **mac address-table acquire** command on page 17.17.

If the ageing timer for an entry in the forwarding database expires before another frame with the same source address is received, the entry is removed from the forwarding database. This prevents the forwarding database from being filled with information about stations that are inactive or have been disconnected from the network. It also ensures that entries for active stations are kept alive in the forwarding database.

By default, the ageing timer is enabled with a default ageing-time. The ageing timer can be reset to the default with the **no mac address-table ageing-time** command. The ageing timer can be increased or decreased using the **mac address-table ageing-time** command.

If switch learning is disabled and the ageing timer has aged out all dynamically learned filter entries, only statically entered MAC source addresses decide the packets to forward or discard. When the switch finds no matching entries in the forwarding database during the forwarding process, all switch ports in the VLAN are flooded with the packet, except the port that received it.

The default for the mac address-table ageing-time is 300 seconds (5 minutes) and can be modified by using the command **mac address-table ageing-time**. The **no mac address-table ageing-time** command will reset the ageing-time back to the default (5 minutes).

To set the mac address-table ageing-time to 1000 seconds:

`awplus#`	
`configure terminal`	Enter the config terminal mode
`awplus(config)#`	
`mac address-table ageing-time 1000`	Set the ageing time to 1000 seconds

To display general switch settings, including settings for switch learning and the switch ageing timer, use the **show system** command on page 10.49.

The Forwarding Process

After a VID is assigned to a frame using the ingress rules, the switch forwards it to the destination MAC address specified in the frame. To do this the switch must learn which MAC addresses are available on each port for each VLAN. When the destination MAC address is not found, the switch floods the frame on all ports that are members of the VLAN except the port on which the frame was received.

The forwarding database (also known as the ***MAC Address table***) determines the egress port on which the destination MAC address has been learned. MAC addresses are learned dynamically as part of the Layer 2 switching process.

The forwarding database is ordered according to MAC address and VLAN identifier. This means a MAC address can appear more than once in the forwarding database having been learned on the same port but for different VLANs. This could occur if the IP address of an end station is changed thereby moving the end station to a different IP subnet-based VLAN while still connected to the same switch port. When the forwarding database ageing process is enabled, old entries in the forwarding database are deleted after a user-configurable period.

If the destination address is found, the switch discards the frame when the port is not in the STP forwarding or disabled state if the destination address is on the same port as the source address, or if there is a static filter entry for the destination address set to **discard** (see **"Layer 2 Filtering" on page 16.10**). Otherwise, the frame is forwarded on the indicated port.

Forwarding occurs only when the port on which the frame was received is in the Spanning Tree forwarding or disabled state. The destination address is then looked up in the forwarding database for the VLAN.

The Egress Rules

After the forwarding process has determined from which ports and transmission queues to forward a frame, the egress rules for each port determine whether the outgoing frame is VLAN-tagged with its numerical VLAN identifier (VID).

A port must belong to a VLAN at all times unless the port has been set as the mirror port for the switch.

A port can transmit VLAN-tagged frames for any VLAN to which the port belongs. A port can transmit untagged frames for any VLAN for which the port is configured, e.g. IP subnet-based or protocol-based, unless prevented by the port-based VLAN egress rules. A port that belongs to a port-based VLAN can transmit untagged packets for only one VLAN. For more information about VLANs and VLAN tagging, see **Chapter 18, VLAN Introduction**.

For more information on port tagging see the following commands:
switchport mode access command on page 19.17
switchport mode trunk command on page 19.23

Layer 2 Filtering

The switch has a forwarding database (also known as the ***MAC address table***) whose entries determine whether frames are forwarded or discarded over each port. Entries in the forwarding database are created dynamically by the learning process. A dynamic entry is automatically deleted from the forwarding database when its ageing timer expires.

The forwarding database supports queries by the forwarding process as to whether frames with given values of the destination MAC address field should be forwarded to a given port.

For each VLAN, the destination MAC address of a frame to be forwarded is checked against the forwarding database. If there is no entry for the destination address and VLAN, the frame is transmitted on all ports in the VLAN that are in the forwarding or disabled state, except the port on which the frame was received. This process is referred to as ***flooding***. If an entry is found in the forwarding database but the entry is not marked ***forwarding*** or the entry points to the same port the frame was received on, the frame is discarded. Otherwise, the frame is transmitted on the port specified by the forwarding database.

Ingress Filtering

The **ingress-filter** parameter of the **switchport mode trunk** command on page 19.23 and the **switchport mode access** command on page 19.17, enables or disables ingress filtering of frames entering the specified port (or port range). Each port on the switch belongs to one or more VLANs. If ingress filtering is enabled, any frame received on the specified port is only admitted if its VID matches one for which the port is tagged. Any frame received on the port is discarded if its VID does not match one for which the port is tagged.

Untagged frames are admitted and are assigned the VLAN Identifier (VID) of the port's native VLAN. Ingress filtering can be turned off by setting the **disable** parameter of the above two commands. The default setting of the **enable** / **disable** parameter option is **enable**.

Note

Enabling the **vlan-disable** parameter of the **thrash-limiting** command on page 17.56 will also enable ingress filtering, and will override the setting of the switchport mode access, and trunk commands

Storm-control

The packet storm-control feature enables you to set limits on the reception rate of broadcast, multicast frames and destination lookup failures. You can set separate limits beyond which each of the different packet types are discarded.

Note A destination lookup failure (DLF) is the event of receiving a unicast Ethernet frame with an unknown destination address.

For more information on applying storm-control, see the **storm-control level** command on page 17.52.

To apply storm-control by limiting broadcasts to 30% on `port1.0.4`

`awplus(config-if)#` `configure terminal`	Enter Global Configuration mode.
`awplus(config-if)#` `interface port1.0.4`	Enter the Interface Configuration mode for the selected port.
`awplus(config-if)#` `storm-control broadcast level 30`	Configure the interface.

To turn off storm protection on `port1.0.4`

`awplus(config-if)#` `configure terminal`	Enter Global Configuration mode.
`awplus(config-if)#` `interface port1.0.4`	Enter the Interface Configuration mode for the selected port.
`awplus(config-if)#` `no storm-control broadcast level`	Configure the interface.

Loop Protection

Loop protection is a general term that embraces several different methods you can apply to protect your network from effects such as broadcast storms that can result from data loops or equipment malfunction. Presently two methods of loop protection are available:

- **Loop Detection**
- **Thrash Limiting**

Loop Detection

Introduction

This feature is used to detect loops with a network segment. If a loop is detected then a selected protection mechanism is applied to limit the effect of the loop. The loop protection actions can be applied either to the port at which the loop is detected or to the VLAN within which the loop was detected.

Limiting Actions

You can configure loop detection to apply one of the following mechanisms when a loop condition is detected:

- Block all traffic on the port (or aggregated link) that detected the loop, and take **down** the link.
- Block all traffic on the port (or aggregated link) that detected the loop, but keep the link in the **up** state.
- Block all traffic on a vlan. Note that setting this parameter will also enable ingress filtering. This is the default action.
- Take no action, but log the details.
- Take no action.

Operation

To detect loops this feature operates by transmitting a series of Loop Detection Frames (LDFs) from each switch port out into the network. If no loops exist, then none of these frame should ever return. If a frame returns to its original port, the detection mechanism assumes that there is a loop somewhere in the network and offers a number of protective options.

Each LDF is a Layer 2 LLC frame that contains the following components:

- the source MAC address of the originating switch
- the destination MAC address of the non-existent end station 00-00-F4-27-71-01
- VLAN ID (where the port is a tagged member of a VLAN).
- a randomly generated LDF ID number.

You can set the detection mechanism to remember the LDF ID of up to 5 of the most recently transmitted LDF frames. Each of the 5 most recently transmitted frames is compared with every frame that arrives at that same port.

Configuration

To enable loop protection and configure its basic parameters, you use the **loop-protection** command on page 17.14.

Example To enable the loop-detect mechanism, and generate loop-detect frames once every 5 seconds, use the command:

```
awplus(config)# loop-protection loop-detect ldf-interval 5
```

Note LDFs are sent sequentially for each VLAN defined to a particular port. For example, if a particular port in this example is a member of 4 VLANs, then the LDFs will be sent from this port at the rate of 4 frames every 5 seconds.

You can now use the **loop-protection action** command on page 17.15 configure the action that the switch will take if a loop is detected.

Example To disable an interface, and bring the link down, when a network loop is detected, use the command:

```
awplus(config-if)# loop-protection action link-down
```

Now decide how long you want the protective action to apply for. You configure this function by using the **loop-protection timeout** command on page 17.16.

Example To configure a loop protection action timeout of 10 seconds, use the command:

```
awplus(config-if)# loop-protection timeout 10
```

Thrash Limiting

MAC address thrashing occurs when MAC addresses move rapidly between one or more ports or trunks, for example, due to a network loop.

Thrash limiting enables you to apply actions to a port when thrashing is detected. It is supported on all port types and also on aggregated ports.

Limiting Actions There are several different thrash actions that you can apply to a port when thrashing is detected. These actions are:

- learnDisable
  MAC address learning is temporarily disabled on the port.
- portDisable
  The port is logically disabled. Traffic flow is prevented, but the link remains up. The device at the other end does not notice that the port has changed status, and the link LEDs at both ends stay on.
- linkDown
  The port is physically disabled and the link is down. This is equivalent to entering the **shutdown** command on page 14.14.
- vlanDisable
  The port is disabled only for the VLAN on which thrashing has occurred. It can still receive and transmit traffic for any other VLANs of which it is a member.

When a MAC address is thrashing between two ports, one of these ports (the first to cross its thrashing threshold) is disabled. All other ports on the device will then have their threshold counters reset.

To set a thrash action for a port, use the **thrash-limiting** command on page 17.56:

To view the thrash action that is set for a port, use the **show interface switchport** command on page 17.32:

Re-enabling a port

When a port is disabled, either completely or for a specific VLAN, it remains disabled until it is manually re-enabled in any of the following ways:

- by using SNMP
- by rebooting the switch or stack
- by specifying a thrash timeout value along with the thrash action
- via the CLI

Support for Jumbo Frames

Jumbo frames are frames with more than 1500 bytes of payload. You can enable jumbo frame support on the switch to improve throughput and network utilization. Jumbo frame support allows you to put more data in each packet that the switch has to process. The maximum received packet size is 16357 bytes.

You can increase the Maximum Receive Unit (MRU) size for switch ports to receive jumbo frames with payload larger than 1500 bytes. To increase MRU size, use the **mru** command on page 14.5.

Note

Jumbo packet switching is supported for L2 and L3 traffic flows that have established traffic paths. Jumbo frames cannot be used for establishing these network paths. Please use frames less than 1518 bytes to establish the path, for example by pinging the destination.

Port Mirroring

Port mirroring enables traffic being received and transmitted on a switch port to be sent to another switch port, the mirror port, usually for the purposes of capturing the data with a protocol analyzer.

The mirror port is the only switch port that does not belong to a VLAN, and therefore does not participate in any other switching. Before the mirror port can be set, it must be removed from all trunk groups and all VLANs except the default VLAN.

The following example sets mirroring on ports 1.0.2 and 1.0.5 for both incoming and outgoing data.

Note

Due to the internal hardware properties of the switch, frames that are destined to leave the mirrored port untagged (i.e. will have their VLAN tag removed on egress) will be received by the mirror port with the tag retained. Consequently, if frames were being transmitted by the mirror port (into the network) at wire speed, then the mirror port might be unable to accept all the frames supplied to it.

To configure port 1. 0. 2 to mirror port 1. 0. 5

`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2`	Enter the Interface Configuration mode for port1.0.2.
`awplus(config-if)#`	
`mirror interface port1.0.5 direction both`	Configure this port to mirror port 1. 0. 5.

Port Security

The port security features provide control over the stations connected to each switch port. These comprise:

- MAC address learn limits
- IEEE 802.1X

MAC Address Learn Limits

MAC address limiting is applied using the **switchport port-security** command on page 17.53. If enabled on a port, the switch will learn MAC addresses up to a user-defined limit from 1 to 256, then lock out all other MAC addresses. One of the following options can be specified for the action taken when an unknown MAC address is detected on a locked port:

- Discard the packet and take no further action.
- Discard the packet and notify management with an SNMP trap.
- Discard the packet, notify management with an SNMP trap and disable the port.

IEEE 802.1X

IEEE 802.1X restricts unauthenticated devices from connecting to the switch. After authentication is successful, traffic is allowed through the switch. For more information see **Chapter 64, 802.1X Introduction and Configuration**.

Quality of Service

Quality of Service (QoS) enables you to both prioritize traffic and limit its available bandwidth. The concept of QoS is a departure from the original networking protocols, in which all traffic on the Internet or within a LAN had the same available bandwidth. Without QoS, all traffic types are equally likely to be dropped if a link becomes oversubscribed. This approach is now inadequate in many networks, because traffic levels have increased and networks often carry time-critical applications such as streams of real-time video data. QoS also enables service providers to easily supply different customers with different amounts of bandwidth.

Configuring Quality of Service involves two separate stages:

1. Classifying traffic into flows, according to a wide range of criteria. Classification is performed by the switch's class maps.

2. Acting on these traffic flows.

The switch's QoS functionality includes the following:

- policies, to provide a QoS configuration for a port or ports
- traffic classes, for bandwidth limiting and user prioritization
- maximum bandwidth limiting on a traffic class
- flow groups within traffic classes, for user prioritization
- control of the egress scheduling algorithm
- priority relabelling of frames, at Layer 2, by replacing the VLAN tag User Priority field
- class of service relabelling of frames, at Layer 3, by replacing the DSCP (DiffServ Code Point) or the TOS precedence value in the IP header's Type of Service (TOS) field.

For more information on QoS see **Chapter 62, Quality of Service (QoS) Introduction** and **Chapter 63, QoS Commands**.

IGMP Snooping

IGMP (Internet Group Management Protocol) is used by IP hosts to report their multicast group memberships to routers and switches. IP hosts join a multicast group to receive broadcast messages directed to the multicast group address. IGMP is an IP-based protocol and uses IP addresses to identify both the multicast groups and the host members. For a VLAN-aware devices, this means multicast group membership is on a per-VLAN basis. If at least one port in the VLAN is a member of a multicast group, by default multicast packets will be flooded onto all ports in the VLAN.

IGMP snooping enables the switch to forward multicast traffic intelligently on the switch. The switch listens to IGMP membership reports, queries and leave messages to identify the switch ports that are members of multicast groups. Multicast traffic will only be forwarded to ports identified as members of the specific multicast group.

IGMP snooping is performed at Layer 2 on VLAN interfaces automatically. By default, the switch will forward traffic only from those ports with multicast listeners, therefore it will not act as a simple hub and flood all multicast traffic out all ports. IGMP snooping is independent of the IGMP and Layer 3 configuration, so an IP interface does not have to be attached to the VLAN, and IGMP does not have to be enabled or configured.

IGMP snooping is enabled by default.

For more information on IGMP see **Chapter 48, IGMP and IGMP Snooping Introduction** and **Chapter 49, IGMP and IGMP Snooping Commands**.

Chapter 17: Switching Commands

Command List

This chapter provides an alphabetical reference of commands used to configure switching. For more information see **Chapter 16, Switching Introduction**.

backpressure

This command provides a method of applying flow control to ports running in half duplex mode. The setting will only apply when the link is in the half-duplex state.

You can disable backpressure on an interface using the **off** parameter or the **no** variant of this command.

Syntax

```
backpressure {on|off}
no backpressure
```

Parameters	Description
`on`	Enables half-duplex flow control.
`off`	Disables half-duplex flow control.

Default Backpressure is turned off by default. You can determine whether an interface has backpressure enabled by viewing the running-config output; **backpressure on** is shown for interfaces if this feature is enabled.

Mode Interface Configuration

Usage The backpressure feature enables half duplex Ethernet ports to control traffic flow during congestion by preventing further packets arriving. Back pressure utilizes a pre-802.3x mechanism in order to apply ethernet flow control to switch ports that are configured in the half duplex mode.

The flow control applied by the **flowcontrol (switch port)** command on page 17.12 operates only on full-duplex links, whereas back pressure operates only on half-duplex links.

If a port has insufficient capacity to receive further frames, the switch will simulate a collision by transmitting a CSMACD jamming signal from this port until the buffer empties. The jamming signal causes the sending switch to stop transmitting and wait a random period of time, before retransmitting its data, thus providing time for the buffer to clear. Although this command is only valid for switch ports operating in half-duplex mode the remote switch (the one sending the data) can be operating in the full duplex mode.

To see the currently-negotiated duplex mode for ports whose links are up, use the command **show interface**. To see the configured duplex mode (when different from the default), use the command **show running-config**.

Examples To enable back pressure flow control on interfaces `port1.0.1-port1.0.24` enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.24
awplus(config-if)# backpressure on
```

To disable back pressure flow control on interface `port1.0.2` enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# backpressure off
```

Validation Commands **show running-config**
show interface

Related Commands **duplex**

clear loop-protection counters

Use this command to clear the counters for the Loop Protection counters.

Syntax

```
clear loop-protection [interface <port-list>] counters
```

Parameters	Description
`interface`	The interface whose counters are to be cleared.
`<port-list>`	A port, a port range, or an aggregated link.

Mode Privileged Exec

Examples To clear the counter information:

```
awplus# clear loop-protection counters
awplus# clear loop-protection interface port1.0.1 counters
```

clear mac address-table static

Use this command to clear the filtering database of all statically configured entries for a selected MAC address, interface, or VLAN.

Syntax

```
clear mac address-table static
   [address <mac-address>|interface <port>|vlan <vid>]
```

Parameter	Description
`address`	Specify a MAC (Media Access Control) address to be cleared from the filtering database.
<mac-address>	Enter a MAC address to be cleared from the database in the format HHHH.HHHH.HHHH.
`interface`	Specify a switch port to be cleared from the filtering database.
<port>	Specify the switch port from which address entries will be cleared. This can be a single switch port, (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).
`vlan`	Specify a VLAN to be cleared from the filtering database.
<vid>	Enter a VID (VLAN ID) in the range `<1-4094>` to be cleared from the filtering database.

Mode Privileged Exec

Usage Use this command with options to clear the filtering database of all entries made from the CLI for a given MAC address, interface or VLAN. Use this command without options to clear any entries made from the CLI.

Compare this usage with **clear mac address-table dynamic** command on page 17.5.

Examples This example shows how to clear all filtering database entries configured through the CLI.

```
awplus# clear mac address-table static
```

This example shows how to clear all filtering database entries for a given interface configured through the CLI.

```
awplus# clear mac address-table static interface port1.0.3
```

This example shows how to clear filtering database entries filtering database entries configured through the CLI for a given mac address.

```
awplus# clear mac address-table static address 0202.0202.0202
```

Related Commands
clear mac address-table dynamic
mac address-table static
show mac address-table

clear mac address-table dynamic

Use this command to clear the filtering database of all entries learned for a selected MAC address, an MSTP instance, a switch port interface or a VLAN interface.

Syntax

```
clear mac address-table dynamic
   [address <mac-address>|interface <port> [instance <inst>]|
   vlan <vid>]
```

Parameter	Description
`interface`	Specify a switch port to be cleared from the filtering database.
<port>	Specify the switch port from which address entries will be cleared. This can be a single switch port, (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).
`address`	Specify a MAC (Media Access Control) address to be cleared from the filtering database.
<mac-address>	Enter a MAC address to be cleared from the database in the format HHHH.HHHH.HHHH.
`instance`	Specify an MSTP (Multiple Spanning Tree) instance to be cleared from the filtering database.
<inst>	Enter an MSTP instance in the range `<1-63>` to be cleared from the filtering database.
`vlan`	Specify a VLAN to be cleared from the filtering database.
<vid>	Enter a VID (VLAN ID) in the range `<1-4094>` to be cleared from the filtering database.

Mode Privileged Exec

Usage Use this command with options to clear the filtering database of all entries learned for a given MAC address, interface or VLAN. Use this command without options to clear any learned entries.

Use the optional `instance` parameter to clear the filtering database entries associated with a specified MSTP instance Note that you must first specify a switch port interface before you can specify an MSTP instance.

Compare this usage and operation with the **clear mac address-table static** command on page 17.4. Note that an MSTP instance cannot be specified with **clear mac address-table static**.

Examples This example shows how to clear all dynamically learned filtering database entries for all interfaces, addresses, VLANs.

```
awplus# clear mac address-table dynamic
```

This example shows how to clear all dynamically learned filtering database entries when learned through switch operation for a given MAC address.

```
awplus# clear mac address-table dynamic address 0202.0202.0202
```

This example shows how to clear all dynamically learned filtering database entries when learned through switch operation for a given MSTP instance `1` on switch port interface `port1.0.2`.

```
awplus# clear mac address-table dynamic interface port1.0.2
        instance 1
```

Related Commands

clear mac address-table static
show mac address-table

clear port counter

Use this command to clear the packet counters of the port.

Syntax `clear port counter [<port>]`

Parameter	Description
<port>	The port number or range

Mode Privileged Exec

Example To clear the packet counter for `port1.0.1`, use the command:

```
awplus#  clear port counter port1.0.1
```

Related Commands show platform port

debug loopprot

This command enables Loop Protection debugging.

The **no** variant of this command disables Loop Protection debugging.

Syntax `debug loopprot {info|msg|pkt|state|nsm|all}`

no debug loopprot {info|msg|pkt|state|nsm|all}

Parameter	Description
`info`	General Loop Protection information.
`msg`	Received and transmitted Loop Detection Frames (LDFs).
`pkt`	Echo raw ASCII display of received and transmitted LDF packets to the console.
`state`	Loop Protection states transitions.
`nsm`	Network Service Module information.
`all`	All debugging information.

Mode Privileged Exec and Global Configuration

Example To enable debug for all state transitions, use the command:

```
awplus#  debug loopprot state
```

Related Commands show debugging loopprot
undebug loopprot

debug platform packet

This command enables platform to CPU level packet debug functionality on the switch.

Use the **no** variant of this command to disable platform to CPU level packet debug. If the result means both send and receive packet debug are disabled, then any active timeout will be cancelled.

Syntax

```
debug platform packet [recv] [send] [sflow] [timeout <timeout>]
    [vlan <vlan-id>|all]

no debug platform packet [recv] [send]
```

Parameter	Description
`recv`	Debug packets received.
`send`	Debug packets sent.
`sflow`	Debug sFlow packets.
`timeout`	Stop debug after a specified time.
<timeout>	<0-3600>The timeout period, specified in seconds.
`vlan`	Limit debug to a single VLAN ID specified.
<vlan-id>	<1-4094> The VLAN ID to limit the debug output on.
`all`	Debug all VLANs (default setting).

Default A 5 minute timeout is configured by default if no other timeout duration is specified.

Mode Privileged Exec and Global Configuration

Usage This command can be used to trace packets sent and received by the CPU. If a timeout is not specified, then a default 5 minute timeout will be applied.

If a timeout of 0 is specified, packet debug will be generated until the **no** variant of this command is used or another timeout value is specified. The timeout value applies to both send and receive debug and is updated whenever the **debug platform packet** command is used.

Examples To enable both receive and send packet debug for the default timeout of 5 minutes, enter:

```
awplus# debug platform packet
```

To enable receive packet debug for 10 seconds, enter:

```
awplus# debug platform packet recv timeout 10
```

To enable packet debug for sFlow packets only for the default timeout of 5 minutes, enter:

```
awplus# debug platform packet sflow
```

To enable send packet debug with no timeout, enter:

```
awplus# debug platform packet send timeout 0
```

To enable VLAN packet debug for VLAN 2 with a timeout duration of 3 minutes, enter:

```
awplus# debug platform packet vlan 2 timeout 150
```

To disable receive packet debug, enter:

```
awplus# no debug platform packet recv
```

Related Commands

show debugging platform packet
undebug platform packet

duplex

This command changes the duplex mode for the specified port.

To see the currently-negotiated duplex mode for ports whose links are up, use the command **show interface**. To see the configured duplex mode (when different from the default), use the command **show running-config**.

Syntax `duplex {auto|full|half}`

Parameter	Description
`auto`	Auto-negotiate duplex mode.
`full`	Operate in full duplex mode only.
`half`	Operate in half duplex mode only.

Default By default, ports auto-negotiate duplex mode (except for 100Base-FX ports which do not support auto-negotiation, so default to full duplex mode).

Mode Interface Configuration

Usage Switch ports in a static or dynamic (LACP) channel group must have the same port speed and be in full duplex mode. Once switch ports have been aggregated into a channel group, you can set the duplex mode of all the switch ports in the channel group by applying this command to the channel group.

Examples To specify full duplex for `port1.0.4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex full
```

To specify half duplex for `port1.0.4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex half
```

To auto-negotiate duplex mode for `port1.0.4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex auto
```

Related Commands
backpressure
ecofriendly lpi

speed
show interface

flowcontrol (switch port)

Use this command to enable flow control, and configure the flow control mode for the switch port.

Use the **no** variant of this command to disable flow control for the specified switch port.

Syntax

```
flowcontrol both

flowcontrol {send|receive} {off|on}

no flowcontrol
```

Parameter	Description
`both`	Use this parameter to specify send and receive flow control for the port.
`receive`	When the port receives pause frames, it temporarily stops (pauses) sending traffic.
`on`	Enable the specified flow control.
`off`	Disable the specified flow control.
`send`	When the port is congested (receiving too much traffic), it sends pause frames to request the other end to temporarily stop (pause) sending traffic.

Default By default, flow control is disabled.

Mode Interface Configuration

Usage The flow control mechanism specified by 802.3x is only for full duplex links. It operates by sending PAUSE frames to the link partner to temporarily suspend transmission on the link

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If one port experiences congestion, and cannot receive any more traffic, it notifies the other port to stop sending until the condition clears. When the local device detects congestion at its end, it notifies the remote device by sending a pause frame. On receiving a pause frame, the remote device stops sending data packets, which prevents loss of data packets during the congestion period.

Flow control is not recommended when running QoS or ACLs, because the complex queuing, scheduling, and filtering configured by QoS or ACLs may be slowed by applying flow control.

For half-duplex links, an older form of flow control known as back pressure is supported. See the related **backpressure** command on page 17.2.

For flow control on async serial (console) ports, see **flowcontrol hardware (asyn/console)** command on page 5.11.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol receive on

awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol receive off
```

Validation Commands **show running-config**

Related Commands **backpressure**

linkflap action

Use this command to detect flapping on all ports. If more than 15 flaps occur in less than 15 seconds the flapping port will shut down.

Use the **no** variant of this command to disable flapping detection at this rate.

Syntax

```
linkflap action [shutdown]
no linkflap action
```

Parameter	Description
`linkflap`	Global setting for link flapping.
`action`	Specify the action for port.
`shutdown`	Shutdown the port.

Default Linkflap action is disabled by default.

Mode Global Configuration

Example To enable the linkflap action command on the switch, use the following commands:

```
awplus# configure terminal
awplus(config)# linkflap action shutdown
```

loop-protection

Use this command to enable the loop-protection loop-detection feature, and configure the detection mechanism parameters.

Use the **no** variant of this command to disable the loop-protection loop-detection feature.

Syntax

```
loop-protection loop-detect [ldf-interval <period>]
    [ldf-rx-window <frames>]

no loop-protection [loop-detect]
```

Parameter	Description
`loop-detect`	Enables loop detection when used with loop-protection keywords. Disables loop detection when used with no loop-protection keywords.
`ldf-interval`	The time (in seconds) between successive loop-detect frames being sent.
<period>	Specify a period between 1 and 600 seconds. The default is 10 seconds.
`ldf-rx-window`	The number of transmitted loop detection frames whose details are held for comparing with frames arriving at the same port.
<frames>	Specify a value for the window size between 1 and 5 frames. The default is 3 frames.

Default The loop-protection loop-detection feature is disabled by default.
The default interval is 10 seconds, and the default window size is 3 frames.

Mode Global Configuration

Usage See the **Loop Protection** section in **Chapter 16, Switching Introduction** for relevant conceptual, configuration, and overview information prior to applying this command.

Example To enable the loop-detect mechanism on the switch, and generate loop-detect frames once every 5 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# loop-protection loop-detect ldf-interval 5
```

Related Commands
loop-protection action
loop-protection timeout
show loop-protection
thrash-limiting

loop-protection action

Use this command to specify the protective action to apply when a network loop is detected on an interface.

Use the **no** variant of this command to reset the loop protection actions to the default action, vlan-disable, on an interface.

Syntax

```
loop-protection action {link-down|log-only|port-disable|vlan-disable|
   none}
no loop-protection action
```

Parameter	Description
`link-down`	Block all traffic on a port (or aggregated link) that detected the loop, and take **down** the link.
`log-only`	Details of loop conditions are logged. No action is applied to the port (or aggregated link).
`port-disable`	Block all traffic on interface for which the loop occurred, but keep the link in the **up** state.
`vlan-disable`	Block all traffic for the VLAN on which the loop traffic was detected. Note that setting this parameter will also enable ingress filtering. This is the default action.
`none`	Applies no protective action.

Default loop-protection action vlan-disable

Mode Interface Configuration

Usage See the **Loop Protection** section in **Chapter 16, Switching Introduction** for relevant conceptual, configuration, and overview information prior to applying this command.

Example To disable an interface (`port1.0.4`), and bring the link down, when a network loop is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# loop-protection action link-down
```

Related Commands

loop-protection
loop-protection timeout
show loop-protection
thrash-limiting

loop-protection timeout

Use this command to specify the Loop Protection recovery action duration on an interface.

Use the **no** variant of this command to set the loop protection timeout to the default.

Syntax

```
loop-protection timeout <duration>
no loop-protection timeout
```

Parameter	Description
<duration>	The time (in seconds) for which the configured action will apply before being disabled. This duration can be set between 0 and 86400 seconds (24 hours). The set of 0 means infinity so timeout does not expire.

Default The default is 7 seconds.

Mode Interface Configuration

Usage See the **Loop Protection** section in **Chapter 16, Switching Introduction** for relevant conceptual, configuration, and overview information prior to applying this command.

Example To configure a loop protection action timeout of 10 seconds for `port1.0.4`, use the command:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# loop-protection timeout 10
```

Related Commands

loop-protection
loop-protection action
show loop-protection
thrash-limiting

mac address-table acquire

Use this command to enable MAC address learning on the device.

Use the **no** variant of this command to disable learning.

Syntax

```
mac address-table acquire
no mac address-table acquire
```

Default Learning is enabled by default for all instances.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# mac address-table acquire
```

mac address-table ageing-time

Use this command to specify an ageing-out time for a learned MAC address. The learned MAC address will persist for at least the specified time.

The **no** variant of this command will reset the ageing-out time back to the default of 300 seconds (5 minutes).

Syntax

```
mac address-table ageing-time <ageing-timer> none
no mac address-table ageing-time
```

Parameter	Description
<ageing-timer>	*<10-1000000>* The number of seconds of persistence.
none	Disable learned MAC address timeout.

Default The default ageing time is 300 seconds.

Mode Global Configuration

Examples The following commands specify various ageing timeouts on the switch:

```
awplus# configure terminal
awplus(config)# mac address-table ageing-time 1000

awplus# configure terminal
awplus(config)# mac address-table ageing-time none

awplus# configure terminal
awplus(config)# no mac address-table ageing-time
```

mac address-table static

Use this command to statically configure the MAC address-table to forward or discard frames with a matching destination MAC address.

Syntax

```
mac address-table static <mac-addr> {forward|discard} interface
   <port> [vlan <vid>]

no mac address-table static <mac-addr> {forward|discard} interface
   <port> [vlan <vid>]
```

Parameter	Description
<mac-addr>	The destination MAC address in HHHH.HHHH.HHHH format.
<port>	The port to display information about. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).
<vid>	The VLAN ID. If you do not specify a VLAN, its value defaults to vlan 1.

Mode Global Configuration

Usage The **mac address-table static** command is only applicable to Layer 2 switched traffic within a single VLAN. Do not apply the **mac address-table static** command to Layer 3 switched traffic passing from one VLAN to another VLAN. Frames will not be discarded across VLANs because packets are routed across VLANs. This command only works on Layer 2 traffic.

Example

```
awplus# configure terminal

awplus(config)# mac address-table static 2222.2222.2222 forward
                interface port1.0.4 vlan 3
```

Related Commands clear mac address-table static
show mac address-table

mac address-table thrash-limit

Use this command to set the thrash limit on the switch or stack. Thrashing occurs when a MAC address table rapidly "flips" its mapping of a single MAC address between two subnets, usually as a result of a network loop.

Use the **no** variant of this command to disable thrash limiting.

Syntax

```
mac address-table thrash-limit <rate>
no mac address-table thrash-limit
```

Parameter	Description
<rate>	sets the maximum thrash rate at which limiting is applied. This rate can be set between 5 and 255 MAC thrashing flips per second. Once the thrash limit rate is reached, the port is considered to be thrashing.

Default No thrash limiting

Mode Global Configuration

Usage Use this command to limit thrashing on the selected port range.

Example To apply a thrash limit of 100 MAC address flips per second:

```
awplus# configure terminal
awplus(config)# mac address-table thrash-limit 100
```

Related Commands **show mac address-table thrash-limit**

mirror interface

Use this command to define a mirror port and mirrored (monitored) ports and direction of traffic to be mirrored. The port for which you enter interface mode will be the mirror port.

The destination port is removed from all VLANs, and no longer participates in other switching.

Use the **no** variant of this command to disable port mirroring by the destination port on the specified source port.

Use the **none** variant of this command when using copy-to-mirror ACL and QoS commands.

Syntax

```
mirror interface <source-port-list> direction {both|receive|transmit}
mirror interface none
no mirror interface <source-port-list>
no mirror interface none
```

Parameter	Description
<source-port-list>	The source switch ports to mirror. A port-list can be: ■ a port (e.g. `port1.0.12`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.8-1.0.24` The source port list cannot include dynamic or static channel groups (link aggregators).
`direction`	Specifies whether to mirror traffic that the source port receives, transmits, or both.
`both`	Mirroring traffic both received and transmitted by the source port.
`receive`	Mirroring traffic received by the source port.
`transmit`	Mirroring traffic transmitted by the source port.
`none`	Specify this parameter for use with the ACL (Access Control List) **access-list** and QoS (Quality of Service) default action commands when used with the **copy-to-mirror** parameter option, so you can specify the destination port (the analyzer port) for the traffic without specifying a source mirror port. See the ACL commands **access-list (hardware IP numbered)** and **access-list (hardware MAC numbered)**, and the QoS command **default-action** for further information.

Mode Interface Configuration

Usage Use this command to send traffic to another device connected to the mirror port for monitoring.

See **"Port Mirroring" on page 16.15**.

A mirror port cannot be associated with a VLAN. If a switch port is configured to be a mirror port, it is automatically removed from any VLAN it was associated with.

This command can only be applied to a single mirror (destination) port, not to a range of ports, nor to a static or dynamic channel group. Do not apply multiple interfaces with an interface command before issuing the mirror interface command. One interface may have multiple mirror interfaces.

Example To mirror traffic received and transmitted on `port1.0.4` and `port1.0.5` to destination `port1.0.3`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# mirror interface port1.0.4,port1.0.5
                   direction both
```

To enable use with the **access-list (hardware IP numbered)** ACL and **default-action** QoS commands to destination `port1.0.3` without specifying a source port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# mirror interface none
```

To mirror all TCP traffic, received or transmitted to analyzer `port1.0.1`, see the sample config below:

```
awplus#show running-config

!
mls qos enable
access-list 3000 copy-to-mirror tcp any any
access-group 3000
!
interface port1.0.1
 mirror interface none
 switchport
!
```

Related Commands
access-list (hardware IP numbered)
access-list (hardware MAC numbered)
default-action

platform hwfilter-size

You can use this command to control the configuration of hardware Access Control Lists (ACLs), which determines the total available number and functionality of hardware ACLs.

For this command to take effect, you need to reboot the affected service.

One cannot attach an IPv6 ACL to a port if the ACL contains a specified source or destination IPv6 address or both and the **hw-filter size** setting is **ipv4-limited-ipv6**. If you do so, a diagnostic message will be generated.

Syntax platform hwfilter-size {ipv4-limited-ipv6|ipv4-full-ipv6}

Parameter	Description
`hwfilter-size`	Configure hardware ACLs command.
`ipv4-full-ipv6`	Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic, including filtering on source or destination IPv6 addresses, or both; however, this will reduce the total number of filters available in the hardware table.
`ipv4-limited-ipv6`	Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic. Source or destination IPv6 addresses or both are not filtered.

Default The default mode is **ipv4-limited-ipv6**.

Mode Global Configuration

Example To configure hardware ACLs to filter IPv4 and IPv6 traffic, use the following commands:

```
awplus# configure terminal
awplus(config)# platform hwfilter-size ipv4-full-ipv6
```

Related Commands **show platform**
ipv6 access-list (named)

platform load-balancing

This command selects which address fields are used as inputs into the load balancing algorithm. The output from this algorithm is used to select which individual path a given packet will traverse within an aggregated link.

The **no** variant of this command applies its default setting.

Syntax

```
platform load-balancing {src-dst-mac|src-dst-ip}
no platform load-balancing
```

Parameter	Description
src-dst-mac	Include the source and destination MAC addresses (Layer 2)
src-dst-ip	Include the source and destination IP addresses (Layer 3)

Default Includes the **src-dst-mac** and **src-dst-ip** addresses as inputs into the platform load balancing algorithm.

Mode Global configuration

Examples To set the load balancing algorithm to include only Layer 2 MAC addresses, enter:

```
awplus# configure terminal
awplus(config)# platform load-balancing src-dst-mac
```

To set the load balancing algorithm to include only Layer 3 IP addresses, enter:

```
awplus# configure terminal
awplus(config)# platform load-balancing src-dst-ip
```

Related Commands show platform

platform stop-unreg-mc-flooding

This command stops multicast packets flooding out of all the ports in the VLAN until these packets are registered. This command does this by sending unregistered multicast packets to the switch processor, so there is no flooding of the multicast traffic onto the VLAN. Unregistered traffic will not flow until the switch has registered it, regardless of attempts to subscribe to it. Once the traffic is registered, it flows to registered subscribers and ports.Use the **no** variant of this command to revert to default behavior and disable this feature.

Note

This command should not be used within any IPv6 networks.
IPv6 neighbor discovery operation is inhibited by this feature.
This command does not stop reserved Local Network Control Block IPv4 multicast packets in the address range 224.0.0.1 to 224.0.0.255 (224.0.0/24).
See **http://www.iana.org/assignments/multicast-addresses/multicast-addresses.xml#multicast-addresses-1**

Syntax `platform stop-unreg-mc-flooding`

no platform stop-unreg-mc-flooding

Default This feature is disabled by default.

Mode Global Configuration

Usage This command stops the periodic flooding of unknown or unregistered multicast packets when the Group Membership interval timer expires and there are no subscribers to a multicast group. If there is multicast traffic in a VLAN without subscribers, multicast traffic temporarily floods out of the VLAN when the Group Membership interval timer expires, which happens when the switch does not get replies from Group Membership queries.

For further information about multicast groups see the **Multicast groups** section in **Chapter 47, Multicast Introduction and Commands**.

For further information about query messages see the **Staying in the multicast group (Query message)** section in **Chapter 48, IGMP and IGMP Snooping Introduction**.

This command also stops the initial flood of multicast packets that happens when a new multicast source starts to send traffic. This flooding lasts until snooping recognizes the multicast group. For example, in sites where IP cameras have multicast groups, traffic is flooded to the VLAN and causes large bursts of traffic. Use this command when there is limited processing available for large bursts of traffic, such as in sites with IP cameras.

Output See the console message warning about IPv6 operation after entering this command:

```
% WARNING: IPv6 will not work with this setting enabled
% Please consult the documentation for more information
```

See these sample console messages when the Group Membership interval timer expires, which happens when the switch does not get replies from Group Membership queries:

```
awplus: [MLD-EVENTS] Grp - Rec Liveness Timer: Expiry for Grp ff0e::1 on port1.2.7
awplus: [IGMP-EVENTS] : Expiry (Unreg MC Timer) for Grp 224.2.2.2 on vlan4
```

Examples To enable this feature and stop multicast packet flooding, use the following commands:

```
awplus# configure terminal
awplus(config)# platform stop-unreg-mc-flooding
```

To disable this feature and allow multicast packet flooding, use the following commands:

```
awplus# configure terminal
awplus(config)# no platform stop-unreg-mc-flooding
```

Related Commands **show platform**
show running-config

platform vlan-stacking-tpid

This command specifies the Tag Protocol Identifier (TPID) value that applies to all frames that are carrying double tagged VLANs. All nested VLANs must use the same TPID value. (This feature is sometimes referred to as VLAN stacking or VLAN double-tagging.)

Use the **no** variant of this command to revert to the default TPID value (0x8100).

Note Because the additional tag increases the frame size beyond 1522 bytes, you must increase the MRU size to activate VLAN-stacking.

Syntax

```
platform vlan-stacking-tpid <tpid>
```

no platform vlan-stacking-tpid

Parameter	Description
<tpid>	The Ethernet type of the tagged packet, as a two byte hexadecimal number.

Default The default TPID value of 0x8100 is restored using a **no platform vlan-stacking-tpid** command.

Mode Global Configuration

Examples To set the VLAN stacking TPID value to 0x9100, use the following commands:

```
awplus# configure terminal
awplus(config)# platform vlan-stacking-tpid 9100
```

To reset the VLAN stacking TPID value to the default (0x8100), use the following commands:

```
awplus# configure terminal
awplus(config)# no platform vlan-stacking-tpid
```

Related Commands
switchport vlan-stacking (double tagging)
show platform
show running-config

polarity

This command sets the MDI/MDIX polarity on a copper-based switch port.

Syntax `polarity {auto|mdi|mdix}`

Parameter	Description
`mdi`	Sets the polarity to MDI (medium dependent interface).
`mdix`	Sets the polarity to MDI-X (medium dependent interface crossover).
`auto`	The switch port sets the polarity automatically. This is the default option.

Default By default, switch ports set the polarity automatically (**auto**).

Mode Interface Configuration

Usage We recommend the default **auto** setting for MDI/MDIX polarity. Polarity applies to copper 10BASE-T, 100BASE-T, and 1000BASE-T switch ports; It does not apply to fibre ports. For more information, see **"MDI/MDIX Connection Modes" on page 16.5**.

Example To set the polarity for `port1.0.7` to fixed MDI mode, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.7
awplus(config-if)# polarity mdi
```

show debugging loopprot

This command shows Loop Protection debugging information.

Syntax `show debugging loopprot`

Mode User Exec and Privileged Exec

Example To display the enabled Loop Protection debugging modes, use the command:

```
awplus# show debugging loopprot
```

Related Commands **debug loopprot**

show debugging platform packet

This command shows platform to CPU level packet debugging information.

Syntax `show debugging platform packet`

Mode User Exec and Privileged Exec

Example To display the platform packet debugging information, use the command:

```
awplus# show debugging platform packet
```

Related Commands **debug platform packet**
undebug platform packet

show flowcontrol interface

Use this command to display flow control information.

Syntax `show flowcontrol interface <port>`

Parameter	Description
<port>	Specifies the name of the port to be displayed.

Mode User Exec and Privileged Exec

Example To display the flow control for the `port1.0.5`, use the command:

```
awplus# show flowcontrol interface port1.0.5
```

Output **Figure 17-1: Example output from the show flowcontrol interface command for a specific interface**

```
Port     Send  FlowControl    Receive  FlowControl  RxPause TxPause
          admin    oper        admin    oper
-----     ------- --------    ------- --------     ------- -------
port1.0.5 on       on           on       on           0       0
```

show interface switchport

Use this command to show VLAN information about each switch port.

Syntax `show interface switchport`

Mode User Exec and Privileged Exec

Example To display VLAN information about each switch port, enter the command:

```
awplus# show interface switchport
```

Output **Figure 17-2: Example output from the show interface switchport command**

```
 Interface name          : port1.0.1
 Switchport mode         : access
 Ingress filter          : enable
 Acceptable frame types  : all
 Default Vlan            :  2
 Configured Vlans        : 2

 Interface name          : port1.0.2
 Switchport mode         : trunk
 Ingress filter          : enable
 Acceptable frame types  : all
 Default Vlan            :  1
 Configured Vlans        : 1 4 5 6 7 8
...
```

Related Commands show interface memory

show loop-protection

Use this command to display the current loop protection setup for the device.

Syntax `show loop-protection [interface <port-list>] [counters]`

Parameter	Description
`interface`	The interface selected for display.
`<port-list>`	A port, a port range, or an aggregated link.
`counters`	Displays counter information for loop protection.

Mode User Exec and Privileged Exec

Usage This command is used to display the current configuration and operation of the Loop Protection feature

Examples To display the current configuration status for `port1.0.1`, use the command:

```
awplus# show loop-protection interface port1.0.1
```

Figure 17-3: Example output from the show loop-protection command

```
Loop-Detection:          Enabled
LDF Interval:            10 [sec]
Interface:               port1.0.1
 Action:                 port-disable
 Timeout:                300 [sec]
 Vlan:                   1
  Status:                Blocking
  Timeout Remaining:     115 [sec]
 Vlan:                   2
  Status:                Normal
  Timeout Remaining:     0 [sec]
```

To display the counter information for `port1.0.1`, use the command:

```
awplus# show loop-protection interface port1.0.1 counters
```

Figure 17-4: Example output from the show loop-protection interface counters command for port1.0.1

```
Interface:               port1.0.1
 Vlan:                   1
  LDF Tx:                3
  LDF Rx:                1
  Invalid LDF Rx:        1
  Action:                1
Vlan:                    2
  LDF Tx:                3
  LDF Rx:                0
  Invalid LDF Rx:        0
  Action:                0
```

show mac address-table

Use this command to display the mac address-table for all configured VLANs.

Syntax `show mac address-table`

Mode User Exec and Privileged Exec

Usage The **show mac address-table** command is only applicable to view a mac address-table for Layer 2 switched traffic within VLANs.

Example To display the mac address-table, use the following command:

```
awplus# show mac address-table
```

Output See the below sample output captured when there was no traffic being switched:

```
awplus#show mac address-table

VLAN Port          MAC               State
1    unknown       0000.cd28.0752    static
ARP  -             0000.cd00.0000    static
```

See the sample output captured when packets were switched and mac addresses were learnt:

```
awplus#show mac address-table

VLAN Port          MAC               State
1    unknown       0000.cd28.0752    static
1    port1.0.11    0030.846e.9bf4    dynamic
1    port1.0.9     0030.846e.bac7    dynamic
ARP  -             0000.cd00.0000    static
```

Note the new mac addresses learnt for `port1.0.9` and `port1.0.11` added as dynamic entries.

Note the first column of the output below shows VLAN IDs if multiple VLANs are configured:

```
awplus#show mac address-table

VLAN Port          MAC               State
1    unknown       0000.cd28.0752    static
1    port1.0.9     0030.846e.bac7    dynamic
2    unknown       0000.cd28.0752    static
2    port1.0.11    0030.846e.9bf4    dynamic
ARP  -             0000.cd00.0000    static
```

Also note manually configured static mac-addresses are shown to the right of the type column:

```
awplus(config)#mac address-table static 0000.1111.2222 for int
port1.0.11 vlan 2
awplus(config)#end
awplus#
awplus#show mac address-table

VLAN Port          MAC               State
1    unknown       0000.cd28.0752    static
1    port1.0.9     0030.846e.bac7    dynamic
2    port1.0.11    0000.1111.2222    static
2    unknown       0000.cd28.0752    static
2    port1.0.11    0030.846e.9bf4    dynamic
ARP  -             0000.cd00.0000    statics
```

Related Commands

clear mac address-table dynamic
clear mac address-table static
mac address-table static

show mac address-table thrash-limit

Use this command to display the current thrash limit set for all interfaces on the device.

Syntax

```
show mac address-table thrash-limit
```

Mode

User Exec and Privileged Exec

Example

To display the current, use the following command:

```
awplus# show mac address-table thrash-limit
```

Output

Figure 17-5: Example output from the show mac address-table thrash-limit command

```
% Thrash-limit  7 movements per second
```

Related Commands

mac address-table thrash-limit

show mirror

Use this command to display the status of all mirrored ports.

Syntax `show mirror`

Mode User Exec and Privileged Exec

Example To display the status of all mirrored ports, use the following command:

```
awplus# show mirror
```

Output **Figure 17-6: Example output from the show mirror command**

```
Mirror Test Port Name: port1.0.1
Mirror option: Enabled
Mirror direction: both
Monitored Port Name: port1.0.2
Mirror Test Port Name: port1.0.3
Mirror option: Enabled
Mirror direction: receive
Monitored Port Name: port1.0.4
Mirror Test Port Name: port1.0.3
Mirror option: Enabled
Mirror direction: receive
Monitored Port Name: port1.0.1
Mirror Test Port Name: port1.0.1
Mirror option: Enabled
Mirror direction: receive
Monitored Port Name: port1.0.3
Mirror Test Port Name: port1.0.1
Mirror option: Enabled
Mirror direction: transmit
Monitored Port Name: port1.0.4
```

show mirror interface

Use this command to display port mirroring configuration for a mirrored (monitored) switch port.

Syntax `show mirror interface <port>`

Parameter	Description
<port>	The monitored switch port to display information about.

Mode User Exec, Privileged Exec and Interface Configuration

Example To display port mirroring configuration for the `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# show mirror interface port1.0.4
```

Output **Figure 17-7: Example output from the show mirror interface command**

```
Mirror Test Port Name: port1.0.3
Mirror option: Enabled
Mirror direction: both
Monitored Port Name: port1.0.4
```

show platform

This command displays the settings configured by using the **platform** commands.

Syntax `show platform`

Mode Privileged Exec

Usage This command displays the settings in the running config. For changes in some of these settings to take effect, the switch must be rebooted with the new settings in the startup config.

Example To check the settings configured with **platform** commands on the switch, use the following command:

```
awplus# show platform
```

Output **Figure 17-8: Example output from the show platform command**

```
awplus# show platform
Vlan-stacking TPID           0x8100
```

Table 17-1: Parameters in the output of the show platform command

Parameter	Description
Vlan-stacking TPID	The value of the TPID set in the Ethernet type field when a frame has a double VLAN tag (**platform vlan-stacking-tpid** command on page 17.28).

Related Commands **platform load-balancing**
platform vlan-stacking-tpid

show platform classifier statistics utilization brief

This command displays the total memory space, and free memory space of CAM (Content-Addressable Memory). Utilization statistics for various platform functions, such as ACLs and QoS are also shown.

Syntax `show platform classifier statistics utilization brief`

Mode Privileged Exec

Example To display the platform classifier utilization statistics, use the following command:

```
awplus# show platform classifier statistics utilization brief
```

Output **Figure 17-9: Output from the show platform classifier statistics utilization brief command.**

```
[Instance 3.0]
(Port1.0.1-1.0.24)
  Number of Entries:
  Policy Type      Group ID   Used / Total
  ---------------------------------------------
  ACL              1476395009    0 /  122 (  0%)
  DoS                      -1    0 /    0 (  0%)
  VLAN Counter             -1    0 /    0 (  0%)
  QoS                            0 /  768 (  0%)

[Instance 3.1]
(Port1.0.25-1.0.48)
  Number of Entries:
  Policy Type      Group ID   Used / Total
  ---------------------------------------------
  ACL              1476395009    0 /  122 (  0%)
  DoS                      -1    0 /    0 (  0%)
  VLAN Counter             -1    0 /    0 (  0%)
  QoS                            2 /  768 (  0%)
```

Output from the **show platform classifier statistics utilization brief** command, with the DOS detection feature enabled.

```
[Instance 3.0]
[Port1.0.1-1.0.24]
Number of Entries:
  Policy Type      Group ID   Used / Total
  -----------------------------------------------
  ACL              1476395009    0 /  122 (  0%)
  DoS              1476395011    0 /  128 (  0%)
  VLAN Counter             -1    0 /    0 (  0%)
  QoS                            0 /  640 (  0%)

[Instance 3.1]
[Port1.0.25-1.0.48]
  Number of Entries:
  Policy Type      Group ID   Used / Total
  -----------------------------------------------
  ACL              1476395009    0 /  122 (  0%)
  DoS              1476395011    1 /  128 (  0%)
  VLAN Counter             -1    0 /    0 (  0%)
  QoS                            2 /  640 (  0%)
                            1    2 /  128 (  1%)
```

show platform port

This command displays the various port registers or platform counters for specified switchports.

Syntax `show platform port [<port-list>|counters]`

Parameter	Description
<port-list>	The ports to display information about. A port-list can be: ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.7-1.0.24`.
`counters`	Show the platform counters.

Mode Privileged Exec

Examples To display port registers for `port1.0.1` and `port1.0.2` use the following command:

```
awplus# show platform port port1.0.1-port1.0.2
```

To display platform counters for `port1.0.1` and `port1.0.2` use the following command:

```
awplus# show platform port port1.0.1-port1.0.2 counters
```

Output **Figure 17-10: Example output from the show platform port command**

```
awplus#show platform port port1.0.1
Phy register value for port1.0.1 (ifindex: 5001)

Table 17-2: Parameters in the output from the show platform port command

Parameter	Description
Ethernet MAC counters	
Combined receive/ transmit packets by size (octets) counters	Number of packets in each size range received and transmitted.
64	Number of 64 octet packets received and transmitted.
65 - 127	Number of 65 - 127 octet packets received and transmitted.
128 - 255	Number of 128 - 255 octet packets received and transmitted.
256 - 511	Number of 256 - 511 octet packets received and transmitted.
512 - 1023	Number of 512 - 1023 octet packets received and transmitted.
1024 - MaxPktSz	Number of packets received and transmitted with size 1024 octets to the maximum packet length.
1519 - 1522	Number of 1519 - 1522 octet packets received and transmitted.
1519 - 2047	Number of 1519 - 2047 octet packets received and transmitted.

Table 17-2: Parameters in the output from the show platform port command(cont.)

Parameter	Description
2048 - 4095	Number of 2048 - 4095 octet packets received and transmitted.
4096 - 9216	Number of 4096 - 9216 octet packets received and transmitted.
General Counters	
Receive	Counters for traffic received.
Octets	Number of octets received.
Pkts	Number of packets received.
FCSErrors	Number of FCS (Frame Check Sequence) error events received.
UnicastPkts	Number of unicast packets received.
MulticastPkts	Number of multicast packets received.
BroadcastPkts	Number of broadcast packets received.
PauseMACCtlFrms	Number of Pause MAC Control Frames received.
OversizePkts	Number of oversize packets received.
Fragments	Number of fragments received.
Jabbers	Number of jabber frames received.
UnsupportOpcode	Number of MAC Control frames with unsupported opcode received.
AlignmentErrors	Receive Alignment Error Frame Counter.
SysErDurCarrier	Receive Code Error Counter.
CarrierSenseErr	Receive False Carrier Counter.
UndersizePkts	Number of undersized packets received.
Transmit	Counters for traffic transmitted.
Octets	Number of octets transmitted.
Pkts	Number of packets transmitted.
UnicastPkts	Number of unicast packets transmitted.
MulticastPkts	Number of multicast packets transmitted.
BroadcastPkts	Number of broadcast packets transmitted.
PauseMACCtlFrms	Number of Pause MAC Control Frames transmitted.
OversizePkts	Number of oversize packets transmitted.
FrameWDeferrdTx	Transmit Single Deferral Frame counter.
FrmWExcesDefer	Transmit Multiple Deferral Frame counter.
SingleCollsnFrm	Transmit Single Collision Frame counter.
MultCollsnFrm	Transmit Multiple Collision Frame counter.
LateCollisions	Transmit Late Collision Frame counter.
ExcessivCollsns	Transmit Excessive Collision Frame counter.
Collisions	Transmit Total Collision counter
Layer 3 Counters:	
ifInUcastPkts	Inbound interface Unicast counter.
ifInDiscards	Inbound interface Discarded Packets counter.
ipInHdrErrors	Inbound interface Header Errors counter.

Table 17-2: Parameters in the output from the show platform port command(cont.)

Parameter	Description
ifOutUcastPkts	Outbound interface Unicast counter.
ifOutErrors	Outbound interface Error counter.
Miscellaneous Counters	
DropEvents	Drop Event counter
ifOutDiscards	Outbound interface Discarded Packets counter.
MTUExcdDiscard	Receive MTU Check Error Frame Counter

Output **Figure 17-11: Example output from the show platform port counters command**

```
awplus#show platform port port1.0.1 counters

 Switch Port Counters
------------------------------------------------------------------------

Port port1.0.1 Ethernet MAC counters:
 Combined receive/transmit packets by size (octets) counters:
  64                              0 1024 - MaxPktSz                 0
  65 - 127                        0 1519 - 1522                     0
  128 - 255                       0 1519 - 2047                     0
  256 - 511                       0 2048 - 4095                     0
  512 - 1023                      0 4096 - 9216                     0

 General Counters:
 Receive                            Transmit
  Octets                         0 Octets                          0
  Pkts                           0 Pkts                            0
  FCSErrors                      0
  UnicastPkts                    0 UnicastPkts                     0

```

Table 17-3: Output parameters from the show platform port counters command

Parameter	Description
Ethernet MAC counters	
Combined receive/ transmit packets by size (octets) counters	Number of packets in each size range received and transmitted.
64	Number of 64 octet packets received and transmitted.
65 - 127	Number of 65 - 127 octet packets received and transmitted.
128 - 255	Number of 128 - 255 octet packets received and transmitted.
256 - 511	Number of 256 - 511 octet packets received and transmitted.
512 - 1023	Number of 512 - 1023 octet packets received and transmitted.
1024 - MaxPktSz	Number of packets received and transmitted with size 1024 octets to the maximum packet length.
General Counters	
Receive	Counters for traffic received.
Octets	Number of octets received.
Pkts	Number of packets received.
CRCErrors	Number of CRC (Cyclic Redundancy Check) error events received.
UnicastPkts	Number of unicast packets received.
MulticastPkts	Number of multicast packets received.
BroadcastPkts	Number of broadcast packets received.
FlowCtrlFrms	Number of good Flow Control frames received.
OversizePkts	Number of oversize packets received.
Fragments	Number of fragments received.
Jabbers	Number of jabber frames received.
UnsupportOpcode	Number of MAC Control frames with unsupported opcode received.
UndersizePkts	Number of undersized packets received.
Transmit	Counters for traffic transmitted.
Octets	Number of octets transmitted.
Pkts	Number of packets transmitted.
UnicastPkts	Number of unicast packets transmitted.
MulticastPkts	Number of multicast packets transmitted.
BroadcastPkts	Number of broadcast packets transmitted.
FlowCtrlFrms	Number of good Flow Control frames transmitted.
OversizePkts	Number of oversize packets transmitted.
FlowCtrlFrms	The number of Flow Control frames transmitted.
Collisions	Total number of collisions seen by the MAC.
LateCollisions	Total number of late collisions seen by the MAC.

Table 17-3: Output parameters from the show platform port counters

Parameter	Description
`ExcessivCollsns`	Number of frames dropped in the transmit MAC due to excessive collisions. This is applicable for Half-Duplex mode only.
`Miscellaneous Counters`	
`Mac TxErr`	Number of frames not transmitted correctly or dropped due to internal MAC transmit error.
`Mac RxErr`	Number of Receive Error events seen by the receive side of the MAC.
`DropEvents`	Number of instances that the port was unable to receive packets due to insufficient bandwidth to one of the PP internal resources, such as the DRAM or buffer allocation.

show port-security interface

Use this command to show the current port-security configuration and the switch port status.

Syntax `show port-security interface <port>`

Parameter	Description
`<port>`	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode Privileged Exec

Example To see the port-security status on `port1.0.1`, use the following command:

```
awplus# show port-security interface port1.0.1
```

Output **Figure 17-12: Example output from the show port-security interface command**

```
Port Security configuration
Security Enabled               : YES
Port Status                    : ENABLED
Violation Mode                 : TRAP
Aging                          : OFF
Maximum MAC Addresses          : 3
Total MAC ddresses             : 1
Lock Status                    : UNLOCKED
Security Violation Count       : 0
Last Violation Source Address : None
```

show port-security intrusion

Shows the intrusion list. If the port is not give, entire intrusion table is shown.

Syntax `show port-security intrusion [interface <port>]`

Parameter	Description
`interface`	Specify a port
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode Privileged Exec

Example To see the intrusion list on `port1.0.1`, use the following command:

```
awplus# show port-security intrusion interface port1.0.1
```

Output **Figure 17-13: Example output from the show port-security intrusion command for port 1.0.1**

```
Port Security Intrusion List
Interface: port1.0.1 -3 intrusion(s) detected
11-22-33-44-55-04 11-22-33-44-55-06 11-22-33-44-55-08
```

show storm-control

Use this command to display storm-control information for all interfaces or a particular interface.

Syntax `show storm-control [<port>]`

Parameter	Description
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode User Exec and Privileged Exec

Example To display storm-control information for `port1.0.2`, use the following command:

```
awplus# show storm-control port1.0.2
```

Output **Figure 17-14: Example output from the show storm-control command for port1.0.2**

```
Port       BcastLevel  McastLevel  DlfLevel
port1.0.2      40. 0%     100. 0%   100. 0%
```

Example To display storm-control information for all ports, use the following command:

```
awplus# show storm-control
```

Output **Figure 17-15: Example output from the show storm-control command for all ports**

```
awplus#show storm-control
Port       BcastLevel  McastLevel  DlfLevel
port1.0.1      100.0%      100.0%    100.0%
port1.0.2      100.0%      100.0%    100.0%
port1.0.3      100.0%      100.0%    100.0%
port1.0.4      100.0%      100.0%    100.0%
port1.0.5      100.0%      100.0%    100.0%

port1.0.16     100.0%      100.0%    100.0%
port1.0.17     100.0%      100.0%    100.0%
port1.0.18     100.0%      100.0%    100.0%
port1.0.19     100.0%      100.0%    100.0%
port1.0.20     100.0%      100.0%    100.0%
port1.0.21     100.0%      100.0%    100.0%
port1.0.22     100.0%      100.0%    100.0%
port1.0.23     100.0%      100.0%    100.0%
port1.0.24     100.0%      100.0%    100.0%
```

Related Commands storm-control level

speed

This command changes the speed of the specified port. You can optionally specify the speed or speeds that get autonegotiated, so autonegotiation is only attempted at the specified speeds.

To see the currently-negotiated speed for ports whose links are up, use the **show interface** command. To see the configured speed (when different from the default), use the **show running-config** command.

Syntax speed {10|100|1000|10000|auto [10][100][1000][10000]}

The following table shows the speed options for each type of port.

Port type	Speed Options (units are Mbps)
RJ-45 and RJ.5copper ports	auto (default) 10 100 1000
supported tri-speed copper SFPs	auto (default) 10 100 1000
100Mb fibre SFPs	100
1000Mb fibre SFPs	auto (default) 1000
10000Mb fibre SFP+	auto (default) 10000

Mode Interface Configuration

Default By default, ports autonegotiate speed (except for 100Base-FX ports which do not support auto-negotiation, so default to 100Mbps).

Usage Switch ports in a static or dynamic (LACP) channel group must have the same port speed and be in full duplex mode. Once switch ports have been aggregated into a channel group, you can set the speed of all the switch ports in the channel group by applying this command to the channel group.

Note Note that if multiple speeds are specified after the auto option to autonegotiate speeds, then only those speeds specified are attempted for autonegotiation.

Examples To set the speed of a tri-speed port to 100Mbps, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# speed 100
```

To return the port to auto-negotiating its speed, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# speed auto
```

To set a port to auto-negotiate its speed at 100Mbps and 1000Mbps, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# speed auto 100 1000
```

To set a port to auto-negotiate its speed at 1000Mbps only, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# speed auto 1000
```

storm-control level

Use this command to specify the threshold level for broadcasting, multicast, or destination lookup failure (DLF) traffic for the port. Storm-control limits the specified traffic type to the specified threshold.

Use the **no** variant of this command to disable storm-control for broadcast, multicast or DLF traffic.

Syntax

```
storm-control {broadcast|multicast|dlf} level <level>
no storm-control {broadcast|multicast|dlf} level
```

Parameter	Description
<level>	<0-100> Specifies the threshold as a percentage of the maximum port speed.
broadcast	Applies the storm-control to broadcast frames.
multicast	Applies the storm-control to multicast frames.
dlf	Applies the storm-control to destination lookup failure traffic.

Default By default, storm-control is disabled.

Mode Interface Configuration

Usage Flooding techniques are used to block the forwarding of unnecessary flooded traffic. A packet storm occurs when a large number of broadcast packets are received on a port. Forwarding these packets can cause the network to slow down or time out.

Example To limit broadcast traffic on `port1.0.2` to 30% of the maximum port speed, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# storm-control broadcast level 30
```

Related Commands show storm-control

switchport port-security

Enables the port-security feature. This feature is also known as the port-based learn limit. It allows the user to set the maximum number of MAC addresses that each port can learn.

Use the **no** variant of this command to disable the port-security feature.

Syntax

```
switchport port-security
no switchport port-security
```

Mode Interface Configuration

Examples To enable the port-security feature on `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# switchport port-security
```

To disable port-security feature on `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no switchport port-security
```

switchport port-security aging

Sets the port-security MAC to time out.

Use the **no** variant of this command to set the port-security to not time out.

Syntax

```
switchport port-security aging
no switchport port-security aging
```

Mode Interface Configuration

Examples To set the MAC to time out, use the following command:

```
awplus# switchport port-security aging
```

To unset the MAC time out, use the following command:

```
awplus# no switchport port-security aging
```

switchport port-security maximum

Sets the maximum MAC address that each port can learn.

Use the **no** variant of this command to unset the maximum number of MAC addresses that each port can learn. This is same as setting the maximum number to 0. This command also resets the intrusion list table.

Syntax

```
switchport port-security maximum <0-256>
no switchport port-security maximum
```

Parameter	Description
`maximum`	Maximum number of address to learn.
<0-256>	Maximum number of address to learn.

Mode Interface Configuration

Examples To learn 3 MAC addresses on `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# switchport port-security maximum 3
```

To remove the MAC learning limit on `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no switchport port-security maximum
```

switchport port-security violation

Sets the violation action for a switch port when the port exceeds the learning limits. The port action can be either **shutdown**, **restrict** or **protect**. If **shutdown** is set, the physical link will be disabled and "shutdown" will be shown in the config. If **restrict** is set, the packet from the un-authorized MAC will be discarded and SNMP TRAP will be generated to alert management. If **protect** is set, the packet will simply be discarded by the packet processor silently.

The **no** variant of this command sets the violation action to default. The default violation action is protect.

Syntax

```
switchport port-security violation {shutdown|restrict|protect}
no switchport port-security violation
```

Parameter	Description
`shutdown`	Disable the port.
`restrict`	Alert the network administrator.
`protect`	Discard the packet.

Mode Interface Configuration

Examples To set the action to be shutdown on `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# switchport port-security violation shutdown
```

To set the port-security action to the default (protect) on `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no switchport port-security violation
```

thrash-limiting

Sets and configures the thrash limit action that will be applied to any port on the switch when a thrashing condition is detected. The thrash-limiting timeout specifies the time, in seconds, for which the thrash action is employed.

Syntax

```
thrash-limiting {[action {learn-disable|link-down|port-disable|
   vlan-disable|none}] [timeout <0-86400>]}

no thrash-limiting {action|timeout}
```

Parameter	Description
`action`	The mac thrashing detected action. The default is vlan-disable.
`learn-disable`	Disable mac address learning
`link-down`	Block all traffic on an interface - link down
`port-disable`	Block all traffic on an interface - link remains up
`vlan-disable`	Block all traffic on a vlan Note that setting this parameter will also enable ingress filtering.
`none`	No thrash action
`timeout`	Set the duration for the thrash action
<0-86400>	The duration of the applied thrash action in seconds. The default is 1 seconds.

Default The default action is learn-disable.

Mode Interface Configuration

Usage See the **Thrash Limiting** section in **Chapter 16, Switching Introduction** for relevant conceptual, configuration, and overview information prior to applying this command.

Examples To set the action to learn disable for `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# thrash-limiting action learn-disable
```

To block all traffic on a vlan, use the following command:

```
awplus# configure terminal
awplus(config)# thrash-limiting action vlan-disable
```

To set the thrash limiting timeout to 5 seconds, use the following command:

```
awplus(config-if)# thrash-limiting timeout 5
```

To set the thrash limiting action to its default, use the following command:

```
awplus(config-if)# no thrash-limiting action
```

To set the thrash limiting timeout to its default, use the following command:

```
awplus(config-if)# no thrash-limiting timeout
```

Chapter 18: VLAN Introduction

Introduction

This chapter describes Virtual LANs (VLAN), VLAN features and configuration on the switch. For detailed descriptions of commands used to configure VLANs, see **Chapter 19, VLAN Commands**. For information about Voice VLAN and LLDP-MED, see **Chapter 96, LLDP Introduction and Configuration**.

Virtual LANs (VLANs)

A Virtual LAN (VLAN) is a logical, software-defined subnetwork. It allows similar devices on the network to be grouped together into one broadcast domain, irrespective of their physical position in the network. Multiple VLANs can be used to group workstations, servers, and other network equipment connected to the switch, according to similar data and security requirements.

Decoupling logical broadcast domains from the physical wiring topology offers several advantages, including the ability to:

- Move devices and people with minimal, or no, reconfiguration
- Change a device's broadcast domain and access to resources without physically moving the device, by software reconfiguration or by moving its cable from one switch port to another
- Isolate parts of the network from other parts, by placing them in different VLANs
- Share servers and other network resources without losing data isolation or security
- Direct broadcast traffic to only those devices which need to receive it, to reduce traffic across the network
- Connect 802.1Q-compatible switches together through one port on each switch

Devices that are members of the same VLAN only exchange data with each other through the switch's Layer 2 switching capabilities. To exchange data between devices that are located in different VLANs, the switch's Layer 3 (routing) capabilities are used.

Different IP subnets are associated with different VLANs. The switch's IP router table will be populated by the routes to the subnets on any active VLANs, and by routes statically configured over active VLAN interfaces, or learnt via routing protocols operating over these interfaces.

The device supports up to 4094 VLANs (the maximum allowed by the VID field in the 802.1Q tag). On some devices a few of these VLANs may be reserved for management purposes.

When the switch is first powered up (and therefore unconfigured), it creates a default VLAN with a VID of 1 and an interface name of *vlan1*. In this initial condition, the switch attaches all its ports to this default VLAN.

The default VLAN cannot be deleted, and ports can only be removed from it if they also belong to at least one other VLAN. If all the devices on the physical LAN belong to the same logical LAN, that is, the same broadcast domain, then the default settings will be acceptable, and no additional VLAN configuration is required.

Configuring VLANs

Defaults

By default, all switch ports are in access mode, are associated with the default VLAN (**vlan1**), and have ingress filtering on. You cannot delete **vlan1**.

VLAN names

When you create a VLAN (using the **vlan** command), you give it a numerical VLAN Identifier (VID) - a number from 2 to 4094. If tagged frames are transmitted from this VLAN, they will contain this VID in their tag. You may also give it an arbitrary alphanumeric name containing a meaningful description, which is not transmitted to other devices.

When referring to a VLAN, some commands require the VLAN to be specified by its VID while some commands require it to be specified by its interface name: vlan<VID>. In command output, the VLAN may be referred to by its VID, its interface name (vlan<VID>), or its VLAN name (the arbitrary alphanumeric string).

You can name a VLAN with a string containing “vlan” and its VLAN Identifier (VID). To avoid confusion, we recommend not naming it “vlan” followed by any number different from its VID.

Access mode

A switch port in access mode sends untagged Ethernet frames, that is, frames without a VLAN tag. Each port is associated with one VLAN (the port-based VLAN, by default, *vlan1*), and when it receives untagged frames, it associates them with the VID of this VLAN. You can associate the port with another VLAN (using the **switchport access vlan** command). This removes it from the default VLAN.

Use access mode for any ports connected to devices that do not use VLAN tagging, for instance PC workstations.

Trunk mode

A switch port in trunk mode is associated with one or more VLANs for which it transmits VLAN-tagged frames, and for which it identifies incoming tagged frames with these VIDs.

To allow a switch port to distinguish and identify traffic from different VLANs, put it in trunk mode (using the **switchport mode trunk** command), and add the VLANs (using the **switchport trunk allowed vlan** command). Use trunk mode for ports connected to other switches which send VLAN-tagged traffic from one or more VLANs.

A trunk mode port may also have a native VLAN (by default vlan1), for which it transmits untagged frames, and with which it associates incoming untagged frames (using the **switchport trunk native vlan** command).

Ports in trunk mode can be enabled as promiscuous ports for private VLANs (using the **switchport mode private-vlan trunk promiscuous**) and secondary ports for private VLANs (using the **switchport mode private-vlan trunk secondary**).

Mirror ports

A mirror port cannot be associated with a VLAN. If a switch port is configured to be a mirror port (using the **mirror interface** command), it is automatically removed from any VLAN it was associated with.

VLANs and channel groups

All the ports in a channel group must have the same VLAN configuration: they must belong to the same VLANs and have the same tagging status, and can only be operated on as a group.

Table 18-1: Configuration procedure for VLANs

Create VLANs	
`awplus#` **`configure terminal`**	Enter Configuration mode.
`awplus(config)#` `vlan database`	Enter VLAN Configuration mode.

`awplus(config-vlan)#`
`vlan <vid> [name <vlan-name>] [state {enable|disable}]`
or
`vlan <vid-range> [state {enable|disable}]`
	Create VLANs.

Associate switch ports with VLANs	
`awplus(config-vlan)#` `interface <port-list>`	Associate switch ports in access mode with VLANs:
`awplus(config-if)#` `switchport access vlan <vlan-id>`	Enter Interface Configuration mode for the switch ports that will be in access mode for a particular VLAN. Associate the VLAN with these ports in access mode. Repeat for other VLANs and ports in access mode.
`awplus(config-if)#` `interface <port-list>`	Associate switch ports in trunk mode with VLANs. Enter Interface Configuration mode for all the switch ports that will be in trunk mode for a particular set of VLANs.
`awplus(config-if)#` `switchport mode trunk [ingress-filter {enable|disable}]`	Set these switch ports to trunk mode.

`awplus(config-if)#`
`switchport trunk allowed vlan all`
or
`switchport trunk allowed vlan add <vid-list>`
	Allow these switch ports to trunk this set of VLANs.

`awplus(config-if)#` `switchport trunk native vlan {<vid>|none}`	By default, a trunk mode switch port's native VLAN, the VLAN that the port uses for untagged packet, is VLAN 1. If required, change the native VLAN from the default.
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
`awplus(config)#` `exit`	Return to Privileged Exec mode.
`awplus#` `show vlan {all|brief|dynamic|static|auto|static-ports<1-4094>}`	Confirm VLAN configuration.

VLAN Double Tagging (VLAN Stacking)

VLAN double tagging, also known as VLAN Stacking, Nested VLANs, or Q-in-Q VLANs, is used to operate a number of private Layer 2 networks within a single public Layer 2 network. This feature provides simple access infrastructure for network service providers to operate Metropolitan Area Networks (MANs) as commercial value added networks. Customers can connect to a service provider's network at multiple locations and use their own VLAN IDs, without requiring the service provider's equipment between to know about those VLANs.

A nested VLAN implementation consists of the following port types:

- Provider ports - these connect to a service provider's Layer 2 network
- Customer edge ports - these connect to a customer's private Layer 2 network

How double-tagged VLANs work

In a nested VLAN environment VLAN tagging exists at two levels:

- client tagging (C-tag)
- service provider tagging (S-tag)

When nested VLAN functionality is enabled, the service provider assigns to each of its clients an individual 12 bit customer VID called an S-Tag. The S-Tag field has an identical structure to a conventional VLAN tag field.

The S-Tag is attached to a packet as it enters the service provider network at the customer edge port. From this point on, the S-Tag is used for transmission within the service provider, or public Layer 2, network. The S-Tag is then removed as it leaves the destination customer edge port. This process is shown in **Figure 18-1 on page 18.7**.

The VID that is used within the client's own network, the C-Tag, is ignored by the service provider network and bridging is based on the value of the S-Tag. The ethertype of the S-Tag is set by changing the Tag Protocol Identifier (TPID). Once the S-Tag is removed from the packet, it is forwarded "as is" out of the customer-edge port. The tagged status of the Customer port is ignored on egress.

VLAN rules for double tagging

When double-tagged VLANs are created on the switch:

- a nested VLAN belongs to only one customer and can have multiple customer-edge ports
- a port must be either a customer-edge port or a provider port, but cannot be both

A service provider port:

- accepts only tagged packets
- transmits only tagged packets
- can be in many double-tagged VLANs

A customer edge port:

- accepts both tagged and untagged packets
- transmits both tagged and untagged packets
- can be a member of only one nested VLAN

Restrictions when using double-tagged VLANs

Restrictions when double-tagged VLANs are implemented are:

- Ethernet bridging is based on the S-Tag VID instead of the packet C-Tag VID. The packets C-Tag VID does not change
- ARP packet trapping is restricted
- hardware filtering does not work above MAC address level

Configuring double-tagged VLANs

You need a special feature license to use double-tagged VLANs. Contact your authorized Allied Telesis distributor or reseller for more information.

Set the Tag Protocol Identifier (TPID)

If required, you can change the Tag Protocol Identifier (TPID) from its default (for VLAN stacking) of 0x8100 (specified as hex notation), with the **platform vlan-stacking-tpid** command on page 17.28. Note that this command specifies the TPID value that applies to all VLANs used for double-tagged VLANs. You cannot set individual TPID values for different VLANs within a multi double-tagged VLAN network

Set the Maximum Receive Unit (MRU)

- Adding the S-Tag can result in frame sizes that exceed the maximum of 1522 bytes. In order to cope with these larger than normal frames, you should increase the MRU size set for ports configured for double-tagged VLANs. Set the MRU size to:9710 bytes for ports that work at speeds of either 100 Mbps or 100 Mbps
- 10240 bytes for ports that work at speeds of 1000 Mbps

For more information, see the **mru** command on page 14.5.

Double-tagged VLAN configuration example

Figure 18-1: VLAN double tagging

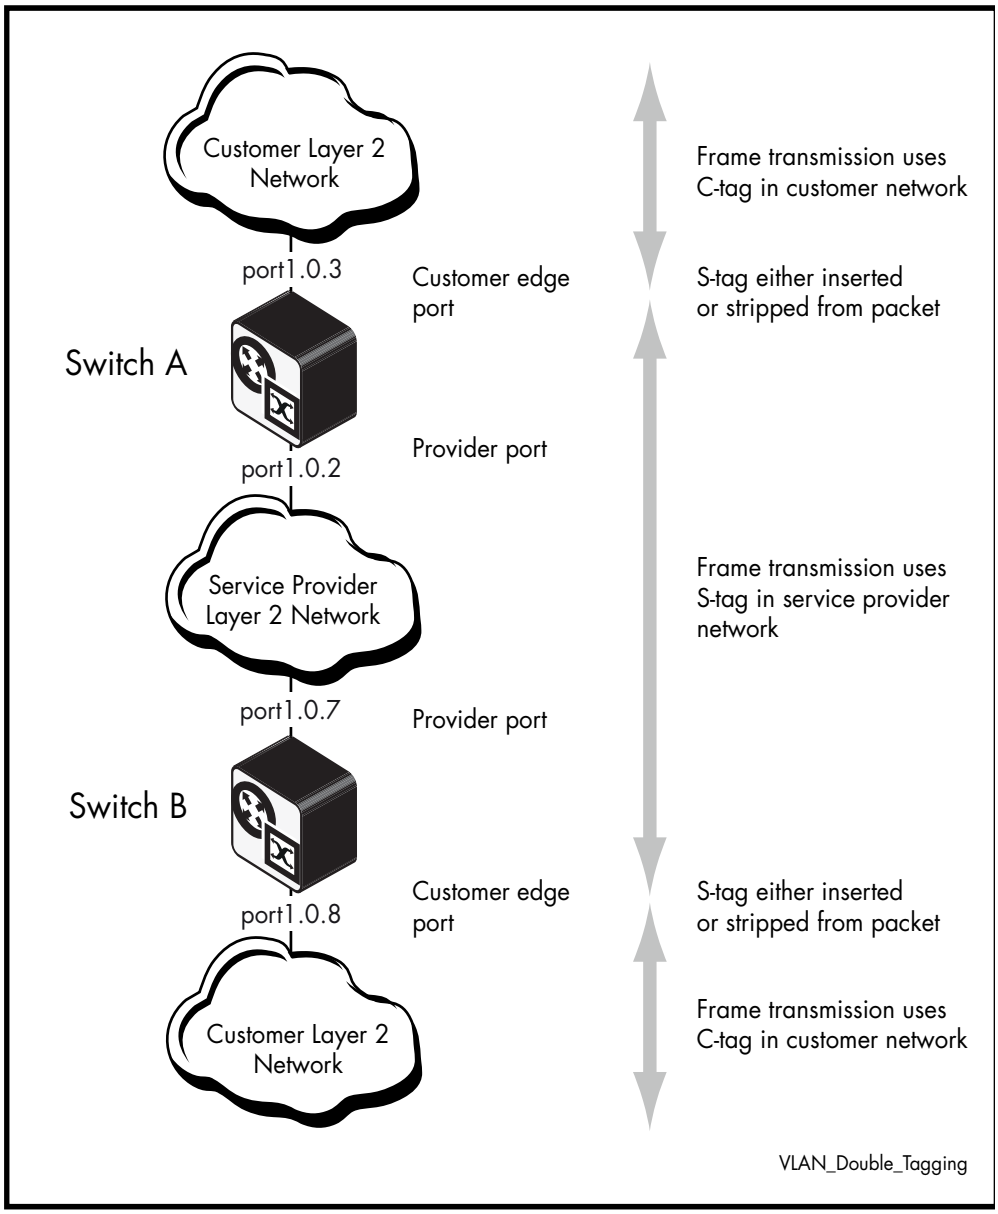

Table 18-2: Switch A Configuration

Create and enable the service provider VLAN 2 (the VLAN that will be used in the outer-tag)	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`vlan database`	Enter VLAN database mode.
`awplus(config-vlan)#`	
`vlan 2 state enable`	Create and enable VLAN 2.

Table 18-2: Switch A Configuration(cont.)

`awplus(config-vlan)#`	
`exit`	Return to Global Configuration mode.
Configure port 1.0.2 as a provider-port member of VLAN 2	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2`	Select `port1.0.2` for configuring.
`awplus(config-if)#`	
`switchport mode trunk`	Set the port to trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 2`	Add the VLAN to be trunked over the port.
`awplus(config-if)#`	
`switchport vlan-stacking provider-port`	Enable VLAN stacking and set the port to be a provider port.
Set the Maximum Receive Unit (MRU)	
`awplus(config-if)#`	
`mru <10240>`	Specify the MRU size in bytes.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
Configure port 1.0.3 as a customer edge port member of VLAN 10	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`interface port1.0.3`	Select `port1.0.3` for configuring.
`awplus(config-if)#`	
`switchport mode access`	Set the port to access mode.
`awplus(config-if)#`	
`switchport access vlan 2`	Associate the port with VLAN 2.
`awplus(config-if)#`	
`switchport vlan-stacking customer-edge-port`	Enable VLAN stacking and set the port to be a customer edge port.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.

Table 18-3: Switch B Configuration

Create and enable the service provider VLAN 2 (the VLAN that will be used in the outer-tag)	
`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `vlan database`	Enter VLAN database mode.
`awplus(config-vlan)#` `vlan 2 state enable`	Create and enable VLAN 2.
`awplus(config-vlan)#` `exit`	Return to Global Configuration mode.
Configure port 1.0.7 as a provider-port member of VLAN 2	
`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `interface port1.0.7`	Select `port1.0.7` for configuring.
`awplus(config-if)#` `switchport mode trunk`	Set the port to trunk mode.
`awplus(config-if)#` `switchport trunk allowed vlan add 2`	Add the VLAN to be trunked over the port.
`awplus(config-if)#` `switchport vlan-stacking provider-port`	Enable VLAN stacking and set the port to be provider port.
Set the Maximum Receive Unit (MRU)	
`awplus(config-if)#` `mru <10240>`	Specify the MRU size in bytes.
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
Configure port 1.0.8 as a customer edge port member of VLAN 10	
`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `interface port1.0.8`	Select `port1.0.8` for configuring.
`awplus(config-if)#` `switchport mode access`	Set the port to access mode.

Table 18-3: Switch B Configuration(cont.)

`awplus(config-if)#`	
`switchport access vlan 2`	Associate the port with VLAN 2.
`awplus(config-if)#`	
`switchport vlan-stacking customer-edge-port`	Enable VLAN stacking and set the port to be a customer edge port.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.

Private VLANs

Private VLANs combine the network advantages of conventional VLANs, with an added degree of privacy obtained by limiting the connectivity between selected ports.

This section provides an introduction to:

- Private VLANs for ports in access mode
- **Private VLANs for trunked ports**

Private VLANs for ports in access mode

An example application of a private VLAN would be a library in which user booths each have a PC with Internet access. In this situation it would usually be undesirable to allow communication between these individual PCs. Connecting the PC to ports within a private isolated VLAN would enable each PC to access the Internet or a library server via a single connection, whilst preventing access between the PCs in the booths.

Another application might be to use private VLANs to simplify IP address assignment. Ports can be isolated from each other whilst still belonging to the same subnet.

A private VLAN comprises the following components:

- **a single promiscuous port**
- **one or more host ports**
  There are two types of host ports:
  - **isolated ports**
    These can only communicate with the promiscuous port that is associated with the isolated VLAN.
  - **community ports**
    These can communicate with their associated promiscuous port and other community ports within the community VLAN.
- **a single primary VLAN**
- **one or more secondary VLANS**
  There are two types of secondary VLANs:
  - **isolated VLANs**
    In this VLAN type, communication can only take place between each host port and its associated promiscuous port.
  - **community VLANs**
    In this VLAN type, communication can take place between host ports and between each host port and its associated promiscuous port.

Membership rules for private VLANs in access mode

The following membership rules apply when creating and operating private VLANs in access mode.

Each private VLAN:

- must contain one promiscuous port (or aggregated link)
- may contain multiple host ports
- can be configured to span switch instances
- can only contain promiscuous and host ports
- cannot use the default VLAN (vlan1)
- a private *isolated* VLAN can only contain a single promiscuous port
- a private *community* VLAN can contain more than one promiscuous port

A promiscuous port:

- is a member of the primary VLAN and all its associated secondary VLANs
- cannot be a member of both private and non-private VLANs

A host port:

- can be a member of multiple private (community) VLANs, but all these VLANs must share the same promiscuous port
- cannot be a host port in some VLANs and a non-host port in others
- cannot be a promiscuous port in another VLAN

Promiscuous ports

A promiscuous port can communicate with all ports that are members of its associated secondary VLANs. Multiple promiscuous ports can exist in a primary VLAN, but only if the primary VLAN is only associated with community VLANS (that is, that there are no isolated VLANs associated with this port).

A promiscuous port is a member of the primary VLAN and all associated secondary VLANs. Its Port VID is set to the VLAN ID of the primary VLAN.

Host ports

Host ports have two levels of connectivity depending on whether they exist in an isolated or a community VLAN.

1. Host ports within an isolated VLAN

These ports are only allowed to communicate with their VLAN's promiscuous port, even though they share their secondary (isolated) VLAN with other hosts. The host ports receive their data from the promiscuous port via the primary VLAN, and *individually* transmit their data to the promiscuous port via their common secondary VLAN.

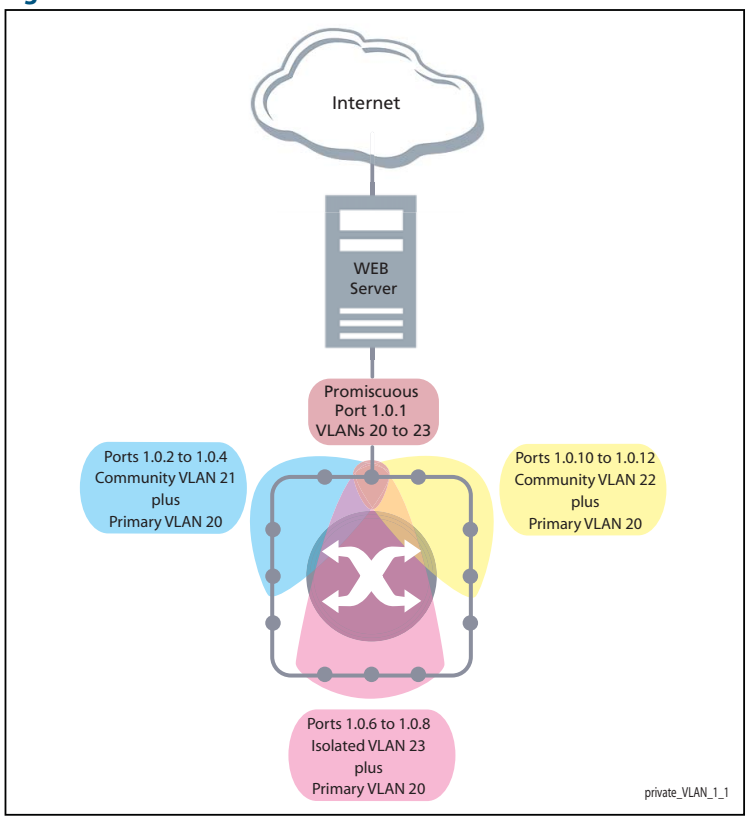
2. Host ports within a community VLAN

These ports are able to communicate with both the promiscuous port and the other ports within the community VLAN that they are associated with. They receive their data from the promiscuous port via the primary VLAN, and transmit their data to both the promiscuous port and the other host ports (within their community VLAN) via their common secondary VLAN. However, the only external path from a community VLAN is from its promiscuous port.

Private VLAN operation with ports in access mode

A basic private VLAN operation is shown in **Figure 18-2**.It comprises primary VLAN 20 plus three secondary VLANS, two community VLANs 21 and 22, and an isolated VLAN 23.

Figure 18-2: Private VLAN



The ports on this switch have the following configuration:

- Port 1.0.1 is the promiscuous port and is a member of the primary VLAN 20 and all its associated secondary VLANs.
- Ports 1.0.2 to 1.0.4 are members of the community VLAN 21 and are able to communicate with both the promiscuous port and all other ports in VLAN 21.
- Ports 1.0.10 to 1.0.12 are members of the community VLAN 22 and are able to communicate with both the promiscuous port and all other ports in VLAN 22.
- Ports 1.0.6 to 1.0.8 are members of the isolated VLAN 23. Each of these ports can only communicate with the promiscuous port.

Table 18-4: Private VLANs - Port Tagging

Port	Mode	Untagged VLAN Membership	PVID
1.0.1	Promiscuous	20, 21, 22, 23	20
1.0.2 to 1.0.4	Host	20, 21	21
1.0.10 to 1.0.12	Host	20, 22	22
1.0.6 to 1.0.8	Host	20, 23	23
1.0.5	Not members of the private VLAN		-
1.0.9	Not members of the private VLAN		-

Private VLANs operate within a single switch and comprise one primary VLAN plus a number of secondary VLANS. All data enters the private VLAN ports untagged. Using the example of **Figure 18-2**, data enters the switch via the promiscuous `port1.0.1` and is forwarded to the host ports using VLAN 20, the primary VLAN. Data returning from the host ports to the promiscuous port (and exiting the switch) use the secondary VLAN associated with its particular host port, VLAN 21, 22, or 23 in the example. Thus the data flows into the switch via the primary VLAN and out of the switch via the secondary VLANs. This situation is not detected outside of the switch, because all its private ports are untagged. Note however, that data flowing between ports within the same community VLAN will do so using the VID of the community VLAN.

Portfast on private VLANS

Within private VLANs, we recommend that you place all host ports into spanning-tree portfast mode and enable BPDU guard. Portfast assumes that because host ports will also be edge ports, they will have no alternative paths (loops) via other bridges. These ports are therefore allowed to move directly from the spanning-tree blocking state into the forwarding state, thus bypassing the intermediate states.

Applying BPDU guard is an extra precaution. This feature disables an edge port if it receives a BPDU frame, because receiving such a frame would indicate that the port has a connection to another network bridge.

For more information on BPDU guard and portfast, see their following commands:

- **spanning-tree portfast bpdu-guard** command on page 21.63
- **spanning-tree portfast (STP)** command on page 21.59

Access mode private VLAN configuration example

Table 18-5: Configuration procedure for access mode private VLANs

Command	Description
Create the VLANs	
`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `vlan database`	Enter VLAN Configuration mode.
`awplus(config-vlan)#` `vlan 20-23`	Create the VLANs.
Create the private VLANs and set the type	
`awplus(config-vlan)#` `private-vlan 20 primary`	Create primary VLAN 20.
`awplus(config-vlan)#` `private-vlan 21 community`	Create community VLAN 21.
`awplus(config-vlan)#` `private-vlan 22 community`	Create community VLAN 22.
`awplus(config-vlan)#` `private-vlan 23 isolated`	Create isolated VLAN 23.
Associate the secondary VLANs with the primary VLAN	
`awplus(config-vlan)#` `private-vlan 20 association add 21`	Associate secondary VLAN 21 with the primary VLAN 20.
`awplus(config-vlan)#` `private-vlan 20 association add 22`	Associate secondary VLAN 22 with the primary VLAN 20.
`awplus(config-vlan)#` `private-vlan 20 association add 23`	Associate secondary VLAN 23 with the primary VLAN 20.
Set port 1.0.1 to be the promiscuous port	
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
`awplus(config)#` `interface port1.0.1`	Enter Interface Configuration mode for `port1.0.1`.
`awplus(config-if)#` `switchport mode private-vlan promiscuous`	Set the port as a promiscuous ports.
Set the other ports to be host ports	

Table 18-5: Configuration procedure for access mode private VLANs(cont.)

`awplus(config-if)#` `exit`	Return to Global Configuration mode.
`awplus(config)#` `interface port1.0.2-1.0.4, port1.0.6-1.0.8, port1.0.10 -1.0.12`	Enter Interface Configuration mode for the ports.
`awplus(config-if)#` `switchport mode private-vlan host`	Set the ports as host ports.
On the promiscuous port, map the primary VLAN to each of the secondary VLANs	
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
`awplus(config)#` `interface port1.0.1`	Enter Interface Configuration mode for `port1.0.1`.
`awplus(config-if)#` `switchport private-vlan mapping 20 add 21-23`	Associate primary VLAN 20 and the secondary VLANs 21 to 23 to the promiscuous port.
Associate the community host ports with the community VLANs	
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
`awplus(config)#` `interface port1.0.2-1.0.4`	Enter Interface Configuration mode for ports 1.0.2 to 1.0.4.
`awplus(config-if)#` `switchport private-vlan host-association 20 add 21`	Associate primary VLAN 20 and secondary VLAN 21 to the host ports.
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
`awplus(config)#` `interface port1.0.10-1.0.12`	Enter Interface Configuration mode for ports 1.0.10 to 1.0.12.
`awplus(config-if)#` `switchport private-vlan host-association 20 add 22`	Associate primary VLAN 20 and secondary VLAN 22 to the host ports.
Associate the isolated host ports with the isolated VLAN 23	
`awplus(config-if)#` `exit`	Return to Global Configuration mode.

Table 18-5: Configuration procedure for access mode private VLANs(cont.)

`awplus(config)#`	
`interface port1.0.6-1.0.8`	Enter Interface Configuration mode for ports 1.0.6 to 1.0.8.
`awplus(config-if)#`	
`switchport private-vlan host-association 20 add 23`	Associate primary VLAN 20 and secondary VLAN 23 to the host ports.

Private VLANs for trunked ports

Private VLAN trunk ports allow you to combine traffic for private isolated VLANs over a trunk. A port in trunk mode enabled as a promiscuous port with the **switchport mode private-vlan trunk promiscuous** command can carry both multiple isolated private VLANs and non-private VLANs. A promiscuous port in trunk mode allows you to combine multiple isolated VLANs on a single trunk port. A port in trunk mode enabled as a secondary port with the **switchport mode private-vlan trunk secondary** command can combine traffic for multiple isolated VLANs over a trunk.

Note Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. Private VLAN trunk ports and GVRP are mutually exclusive.

A private VLAN group for trunked ports comprises the following components:

- a single promiscuous port
- **one or more isolated secondary ports**
  These can only communicate with the associated promiscuous port.
- **isolated VLANs**
  In this VLAN type, communication can only take place between each secondary port and its associated promiscuous port. Membership rules for private VLANs for trunked ports

The following membership rules apply when creating and operating private VLANs for trunked ports.

A promiscuous trunk port:

- must be in trunk mode
- can be a member of both isolated VLANs and non-isolated VLANs
- has a group ID that is solely used to associate the promiscuous port with secondary ports

A secondary trunk port:

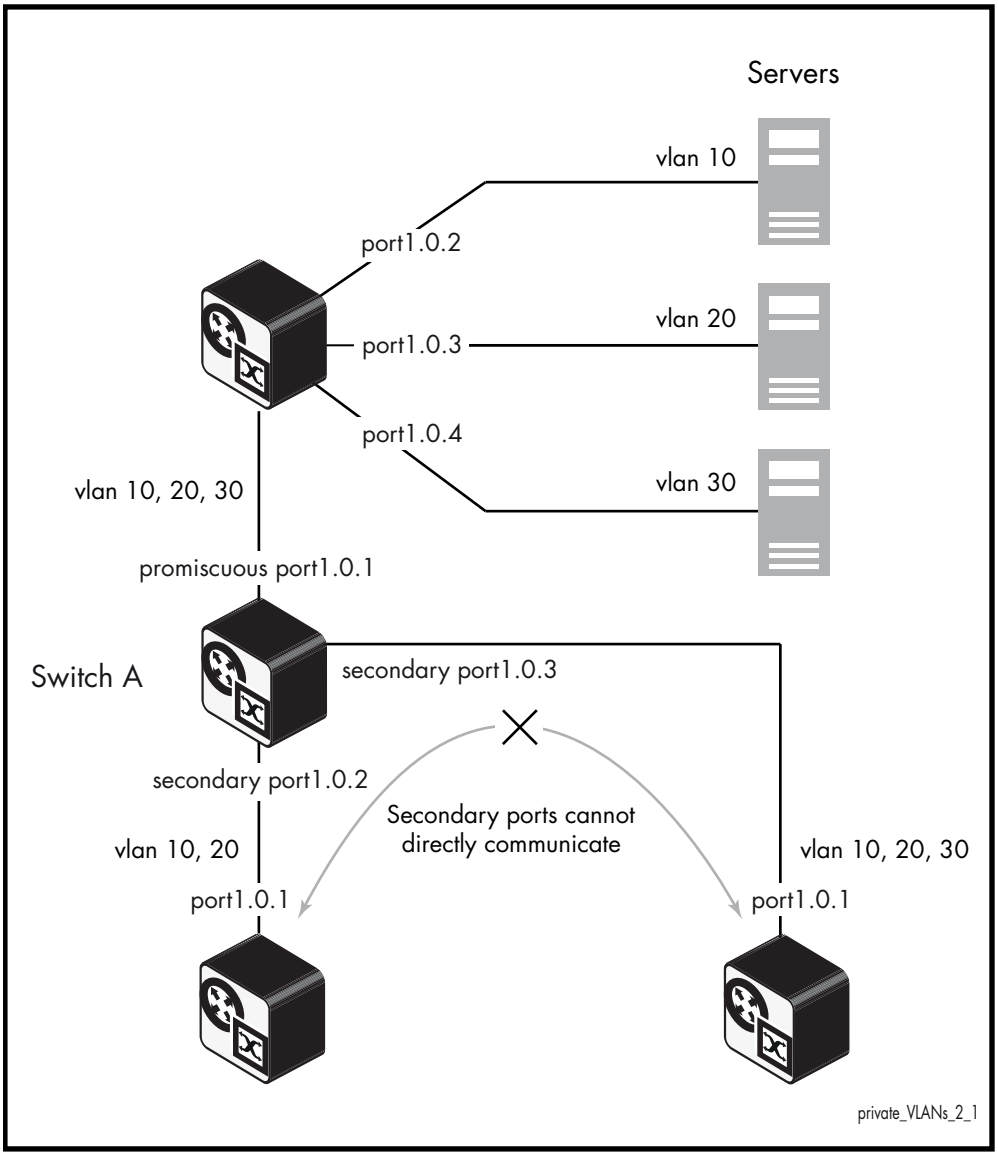
- must be in trunk mode
- can only be a member of isolated VLANs
- cannot be a promiscuous port in another VLAN
- has a group ID that is solely used to associate the secondary port with its promiscuous port

Unlike private VLANs for ports in access mode, private VLANs for trunked ports have no secondary to primary VLAN mappings.

Trunked port private VLAN configuration example

A basic trunked port private VLAN operation is shown in **Figure 18-3**.

Figure 18-3: Trunked port private VLAN



The ports on **Switch A** have the following configuration:

- Port 1.0.1 is the promiscuous port, and has a group ID of 1
- Port 1.0.2 is a secondary port for isolated private VLANs 10 and 20, and has a group ID of 1
- Port 1.0.3 is a secondary port for isolated private VLANs 10, 20 and 30, and has a group ID of 1

The configuration procedure in **Table 18-6** show the steps to configure **Switch A**.

Table 18-6: Configuration procedure for Switch A

Command	Description
Create the VLANs	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`vlan database`	Enter VLAN Configuration mode.
`awplus(config-vlan)#`	
`vlan 10,20,30`	Create the VLANs.
Create the private VLANs and set the type	
`awplus(config-vlan)#`	
`private-vlan 10 isolated`	Create isolated VLAN 10.
`awplus(config-vlan)#`	
`private-vlan 20 isolated`	Create isolated VLAN 20.
`awplus(config-vlan)#`	
`private-vlan 30 isolated`	Create isolated VLAN 30.
Set port 1.0.1 to trunk mode and add the VLANs to be trunked over the port	
`awplus(config-vlan)#`	
`interface port1.0.1`	Enter Interface Configuration mode for `port1.0.1`.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of the port to trunk.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 10,20,30`	Add the VLANs to be trunked over this port.
Set port 1.0.2 to trunk mode and add the VLANs to be trunked over the port	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2`	Enter Interface Configuration mode for `port1.0.2`.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of the port to trunk.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 10,20`	Add the VLANs to be trunked over this port.

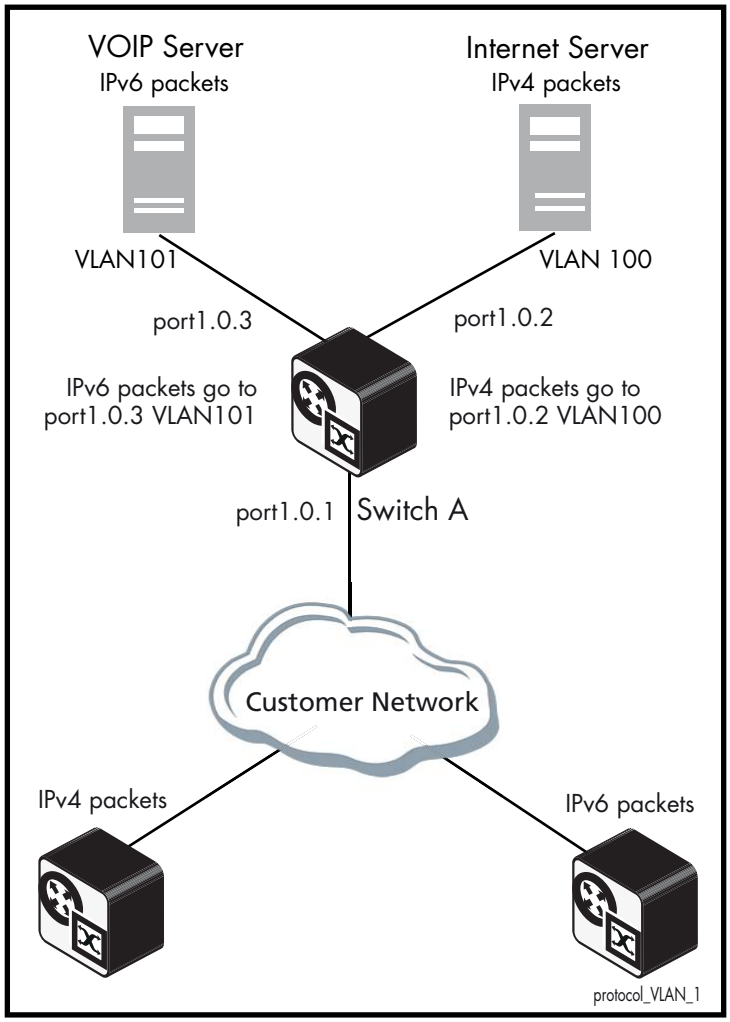
Table 18-6: Configuration procedure for Switch A(cont.)

Set port 1.0.3 to trunk mode and add the VLANs to be trunked over the port	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.3`	Enter Interface Configuration mode for port 1.0.3.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of the port to trunk.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 10,20,30`	Add the VLANs to be trunked over this port.
Set port 1.0.1 to be the promiscuous port	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.1`	Enter Interface Configuration mode for port 1.0.1.
`awplus(config-if)#`	
`switchport mode private-vlan trunk promiscuous group 1`	Enable the port in trunk mode to be promiscuous port for isolated VLANs 10, 20 and 30 with a group ID of 1.
Set port 1.0.2 to be a secondary port	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2`	Enter Interface Configuration mode for `port1.0.2`.
`awplus(config-if)#`	
`switchport mode private-vlan trunk secondary group 1`	Enable the port in trunk mode to be a secondary port for isolated VLANs 10 and 20 with a group ID of 1.
Set port 1.0.3 to be a secondary port	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.3`	Enter Interface Configuration mode for `port1.0.3`.
`awplus(config-if)#`	
`switchport mode private-vlan trunk secondary group 1`	Enable the port in trunk mode to be a secondary port for isolated VLANs 10, 20 and 30 with a group ID of 1.

Protocol based VLAN configuration example

A protocol based VLAN topology is shown below in **Figure 18-4**.
See the configuration procedure to configure **Switch A** in **Table 18-6** on the next page.

Figure 18-4: Protocol based VLAN configuration



Switch A has the following configuration to enable protocol based VLAN classification:

- VLAN 100 and VLAN 101 created and applied to port1.0.2 and port1.0.3 respectively
- IPv4 and IPv6 VLAN classifier rules created and mapped to VLAN 100 and VLAN 101
- VLAN classifier group created and mapped to port1.0.1
- VLAN 100 and VLAN 101 are trunked over port1.0.2 and port1.0.3 respectively
- IPv4 packets received on port1.0.1 go to port1.0.2 VLAN 100
- IPv6 packets received on port1.0.1 go to port1.0.3 VLAN 101

The configuration procedure in **Table 18-6** show the steps to configure **Switch A**.

Table 18-7: Configuration procedure for Switch A

Command	Description
Create the VLANs 100 and 101	
`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `vlan database`	Enter VLAN Configuration mode.
`awplus(config-vlan)#` `vlan 100,101`	Create the VLANs.
`awplus(config-vlan)#` `exit`	Exit VLAN Configuration mode.
Create two protocol type based VLAN classifier rules for IPv4 and IPv6 mapped to VLAN 100 and 101	
`awplus(config)#` `vlan classifier rule 1 proto ip encap ethv2 vlan 100`	Create a VLAN classifier rule `1` for IPv4 packets on VLAN `100`.
`awplus(config)#` `vlan classifier rule 2 proto ipv6 encap ethv2 vlan 101`	Create a VLAN classifier rule `2` for IPv6 packets on VLAN `101`.
Create a group of VLAN classifier rules and map the defined VLAN classifier rules 1 and 2 to the group	
`awplus(config)#` `vlan classifier group 1 add rule 1`	Add VLAN classifier rule `1` to VLAN classifier group `1`.
`awplus(config)#` `vlan classifier group 1 add rule 2`	Add VLAN classifier rule `2` to VLAN classifier group `1`.
Associate the created VLAN classifier group 1 with port1.0.1	
`awplus(config)#` `interface port1.0.1`	Enter Interface Configuration mode for `port1.0.1`.
`awplus(config-if)#` `vlan classifier activate 1`	Associate VLAN classifier group `1` with `port1.0.1`.

Table 18-7: Configuration procedure for Switch A(cont.)

`awplus(config-if)#`	
`exit`	Exit Interface Configuration mode.
Add VLAN 100 to be trunked over port1.0.2	
`awplus(config)#`	
`interface port1.0.2`	Enter Interface Configuration mode for `port1.0.2`.
`awplus(config-if)#`	
`switchport mode trunk`	Enable switchport trunking on `port1.0.2`.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 100`	Add VLAN 100 to be trunked over `port1.0.2`.
`awplus(config-if)#`	
`exit`	Exit Interface Configuration mode.
Add VLAN 101 to be trunked over port1.0.3	
`awplus(config)#`	
`interface port1.0.3`	Enter Interface Configuration mode for `port1.0.3`.
`awplus(config-if)#`	
`switchport mode trunk`	Enable switchport trunking on `port1.0.3`.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 101`	Add VLAN 101 to be trunked over `port1.0.3`.
`awplus(config-if)#`	
`exit`	Exit Interface Configuration mode.

VLAN Statistics

This feature provides a series of data counters each able to count both the number of received frames or the number of received bytes (octets) belonging to a particular VLAN. Data frames are counted as they enter the switch ports. By allocating VLANs to each customer, a service provider could use the VLAN counter output to provide the basis for a traffic based billing component.

Counter Operation

Two scenarios are detailed; in the first scenario the switch is being used at the edge of the network, and in the second it is directly connected to an edge switch. In each situation, separate counters are maintained for incoming traffic that is associated with a particular VLAN across a range of ports. This enables both incoming and outgoing traffic volumes to be measured.

A port may not be assigned to multiple counter instances so as to count frames (or bytes) within the same VLAN.

The byte count includes frame headers, therefore the byte counter for a VLAN tagged frame will be 4 bytes longer than for an untagged frame.

Where a VLAN packet counter instance encompasses ports on a stacked member and the member is removed from the stack, these ports will automatically be removed from the counter instance. If this process removes all ports within a counter instance, then the instance will be deleted.

Edge Switch Scenario

This network is shown in **Figure 18-5 on page 18.26**. The total data count is the upload count plus the download packet count

Customer A data count

The upload data count for customer A is determined by monitoring the inbound VLAN 10 packets on ports 1.0.2 and 1.0.8 (i.e. packets from Customer A's network). These ports must be untagged members of VLAN 10. Note that packets traveling between these ports will be included in the count.

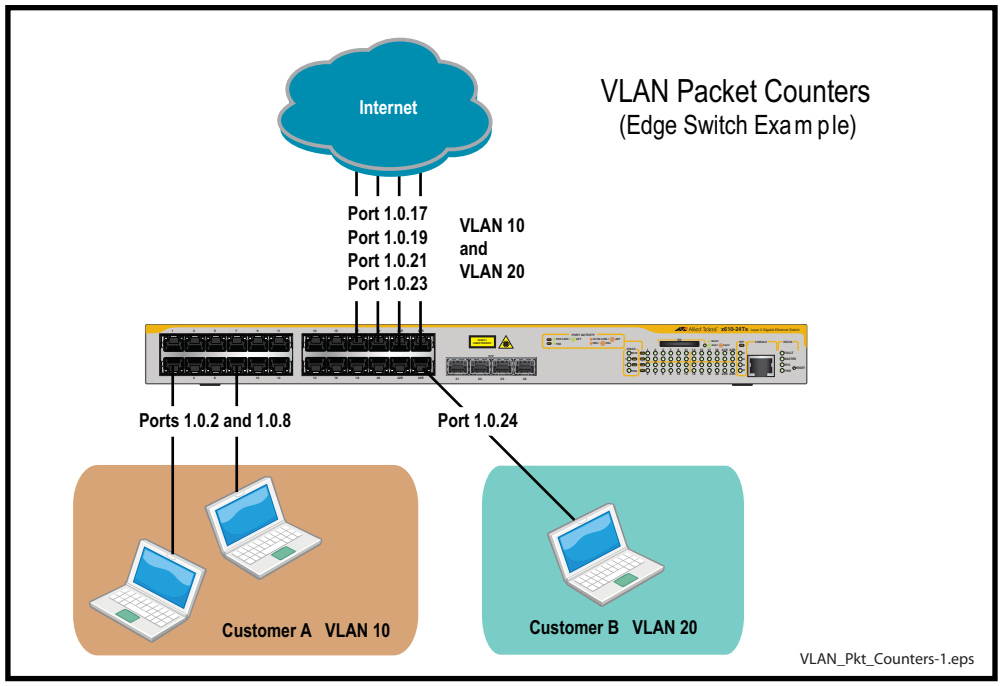
The download data count for customer A is determined by monitoring inbound VLAN 10 packets on ports 1.0.17, 1.0.19, 1.0.21, and 1.0.23 (i.e. packets destined for Customer A's network from the Internet).

Customer B data count

The upload data count for customer B is determined by monitoring the inbound VLAN 20 packets on `port1.0.24` (i.e. packets from Customer B's network). This port must be an untagged member of VLAN 20.

The download data count for customer B is determined by monitoring inbound VLAN 20 packets on ports 1.0.17, 1.0.19, 1.0.21, and 1.0.23 (i.e. packets destined for Customer B's network from the Internet).

Figure 18-5: VLAN Packet Counters - Edge Switch Scenario



Non Edge Switch Scenario

This network is shown in **Figure 18-6 on page 18.27**. The total data count is the upload count plus the download packet count.

Customer A data count

The upload data count for customer A is determined by monitoring the inbound VLAN 10 packets on ports 1.0.18 and 1.0.20, 1.0.22, and 1.0.24 on switch Y (i.e. the traffic from customer A's network).

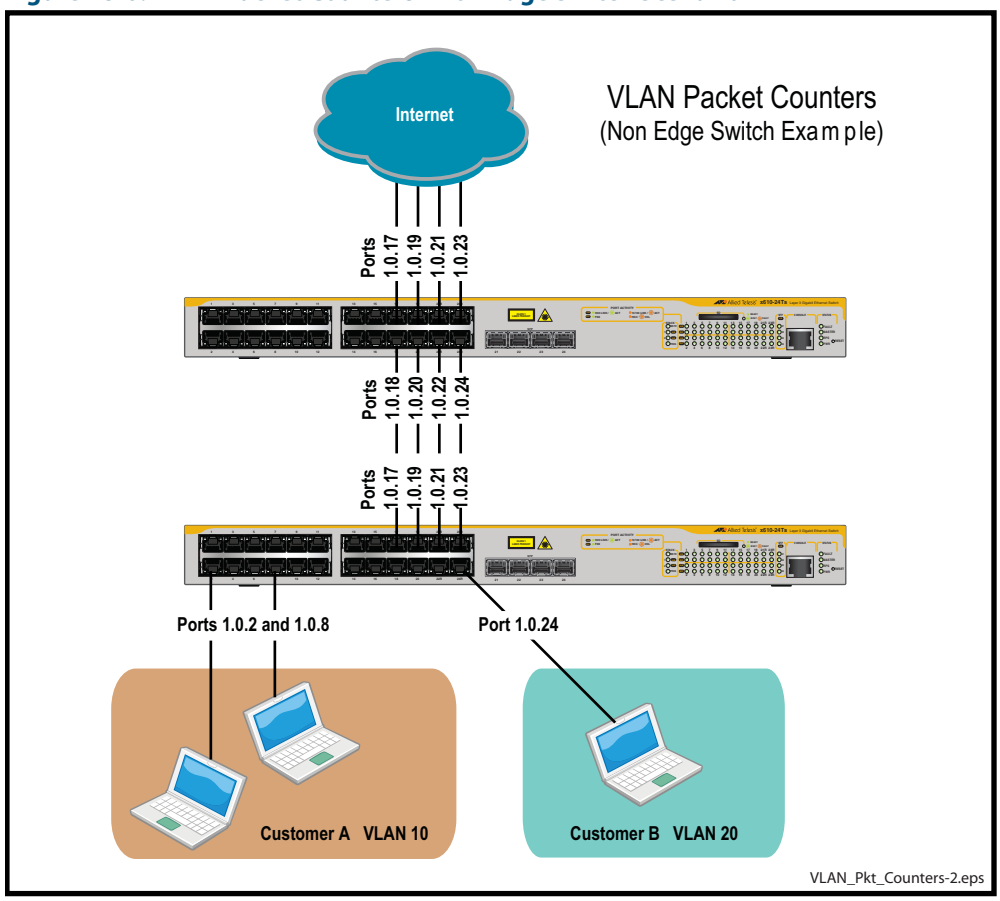
The download data count for customer A is determined by monitoring inbound VLAN 10 packets on ports 1.0.17, 1.0.19, 1.0.21, and 1.0.23.

Customer B data count

The upload data count for customer B is determined by monitoring the inbound VLAN 20 packets on ports 1.0.18 and 1.0.20, 1.0.22, and 1.0.24 on switch Y (i.e. the traffic from customer B's network).

The download data count for customer B is determined by monitoring inbound VLAN 20 packets on ports 1.0.17, 1.0.19, 1.0.21, and 1.0.23.

Figure 18-6: VLAN Packet Counters - Non Edge Switch Scenario



Chapter 19: VLAN Commands

Command List

This chapter provides an alphabetical reference of commands used to configure VLANs. For more information see **Chapter 18, VLAN Introduction**.

clear vlan statistics

This command resets the counters for either a specific VLAN statistics instance or (by not specifying an instance) resets the counters for all instances.

Syntax `clear vlan statistics [name <instance_name>]`

Parameter	Description
`vlan statistics`	The count of incoming frames or bytes collected on a per VLAN basis.[1]
`<instance-name>`	The name of the instance for which incoming frames and their bytes are counted.[1]

1. The terms frame and packet are used interchangeably.

Mode Privileged Exec

Examples To reset all packet counters for the packet counter instance **vlan2-data:**

```
awplus# clear vlan statistics name vlan2-data
```

To reset all packet counters for all packet counter instances.

```
awplus# clear vlan statistics
```

Related Commands **show vlan statistics**
vlan statistics

private-vlan

Use this command to a create a private VLAN. Private VLANs can be either primary or secondary. Secondary VLANs can be ether community or isolated.

Use the **no** variant of this command to remove the specified private VLAN.

For more information, see the section **"Private VLANs" on page 18.11**.

Syntax

```
private-vlan <vlan-id> {community|isolated|primary}
no private-vlan <vlan-id> {community|isolated|primary}
```

Parameter	Description
<vlan-id>	VLAN ID in the range <2-4094> for the VLAN which is to be made a private VLAN.
`community`	Community VLAN.
`isolated`	Isolated VLAN.
`primary`	Primary VLAN.

Mode VLAN Configuration

Examples

```
                awplus# configure terminal
           awplus(config)# vlan database
     awplus(config-vlan)# vlan 2 name vlan2 state enable
     awplus(config-vlan)# vlan 3 name vlan3 state enable
     awplus(config-vlan)# vlan 4 name vlan4 state enable
     awplus(config-vlan)# private-vlan 2 primary
     awplus(config-vlan)# private-vlan 3 isolated
     awplus(config-vlan)# private-vlan 4 community

                awplus# configure terminal
           awplus(config)# vlan database
     awplus(config-vlan)# no private-vlan 2 primary
     awplus(config-vlan)# no private-vlan 3 isolated
     awplus(config-vlan)# no private-vlan 4 community
```

private-vlan association

Use this command to associate a secondary VLAN to a primary VLAN. Only one isolated VLAN can be associated to a primary VLAN. Multiple community VLANs can be associated to a primary VLAN.

Use the **no** variant of this command to remove association of all the secondary VLANs to a primary VLAN.

For more information, see the section **"Private VLANs" on page 18.11**.

Syntax

```
private-vlan <primary-vlan-id> association
   {add <secondary-vlan-id> | remove <secondary-vlan-id>}

no private-vlan <primary-vlan-id> association
```

Parameter	Description
<primary-vlan-id>	VLAN ID of the primary VLAN.
<secondary-vlan-id>	VLAN ID of the secondary VLAN (either isolated or community).

Mode VLAN Configuration

Examples The following commands associate primary VLAN 2 with secondary VLAN 3:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# private-vlan 2 association add 3
```

The following commands remove the association of primary VLAN 2 with secondary VLAN 3:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# private-vlan 2 association remove 3
```

The following commands remove all secondary VLAN associations of primary VLAN 2:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no private-vlan 2 association
```

port-vlan-forwarding-priority

Use this command to set the highest priority protocol to control transitions from blocking to forwarding traffic. This command prioritizes switch port forwarding mode control, when more than one of EPSR, Loop Protection, and MAC thrashing protection protocols are used on the switch.

EPSR, Loop Protection and MAC Thrashing use the same mechanism to block or forward traffic. This command sets the highest priority protocol to control transitions from blocking to forwarding traffic. Setting the priority stops contention between protocols.

For example, If EPSR is set to the highest priority protocol to block traffic on vlan10 on port1.0.2 then this stops MAC Thrashing from forwarding traffic on vlan10 on port1.0.2.

Caution  **loop-protection** and **none** parameter options must not be set on an EPSR master node. Use the **epsr** parameter option on an EPSR master node instead. Setting this command incorrectly on an EPSR master node could cause unexpected broadcast storms.

Use the **no** variant of this command to restore the default highest priority protocol back to the default of EPSR.

For more information about EPSR, see the section **"EPSR Introduction and Configuration" on page 83.1**.

Syntax

```
port-vlan-forwarding-priority {epsr|loop-protection|none}

no port-vlan-forwarding-priority
```

Parameter	Description
`epsr`	Sets EPSR as the highest priority protocol. Use this parameter on an EPSR master node to avoid unexpected broadcast storms.
`loop-protection`	Sets Loop Protection as the highest priority protocol. Note that this option must not be set on an EPSR master node. Use the **epsr** parameter option on an EPSR master node to avoid unexpected broadcast storms.
`none`	Sets the protocols to have equal priority. This was the previous behavior before this command was added, and allows protocols to override each other to set a port to forwarding a VLAN. Note that this option must not be set on a EPSR master node. Use the **epsr** parameter option on an EPSR master node to avoid unexpected broadcast storms.

Default By default, the highest priority protocol is EPSR

Mode Global Configuration

Usage EPSR, Loop Protection and MAC Thrashing protection do not usually need to be configured on a switch, because they perform similar functions—each prevents network loops by blocking a selected port for each (loop containing) VLAN.

However, if more than one of these three features is configured on a switch, you can use this command to prioritize either EPSR or Loop Protection when their effects on a port would conflict and override each other. Previously, each protocol could set a port to forwarding for a VLAN, sometimes overriding the previous setting by another protocol to block the port. This could sometimes lead to unexpected broadcast storms.

Now, when a protocol is set to have the highest priority over a data VLAN on a port, it will not allow other protocols to put that port-vlan into a forwarding state if the highest priority protocol blocked it.

The priority mechanism is only used for blocking-to-forwarding transitions; protocols remain independent on the forwarding-to-blocking transitions.

For example, with an EPSR master node in a two-node ESPR ring with the below settings:

- The EPSR master node primary port is configured to switchport interface **port1.0.1**
- The EPSR master node secondary port is configured to switchport interface **port1.0.2**
- The EPSR master node control VLAN is configured to VLAN interface **vlan10**
- The EPSR master node has a first data VLAN configured to VLAN interface **vlan20**
- The EPSR master node has a second data VLAN configured to VLAN interface **vlan30**.

Initially, the EPSR ring is complete, with **port1.0.2** blocking data VLANs **vlan20** and **vlan30** and some broadcast traffic flowing through. If the user removes **vlan30** from EPSR, a storm is created on **vlan30**. MAC thrashing protection detects it and blocks **vlan30**.

Then after the storm has stopped, MAC thrashing protection sets it to forwarding again and it keeps oscillating between forwarding and blocking. In the meantime, the user adds back **vlan30** to EPSR as a data VLAN and EPSR blocks it on **port1.0.2**.

If the priority is set to none (**port-vlan-forwarding-priority none**), MAC thrashing protection notices that the storm has stopped again and decides to put **vlan30** on **port1.0.2** into forwarding state. This overrides what EPSR requires for this port-VLAN and creates a storm. This matches the old behavior before this feature was implemented.

If the priority is set to EPSR or default (**port-vlan-forwarding-priority epsr**), MAC thrashing protection notices that the storm has stopped again and attempts to put **vlan30** on **port1.0.2** into forwarding state. The higher priority protocol (EPSR) is blocking the VLAN on this port, so it stays blocking and no storm occurs.

Example To prioritize EPSR over Loop Protection or MAC Thrashing protection settings, so that Loop Protection or MAC Thrashing protection cannot set a port to the forwarding state a VLAN if EPSR has set it to the blocking state, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority epsr
```

To prioritize Loop Protection over EPSR or MAC Thrashing protection settings, so that EPSR or MAC Thrashing protection cannot set a port to the forwarding state a VLAN if Loop Protection has set it to the blocking state, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority loop-
protection
```

To set EPSR, Loop Protection, and MAC Thrashing protection protocols to have equal priority for port forwarding and blocking, which allows the protocols to override each other to set a port to the forwarding or blocking states, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority none
```

To restore the default highest priority protocol back to the default of EPSR, use the commands:

```
awplus# configure terminal
awplus(config)# no port-vlan-forwarding-priority
```

Related Commands **show port-vlan-forwarding-priority**

show port-vlan-forwarding-priority

Use this command to display the highest priority protocol that controls port-vlan forwarding or blocking traffic. This command displays whether EPSR or Loop Protection is set as the highest priority for determining whether a port forwards a VLAN, as set by the **port-vlan-forwarding-priority** command.

For more information about EPSR, see the section **"EPSR Introduction and Configuration" on page 83.1**.

Syntax

```
show port-vlan-forwarding-priority
```

Mode Privileged Exec

Example To display the highest priority protocol, use the command:

```
awplus# show port-vlan-forwarding-priority
```

Output **Figure 19-1: Example output from the show port-vlan-forwarding-priority command**

```
Port-vlan Forwarding Priority: EPSR
```

Related Commands **port-vlan-forwarding-priority**

show vlan

Use this command to display information about a particular VLAN by specifying the VLAN ID. It displays information for all the VLANs configured.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show vlan {all|brief|dynamic|static|auto|static-ports<1-4094>}`

Parameter	Description
<1-4094>	Display information about the VLAN specified by the VLAN ID.
`all`	Display information about all VLANs on the device.
`brief`	Display information about all VLANs on the device.
`dynamic`	Display information about all VLANs learned dynamically.
`static`	Display information about all statically configured VLANs.
`auto`	Display information about all auto-configured VLANs.
`static-ports`	Display static egress/forbidden ports.

Mode User Exec and Privileged Exec

Example To display information about VLAN 2, use the command:

```
awplus# show vlan 2
```

Output **Figure 19-2: Example output from the show vlan command**

```
VLAN ID  Name            Type    State   Member ports
                                         (u)-Untagged, (t)-Tagged
======= ================ ======= ======= ===================================
2       VLAN0002         STATIC  ACTIVE  port1.0.5(u) port1.0.6(u) port1.0.7(u)
                                         port1.0.8(u)
.
.
```

Related Commands **vlan**

show vlan classifier group

Use this command to display information about all configured VLAN classifier groups or a specific group.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show vlan classifier group [<1-16>]`

Parameter	Description
<1-16>	VLAN classifier group identifier

Mode User Exec and Privileged Exec

Usage If a group ID is not specified, all configured VLAN classifier groups are shown. If a group ID is specified, a specific configured VLAN classifier group is shown.

Example To display information about VLAN classifier group 1, enter the command:

```
awplus# show vlan classifier group 1
```

Related Commands **vlan classifier group**

show vlan classifier group interface

Use this command to display information about a single switch port interface for all configured VLAN classifier groups.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show vlan classifier group interface <switch-port>
```

Parameter	Description
<switch-port>	Specify the switch port interface classifier group identifier

Mode User Exec and Privileged Exec

Usage All configured VLAN classifier groups are shown for a single interface.

Example To display VLAN classifier group information for switch port interface `port1.0.2`, enter the command:

```
awplus# show vlan classifier group interface port1.0.2
```

Output **Figure 19-3: Example output from the show vlan classifier group interface port1.0.1 command:**

```
vlan classifier group 1 interface port1.0.1
```

Related Commands

vlan classifier group
show vlan classifier interface group

show vlan classifier interface group

Use this command to display information about all interfaces configured for a VLAN group or all the groups.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show vlan classifier interface group [<1-16>]`

Parameter	Description
<1-16>	VLAN classifier interface group identifier

Mode User Exec and Privileged Exec

Usage If a group ID is not specified, all interfaces configured for all VLAN classifier groups are shown. If a group ID is specified, the interfaces configured for this VLAN classifier group are shown.

Example To display information about all interfaces configured for all VLAN groups, enter the command:

```
awplus# show vlan classifier interface group
```

To display information about all interfaces configured for VLAN group 1, enter the command:

```
awplus# show vlan classifier interface group 1
```

Output **Figure 19-4: Example output from the show vlan classifier interface group command**

```
vlan classifier group 1 interface port1.0.1
vlan classifier group 1 interface port1.0.2
vlan classifier group 2 interface port1.0.3
vlan classifier group 2 interface port1.0.4
```

Output **Figure 19-5: Example output from the show vlan classifier interface group 1 command**

```
vlan classifier group 1 interface port1.0.1
vlan classifier group 1 interface port1.0.2
```

Related Commands **vlan classifier group**
show vlan classifier group interface

show vlan classifier rule

Use this command to display information about all configured VLAN classifier rules or a specific rule.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show vlan classifier rule [<1-256>]
```

Parameter	Description
<1-256>	VLAN classifier rule identifier

Mode User Exec and Privileged Exec

Usage If a rule ID is not specified, all configured VLAN classifier rules are shown. If a rule ID is specified, a specific configured VLAN classifier rule is shown.

Example To display information about VLAN classifier rule 1, enter the command:

```
awplus# show vlan classifier rule 1
```

Output **Figure 19-6: Example output from the show vlan classifier rule 1 command**

```
vlan classifier group 1 add rule 1
```

Related Commands

vlan classifier activate
vlan classifier rule ipv4
vlan classifier rule proto

show vlan private-vlan

Use this command to display the private VLAN configuration and associations.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show vlan private-vlan`

Mode User Exec and Privileged Exec

Example To display the private VLAN configuration and associations, enter the command:

```
awplus# show vlan private-vlan
```

Output **Figure 19-7: Example output from the show vlan private-vlan command**

```
awplus#show vlan private-vlan
 PRIMARY       SECONDARY          TYPE          INTERFACES
 -------       ---------        ----------      ----------
       2               3          isolated
       2               4         community
                       8          isolated
```

Related Commands **private-vlan**
private-vlan association

show vlan statistics

Use this command to display the current configuration for either a specific VLAN statistics instance, or (by not specifying an instance) display all VLAN packet counter instances.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show vlan statistics [name <instance_name>]`

Mode User Exec and Privileged Exec

Examples To display all packet counters for the packet counter instance **vlan2-data**

```
awplus# show vlan statistics name vlan2-data
```

To display all packet counters for all packet counter instances.

```
awplus# show vlan statistics
```

Figure 19-8: Example output from the show vlan statistics command

```
VLAN Stats Collection: vlan2-data
  VLAN ID: 2
  Port Map: port1.0.1, port1.0.2, port1.0.4
  Ingress Packets: total 941, bytes 66185
```

Related Commands **clear vlan statistics**
vlan statistics

switchport access vlan

Use this command to change the port-based VLAN of the current port.

Use the **no** variant of this command to change the port-based VLAN of this port to the default VLAN, *vlan1*.

Syntax

```
switchport access vlan <vlan-id>
no switchport access vlan
```

Parameter	Description
<vlan-id>	<1-4094> The port-based VLAN ID for the port.

Default Reset the default VLAN 1 to specified switchports using the negated form of this command.

Mode Interface Configuration

Usage Any untagged frame received on this port will be associated with the specified VLAN.

Examples To change the port-based VLAN to VLAN 3 for `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport access vlan 3
```

To reset the port-based VLAN to the default VLAN 1 for `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport access vlan
```

Validation Command **show interface switchport**

Related Commands **show vlan**

switchport enable vlan

This command enables the VLAN on the port manually once disabled by certain actions, such as QSP (QoS Storm Protection) or EPSR (Ethernet Protection Switching Ring). Note that if the VID is not given, all disabled VLANs are re-enabled.

Syntax `switchport enable vlan [<1-4094>]`

Parameter	Description
`vlan`	Re-enables the VLAN on the port.
<1-4094>	VLAN ID.

Mode Interface Configuration

Example To re-enable the `port1.0.1` from VLAN 1:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport enable vlan 1
```

Related Commands **show mls qos interface storm-status**
storm-window

switchport mode access

Use this command to set the switching characteristics of the port to access mode. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

Syntax

```
switchport mode access [ingress-filter {enable|disable}]
```

Parameter	Description
`ingress-filter`	Set the ingress filtering for the received frames.
`enable`	Turn on ingress filtering for received frames. This is the default.
`disable`	Turn off ingress filtering to accept frames that do not meet the classification criteria.

Default By default, ports are in access mode with ingress filtering on.

Usage Use access mode to send untagged frames only.

Mode Interface Configuration

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access ingress-filter
enable
```

Validation Command **show interface switchport**

switchport mode private-vlan

Use this command to make a Layer 2 port a private VLAN host port or a promiscuous port.

Use the **no** variant of this command to remove the configuration.

Syntax

```
switchport mode private-vlan {host|promiscuous}
no switchport mode private-vlan {host|promiscuous}
```

Parameter	Description
`host`	This port type can communicate with all other host ports assigned to the same community VLAN, but it cannot communicate with the ports in the same isolated VLAN. All communications outside of this VLAN must pass through a promiscuous port in the associated primary VLAN.
`promiscuous`	A promiscuous port can communicate with all interfaces, including the community and isolated ports within a private VLAN.

Mode Interface Configuration

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode private-vlan host
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode private-vlan promiscuous
awplus(config)# interface port1.0.4
awplus(config-if)# no switchport mode private-vlan promiscuous
```

Related Commands switchport private-vlan mapping

switchport mode private-vlan trunk secondary

Use this command to enable a port in trunk mode to be a secondary port for isolated VLANs.

Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. Private VLAN trunk ports and GVRP are mutually exclusive.

Use the **no** variant of this command to remove a port in trunk mode as a secondary port for isolated VLANs.

Syntax

```
switchport mode private-vlan trunk secondary group <group-id>
no switchport mode private-vlan trunk secondary
```

Parameter	Description
<group-id>	The group ID is a numeric value in the range 1 to 32 that is used to associate a secondary port with its promiscuous port.

Default By default, a port in trunk mode is disabled as a secondary port.

When a port in trunk mode is enabled to be a secondary port for isolated VLANs, by default it will have a native VLAN of **none** (no native VLAN specified).

Mode Interface Configuration

Usage A port must be put in trunk mode with **switchport mode trunk** command before the port is enabled as a secondary port in trunk mode.

To add VLANs to be trunked over the secondary port use the **switchport trunk allowed vlan** command. These must be isolated VLANs and must exist on the associated promiscuous port.

To configure the native VLAN for the secondary port, use the **switchport trunk native vlan** command. The native VLAN must be an isolated VLAN and must exist on the associated promiscuous port.

For further information, see **"Private VLANs for trunked ports" on page 18.18**.

Examples To create isolated private VLAN 2 and then enable `port1.0.3` in trunk mode as a secondary port for the this VLAN with the group ID of `3`, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2
awplus(config-vlan)# private-vlan 2 isolated
awplus(config-vlan)# exit
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan add 2
awplus(config-if)# switchport mode private-vlan trunk
secondary group 3
```

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no switchport mode private-vlan trunk
secondary
```

Related Commands
switchport mode private-vlan trunk promiscuous
switchport mode trunk
switchport trunk allowed vlan
switchport trunk native vlan
show vlan private-vlan

switchport mode private-vlan trunk promiscuous

Use this command to enable a port in trunk mode to be promiscuous port for isolated VLANs.

Note Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. Private VLAN trunk ports and GVRP are mutually exclusive.

Use the **no** variant of this command to remove a port in trunk mode as a promiscuous port for isolated VLANs. You must first remove the secondary port, or ports, in trunk mode associated with the promiscuous port with the **no switchport mode private-vlan trunk secondary** command.

Syntax

```
switchport mode private-vlan trunk promiscuous group <group-id>
no switchport mode private-vlan trunk promiscuous
```

Parameter	Description
<group-id>	The group ID is a numeric value in the range 1 to 32 that is used to associate the promiscuous port with secondary ports.

Default By default, a port in trunk mode is disabled as a promiscuous port.

Mode Interface Configuration

Usage A port must be put in trunk mode with **switchport mode trunk** command before it can be enabled as a promiscuous port.

To add VLANs to be trunked over the promiscuous port, use the **switchport trunk allowed vlan** command. These VLANs can be isolated VLANs, or non-private VLANs.

To configure the native VLAN for the promiscuous port, use the **switchport trunk native vlan** command. The native VLAN can be an isolated VLAN, or a non-private VLAN.

When you enable a promiscuous port, all of the secondary port VLANs associated with the promiscuous port via the group ID number must be added to the promiscuous port. In other words, the set of VLANs on the promiscuous port must be a superset of all the VLANs on the secondary ports within the group.

For further information, see **"Private VLANs for trunked ports" on page 18.18**.

Examples To create the isolated VLANs 2, 3 and 4 and then enable `port1.0.2` in trunk mode as a promiscuous port for these VLANs with the group ID of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2-4
awplus(config-vlan)# private-vlan 2 isolated
awplus(config-vlan)# private-vlan 3 isolated
awplus(config-vlan)# private-vlan 4 isolated
awplus(config-vlan)# exit
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan add 2-4
awplus(config-if)# switchport mode private-vlan trunk
                   promiscuous group 3
```

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport mode private-vlan trunk
                   promiscuous
```

Note that you must remove the secondary port or ports enabled as trunk ports that are associated with the promiscuous port before removing the promiscuous port.

Related Commands

switchport mode private-vlan trunk secondary
switchport mode trunk
switchport trunk allowed vlan
switchport trunk native vlan
show vlan private-vlan

switchport mode trunk

Use this command to set the switching characteristics of the port to trunk. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

Syntax

```
switchport mode trunk [ingress-filter {enable|disable}]
```

Parameter	Description
`ingress-filter`	Set the ingress filtering for the frames received.
`enable`	Turn on ingress filtering for received frames. This is the default.
`disable`	Turn off ingress filtering to accept frames that do not meet the classification criteria.

Default By default, ports are in access mode, are untagged members of the default VLAN (vlan1), and have ingress filtering on.

Mode Interface Configuration

Usage A port in trunk mode can be a tagged member of multiple VLANs, and an untagged member of one native VLAN.

To configure which VLANs this port will trunk for, use the **switchport trunk allowed vlan** command.

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode trunk ingress-filter enable
```

Validation Command **show interface switchport**

switchport private-vlan host-association

Use this command to associate a primary VLAN and a secondary VLAN to a host port. Only one primary and secondary VLAN can be associated to a host port.

Use the **no** variant of this command to remove the association.

Syntax

```
switchport private-vlan host-association <primary-vlan-id> add
   <secondary-vlan-id>
no switchport private-vlan host-association
```

Parameter	Description
<primary-vlan-id>	VLAN ID of the primary VLAN.
<secondary-vlan-id>	VLAN ID of the secondary VLAN (either isolated or community).

Mode Interface Configuration

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport private-vlan host-association 2
add 3

awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport private-vlan host-association
```

switchport private-vlan mapping

Use this command to associate a primary VLAN and a set of secondary VLANs to a promiscuous port.

Use the **no** variant of this to remove all the association of secondary VLANs to primary VLANs for a promiscuous port.

Syntax

```
switchport private-vlan mapping <primary-vlan-id> add
   <secondary-vid-list>

switchport private-vlan mapping <primary-vlan-id> remove
   <secondary-vid-list>

no switchport private-vlan mapping
```

Parameter	Description
<primary-vlan-id>	VLAN ID of the primary VLAN.
<secondary-vid-list>	VLAN ID of the secondary VLAN (either isolated or community), or a range of VLANs, or a comma-separated list of VLANs and ranges.

Mode Interface Configuration

Usage This command can be applied to a switch port or a static channel group, but not a dynamic (LACP) channel group. LACP channel groups (dynamic/LACP aggregators) cannot be promiscuous ports in private VLANs.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport private-vlan mapping 2 add 3-4
awplus(config-if)# switchport private-vlan mapping 2 remove 3-4
awplus(config-if)# no switchport private-vlan mapping
```

Related Commands switchport mode private-vlan

switchport trunk allowed vlan

Use this command to add VLANs to be trunked over this switch port. Traffic for these VLANs can be sent and received on the port.

Use the **no** variant of this command to reset switching characteristics of a specified interface to negate a trunked configuration specified with **switchport trunk allowed vlan** command.

Syntax

```
switchport trunk allowed vlan all
switchport trunk allowed vlan none
switchport trunk allowed vlan add <vid-list>
switchport trunk allowed vlan remove <vid-list>
switchport trunk allowed vlan except <vid-list>
no switchport trunk
```

Parameter	Description
`all`	Allow all VLANs to transmit and receive through the port.
`none`	Allow no VLANs to transmit and receive through the port.
`add`	Add a VLAN to transmit and receive through the port. Only use this parameter if a list of VLANs are already configured on a port.
`remove`	Remove a VLAN from transmit and receive through the port. Only use this parameter if a list of VLANs are already configured on a port.
`except`	All VLANs, except the VLAN for which the VID is specified, are part of its port member set. Only use this parameter to remove VLANs after either this parameter or the **all** parameter have added VLANs to a port.
`<vid-list>`	<2-4094> The ID of the VLAN or VLANs that will be added to, or removed from, the port. A single VLAN, VLAN range, or comma-separated VLAN list can be set. For a VLAN range, specify two VLAN numbers: lowest, then highest number in the range, separated by a hyphen. For a VLAN list, specify the VLAN numbers separated by commas. Do not enter spaces between hyphens or commas when setting parameters for VLAN ranges or lists.

Default By default, ports are untagged members of the default VLAN (vlan1).

Mode Interface Configuration

Usage The **all** parameter sets the port to be a tagged member of all the VLANs configured on the device. The **none** parameter removes all VLANs from the port's tagged member set. The **add** and **remove** parameters will add and remove VLANs to and from the port's member set. See the note below about restrictions when using the **add**, **remove**, **except**, and **all** parameters.

Note: Only use the **add** or the **remove** parameters with this command if a list of VLANs are configured on a port. Only use the **except** parameter to remove VLANs after either the **except** or the **all** parameters have first been used to add a list of VLANs to a port.

Remove VLAN 3 by re-entering the **except** parameter with the list of VLANs to remove, instead of using the **remove** parameter, as shown in the command example below:

```
awplus# configure terminal
awplus(config)# interface port1.0.18
awplus(config-if)# switchport trunk allowed vlan except 3,4
```

Then the configuration is changed after entering the above commands to remove VLAN 3:

```
awplus#show running-config
!
interface port1.0.18
switchport
switchport mode trunk
switchport trunk allowed vlan except 3-4
```

To add a VLAN, where the configuration for `port1.0.18` shows the below output:

```
awplus#show running-config
!
interface port1.0.18
switchport
switchport mode trunk
switchport trunk allowed vlan except 3-5
```

Add VLAN 4 by re-entering the **except** parameter with a list of VLANs to exclude, instead of using the **add** parameter to include VLAN 4, as shown in the command example below:

```
awplus# configure terminal
awplus(config)# interface port1.0.18
awplus(config-if)# switchport trunk allowed vlan except 3,5
```

The configuration is changed after entering the above commands to add VLAN 4:

```
awplus#show running-config
!
interface port1.0.18
switchport
switchport mode trunk
switchport trunk allowed vlan except 3,5
```

Examples The following shows adding a single VLAN to the port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2
```

The following shows adding a range of VLANs to the port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2-4
```

The following shows adding a list of VLANs to the port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2,3,4
```

switchport trunk native vlan

Use this command to configure the native VLAN for this port. The native VLAN is used for classifying the incoming untagged packets. Use the **none** parameter with this command to remove the native VLAN from the port and set the acceptable frame types to vlan-tagged only.

Use the **no** variant of this command to revert the native VLAN to the default VLAN ID 1. Command negation removes tagged VLANs, and sets the native VLAN to the default VLAN.

Syntax

```
switchport trunk native vlan {<vid>|none}
no switchport trunk native vlan
```

Parameter	Description
`<vid>`	`<2-4094>` The ID of the VLAN that will be used to classify the incoming untagged packets. The VLAN ID must be a part of the VLAN member set of the port.
`none`	No native VLAN specified. This option removes the native VLAN from the port and sets the acceptable frame types to vlan-tagged only. Note: Use the **no** variant of this command to revert to the default VLAN 1 as the native VLAN for the specified interface switchport - not **none**.

Default VLAN 1 (the default VLAN), which is reverted to using the **no** form of this command.

Mode Interface Configuration

Examples The following commands show configuration of VLAN 2 as the native VLAN for interface `port1.0.2`:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk native vlan 2
```

The following commands show the removal of the native VLAN for interface `port1.0.2`:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk native vlan none
```

The following commands revert the native VLAN to the default VLAN 1 for interface `port1.0.2`:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport trunk native vlan
```

switchport vlan-stacking (double tagging)

Use this command to enable VLAN stacking on a port and set it to be a customer-edge-port or provider-port. This is sometimes referred to as VLAN double-tagging, nested VLANs, or QinQ.

Use **no** parameter with this command to disable VLAN stacking on an interface.

Syntax

```
switchport vlan-stacking {customer-edge-port|provider-port}
no switchport vlan-stacking
```

Parameter	Description
`customer-edge-port`	Set the port to be a customer edge port. This port must already be in access mode.
`provider-port`	Set the port to be a provider port. This port must already be in trunk mode.

Default By default, ports are not VLAN stacking ports.

Mode Interface Configuration

Usage Use VLAN stacking to separate traffic from different customers to that they can be managed over a provider network

Traffic with an extra VLAN header added by VLAN stacking cannot be routed.

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport vlan-stacking customer-edge-port
```

switchport voice dscp

Use this command to configure the Layer 3 DSCP value advertised when the transmission of LLDP-MED Network Policy TLVs for voice devices is enabled. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified DSCP value.

Use the **no** variant of this command to reset the DSCP value to the default, 0.

Syntax

```
switchport voice dscp <0-63>
no switchport voice dscp
```

Parameter	Description
`dscp`	Specify a DSCP value for voice data.
<0-63>	DSCP value.

Default A DSCP value of 0 will be advertised.

Mode Interface Configuration

Usage LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (**lldp run** command on page 97.16)
- Voice VLAN is configured for the port (**switchport voice vlan** command on page 19.32)
- The port is configured to transmit LLDP advertisements—enabled by default (**lldp transmit receive** command on page 97.21)
- The port is configured to transmit Network Policy TLVs—enabled by default (**lldp med-tlv-select** command on page 97.9)
- There is an LLDP-MED device connected to the port

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.5
awplus(config-if)# switchport voice dscp 27
```

Related Commands

lldp med-tlv-select
show lldp
switchport voice vlan

switchport voice vlan

Use this command to configure the Voice VLAN tagging advertised when the transmission of LLDP-MED Network Policy TLVs for voice endpoint devices is enabled. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified tagging. This command also sets the ports to be spanning tree edge ports, that is, it enables spanning tree portfast on the ports.

Use the **no** variant of this command to remove LLDP-MED network policy configuration for voice devices connected to these ports. This does not change the spanning tree edge port status.

Syntax

```
switchport voice vlan [<vid>|dot1p|dynamic|untagged]
no switchport voice vlan
```

Parameter	Description
`<vid>`	VLAN identifier, in the range 1 to 4094.
`dot1p`	The IP phone should send User Priority tagged packets, that is, packets in which the tag contains a User Priority value, and a VID of 0. (The User Priority tag is also known as the 802.1p priority tag, or the Class of Service (CoS) tag.)
`dynamic`	The VLAN ID with which the IP phone should send tagged packets will be assigned by RADIUS authentication.
`untagged`	The IP phone should send untagged packets.

Default By default, no Voice VLAN is configured, and therefore no network policy is advertised for voice devices.

Mode Interface Configuration

Usage LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (**lldp run** command on page 97.16)
- Voice VLAN is configured for the port using this command (**switchport voice vlan**)
- The port is configured to transmit LLDP advertisements—enabled by default (**lldp transmit receive** command on page 97.21)
- The port is configured to transmit Network Policy TLVs—enabled by default (**lldp med-tlv-select** command on page 97.9)
- There is an LLDP-MED device connected to the port.

To set the priority value to be advertised for tagged frames, use the **switchport voice vlan priority** command on page 19.34.

If the Voice VLAN details are to be assigned by RADIUS, then the RADIUS server must be configured to send the attribute “Egress-VLANID (56)” or “Egress-VLAN-Name (58)” in the RADIUS Accept message when authenticating a phone attached to this port. To set these attributes on the local RADIUS server, use the **egress-vlan-id** command on page 75.17 or the **egress-vlan-name** command on page 75.18.

For more information about configuring authentication for Voice VLAN, **“Configuring LLDP” on page 96.11**.

If the ports have been set to be edge ports by the **switchport voice vlan** command, the **no** variant of this command will leave them unchanged as edge ports. To set them back to their default non-edge port configuration, use the **spanning-tree edgeport (RSTP and MSTP)** command on page 21.40.

Examples To tell IP phones connected to `port1.0.5` to send voice data tagged for VLAN 10, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.5
awplus(config-if)# switchport voice vlan 10
```

To tell IP phones connected to ports 1.0.8-1.0.12 to send priority tagged packets (802.1p priority tagged with VID 0, so that they will be assigned to the port VLAN) use the following commands. The priority value is 5 by default, but can be configured with the **switchport voice vlan priority** command.

```
awplus# configure terminal
awplus(config)# interface port1.0.8-port1.0.12
awplus(config-if)# switchport voice vlan dot1p
```

To dynamically configure the VLAN ID advertised to IP phones connected to `port1.0.1` based on the VLAN assigned by RADIUS authentication (with RADIUS attribute “Egress-VLANID” or “Egress-VLAN-Name” in the RADIUS accept packet), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport voice vlan dynamic
```

To remove the Voice VLAN, and therefore disable the transmission of LLDP-MED network policy information for voice devices on `port1.0.24`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.24
awplus(config-if)# no switchport voice vlan
```

Related Commands
egress-vlan-id
egress-vlan-name
lldp med-tlv-select
spanning-tree edgeport (RSTP and MSTP)
switchport voice dscp
switchport voice vlan priority
show lldp

switchport voice vlan priority

Use this command to configure the Layer 2 user priority advertised when the transmission of LLDP-MED Network Policy TLVs for voice devices is enabled. This is the priority in the User Priority field of the IEEE 802.1Q VLAN tag, also known as the Class of Service (CoS), or 802.1p priority. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified priority.

Syntax

```
switchport voice vlan priority <0-7>
no switchport voice vlan priority
```

Parameter	Description
`priority`	Specify a user priority value for voice data.
<0-7>	Priority value.

Default By default, the Voice VLAN user priority value is 5.

Mode Interface Configuration

Usage LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (**lldp run** command on page 97.16)
- Voice VLAN is configured for the port (**switchport voice vlan** command on page 19.32)
- The port is configured to transmit LLDP advertisements—enabled by default (**lldp transmit receive** command on page 97.21)
- The port is configured to transmit Network Policy TLVs—enabled by default (**lldp med-tlv-select** command on page 97.9)
- There is an LLDP-MED device connected to the port.

To set the Voice VLAN tagging to be advertised, use the **switchport voice vlan** command on page 19.32.

Example To remove the Voice VLAN, and therefore disable the transmission of LLDP-MED network policy information for voice devices on `port1.0.24`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.24
awplus(config-if)# no switchport voice vlan
```

Related Commands

lldp med-tlv-select
show lldp
switchport voice vlan

vlan

This command creates VLANs, assigns names to them, and enables or disables them. Specifying the `disable` state causes all forwarding over the specified VLAN ID to cease. Specifying the `enable` state allows forwarding of frames on the specified VLAN.

The **no** variant of this command destroys the specified VLANs.

Syntax

```
vlan <vid> [name <vlan-name>] [state {enable|disable}]
vlan <vid-range> [state {enable|disable}]
vlan {<vid>|<vlan-name>} [mtu <mtu-value>]
no vlan {<vid>|<vid-range>} [mtu]
```

Parameter	Description
<vid>	The VID of the VLAN to enable or disable in the range <**1-4094**>.
<vlan-name>	The ASCII name of the VLAN. Maximum length: **32** characters.
<vid-range>	Specifies a range of VLAN identifiers.
<mtu-value>	Specifies the Maximum Transmission Unit (MTU) size in bytes, in the range 68 to1500 bytes, for the VLAN.
`enable`	Sets VLAN into an `enable` state.
`disable`	Sets VLAN into a `disable` state.

Default By default, VLANs are enabled when they are created.

Mode VLAN Configuration

Examples

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 45 name accounts state enable

awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 45
```

Related Commands

mtu
vlan database
show vlan

vlan classifier activate

Use this command in Interface Configuration mode to associate a VLAN classifier group with the switch port.

Use the **no** variant of this command to remove the VLAN classifier group from the switch port.

Syntax

```
vlan classifier activate <vlan-class-group-id>
no vlan classifier activate <vlan-class-group-id>
```

Parameter	Description
<vlan-class-group-id>	Specify a VLAN classifier group identifier in the range <1-16>.

Mode Interface Configuration mode for a switch port.

Usage See the **Protocol based VLAN configuration example** section in **Chapter 18, VLAN Introduction** for a configuration example and network topology using this command.

Example To associate VLAN classifier group 3 with switch `port1.0.3`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# vlan classifier activate 3
```

To remove VLAN classifier group 3 from switch `port1.0.3`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no vlan classifier activate 3
```

Related Commands

show vlan classifier rule
vlan classifier group
vlan classifier rule ipv4
vlan classifier rule proto

vlan classifier group

Use this command to create a group of VLAN classifier rules. The rules must already have been created.

Use the **no** variant of this command to delete a group of VLAN classifier rules.

Syntax

```
vlan classifier group <1-16> {add|delete} rule <vlan-class-rule-id>
no vlan classifier group <1-16>
```

Parameter	Description
<1-16>	VLAN classifier group identifier
add	Add the rule to the group.
delete	Delete the rule from the group.
<vlan-class-rule-id>	The VLAN classifier rule identifier.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# vlan classifier group 3 add rule 5
```

Related Commands

show vlan classifier rule
vlan classifier activate
vlan classifier rule ipv4
vlan classifier rule proto

vlan classifier rule ipv4

Use this command to create an IPv4 subnet-based VLAN classifier rule and map it to a specific VLAN. Use the **no** variant of this command to delete the VLAN classifier rule.

Syntax

```
vlan classifier rule <1-256> ipv4 <ip-addr/prefix-length>  vlan
   <1-4094>

no vlan classifier rule <1-256>
```

Parameter	Description
<1-256>	Specify the VLAN Classifier Rule identifier.
<ip-addr/prefix-length>	Specify the IP address and prefix length.
<1-4094>	Specify a VLAN ID to which an untagged packet is mapped in the range *<1-4094>*.

Mode Global Configuration

Usage If the source IP address matches the IP subnet specified in the VLAN classifier rule, the received packets are mapped to the specified VLAN.

Example

```
awplus# configure terminal
awplus(config)# vlan classifier rule 3 ipv4 3.3.3.3/8 vlan 5
```

Related Commands

show vlan classifier rule
vlan classifier activate
vlan classifier rule proto

vlan classifier rule proto

Use this command to create a protocol type-based VLAN classifier rule, and map it to a specific VLAN. See the published IANA EtherType IEEE 802 numbers here: **http://www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt**.

The decimal value that you can enter instead of a protocol name is also a hexadecimal value for the EtherType field. The EtherType field is a two-octet field in an Ethernet frame. It is used to show which protocol is encapsulated in the payload of the Ethernet frame.

The **no** variant of this command removes a previously set rule.

Syntax

```
vlan classifier rule <1-256> proto <protocol>
   encap {ethv2|nosnapllc|snapllc} vlan <1-4094>

no vlan classifier rule <1-256>
```

Parameter	Description	
<1-256>	VLAN Classifier identifier	
`proto`	Protocol type	
`<protocol>`	Specify a protocol either by its decimal number (0-65535) or by one of the following protocol names:	
	`[arp|2054]`	Address Resolution protocol
	`[atalkaarp|33011]`	Appletalk AARP protocol
	`[atalkddp|32923]`	Appletalk DDP protocol
	`[atmmulti|34892]`	MultiProtocol Over ATM protocol
	`[atmtransport|34948]`	Frame-based ATM Transport protocol
	`[dec|24576]`	DEC Assigned protocol
	`[deccustom|24582]`	DEC Customer use protocol
	`[decdiagnostics|24581]`	DEC Systems Comms Arch protocol
	`[decdnadumpload|24577]`	DEC DNA Dump/Load protocol
	`[decdnaremoteconsole|24578]`	DEC DNA Remote Console protocol
	`[decdnarouting|24579]`	DEC DNA Routing protocol
	`[declat|24580]`	DEC LAT protocol
	`[decsyscomm|24583]`	DEC Systems Comms Arch protocol
	`[g8bpqx25|2303]`	G8BPQ AX.25 protocol

Parameter(cont	Description(cont.)	
	`[ieeeaddrtrans|2561]`	Xerox IEEE802.3 PUP Address
	`[ieeepup|2560]`	Xerox IEEE802.3 PUP protocol
	`[ip|2048]`	IP protocol
	`[ipv6|34525]`	IPv6 protocol
	`[ipx|33079]`	IPX protocol
	`[netbeui|61680]`	IBM NETBIOS/NETBEUI protocol
	`[netbeui|61681]`	IBM NETBIOS/NETBEUI protocol
	`[pppdiscovery|34915]`	PPPoE discovery protocol
	`[pppsession|34916]`	PPPoE session protocol
	`[rarp|32821]`	Reverse Address Resolution protocol
	`[x25|2056]`	CCITT.25 protocol
	`[xeroxaddrtrans|513]`	Xerox PUP Address Translation protocol
	`[xeroxpup|512]`	Xerox PUP protocol
`ethv2`	Ethernet Version 2 encapsulation	
`nosnapllc`	LLC without SNAP encapsulation	
`snapllc`	LLC SNAP encapsulation	
`<1-4094>`	Specify a VLAN ID to which an untagged packet is mapped in the range *`<1-4094>`*	

Mode Global Configuration

Usage If the protocol type matches the protocol specified in the VLAN classifier rule, the received packets are mapped to the specified VLAN. Ethernet Frame Numbers may be entered in place of the protocol names listed. For a full list please refer to the IANA list online: **http://www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt**

Examples

```
awplus# configure terminal
awplus(config)# vlan classifier rule 1 proto x25 encap ethv2
vlan 2
awplus(config)# vlan classifier rule 2 proto 512 encap ethv2
vlan 2
awplus(config)# vlan classifier rule 3 proto 2056 encap ethv2
vlan 2
awplus(config)# vlan classifier rule 4 proto 2054 encap ethv2
vlan 2
awplus(config)# vlan classifier rule 4 proto 34525 encap ethv2
vlan 2
awplus(config)# vlan classifier rule 4 proto ipv6 encap ethv2
vlan 2
awplus(config)# vlan classifier rule 4 proto 2048 encap ethv2
vlan 2
awplus(config)# vlan classifier rule 4 proto ip encap ethv2
vlan 2
```

Validation Output

```
awplus# show vlan classifier rule
```

```
vlan classifier rule 16 proto rarp encap ethv2 vlan 2
vlan classifier rule 8 proto encap ethv2 vlan 2
vlan classifier rule 4 proto arp encap ethv2 vlan 2
vlan classifier rule 2 proto xeroxpup encap ethv2 vlan 2
vlan classifier rule 2 proto ip encap ethv2 vlan 2
vlan classifier rule 2 proto ipv6 encap ethv2 vlan 2
```

Related Commands

show vlan classifier rule
vlan classifier activate
vlan classifier group

vlan database

Use this command to enter the VLAN Configuration mode.

Syntax `vlan database`

Mode Global Configuration

Usage Use this command to enter the VLAN configuration mode. You can then add or delete a VLAN, or modify its values.

Example In the following example, note the change to VLAN configuration mode from Configure mode:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)#
```

Related Commands vlan

vlan statistics

This command creates a VLAN packet counter instance, and enables you to add one or more ports to a defined counter instance. This command can only be applied to switch ports. You cannot apply it to aggregated links or eth ports.

The **no** variant of this command enables the deletion of VLAN packet counter instances, or for removing one or more ports that are currently mapped to a counter instance. Note that the selected range of ports must all be switch ports.

Note In describing this command, the terms frame and packet are used interchangeably.

Syntax

```
vlan <vid> statistics name <instance_name>
no vlan statistics name <instance_name>
```

Parameter	Description
<vid>	The VID of the VLAN that is associated with *<instance-name>*.
<instance-name>	The name of the instance for which incoming frames and their bytes are counted.

Mode Interface Configuration

Usage A maximum of 128 packet counter instances can be created. When the first instance is configured, the switch will reserve sufficient resources to support 128 packet counter instances. These resources are also shared with other features such as QoS and ACLs. Where the remaining resources are insufficient to support the VLAN Statistics feature the feature will not be enabled, and an error message will display.

Examples Create a VLAN packet counter instance named **vlan2-data**, and apply this to count incoming vlan2 tagged frames on ports 1.0.4 and 1.0.5.

```
awplus# configure terminal
awplus(config)# interface port1.0.4,port1.0.5
awplus(config-if)# vlan 2 statistics name vlan2-data
```

From the previous example, add ports in the range 1.0.2 to 1.0.3 to the VLAN packet counter instance. The **vlan2-data** instance will now count all incoming vlan2 tagged frames on ports within the range 1.0.1 to 1.0.5.

```
awplus(config)# interface port1.0.2-port1.0.3
awplus(config-if)# vlan 2 statistics name vlan2-data
```

To remove `port1.0.5` from the packet counter instance named **vlan2-data.**

```
awplus(config)# interface port1.0.5
awplus(config-if)# no vlan statistics name vlan2-data
```

To remove the remaining ports 1.0.2 to 1.0.4 from the packet counter instance named **vlan2-data.** Note that because there are no ports associated with the **vlan2-data**, this instance will be removed.

```
awplus(config)# interface port1.0.2-port1.0.4
awplus(config-if)# no vlan statistics name vlan2-data
```

Chapter 20: Spanning Tree Introduction: STP, RSTP, and MSTP

Introduction

This chapter describes and provides configuration procedures for:

- Spanning Tree Protocol (STP)
- Rapid Spanning Tree Protocol (RSTP)
- Multiple Spanning Tree Protocol (MSTP)

For detailed information about the commands used to configure spanning trees, see **Chapter 21, Spanning Tree Commands**.

Overview of Spanning Trees

The concept of the spanning tree protocol was devised to address broadcast storming. The spanning tree algorithm itself is defined by the IEEE standard 802.1D and its later revisions.

The IEEE Standard 802.1 uses the term “bridge” to define the spanning tree operation and uses terms such as Bridge Protocol Data Units, Root Bridge etc., when defining spanning tree protocol functions.

When a bridge receives a frame, it reads the source and destination address fields. The bridge then enters the frame’s source address in its forwarding database. In doing this the bridge associates the frame’s source address with the network attached to the port on which the frame was received. The bridge also reads the destination address and if it can find this address in its forwarding database, it forwards the frame to the appropriate port. If the bridge does not recognize the destination address, it forwards the frame out from all its ports except for the one on which the frame was received, and then waits for a reply. This process is known as “flooding”.

A significant problem arises where bridges connect via multiple paths. A frame that arrives with an unknown destination address is flooded over all available paths. The arrival of these frames at another network via different paths and bridges produces major problems. The bridges can become confused about the location of the send and receive devices and begin sending frames in the wrong directions. This process feeds on itself and produces a condition known as a broadcast storm, where the increase of circulating frames can eventually overload the network.

Spanning tree operation

Where a LAN’s topology results in more than one path existing between bridges, frames transmitted onto the extended LAN circulate in increasing numbers around the loop, decreasing performance and potentially overloading the network. However, multiple paths through the extended LAN are often required in order to provide redundancy and backup in the event of a bridge or link failure.

The spanning tree is created through the exchange of Bridge Protocol Data Units (BPDUs) between the bridges in the LAN. The spanning tree algorithm operates by:

- Automatically computing a loop-free portion of the topology, called a *spanning tree*. The topology is dynamically pruned to the spanning tree by declaring certain ports on a switch to be redundant, and placing them into a ‘Blocking’ state.
- Automatically recovering from a switch failure that would partition the extended LAN by reconfiguring the spanning tree to use redundant paths, if available.

The logical tree computed by the spanning tree algorithm has the following properties:

- A single bridge is selected to become the spanning tree's unique *root bridge*. This is the device that advertises the lowest Bridge ID. Each bridge is uniquely identified by its Bridge ID, which comprises the bridge's *root priority* (a spanning tree parameter) followed by its MAC address.
- Each bridge or LAN in the tree, except the root bridge, has a unique parent, known as the *designated bridge*. Each LAN has a single bridge, called the *designated bridge*, that connects it to the next LAN on the path towards the root bridge.
- Each port connecting a bridge to a LAN has an associated *cost*, called the *root path cost*. This is the sum of the costs for each path between the particular bridge port and the root bridge. The designated bridge for a LAN is the one that advertises the lowest *root path cost*. If two bridges on the same LAN have the same lowest root path cost, then the switch with the lowest bridge ID becomes the designated bridge.

The spanning tree computation is a continuous, distributed process to establish and maintain a spanning tree (**Table 20-1**). The basic algorithm is similar for STP, RSTP and MSTP modes.

Table 20-1: Spanning tree process

The spanning tree algorithm ...	By ...
Selects a root bridge	It selects as the root bridge for the spanning tree the device with the (numerically) lowest bridge identifier (that is, the device with lowest root bridge priority value, or if they have the same priority, the bridge with the lowest MAC address).
Selects root ports	On each device, it selects the root port according to: ■ the port with the lowest path cost to the root bridge ■ the port connected to the bridge with the lowest root identifier ■ MSTP and RSTP only: the port with the lowest port priority value ■ the port with the lowest port number[1]
Blocks alternate ports	In order to prevent loops, it blocks alternate ports (Discarding state) that provide higher cost paths to the root bridge.
Blocks backup ports	Where a second port connects one switch back to itself, it blocks the backup port that has the highest path cost or port number.
Selects designated ports	All other ports that are not disabled are selected as designated ports and are eventually made active (Forwarding state).
Maintains the spanning tree	If a switch or port fails, the spanning tree configures a new active topology, changing some port states, to reestablish connectivity and block loops. Depending on where the failure occurs, the changes may be widespread (e.g., if the root bridge fails), or local (e.g., if a designated port fails).

1. **The whole three part port number (D.M.P) is used to find the lowest port number, where D is the device number within a stack (1 for a non stacked device), M is the module number within the device (note that 0 is used for all base-board connected ports), and P is the number of the port within the base-board.**

The logical spanning tree, sometimes called the *active topology*, includes the root bridge and all designated bridges, meaning all ports that are to be used for communication within the spanning tree. These ports are in the forwarding state. Ports removed from the logical spanning tree are not in the forwarding state. To implement the spanning tree algorithm, devices communicate with one another using the Spanning Tree Protocol.

Spanning tree modes

STP can run in one of three modes: STP, RSTP or MSTP. A device running RSTP is compatible with other devices running STP; a device running MSTP is compatible with other devices running RSTP or STP. By default, on a device in MSTP mode each port automatically detects the mode of the device connected to it (MSTP, RSTP or STP), and responds in the appropriate mode by sending messages (BPDUs) in the corresponding format. Ports on a device in RSTP mode can automatically detect and respond to connected devices in RSTP and STP mode. Particular ports can also be forced to only operate in a particular mode (**spanning-tree force-version** command on page 21.44).

STP The Spanning Tree Protocol (STP) is the original protocol defined by IEEE standard 802.1D-1988. It creates a single spanning tree over a network.

STP mode may be useful for supporting applications and protocols whose frames may arrive out of sequence or duplicated, for example NetBeui.

RSTP Rapid Spanning Tree Protocol (RSTP) also creates a single spanning tree over a network. Compared with STP, RSTP provides for more rapid convergence to an active spanning tree topology. RSTP is defined in IEEE standard 802.1D-2004.

By default, the device operates in RSTP mode.

MSTP The Multiple Spanning Tree Protocol (MSTP) addresses the limitations in the previous spanning tree protocols, STP and RSTP, within networks that use multiple VLANs with topologies that employ alternative physical links. It supports multiple spanning tree instances on any given link within a network, and supports large networks by grouping bridges into regions that appear as a single bridge to other devices.

MSTP is defined in IEEE standard 802.1Q-2005. The protocol builds on, and remains compatible with, the previous IEEE standards defining STP and RSTP.

Spanning Tree Protocol (STP)

STP uses the process described in **Table 20-1** to avoid loops.

STP port states

In STP mode, each switch port can be in one of five spanning tree states, and one of two switch states. The state of a switch port is taken into account by STP. The STP port states (**Table 20-2**) affect the behavior of ports whose switch state is enabled.

Table 20-2: STP port states

State	Meaning
DISABLED	STP operations are disabled on the port. The port does not participate in the operation of the Spanning Tree Algorithm and Protocol. The port can still switch if its switch state is enabled.
BLOCKING	The forwarding process discards received frames and does not submit forwarded frames for transmission. This is the “standby” mode.The port does not participate in frame relay.
LISTENING	The port is enabled for receiving frames only. The port is preparing to participate in frame relay. The forwarding process discards received frames and does not submit forwarded frames for transmission.
LEARNING	The port is enabled for receiving frames only, and the Learning Process can add new source address information to the Forwarding Database.
FORWARDING	The normal state for a switch port. The forwarding process and the Spanning Tree entity are enabled for transmit and receive operations on the port.

Configuring STP

By default, RSTP is enabled on all switch ports. This section provides a procedure for configuring STP (**Table 20-3**).

To configure other modes, see **"Configuring RSTP" on page 20.9** or **"Configuring MSTP" on page 20.19**.

Table 20-3: Configuration procedure for STP

Command	Description
Configure STP	
RSTP is enabled by default with default settings on all switch ports to prevent Layer 2 loops in your network.	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`spanning-tree mode stp`	By default, the device is in RSTP mode. Change to STP mode.
`awplus(config)#`	
`spanning-tree enable`	By default, spanning tree is enabled on all switch ports. If it has been disabled, enable it for STP.
`awplus(config)#`	
`spanning-tree priority <priority>`	By default, all devices have the same root bridge priority, 32768 (8000 in hexadecimal), so the device with the lowest MAC address becomes the root bridge. If you want the device to be the root bridge, set the root bridge priority to a value lower than 32768. Enter a value in the range 0 to 61440. If you enter a number that is not a multiple of 4096, the switch rounds the number down.
Configure Root Guard	
The Root Guard feature makes sure that the port on which it is enabled is a designated port. If the Root Guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP).	
`awplus(config)#`	
`interface <port-list>`	Enter Interface Configuration mode for the switch ports you want to enable Root Guard for.
`awplus(config-if)#`	
`spanning-tree guard root`	Enable the Guard Root feature for these ports.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`exit`	Return to Privileged Exec mode.

Table 20-3: Configuration procedure for STP(cont.)

Check STP configuration	
`awplus#` `show spanning-tree [interface <port-list>]`	Display the spanning tree configuration for the device, and confirm the new root bridge priority (Bridge Priority). Note that the Bridge ID is in a form like this: 80000000cd240331, and that other IDs follow the same pattern. This is made up of: 8000—the devices' root bridge priority in hexadecimal 0000cd240331—the devices' MAC address.

Advanced configuration: For most networks the default settings for path costs will be suitable, however, you can configure them if required (**spanning-tree path-cost**).

Rapid Spanning Tree Protocol (RSTP)

RSTP uses the process described in **Table 20-1** to avoid loops.

A spanning tree running in STP mode can take up to one minute to rebuild after a topology or configuration change. The RSTP algorithm provides for a faster recovery of connectivity following the failure of a bridge, bridge port, or a LAN. RSTP provides rapid recovery by including port roles in the computation of port states, and by allowing neighboring bridges to explicitly acknowledge signals on a point-to-point link that indicate that a port wants to enter the forwarding mode.

In rapid mode, the rapid transition of a port to the forwarding state is possible when the port is considered to be part of a point-to-point link, or when the port is considered to be an *edge* port. An edge port is one that attaches to a LAN that has no other bridges attached.

Table 20-4: RSTP port states

State	Meaning
DISABLED	STP operations are disabled on the port.
DISCARDING	The port does not participate in frame relay. The forwarding process discards received frames and does not submit forwarded frames for transmission.
LEARNING	The port is enabled for receiving frames only, and the learning process can add new source address information to the forwarding database. The port does not forward any frames.
FORWARDING	The normal state for a switch port. The forwarding process and the Spanning Tree entity are enabled for transmit and receive operations on the port.

Configuring RSTP

RSTP is enabled by default with default settings on all switch ports to prevent Layer 2 loops in your network. No further configuration is required if you want to use RSTP with these default settings. For further RSTP configuration, see **Table 20-5** below.

To configure other modes, see **"Configuring MSTP" on page 20.19** or **"Configuring STP" on page 20.6**.

For detailed configuration examples, see the How To Note *How To Configure Basic Switching Functionality*, available from **http://www.alliedtelesis.com**.

Table 20-5: Configuration procedure for RSTP

Command	Description
Configure RSTP	
RSTP is enabled by default with default settings on all switch ports to prevent Layer 2 loops in your network. No further configuration is required if you want to use RSTP with these default settings. If you need to restore the device to RSTP after it has been set to another mode, or modify the default RSTP settings, follow the procedure below.	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`spanning-tree mode rstp`	By default, the device is in RSTP mode. If it has been changed to STP or MSTP mode, change it back to RSTP.
`awplus(config)#`	
`spanning-tree enable`	By default, spanning tree is enabled on all switch ports. If it has been disabled, enable it for RSTP.
`awplus(config)#`	
`spanning-tree priority <priority>`	By default, all devices have the same root bridge priority, 32768 (8000 in hexadecimal), so the device with the lowest MAC address becomes the root bridge. If you want the device to be the root bridge, set the root bridge priority to a value lower than 32768. Enter a value in the range 0 to 61440. If you enter a number that is not a multiple of 4096, the switch rounds the number down.
Configure edge ports	
If some switch ports are connected to devices that cannot generate BPDUs (such as workstations), you can set particular switch ports as edge ports, or set them to automatically detect whether they are edge ports.	
`awplus(config)#`	
`interface <port-list>`	Enter Interface Configuration mode for these switch ports.
`awplus(config-if)#`	
`spanning-tree edgeport (RSTP and MSTP)`	Set these ports to be edge ports,
or	
`awplus(config-if)#`	
`spanning-tree autoedge (RSTP and MSTP)`	or set these ports to automatically detect whether they are edge ports.

Table 20-5: Configuration procedure for RSTP(cont.)

Configure Root Guard	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface <port-list>`	Enter Interface Configuration mode for the switch ports you want to enable Root Guard for.
`awplus(config-if)#`	
`spanning-tree guard root`	The Root Guard feature makes sure that the port on which it is enabled is a designated port. If the Root Guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP). Enable the Guard Root feature if required.
Configure BPDU Guard	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`spanning-tree portfast bpdu-guard`	If required, enable the BPDU Guard feature.
`awplus(config)#`	
`spanning-tree errdisable-timeout enable`	Set a timeout for ports that are disabled due to the BPDU guard feature.
`awplus(config)#`	
`spanning-tree errdisable-timeout interval`	Specify the time interval after which a port is brought back up when it has been disabled by the BPDU guard feature.
Check RSTP configuration	
`awplus(config)#`	
`exit`	Return to Privileged Exec mode.
`awplus#`	
`show spanning-tree [interface <port-list>]`	Display the spanning tree configuration for the device, and confirm the new root bridge priority (Bridge Priority). Note that the Bridge ID is in a form like this: 80000000cd240331, and that other IDs follow the same pattern. This is made up of: 8000—the devices' root bridge priority in hexadecimal 0000cd240331—the devices' MAC address.

Advanced configuration: For most networks the default settings for path costs will be suitable, however, you can configure them if required (**spanning-tree path-cost**).

Multiple Spanning Tree Protocol (MSTP)

Conceptually, MSTP views the total bridged network as one that comprises a number of *Multiple Spanning Tree Regions* (MSTRs), where each region can contain up to 64 spanning trees, which operate locally, called *Multiple Spanning Tree Instances* (MSTIs). AlliedWare Plus™ supports up to 15 MSTIs. The regions are linked by the *Common Internal Spanning Tree* (CIST).

MSTP uses BPDUs to exchange information between spanning-tree compatible devices, to prevent loops in each MSTI and also in the CIST, by selecting active and blocked paths. This process is described in **Table 20-1**.

If multiple ports are aggregated together into a dynamic (LACP) or static channel group, then the spanning-tree process is aware of the link aggregation and treats the aggregated ports as a single logical path.

Advantage of MSTP over RSTP

MSTP is similar to RSTP, in that it provides loop resolution and rapid convergence. However, RSTP can keep track of only one spanning-tree. MSTP can track many spanning-trees, referred to as *instances*. MSTP makes it possible to have different forwarding paths for different MST instances. This enables load balancing of network traffic across redundant links, so that all the links in a network can be used by at least one MSTI, and no link is left completely idle. That is to say that no link is unnecessarily shut down by spanning-tree.

Essentially, MSTP is VLAN aware and RSTP is not VLAN aware. MSTP BPDUs and RSTP BPDUs are compatible, so a network can have a mixture of MSTP and RSTP areas.

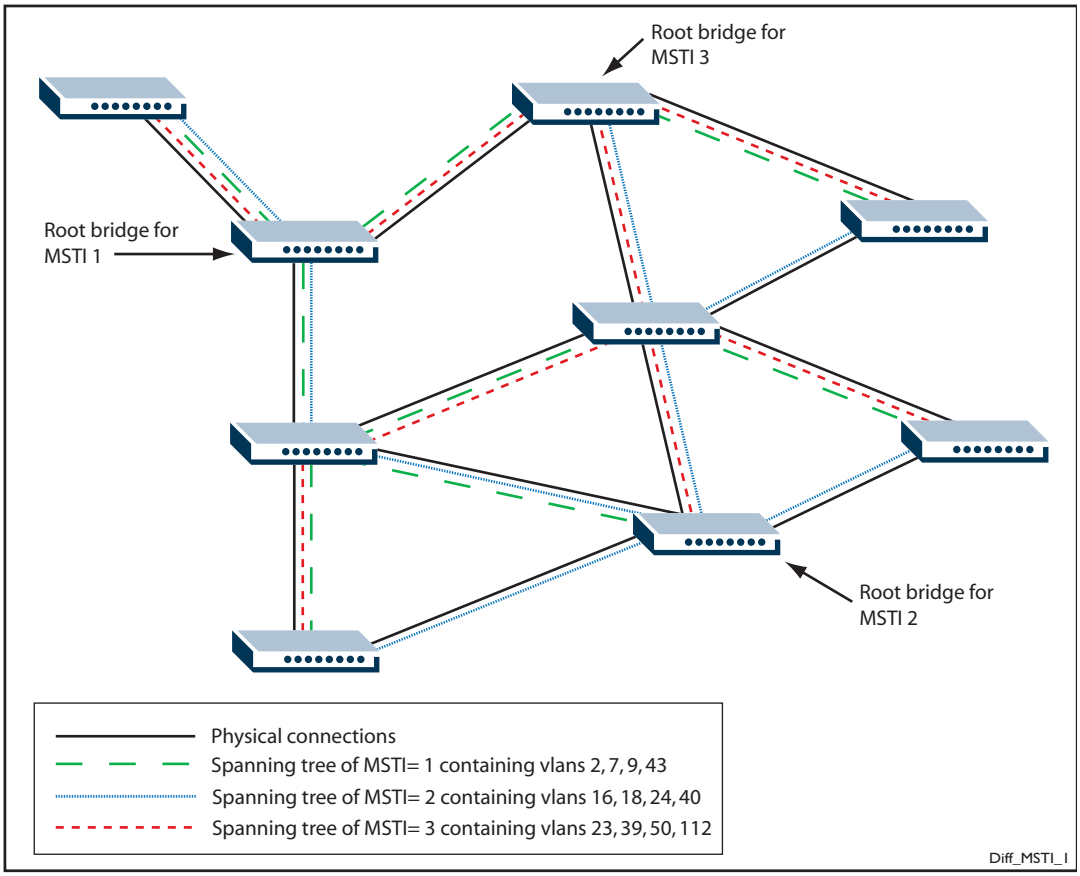
Multiple Spanning Tree Instances (MSTI)

MSTP enables the grouping and mapping of VLANs to different spanning tree instances. So, an MST Instance (MSTI) is a particular set of VLANs that are all using the same spanning tree.

In a network where all VLANs span all links of the network, judicious choice of bridge priorities for different MSTIs can result in different switches becoming root bridges for different MSTIs. That will result in the different MSTIs choosing different active topologies on the network. An example of how different MSTIs can choose different active topologies on the same physical set of links is illustrated in **Figure 20-1**.

MSTP is compatible with RSTP and STP—see **"Common and Internal Spanning Tree (CIST)" on page 20.14**.

Figure 20-1: Different spanning trees created by different MSTIs on the same physical layout



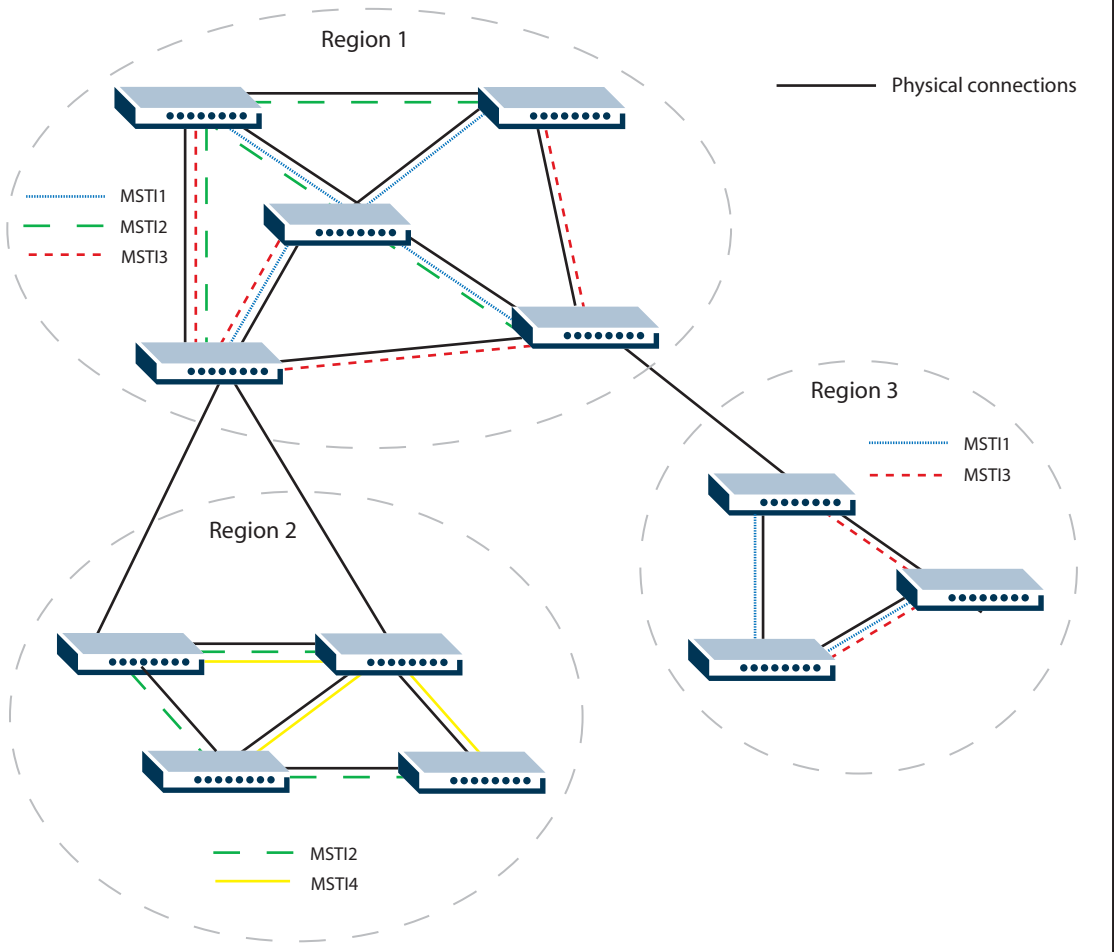
MSTP Regions

An MST region is a set of interconnected switches that all have the same values for the following MST configuration identification elements:

- MST configuration name - the name of the MST region
- Revision level - the revision number of configuration
- Configuration Digest - the mapping of which VLANs are mapped to which MST instances

Each of the MST instances created are identified by an MSTI number. This number is locally significant within the MST region. Therefore, an MSTI will not span across MST regions.

Figure 20-2: MSTIs in different regions



The task of assigning each bridge to a particular region is achieved by the member bridges each comparing their *MST Configuration Identifiers*. More information on configuration identifiers is provided in **Table 20-6**, but for the moment an *MST Configuration Identifier* can simply be thought of as an identifier that represents the mapping of VLANs to MSTIs within each bridge. Therefore, bridges with identical *MST Configuration Identifiers*, must have identical MSTI mapping tables.

While each MSTI can have multiple VLANs, each VLAN can be associated with only one MSTI. Once these associations have been made, the bridges in each region can transmit their spanning tree BPDUs and advertise their MSTIs. This in turn establishes the active data paths between the bridges for each group of VLANs (that is, for each MSTI) and block any duplicate paths within each instance. A particular advantage of this enhancement applies where a large number of VLANs share a few internetwork paths. In this situation there need only be as many Multiple Spanning Tree Instances (MSTIs) as there are source and destination bridge pairs, remembering that a pair of bridges probably has multiple paths between them.

In order to ensure that each bridge within a region maintains the same configuration information (particularly their VID to MSTI mappings) and to ensure each bridge's membership of a particular region, the bridges exchange configuration information in the form of *MST Configuration Identifiers*. **Table 20-6** provides a breakdown of an *MST Configuration Identifier*. A detailed explanation of bridge configuration identifiers can be found in Section 13.7 of the IEEE 802.1Q-2003 standard.

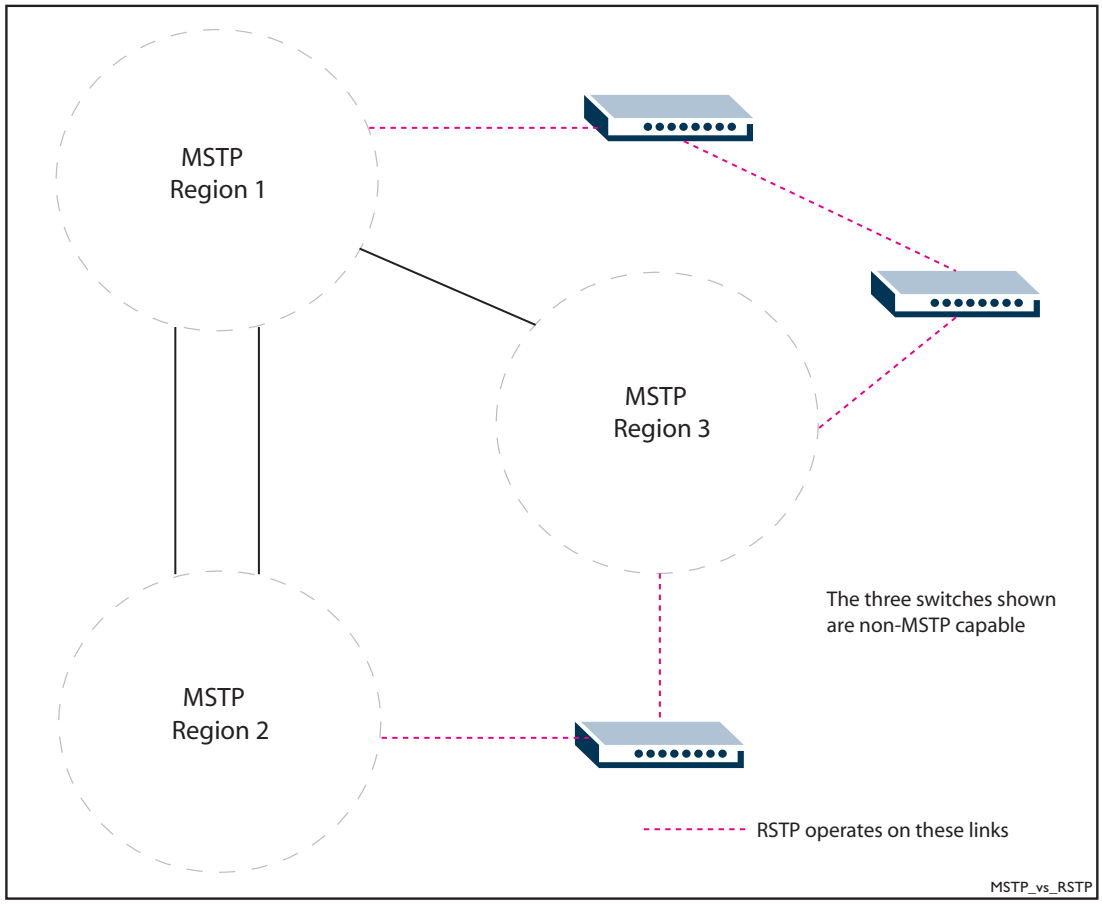
Table 20-6: MST Configuration Identifier

Field Name	Description
Format Selector	A single octet field whose value of 0 indicates MSTP operation
Region Name	A name (up to 32 characters long) that identifies a particular MST region, defined using the **region (MSTP)** command on page 21.12
Revision Level	A number representing the region's revision level, defined using the **revision (MSTP)** command on page 21.13.
Configuration Digest	A 16 octet (HMAC-MD5 based) signature created from the MST configuration table.

Common and Internal Spanning Tree (CIST)

The CIST is the default spanning tree instance of MSTP, i.e. all VLANs that are not members of particular MSTIs are members of the CIST. Also, an individual MST region can be regarded as a single virtual bridge by other MST regions. The spanning tree that runs between regions is the CIST. The CIST is also the spanning tree that runs between MST regions and Single Spanning Tree (SST) entities. So, in **Figure 20-3**, the STP that is running between the regions, and to the SST bridges, is the CIST.

Figure 20-3: The CIST operates on links between regions and to SST devices



Compatibility with Previous Spanning Tree Protocols

MSTP provides for compatibility with older spanning tree protocols in several ways. In addition to the MST region described in the previous section, the protocol provides for single spanning tree systems by employing a Common and Internal Spanning Tree (CIST). The CIST applies a common and internal spanning tree protocol to the whole of the bridged network and is a direct equivalent to the internal spanning tree (IST) protocol of earlier versions.

In common with legacy spanning tree systems, the CIST protocol first determines its root bridge from all the bridges on the network. This is the bridge that contains the lowest bridge identifier. The protocol then selects a regional root bridge for each MSTR. This is the bridge that provides the best path to the CIST root. After the MSTR root bridges have been chosen, they then act on the region's behalf in such a way that the region appears to the Common Spanning Tree (CST) as a virtual bridge. So in addition to having multiple MSTIs, each region operates as a bridge in a CST.

CIST

In addition to the individual MSTIs within each MSTP region, the MSTP region is a member of a network-wide spanning tree called the Common and Internal Spanning Tree (CIST). Conceptually, each region represents a virtual bridge. Internal and external bridge connectivity are two independent functions.

Frames with VIDs allocated to the CIST are subject to the rules and path costs of the complete bridged LAN as determined by the CIST's vectors. Frames other than these are subject to the CIST when travelling outside their region, and subject to its particular MSTI inside the region.

The following operational rules apply:

- Each bridge can be a member of only one region.
- A data frame is associated with a single VID.
- Data frames with a given VID are associated with either the CIST or their particular MSTI, but not both.

The role of the Common Spanning Tree (CST) in a network, and the Common and Internal Spanning Tree (CIST) configured on each device, is to prevent loops within a wider network that may span more than one MSTP region and parts of the network running in legacy STP or RSTP mode.

CIST first allocates root and designated bridges by selecting the bridge with the lowest identifier as the root. MSTP then deals with any loops between the regions in the CST. It does this by considering the CIST "vectors" in the following order:

1. CIST External Root Path Cost
2. CIST Regional Root Identifier
3. CIST Internal Root Path Cost
4. CIST Designated Bridge Identifier
5. CIST Designated Port Identifier
6. CIST Receiving Port Identifier

MSTP Bridge Protocol Data Units (BPDUs)

The main function of bridge protocol data units is to enable MSTP to select its root bridges for the CIST (**"Common and Internal Spanning Tree (CIST)" on page 20.14**) and each MSTI. MSTP is compatible with earlier spanning tree versions; its Bridge Protocol Data Unit (BPDU) formats build on earlier versions (**"Compatibility with Previous Spanning Tree Protocols" on page 20.15**).

Table 20-7 shows the standardized format for MSTP BPDU messages. The general format of the BPDUs comprise a common generic portion—octets 1 to 36—that are based on those defined in IEEE Standard 802.1D, 1998, followed by components that are specific to CIST—octets 37 to 102. Components specific to each MSTI are added to this BPDU data block.

Table 20-7: MSTP Bridge Protocol Data Units (BPDUs)

Field Name	Octets	Description
Protocol Identifier	1–2	Protocol being used. The value 0000 0000 0000 0000 identifies the spanning tree algorithm and protocol.
Protocol Version Identifier	3	Identifies the protocol version used.
BPDU Type	4	Value 0000 0000 specifies a configuration BPDU.
CIST Flags	5	Bit 1 is the topology change flag. Bit 2 conveys the CIST proposal flag in RST and MST BPDUs - unused in STP. Bits 3 & 4 convey the CIST port role in RST, and MST BPDUs - unused in STP. Bit 5 conveys the CIST learning flag in RST and MST BPDUs - unused in STP. Bit 6 conveys the CIST forwarding flag in RST and MST BPDUs - unused in STP. Bit 7 conveys the CIST agreement flag in RST and MST BPDUs - unused in STP. Bit 8 conveys the topology change acknowledge flag in STP configuration BPDUs - unused in RSTP and MSTP BPDUs.
CIST Root Identifier	6–13	The Bridge identifier of the CIST Root
CIST External Path Cost	14–17	The path cost between MST regions from the transmitting bridge to the CIST root.
CIST Regional Root Identifier	18–25	ID of the current CIST regional root bridge.
CIST Port Identifier	26–27	CIST port identifier of the transmitting bridge port.
Message Age	28–29	Message age timer value.
Max Age	30–31	Timeout value to be used by all bridges in the bridged network. This value is set by the root. Some implementations of MSTP may choose not to use this value.
Hello Time	32–33	Time interval between the generation of configuration BPDUs by the root bridge.
Forward Delay	34–35	A timeout value used to ensure forward delay timer consistency when transferring a port to the forwarding state. It is also used for ageing filtering database dynamic entries following changes in the active topology.
Version 1 Length	36	Used to convey the Version 1 length. It is always transmitted as 0.

Table 20-7: MSTP Bridge Protocol Data Units (BPDUs)(cont.)

Field Name	Octets	Description
Version 3 Length	37–38	Used to convey the Version 3 length. It is the number of octets taken by the parameters that follow in the BPDU.
MST Configuration Identifier	39–89	An identifier comprising elements of the following: Format Selector Configuration Name Revision Level Configuration Digest.
CIST Internal Root Path Cost	90–93	Path cost to the CIST regional root.
CIST Bridge Identifier	94–101	CIST bridge identifier of the transmitting bridge.
CIST Remaining Hops	102	Remaining hops which limits the propagation and longevity of received spanning tree information for the CIST.
MSTI Configuration Messages (may be absent)	103–39 plus Version 3 Length	See **Table 20-8**.

Table 20-8: MSTI configuration messages

Field Name	Octets	Description
MSTI Flags	1	Bits 1 through 8, convey the topology change flag, proposal flag, port role (two bits), Learning flag, forwarding flag, agreement flag, and master flag for this MSTI.
MSTI Regional Root Identifier	2–9	This includes the value of the MSTID for this configuration message encoded in bits 4 through 1 of octet 1, and bits 8 through 1 of octet 2.
MSTI Internal Root Path Cost	10-13	Internal Root Path Cost.
MSTI Bridge Priority	14	Bits 5 through 8 convey the value of the bridge identifier priority for this MSTI. Bits 1 through 4 of Octet 14 are transmitted as 0, and ignored on receipt.
MSTI Port Priority	15	Bits 5 through 8 are used to convey the value of the port identifier priority for this MSTI. Bits 1 through 4 are transmitted as 0, and ignored on receipt.
MSTI Remaining Hops	16	Value of remaining hops for this MSTI.

Configuring MSTP

By default, RSTP is enabled with default settings on all switch ports. To configure MSTP, see the configuration procedure in **Table 20-9**.

To configure other modes, see **"Configuring RSTP" on page 20.9** or **"Configuring STP" on page 20.6**.

For detailed configuration examples, see the How To Note *How To Configure Basic Switching Functionality*, available from website at **http://www.alliedtelesis.com**.

Configuration guidelines for MSTP

- Switches must have the same MST configuration identification elements (region name, revision level and VLAN to MSTI mapping) to be in the same MST region. When configuring multiple MST regions for MSTP, MSTIs are locally significant within an MST region. MSTIs will not span from one region to another region.
- Common and Internal Spanning Tree (CIST) is the default spanning tree instance for MSTP. This means that all VLANs that are not explicitly configured into another MSTI are members of the CIST.
- The software supports a single instance of the MSTP Algorithm consisting of the CIST and up to 15 MSTIs.
- A VLAN can only be mapped to one MSTI or to the CIST. One VLAN mapped to multiple spanning trees is not allowed. All the VLANs are mapped to the CIST by default. Once a VLAN is mapped to a specified MSTI, it is removed from the CIST.
- An MSTI is locally significant within an MST region. An MSTI cannot span across multiple MST regions. The CIST is the spanning tree instance for connecting different MST regions and single spanning tree entities, such as RSTP and STP switches.
- MSTP is compatible with RSTP and STP. An MST region appears as a virtual bridge connecting to single spanning tree entities.
- To avoid unnecessary STP processing, a port that attaches to a LAN that is known to have no other bridges/switches attached can be configured as an edge port.

Before configuring MSTP

Before configuring MSTP, configure VLANs and associate them with switch ports (**Chapter 18, VLAN Introduction** and **Chapter 19, VLAN Commands**), and determine for your network:

- which MSTP regions, revision level and instances are required
- which VLANs and switch ports will belong to which MSTIs,
- which devices you want to be root bridges for each MSTI

Table 20-9: Configuration procedure for MSTP

Command	Description
`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `spanning-tree mode mstp`	By default, the device is in RSTP mode. Change to MSTP mode.
`awplus(config)#` `spanning-tree enable`	By default, spanning tree is enabled on all switch ports. If it has been disabled, enable it for MSTP.

Table 20-9: Configuration procedure for MSTP(cont.)

Configure MSTP region, revision, and instances	
All MSTP devices in this region of the network must have the same region name, revision number, and VLAN to MSTI mappings.	
`awplus(config)#`	
`spanning-tree mst configuration`	Enter MST Configuration mode.
`awplus(config-mst)#`	
`region <region-name>`	Specify the MSTP region. The **region-name** parameter is an arbitrary string that specifies the name you want to assign to the MST region for identification.
`awplus(config-mst)#`	
`revision <revision-number>`	The **revision-number** parameter specifies the revision of the current MST configuration. The revision is an arbitrary number that you assign to an MST region. It can be used to keep track of the number of times that MST configuration has been updated for the network. Specify the MST revision number in the range 0 to 255.
`awplus(config-mst)#`	
`instance <msti-id> vlan {<vid>|<vid-list>}`	To allow MSTP to block traffic for different VLANs in different places in a loop, create multiple MSTP instances and associate VLANs with them. Each VLAN can only be in one instance. Specify the MST instance ID in the range 1 to 15.
Advanced configuration	
The commands above are the minimum required to configure MSTP. The following commands allow more advanced configuration.	
Assign root bridge priorities	
MSTP lets you distribute traffic more efficiently across a network by blocking different links for different VLANs. You do this by making different devices into the root bridge for each MSTP instance, and for the CIST, so that each instance blocks a different link. By default, all devices have the same root bridge priority, 32768 (8000 in hexadecimal), so the device with the lowest MAC address becomes the root bridge. If you want the device to be the root bridge for an instance or for the CIST, set the priority to a lower value (a higher priority) than other devices for this instance. (If you enter a number that is not a multiple of 4096, the device rounds the number down.)	
`awplus(config)#`	
`spanning-tree mst configuration`	Enter MST Configuration mode.
`awplus(config-mst)#`	
`instance <msti-id> priority <priority>`	Set the priority for the device to become the root bridge for each instance. Specify the MST instance ID in the range 1 to 15. Specify the root bridge priority in the range 0 to 61440. If you enter a number that is not a multiple of 4096, the switch rounds the number down.
`awplus(config-mst)#`	
`exit`	Return to Global Configuration mode.

Table 20-9: Configuration procedure for MSTP(cont.)

`awplus(config)#`	
`spanning-tree priority <priority>`	Set the priority for the device to become the root bridge for the CIST. Specify the bridge priority in the range 0 to 61440. If you enter a number that is not a multiple of 4096, the switch rounds the number down.
Configure edge ports	
If some switch ports are connected to devices that cannot generate BPDUs (such as workstations), you can set particular switch ports as edge ports, or set them to automatically detect whether they are edge ports.	
`awplus(config)#`	
`interface <port-list>`	Enter Interface Configuration mode for these switch ports.
`awplus(config-if)#`	
`spanning-tree edgeport (RSTP and MSTP)`	Set these ports to be edge ports,
or	or
`awplus(config-if)#`	
`spanning-tree autoedge (RSTP and MSTP)`	set these ports to automatically detect whether they are edge ports.
Configure Root Guard	
`awplus(config-if)#`	
`spanning-tree guard root`	The Root Guard feature makes sure that the port on which it is enabled is a designated port. If the Root Guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP). Enable the Guard Root feature if required.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
Configure BPDU Guard	
`awplus(config)#`	
`spanning-tree portfast bpdu-guard`	If required, enable the BPDU Guard feature.
`awplus(config)#`	
`spanning-tree errdisable-timeout enable`	Set a timeout for ports that are disabled due to the BPDU guard feature.
`awplus(config)#`	
`spanning-tree errdisable-timeout interval <10-1000000>`	Specify the time interval after which a port is brought back up when it has been disabled by the BPDU guard feature.

Table 20-9: Configuration procedure for MSTP(cont.)

Check MSTP configuration	
`awplus(config)#`	
`exit`	Return to Privileged Exec mode.
`awplus#`	
`show spanning-tree mst config`	Check that the digest is the same on this device as for all other devices in the same region.
`awplus#`	
`show spanning-tree mst`	Check the MST to VLAN and port mapping.
`awplus#`	
`show spanning-tree mst instance <instance>`	Check the detailed information for a particular instance, and all switch ports associated with that instance. Specify the MST instance ID in the range 1 to 15.
`awplus#`	
`show spanning-tree mst interface <port>`	Check general information about MSTP, and the CIST settings.

Advanced configuration: For most networks, the default settings of the following will be suitable. However, you can also configure them.

- path costs for ports in an MSTI (**spanning-tree mst instance path-cost**) or for the CIST (**spanning-tree path-cost**)
- port priority for ports in an MSTI (**spanning-tree mst instance priority**) or for the CIST (**spanning-tree priority (port priority)**)

Chapter 21: Spanning Tree Commands

Command List

This chapter provides an alphabetical reference for commands used to configure RSTP, STP or MSTP. For information about spanning trees, including configuration procedures, see **Chapter 20, Spanning Tree Introduction: STP, RSTP, and MSTP**

clear spanning-tree statistics

Use this command to clear all the STP BPDU (Bridge Protocol Data Unit) statistics.

Syntax

```
clear spanning-tree statistics

clear spanning-tree statistics [instance <mstp-instance>]

clear spanning-tree statistics
   [interface <port> [instance <mstp-instance>]]
```

Parameter	Description
<port>	The port to clear STP BPDU statistics for. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).
<mstp-instance>	The MSTP instance (MSTI - Multiple Spanning Tree Instance) to clear MSTP BPDU statistics.

Mode User Exec and Privileged Exec

Usage Use this command with the **instance** parameter in MSTP mode. Specifying this command with the **interface** parameter only not the instance parameter will work in STP and RSTP mode.

Examples

```
awplus# clear spanning-tree statistics

awplus# clear spanning-tree statistics instance 1

awplus# clear spanning-tree statistics interface port1.0.2

awplus# clear spanning-tree statistics interface port1.0.2
       instance 1
```

clear spanning-tree detected protocols (RSTP and MSTP)

Use this command to clear the detected protocols for a specific port, or all ports.

Use this command in RSTP or MSTP mode only.

Syntax `clear spanning-tree detected protocols [interface <port>]`

Parameter	Description
<port>	The port to clear detected protocols for. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode Privileged Exec

Example

```
awplus# clear spanning-tree detected protocols
```

debug mstp (RSTP and STP)

Use this command to enable debugging for the configured spanning tree mode, and echo data to the console, at various levels. Note that although this command uses the keyword **mstp** it displays debugging output for RSTP and STP protocols as well the MSTP protocol.

Use the **no** variant of this command to disable spanning tree debugging.

Syntax

```
debug mstp {all|cli|protocol [detail]|timer [detail]}
debug mstp {packet {rx|tx} [decode] [interface <interface>]}
debug mstp {topology-change [interface <interface>]}
no debug mstp {all|cli|protocol [detail]|timer [detail]}
no debug mstp {packet {rx|tx} [decode] [interface <interface>]}
no debug mstp {topology-change [interface <interface>]}
```

Parameter	Description
`all`	Echoes all spanning tree debugging levels to the console.
`cli`	Echoes spanning tree commands to the console.
`packet`	Echoes spanning tree packets to the console.
`rx`	Received packets.
`tx`	Transmitted packets.
`protocol`	Echoes protocol changes to the console.
`timer`	Echoes timer information to the console.
`detail`	Detailed output.
`decode`	Interprets packet contents
`topology-change`	Interprets topology change messages
`interface`	Keyword before <*interface*> placeholder to specify an interface to debug
<*interface*>	Placeholder used to specify the name of the interface to debug.

Mode Privileged Exec and Global Configuration mode

Usage 1 Use the **debug mstp topology-change interface** command to generate debugging messages when the switch receives an indication of a topology change in a BPDU from another device. The debugging can be activated on a per-port basis. Although this command uses the keyword **mstp**, it displays debugging output for RSTP and STP protocols as well as the MSTP protocol.

Due to the likely volume of output, these debug messages are best viewed using the **terminal monitor** command on page 10.72 before issuing the relevant **debug mstp** command. The default terminal monitor filter will select and display these messages. Alternatively, the messages can be directed to any of the other log outputs by adding a filter for the MSTP application using **log buffered (filter)** command on page 12.9:

```
awplus# configure terminal
awplus(config)# log buffered program mstp
```

Output 1

```
awplus#terminal monitor
awplus#debug mstp topology-change interface port1.0.19
10:09:09 awplus MSTP[1409]: Topology change rcvd on port1.0.19 (internal)
10:09:09 awplus MSTP[1409]: Topology change rcvd on MSTI 1 port1.0.19
aawplus#debug mstp topology-change interface port1.0.21
10:09:29 awplus MSTP[1409]: Topology change rcvd on port1.0.21 (external)
10:09:29 awplus MSTP[1409]: Topology change rcvd on MSTI 1 port1.0.21
```

Usage 2 Use the **debug mstp packet rx|tx decode interface** command to generate debugging messages containing the entire contents of a BPDU displayed in readable text for transmitted and received xSTP BPDUs. The debugging can be activated on a per-port basis and transmit and receive debugging is controlled independently. Although this command uses the keyword **mstp**, it displays debugging output for RSTP and STP protocols as well as the MSTP protocol.

Due to the likely volume of output, these debug messages are best viewed using the **terminal monitor** command on page 10.72 before issuing the relevant **debug mstp** command. The default terminal monitor filter will select and display these messages. Alternatively, the messages can be directed to any of the other log outputs by adding a filter for the MSTP application using the **log buffered (filter)** command on page 12.9:

```
awplus(config)# log buffered program mstp
```

Output 2 In MSTP mode - an MSTP BPDU with 1 MSTI:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.19
17:23:42 awplus MSTP[1417]: port1.0.19 xSTP BPDU rx - start
17:23:42 awplus MSTP[1417]: Protocol version: MSTP, BPDU type: RST
17:23:42 awplus MSTP[1417]: CIST Flags:  Agree Forward Learn role=Desig
17:23:42 awplus MSTP[1417]: CIST root id      : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST ext pathcost : 0
17:23:42 awplus MSTP[1417]: CIST reg root id  : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST port id      : 8001 (128:1)
17:23:42 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:23:42 awplus MSTP[1417]: Version 3 length : 80
17:23:42 awplus MSTP[1417]: Format id      : 0
17:23:42 awplus MSTP[1417]: Config name    : test
17:23:42 awplus MSTP[1417]: Revision level : 0
17:23:42 awplus MSTP[1417]: Config digest  : 3ab68794d602fdf43b21c0b37ac3bca8
17:23:42 awplus MSTP[1417]: CIST int pathcost : 0
17:23:42 awplus MSTP[1417]: CIST bridge id    : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST hops remaining : 20
17:23:42 awplus MSTP[1417]: MSTI flags           : Agree Forward Learn role=Desig
17:23:42 awplus MSTP[1417]: MSTI reg root id     : 8001:0000cd1000fe
17:23:42 awplus MSTP[1417]: MSTI pathcost        : 0
17:23:42 awplus MSTP[1417]: MSTI bridge priority : 32768 port priority : 128
17:23:42 awplus MSTP[1417]: MSTI hops remaining  : 20
17:23:42 awplus MSTP[1417]: port1.0.19 xSTP BPDU rx - finish
```

In STP mode transmitting a TCN BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet tx decode interface port1.0.19
17:28:09 awplus MSTP[1417]: port1.0.19 xSTP BPDU tx - start
17:28:09 awplus MSTP[1417]: Protocol version: STP, BPDU type: TCN
17:28:09 awplus MSTP[1417]: port1.0.19 xSTP BPDU tx - finish
```

In STP mode receiving an STP BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.19
17:31:36 awplus MSTP[1417]: port1.0.19 xSTP BPDU rx - start
17:31:36 awplus MSTP[1417]: Protocol version: STP, BPDU type: Config
17:31:36 awplus MSTP[1417]: Flags:  role=none
17:31:36 awplus MSTP[1417]: Root id      : 8000:0000cd1000fe
17:31:36 awplus MSTP[1417]: Root pathcost : 0
17:31:36 awplus MSTP[1417]: Bridge id  : 8000:0000cd1000fe
17:31:36 awplus MSTP[1417]: Port id      : 8001 (128:1)
17:31:36 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:31:36 awplus MSTP[1417]: ort1.0.19 xSTP BPDU rx - finish
```

In RSTP mode receiving an RSTP BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.19
awplus#17:30:17 awplus MSTP[1417]: port1.0.19 xSTP BPDU rx - start
17:30:17 awplus MSTP[1417]: Protocol version: RSTP, BPDU type: RST
17:30:17 awplus MSTP[1417]: CIST Flags:  Forward Learn role=Desig
17:30:17 awplus MSTP[1417]: CIST root id      : 8000:0000cd1000fe
17:30:17 awplus MSTP[1417]: CIST ext pathcost : 0
17:30:17 awplus MSTP[1417]: CIST reg root id  : 8000:0000cd1000fe
17:30:17 awplus MSTP[1417]: CIST port id      : 8001 (128:1)

show debugging mstp
terminal monitor
undebug mstp

instance priority (MSTP)

Use this command to set the priority for this device to become the root bridge for the specified MSTI (Multiple Spanning Tree Instance).

Use this command for MSTP only.

Use the **no** variant of this command to restore the root bridge priority of the device for the instance to the default.

Syntax

```
instance <msti-id> priority <priority>
no instance <msti-id> priority
```

Parameter	Description
<msti-id>	Specify the The MST instance ID in the range <1-15>.
<priority>	Specify the root bridge priority for the device for the MSTI in the range <0-61440>. Note that a lower priority number indicates a greater likelihood of the device becoming the root bridge. The priority values can be set only in increments of 4096. If you specify a number that is not a multiple of 4096, it will be rounded down. The default priority is 32768.

Default The default priority value for all instances is 32768.

Mode MST Configuration

Usage MSTP lets you distribute traffic more efficiently across a network by blocking different links for different VLANs. You do this by making different devices into the root bridge for each MSTP instance, so that each instance blocks a different link.

If all devices have the same root bridge priority for the instance, MSTP selects the device with the lowest MAC address to be the root bridge. Give the device a higher priority for becoming the root bridge for a particular instance by assigning it a lower priority number, or vice versa.

Examples To set the root bridge priority for MSTP instance 2 to be the highest (0), so that it will be the root bridge for this instance when available, use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# instance 2 priority 0
```

To reset the root bridge priority for instance 2 to the default (32768), use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# no instance 2 priority
```

Related Commands

region (MSTP)
revision (MSTP)
show spanning-tree mst config
spanning-tree mst instance
spanning-tree mst instance priority

instance vlan (MSTP)

Use this command to create an MST Instance (MSTI), and associate the specified VLANs with it. An MSTI is a spanning tree instance that exists within an MST region (MSTR). An MSTR can contain up to 15 MSTIs.

When a VLAN is associated with an MSTI the member ports of the VLAN are automatically configured to send and receive spanning-tree information for the associated MSTI. You can disable this automatic configuration of member ports of the VLAN to the associated MSTI by using a **no spanning-tree mst instance** command to remove the member port from the MSTI.

Use the **instance vlan** command for MSTP only.

Use the **no** variant of this command to remove the specified VLANs from the MSTI.

Syntax

```
instance <msti-id> vlan {<vid>|<vid-list>}
no instance <msti-id> vlan {<vid>|<vid-list>}
```

Parameter	Description
<msti-id>	Specify the MST instance ID <1-15>.
<vid>	Specify a VLAN identifier (VID) in the range <1-4094> to be associated with the MSTI specified.
<vid-list>	A hyphen-separated range or a comma-separated list of VLAN IDs

Mode MST Configuration

Usage The VLANs must be created before being associated with an MST instance (MSTI). If the VLAN range is not specified, the MSTI will not be created.

This command removes the specified VLANs from the CIST and adds them to the specified MSTI. If you use the **no** variant of this command to remove the VLAN from the MSTI, it returns it to the CIST. To move a VLAN from one MSTI to another, you must first use the **no** variant of this command to return it to the CIST.

Ports in these VLANs will remain in the control of the CIST until you associate the ports with the MSTI using the **spanning-tree mst instance** command.

Example

```
awplus# configure terminal
awplus(config)# spanning-tree mode mstp
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# instance 2 vlan 30
```

Related Commands

region (MSTP)
revision (MSTP)
show spanning-tree mst config
spanning-tree mst instance
vlan

region (MSTP)

Use this command to assign a name to the device's MST Region. MST Instances (MSTI) of a region form different spanning trees for different VLANs.

Use this command for MSTP only.

Use the **no** variant of this command to remove this region name and reset it to the default.

Syntax

```
region <region-name>
no region
```

Parameter	Description
<region-name>	Specify the name of the region, up to 32 characters. Valid characters are upper-case, lower-case, digits, underscore.

Default By default, the region name is My Name.

Mode MST Configuration

Usage The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

Example

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# region ATL
```

Related Commands revision (MSTP)
show spanning-tree mst config

revision (MSTP)

Use this command to specify the MST revision number to be used in the configuration identifier.

Use this command for MSTP only.

Syntax `revision <revision-number>`

Parameter	Description
<revision-number>	<0-65535> Revision number.

Default The default of revision number is 0.

Mode MST Configuration

Usage The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

Example

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# revision 25
```

Related Commands **region (MSTP)**
show spanning-tree mst config
instance vlan (MSTP)

show debugging mstp

Use this command to show the MSTP debugging options set.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show debugging mstp`

Mode User Exec and Privileged Exec mode

Example To display the MSTP debugging options set, enter the command:

```
awplus# show debugging mstp
```

Output **Figure 21-1: Example output from the show debugging mstp command**

```
MSTP debugging status:
  MSTP receiving packet debugging is on
```

Related Commands **debug mstp (RSTP and STP)**

show spanning-tree

Use this command to display detailed spanning tree information on the specified port or on all ports. Use this command for RSTP, MSTP or STP.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show spanning-tree [interface <port-list>]`

Parameter	Description
`interface`	Display information about the following port only.
`<port-list>`	The ports to display information about. A port-list can be: ■ a switch port (e.g. `port1.0.12`) a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po3`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24`, or `sa1-2`, or `po1-4` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.4-1.2.24`. Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list

Mode User Exec and Privileged Exec

Usage Note that any list of interfaces specified must not span any interfaces that are not installed.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

Example To display spanning tree information about `port1.0.23`, use the command:

```
awplus# show spanning-tree interface port1.0.23
```

Output **Figure 21-2: Example output from the show spanning-tree command**

```

show spanning-tree brief

Use this command to display a summary of spanning tree status information on all ports. Use this command for RSTP, MSTP or STP.

Syntax `show spanning-tree brief`

Parameter	Description
`brief`	A brief summary of spanning tree information.

Mode User Exec and Privileged Exec

Usage Note that any list of interfaces specified must not span any interfaces that are not installed.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

Example To display a summary of spanning tree status information, use the command:

```
awplus# show spanning-tree brief
```

Output **Figure 21-4: Example output from the show spanning-tree brief command**

```
Default: Bridge up - Spanning Tree Enabled

show spanning-tree mst detail interface

This command prints detailed information about the specified switch port, and the MST instances associated with it.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show spanning-tree mst detail interface <port>`

Parameter	Description
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode User Exec, Privileged Exec and Interface Configuration

Example To display detailed information about `port1.0.3` and the instances associated with it, enter the command:

```
awplus# show spanning-tree mst detail interface port1.0.3
```

Output **Figure 21-8: Example output from the show spanning-tree mst detail interface command**

```

show spanning-tree mst instance

This command displays detailed information for the specified instance, and all switch ports associated with that instance.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show spanning-tree mst instance <instance>
```

Parameter	Description
<instance>	Specify an MSTP instance in the range <1-15>.

Mode User Exec, Privileged Exec, and Interface Configuration

Usage To display detailed information for **instance 2**, and all switch ports associated with that instance, use the command:

```
awplus# show spanning-tree mst instance 2
```

Output **Figure 21-9: Example output from the show spanning-tree mst instance command**

```
% 1: MSTI Root Path Cost 0 - MSTI Root Port 0 - MSTI Bridge Priority 32768
% 1: MSTI Root Id 80020000cd24ff2d
% 1: MSTI Bridge Id 80020000cd24ff2d
%   port1.0.2: Port 5002 - Id 838a - Role Disabled - State Discarding
%   port1.0.2: Designated Internal Path Cost 0  - Designated Port Id 838a
%   port1.0.2: Configured Internal Path Cost 20000000
%   port1.0.2: Configured CST External Path cost 20000000
%   port1.0.2: CST Priority 128  - MSTI Priority 128
%   port1.0.2: Designated Root 80020000cd24ff2d
%   port1.0.2: Designated Bridge 80020000cd24ff2d

%   port1.0.2: Hello Time 2 - Forward Delay 15
%   port1.0.2: Forward Timer 0 - Msg Age Timer 0 - Hello Timer 0
%
```

show spanning-tree mst instance interface

This command displays detailed information for the specified MST (Multiple Spanning Tree) instance, and the specified switch port associated with that MST instance.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show spanning-tree mst instance <instance> interface <port>`

Parameter	Description
<instance>	Specify an MSTP instance in the range `<1-15>`.
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode User Exec, Privileged Exec, and Interface Configuration

Example To display detailed information for `instance 2`, interface `port1.0.2`, use the command

```
awplus# show spanning-tree mst instance 2 interface port1.0.2
```

Output **Figure 21-10: Example output from the show spanning-tree mst instance command**

```
% 1: MSTI Root Path Cost 0 - MSTI Root Port 0 - MSTI Bridge Priority 32768
% 1: MSTI Root Id 80020000cd24ff2d
% 1: MSTI Bridge Id 80020000cd24ff2d
%   port1.0.2: Port 5002 - Id 838a - Role Disabled - State Discarding
%   port1.0.2: Designated Internal Path Cost 0  - Designated Port Id 838a
%   port1.0.2: Configured Internal Path Cost 20000000
%   port1.0.2: Configured CST External Path cost 20000000
%   port1.0.2: CST Priority 128  - MSTI Priority 128
%   port1.0.2: Designated Root 80020000cd24ff2d
%   port1.0.2: Designated Bridge 80020000cd24ff2d
%   port1.0.2: Message Age 0 - Max Age 0
%   port1.0.2: Hello Time 2 - Forward Delay 15
%   port1.0.2: Forward Timer 0 - Msg Age Timer 0 - Hello Timer 0
%
```

show spanning-tree mst interface

This command displays the number of instances created, and VLANs associated with it for the specified switch port.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show spanning-tree mst interface <port>`

Parameter	Description
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode User Exec, Privileged Exec, and Interface Configuration

Example To display detailed information about each instance, and all interfaces associated with them, for `port1.0.4`, use the command:

```
awplus# show spanning-tree mst interface port1.0.4
```

Output **Figure 21-11: Example output from the show spanning-tree mst interface command**

```
% 1: Bridge up - Spanning Tree Enabled
% 1: CIST Root Path Cost 0 - CIST Root Port 0 - CIST Bridge Priority 32768
% 1: Forward Delay 15 - Hello Time 2 - Max Age 20 - Max-hops 20

%   2:              4-5
```

show spanning-tree mst detail interface

This command displays detailed information about the specified switch port, and the MST instances associated with it.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show spanning-tree mst detail interface <port>`

Parameter	Description
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode User Exec, Privileged Exec and Interface Configuration

Example To display detailed information about `port1.0.3` and the instances associated with it, enter the command:

```
awplus# show spanning-tree mst detail interface port1.0.3
```

Output **Figure 21-12: Example output from the show spanning-tree mst detail interface command**

```
% 1: Bridge up - Spanning Tree Enabled

```

show spanning-tree statistics

This command displays BPDU (Bridge Protocol Data Unit) statistics for all spanning-tree instances, and all switch ports associated with all spanning-tree instances. For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show spanning-tree statistics`

Mode Privileged Exec

Usage To display BPDU statistics for all spanning-tree instances, and all switch ports associated with all spanning-tree instances, use the command:

```
awplus# show spanning-tree statistics
```

Output **Figure 21-13: Example output from the show spanning-tree statistics command**

```
Port number = 915 Interface = port1.0.11

show spanning-tree statistics instance

This command displays BPDU (Bridge Protocol Data Unit) statistics for the specified MST (Multiple Spanning Tree) instance, and all switch ports associated with that MST instance. For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show spanning-tree statistics instance <instance>`

Parameter	Description
`<instance>`	Specify an MSTP instance in the range `<1-15>`.

Mode Privileged Exec

Usage To display BPDU statistics information for MST instance 2, and all switch ports associated with that MST instance, use the command:

```
awplus# show spanning-tree statistics instance 2
```

Output **Figure 21-14: Example output from the show spanning-tree statistics instance command:**

```

Related Commands **show spanning-tree statistics**

show spanning-tree statistics instance interface

This command displays BPDU (Bridge Protocol Data Unit) statistics for the specified MST (Multiple Spanning Tree) instance and the specified switch port associated with that MST instance.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show spanning-tree statistics instance <instance> interface <port>`

Parameter	Description
<instance>	Specify an MSTP instance in the range `<1-15>`.
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode Privileged Exec

Example To display BPDU statistics for MST `instance 2`, interface `port1.0.2`, use the command

```
awplus# show spanning-tree statistics instance 2 interface
       port1.0.2
```

Output **Figure 21-15: Example output from the show spanning-tree statistics instance interface command**

```
awplus#sh spanning-tree statistics interface port1.0.2 instance 1
        Spanning Tree Enabled for Instance : 1

Related Commands **show spanning-tree statistics**

show spanning-tree statistics interface

This command displays BPDU (Bridge Protocol Data Unit) statistics for the specified switch port, and all MST instances associated with that switch port.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show spanning-tree statistics interface <port>`

Parameter	Description
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode Privileged Exec

Example To display BPDU statistics about each MST instance for `port1.0.4`, use the command:

```
awplus# show spanning-tree statistics interface
       port1.0.4
```

Output **Figure 21-16: Example output from the show spanning-tree statistics interface command**

```
awplus#show spanning-tree statistics interface port1.0.2

                Port number = 906 Interface = port1.0.2

```

Related Commands **show spanning-tree statistics**

show spanning-tree vlan range-index

Use this command to display information about MST (Multiple Spanning Tree) instances and the VLANs associated with them including the VLAN range-index value for the switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show spanning-tree vlan range-index`

Mode Privileged Exec

Example To display information about MST instances and the VLANs associated with them for the switch, including the VLAN range-index value, use the following command:

```
awplus# show spanning-tree vlan range-index
```

Output **Figure 21-17: Example output from the show spanning-tree vlan range-index command**

```
awplus#show spanning-tree vlan range-index
% MST Instance  VLAN       RangeIdx
%      1        1          1
%
```

Related Commands **show spanning-tree statistics**

spanning-tree autoedge (RSTP and MSTP)

Use this command to enable the autoedge feature on the port.

The autoedge feature allows the port to automatically detect that it is an edge port. If it does not receive any BPDUs in the first three seconds after linkup, enabling, or entering RSTP or MSTP mode, it sets itself to be an edgeport and enters the forwarding state.

Use this command for RSTP or MSTP.

Use the **no** variant of this command to disable this feature.

Syntax

```
spanning-tree autoedge
no spanning-tree autoedge
```

Default Disabled

Mode Interface Configuration

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# spanning-tree autoedge
```

Related Commands spanning-tree edgeport (RSTP and MSTP)

spanning-tree bpdu

Use this command in Global Configuration mode to configure BPDU (Bridge Protocol Data Unit) discarding or forwarding, with STP (Spanning Tree Protocol) disabled on the switch.

See the **Usage** note about disabling Spanning Tree before using this command, and using this command to forward unsupported BPDUs unchanged for unsupported STP Protocols.

There is not a **no** variant for this command. Instead, apply the `discard` parameter to reset it back to the default then re-enable STP with **spanning-tree enable** command.

Syntax

```
spanning-tree bpdu
   {discard|forward|forward-untagged-vlan|forward-vlan}
```

Parameter	Description	
`bpdu`	A port that has BPDU filtering enabled will not transmit any BPDUs and will ignore any BPDUs received. This port type has one of the following parameters (in Global Configuration mode):	
	`discard`	Discards all ingress STP BPDU frames.
	`forward`	Forwards any ingress STP BPDU packets to all ports, regardless of any VLAN membership.
	`forward-untagged-vlan`	Forwards any ingress STP BPDU frames to all ports that are untagged members of the ingress port's native VLAN.
	`forward-vlan`	Forwards any ingress STP BPDU frames to all ports that are tagged members of the ingress port's native VLAN.

Default The discard parameter is enabled by default.

Mode Global Configuration

Usage You must first disable Spanning Tree with the **no spanning-tree {mstp|rstp|stp} enable** command before you can use this command to then configure BPDU discarding or forwarding.

This command enables the switch to forward unsupported BPDUs with an unsupported Spanning Tree Protocol, such as proprietary STP protocols with unsupported BPDUs, by forwarding BDPU (Bridge Protocol Data Unit) frames unchanged through the switch.

When you want to revert to default behavior on the switch, issue a **spanning-tree bdpu discard** command and re-enable Spanning Tree with a **spanning-tree enable** command.

Examples To enable STP BPDU discard in Global Configuration mode with STP disabled, which discards all ingress STP BPDU frames, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
awplus(config)# spanning-tree bpdu discard
```

To enable STP BPDU forward in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports regardless of any VLAN membership, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
awplus(config)# spanning-tree bpdu forward
```

To enable STP BPDU forwarding for untagged frames in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports that are untagged members of the ingress port's native VLAN, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
awplus(config)# spanning-tree bpdu forward-untagged-vlan
```

To enable STP BPDU forwarding for tagged frames in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports that are tagged members of the ingress port's native VLAN, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
awplus(config)# spanning-tree bpdu forward-vlan
```

To reset STP BPDU back to the default `discard` parameter and re-enable STP on the switch, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree bpdu discard
awplus(config)# spanning-tree stp enable
```

Related Commands **show spanning-tree**
spanning-tree enable

spanning-tree cisco-interoperability (MSTP)

Use this command to enable/disable Cisco-interoperability for MSTP.

Use this command for MSTP only.

Syntax `spanning-tree cisco-interoperability {enable|disable}`

Parameter	Description
`enable`	Enable Cisco interoperability for MSTP.
`disable`	Disable Cisco interoperability for MSTP.

Default If this command is not used, Cisco interoperability is disabled.

Mode Global Configuration

Usage For compatibility with certain Cisco devices, all devices in the switched LAN running the AlliedWare Plus™ Operating System must have Cisco-interoperability enabled. When the AlliedWare Plus™ Operating System is interoperating with Cisco, the only criteria used to classify a region are the region name and revision level. VLAN to instance mapping is not used to classify regions when interoperating with Cisco.

Examples To enable Cisco interoperability on a Layer 2 switch:

```
awplus# configure terminal
awplus(config)# spanning-tree cisco-interoperability enable
```

To disable Cisco interoperability on a Layer 2 switch:

```
awplus# configure terminal
awplus(config)# spanning-tree cisco-interoperability disable
```

spanning-tree edgeport (RSTP and MSTP)

Use this command to set a port as an edge-port.

Use this command for RSTP or MSTP.

This command has the same effect as the **spanning-tree portfast (STP)** command, but the configuration displays differently in the output of some show commands.

Use the **no** variant of this command to set a port to its default state (not an edge-port).

Syntax

```
spanning-tree edgeport
no spanning-tree edgeport
```

Default Not an edge port.

Mode Interface Configuration

Usage Use this command on a switch port connected to a LAN that has no other bridges attached. If a BPDU is received on the port that indicates that another bridge is connected to the LAN, then the port is no longer treated as an edge port.

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree edgeport
```

Related Commands **spanning-tree autoedge (RSTP and MSTP)**

spanning-tree enable

Use this command in Global Configuration mode to enable the specified spanning tree protocol for all switch ports. Note that this must be the spanning tree protocol that is configured on the switch by the **spanning-tree mode** command.

Use the **no** variant of this command to disable the configured spanning tree protocol. This places all switch ports in the forwarding state.

Syntax

```
spanning-tree {mstp|rstp|stp} enable
no spanning-tree {mstp|rstp|stp} enable
```

Parameter	Description
mstp	Enables or disables MSTP (Multiple Spanning Tree Protocol).
rstp	Enables or disables RSTP (Rapid Spanning Tree Protocol).
stp	Enables or disables STP (Spanning Tree Protocol).

Default RSTP is enabled by default for all switch ports.

Mode Global Configuration

Usage With no configuration, spanning tree is enabled, and the spanning tree mode is set to RSTP. To change the mode, see **spanning-tree mode** command on page 21.51.

Examples To enable STP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree stp enable
```

To disable STP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
```

To enable MSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mstp enable
```

To disable MSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree mstp enable
```

To enable RSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree rstp enable
```

To disable RSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
```

Related Commands
spanning-tree bpdu
spanning-tree mode

spanning-tree errdisable-timeout enable

Use this command to enable the errdisable-timeout facility, which sets a timeout for ports that are disabled due to the BPDU guard feature.

Use this command for RSTP or MSTP.

Use the **no** variant of this command to disable the errdisable-timeout facility.

Syntax

```
spanning-tree errdisable-timeout enable
no spanning-tree errdisable-timeout enable
```

Default By default, the errdisable-timeout is disabled.

Mode Global Configuration

Usage The BPDU guard feature shuts down the port on receiving a BPDU on a BPDU-guard enabled port. This command associates a timer with the feature such that the port is re-enabled without manual intervention after a set interval. This interval can be configured by the user using the **spanning-tree errdisable-timeout interval** command.

Example

```
awplus# configure terminal
awplus(config)# spanning-tree errdisable-timeout enable
```

Related Commands
show spanning-tree
spanning-tree errdisable-timeout interval
spanning-tree portfast bpdu-guard

spanning-tree errdisable-timeout interval

Use this command to specify the time interval after which a port is brought back up when it has been disabled by the BPDU guard feature.

Use this command for RSTP or MSTP.

Syntax

```
spanning-tree errdisable-timeout interval <10-1000000>
no spanning-tree errdisable-timeout interval
```

Parameter	Description
<10-1000000>	Specify the errdisable-timeout interval in seconds.

Default By default, the port is re-enabled after 300 seconds.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# spanning-tree errdisable-timeout interval 34
```

Related Commands

show spanning-tree
spanning-tree errdisable-timeout enable
spanning-tree portfast bpdu-guard

spanning-tree force-version

Use this command in Interface Configuration mode for a switch port interface only to force the protocol version for the switch port. Use this command for RSTP or MSTP only.

Syntax

```
spanning-tree force-version <version>
no spanning-tree force-version
```

Parameter	Description	
<version>	<0-3>	Version identifier.
	0	Forces the port to operate in STP mode.
	1	Not supported.
	2	Forces the port to operate in RSTP mode. If it receives STP BPDUs, it can automatically revert to STP mode.
	3	Forces the port to operate in MSTP mode (this option is only available if MSTP mode is configured). If it receives RSTP or STP BPDUs, it can automatically revert to RSTP or STP mode.

Default By default, no version is forced for the port. The port is in the spanning tree mode configured for the device, or a lower version if it automatically detects one.

Mode Interface Configuration mode for a switch port interface only.

Examples Set the value to enforce the spanning tree protocol (STP):

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree force-version 0
```

Set the default protocol version:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree force-version
```

Related Commands show spanning-tree

spanning-tree forward-time

Use this command to set the forward delay value. Use the **no** variant of this command to reset the forward delay value to the default setting of 15 seconds.

The **forward delay** sets the time (in seconds) to control how fast a port changes its spanning tree state when moving towards the forwarding state. If the mode is set to STP, the value determines how long the port stays in each of the listening and learning states which precede the forwarding state. If the mode is set to RSTP or MSTP, this value determines the maximum time taken to transition from discarding to learning and from learning to forwarding.

This value is used only when the switch is acting as the root bridge. Switches not acting as the Root Bridge use a dynamic value for the **forward delay** set by the root bridge. The **forward delay**, **max-age**, and **hello time** parameters are interrelated.

Syntax

```
spanning-tree forward-time <forward-delay>
no spanning-tree forward-time
```

Parameter	Description
<forward-delay	<4-30> The forwarding time delay in seconds.

Default The default is 15 seconds.

Mode Global Configuration

Usage The allowable range for forward-time is 4-30 seconds.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formulae, as specified in IEEE Standard 802.1d:

2 x (forward delay - 1.0 seconds) >= max-age

max-age >= 2 x (hello time + 1.0 seconds)

Example

```
awplus# configure terminal
awplus(config)# spanning-tree forward-time 6
```

Related Commands

show spanning-tree
spanning-tree forward-time <forward-delay>
spanning-tree hello-time <hello-time>
spanning-tree mode

spanning-tree guard root

Use this command in Interface Configuration mode for a switch port only to enable the Root Guard feature for the switch port. The root guard feature disables reception of superior BPDUs. You can use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to disable the root guard feature for the port.

Syntax

```
spanning-tree guard root
no spanning-tree guard root
```

Mode Interface Configuration mode for a switch port interface only.

Usage The Root Guard feature makes sure that the port on which it is enabled is a designated port. If the Root Guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP).

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree guard root
```

spanning-tree hello-time

Use this command to set the hello-time. This sets the time in seconds between the transmission of switch spanning tree configuration information when the switch is the Root Bridge of the spanning tree or is trying to become the Root Bridge.

Use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to restore the default of the hello time.

Syntax

```
spanning-tree hello-time <hello-time>
no spanning-tree hello-time
```

Parameter	Description
<hello-time>	<1-10> The hello BPDU interval in seconds.

Default Default is 2 seconds.

Mode Global Configuration and Interface Configuration for switch ports.

Usage The allowable range of values is 1-10 seconds.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formulae, as specified in IEEE Standard 802.1d:

2 x (**forward delay** - 1.0 seconds) >= **max-age**

max-age >= 2 x (**hello time** + 1.0 seconds)

Example

```
awplus# configure terminal
awplus(config)# spanning-tree hello-time 3
```

Related Commands

spanning-tree forward-time <forward-delay>
spanning-tree max-age <max-age>
show spanning-tree

spanning-tree link-type

Use this command in Interface Configuration mode for a switch port interface only to enable or disable point-to-point or shared link types on the switch port.

Use this command for RSTP or MSTP only.

Use the **no** variant of this command to return the port to the default link type.

Syntax

```
spanning-tree link-type {point-to-point|shared}
no spanning-tree link-type
```

Parameter	Description
`shared`	Disable rapid transition.
`point-to-point`	Enable rapid transition.

Default The default link type is point-to-point.

Mode Interface Configuration mode for a switch port interface only.

Usage You may want to set link type to shared if the port is connected to a hub with multiple switches connected to it.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# spanning-tree link-type point-to-point
```

spanning-tree max-age

Use this command to set the max-age. This sets the maximum age, in seconds, that dynamic spanning tree configuration information is stored in the switch before it is discarded.

Use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to restore the default of max-age.

Syntax

```
spanning-tree max-age <max-age>
no spanning-tree max-age
```

Parameter	Description
<max-age>	<6-40> The maximum time, in seconds.

Default The default of spanning-tree max-age is 20 seconds.

Mode Global Configuration

Usage Max-age is the maximum time in seconds for which a message is considered valid.

Configure this value sufficiently high, so that a frame generated by the root bridge can be propagated to the leaf nodes without exceeding the max-age.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formulae, as specified in IEEE Standard 802.1d:

2 x (forward delay - 1.0 seconds) >= max-age

max-age >= 2 x (hello time + 1.0 seconds)

Example

```
awplus# configure terminal
awplus(config)# spanning-tree max-age 12
```

Related Commands

show spanning-tree
spanning-tree forward-time <forward-delay>
spanning-tree hello-time <hello-time>

spanning-tree max-hops (MSTP)

Use this command to specify the maximum allowed hops for a BPDU in an MST region. This parameter is used by all the instances of the MST region.

Use the **no** variant of this command to restore the default.

Use this command for MSTP only.

Syntax

```
spanning-tree max-hops <hop-count>
no spanning-tree max-hops <hop-count>
```

Parameter	Description
<hop-count>	Specify the maximum hops the BPDU will be valid for in the range <1-40>.

Default The default max-hops in a MST region is 20.

Mode Global Configuration

Usage Specifying the max hops for a BPDU prevents the messages from looping indefinitely in the network. The hop count is decremented by each receiving port. When a switch receives an MST BPDU that has a hop count of zero, it discards the BPDU.

Examples

```
awplus# configure terminal
awplus(config)# spanning-tree max-hops 25

awplus# configure terminal
awplus(config)# no spanning-tree max-hops
```

spanning-tree mode

Use this command to change the spanning tree protocol mode on the switch. The spanning tree protocol mode on the switch can be configured to either STP, RSTP or MSTP.

Syntax `spanning-tree mode {stp|rstp|mstp}`

Default The default spanning tree protocol mode on the switch is RSTP.

Mode Global Configuration

Usage With no configuration, the switch will have spanning tree enabled, and the spanning tree mode will be set to RSTP. Use this command to change the spanning tree protocol mode on the device. MSTP is VLAN aware, but RSTP and STP are not VLAN aware. To enable or disable spanning tree operation, see the **spanning-tree enable** command on page 21.41.

Examples To change the spanning tree mode from the default of RSTP to MSTP, use the following commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mode mstp
```

Related Commands **spanning-tree enable**

spanning-tree mst configuration

Use this command to enter the MST Configuration mode to configure the Multiple Spanning-Tree Protocol.

Syntax `spanning-tree mst configuration`

Mode Global Configuration

Examples The following example uses this command to enter MST Configuration mode. Note the change in the command prompt.

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)#
```

spanning-tree mst instance

Use this command in Interface Configuration mode to assign a Multiple Spanning Tree instance (MSTI) to a switch port or channel group.

Note that ports are automatically configured to send and receive spanning-tree information for the associated MSTI when VLANs are assigned to MSTIs using the **instance vlan (MSTP)** command.

Use the **no** variant of this command in Interface Configuration mode to remove the MSTI from the specified switch port or channel group.

Syntax

```
spanning-tree mst instance <instance-id>
no spanning-tree mst instance <instance-id>
```

Parameter	Description
<instance-id>	<1-15> Specify the MST instance ID. The MST instance must have already been created using the **instance vlan (MSTP)** command.

Default A port automatically becomes a member of an MSTI when it is assigned to a VLAN.

Mode Interface Configuration mode for a switch port or channel group.

Usage You can disable automatic configuration of member ports of a VLAN to an associated MSTI by using a **no spanning-tree mst instance** command to remove the member port from the MSTI. Use the **spanning-tree mst instance** command to add a VLAN member port back to the MSTI.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3

awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
```

Related Commands

instance vlan (MSTP)
spanning-tree mst instance path-cost
spanning-tree mst instance priority
spanning-tree mst instance restricted-role
spanning-tree mst instance restricted-tcn

spanning-tree mst instance path-cost

Use this command in Interface Configuration mode for a switch port interface only to set the cost of a path associated with a switch port, for the specified MSTI (Multiple Spanning Tree Instance) identifier.

This specifies the switch port's contribution to the cost of a path to the MSTI regional root via that port. This applies when the port is the root port for the MSTI.

Use the **no** variant of this command to restore the default cost value of the path.

Syntax

```
spanning-tree mst instance <instance-id> path-cost <path-cost>
no spanning-tree mst instance <instance-id> path-cost
```

Parameter	Description
<instance-id>	Specify the MSTI identifier in the range <1-15>.
<path-cost>	Specify the cost of path in the range of <1-200000000>, where a lower path-cost indicates a greater likelihood of the specific interface becoming a root.

Default The default path cost values and the range of recommended path cost values depend on the port speed, as shown in the following table from the IEEE 802.1q-2003 standard.

Port speed	Default path cost	Recommended path cost range
Less than 100 Kb/s	200,000,000	20,000,000-200,000,000
1Mbps	20,000,000	2,000,000-20,000,000
10Mbps	2,000,000	200,000-2,000,000
100 Mbps	200,000	20,000-200,000
1 Gbps	20,000	2,000-20,000
10 Gbps	2,000	200-2, 000
100 Gbps	200	20-200
1Tbps	20	2-200
10 Tbps	2	2-20

Mode Interface Configuration mode for a switch port interface only.

Usage Before you can use this command to set a path-cost in a VLAN configuration, you must explicitly add an MST instance to a port using the `spanning-tree instance` command.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 path-cost 1000

awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3 path-cost
```

Related Commands

instance vlan (MSTP)
spanning-tree mst instance
spanning-tree mst instance priority
spanning-tree mst instance restricted-role
spanning-tree mst instance restricted-tcn

spanning-tree mst instance priority

Use this command in Interface Configuration mode for a switch port interface only to set the port priority for an MST instance (MSTI).

Use the **no** variant of this command to restore the default priority value (128).

Syntax

```
spanning-tree mst instance <instance-id> priority <priority>
no spanning-tree mst instance <instance-id> [priority]
```

Parameter	Description
<instance-id>	Specify the MSTI identifier in the range <1-15>.
<priority>	This must be a multiple of 16 and within the range <0-240>. A lower priority indicates greater likelihood of the port becoming the root port.

Default The default is 128.

Mode Interface Configuration mode for a switch port interface.

Usage This command sets the value of the priority field contained in the port identifier. The MST algorithm uses the port priority when determining the root port for the switch in the MSTI. The port with the lowest value is considered to have the highest priority and will be chosen as root port over a port - equivalent in all other aspects - but with a higher priority value.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 priority 112

awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3 priority
```

Related Commands

instance vlan (MSTP)
spanning-tree priority (port priority)
spanning-tree mst instance
spanning-tree mst instance path-cost
spanning-tree mst instance restricted-role
spanning-tree mst instance restricted-tcn

spanning-tree mst instance restricted-role

Use this command in Interface Configuration mode for a switch port interface only to enable the restricted role for an MSTI (Multiple Spanning Tree Instance) on a switch port. Configuring the restricted role for an MSTI on a switch port prevents the switch port from becoming the root port in a spanning tree topology.

Use the **no** variant of this command to disable the restricted role for an MSTI on a switch port. Removing the restricted role for an MSTI on a switch port allows the switch port to become the root port in a spanning tree topology.

Syntax

```
spanning-tree mst instance <instance-id> restricted-role
no spanning-tree mst instance <instance-id> restricted-role
```

Parameter	Description
<instance-id>	<1-15> Specify the MST instance ID. The MST instance must have already been created using the **instance vlan (MSTP)** command.

Default The restricted role for an MSTI instance on a switch port is disabled by default.

Mode Interface Configuration mode for a switch port interface only.

Usage The root port is the port providing the best path from the bridge to the root bridge. Use this command to disable a port from becoming a root port. Use the **no** variant of this command to enable a port to become a root port. See **Spanning tree operation** for root port information.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3
restricted-role

awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
restricted-role
```

Related Commands

instance vlan (MSTP)
spanning-tree priority (port priority)
spanning-tree mst instance
spanning-tree mst instance path-cost
spanning-tree mst instance restricted-tcn

spanning-tree mst instance restricted-tcn

Use this command in Interface Configuration mode for a switch port interface only to set the restricted TCN (Topology Change Notification) value to TRUE for the specified MSTI (Multiple Spanning Tree Instance).

Use the **no** variant of this command in Interface Configuration mode to reset the restricted TCN for the specified MSTI to the default value of FALSE.

Syntax

```
spanning-tree mst instance <instance-id> restricted-tcn
no spanning-tree mst instance <instance-id> restricted-tcn
```

Parameter	Description
<instance-id>	<1-15> Specify the MST instance ID. The MST instance must have already been created using the **instance vlan (MSTP)** command.

Default The default value for restricted TCNs is FALSE, as reset with the **no** variant of this command.

Mode Interface Configuration mode for a switch port interface only.

Usage A Topology Change Notification (TCN) is a simple Bridge Protocol Data Unit (BPDU) that a bridge sends out to its root port to signal a topology change. You can configure restricted TCN between TRUE and FALSE values with this command and the **no** variant of this command.

If you configure restricted TCN to TRUE with this command then this stops the switch port from propagating received topology change notifications and topology changes to other switch ports.

If you configure restricted TCN to FALSE with the **no** variant of this command then this enables the switch port to propagate received topology change notifications and topology changes to other switch ports.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 restricted-tcn

awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
restricted-tcn
```

Related Commands

instance vlan (MSTP)
spanning-tree priority (port priority)
spanning-tree mst instance
spanning-tree mst instance path-cost
spanning-tree mst instance restricted-role

spanning-tree path-cost

Use this command in Interface Configuration mode for a switch port interface only to set the cost of a path for the specified port. This value then combines with others along the path to the root bridge in order to determine the total cost path value from the particular port, to the root bridge. The lower the numeric value, the higher the priority of the path. This applies when the port is the root port.

Use this command for RSTP, STP or MSTP. When MSTP mode is configured, this will apply to the port's path cost for the CIST.

Syntax

```
spanning-tree path-cost <pathcost>
no spanning-tree path-cost
```

Parameter	Description
<pathcost>	<1-200000000> The cost to be assigned to the port.

Default The default path cost values and the range of recommended path cost values depend on the port speed, as shown in the following table from the IEEE 802.1q-2003 and IEEE 802.1d-2004 standards.

Port speed	Default path cost	Recommended path cost range
Less than 100 Kb/s	200,000,000	20,000,000-200,000,000
1Mbps	20,000,000	2,000,000-20,000,000
10Mbps	2,000,000	200,000-2,000,000
100 Mbps	200,000	20,000-200,000
1 Gbps	20,000	2,000-20,000
10 Gbps	2,000	200-2, 000
100 Gbps	200	20-200
1Tbps	20	2-200
10 Tbps	2	2-20

Mode Interface Configuration mode for switch port interface only.

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree path-cost 123
```

spanning-tree portfast (STP)

Use this command in Interface Configuration mode for a switch port interface only to set a port as an edge-port. The portfast feature enables a port to rapidly move to the forwarding state, without having first to pass through the intermediate spanning tree states. This command has the same effect as the **spanning-tree edgeport (RSTP and MSTP)** command, but the configuration displays differently in the output of some show commands.

Note

You can run either of two additional parameters with this command. To simplify the syntax these are documented as separate commands. See the following additional portfast commands:

- **spanning-tree portfast bpdu-filter** command on page 21.61
- **spanning-tree portfast bpdu-guard** command on page 21.63.

You can obtain the same effect by running the **spanning-tree edgeport (RSTP and MSTP)** command. However, the configuration output may display differently in some show commands.

Use the **no** variant of this command to set a port to its default state (not an edge-port).

Syntax

```
spanning-tree portfast

no spanning-tree portfast
```

Default Not an edge port.

Mode Interface Configuration mode for a switch port interface only.

Usage Portfast makes a port move from a blocking state to a forwarding state, bypassing both listening and learning states. The portfast feature is meant to be used for ports connected to end-user devices not switches. Enabling portfast on ports that are connected to a workstation or server allows devices to connect to the network without waiting for spanning-tree to converge.

For example, you may need hosts to receive a DHCP address quickly and waiting for STP to converge would cause the DHCP request to time out. Ensure you do not use portfast on any ports connected to another switch to avoid creating a spanning-tree loop on the network.

Use this command on a switch port that connects to a LAN with no other bridges attached. An edge port should never receive BPDUs. Therefore if an edge port receives a BPDU, the portfast feature takes one of three actions.

- Cease to act as an edge port and pass BPDUs as a member of a spanning tree network (**spanning-tree portfast (STP)** command disabled).
- Filter out the BPDUs and pass only the data and continue to act as a edge port (**spanning-tree portfast bpdu-filter** command enabled)
- Block the port to all BPDUs and data (**spanning-tree portfast bpdu-guard** command enabled).

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast
```

Related Commands

spanning-tree edgeport (RSTP and MSTP)
show spanning-tree
spanning-tree portfast bpdu-filter
spanning-tree portfast bpdu-guard

spanning-tree portfast bpdu-filter

This command sets the bpdu-filter feature and applies a filter to any BPDUs (Bridge Protocol Data Units) received. Enabling this feature ensures that configured ports will not transmit any BPDUs and will ignore (filter out) any BPDUs received. BPDU Filter is not enabled on a port by default.

Using the **no** variant of this command to turn off the bpdu-filter, but retain the port's status as an enabled port. If the port then receives a BPDU it will change its role from an **edge-port** to a **non edge-port**.

Syntax (Global Configuration)

```
spanning-tree portfast bpdu-filter

no spanning-tree portfast bpdu-filter
```

Syntax (Interface Configuration)

```
spanning-tree portfast bpdu-filter {default|disable|enable}

no spanning-tree portfast bpdu-filter
```

Parameter	Description	
`bpdu-filter`	A port that has bpdu-filter enabled will not transmit any BPDUs and will ignore any BPDUs received. This port type has one of the following parameters (in Interface Configuration mode):	
	`default`	Takes the setting that has been configured for the whole switch, i.e. the setting made from the Global configuration mode.
	`disable`	Turns off BPDU filter.
	`enable`	Turns on BPDU filter.

Default BPDU Filter is not enabled on any ports by default.

Mode Global Configuration and Interface Configuration

Usage This command filters the BPDUs and passes only data to continue to act as an edge port. Using this command in Global Configuration mode applies the portfast bpdu-filter feature to all ports on the switch. Using it in Interface mode applies the feature to a specific port, or range of ports.The command will operate in both RSTP and MSTP networks.

Use the **show spanning-tree** command to display status of the bpdu-filter parameter for the switch ports.

Example To enable STP BPDU filtering in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree portfast bpdu-filter
```

To enable STP BPDU filtering in Interface Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast bpdu-filter enable
```

Related Commands
spanning-tree edgeport (RSTP and MSTP)
show spanning-tree
spanning-tree portfast (STP)
spanning-tree portfast bpdu-guard

spanning-tree portfast bpdu-guard

This command applies a BPDU (Bridge Protocol Data Unit) guard to the port. A port with the bpdu-guard feature enabled will block all traffic (BPDUs and user data), if it starts receiving BPDUs.

Use this command in Global Configuration mode to apply BPDU guard to all ports on the switch. Use this command in Interface mode for an individual interface or a range of interfaces specified. BPDU Guard is not enabled on a port by default.

Use the **no** variant of this command to disable the BPDU Guard feature on a switch in Global Configuration mode or to disable the BPDU Guard feature on a port in Interface mode.

Syntax (Global Configuration)

```
spanning-tree portfast bpdu-guard
no spanning-tree portfast bpdu-guard
```

Syntax (Interface Configuration)

```
spanning-tree portfast bpdu-guard {default|disable|enable}
no spanning-tree portfast bpdu-guard
```

Parameter	Description	
`bpdu-guard`	A port that has bpdu-guard turned on will enter the STP blocking state if it receives a BPDU. This port type has one of the following parameters (in Interface Configuration mode):	
	`default`	Takes the setting that has been configured for the whole switch, i.e. the setting made from the Global configuration mode.
	`disable`	Turns off BPDU guard.
	`enable`	Turns on BPDU guard and will also set the port as an edge port.

Default BPDU Guard is not enabled on any ports by default.

Mode Global Configuration or Interface Configuration

Usage This command blocks the port(s) to all BPDUs and data when enabled. BPDU Guard is a port-security feature that changes how a portfast-enabled port behaves if it receives a BPDU. When **bpdu-guard** is set, then the port shuts down if it receives a BPDU. It does not process the BPDU as it is considered suspicious. When **bpdu-guard** is not set, then the port will negotiate spanning-tree with the device sending the BPDUs. By default, bpdu-guard is not enabled on a port.

You can configure a port disabled by the bpdu-guard to re-enable itself after a specific time interval. This interval is set with the **spanning-tree errdisable-timeout interval** command on page 21.43. If you do not use the **errdisable-timeout** feature, then you will need to manually re-enable the port by using the **no shutdown** command.

Use the **show spanning-tree** command on page 21.15 to display the switch and port configurations for the BPDU Guard feature. It shows both the administratively configured and currently running values of bpdu-guard.

Example To enable STP BPDU guard in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree portfast bpdu-guard
```

To enable STP BPDU guard in Interface Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast bpdu-guard enable
```

Related Commands
spanning-tree edgeport (RSTP and MSTP)
show spanning-tree
spanning-tree portfast (STP)
spanning-tree portfast bpdu-filter

spanning-tree priority (bridge priority)

Use this command to set the bridge priority for the switch. A lower priority value indicates a greater likelihood of the switch becoming the root bridge.

Use this command for RSTP, STP or MSTP. When MSTP mode is configured, this will apply to the CIST.

Use the **no** variant of this command to reset it to the default.

Syntax

```
spanning-tree priority <priority>
no spanning-tree priority
```

Parameter	Description
<priority>	<0-61440> The bridge priority, which will be rounded to a multiple of 4096.

Default The default priority is 32678.

Mode Global Configuration

Usage To force a particular switch to become the root bridge use a lower value than other switches in the spanning tree.

Example

```
awplus# configure terminal
awplus(config)# spanning-tree priority 4096
```

Related Commands **spanning-tree mst instance priority**
show spanning-tree

spanning-tree priority (port priority)

Use this command in Interface Configuration mode for a switch port interface only to set the port priority for port. A lower priority value indicates a greater likelihood of the port becoming part of the active topology.

Use this command for RSTP, STP, or MSTP. When the device is in MSTP mode, this will apply to the CIST.

Use the **no** variant of this command to reset it to the default.

Syntax

```
spanning-tree priority <priority>
no spanning-tree priority
```

Parameter	Description
<priority>	<0-240>, in increments of 16. The port priority, which will be rounded down to a multiple of 16.

Default The default priority is 128.

Mode Interface Configuration mode for a switch port interface only.

Usage To force a port to be part of the active topology (for instance, become the root port or a designated port) use a lower value than other ports on the device. (This behavior is subject to network topology, and more significant factors, such as bridge ID.)

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree priority 16
```

Related Commands

spanning-tree mst instance priority
spanning-tree priority (bridge priority)
show spanning-tree

spanning-tree restricted-role

Use this command in Interface Configuration mode for a switch port interface only to restrict the port from becoming a root port.

Use the **no** variant of this command to disable the restricted role functionality.

Syntax

```
spanning-tree restricted-role
no spanning-tree restricted-role
```

Default The restricted role is disabled.

Mode Interface Configuration mode for a switch port interface only.

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree restricted-role
```

spanning-tree restricted-tcn

Use this command in Interface Configuration mode for a switch port interface only to prevent TCN (Topology Change Notification) BPDUs (Bridge Protocol Data Units) from being sent on a port. If this command is enabled, after a topology change a bridge is prevented from sending a TCN to its designated bridge.

Use the **no** variant of this command to disable the restricted TCN functionality.

Syntax

```
spanning-tree restricted-tcn
no spanning-tree restricted-tcn
```

Default The restricted TCN is disabled.

Mode Interface Configuration mode for a switch port interface only.

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree restricted-tcn
```

spanning-tree transmit-holdcount

Use this command to set the maximum number of BPDU transmissions that are held back.

Use the **no** variant of this command to restore the default transmit hold-count value.

Syntax

```
spanning-tree transmit-holdcount
no spanning-tree transmit-holdcount
```

Default Transmit hold-count default is 3.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# spanning-tree transmit-holdcount
```

undebug mstp

This command applies the functionality of the **no debug mstp (RSTP and STP)** command.

Chapter 22: Link Aggregation Introduction and Configuration

Introduction and Overview

This chapter contains two sample Link Aggregation Control Protocol (LACP), or dynamic channel group, configurations and a sample static channel group configuration.

Link aggregation is the process where two or more ports in an Ethernet switch are combined together to operate as a single virtual port.

Link aggregation is a key component in resilient network design, since it increases the available bandwidth between network devices and it provides continuity of connectivity if one link is broken between network devices.

By aggregating two or more links together, you can increase the bandwidth between neighboring devices since this is effectively additive, where two links give up to twice the bandwidth of one link. Having more than one link to a neighboring device provides connectivity if one of the links break, where a feature of this resiliency is the speed at which link aggregation reacts to the change of link status in a matter of millisecond.

A link aggregation can only exist between a pair of neighboring switches, where the switch ports that are aggregated on one switch cannot be connected to switch ports that are not aggregated on the other switch. A switch can have multiple link aggregations to different neighbors, even to the same neighbor if the network is loop protected.

To see details about the commands used to configure dynamic (LACP) and static Link aggregation, see **Chapter 23, Link Aggregation Commands**.

For a brief overview of static and dynamic link aggregation (LACP), see **Static and Dynamic (LACP) Link Aggregation**.

Static and Dynamic (LACP) Link Aggregation

Channels, either static or dynamic LACP, increase reliability by distributing the data path over more than one physical link. Channels must be configured on both ends of a link or network loops may result. Ports in a channel group need not be contiguous. A mirror port cannot be a member of either a static or a dynamic channel group.

Aggregation criteria

For individual links to be aggregated into a channel group they must:

- originate on the same device or stack
- terminate on the same device or stack
- be members of the same VLANs (**vlan** command on page 19.35)
- have the same data rate (**speed** command on page 17.50)
- share the same admin port key (assigned by using the **channel-group** command on page 23.4 command)
- be operating in full duplex mode (**duplex** command on page 17.11)

The hardware must also be capable and have the capacity to handle the number of links to be aggregated.

Static Channel Groups

A static channel group, also known as a static aggregator, enables a number of ports to be manually configured to form a single logical connection of higher bandwidth. By using static channel groups you increase channel reliability by distributing the data path over more than one physical link. Static channel groups are best used in simpler environments, usually where neighbor switches are close together, situated within the same rack, so that you can easily ensure that the correct statically aggregated ports are connected together.

For a static channel group configuration example see the **Configuring a Static Channel Group** section in this chapter. For details of static channel group commands, such as the **static-channel-group** command, see **Chapter 23, Link Aggregation Commands**.

Dynamic (LACP) Channel Groups

A LACP channel group, also known as an etherchannel, a LACP aggregator, or a dynamic channel group, enables a number of ports to be dynamically combined to form a single higher bandwidth logical connection. LACP channel groups are best used for complex environments, typically long-distance links, to detect failure between neighbor switches.

For LACP configuration examples see **Configuring an LACP Channel Group** and **Minimal LACP Group Configuration** sections in this chapter. For details of LACP channel group commands, such as the **channel-group** command, see **Chapter 23, Link Aggregation Commands**.

Link Aggregation Control Protocol (LACP)

LACP is based on the IEEE Standard 802.3ad. It allows bundling of several physical ports to form a single logical channel providing enhanced performance and resiliency. The aggregated channel is viewed as a single link by each switch. Spanning tree also views the channel as one interface and not as multiple interfaces. When there is a failure in one physical port, the other ports stay up and there is no disruption.

This device supports the aggregation of a maximum of eight physical ports into a single channel group.

Note

AlliedWare Plus™ supports IEEE 802.3ad link aggregation and uses the Link Aggregation Control Protocol (LACP). LACP does not interoperate with devices that use Port Aggregation Protocol (PAgP).

Note

Link aggregation does not necessarily achieve exact load balancing across the links. The load sharing algorithm is designed to ensure that any given data flow always goes down the same link. It also aims to spread data flows across the links as evenly as possible.

Link aggregation hashes the source and destination MAC address, IP address and UDP/TCP ports to select a link on which to send a packet. So packet flow between a pair of hosts always takes the same link inside the Link Aggregation Group (LAG). The net effect is that the bandwidth for a given packet stream is restricted to the speed of one link in the LAG.

For example, for a 2 Gbps LAG that is a combination of two 1 Gbps ports, one flow of traffic can only ever reach a maximum throughput of 1 Gbps. However, the hashing algorithm should spread the flows across the links so that when many flows are operating, the full 2 Gbps can be utilized.

For information about load balancing see the **platform load-balancing** command

LACP operates where systems are connected over multiple communications links. Once LACP has been initially configured and enabled, it automatically aggregates the ports that have been assigned to a channel group, if possible. LACP continues to monitor these groups and dynamically adds or removes links to them as network changes occur.

LACP achieves this by determining:

- which ports are under LACP control (**channel-group** command on page 23.4)
- whether each port is in LACP active or LACP passive mode (**channel-group** command on page 23.4)
- which system has the highest LACP priority (**lacp system-priority** command on page 23.7)
- the LACP priority of ports (**lacp port-priority** command on page 23.7)
- whether the LACP timeout is short or long (**lacp timeout** command on page 23.8)

Channel group identification

In order to identify particular channel groups, each group is assigned a link aggregation identifier called a **lag ID**. The lag ID comprises the following components for both the local system (called the Actor) followed by their equivalent components for the remote system (called the Partner):

- system identifier - the MAC address of the system
- port key - An identifier - created by the LACP software
- port priority - set by the **lacp port-priority** command on page 23.7
- port number - determined by the device connection

The lag ID can be displayed for each aggregated link by entering the **show etherchannel** command on page 23.11.

Configuring an LACP Channel Group

The following example shows how to configure three links between two Allied Telesis managed Layer 3 Switches. The three links are assigned the same administrative key (1), so that they aggregate to form a single channel (1). They are viewed by the STP as one interface.

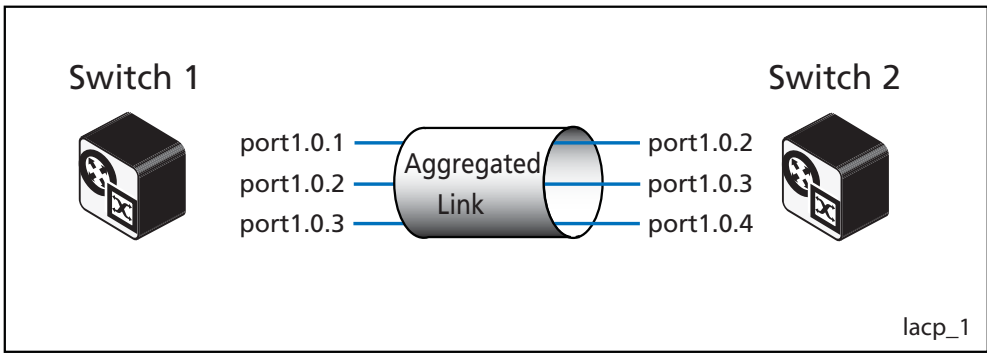

Table 22-1: Switch 1 configuration

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `lacp system-priority 20000`	Set the system priority of this switch. This priority is used to determine which switch in the system is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority. Switch 1 has a higher priority than Switch 2 in this configuration.
`awplus(config)#` `interface port1.0.1`	Enter the Interface Configuration mode to configure port `1.0.1`.
`awplus(config-if)#` `channel-group 1 mode active`	Add this interface to a channel group `1` and enable link aggregation so that it may be selected for aggregation by the local system.
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to the Global Configure mode.
`awplus(config)#` `interface port1.0.2`	Enter the Interface Configuration mode to configure port `1.0.2`.
`awplus(config-if)#` `channel-group 1 mode active`	Add this interface to a channel group `1` and enable link aggregation so that it may be selected for aggregation by the local system.

Table 22-1: Switch 1 configuration (cont.)

`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to the Global Configure mode.
`awplus(config)#` `interface port1.0.3`	Enter the Interface Configuration mode to configure port `1.0.3`.
`awplus(config-if)#` `channel-group 1 mode active`	Add this interface to a channel group `1` and enable link aggregation so that it may be selected for aggregation by the local system.
`awplus(config-if)#` `interface po1`	Select the dynamic aggregator logical interface created for channel-group 1 named `po1`.

Table 22-2: Switch 2 configuration

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `lacp system-priority 3000`	Set the system priority of this switch. This priority is used to determine which switch in the system is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority. Switch 2 has a lower priority than Switch 1 in this configuration.
`awplus(config)#` `interface port1.0.2`	Enter the Interface Configuration mode to configure port `1.0.2`.
`awplus(config-if)#` `channel-group 1 mode active`	Add this interface to a channel group `1` and enable link aggregation so that it may be selected for aggregation by the local system.
`awplus(config-if)#` `exit`	Exit the Interface mode and return to the Configure mode.
`awplus(config)#` `interface port1.0.3`	Enter the Interface mode to configure port `1.0.3`.
`awplus(config-if)#` `channel-group 1 mode active`	Add this interface to a channel group `1` and enable link aggregation so that it may be selected for aggregation by the local system.

Table 22-2: Switch 2 configuration

`awplus(config-if)#`	
`exit`	Exit the Interface Configuration mode and return to the Global Configuration mode.
`awplus(config)#`	
`interface port1.0.4`	Enter the Interface Configuration mode to configure port `1.0.4`.
`awplus(config-if)#`	
`channel-group 1 mode active`	Add this interface to a channel group `1` and enable link aggregation so that it may be selected for aggregation by the local system.
`awplus(config-if)#`	
`interface po1`	Select the dynamic aggregator logical interface created for channel-group 1 named `po1`.

Commands Used

lacp system-priority
channel-group

Validation Commands

show lacp sys-id
show port etherchannel
show etherchannel
show etherchannel detail

Minimal LACP Group Configuration

For details of LACP channel group commands, see **Chapter 23, Link Aggregation Commands**.

The following minimal LACP group configuration example creates LACP channel group 2 and enables link aggregation on switch ports `1.0.1` and `1.0.2` within this channel group. Note that all aggregated ports must belong to the same VLAN.

`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `interface port1.0.1-port1.0.2`	Enter the Interface Configuration mode for the switch ports to aggregate into the channel group.
`awplus(config-if)#` `channel-group 2 mode active`	Assign the switch ports to channel group `2` in active mode. This creates the channel group.
`awplus(config-if)#` `interface po2`	Select the dynamic aggregator logical interface created for channel-group 2 named `po2`.

Commands Used **channel-group**

Validation Commands **show static-channel-group**

Configuring a Static Channel Group

For details of LACP channel group commands, see **Chapter 23, Link Aggregation Commands**.

The following example creates a static channel group and adds switch ports `1.0.1` and `1.0.2`.

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `interface port1.0.1`	Enter the Interface Configuration mode to configure port `1.0.1`.
`awplus(config-if)#` `static-channel-group 2`	Add port `1.0.1` to static-channel-group `2`.
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `interface port1.0.2`	Enter the Interface Configuration mode to configure port `1.0.2`.
`awplus(config-if)#` `static-channel-group 2`	Add port `1.0.2` to static-channel-group `2`.
`awplus(config-if)#` `interface sa2`	Select the static aggregator logical interface created for static-channel-group 2 named `sa2`.

Commands Used **static-channel-group**

Validation Commands **show static-channel-group**

Chapter 23: Link Aggregation Commands

Introduction

This chapter provides an alphabetical reference of commands used to configure a static channel group (static aggregator) and dynamic channel group (LACP channel group, etherchannel or LACP aggregator). Link aggregation is also sometimes referred to as channelling.

Note

AlliedWare Plus™ supports IEEE 802.3ad link aggregation and uses the Link Aggregation Control Protocol (LACP). LACP does not interoperate with devices that use Port Aggregation Protocol (PAgP).

Note

LACP does not perform load balancing. The LACP algorithm is based on the packet flow. Link aggregation (LAG) hashes the source and destination MAC address, IP address and UDP/TCP ports to select a port on which to send a packet. So packet flow between a pair of hosts always takes the same port inside the LAG. The net effect is that the bandwidth for one packet stream is restricted to the speed of one link in the LAG. For example, for a 2 Gbps LAG that is a combination of two 1 Gbps ports, one flow of traffic can only ever reach a maximum throughput of 1 Gbps.

For information about load balancing see the **platform load-balancing** command on page 17.25 command.

For a description of static and dynamic link aggregation (LACP), see **"Configuring an LACP Channel Group" on page 22.5**. For an LACP configuration example, see **Chapter 22, Link Aggregation Introduction and Configuration**.

Command List

clear lacp counters

Use this command to clear all counters of all present LACP aggregators (channel groups) or a given LACP aggregator.

Syntax `clear lacp [<1-32>] counters`

Parameter	Description
<1-32>	Channel-group number.

Mode Privileged Exec

Example

```
awplus# clear lacp 2 counters
```

channel-group

Use this command to add the switch port to a dynamic channel group specified by the dynamic channel group number, and set its mode. This command enables LACP link aggregation on the switch port, so that it may be selected for aggregation by the local system. Dynamic channel groups are also known as LACP channel groups, LACP aggregators or etherchannels.

You can create up to 32 dynamic (LACP) channel groups (and up to 96 static channel groups).

Use the **no** variant of this command to turn off link aggregation on the switch port. You will be returned to Global Configuration mode from Interface Configuration mode.

Syntax

```
channel-group <dynamic-channel-group-number> mode {active|passive}
no channel-group
```

Parameter	Description
<dynamic-channel-group-number>	<1-32> Specify a dynamic channel group number for an LACP link. A maximum of 32 combined dynamic and static channel groups is supported with the base license. The optional LAG-128 feature licence extends the maximum number of combined dynamic and static channel groups supported to 128 with up to 32 dynamic channel groups and up to 96 static channel groups.
active	Enables initiation of LACP negotiation on a port. The port will transmit LACP dialogue messages whether or not it receives them from the partner system.
passive	Disables initiation of LACP negotiation on a port. The port will only transmit LACP dialogue messages if the partner systems is transmitting them, i.e. the partner is in the active mode.

Mode Interface Configuration

Usage All the switch ports in a channel-group must belong to the same VLANs, have the same tagging status, and can only be operated on as a group. All switch ports within a channel group must have the same port speed and be in full duplex mode.

Once the LACP channel group has been created, it is treated as a switch port, and can be referred to in most other commands that apply to switch ports.

To refer to an LACP channel group in other LACP commands, use the channel group number. To specify an LACP channel group (LACP aggregator) in other commands, prefix the channel group number with **po**. For example, 'po4' refers to the LACP channel group with channel group number 4.

For more on LACP, see **"Dynamic (LACP) Channel Groups" on page 22.3** and **Chapter 22, Link Aggregation Introduction and Configuration**.

Examples To add switch `port1.0.10` to a newly created LACP channel group 4 use the commands below:

```
awplus# configure terminal
awplus(config)# interface port1.0.10
awplus(config-if)# channel-group 4 mode active
```

To remove switch `port1.0.8` from any created LACP channel groups use the command below:

```
awplus# configure terminal
awplus(config)# interface port1.0.8
awplus(config-if)# no channel-group
awplus(config)#
```

To reference the pre-defined LACP channel group 2 as an interface, apply commands as below:

```
awplus# configure terminal
awplus(config)# interface port1.0.8
awplus(config-if)# channel-group 2 mode active
awplus(config-if)# exit
awplus(config)# interface port.1.0.10
awplus(config-if)# channel-group 2 mode active
awplus(config-if)# exit
awplus(config)# interface po2
awplus(config-if)#
```

Related Commands

debug lacp

Use this command to enable all LACP troubleshooting functions.

Use the **no** variant of this command to disable this function.

Syntax

```
debug lacp {all|cli|event|ha|packet|sync|timer[detail]}
no debug lacp {all|cli|event|ha|packet|sync|timer[detail]}
```

Parameter	Description
`all`	Turn on all debugging for LACP.
`cli`	Specifies debugging for CLI messages. Echoes commands to the console.
`event`	Specifies debugging for LACP events. Echoes events to the console.
`ha`	Specifies debugging for HA (High Availability) events. Echoes High Availability events to the console.
`packet`	Specifies debugging for LACP packets. Echoes packet contents to the console.
`sync`	Specified debugging for LACP synchronization. Echoes synchronization to the console.
`timer`	Specifies debugging for LACP timer. Echoes timer expiry to the console.
`detail`	Optional parameter for LACP timer-detail. Echoes timer start/stop details to the console.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# debug lacp timer detail
awplus# debug lacp all
```

Related Commands **show debugging lacp**
undebug lacp

lacp port-priority

Use this command to set the priority of a switch port. Ports are selected for aggregation based on their priority, with the higher priority (numerically lower) ports selected first.

Use the **no** variant of this command to reset the priority of port to the default.

Syntax

```
lacp port-priority <1-65535>
no lacp port-priority
```

Parameter	Description
<1-65535>	Specify the LACP port priority.

Default The default is 32768.

Mode Interface Configuration

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.5
awplus(config-if)# lacp port-priority 34
```

lacp system-priority

Use this command to set the system priority of a local system. This is used in determining the system responsible for resolving conflicts in the choice of aggregation groups.

Use the **no** variant of this command to reset the system priority of the local system to the default.

Syntax

```
lacp system-priority <1-65535>
no lacp system-priority
```

Parameter	Description
<1-65535>	LACP system priority. Lower numerical values have higher priorities.

Default The default is 32768.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# lacp system-priority 6700
```

lacp timeout

Use this command to set the short or long timeout on a port. Ports will time out of the aggregation if three consecutive updates are lost.

Syntax `lacp timeout {short|long}`

Parameter	Description
`timeout`	Number of seconds before invalidating a received LACP data unit (DU).
`short`	LACP short timeout. The **short** timeout value is **1** second.
`long`	LACP long timeout. The **long** timeout value is **30** seconds.

Default The default is **long** timeout (30 seconds).

Mode Interface Configuration

Usage This command enables the switch to indicate the rate at which it expects to receive LACPDUs from its neighbor.

If the timeout is set to **long**, then the switch expects to receive an update every **30** seconds, and this will time a port out of the aggregation if no updates are seen for 90 seconds (i.e. 3 consecutive updates are lost).

If the timeout is set to **short**, then the switch expects to receive an update every second, and this will time a port a port out of the aggregation if no updates are seen for 3 seconds (i.e. 3 consecutive updates are lost).

The switch indicates its preference by means of the '`Timeout`' field in the '`Actor`' section of its LACPDUs. If the '`Timeout`' field is set to 1, then the switch has set the **short** timeout. If the '`Timeout`' field is set to 0, then the switch has set the **long** timeout.

Setting the **short** timeout enables the switch to be more responsive to communication failure on a link, and does not add too much processing overhead to the switch (1 packet per second).

Note 
It is not possible to configure the rate that the switch sends LACPDUs; the switch must send at the rate which the neighbor indicates it expects to receive LACPDUs.

Examples The following commands set the LACP long timeout period for 30 seconds on `port1.0.2`.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# lacp timeout long
```

The following commands set the LACP short timeout for 1 second on `port1.0.2`.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# lacp timeout short
```

show debugging lacp

Use this command to display the LACP debugging option set.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show debugging lacp`

Mode User Exec and Privileged Exec

Example

```
awplus# show debugging lacp
```

Output **Figure 23-1: Example output from the show debugging lacp command**

```
LACP debugging status:
 LACP timer debugging is on
 LACP timer-detail debugging is on
 LACP cli debugging is on
 LACP packet debugging is on
 LACP event debugging is on
 LACP sync debugging is on
```

Related Commands **show tech-support**

show etherchannel

Use this command to display information about a LACP channel specified by the channel group number.

The command output also shows the thrash limiting status. If thrash limiting is detected and the **thrash limiting** parameter of the **thrash-limiting** command on page 17.56 is set to **vlan disable**, the output will also show the VLANs on which thrashing is detected.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show etherchannel [<1-32>]`

Parameter	Description
<1-32>	Channel-group number.

Mode User Exec and Privileged Exec

Example

```
awplus# show etherchannel 5
```

Output **Figure 23-3: Example output from the show etherchannel command**

```
% Lacp Aggregator: po1
 Thrash-limiting
 Status Vlan Thrashing Detected, Action vlan-disable 60(s)
 Thrashing Vlans 1 2 3 4 5
% Member:
   port1.0.4
   port1.0.8
```

show etherchannel detail

Use this command to display detailed information about all LACP channels.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show etherchannel detail`

Mode User Exec and Privileged Exec

Example

```
awplus# show etherchannel detail
```

Output **Figure 23-4: Example output from the show etherchannel detail command**

```
% Aggregator po1 (4501)
%  Mac address: 00:00:cd:24:fd:29
%  Admin Key: 0001 - Oper Key 0001
%  Receive link count: 1 - Transmit link count: 0
%  Individual: 0 - Ready: 1
%  Partner LAG: 0x8000,00-00-cd-24-da-a7

```

show etherchannel summary

Use this command to display a summary of all LACP channels.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show etherchannel summary`

Mode User Exec and Privileged Exec

Example

```
awplus# show etherchannel summary
```

Output **Figure 23-5: Example output from the show etherchannel summary command**

```
% Aggregator po1
%  Admin Key: 0001 - Oper Key 0001
%   Link: port1.0.1 (5001) disabled
%   Link: port1.0.2 (5002) sync: 1
% Aggregator po2
%  Admin Key: 0002 - Oper Key 0002
%   Link: port1.0.7 (5007) disabled
```

show lacp-counter

Use this command to display the packet traffic on all ports of all present LACP aggregators, or a given LACP aggregator.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show lacp-counter [<1-32>]`

Parameter	Description
<1-32>	Channel-group number.

Mode User Exec and Privileged Exec

Example

```
awplus# show lacp-counter 2
```

Output **Figure 23-6: Example output from the show lacp-counter command**

```
% Traffic statistics

% System Priority: 0x8000 (32768)
% MAC Address: 00-00-cd-24-fd-29
```

show port etherchannel

Use this command to show LACP details of the switch port specified.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax

```
show port etherchannel <port>
```

Parameter	Description
<port>	Name of the switch port to display LACP information about.

Mode User Exec and Privileged Exec

Example

```
awplus# show port etherchannel port1.0.1
```

Output **Figure 23-8: Example output from the show port etherchannel command**

```
% Aggregator: po1 (4501)

```

show static-channel-group

Use this command to display all configured static channel groups and their corresponding member ports. Note that a static channel group is the same as a static aggregator.

The command output also shows the thrash limiting status. If thrash limiting is detected and the **thrash limiting** parameter of the **thrash-limiting** command on page 17.56 is set to **vlan disable**, the output will also show the VLANs on which thrashing is detected.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show static-channel-group
```

Mode

User Exec and Privileged Exec

Example

```
awplus#  show static-channel-group
```

Output

Figure 23-9: Example output from the show static-channel-group command

```
% LAG Maximum        : 128
% LAG Static  Maximum: 96
% LAG Dynamic Maximum: 32
% LAG Static  Count  : 2
% LAG Dynamic Count  : 2
% LAG Total   Count  : 4
% Static Aggregator: sa2
% Member:
   port1.0.1
% Static Aggregator: sa3
% Member:
   port1.0.2
```

Related Commands

static-channel-group

static-channel-group

Use this command to create a static channel group, also known as a static aggregator, or add a member port to an existing static channel group.

Use the **no** variant of this command to remove the switch port from the static channel group.

Syntax

```
static-channel-group <static-channel-group-number>
no static-channel-group
```

Parameter	Description
<static-channel-group-number>	<1-96> Static channel group number.

Mode Interface Configuration

Usage This command adds the switch port to the static channel group with the specified channel group number. If the channel group does not exist, it is created, and the port is added to it. The **no** prefix detaches the port from the static channel group. If the port is the last member to be removed, the static channel group is deleted.

All the ports in a channel group must have the same VLAN configuration: they must belong to the same VLANs and have the same tagging status, and can only be operated on as a group.

Once the static channel group has been created, it is treated as a switch port, and can be referred to in other commands that apply to switch ports.

To refer to a static channel group in other static channel group commands, use the channel group number. To specify a static channel group in other commands, prefix the channel group number with **sa**. For example, 'sa3' refers to the static channel group with channel group number 3.

For more on static channel groups, see **"Static Channel Groups" on page 22.3** and **Chapter 22, Link Aggregation Introduction and Configuration**.

Examples To define a static channel group on a switch port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# static-channel-group 3
```

To reference the pre-defined static channel group 2 as an interface apply the example commands as below:

```
awplus# configure terminal
awplus(config)# interface port1.0.8
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface port.1.0.10
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface sa2
awplus(config-if)#
```

Related Commands **show static-channel-group**

undebug lacp

This command applies the functionality of the **no debug lacp** command on page 23.6.

Chapter 24: Power over Ethernet Introduction

Introduction

This chapter provides an introduction to Power over Ethernet (PoE) technology, the PoE standards, PoE devices, and how to configure PoE on your switch. The following x510 Series switches are PoE capable: x510-52GPX, x510-28GPX. For information about the PoE commands available on your switch, see **Chapter 25, Power over Ethernet Commands**.

PoE is a method of supplying power to network devices by utilizing the same cabling used to carry network traffic. PoE is appropriate for devices that have a low power consumption (termed Powered Devices) such as IP phones and security cameras etc. A number of standards have been created to define PoE connectivity. Two PoE standards are presently defined by the Institute of Electrical and Electronics Engineers (IEEE), these are: IEEE 802.3af and IEEE 802.3at.

In addition to the formal PoE methods defined by the IEEE, there are also legacy industry methods for supplying power over Ethernet cabling. For details of legacy support see the command, **power-inline allow-legacy** command on page 25.5.

PoE standards

PoE is formally defined by the following standards: **formal** (defined by the IEEE), and **de-facto** (industry developed):

- IEEE 802.3af Power Ethernet standard
  - « Approved 2003.
  - « Supplies 15.94 W of power of which 12.95 W is available to each powered device.
  - « Superceded by IEEE IEEE802.3at.
  - « Fully supported on the x510-52GPX and x510-28GPX switches

For more information on this standard, refer to **"PoE (IEEE 802.3af)" on page 24.3**.

- Enhanced PoE
  - « Industry standard introduced after the IEEE 802.af. It provides more power (20 W) than defined by IEEE 802.3.af but less than the power (30 W) defined by IEEE 802.3.at.
  - « Compliance with this method is provided on the x510-52GPX and x510-28GPX switches on a best effort basis.
  - « For more information on this standard, refer to **"Enhanced PoE" on page 24.4**.
- IEEE 802.3at Power Ethernet standard (commonly known as PoE+)
  - « Approved 2009.
  - « Supplies 30 W of power of which 25.5 W is available to each powered device.
  - « For more information on this method, refer to **"PoE+ (IEEE 802.3at)" on page 24.4**.
  - « Fully supported on the x510-52GPX and x510-28GPX switches.

PoE (all standards)

The general objective that is common to all PoE methods described in this document is to distribute both data and cable over the same cabling that is used for transmitting Ethernet based data. This eliminates the need for having one set of cables and outlets for data, and another set for power. Also, because the voltage and power requirements are much lower than for mains powered devices, the cabling and installation costs are significantly reduced.

Power Sourcing Equipment (PSE) such as an Ethernet LAN switch or router, supplies power to the cable together with the data. **Powered Devices (PDs)** such as Wireless Access Points or an IP Phones, receive power and data over this same cabling. The PSE employs various methods of power classification (depending on the standard) for detecting compatible PDs from non-compatible devices and will only provide the maximum power limit to compatible PDs, based on their PoE device class. The PSE continuously monitors the PDs and stops providing power when it is no longer requested or it detects an overload or short circuit condition on a port.

PoE (IEEE 802.3af)

The IEEE 802.3at-2003 standard specifies how power is distributed along with data on twisted pair Ethernet LAN cables. The standard specifies that the PSE is able to supply up to 15.4 watts (W) of power (at a nominal 48 VDC), with the full 100 m cable length, is then able to utilise 12.95 W. The difference between these power levels (15.4 -12.98) allows for power loss within the cabling. This figure is approximate and will vary with the cable length and quality. The IEEE 802.3af physical layer classification is a static power allocation based on power bands for power management.

Enhanced PoE

Enhanced was developed prior to IEEE802.3at standard to provide more power the PDs than was currently offered by the old 802.3af standard. Enhanced PoE supplied between 15.4 W and 20 W per port at 48 VDC. Typically, these PD would be used for applications such as building security and video surveillance. Note that IEEE 802.3at standard PoE+ PDs that require 56 VDC cannot use Enhanced PoE PSEs instead of IEEE 802.3at standard PoE+ PSEs. Enhanced PoE PSEs cannot replace IEEE 802.3at standard PSEs when using any PoE+ PDs.

PoE+ (IEEE 802.3at)

The IEEE 802.3at-2009 standard specifies how power is distributed together with data on twisted pair Ethernet LAN cables. PoE+ supplies the higher power required by a new generation of network attached devices. These devices, such as, multiple radio IEEE 802.11n wireless access points, powered pan tilt and zoom IP security cameras, thin clients, door locks, touch screen displays, and video phones frequently require more than the 12.9 W (at a nominal 54 VDC) available under the IEEE 802.3af standard. The IEEE 802.3at specification provides for up to 30 W of power at the PSE, of which 25.5 W is available to the PD.

The standard also requires that PDs support a flexible Layer 2 power classification method using Link Layer Discovery Protocol Media Endpoint Devices (LLDP-MED). The use of LLDP-MED for power classification provides PoE power allocation in steps of 1 watt, along with an ability to reallocate power, for improved power allocation and management between the PSE and PD. For more information see **"LLDP-MED (TIA-1057) with PoE+ (IEEE 802.3at)" on page 24.5**. The IEEE 802.3at specification is backwards compatible with the IEEE 802.3af specification. Devices that support the IEEE 802.3at specification are optimized to operate with IEEE 802.3at PSEs to support dynamic power management. PSEs that support the IEEE 802.3af specification can still interoperate with IEEE 802.3at compliant PDs, providing that the PD can operate using 12.95 W of power. However, these PDs will operate without the dynamic power allocation and management feature.

Differences between PoE and PoE+

The major differences between the IEEE 802.3af (PoE) and the IEEE 802.3at (PoE+) standards relate to the power that the PDs are allowed to consume, and the ability to dynamically manage the power supplied to each PD. The following table summarizes the major differences in terms of their applied voltages and power ratings.

Standard	Voltage dc at PSE	Cabling	Power Supplied by PSE	Power Available to PD	Nominal Current
IEEE 802.3af	44 V	2 pairs (CAT 3 or better)	15.4 W	12.95 W	350 mA
IEEE 802.3at	(44 to 57) V	2 pairs (CAT 5 or better)	30 W	25.5 W	600 mA

LLDP-MED (TIA-1057) with PoE+ (IEEE 802.3at)

The IEEE 802.1AB standard, Link Layer Discovery Protocol (LLDP) was designed to provide a multi-vendor solution for the discovery of network devices and accurate physical topology of how these devices are connected to one another. LLDP allows network devices to advertise their basic configuration and device capabilities to other network devices on the same LAN.

The IEEE 802.1AB standard was extended by the Telecommunications Industry Association (TIA) to fill the need for multi-vendor VoIP deployments. The TIA created the TIA-1057 standard, Link Layer Discovery Protocol Media Endpoint Devices (LLDP-MED), which allows for Media Endpoint Devices, such as VoIP phones, to exchange configuration information, including Power over Ethernet management. The TIA-1057 standard and the IEEE 802.3at standard provide for the following advanced PoE management capabilities:

- Fine grain PoE power allocation (1 watt granularity instead of wider power class bands)
- Power priority of the PD being supplied power
- Backup power conservation to extend UPS battery life

The IEEE 802.3at standard provides a capability for power re-negotiation with LLDP-MED.

PoE and PoE+ Applications

Products designed to the IEEE 802.3af (PoE) standard and IEEE 802.3at (PoE+) standard provide the benefits of lower installation costs, installation flexibility, and remote power monitoring and device management. Products supporting IEEE 802.3at can use higher power levels, along with dynamic power management when using LLDP-MED to exchange configuration data.

Power Device (PD) discovery

The first step for PSE equipment (your x510 switch, for example) is to determine whether a device plugged into a port is a valid Powered Device (PD). If it is, it will require power as well as network communication through the attached LAN cable.

The IEEE 802.3af-2003 and IEEE 802.3at-2009 standards for device detection involves applying a DC voltage between the transmit and receive wire pairs, and measuring the received current.

A PSE will expect to see approximately 25K Ohm resistance and 150nF capacitance between the transmit and receive wire pairs for the device to be considered a valid PD. A range around these values is specified in the IEEE 802.3af and IEEE 802.3at Power Ethernet standards.

The PSE will check for the presence of PD's on connected ports at regular intervals, so that power can be removed when a PD is no longer connected. Legacy (pre-IEEE 802.3af Power Ethernet standard) PDs are also detected by the PSE by default. See **"power-inline allow-legacy" on page 25.5**.

Power classes

Once a PD is discovered, PSE initiates a PD classification test by applying a DC voltage to the port. If the PD supports optional power classification it will apply a load to the line to indicate to the PSE the classification the device requires.

Since PDs may require differing power ranges, the IEEE 802.3af and IEEE 802.3at Power Ethernet standards classifies PDs according to their power consumption. By providing the PSE with its power range, the PD allows the PSE to supply power with greater efficiency. The power classes as outlined by IEEE 802.3af and IEEE 802.3at are as follows showing the different PD classes and the PSE power output for each corresponding PD power range:

PD Class	Power Available at PD	Power Supplied from PSE
0	0.44 W to 12.95 W	15.4 W
1	0.44 W to 3.84 W	4.0 W
2	3.84 W to 6.49 W	7.0 W
3	6.49 W to 12.95 W	15.4 W
4	12.95 W to 25.5 W	30 W

Once the PSE has detected the PDs IEEE 802.3af or IEEE 802.3at power class, it can manage the power allocation by subtracting the PDs class maximum value from the overall power budget. This allows for control and management of power allocation when there is not enough power available from the PSE to supply maximum power to all ports. Any unclassified PD is considered to be a class 0 device.

To view the PD class that has been configured for each PoE port, apply the following command:

```
awplus# show power-inline
```

Typical Values for PD Power Consumption

The IEEE 802.3af standard specifies the delivery of up to 15.4 watts (W) per port to PoE devices. This enables a variety of possible devices to make use of the available power. The maximum power consumed by a PD, as specified by the IEEE 802.3af standard, is 12.95 W. The system provides the 'extra' power (up to 15.4 W) to compensate for losses in the cable. Some common PoE device power requirements are:

PoE Device	PoE Power Requirement
IP phone	3 W-6 W
Wireless access point	4 W-11 W
IP security camera	5 W-12 W

The IEEE 802.3at standard supports delivery of up to 30 W per port that may be used to deliver power to PoE+ devices. This allows a variety of possible devices to make use of the available power. The maximum power consumed by a PD, as specified by the IEEE 802.3at standard, is 25.5 W. The system provides the 'extra' power (up to 30 W) to compensate for line loss.

Some common PoE+ device power requirements are:

PoE+ Device	PoE+ Power Requirement
Wireless Access Point (with LLDP-MED support)	12 W-24 W
Pan Tilt and Zoom powered IP security camera	12 W-24 W

Refer to the LLDP chapters **Chapter 96, LLDP Introduction and Configuration** and **Chapter 97, LLDP Commands** for information about power monitoring at the PD.

Power through the cable:

10/100BASE-TX Endpoint Mode

The IEEE 802.3af and IEEE 802.3at standards describe two methods for applying PoE over twisted pair cabling are termed "alternatives A and B". Alternative A applies power to the data carrying cable pairs (using pins 1-2 and 3-6). Alternative B applies the power to the spare cable pairs (using pins 4-5 and 7-8).

The x510 series switches use "alternative A" to apply power to its PDs. An IEEE compliant PD should be able to receive PoE using either of the two wiring methods.

1000BASE-T Endpoint Mode

An amendment to the IEEE 802.3at (2008) standard defines PoE cable connections for data transmission at 1 GHz. Although data is carried over all four cable pairs, the same cable pinning is used for PoE. i.e. alternative A applies power to the cable using pins 1-2 and 3-6, and alternative B applies the power to the cable using pins 4-5 and 7-8.

Cable Types

Although the IEEE standards 802.3af and 802.3at indicate minimum cable types for each standard version; using cables of a higher rating will reduce the cable resistance, allowing more power to be provided from the PSE to the PD. Also the power negotiation process that takes place between the PD and the PSE takes no account of the cable type that connects them, therefore the cabling used should be rated to meet the highest power that your PSE is able to supply

A further factor is that network operation at 1 Gbps places higher demands on the cabling type used. These demands are increased when power is also carried over these cables.

For more information on twisted-pair cable selection for PoE, see the **Allied Telesis x510 Series Installation Guide**.

Static and Automatic Power Allocation

When configuring PoE on your switch, you can either allow each port to auto-negotiate its power requirement, based on the power class of its connected PD, or you can statically allocate fixed power levels to each port.

Where dynamic PoE power assignment is used, the total power drawn from your switch's power supply will be the total of the individual power requirements of each port. See **"power-inline max" on page 25.8**

AW+ PoE and PoE+ Implementation

The following x510 series switches support PoE:

- x510-52GPX
- x510-28GPX

This section explains how to implement PoE on these switches.

Power Capacity

The following information is provided as a guide, and we recommend that you consult the appropriate hardware reference for your particular switch for more detailed information.

The x510 series switches are supplied with two internal power supplies (PSUs). For resiliency, each of these PSUs has its own external mains connection. When ports are supplying PoE, the dual PSU facility enables you to run the switch in one of two modes:

- standard (Redundant) mode
- boost mode

In standard (Redundant) mode you apply power to both PSUs but restrict the power demands of your PDs to be within the capabilities of a single power supply.

In boost mode you employ both PSUs, and utilise more power than is available from a single PSU. However, if power from one of the PSUs is lost, the result will be a loss of PoE capability to a number of ports - the exact number will depend on your particular port configuration.

Note Note that you can preserve the operation of a number of essential PoE ports by using the command, **"power-inline priority" on page 25.10**. For more details of using this feature see, **"Port prioritization" on page 24.10**.

The specific power capacity available depends on the model purchased, x510-52GPX or x510-28GPX. In this respect, the following information is provided as a guide, and we recommend that you consult your switch's hardware reference for more accurate information.

PoE Port Allocation and Distribution

The total power available for PoE is dependant on the capacity of the power supply. How this power is distributed across the available PoE ports depends on the PoE configuration applied to the switch, particularly how you set the **power-inline priority** and **power-inline max** commands.

The x510-28GPX and the x510-52GPX model switches are both Layer 3 PoE+ Gigabit Ethernet switches with SFP and SFP+ support.

Power threshold

The switch can be configured to send a Simple Network Management Protocol (SNMP) trap to your management workstation and records an entry in the event log whenever the total power requirements of the powered devices exceed the specified percentage of the total maximum power available on the switch. With the default setting of 80% applied, the switch sends an SNMP trap when the PoE devices require more than 80% of the maximum available power on the switch.

To adjust the threshold, use the command:

```
awplus(config)# power-inline usage-threshold <1-99>
```

For your management workstation to receive traps from your switches, you must configure SNMP on the switch by specifying the IP address of the workstation. The management workstation will also record an entry in the event log whenever power consumption of the switch has returned to a value that is less than the power limit threshold.

To set the SNMP traps (notifications) for PoE, use the command:

```
awplus(config)# snmp-server enable trap power-inline
```

See **Chapter 93, SNMP Introduction** for information about configuring SNMP traps for PoE. See **Chapter 94, SNMP Commands** for command examples to configure SNMP traps for PoE.

Negotiating Power Requirements

When configuring PoE on your switch, you can either allow each port to auto-negotiate its power requirement, based on the power class of its connected PD, or you can statically configure each port to have a fixed power allocation.

Where dynamic PoE power assignment is used, the total power assigned from your switch's power supply will be the total of the individual power requirements assigned to each port.

To enable you PoE ports to dynamically allocate their power, set the **"power-inline max" on page 25.8** to its default by entering, **no power-inline max.**

PoE port management

PoE is enabled by default on all non-SFP (or SFP+) RJ-45 ports. You can connect either a powered or non-powered device to a PoE-enabled port without having to re-configure the port. This is because PD detection is carried out before any power is supplied to the connected device.

PoE can be administratively enabled or disabled on each port using the **power-inline enable** command in Interface Configuration mode. To disable PoE on a selected port, use the command:

```
awplus(config-if)# no power-inline enable
```

Powered Device (PD) detection

Your switch applies two methods to detect the connection of a PD. The first method applies the resistance and capacitance methods defined in the IEEE standards, see **"Power Device (PD) discovery" on page 24.5**. The second method is applied to detect the connection of legacy PDs. This method involves measuring for a large capacitance value. The IEEE method is tried first, and if this fails to detect a PD, the second method is applied.

By default, legacy PD detection is enabled on all ports. To disable legacy PD detection, use the command:

```
awplus(config)# no power-inline allow-legacy
```

The switch applies its PD detection process in real time to all PoE enabled ports. It will not supply power to any PoE enabled port unless it detects the connection of a valid PD.

Port prioritization

Port prioritization enables you to assign ports to be one of the following three priority levels:

- Critical
- High
- Low

Where the power required collectively by the Powered Devices (PDs) is greater than the PSUs are able to supply, these priority levels will be used to sequentially remove power from the PDs in an order of their importance.

Critical The highest priority level. Ports set to this level are guaranteed power before any ports assigned to the other two priority levels. Ports assigned to the other priority levels receive power only if all the Critical ports are receiving power. Your most critical powered devices should be assigned to this level. If there is not enough power to support all the ports set to the Critical priority level, power is provided to the ports based on port number, in ascending order.

High The second highest level. Ports set to this level receive power only if all the ports set to the Critical level are already receiving power. If there is not enough power to support all of the ports set to the High priority level, power is provided to the ports based on port number, in ascending order.

Low The lowest priority level. This is the default setting. Ports set to this level only receive power if all the ports assigned to the other two levels are already receiving power. As with the other levels, if there is not enough power to support all of the ports set to the Low priority level, power is provided to the ports based on port number, in ascending order

If power needs to be removed from some of the PoE ports, where for example, one of the power supplies is disconnected; power will be removed from these ports in the order Low, High, and Critical. In addition, within each of these priority categories, lower numbered ports will be given higher priority than higher numbered ports; i.e. the lower the port number, the higher its PoE priority (within its particular category).

You can set the port priority by using the command:

```
awplus# power-inline priority
```

For more details on using this command see, **"power-inline priority" on page 25.10**..

Note

Power allocation is dynamic. Ports supplying power may stop powering a PD if the switch's power capacity has reached maximum usage and new PD's are connected to ports with a higher priority, which become active.

To ensure continued operation of a PD if the power resources of the switch are exceeded you should install a PD to a lower numbered PoE port with the Critical priority level configured.

Software monitoring

There are four PoE **show** commands available that return information about the PoE settings on your switch.

The **show power-inline** command displays the power threshold set, a power usage percentage, and power consumed by each switch port.

```
awplus# show power-inline
```

The **show power-inline counters** command displays PoE event counters from the PoE MIB (RFC 3621).

```
awplus# show power-inline counters
```

The **show power-inline interface** command displays a summary of all PoE information, including power limit, power consumed, and power class.

```
awplus# show power-inline interface
```

The **show power-inline interface detail** command displays all PoE information, including power limit, power consumed, and power class.

```
awplus# show power-inline interface detail
```

You can also specify an individual PoE port, a range of PoE ports, or a selection of PoE ports with the **show power-inline interface detail** command when using the *<port-list>* option, as shown below for a PoE port, a selection of PoE ports, and a range of PoE ports:

```
awplus# show power-inline interface port1.0.2 detail

awplus# show power-inline interface
        port1.0.2,port1.0.4,port1.0.8 detail

awplus# show power-inline interface port1.0.2-port1.0.10
        detail
```

AW+ PoE and PoE+ Configuration

This section is based around PoE configuration tasks for the Allied Telesis x510-28GPX and x510-52GPX switches running the AlliedWare Plus™ Operating System.

Add a description for a PoE or PoE+ port

You can add a description (typically the device type) for a PoE port, which the switch will display in certain Show commands. Knowing the type of PD is useful when inspecting PD Class power usage. The description entered will appear in the following commands under Device, or Powered Device Type, for each PoE or PoE+ port:

show power-inline interface command on page 25.20 and,

show power-inline interface detail command on page 25.22.

In the following example a description is added for the PoE port listed as **port1.0.2** to display the words "**Desk Phone"** in the show output of the commands mentioned above.

Command	Description
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`configure interface port1.0.2`	Specify the PoE or PoE+ port to be configured and enter Interface mode.
`awplus(config-if)#`	
`power-inline description Wireless Access Point # 1`	The description "Desk Phone" will be displayed in all PoE show command output for `port1.0.2`.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`exit`	Return to Privileged Exec mode.
`awplus#`	
`show power-inline interface port1.0.2`	Display the PoE status for `port1.0.2` to confirm that your PoE configuration on the PSE has been successful. If a PD is connected to the configured PoE port then power consumption as well as power allocation values will display.
`awplus#`	
`copy running-config startup-config`	Save your running-config to the startup-config to keep your PoE configuration after a switch restart or reboot.

Configuring Capacity and Priority on a PoE or PoE+ Port

The following commands set a higher priority and a lower maximum power for a PoE or PoE+ port. This prevents high powered PDs from being connected to a PoE or PoE+ port reserved for low powered PDs. Follow the configuration table below to configure **port1.0.2**.

Command	Description
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`configure interface port1.0.2`	Specify the PoE or PoE+ port to be configured and enter Interface mode.
`awplus(config-if)#`	
`power-inline priority high`	Specify a higher priority for the PoE or PoE+ port than the default low setting.
`awplus(config-if)#`	
`power-inline max 4000`	Specify the lowest available power that the PSE can supply to the PD: 4000 mW.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`exit`	Return to Privileged Exec mode.
`awplus#`	
`show power-inline interface port1.0.2`	Display the PoE status for `port1.0.2` to confirm that your PoE configuration on the PSE has been successful. If a PD is connected to the configured PoE port then power consumption as well as power allocation values will display.
`awplus#`	
`copy running-config startup-config`	Save your running-config to the startup-config to keep your PoE configuration after a switch restart or reboot.

Remotely monitoring power for all connected PDs

By using the **power-inline usage-threshold** command and the **snmp-server enable trap** commands together you can remotely monitor PD power requests on the PSE.

Note that you will need to configure SNMP first for this. For more information on configuring SNMP, see the following chapters in your switch's software reference:

- **Chapter 93, SNMP Introduction**
- **Chapter 94, SNMP Commands**
- **Chapter 95, SNMP MIBs**

For example, if the PD is a Class 0 (default class) or a Class 3 (15400 mW) PD then the PSE budgets 15400 mW for the PD regardless of the actual amount of power needed by the PD.

The following procedure allows you to remotely monitor power usage for all connected PDs. Follow the configuration table to configure the PSE.

Command	Description
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`service power-inline`	Enable PoE globally for the PSE. This will also enable PoE globally for all PoE ports on all connected stacked switches.
`awplus(config)#`	
`snmp-server enable trap power-inline`	Configure SNMP notification so an SNMP trap is sent when the power usage threshold is exceeded to trigger an alarm.
`awplus(config)#`	
`power-inline usage-threshold 75`	Specify SNMP notifications are generated when the power supplied exceeds 75% of the nominal PSE power available.
`awplus(config)#`	
`exit`	Return to Privileged Exec mode.
`awplus#`	
`show power-inline`	Display the PoE status for all PoE ports on the PSE. The PD Class, power consumption, and power allocated per PoE port displays for all PoE ports on the PSE.
`awplus#`	
`copy running-config startup-config`	Save your running-config to the startup-config to keep your PoE configuration after a switch restart or reboot.

Chapter 25: Power over Ethernet Commands

Introduction

Power over Ethernet (PoE) is a technology allowing devices such as IP phones to receive power over existing LAN cabling.

PoE is configured using the commands in this chapter. Note the Power Sourcing Equipment (PSE) referred to throughout this chapter is an Allied Telesis PoE switch running the AlliedWare Plus™ Operating System, supporting the IEEE 802.3af and IEEE 802.3at Power Ethernet standards. The Powered Device (PD) referred to throughout this chapter is a PoE or PoE+ powered device, such as an IP phone or a Wireless Access Point (WAP).

The commands in this chapter are available on the Allied Telesis x510-52GPX and x510-28GPX switches:

Command List

This chapter contains an alphabetical list of commands used to configure Power over Ethernet (PoE). Each command contains a functional description and shows examples of configuration and output screens for show commands. These commands are only supported on PoE capable ports. An error message will display on the console if you enter a PoE command on a port that does not support PoE. The following chapters offer further information for configuring PoE on Allied Telesis switches.

- **Chapter 24, Power over Ethernet Introduction** for introductory information about PoE and how to configure PoE on Allied Telesis switches.
- **Chapter 95, SNMP MIBs** for information about which PoE MIB objects are supported.
- **Chapter 93, SNMP Introduction** for information about SNMP traps.
- **Chapter 94, SNMP Commands** for SNMP command descriptions used when configuring SNMP traps for PoE.

clear power-inline counters interface

This command will clear the counters from a specified port, a range of ports, or all ports on the Power Sourcing Equipment (PSE). If no ports are entered then PoE counters for all ports are cleared. It will also clear all Power over Ethernet (PoE) counters supported by the Power Ethernet MIB (RFC 3621).

Syntax `clear power-inline counters interface [<port-list>]`

Parameter	Description
<port-list>	Selects the port or ports whose counters are to be cleared.

Mode Privileged Exec

Usage The PoE counters are displayed with the **show power-inline counters** command.

Examples To clear the PoE counters for `port1.0.2` only, use the following command:

```
awplus# clear power-inline counters interface port1.0.2
```

To clear the PoE counters for `port1.0.1` through `port1.0.10`, use the following command:

```
awplus# clear power-inline counters interface port1.0.1-
port1.0.10
```

To clear the PoE counters for all ports, use the following command:

```
awplus# clear power-inline counters interface
```

Validation Commands **show power-inline counters**

debug power-inline

This command enables debugging display for messages that are specific to Power over Ethernet (PoE).

Use the **no** variant of this command to disable the specified PoE debugging messages.

Syntax

```
debug power-inline [all|event|info|power]
no debug power-inline [all|event|info|power]
```

Parameter	Description
`all`	Displays all (`event`, `info`, `nsm`, `power`) debug messages.
`event`	Displays event debug information, showing any error conditions that may occur during PoE operation.
`info`	Displays informational level debug information, showing high-level essential debugging, such as information about message types.
`power`	Displays power management debug information.

Default No debug messages are enabled by default.

Mode Privileged Exec

Usage Use the **terminal monitor** command to display PoE debug messages on the console.

Use the **show debugging power-inline** command to show the PoE debug configuration.

Examples To enable PoE debugging and start the display of PoE `event` and `info` debug messages on the console, use the following commands:

```
awplus# terminal monitor
awplus# debug power-inline event info
```

To enable PoE debugging and start the display of all PoE debugging messages on the console, use the following commands:

```
awplus# terminal monitor
awplus# debug power-inline all
```

To disable PoE debugging and stop the display of PoE `event` and `info` debug messages on the console, use the following command:

```
awplus# no debug power-inline event info
```

To disable all PoE debugging and stop the display of any PoE debugging messages on the console, use the following command:

```
awplus# no debug power-inline all
```

Validation Commands **show debugging power-inline**

Related Commands **terminal monitor**

power-inline allow-legacy

This command enables detection of pre-IEEE 802.3af Power Ethernet standard legacy Powered Devices (PDs).

The no variant of this command disables detection of pre-IEEE 802.3af Power Ethernet standard legacy Powered Devices (PDs).

Syntax

```
power-inline allow-legacy
no power-inline allow-legacy
```

Default Detection of legacy PDs is enabled on all ports on the Power Sourcing Equipment (PSE).

Mode Global Configuration

Examples To disable detection of legacy PDs, use the following commands:

```
awplus# configure terminal
awplus(config)# no power-inline allow-legacy
```

To enable detection of legacy PDs, use the following commands:

```
awplus# configure terminal
awplus(config)# power-inline allow-legacy
```

Validation Commands **show power-inline**
show running-config power-inline

power-inline description

This command adds a description for a Powered Device (PD) connected to a PoE port.

The **no** variant of this command clears a previously entered description for a connected PD, resetting the PD description to the default (null).

Syntax

```
power-inline description <pd-description>
no power-inline description
```

Parameter	Description
<pd-description>	Description of the PD connected to the PoE capable port (with a maximum 256 character string limit per PD description).

Default No description for a connected PD is set by default.

Mode Interface Configuration

Usage Select a PoE port, a list of PoE ports, or a range of PoE ports with the preceding **interface (to configure)** command. If you specify a range or list of ports they must all be PoE capable ports.

Examples To add the description `Desk Phone` for a connected PD on `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# power-inline description Desk Phone
```

To clear the description as added above for the connected PD on `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no power-inline description
```

Validation Commands **show power-inline interface**
show running-config power-inline

power-inline enable

This command enables Power over Ethernet (PoE) to detect a connected Powered Device (PD) and supply power from the Power Sourcing Equipment (PSE).

The **no** variant of this command disables PoE functionality on the selected PoE port(s). No power is supplied to a connected PD after PoE is disabled on the selected PoE port(s).

Syntax

```
power-inline enable
no power-inline enable
```

Default PoE is enabled by default on all ports on the PSE.

Mode Interface Configuration

Usage In a stack of x510 Series switches this command is supported on all PoE capable ports.

Select a PoE port, a list of PoE ports, or a range of PoE ports from the preceding **interface (to configure)** command. If you specify a range or list of ports they must all be PoE capable ports.

No PoE log messages are generated for specified PoE port(s) after PoE is disabled. The disabled PoE port(s) still provide Ethernet connectivity after PoE is disabled.

Examples To disable PoE on ports `port1.0.1` to `port1.0.10`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.10
awplus(config-if)# no power-inline enable
```

To enable PoE on ports `port1.0.1` to `port1.0.10`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.10
awplus(config-if)# power-inline enable
```

Validation Commands

show power-inline
show power-inline interface
show power-inline interface detail
show running-config power-inline

power-inline max

This command sets the "maximum" power allocated to a Power over an Ethernet (PoE and PoE+) port. The amount of power actually supplied to the port depends on the power requirements of the connected PD. It is also a function of the total PoE power loading on the switch and the PoE priority set for the port by the **power-inline priority** command. However this command (power-inline max) does apply a "maximum" value to the power that the port is able to supply.

Note that the value set by this command will be the figure the switch will use when apportioning the power budget for its ports. For example, if 15.4 W is assigned to a port whose PD only consumes 5 W, the switch will reserve the full 15.4 W for this port when determining its total power PoE power requirement.

Note that the value set by this command will be the figure the switch will use when apportioning the power budget for its ports. For example, if 15.4 W is assigned to a port whose PD only consumes 5 W, the switch will reserve the full 15.4 W for this port when determining its total power PoE power requirement.

The **no** variant of this command sets the maximum power supplied to a PoE port to the default, which is set to the maximum power limit for the class of the connected Powered Device (PD).

Syntax

```
power-inline max <4000-30000>

no power-inline max
```

Parameter	Description
<4000-30000>	The maximum power allocated to a PoE port in milliwatts (mW).

Default The Power Sourcing Equipment (PSE) supplies the maximum power limit for the class of the PD connected to the port by default.

Power limits for all classes of PDs are listed in **"Power classes" on page 24.6**. See **Chapter 24, Power over Ethernet Introduction** for further PoE information.

Mode Interface Configuration

Usage In a stack of x510 Series switches this command is supported on all PoE capable ports.

Select a PoE port, a list of PoE ports, or a range of PoE ports with the preceding **interface (to configure)** command. If you specify a range or list of ports they must all be PoE capable ports.

If you select a range of PoE ports in Interface Configuration mode before issuing this command, then each port in the range selected will have the same maximum power value configured. If the PoE port attempts to draw more than the maximum power, this is logged and all power is removed. Note that the value entered is rounded up to the next value supported by the hardware.

See the actual value used, as shown after command entry, in the sample console output below:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#power-line max 5300
% The maximum power has been rounded to 5450mW in hardware.
```

Refer to **Chapter 96, LLDP Introduction and Configuration** and **Chapter 97, LLDP Commands** for information about power monitoring at the PD.

Note the difference in power supplied from the PSE to the power available at the PD due to line loss.

The **"Power classes" on page 24.6** shows the difference between the power supplied from the PSE and the power available at the PD.

Examples

To set the maximum power supplied to ports in the range `1.0.2 to 1.0.12` to 6450mW per port, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.12
awplus(config-if)# power-inline max 6450
```

To set the maximum power supplied to `port1.0.2`, to `6450` mW, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# power-inline max 6450
```

To clear the user-configured maximum power supplied to `port1.0.2`, and revert to using the default maximum power of 30000 mW, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no power-inline max
```

Validation Commands

show power-inline interface
show running-config power-inline

power-inline priority

This command sets the Power over Ethernet (PoE) priority level of a PoE port to one of three available priority levels:

- low
- high
- critical

The **no** variant of this command restores the PoE port priority to the default (low).

Syntax

```
power-inline priority {low|high|critical}

no power-inline priority
```

Parameter	Description
`low`	The lowest priority for a PoE enabled port (default). PoE ports set to `low` only receive power if all the PoE ports assigned to the other two levels are already receiving power.
`high`	The second highest priority for a PoE enabled port. PoE ports set to `high` receive power only if all the ports set to `critical` are already receiving power.
`critical`	The highest priority for a PoE enabled port. PoE ports set to `critical` are guaranteed power before any ports assigned to the other two priority levels. Ports assigned to the other priority levels receive power only if all Critical ports are receiving power.

Default The default priority is `low` for all PoE ports on the Power Sourcing Equipment (PSE).

Mode Interface Configuration

Usage This command is supported on all PoE capable ports, whether operating as a stand-alone switch, or within a VCStack.

Select a PoE port, a list of PoE ports, or a range of PoE ports with the preceding **interface (to configure)** command. If you specify a range or list of ports they must all be PoE capable ports.

PoE ports with higher priorities are given power before PoE ports with lower priorities. If the priorities for two PoE ports are the same then the lower numbered PoE port is given power before the higher numbered PoE port.

See **"Port prioritization" on page 24.10** for further information about PoE priority.

Examples To set the priority level to `high` for `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# power-inline priority high
```

To reset the priority level to the default for `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no power-inline priority
```

Validation Commands
show power-inline
show power-inline interface
show running-config power-inline

Related Commands
power-inline usage-threshold

power-inline usage-threshold

This command sets the level at which the Power Sourcing Equipment (PSE) will issue a message that the power supplied to all Powered Devices (PDs) has reached a critical level of the nominal power rating for the PSE. The level is set as a percentage of total available power.

The **no** variant of this command resets the notification usage-threshold to the default (80% of the nominal power rating of the PSE).

Syntax

```
power-inline usage-threshold <1-99>

no power-inline usage-threshold
```

Parameter	Description
<1-99>	The usage-threshold percentage configured with this command.

Default The default power usage threshold is 80% of the nominal power rating of the PSE.

Mode Global Configuration

Usage Use the **snmp-server enable trap** command on page 94.18 to configure SNMP notification. An SNMP notification is sent when the usage-threshold, as configured in the example, is exceeded.

Examples To generate SNMP notifications when power supplied exceeds 70% of the nominal PSE power, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap power-inline
awplus(config)# power-inline usage-threshold 70
```

To reset the notification threshold to the default (80% of the nominal PSE power rating), use the following commands:

```
awplus# configure terminal
awplus(config)# no power-inline usage-threshold
```

Validation Commands **show power-inline interface**
show running-config power-inline

Related Commands **snmp-server enable trap**

service power-inline

This command enables Power over Ethernet (PoE) globally on the Power Sourcing Equipment (PSE) for all PoE ports.

Syntax

```
service power-inline
no service power-inline
```

Default PoE functionality is enabled by default on the PSE.

Mode Global Configuration

Usage In a stack, issuing this command enables PoE globally for all PoE ports.

In a stack configuration, only stack members containing PoE hardware will have PoE enabled by default in software.

Examples To disable PoE on the PSE, use the following commands:

```
awplus# configure terminal
awplus(config)# no service power-inline
```

To re-enable PoE on the PSE, if PoE has been disabled, use the following commands:

```
awplus# configure terminal
awplus(config)# service power-inline
```

Validation Commands **show power-inline**
show running-config power-inline

show debugging power-inline

This command displays Power over Ethernet (PoE) debug settings.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show debugging power-inline`

Mode User Exec and Privileged Exec

Example To display PoE debug settings, use the following command:

```
awplus# show debugging power-inline
```

Output **Figure 25-1: Example output from the show debugging power-inline command**

```
awplus#show debugging power-inline
PoE Debugging status:
PoE Informational debugging is disabled
PoE Event debugging is disabled
PoE Power Management debugging is disabled
PoE NSM debugging is enabled
```

Related Commands **debug power-inline**
terminal monitor

show power-inline

This command displays the Power over Ethernet (PoE) status for all ports on the Power Sourcing Equipment (PSE).

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show power-inline`

Mode User Exec and Privileged Exec

Example To display the PoE status for all ports on the PSE, use the following command:

```
awplus# show power-inline
```

Output **Figure 25-2: Example output from the show power-inline command**

```
awplus#show power-inline
PoE Status:

Stack Member 2
 Nominal Power: 370W
 Power Allocated: 246W
 Actual Power Consumption: 151W
 Operational Status: On
 Power Usage Threshold: 80% (296W)

PoE Interface:
Interface  Admin   Pri  Oper    Power   Device    Class  Max(mW)
port2.0.1  Enabled Low  Powered  3840   n/a          1    4000 [C]
port2.0.2  Enabled High Powered  6720   n/a          2    7000 [C]
port2.0.3  Enabled Low  Powered 14784   n/a          3   15400 [C]
port2.0.4  Enabled Crit Powered 14784   n/a          3   15400 [C]
port2.0.5  Enabled Crit Powered  3840   n/a          1    4000 [C]
port2.0.6  Enabled High Powered  6720   n/a          2    7000 [C]
port2.0.7  Enabled Low  Powered 14784   n/a          3   15400 [C]
```

Table 25-1: Parameters in the show power-inline command output

Parameter	Description
`Nominal Power`	The nominal power available on the switch in watts (W).
`Power Allocated`	The current power allocated in watts (W) that is available to be drawn by any connected Powered Devices (PDs). This is updated every 5 seconds.
`Actual Power Consumption`	The current power consumption in watts (W) drawn by all connected Powered Devices (PDs). This is updated every 5 seconds.
`Operational Status`	The operational status of the PSU hardware on the PSE when this command was issued: ■ **On** if the PSU as installed inside the PSE is switched on. ■ **Off** when the PSU in the PSE is switched off (an RPS may be connected to the PSE to power PoE instead of the PSU). ■ **Fault** when there is an issue with the PSE PSU hardware.
`Power Usage Threshold (%)`	The configured SNMP trap / log threshold for the PSE, as configured from a **power-inline usage-threshold** command.
`Interface`	The PoE port(s) in the format `portx.y.z`, where `x` is the device number, `y` is the module number within the device, and `z` is the PoE port number within the module.
`Admin`	The administrative state of PoE on a PoE port, either **Enabled** or **Disabled**.
`Pri`	The current PoE priorities for PoE ports on the PSE, as configured from a **power-inline priority** command: ■ **Low** displays when the `low` parameter is issued. The lowest priority for a PoE enabled port (default). ■ **High** displays when the `high` parameter is issued. The second highest priority for a PoE enabled port. ■ **Crit** displays when the `critical` parameter is issued. The highest priority for a PoE enabled port.
`Oper`	The current PSE PoE port state when this command was issued: ■ **Powered** displays when there is a PD connected and power is being supplied from the PSE. ■ **Disabled** displays when supplying power would make the PSE go over the power budget. ■ **Off** displays when PoE has been disabled for the PoE port. **Fault** displays when a PSE goes over its power allocation.
`Power`	The power consumption in milliwatts (mW) for the PoE port when this command was entered.
`Device`	The description of the connected PD device if a description has been added with the **power-inline description** command. No description is shown for PDs not configured with the **power-inline description** command.

Table 25-1: Parameters in the show power-inline command output(cont.)

Parameter	Description
`Class`	The class of the connected PD, if power is being supplied to the PD from the PSE. See the **Power over Ethernet Introduction** chapter for further information about PD classes and the power levels assigned per class.
`Max (mW)`	The power in milliwatts (mW) allocated for the PoE port. Additionally, note the following as displayed per PoE port: ■ **[U]** if the power limit for a port was user configured (with the **power-inline max** command). ■ **[L]** if the power limit for a port was supplied by LLDP. ■ **[C]** if the power limit for a port was supplied by the PD class.

Related Commands

show power-inline counters
show power-inline interface

show power-inline counters

This command displays Power over Ethernet (PoE) event counters for ports on the Power Sourcing Equipment (PSE). The PoE event counters displayed can also be accessed by objects in the PoE MIB (RFC 3621). See **Chapter 95, SNMP MIBs** for information about which PoE MIB objects are supported.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show power-inline counters [<port-list>]
```

Parameter	Description
<port-list>	Enter the PoE port(s) to display all PoE event counters for them.

Mode User Exec and Privileged Exec

Usage To display all PoE event counters for all PoE ports on the PSE, do not enter the optional interface parameter.

Examples To display all PoE event counters for all PoE ports on the PSE, use the command:

```
awplus# show power-inline counters
```

To display the PoE event counters for the port range `1.0.4` to `1.0.12`, use the command:

```
awplus# show power-inline counters interface port1.0.4-1.0.12
```

Output **Figure 25-3: Example output from the show power-inline counters command**

```
awplus#show power-inline counters interface port1.0.4-port1.0.12
PoE Counters:
Interface   MPSAbsent Overload Short Invalid Denied
port1.0.4   0         0        0     0       0
port1.0.5   0         0        0     0       0
port1.0.6   0         0        0     0       0
port1.0.7   0         0        0     0       0
port1.0.8   0         0        0     0       0
port1.0.9   0         0        0     0       0
port1.0.10  0         0        0     0       0
port1.0.11  0         0        0     0       0
port1.0.12  0         0        0     0       0
```

Table 25-2: Parameters in the show power-inline counters command output

Parameter	Description
`Interface`	The PoE port(s) in the format `portx.y.z`, where `x` is the device number, `y` is the module number within the device, and `z` is the PoE port number within the module.
`MPSAbsent`	The number of instances when the PoE MPS (Maintain Power Signature) signal has been lost. The PoE MPS signal is lost when a PD is disconnected from the PSE. Also increments `pethPsePortMPSAbsentCounter` in the PoE MIB.
`Overload`	The number of instances when a PD exceeds its configured power limit (as configured by the **power-inline max** command). Also increments `pethPsePortOverLoadCounter` in the PoE MIB.
`Short`	The number of short circuits that have happened with a PD. Also increments `pethPsePortShortCounter` in the PoE MIB.
`Invalid`	The number of times a PD with an Invalid Signature (where the PD has an open or short circuit, or is a legacy PD) is detected. Also increments `pethPseInvalidSignatureCounter` in the PoE MIB.
`Denied`	The number of times a PD has been refused power due to power budget limitations for the PSE. Also increments `pethPsePortPowerDeniedCounter` in the PoE MIB.

Related Commands

clear power-inline counters interface
show power-inline
show power-inline interface

show power-inline interface

This command displays a summary of Power over Ethernet (PoE) information for specified ports. If no ports are specified then PoE information is displayed for all ports on the Power Sourcing Equipment (PSE).

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show power-inline interface [<port-list>]`

Parameter	Description
<port-list>	Enter the PoE port(s) to display PoE specific information in the show output.

Mode User Exec and Privileged Exec

Usage To display PoE information for all PoE ports on the PSE, do not specify any ports.

Example To display the PoE port specific information for all PoE ports on the switch, use the following command:

```
awplus# show power-inline interface
```

To display the PoE port specific information for the port range `1.0.1` to `1.0.4`, use the following command:

```
awplus# show power-inline interface port1.0.1-port1.0.4
```

Output **Figure 25-4: Example output from the show power-inline interface command**

```
awplus#show power-inline interface port1.0.1-port1.0.4
Interface  Admin    Pri  Oper      Power Device      Class Max(mW)
port1.0.1  Disabled Low  Disabled      0 n/a         n/a   n/a
port1.0.2  Enabled  High Powered    3840 Desk Phone  1     5000 [U]
port1.0.3  Enabled  Crit Powered    6720 AccessPoint 2     7000 [C]
port1.0.4  Disabled Low  Disabled      0 n/a         n/a   n/a
```

Table 25-3: Parameters in the show power-inline interface command output

Parameter	Description
`Interface`	The PoE port(s) in the format `portx.y.z`, where `x` is the device number, `y` is the module number within the device, and `z` is the PoE port number within the module.
`Admin`	The administrative state of PoE on a PoE port, either **Enabled** or **Disabled**.
`Pri`	The current PoE priorities for PoE ports on the PSE, as configured from a **power-inline priority** command: ■ **Low** displays when the `low` parameter is issued. The lowest priority for a PoE enabled port (default). ■ **High** displays when the `high` parameter is issued. The second highest priority for a PoE enabled port. ■ **Crit** displays when the `critical` parameter is issued. The highest priority for a PoE enabled port.
`Oper`	The current PSE PoE port state when this command was issued: ■ **Powered** displays when there is a PD connected and power is being supplied from the PSE. ■ **Denied** displays when supplying power would make the PSE go over the power budget. ■ **Disabled** displays when the PoE port is administratively disabled. ■ **Off** displays when PoE has been disabled for the port. ■ **Fault** displays when a PSE goes over its power allocation.
`Power`	The power consumption in milliwatts (mW) for the PoE port when this command was entered.
`Device`	The description of the connected PD device if a description has been added with the **power-inline description** command. No description is shown for PDs not configured with the **power-inline description** command.
`Class`	The class of the connected PD, if power is being supplied to the PD from the PSE. See **"Power classes" on page 24.6** in **Chapter 24, Power over Ethernet Introduction** for further information about PD classes and the power assigned per class.
`Max (mW)`	The power in milliwatts (mW) allocated for the PoE port. Additionally, note the following as displayed per PoE port: ■ **[U]** if the power limit for a port was user configured (with the **power-inline max** command). ■ **[L]** if the power limit for a port was supplied by LLDP. ■ **[C]** if the power limit for a port was supplied by the PD class.

Related Commands

show power-inline
show power-inline interface detail

show power-inline interface detail

This command displays detailed information for specified Power over Ethernet (PoE) port(s) on the Power Sourcing Equipment (PSE).

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show power-inline interface [<port-list>] detail`

Parameter	Description
<port-list>	Enter the PoE port(s) to display the PoE port specific information.

Mode User Exec and Privileged Exec

Usage To show detailed PoE information for all ports on the PSE, do not specify any ports.

The power allocated to each port is listed in the `Power allocated` row, and is limited by the maximum power per Powered Device (PD) class, or a user configured power limit.

Example To display detailed PoE port specific information for the port range `2.0.1` to `2.0.2`, use the following command:

```
awplus# show power-inline interface port2.0.1-port2.0.2
       detail
```

Output **Figure 25-5: Example output from the show power-inline interface detail command**

```
awplus#show power-inline interface port1.0.1-1.0.2 detail
Interface port1.0.1
  Powered device type: Desk Phone #1
  PoE admin enabled
  Priority Low
  Detection status: Powered
  Current power consumption: 4800 mW
  Powered device class: 1
  Power allocated: 5000 mW (from configuration)
  Detection of legacy devices is disabled
  Powered pairs: Data
Interface port1.0.2
  Powered device type: Access Point #3
  PoE admin enabled
  Priority High
  Detection status: Powered
  Current power consumption: 6720 mW
  Powered device class: 2
  Power allocated: 7000 mW (from powered device class)
  Detection of legacy devices is enabled
  Powered pairs: Data
```

Table 25-4: Parameters in show power-inline interface detail command output

Parameter	Description
`Interface`	The PoE port(s) in the format `portx.y.z`, where `x` is the device number, `y` is the module number within the device, and `z` is the PoE port number within the module.
`Powered device type:`	The name of the PD, if connected and if power is being supplied to the PD from the PSE, configured with the **power-inline description** command. **n/a** displays if a description has not been configured for the PD.
`PoE admin`	The administrative state of PoE on a PoE capable port, either **Enabled** or **Disabled** as configured from the **power-inline enable** command or the **no power-inline enable** command respectively.
`Priority`	The PoE priority of a port, which is either **Low,** or **High,** or **Critical**, as configured by the **power-inline priority** command.
`Detection status:`	The current PSE PoE port state when this command was issued: ■ **Powered** displays when there is a PD connected and power is being supplied from the PSE. ■ **Denied** displays when supplying power would make the PSE go over the power budget. ■ **Disabled** displays when the PoE port is administratively disabled. ■ **Off** displays when PoE has been disabled for the port. ■ **Fault** displays when a PSE goes over its power allocation.
`Current power consumption:`	The power consumption for the PoE port when this command was entered. Note that the power consumption may have changed since the command was entered and the power is displayed.
`Powered device class:`	The class of the connected PD if connected, and if power is being supplied to the PD from the PSE. See **Chapter 24, Power over Ethernet Introduction** chapter for further information about PD classes and the power assigned per class.
`Power allocated:`	The power in milliwatts (mW) allocated for the PoE port. Additionally, note the following as displayed per PoE port: ■ **[U]** if the power limit for a port was user configured (with the **power-inline max** command). ■ **[L]** if the power limit for a port was supplied by LLDP. ■ **[C]** if the power limit for a port was supplied by the PD class.
`Detection of legacy devices is`	`[Enabled|Disabled]` The status of legacy PoE detection on the PoE port, as configured for the PoE port with the **power-inline allow-legacy** command.
`Powered pairs:`	`[Data|Spare]` The IEEE 802.3af and IEEE 802.3at standards allow for either **data** or **spare** twisted pairs to be used to transfer power to a PD. The powered pairs status for each port. AlliedWare Plus™ PoE switches implement IEEE 802.3af and IEEE 802.3at Endpoint PSE Alternative A (**Data**). See **"Power through the cable:" on page 24.7** for further information about the data pairs in Ethernet cable used to transmit power.

Chapter 26: GVRP Introduction and Configuration

Introduction

GVRP enables the automatic VLAN configuration of switches in a network by allowing GVRP enabled switches to dynamically exchange VLAN configuration information with each other. GVRP is based on GARP, which defines how attributes, like VIDs, are registered and deregistered. This makes it easier to manage VLANs that span more than one switch. Without GVRP, you have to manually configure your switches to ensure that the various parts of the VLANs can communicate with each other across the different switches. With GVRP this is done for you automatically.

The switch uses GVRP protocol data units (PDUs) to share VLAN information among GVRP-active devices. The PDUs contain the VID numbers of all the VLANs on the switch. When the switch receives a GVRP PDU on a port, it examines the PDU to determine the VIDs of the VLANs on the device that sent it. It then does the following:

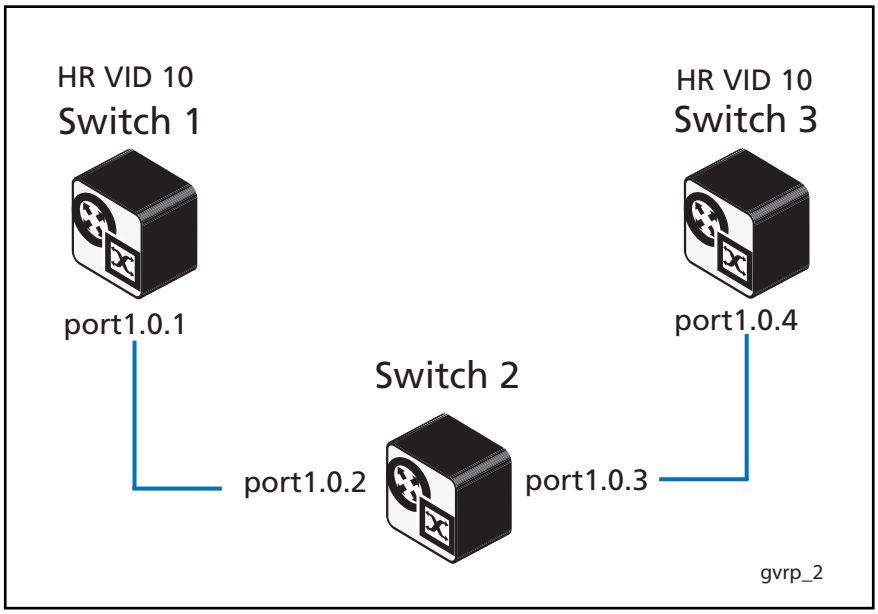
- If the PDU contains a VID of a VLAN that does not exist on the switch, it creates this VLAN and adds the port that received the PDU as a tagged member of the VLAN. A VLAN created by GVRP is called a dynamic GVRP VLAN.
- If the PDU contains a VID of a VLAN that already exists on the switch but the receiving port is not a member of it, the switch adds the port as a tagged member of the VLAN. A port that has been added by GVRP to a static VLAN (that is a user-created VLAN) is called a dynamic GVRP port.

Only GVRP can modify or delete dynamic GVRP VLANs. Dynamic GVRP VLANs exist only so long as the switch continues to receive GVRP PDUs that contain the VID of that VLAN. If there are no more relevant GVRP PDUs arriving, or there are no active links in the VLAN, GVRP deletes it from the switch.

A dynamic GVRP port in a static VLAN remains a member of the VLAN as long as the switch continues to receive GVRP PDUs that contain the VID of that VLAN. If the relevant GVRP PDUs are no longer being received on the port, then GVRP removes the dynamic port from the VLAN, but does not delete the VLAN if the VLAN is a static VLAN.

GVRP Example

The example consists of three switches. Switch 1 and Switch 3 have the HR VLAN 10, but Switch 2 is not configured with the HR VLAN 10. Consequently, the end nodes of the two parts of the HR VLAN 10 cannot communicate with each other because Switch 2 does not have VLAN 10.



Without GVRP, you would have to manually add the HR VLAN 10 to Switch 2. But with GVRP, the VLAN is added automatically. Here is how GVRP resolves this example.

1. Interface `port1.0.1` on Switch 1 sends a PDU (Protocol Data Unit) to interface `port1.0.2` on Switch 2 that contains the VIDs of all the VLANs on Switch 1, including VID 10 for the HR VLAN.

2. Switch 2 examines the PDU it receives on interface `port1.0.2` and finds that it does not have a VLAN with a VID 10. In response, it creates the VLAN as a dynamic GVRP VLAN, assigning it VID 10. Switch 2 then adds interface `port1.0.2`, the switch port that received the PDU, as a tagged member of HR VLAN 10.

3. Switch 2 sends a PDU from interface `port1.0.3` containing all the VIDs of the VLANs on the switch, including the new VID 10. Note at this point interface `port1.0.3` is not a member of VLAN 10. Ports are added to VLANs when they receive PDUs from other switches in the network, not when they transmit PDUs.

4. Switch 3 receives the PDU on interface port1.0.4 and, after examining it, finds that one of the VLANs on Switch 2 has the VID 10, which matches the VID of an already existing VLAN on the switch. So it does not create the VLAN because it already exists. It then determines whether the port that received the PDU, in this case interface `port1.0.4`, is a member of the VLAN. If it is not a member, it adds the port to the VLAN as a tagged dynamic GVRP port. If the port is already a member of the VLAN, then no change is made.

5. Switch 3 sends a PDU out interface `port1.0.4` to interface `port1.0.3` on Switch 2.

6. Switch 2 receives the PDU on interface `port1.0.3` and then adds the port as a tagged dynamic GVRP port to the dynamic GVRP VLAN 10.

There is now a communications path for the end nodes of the HR VLAN 10 on Switch 1 and Switch 3. GVRP created the new dynamic GVRP VLAN with a VID of 10 on Switch 2 and added interfaces `port1.0.2` and `port1.0.3` to HR VLAN 10 as tagged dynamic GVRP ports.

GVRP Guidelines

Here are the guidelines for configuring GVRP on your switch:

- All ports the constitute a network link between the switch and the other switches must be running GVRP.
- You cannot modify or delete dynamic GVRP VLANs.
- You cannot remove dynamic GVRP ports from static or dynamic VLANs.
- There is limit of 400 VLANs supported by the AlliedWare Plus GVRP implementation. VLANs may be numbered 1-4094, but a limit of 400 of these VLANs are supported.
- MSTP is not supported by the current AlliedWare Plus GVRP implementation. GVRP and MSTP are mutually exclusive. STP and RSTP are supported by GVRP.
- VCStack is not supported by the current AlliedWare Plus GVRP implementation.
- To be detected by GVRP, a VLAN must have at least one active port. GVRP cannot detect a VLAN that does not have any active nodes or valid port links.
- Rebooting the switch erases all dynamic GVRP VLANs and dynamic GVRP port assignments. The dynamic assignments are relearned by the switch as PDUs arrive on the ports from other switches.
- GVRP has three timers: join timer, leave timer, and leave all timer. The values for these timers must be set the same on all switches running GVRP. Timers with different values on different switches can result in GVRP compatibility problems.
- You can convert dynamic GVRP VLANs and dynamic GVRP port assignments to static VLANs and static port assignments.
- The default port settings on the switch for GVRP is inactive, meaning that the ports will not participate in GVRP until enabled on the switch globally and on the interface locally.
- Allied Telesis recommends disabling GVRP on those ports that are connected to GVRP-inactive devices, meaning any switches that do not have the GVRP feature enabled.
- PDUs are transmitted from only those switch ports where GVRP is enabled.
- Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. GVRP and private VLAN trunk ports are mutually exclusive.

GVRP and Network Security

GVRP should be used with caution because it can expose your network to unauthorized access. If a network intruder were to connect to a switch port running GVRP and transmit a bogus GVRP PDU containing VIDs of restricted VLANs, GVRP would make the port a member of the VLANs, giving the intruder access to restricted areas of your network.

Here are a few suggestions to protect against this type of unauthorized network intrusion:

- Activating GVRP only on those switch ports connected to other GVRP devices. Do not activate GVRP on ports that are connected to GVRP inactive devices.
- Converting all dynamic GVRP VLANs and dynamic GVRP ports to static assignments, and then turning off GVRP on all the switches. This preserves the new VLAN assignments while protecting against unauthorized network intrusion.

GVRP-inactive Intermediate Switches

If two GVRP-active devices are separated by a GVRP-inactive switch, the GVRP-active devices may not be able to share VLAN information. There are two issues involved.

The first is whether the intermediate switch forwards the GVRP PDUs that it receives from the GVRP-active switches. GVRP PDUs are management frames, intended for the switch's CPU. In all likelihood, a GVRP-inactive switch will discard the PDUs because it will not recognize them.

The second issue is that even if a GVRP-inactive switch forwards GVRP PDUs, it will not automatically create the VLANs. Consequently, even if GVRP-active switches receive the PDUs and create the necessary VLANs, an intermediate switch may block the VLAN traffic, unless you modify its VLANs and port assignments manually.

Enabling GVRP on the Switch

The command for enabling GVRP on the switch is found in the Global Configuration mode. It is the **gvrp enable (global)** command. After the command is entered, the switch immediately begins to transmit PDUs from those ports where GVRP is enabled.

Further, to enable the switch to create dynamic VLANs if it receives GVRP PDUs that contain VIDs for VLANs it does not currently have, use the command **gvrp dynamic-vlan-creation**.

Here are the commands to enable GVRP on the switch and enable to switch to create dynamic VLANs if it receives GVRP PDUs that contain VIDs for VLANs it does not currently have:

```
awplus>enable
awplus#configure terminal
awplus(config)#gvrp enable
awplus(config)#gvrp dynamic-vlan-creation
```

For reference information, refer to the **gvrp enable (global)** command and the **gvrp dynamic-vlan-creation** command in the **GVRP Commands** chapter.

Enabling GVRP on the Ports

To activate GVRP on the ports so that they transmit GVRP PDUs, use the **gvrp registration** and the **gvrp (interface)** commands in the Interface Configuration mode. Because the default setting for GVRP on the ports is disabled, you need to use these commands if you want to re-enable GVRP after disabling it on a port.

This example of these commands activates GVRP on interface `port1.0.12`, `port1.0.13`, and `port1.0.17`:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface port1.0.12,port1.0.13,port1.0.17
awplus(config-if)#gvrp registration normal
awplus(config-if)#gvrp
```

For reference information, refer to the **gvrp registration** and **gvrp (interface)** commands in the **GVRP Commands** chapter.

Setting the GVRP Timers

The switch has a join timer, a leave timer, and a leave all timer. You should not change the timers unless you understand their functions. (Refer to the IEEE 802.1p standard for the timer definitions.) The timers have to be set the same on all GARP-active network devices and the join timer and the leave timer have to be set according to the following rule:

leave timer >= (3 x (join timer))

When configuring the leave timer, set it to more than or equal to three times the join timer value. The settings for the leave and join timers must be the same for all GVRP enabled switches.

The commands for setting the timers are in the Interface Configuration mode. They are:

gvrp timer join
gvrp timer leave
gvrp timer leaveall

The timers are set in one hundredths of a second. This example sets the join timer to 0.2 seconds, the leave timer to 0.8 seconds and the leave all timer to 10 seconds for port1.0.2:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface port1.0.2
awplus(config-if)#gvrp timer join 20
awplus(config-if)#gvrp timer leave 80
awplus(config-if)#gvrp timer leaveall 1000
```

For reference information, refer to **gvrp timer** command in the **GVRP Commands** chapter.

Disabling GVRP on the Ports

To disable GVRP on the ports, use the **gvrp registration none** and **no gvrp (interface)** commands in the Interface Configuration mode.

This example of the command deactivates GVRP on interfaces `port1.0.4` and `port1.0.5`:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface port1.0.4,port1.0.5
awplus(config-if)#gvrp registration none
awplus(config-if)#no gvrp
```

For reference information, refer to **gvrp registration** and **gvrp (interface)** command in the **GVRP Commands** chapter.

Disabling GVRP on the Switch

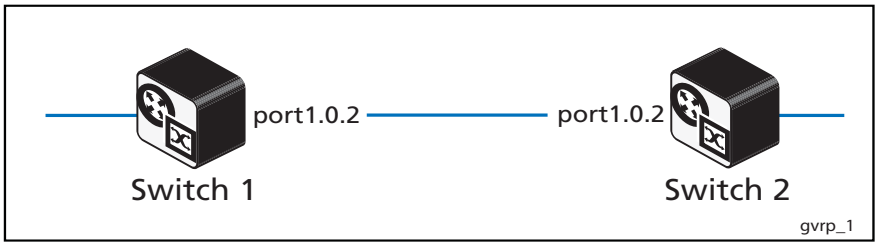
To disable GVRP to stop the switch from learning any further dynamic VLANs or GVRP ports, use the **no gvrp (interface) enable** command in the Global Configuration mode. Here is the command.

```
awplus>enable
awplus#configure terminal
awplus(config)#no gvrp enable
```

For reference information, refer to the **gvrp (interface)** command in the **GVRP Commands** chapter.

Configuring and validating GVRP

GVRP (GARP VLAN Registration Protocol) allows the exchange of VLAN information between switches in a network. If one switch is manually configured with multiple VLANs, other switches in the network learn about these VLANs dynamically through GVRP.



Switch 1: Configuring GVRP to receive VLANs from Switch 1

`awplus#` `configure terminal`	Enter the Global Configuration mode from the Privileged Exec mode.
`awplus(config)#` `gvrp enable`	Enter GVRP on **Switch 1**.
`awplus(config)#` `gvrp dynamic-vlan-creation`	Enable dynamic VLAN creation for GVRP. Note that GVRP is now enabled globally for **Switch 1**.
`awplus(config)#` `interface port1.0.2`	Specify an interface (`port1.0.2`) to be configured and enter Interface Configuration mode.
`awplus(config-if)#` `switchport mode trunk`	Set the switching characteristics of the interface as trunk and specify tagged frames only. Any frames not tagged as trunk frames are discarded.
`awplus(config-if)#` `switchport trunk allowed vlan all`	Apply to all VLANs on this interface.
`awplus(config-if)#` `gvrp`	Enable GVRP on switch port `port1.0.2`. Note that GVRP is now set up on interface `port1.0.2` as GVRP is also enabled globally for **Switch 1**.
`awplus(config-if)#` `exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#` `exit`	Exit Global Configuration mode and enter Privileged Exec mode.
`awplus#` `show gvrp configuration`	Show GVRP configuration on **Switch 1** to confirm GVRP is ready to propagate VLANs.

Switch 2: Configuring GVRP & creating VLANs to propagate:

`awplus#` `enable`	Enter the Privileged Exec mode.
`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `gvrp enable`	Enter GVRP on **Switch 2**.
`awplus(config)#` `vlan database`	Create VLANs to propagate between **Switch 1** and **Switch 2** with GVRP enabled on the Switches and on the interfaces on each Switch.
`awplus(config-vlan)#` `vlan 20-30`	Create 11 VLANs with VIDs 20 through 30 to propagate between interface `port1.0.2` on **Switch 1** and **Switch 2**.
`awplus(config)#` `gvrp dynamic-vlan-creation`	Enable dynamic VLAN creation for GVRP. Note that GVRP is now enabled globally for **Switch 2**.
`awplus(config)#` `interface port1.0.2`	Specify an interface (`port1.0.2`) to be configured and enter Interface Configuration mode.
`awplus(config-if)#` `switchport mode trunk`	Set the switching characteristics of the interface as trunk and specify tagged frames only. Any frames not tagged as trunk frames are discarded.
`awplus(config-if)#` `switchport trunk allowed vlan all`	Set this interface to be a tagged member of all VLANs.
`awplus(config-if)#` `gvrp`	Enable GVRP on switch port `port1.0.2`.
`awplus(config-if)#` `exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#` `exit`	Exit Global Configuration mode and enter Privileged Exec mode.
`awplus#` `show gvrp configuration`	Show GVRP configuration on **Switch 2** to confirm GVRP is ready to propagate VLANs.

Switch 1: Validating VLANs have propagated from Switch 2:

`awplus#`	
`show vlan`	Confirm the VLANs are available from **Switch 2** on **Switch 1** by examining show output to confirm VLANs from **Switch 2** are on **Switch 1**.

Names of Commands Used

gvrp (interface)
gvrp dynamic-vlan-creation
switchport mode trunk
vlan database
vlan

Validation Commands

show vlan

Chapter 27: GVRP Commands

Command List

With GVRP enabled the switch can exchange VLAN configuration information with other GVRP enabled switches. VLANs can be dynamically created and managed through trunk ports.

- There is limit of 400 VLANs supported by the AlliedWare Plus GVRP implementation. VLANs may be numbered 1-4094, but a limit of 400 of these VLANs are supported.
- MSTP is not supported by the AlliedWare Plus GVRP implementation. GVRP and MSTP are mutually exclusive. STP and RSTP are supported by GVRP.
- VCStack is not supported by the current AlliedWare Plus GVRP implementation.

This chapter provides an alphabetical reference for commands used to configure GVRP. For information about GVRP, including configuration, see **Chapter 26, GVRP Introduction and Configuration**.

clear gvrp statistics

Use this command to clear the GVRP statistics for all switchports, or for a specific switchport.

Syntax `clear gvrp statistics {all|<interface>}`

Parameter	Description
`all`	Specify all switchports to clear GVRP statistics.
`<interface>`	Specify the switchport to clear GVRP statistics.

Mode Privileged Exec

Usage Use this command together with the **show gvrp statistics** command to troubleshoot GVRP.

Examples To clear all GVRP statistics for all switchport on the switch, enter the command:

```
awplus#clear gvrp statistics all
```

To clear GVRP statistics for switchport interface `port1.0.3`, enter the command:

```
awplus#clear gvrp statistics port1.0.3
```

Related Commands **show gvrp statistics**

debug gvrp

Use this command to debug GVRP packets and commands, sending output to the console.

Use the **no** variant of this command to turn off debugging for GVRP packets and commands.

Syntax

```
debug gvrp {all|cli|event|packet}
no debug gvrp {all|cli|event|packet}
```

Parameter	Description
`all`	Specifies debugging for all levels.
`cli`	Specifies debugging for commands.
event	Specified debugging for events.
`packet`	Specifies debugging for packets.

Mode Privileged Exec and Global Configuration

Examples To send debug output to the console for GVRP packets and GVRP commands, and to enable the display of debug output on the console first, enter the commands:

```
awplus#terminal monitor
awplus#configure terminal
awplus(config)#debug gvrp all
```

To send debug output for GVRP packets to the console, enter the commands:

```
awplus#terminal monitor
awplus#configure terminal
awplus(config)#debug gvrp packets
```

To send debug output for GVRP commands to the console, enter the commands:

```
awplus#terminal monitor
awplus#configure terminal
awplus(config)#debug gvrp cli
```

To stop sending debug output for GVRP packets and GVRP commands to the console, and to stop the display of any debug output on the console, enter the commands:

```
awplus#terminal no monitor
awplus#configure terminal
awplus(config)#no debug gvrp all
```

Related Commands

show debugging gvrp
terminal monitor

gvrp (interface)

Use this command to enable GVRP for switchport interfaces.

Use the **no** variant of this command to disable GVRP for switchport interfaces.

Syntax

```
gvrp
no gvrp
```

Mode Interface Configuration (for switchport interfaces).

Default Disabled by default.

Usage Use this command to enable GVRP on switchport interfaces. Note this command does not enable GVRP for the switch. To enable GVRP on switchports use this command in Interface Configuration mode. You must issue a **gvrp enable (global)** command before issuing a **gvrp (interface)** command.

You must enable GVRP on both ends of a link for GVRP to propagate VLANs between links.

Note

MSTP is not supported by the current AlliedWare Plus GVRP implementation. GVRP and MSTP are mutually exclusive. STP and RSTP are supported by GVRP.

Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. GVRP and private VLAN trunk ports are mutually exclusive.

Examples To enable GVRP on interfaces `port1.0.1-port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#gvrp enable
awplus(config)#interface port1.0.1-port1.0.2
awplus(config-if)#gvrp
```

To disable GVRP on interfaces `port1.0.1-port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1-port1.0.2
awplus(config-if)#no gvrp
```

Validation Commands **show gvrp configuration**

Related Commands **gvrp dynamic-vlan-creation**
gvrp enable (global)

gvrp dynamic-vlan-creation

Use this command to enable dynamic VLAN creation globally for the switch.

Use the **no** variant of this command to disable dynamic VLAN creation globally for the switch.

Syntax `gvrp dynamic-vlan-creation`

`no gvrp dynamic-vlan-creation`

Mode Global Configuration

Default Disabled by default.

Usage You must enable GVRP on both ends of a link for GVRP to propagate VLANs between links.

You must also enable GVRP globally in Global Configuration mode before enabling GVRP on an interface in Interface Configuration mode. Both of these tasks must occur to create VLANs.

Note There is limit of 400 VLANs supported by the AlliedWare Plus GVRP implementation. VLANs may be numbered 1-4094, but a limit of 400 of these VLANs are supported.

Examples To enable GVRP dynamic VLAN creation on the switch, enter the commands:

```
awplus#configure terminal
awplus(config)#gvrp enable
awplus(config)#gvrp dynamic-vlan-creation
```

Enter the following commands for switches with hostnames `awplus_switch1` and `awplus_switch2` respectively, so `awplus_switch1` propagates VLANs to `awplus_switch2` and `awplus_switch2` propagates VLANs to `awplus_switch1`:

```
awplus_switch1#configure terminal
awplus_switch1(config)#gvrp enable
awplus_switch1(config)#gvrp dynamic-vlan-creation

awplus_switch2#configure terminal
awplus_switch2(config)#gvrp enable
awplus_switch2(config)#gvrp dynamic-vlan-creation
```

To disable GVRP dynamic VLAN creation on the switch, enter the commands:

```
awplus#configure terminal
awplus(config)#no gvrp dynamic-vlan-creation
```

Validation Commands **show gvrp configuration**

Related Commands **gvrp enable (global)**

gvrp enable (global)

Use this command to enable GVRP globally for the switch.

Use the **no** variant of this command to disable GVRP globally for the switch.

Syntax

```
gvrp enable
no gvrp enable
```

Mode Global Configuration

Default Disabled by default.

Usage Use this command to enable GVRP on the switch. Note that this command does not enable GVRP on switchports. To enable GVRP on switchports use the **gvrp (interface)** command in Interface Configuration mode. You must issue a **gvrp enable (global)** command before issuing a **gvrp (interface)** command.

You must enable GVRP on both ends of a link for GVRP to propagate VLANs between links.

Note

MSTP is not supported by the current AlliedWare Plus GVRP implementation. GVRP and MSTP are mutually exclusive. STP and RSTP are supported by GVRP.

Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. GVRP and private VLAN trunk ports are mutually exclusive.

Examples To enable GVRP for the switch, before enabling GVRP on switchports, enter the commands:

```
awplus#configure terminal
awplus(config)#gvrp enable
```

To disable GVRP on the switch, which will also disable GVRP enabled on switchports, enter the commands:

```
awplus#configure terminal
awplus(config)#no gvrp enable
```

Validation Commands **show gvrp configuration**

Related Commands **gvrp (interface)**
gvrp dynamic-vlan-creation

gvrp registration

Use this command to set GVRP registration to normal, fixed, and forbidden registration modes.

Syntax `gvrp registration {normal|fixed|forbidden}`

Parameter	Description
`normal`	Specify dynamic GVRP registration and deregistration of VLANs.
`fixed`	Specify fixed GVRP registration and deregistration of VLANs.
`forbidden`	Specify no GVRP registration of VLANs. VLANs are deregistered.

Mode Interface Configuration

Default Normal registration is the default.

Usage Configuring a trunk port in normal registration mode allows dynamic creation of VLANs. Normal mode is the default mode. Validate using the **show gvrp configuration** command.

Configuring a trunk port in fixed registration mode allows manual creation of VLANs.

Configuring a trunk port in forbidden registration mode prevents VLAN creation on the port.

Examples To disable GVRP on interfaces `port1.0.1-port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1-port1.0.2
awplus(config-if)#no gvrp
```

To disable GVRP on interfaces `port1.0.1-port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1-port1.0.2
awplus(config-if)#no gvrp
```

To disable GVRP on interfaces `port1.0.1-port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1-port1.0.2
awplus(config-if)#no gvrp
```

Validation Commands **show gvrp configuration**

gvrp timer

Use this command to set GVRP timers in Interface Configuration mode for a given interface.

Use the **no** variant of this command to reset the GVRP timers to the defaults specified in the table below.

Syntax

```
gvrp timer
    {join <timer-value>|leave <timer-value>|leaveall <timer-value>}

no gvrp timer {join|leave|leaveall}
```

Parameter	Description
`join`	Specifies the timer for joining the group (default is 20 centiseconds / hundredths of a second, or 200 milliseconds).
`leave`	Specifies the timer for leaving a group (default is 60 centiseconds / hundredths of a second, or 600 milliseconds).
`leaveall`	Specifies the timer for leaving all groups (default is 1000 centiseconds / hundredths of a second, or 10,000 milliseconds).
<timer-value>	<1-65535> The timer value in hundredths of a second (centiseconds).

Mode Interface Configuration

Defaults The default join time value is 20 centiseconds (200 milliseconds), the default leave timer value is 60 centiseconds (600 milliseconds), and the default leaveall timer value is 1000 centiseconds (10,000 milliseconds).

Usage When configuring the `leave` timer, set it to more than or equal to three times the `join` timer value. The settings for the `leave` and `join` timers must be the same for all GVRP enabled switches. See also the section **"Setting the GVRP Timers" on page 26.6**.

Use the **show gvrp timer** command to confirm GVRP timers set with this command.

Examples To set the GVRP `join` timer to 300 hundredths of a second for interface `port1.0.1`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#gvrp timer join 20
```

To set the GVRP `leave` timer to 600 hundredths of a second for interface `port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.2
awplus(config-if)#gvrp timer leave 60
```

To set the GVRP `leaveall` timer to 1000 hundredths of a second for interface `port1.0.1`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#gvrp timer leaveall 1000
```

To reset the GVRP `join` timer to its default (200 milliseconds) for interface `port1.0.1`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#no gvrp timer join
```

To reset the GVRP `leave` timer to its default (600 milliseconds) for interface `port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.2
awplus(config-if)#no gvrp timer leave
```

To disable GVRP on interfaces `port1.0.1-port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1-port1.0.2
awplus(config-if)#no gvrp
```

Related Commands **show gvrp timer**

show debugging gvrp

Use this command to display the GVRP debugging option set.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show debugging gvrp`

Mode User Exec and Privileged Exec

Example Enter the following commands to display GVRP debugging output on the console:

```
        awplus#configure terminal
awplus(config)#debug gvrp all
awplus(config)#exit
        awplus#show debugging gvrp
```

Output See sample output from the `show debugging gvrp` after entering `debug gvrp all`:

```
GVRP debugging status:
  GVRP Event debugging is on
  GVRP CLI debugging is on
  GVRP Timer debugging is on
  GVRP Packet debugging is on
```

Related Commands **debug gvrp**

show gvrp configuration

Use this command to display GVRP configuration data for a switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show gvrp configuration`

Mode User Exec and Privileged Exec

Example To show GVRP configuration for the switch, enter the command:

```
awplus#show gvrp configuration
```

Output The following is an output of this command displaying the GVRP configuration for a switch:

```
awplus#show gvrp configuration
Global GVRP Configuration:
GVRP Feature: Enabled
Dynamic Vlan Creation: Disabled
Port based GVRP Configuration:
                                                    Timers(centiseconds)
Port    GVRP Status Registration  Applicant   Join    Leave
LeaveAll
---------------------------------------------------------------------
port1.0.1 Enabled   Normal        Normal      20       60     1000
port1.0.2 Enabled   Normal        Normal      200     600    10000
```

show gvrp machine

Use this command to display the state machine for GVRP.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show gvrp machine`

Mode User Exec and Privileged Exec

Example To show the GVRP state machine for the switch, enter the command:

```
awplus#show gvrp machine
```

Output See the following output of this command displaying the GVRP state machine.

```
awplus show gvrp machine
  port = 1.0.1  applicant state = QA   registrar state = INN
  port = 1.0.2  applicant state = QA   registrar state = INN
```

show gvrp statistics

Use this command to display a statistical summary of GVRP information for the switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show gvrp statistics [<interface>]`

Parameter	Description
<interface>	The name of the switchport interface.

Mode User Exec and Privileged Exec

Usage Use this command together with the **clear gvrp statistics** command to troubleshoot GVRP.

Examples To show the GVRP statistics for all switchport interfaces, enter the command:

```
awplus#show gvrp statistics
```

To show the GVRP statistics for switchport interfaces `port1.0.1` and `port1.0.2`, enter the command:

```
awplus#show gvrp statistics port1.0.1-port1.0.2
```

Output The following is an output of this command displaying a statistical summary for `port1.0.1-port1.0.2`

```
awplus# show gvrp statistics port1.0.1-port1.0.2
Port      JoinEmpty    JoinIn   LeaveEmpty     LeaveIn      Empty
-----------------------------------------------------------------
1.0.1     RX           0          2          0         0        0
          TX           0          0          0         0        0
1.0.2     RX           0          1          0         0        1
          TX           0          0          0         0        0
```

Related Commands **clear gvrp statistics**

show gvrp timer

Use this command to display data for the GVRP timers set with the **gvrp timer** command.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show gvrp timer <interface>`

Parameter	Description
<interface>	The name of the switchport interface.

Mode User Exec and Privileged Exec

Examples To show the GVRP timers for all switchport interfaces, enter the command:

```
awplus#show gvrp timer
```

To show the GVRP timers for switchport interface `port1.0.1`, enter the command:

```
awplus#show gvrp timer port1.0.1
```

Output The following show output displays data for timers on the switchport interface `port1.0.1`

```
awplus# show gvrp timer port1.0.1
Timer            Timer Value (centiseconds)
-----------------------------------------
Join                   20
Leave                  60
Leave All              1000
```

Related Commands **gvrp timer**

Part 3: Layer Three, Switching and Routing

Chapter 28: Internet Protocol (IP) Addressing and Protocols

Introduction

This chapter describes how to configure IPv4 addressing and the protocols used to help IP function on your network.

As well as the familiar Internet, with uppercase "I", the term internet (with lowercase "i") can refer to any network (usually a wide area network) that uses the Internet Protocol. This chapter concentrates on this definition—a generalized network that uses IP as its network protocol.

Assigning an IP Address

To configure your device to perform IP routing (for example, to access the Internet) you need to configure IP. You also need to configure IP if you want to manage your device from any IP-based management process (such as SSH, Telnet, or SNMP).

Add an IP address to each of the interfaces that you want to process IP traffic.

You can configure an interface on your device with a static IP address, or with a dynamic IP address assigned using your device's DHCP client.

Static IP addresses

To add a static IP address to an interface, enter interface mode for the interface that you want to configure, then use the command:

```
awplus(config-if)# ip address <ip-addr/prefix-length>
                   [secondary [label <label>]]
```

where `<ip-address/m>` the IP address followed by a slash then the prefix length. Note that you cannot specify the mask in dotted decimal notation in this command.

For example, to give the interface vlan1 an address of 192.168.10.10, with a class C subnet mask, use the command:

```
awplus(config-if)# ip address 192.168.10.10/24
```

The **secondary** parameter allows you to add multiple IP addresses to an interface using this command. Each interface must have a primary IP address before you can add a secondary address. Your device treats secondary addresses the same as primary addresses in most instances, such as responding for ARP requests for the IP address. However, the only packets generated that have a secondary address as source address are routing updates. You can define up to 32 secondary addresses on a single interface.

DHCP dynamic addresses

When you use the DHCP client, it obtains the IP address and subnet mask for the interface, and other IP configuration parameters, from a DHCP server. To configure an interface to gain its IP configuration using the DHCP client, use the command:

```
awplus(config-if)# ip address dhcp [client-id <interface>]
                   [hostname <hostname>]
```

If an IP interface is configured to get its IP address and subnet mask from DHCP, the interface does not take part in IP routing until the IP address and subnet mask have been set by DHCP.

If you need to make a static entry in your DHCP server for the device, you need your device's MAC address, which you can display by using the command:

```
awplus# show interface
```

See **Chapter 89, Dynamic Host Configuration Protocol (DHCP) Introduction** for more information about DHCP.

Address Resolution Protocol (ARP)

Address Resolution Protocol (ARP) is used by your device to dynamically learn the Layer 2 address of devices in its networks. Most hosts also have a MAC physical address in addition to the assigned IP address. For Ethernet, this is a 6-byte, globally unique number. ARP enables your device to learn the physical address of the host that has a given IP address.

When your device needs to forward packets to a destination that it does not know the Layer 2 address of, it broadcasts an ARP request to determine where to send the packet. The ARP request is a broadcast packet and includes the target IP address. All stations on the LAN receive this broadcast but only one host recognizes its own IP address. It replies, thereby giving your device its physical address.

Your device creates a dynamic ARP entry in its ARP cache, to record the IP address to physical address mapping (also called a binding). It uses that ARP entry to forward further packets to that address.

The ARP protocol is described in RFC 826, ***An Ethernet Address Resolution Protocol—or—Converting Network Protocol Addresses to 48 bit Ethernet Address for Transmission on Ethernet Hardware***.

Static ARP Entries

If your LAN includes hosts that do not support ARP, you can add a static ARP entry to the cache. However, it is rarely necessary to add an ARP entry this way. To add a static ARP entry, use the command:

```
awplus(config)# arp <ip-addr> <mac-address> [<port-number>]
                [alias]
```

Timing Out ARP Entries

Your device times out dynamic ARP entries to ensure that the cache does not fill with entries for hosts that are no longer active. If your device stops receiving traffic for a device specified in a dynamic ARP entry, it deletes the ARP entry after a configurable timeout period. Static ARP entries are not aged or automatically deleted.

Increasing the ARP timeout reduces the amount of network traffic. Decreasing the timeout makes your device more responsive to changes in network topology.

To set a timeout period, enter the interface mode, then use the command:

```
awplus(config-if)# arp-aging-timeout <0-432000>
```

Deleting ARP Entries

To remove a static ARP entry, use the command:

```
awplus(config)# no arp <ip-addr>
```

To clear the ARP cache of dynamic entries, use the command:

```
awplus# clear arp-cache
```

This removes the dynamic ARP entries for all interfaces.

To display the entries in the ARP cache, use the command:

```
awplus)# show arp
```

The ARP cache will be repopulated by the normal ARP learning mechanism. As long as the entries are relearned quickly enough, deleting dynamic ARP entries does not affect:

- routes
- OSPF neighbor status
- the TCP/UDP connection status
- VRRP status

Proxy ARP

Proxy ARP (defined in RFC 1027) allows hosts that do not support routing (i.e. they have no knowledge of the network structure) to determine the physical addresses of hosts on other networks. Your device intercepts ARP broadcast packets and substitutes its own physical address for that of the remote host. This occurs only if your device has the best route to the remote host. By responding to the ARP request, your device ensures that subsequent packets from the local host are directed to its physical address, and it can then forward these to the remote host. The process is symmetrical.

Proxy ARP is disabled by default. To enable proxy ARP on an interface, use the commands:

```
awplus(config)# interface <interface>
awplus(config-if)# ip proxy-arp
```

To disable Proxy ARP on an interface, use the command:

```
awplus(config-if)# no ip proxy-arp
```

To check Proxy ARP is enabled on an interface, use the **show running-config** command. If Proxy ARP has been enabled an entry shows **ip proxy-arp** below the interface it is enabled on. No **ip proxy-arp** entry below an interface in the config indicates Proxy ARP is disabled on it.

See the sample configuration commands and validation command with resulting output showing proxy ARP **enabled** on VLAN 2 below:

```
awplus#configure terminal
awplus(config)#interface vlan2
awplus(config-if)#ip proxy-arp
awplus(config-if)#end
awplus(config)#exit
awplus#show running-config
!
interface vlan2
 ip proxy-arp
 ip address 192.168.2.2/24
!
```

See the sample configuration commands and validation command with resulting output showing proxy ARP **disabled** on VLAN 2 below:

```
awplus#configure terminal
awplus(config)#interface vlan2
awplus(config-if)#no ip proxy-arp
awplus(config-if)#end
awplus(config)#exit
awplus#show running-config
!
interface vlan2
 ip address 192.168.2.2/24
!
```

Local Proxy ARP

Local Proxy ARP lets you stop MAC address resolution between hosts within an interface's subnet. This ensures that devices within a subnet cannot send traffic that bypasses Layer 3 routing on your device. This lets you monitor, filter, and control traffic between devices in the same subnet.

Local Proxy ARP extends proxy ARP by intercepting and responding to ARP requests between hosts within a subnet. Local proxy ARP responds to ARP requests with your device's own MAC address details instead of those from the destination host. This stops hosts from learning the MAC address of other hosts within its subnet.

When Local Proxy ARP is operating on an interface, your device does not generate or forward any ICMP-Redirect messages on that interface.

Local Proxy ARP is disabled by default. To enable local proxy ARP on an interface, use the commands:

```
awplus(config)# interface <interface>
awplus(config-if)# ip local-proxy-arp
```

To disable local proxy ARP on an interface, use the command:

```
awplus(config-if)# no ip local-proxy-arp
```

To check Local Proxy ARP is enabled on an interface, use the **show running-config** command. If Local Proxy ARP has been enabled an entry shows **ip local-proxy-arp** below the interface it is enabled on. No **ip local-proxy-arp** entry below an interface in the config indicates Local Proxy ARP is disabled on it.

See the sample configuration commands and validation command with resulting output showing local proxy ARP **enabled** on VLAN 1 below:

```
awplus#configure terminal
awplus(config)#interface vlan1
awplus(config-if)#ip local-proxy-arp
awplus(config-if)#end
awplus(config)#exit
awplus#show running-config
!
interface vlan1
 ip local-proxy-arp
 ip address 192.168.1.2/24
!
```

See the sample configuration commands and validation command with resulting output showing Local Proxy ARP **disabled** on VLAN 1 below:

```
awplus#configure terminal
awplus(config)#interface vlan1
awplus(config-if)#no ip local-proxy-arp
awplus(config-if)#end
awplus(config)#exit
awplus#show running-config
!
interface vlan1
 ip address 192.168.1.2/24
!
```

ARP Logging

You can enable your device to log static and dynamic ARP entries, and you can select either default hexadecimal notation (HHHH.HHHH.HHHH) or standard IEEE format hexadecimal notation (HH-HH-HH-HH-HH-HH) for the MAC addresses displayed in the ARP log output.

If this feature is enabled, ARP log messages are stored on the device in RAM. If the device is rebooted the ARP log messages are lost. ARP logging is disabled by default.

To enable ARP logging, use the command:

```
awplus(config)# arp log [mac-address-format ieee]
```

You can specify whether the MAC address is displayed in the default hexadecimal notation HHHH.HHHH.HHHH or in the standard IEEE format HH-HH-HH-HH-HH-HH.

To disable ARP logging, use the command:

```
awplus(config)# no arp log [mac-address-format ieee]
```

To display the ARP log messages, use the command:

```
awplus(config)# show log | include ARP_LOG
```

See the sample ARP log output and descriptions of the fields displayed in the sample ARP log output in the **arp log** command on page 29.7.

Domain Name System (DNS)

The Domain Name System allows you to access remote systems by entering human-readable device host names rather than IP addresses. DNS works by creating a mapping between a domain name, such as “www.alliedtelesis.com”, and its IP address. These mappings are held on DNS servers. DNS translates meaningful domain names into IP addresses for networking equipment to locate and address these devices. The benefits of DNS are that domain names:

- can map to a new IP address if the host’s IP address changes
- are easier to remember than an IP address
- allow organizations to use a domain name hierarchy that is independent of any IP address assignment

Your AlliedWare Plus™ device has a the ability to resolve domain names for internally generated commands (DNS Client) as well as providing the DNS information to connected hosts (via DNS Relay, DHCP Server or DHCP Relay).

The DNS Client is enabled automatically when at least one DNS server is present on the interface. This client allows you to use domain names instead of IP addresses when using commands on your device from this interface.

The DNS Relay provides the presence of a local virtual DNS server which can service DNS lookup requests sent to it from local hosts. The DHCP Server can be configured to provide domain names information to DHCP clients during the lease process.

Domain name parts

Domain names are made up of a hierarchy of two or more name segments. Each segment is separated by a period. The format of domain names is the same as the host portion of a URL (Uniform Resource Locator). The first segment from the left is unique to the host, with each following segment mapping the host in the domain name hierarchy. The segment on the far right is a top-level domain name shared by many hosts.

Server hierarchy

A network of domain name servers maintains the mappings between domain names and their IP addresses. This network operates in a hierarchy that is similar to the structure of the domain names. When a local DNS server cannot resolve your request it sends the request to a higher level DNS server.

For example, to access the site “alliedtelesis.com”, your PC sends a DNS enquiry to its local DNS server asking for the IP address matching alliedtelesis.com. If this address is already locally cached (following its recent use), the DNS server returns the IP address that matches alliedtelesis.com. If the DNS server does not have this address cached, it forwards the request upwards through the hierarchy of DNS servers until a DNS server can resolve the mapping. This means an often-used domain name is resolved quickly, while an uncommon or nonexistent domain may take longer to resolve or fail.

As well as the hierarchy of domain name servers accessible through the Internet, you can operate your own DNS server to map to private IP addresses within your network.

The DHCP server IP address can be either statically defined, or can be dynamically assigned via DHCPv4 option 6 using **"ip name-server" on page 29.35** and DHCP option 15 using **"ip domain-name" on page 29.25** if DHCP client is configured. See **Chapter 89, Dynamic Host Configuration Protocol (DHCP) Introduction** for more information about DHCP and DHCP options.

DNS Client

Your AlliedWare Plus™ device has a DNS Client that is enabled automatically when you add a DNS server to your device. This client allows you to use domain names instead of IP addresses when using commands on your device.

To add a DNS server to the list of servers that the device sends DNS queries to, use the command:

```
awplus(config)# ip name-server <ip-addr>
```

To check the list of servers that the device sends DNS queries to, use the command:

```
awplus# show ip name-server
```

To add a default domain name used to append to DNS requests, use the command:

```
awplus(config)# ip domain-name <domain-name>
```

For example, to use DNS to match hostnames to your internal network "example.net", use the command:

```
awplus(config)# ip domain-name example.net
```

If you then use the command **ping host2**, your device sends a DNS request for host2.example.net. To check the domain name configured with this command, use the command:

```
awplus# show ip domain-name
```

Alternatively you can create a list of domain names that your device will try in turn by using the command:

```
awplus(config)# ip domain-list <domain-name>
```

For example, to use DNS to match incomplete hostnames to the top level domains ".com", and ".net", use the commands:

```
awplus(config)# ip domain-list .com
awplus(config)# ip domain-list .net
```

If you then use the command **ping alliedtelesis**, your device sends a DNS request for alliedtelesis.com and if no match was found your device would then try alliedtelesis.net. To check the entries in the domain list, use the command:

```
awplus# show ip domain-list
```

To disable the DNS client on your device, use the command:

```
awplus(config)# no ip domain-lookup
```

To check the status of the DNS Client on your device, and the configured servers and domain names, use the command:

```
awplus# show hosts
```

DNS Relay

Enabling DNS Relay your switch provides the capability for it act as a local virtual DNS server. It can then service DNS lookup repetitive requests sent to it from local hosts. Acting as a DNS Relay the switch will usually relay the requests to an external, or upstream, DNS server. By default, DNS Relay is disabled.

Optionally, DNS name resolver caching may be enabled on the DNS Relay, which can provide some lookup speed advantage and avoid unnecessary repeated requests to external DNS servers. By default, DNS caching is disabled.

When the DNS Relay name resolver cache is enabled on your switch, the switch will maintain a cache of recently used mappings between domain names and IP addresses so that other identical requests can be responded to without further reference to an external, or upstream DNS server. When the switch receives a DNS query from a client the switch will attempt to match the request with entries in this cache. If the switch does not have this address cached, it forwards the request upwards through the hierarchy of DNS servers for resolution. The DNS cache has a limited size, and times out entries after a specified period of up to 60 minutes.

The relaying of DNS queries is required for use in networks where the DNS server and the clients connected to the switch are on different subnets and do not know how to reach each other.

DNS Relay uses the DNS server list configured by the **ip name-server** command to forward DNS query packets. To enable DNS Relay you need to configure the list of servers that the device sends DNS queries to and then enable DNS forwarding, as shown in the following example for a DNS server with an IPv4 address:

```
awplus# configure terminal
awplus(config)# ip name-server 192.168.1.1
awplus(config)# ip name-server 192.168.1.2
awplus(config)# ip dns forwarding
```

Note both IPv4 and IPv6 support DNS record types. IPv4 and IPv6 are supported in DNS name-to-address and DNS address-to-name lookup processes. Specifying a name server and enabling DNS forwarding maps both IPv4 and IPv6 addresses. You can configure DNS Relay to use IPv6 addresses using the same commands used to configure DNS Relay to use IPv4 addresses, as shown in the following example:

```
awplus# configure terminal
awplus(config)# ip name-server 2001:0db8:010d::1
awplus(config)# ip name-server 2001:0db8:010d::2
awplus(config)# ip dns forwarding
```

You can then configure DNS Relay behavior with the following commands:

To set the number of times the switch will retry to forward DNS queries, use the command:

```
awplus(config)# ip dns forwarding retry <0-100>
```

To set the number of seconds to wait for a response, use the command:

```
awplus(config)# ip dns forwarding timeout <0-3600>
```

To set the DNS forwarding dead-time period in seconds, use the command:

```
awplus(config)# ip dns forwarding dead-time <60-43200>
```

At the dead-time period set, the switch stops sending requests to an unresponsive server.

To set the interface to use for forwarding and receiving DNS queries, use the command:

```
awplus(config)# ip dns forwarding source-interface
                <interface-name>
```

To specify the DNS Relay name resolver cache size and lifetime, use the command:

```
awplus(config)# ip dns forwarding cache [size <0-1000>]
                [timeout <60-3600>]
```

To remove entries from the DNS Relay name resolver cache, use the command:

```
awplus(config)# clear ip dns forwarding cache
```

Information which may be useful for troubleshooting DNS Relay is available using the DNS Relay debugging function. To enable DNS Relay debugging, use the command:

```
awplus# debug ip dns forwarding
```

To display the status of DNS Relay, use the command:

```
awplus# show ip dns forwarding
```

To display the status of DNS Relay name servers, use the command:

```
awplus# show ip dns forwarding server
```

To display the DNS Relay name resolver cache, use the command:

```
awplus# show ip dns forwarding cache
```

DHCP options

When your device is using its DHCP client for an interface, it can receive the following DHCP options from the DHCP server:

- Option 6 - a list of DNS servers. This list appends to the DNS servers set on your device with the **ip name-server** command.
- Option 15 - a domain name used to resolve host names. This option replaces the domain name set with the **ip domain-name** command.

See **Chapter 89, Dynamic Host Configuration Protocol (DHCP) Introduction** for more information about DHCP and DHCP options.

Internet Control Message Protocol (ICMP)

The Internet Control Message Protocol (ICMP) allows networking devices to send information and control messages to other devices or hosts. Your device implements all non-obsolete ICMP functions.

The following table lists the ICMP messages implemented by your device.

ICMP Message Type	Device Response
Echo reply (0)	This is used to implement the ping command. Your device sends out an echo reply in response to an echo request.
Destination unreachable (3)	This message is sent when your device drops a packet because it did not have a route to the destination.
Redirect (5)	Your device issues this message to inform a local host that its target is located on the same LAN (no routing is required) or when it detects a host using a non-optimal route (usually because a link has failed or changed its status). For example, if your device receives a packet destined to its own MAC address, but with a destination IP address of another host in the local subnet, it returns an ICMP redirect to the originating host. ICMP redirects are disabled on interfaces on which local proxy ARP is enabled.
Echo request (8)	This is related to echo replies. If your device receives an echo request, it sends an echo reply. If you enter the ping command, your device generates echo requests.
Router Advertisements (10)	These are Router Discovery Protocol messages. If Router Discovery is enabled, your device sends these to announce the IP addresses of the sending interface.
Time to Live Exceeded (11)	If the TTL field in a packet falls to zero, your device sends this message.This occurs when there are too many hops in the path that a packet is traversing.

ICMP messages are enabled on all interfaces by default. You can control the flow of ICMP messages across different interfaces using the **access-list** commands. See **Chapter 58, IPv4 Hardware Access Control List (ACL) Commands** and **Chapter 59, IPv4 Software Access Control List (ACL) Commands**.

Checking IP Connections

To verify connections between networks and network devices, use the ping (Packet Internet Groper) and trace route functions on your device.

Ping

Ping tests the connectivity between two network devices to determine whether each network device can “see” the other device. Echo request packets are sent to the destination addresses and responses are displayed on the console.

If you can ping the end destination, then the physical, Layer 2 and Layer 3 links are functioning, and any difficulties are in the network or higher layers.

If pinging the end destination fails, use traceroute to discover the point of failure in the route to the destination.

To ping a device, use the command:

```
awplus# ping {<hostname>|<ipaddr>}
```

Traceroute

You can use traceroute to discover the route that packets pass between two systems running the IP protocol. Traceroute sends an initial UDP packets with the Time To Live (TTL) field in the IP header set starting at 1. The TTL field is increased by one for every subsequent packet sent until the destination is reached. Each hop along the path between two systems responds with a TTL exceeded packet (ICMP type 11) and from this the path is determined.

To use traceroute, use the command:

```
awplus# traceroute {<ip-addr>|<hostname>}
```

Enter either the hostname or the IP address of the device you are trying to reach.

IP Helper

The IP Helper feature allows the switch to receive UDP broadcasts on one subnet, and forward them as broadcasts or unicasts into another subnet, so a client can use an application which uses UDP broadcast (such as Net-BIOS) when the client and server are located in different subnets. The IP Helper feature forwards UDP broadcast network traffic to specific hosts on another subnet and/or to the broadcast address of another subnet.

When the IP Helper feature is enabled on a VLAN interface, the UDP broadcast packets received on the interface are processed for forwarding out through another interface into another subnet. Depending on the nature of the ip-helper addresses configured, the UDP broadcasts will be unicast forwarded to a single host in the destination subnet, or unicast forwarded to multiple hosts in the destination subnet, or broadcast to the broadcast address of the destination subnet. Not all UDP broadcasts will be forwarded when IP Helper is configured. The set of broadcasts to be forwarded can be defined by specifying the destination UDP port(s) of the packets you wish to forward.

The command to enable the forwarding of UDP broadcasts received on a given interface is **ip helper-address** (entered in interface configuration mode). The **ip forward-protocol udp** command specifies types of broadcast packets to forward.

Multiple different destination addresses can be specified by using multiple instances of the **ip helper-address** command under the same interface. If a destination address is specified that is actually the broadcast address of one of the subnets directly connected to the switch, then the UDP packets will be forwarded as broadcasts onto that subnet.

Likewise, multiple different types of UDP packet can be specified for forwarding by specifying multiple different destination ports using the **ip forward-protocol udp** command.

Note

The types of UDP broadcast packets that the switch will forward are **only** those specified by the **ip forward-protocol** command(s). The IP Helper process does not forward any other UDP packet types by default.

IP Directed Broadcast

IP directed-broadcast is enabled and disabled per VLAN interface. When enabled a directed broadcast packet is forwarded to an enabled VLAN interface if received on another subnet.

An IP directed broadcast is an IP packet whose destination address is a broadcast address for some IP subnet, but originates from a node that is not itself part of that destination subnet. When a directed broadcast packet reaches a switch that is directly connected to its destination subnet, the packet is flooded as a broadcast on the destination subnet.

The **ip directed-broadcast** command controls the flooding of directed broadcasts when they reach target subnets. The command affects the final transmission of the directed broadcast on its destination subnet. It does not affect the transit unicast routing of IP directed broadcasts. If directed broadcast is enabled for an interface, incoming directed broadcast IP packets intended for the subnet assigned to interface will be flooded as broadcasts on that subnet.

If the **no ip directed-broadcast** command is configured for an interface, directed broadcasts destined for the subnet where the interface is attached will be dropped instead of broadcast.

Chapter 29: IP Addressing and Protocol Commands

Introduction

This chapter provides an alphabetical reference of commands used to configure the following protocols:

- Address Resolution Protocol (ARP)
- Domain Name Service (DNS)

For more information see **Chapter 28, Internet Protocol (IP) Addressing and Protocols**.

Command List

arp-mac-disparity

Use this command in Interface Configuration mode for a VLAN interface to enable the reception of ARP packets that contain a multicast MAC address in the sender field.

By default, ARP packets that contain a multicast MAC address in the sender field are dropped. The **no** variant of this command reverts to the default behavior.

Syntax

```
arp-mac-disparity
no arp-mac-disparity
```

Default ARP disparity is disabled. ARP packets with a multicast MAC address in the sender field are dropped.

Mode Interface Configuration for a VLAN interface.

Usage Normally, it is invalid for an ARP request to resolve a multicast MAC address. By default, ARP replies with a multicast MAC addresses are not learnt. This command allows control over the learning of dynamic ARPs that resolve to a multicast MAC address.

ARP-MAC disparity may need to be enabled to support multicast network load balancing. The **arp-mac-disparity** command allows ARP replies quoting multicast MAC addresses to be accepted and learnt. No **no arp-mac-disparity** command reverts to default behavior.

If the ARP-MAC disparity feature is enabled, then the switch sends traffic to a single port as specified by the ARP entry.

Examples To enable ARP MAC disparity on interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-mac-disparity
```

To disable ARP MAC disparity on interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no arp-mac-disparity
```

Related Commands **clear arp-cache**
show arp

arp-aging-timeout

This command sets a timeout period on dynamic ARP entries associated with a specific interface. If your device stops receiving traffic for the host specified in a dynamic ARP entry, it deletes the ARP entry from the ARP cache after this timeout is reached.

Your device times out dynamic ARP entries to ensure that the cache does not fill with entries for hosts that are no longer active. Static ARP entries are not aged or automatically deleted.

By default the time limit for dynamic ARP entries is 300 seconds on all interfaces.

The **no** variant of this command sets the time limit to the default of 300 seconds.

Syntax

```
arp-aging-timeout <0-432000>
no arp-aging timeout
```

Parameter	Description
<0-432000>	The timeout period in seconds.

Default 300 seconds (5 minutes)

Mode Interface Configuration for a VLAN interface.

Example To set the ARP entries on interface `vlan30` to time out after two minutes, use the commands:

```
awplus(config)# interface vlan30
awplus(config-if)# arp-aging-timeout 120
```

Related Commands

clear arp-cache
show arp

arp (IP address MAC)

This command adds a static ARP entry to the ARP cache. This is typically used to add entries for hosts that do not support ARP or to speed up the address resolution function for a host. The ARP entry must not already exist. Use the **alias** parameter to allow your device to respond to ARP requests for this IP address.

The **no** variant of this command removes the static ARP entry. Use the **clear arp-cache** command on page 29.11 to remove the dynamic ARP entries in the ARP cache.

Syntax

```
arp <ip-addr> <mac-address> [<port-number>] [alias]
no arp <ip-addr>
```

Parameter	Description
<ip-addr>	IPv4 address of the device you are adding as a static ARP entry.
<mac-address>	MAC address of the device you are adding as a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.
<port-number>	The port number associated with the IP address. Specify this when the IP address is part of a VLAN.
alias	Allows your device to respond to ARP requests for the IP address. Proxy ARP must be enabled on the interface before using this parameter.

Mode Global Configuration

Examples To add the IP address 10.10.10.9 with the MAC address 0010.2533.4655 into the ARP cache, and have your device respond to ARP requests for this address, use the commands:

```
awplus# configure terminal
awplus(config)# arp 10.10.10.9 0010.2355.4566 alias
```

Related Commands

clear arp-cache
ip proxy-arp
show arp

arp log

This command enables the logging of dynamic and static ARP entries in the ARP cache. The ARP cache contains mappings of switch ports, VLAN IDs, and IP addresses to physical MAC addresses for hosts.

This command can display the MAC addresses in the ARP log either using the default hexadecimal notation (HHHH.HHHH.HHHH), or using the IEEE standard hexadecimal notation (HH-HH-HH-HH-HH-HH).

Use the **no** variant of this command to disable the logging of dynamic and static ARP entries in the ARP cache.

Syntax

```
arp log [mac-address-format ieee]

no arp log [mac-address-format ieee]
```

Parameter	Description
`mac-address-format ieee`	Display the MAC address in hexadecimal notation with the standard IEEE format (HH-HH-HH-HH-HH-HH), instead of displaying the MAC address with the default hexadecimal format (HHHH.HHHH.HHHH).

Default The ARP logging feature is disabled by default.

Mode Global Configuration

Usage You have the option to change how the MAC address is displayed in the ARP log message, to use the default hexadecimal notation (HHHH.HHHH.HHHH), or the IEEE format hexadecimal notation (HH-HH-HH-HH-HH-HH) when you apply the **mac-address-format ieee** parameter.

Enter the **arp log** command without the optional **mac-address-format ieee** parameter specified for MAC addresses in the ARP log output to use the default hexadecimal notation (HHHH.HHHH.HHHH).

Enter the **arp log mac-address-format ieee** command for MAC addresses in the ARP log output to use the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH).

Use the **no** variant of this command (**no arp log**) without the optional **mac-address-format ieee** parameter specified to disable ARP logging on the switch

Use the **no** variant of this command with the optional **mac-address-format ieee** parameter specified (**no arp log mac-address-format ieee**) to disable IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) and revert to the default hexadecimal notation (HHHH.HHHH.HHHH) for MAC addresses in the ARP log output.

To display ARP log messages use the **show log | include ARP_LOG** command.

Examples To enable ARP logging and use the default hexadecimal notation (HHHH.HHHH.HHHH), use the following commands:

```
awplus# configure terminal
awplus(config)# arp log
```

To disable ARP logging on the switch of MAC addresses displayed using the default hexadecimal notation (HHHH.HHHH.HHHH), use the following commands:

```
awplus# configure terminal
awplus(config)# no arp log
```

To enable ARP logging and to specify that the MAC address in the log message is displayed in the standard IEEE format hexadecimal notation (HH-HH-HH-HH-HH-HH), use the following commands:

```
awplus# configure terminal
awplus(config)# arp log mac-address-format ieee
```

To disable ARP logging on the switch of MAC addresses displayed using the standard IEEE format hexadecimal notation (HH-HH-HH-HH-HH-HH), and revert to the use of the default hexadecimal notation (HHHH.HHHH.HHHH) instead, use the following commands:

```
awplus# configure terminal
awplus(config)# no arp log mac-address-format ieee
```

To display ARP log messages, use following command:

```
awplus# show log | include ARP_LOG
```

Output Below is example output from the **show log | include ARP_LOG** command after enabling ARP logging displaying default hexadecimal notation MAC addresses (HHHH.HHHH.HHHH) using the **arp log** command.

```
awplus#configure terminal
awplus(config)#arp log
awplus(config)#exit
awplus#show log | include ARP_LOG
2010 Apr  6 06:21:01 user.notice awplus HSL[1007]: ARP_LOG port1.0.7 vlan1 add

2010 Apr  6 06:28:14 user.notice awplus IMISH[1830]: show log | include ARP_LOG
```

Below are the parameters in output of the **show log | include ARP_LOG** command with an ARP log message format of <*ARP_LOG*> <*port number*> <*VLAN ID*> <*Operation*> <*MAC*> <*IP*> after <*date*> <*time*> <*severity*> <*hostname*> <*program name*> information.

Table 29-1: Parameters in output of the show log | include ARP_LOG command

Parameter	Description
<*ARP_LOG*>	Indicates ARP log entry information follows <*date*> <*time*> <*severity*> <*hostname*> <*program name*> log information.
<*port number*>	Indicates switch port number for the ARP log entry.
<*VLAN ID*>	Indicates the VLAN ID for the ARP log entry.
<*Operation*>	Indicates '`add`' if the ARP log entry displays an ARP addition. Indicates '`del`' if the ARP log entry displays an ARP deletion.
<*MAC*>	Indicates the MAC address for the ARP log entry, either in the default hexadecimal notation (HHHH.HHHH.HHHH) or in the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) as specified with the **arp log** or the **arp log mac-address-format ieee** command.
<*IP*>	Indicates the IP address for the ARP log entry.

Validation Commands **show running-config**

Related Commands **show log**

arp opportunistic-nd

This command changes the behavior for unsolicited ARP packet forwarding on the switch.

Use this command to enable opportunistic neighbor discovery for the global ARP cache.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global ARP cache.

```
arp opportunistic-nd
```

```
no arp opportunistic-nd
```

Default Opportunistic neighbor discovery is disabled by default.

Mode Global Configuration

Usage When opportunistic neighbor discovery is enabled, the switch will reply to any received unsolicited ARP packets (but not gratuitous ARP packets). The source MAC address for the unsolicited ARP packet is added to the ARP cache, so the switch forwards the ARP packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ARP packet is not added to the ARP cache, so the ARP packet is not forwarded by the switch.

Note this command enables or disables opportunistic neighbor discovery for a VRF Lite instance if the **VRF Lite** parameter and an instance name are applied. If a VRF Lite instance is not specified, then opportunistic neighbor discovery is enabled or disabled for switch ports configured for IPv4.

Examples To enable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd
```

To disable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd
```

Related Commands **ipv6 opportunistic-nd**

show arp

Validation Commands **show running-config interface**

clear arp-cache

This command deletes dynamic ARP entries from the ARP cache. You can optionally specify the IPv4 address of an ARP entry to be cleared from the ARP cache.

Syntax

```
clear arp-cache [<ip-address>]
```

Mode

Privileged Exec

Usage

To display the entries in the ARP cache, use the **show arp** command. To remove static ARP entries, use the no variant of the **arp (IP address MAC)** command on page 29.6.

Example

To clear all dynamic ARP entries, use the command:

```
awplus# clear arp-cache
```

To clear all dynamic ARP entries associated with the IPv4 address 192.168.1.1, use the command:

```
awplus# clear arp-cache 192.168.1.1
```

Related Commands

arp-mac-disparity
arp (IP address MAC)
show arp

clear ip dns forwarding cache

Use this command to clear the DNS Relay name resolver cache.

Syntax

```
clear ip dns forwarding cache
```

Mode

Privileged Exec

Examples

To clear all cached data, use the command:

```
awplus# clear ip dns forwarding cache
```

Related Commands

ip dns forwarding cache

debug ip dns forwarding

Use this command to enable DNS Relay debugging.

Use the **no** variant of this command to disable DNS Relay debugging.

Syntax

```
debug ip dns forwarding
no debug ip dns forwarding
```

Default DNS Relay debugging is disabled by default.

Mode Privileged Exec

Examples To enable DNS forwarding debugging, use the commands:

```
awplus# debug ip dns forwarding
```

To disable DNS forwarding debugging, use the commands:

```
awplus# no debug ip dns forwarding
```

Related Commands

ip dns forwarding
show debugging ip dns forwarding

debug ip packet interface

The **debug ip packet interface** command enables IP packet debug and is controlled by the **terminal monitor** command.

If the optional **icmp** keyword is specified then ICMP packets are shown in the output.

The **no** variant of this command disables the **debug ip interface** command.

Syntax

```
debug ip packet interface {<interface-name>|all}
   [address <ip-address>|verbose|hex|arp|udp|tcp|icmp]

no debug ip packet interface [<interface-name>]
```

Parameter	Description
<interface>	Specify a single Layer 3 interface name (not a range of interfaces) This keyword can be specified as either all or as a single Layer 3 interface to show debugging for either all interfaces or a single interface.
`all`	Specify all Layer 3 interfaces on the switch.
<ip-address>	Specify an IPv4 address. If this keyword is specified, then only packets with the specified IP address as specified in the ip-address placeholder are shown in the output.
`verbose`	Specify **verbose** to output more of the IP packet. If this keyword is specified then more of the packet is shown in the output.
`hex`	Specify **hex** to output the IP packet in hexadecimal. If this keyword is specified, then the output for the packet is shown in hex.
`arp`	Specify **arp** to output ARP protocol packets. If this keyword is specified, then ARP packets are shown in the output.
`udp`	Specify **udp** to output UDP protocol packets. If this keyword is specified then UDP packets are shown in the output.
`tcp`	Specify **tcp** to output TCP protocol packets. If this keyword is specified, then TCP packets are shown in the output.
`icmp`	Specify **icmp** to output ICMP protocol packets. If this keyword is specified, then ICMP packets are shown in the output.

Mode Privileged Exec and Global Configuration

Examples To turn on ARP packet debugging on `vlan1`, use the command:

```
awplus# debug ip packet interface vlan1 arp
```

To turn on all packet debugging on all interfaces on the switch, use the command:

```
awplus# debug ip packet interface all
```

To turn on TCP packet debugging on `vlan1` and IP address `192.168.2.4`, use the command:

```
awplus# debug ip packet interface vlan1 address 192.168.2.4
       tcp
```

To turn off IP packet interface debugging on all interfaces, use the command:

```
awplus# no debug ip packet interface
```

To turn off IP packet interface debugging on interface `vlan2`, use the command:

```
awplus# no debug ip packet interface vlan2
```

Related Commands

no debug all
show debugging ip dns forwarding

terminal monitor
undebug ip packet interface

ip address

This command sets a static IP address on an interface. To set the primary IP address on the interface, specify only **ip address <*ip-address/m*>**. This overwrites any configured primary IP address. To add additional IP addresses on this interface, use the **secondary** parameter. You must configure a primary address on the interface before configuring a secondary address.

Note Use **show running-config** interface not **show ip interface brief** when you need to view a secondary address configured on an interface. **show ip interface brief** will only show the primary address not a secondary address for an interface.

The **no** variant of this command removes the IP address from the interface. You cannot remove the primary address when a secondary address is present.

Syntax

```
ip address <ip-addr/prefix-length> [secondary [label <label>]]
no ip address <ip-addr/prefix-length> [secondary]
no ip address
```

Parameter	Description
<ip-addr/prefix-length>	The IPv4 address and prefix length you are assigning to the interface.
`label`	Adds a user-defined description of the secondary IP address.
<label>	A user-defined description of the secondary IP address. Valid characters are any printable character and spaces.

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To add the primary IP address `10.10.10.50/24` to the interface `vlan3`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip address 10.10.10.50/24
```

To add the secondary IP address `10.10.11.50/24` to the same interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip address 10.10.11.50/24 secondary
```

To add the IP address `10.10.11.50/24` to the local loopback interface `lo`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.11.50/24
```

Related Commands

interface (to configure)

show running-config interface

ip dns forwarding

Use this command to enable DNS Relay, the forwarding of incoming DNS queries for IP hostname-to-address translation.

Use the **no** variant of this command to disable the forwarding of incoming DNS queries for IP hostname-to-address translation.

Syntax

```
ip dns forwarding
no ip dns forwarding
```

Default The forwarding of incoming DNS query packets is disabled by default.

Mode Global Configuration

Usage See **"DNS Relay" on page 28.10** for more information about DNS Relay to map IPv4 and IPv6 addresses to name servers to maintain a a database of hostname-to-address mappings

Examples To enable the forwarding of incoming DNS query packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding
```

To disable the forwarding of incoming DNS query packets, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding
```

show ip dns forwarding server

ip dns forwarding cache

Use this command to set the DNS Relay name resolver cache size and cache entry lifetime period. The DNS Relay name resolver cache stores the mappings between domain names and IP addresses.

Use the **no** variant of this command to set the default DNS Relay name resolver cache size and cache entry lifetime period.

Note that the lifetime period of the cache entry can be overwritten by the time-out period of the DNS reply from the DNS server if the time-out period of the DNS reply from the DNS server is smaller than the configured time-out period. The time-out period of the cache entry will only be used when the time-out period of the DNS reply from the DNS server is bigger than the time-out period configured on the device.

Syntax

```
ip dns forwarding cache [size <0-1000>] [timeout <60-3600>]
no ip dns forwarding cache [size|timeout]
```

Parameter	Description
<0-1000>	Number of entries in the DNS Relay name resolver cache.
<60-3600>	Timeout value in seconds.

Default The default cache size is 0 (no entries) and the default lifetime is 1800 seconds.

Mode Global Configuration

Usage See **"DNS Relay" on page 28.10** for more information about DNS Relay to map IPv4 and IPv6 addresses to name servers to maintain a a database of hostname-to-address mappings.

Examples To set the cache size to `10` entries and the lifetime to `500` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding cache size 10 time 500
```

To set the cache size to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding cache size
```

ip dns forwarding dead-time

Use this command to set the time period in seconds when the switch stops sending any DNS requests to an unresponsive server and all retries set using **ip dns forwarding retry** are used. This time period is the DNS forwarding dead-time. The switch stops sending DNS requests at the DNS forwarding dead-time configured and when all of the retries are used.

Use the **no** variant of this command to restore the default DNS forwarding dead-time value of 3600 seconds.

Syntax

```
ip dns forwarding dead-time <60-43200>
```

no ip dns forwarding retry

Parameter	Description
<60-43200>	Set the DNS forwarding dead-time in seconds. At the dead-time set, the switch stops sending DNS requests to an unresponsive server.

Default The default time to stop sending DNS requests to an unresponsive server is 3600 seconds.

Mode Global Configuration

Usage See **"DNS Relay" on page 28.10** for more information about DNS Relay to map IPv4 and IPv6 addresses to name servers to maintain a a database of hostname-to-address mappings. See the **ip dns forwarding retry** command used with this command.

Examples To set the DNS forwarding retry count to `50` and to set the DNS forwarding dead-time to `1800` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding dead-time 1800
awplus(config)# ip dns forwarding retry 50
```

To reset the DNS retry count to the default of `2` and the DNS forwarding dead-time to the default of 3600, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding dead-time
awplus(config)# no ip dns forwarding retry
```

Related Commands

debug ip dns forwarding
ip dns forwarding
ip dns forwarding retry
show ip dns forwarding
show ip dns forwarding server

ip dns forwarding retry

Use this command to set the number of times DNS Relay will retry to forward DNS queries. The switch stops sending DNS requests to an unresponsive server at the time set using the **ip dns forwarding dead-time** command and when all of the retries are used.

Use the **no** variant of this command to set the number of retries to the default of 2.

Syntax

```
ip dns forwarding retry <0-100>
```

no ip dns forwarding retry

Parameter	Description
<0-100>	Set the number of times DNS Relay will retry to forward a DNS query.

Default The default number of retries is 2 DNS requests to an unresponsive server.

Mode Global Configuration

Usage See **"DNS Relay" on page 28.10** for more information about DNS Relay to map IPv4 and IPv6 addresses to name servers to maintain a a database of hostname-to-address mappings. See the **ip dns forwarding dead-time** command used with this command.

Examples To set the DNS forwarding retry count to `50` and to set the DNS forwarding dead-time to `1800` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding retry 50
awplus(config)# ip dns forwarding dead-time 1800
```

To reset the DNS retry count to the default of `2` and the DNS forwarding dead-time to the default of `3600` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding retry
awplus(config)# no ip dns forwarding dead-time
```

Related Commands

debug ip dns forwarding
ip dns forwarding
ip dns forwarding dead-time
show ip dns forwarding

ip dns forwarding source-interface

Use this command to set the interface to use for forwarding and receiving DNS queries.

Use the **no** variant of this command to unset the interface used for forwarding and receiving DNS queries.

Syntax

```
ip dns forwarding source-interface <interface-name>
no ip dns forwarding source-interface
```

Parameter	Description
<interface-name>	An alphanumeric string that is the interface name.

Default The default is that no interface is set and the switch selects the appropriate source IP address automatically.

Mode Global Configuration

Usage See **"DNS Relay" on page 28.10** for more information about DNS Relay to map IPv4 and IPv6 addresses to name servers to maintain a a database of hostname-to-address mappings.

Examples To set `vlan1` as the source interface for relayed DNS queries, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding source-interface vlan1
```

To clear the source interface for relayed DNS queries, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding source-interface
```

Related Commands

debug ip dns forwarding
ip dns forwarding
show ip dns forwarding

ip dns forwarding timeout

Use this command to set the time period for the DNS Relay to wait for a DNS response.

Use the **no** variant of this command to set the time period to wait for a DNS response to the default of 3 seconds.

Syntax

```
ip dns forwarding timeout <0-3600>
```

no ip dns forwarding timeout

Parameter	Description
<0-3600>	Timeout value in seconds.

Default The default timeout value is 3 seconds.

Mode Global Configuration

Usage See **"DNS Relay" on page 28.10** for more information about DNS Relay to map IPv4 and IPv6 addresses to name servers to maintain a a database of hostname-to-address mappings.

Examples To set the timeout value to `12` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding timeout 12
```

To set the timeout value to the default of `3` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding timeout
```

Related Commands

debug ip dns forwarding
ip dns forwarding
show ip dns forwarding

ip domain-list

This command adds a domain to the DNS list. Domain are appended to incomplete host names in DNS requests. Each domain in this list is tried in turn in DNS lookups. This list is ordered so that the first entry you create is checked first.

The **no** variant of this command deletes a domain from the list.

Syntax

```
ip domain-list <domain-name>
no ip domain-list <domain-name>
```

Parameter	Description
<domain-name>	Domain string, for example “company.com”.

Mode Global Configuration

Usage If there are no domains in the DNS list, then your device uses the domain specified with the **ip domain-name** command. If any domain exists in the DNS list, then the device does not use the domain set using the **ip domain-name** command.

See **“Domain Name System (DNS)” on page 28.8** for introductory information about DNS.

See **“DNS Client” on page 28.9** for information about DNS Client configuration commands.

Example To add the domain `example.net` to the DNS list, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-list example.net
```

Related Commands

ip domain-lookup
ip domain-name
show ip domain-list

ip domain-lookup

This command enables the DNS client on your device. This allows you to use domain names instead of IP addresses in commands. The DNS client resolves the domain name into an IP address by sending a DNS enquiry to a DNS server, specified with the **ip name-server** command.

The **no** variant of this command disables the DNS client. The client will not attempt to resolve domain names. You must use IP addresses to specify hosts in commands.

Syntax

```
ip domain-lookup
no ip domain-lookup
```

Mode Global Configuration

Usage The client is enabled by default. However, it does not attempt DNS enquiries unless there is a DNS server configured.

See **"DNS Client" on page 28.9** for information about DNS Client configuration commands.

Examples To enable the DNS client on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-lookup
```

To disable the DNS client on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip domain-lookup
```

Related Commands

ip domain-list
ip domain-name
ip name-server
show hosts
show ip name-server

ip domain-name

This command sets a default domain for the DNS. The DNS client appends this domain to incomplete host-names in DNS requests.

The **no** variant of this command removes the domain-name previously set by this command.

Syntax

```
ip domain-name <domain-name>
no ip domain-name <domain-name>
```

Parameter	Description
<domain-name>	Domain string, for example “company.com”.

Mode Global Configuration

Usage If there are no domains in the DNS list (created using the **ip domain-list** command) then your device uses the domain specified with this command. If any domain exists in the DNS list, then the device does not use the domain configured with this command.

See **“DNS Client” on page 28.9** for information about DNS Client configuration commands.

When your device is using its DHCP client for an interface, it can receive Option 15 from the DHCP server. This option replaces the domain name set with this command. See **Chapter 89, Dynamic Host Configuration Protocol (DHCP) Introduction** for more information about DHCP and DHCP options.

Example To configure the domain name, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-name company.com
```

Related Commands

ip domain-list
show ip domain-list
show ip domain-name

ip directed-broadcast

Use this command to enable flooding of directed broadcast packets into a directly connected subnet. If this command is configured on a VLAN interface, then directed broadcasts received on other VLAN interfaces, destined for the subnet on this VLAN, will be flooded to the subnet broadcast address of this VLAN.

Use the **no** variant of this command to disable **ip directed-broadcast**. When this feature is disabled using the **no** variant of this command, directed broadcasts are not forwarded.

Syntax

```
ip directed-broadcast
no ip directed-broadcast
```

Default The **ip directed-broadcast** command is disabled by default.

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Usage IP directed-broadcast is enabled and disabled per VLAN interface. When enabled a directed broadcast packet is forwarded to an enabled VLAN interface if received on another subnet.

An IP directed broadcast is an IP packet whose destination address is a broadcast address for some IP subnet, but originates from a node that is not itself part of that destination subnet. When a directed broadcast packet reaches a switch that is directly connected to its destination subnet, that packet is flooded as a broadcast on the destination subnet.

The **ip directed-broadcast c**ommand controls the flooding of directed broadcasts when they reach target subnets. The command affects the final transmission of the directed broadcast on its destination subnet. It does not affect the transit unicast routing of IP directed broadcasts. If directed broadcast is enabled for an interface, incoming directed broadcast IP packets intended for the subnet assigned to interface will be flooded as broadcasts on that subnet.

If the **no ip directed-broadcast** command is configured for an interface, directed broadcasts destined for the subnet where the interface is attached will be dropped instead of broadcast.

Examples To enable **ip directed-broadcast**, to flood broadcast packets out via the `vlan2` interface, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip directed-broadcast
```

To disable **ip directed-broadcast,** disabling the flooding of broadcast packets via `vlan2`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip directed-broadcast
```

Related Commands

ip forward-protocol udp
ip helper-address
show running-config

ip forward-protocol udp

This command enables you to control which UDP broadcasts will be forwarded to the helper address(es). A UDP broadcast will only be forwarded if the destination UDP port number in the packet matches one of the port numbers specified using this command.

Refer to the IANA site (**www.iana.org**) for a list of assigned UDP port numbers for protocols to forward using **ip forward-protocol udp**.

Use the **no** variant of this command to remove a port number from the list of destination port numbers that are used as the criterion for deciding if a given UDP broadcast should be forwarded to the IP helper address(es).

Syntax

```
ip forward-protocol udp <port>
no ip forward-protocol udp <port>
```

Parameter	Description
<port>	UDP Port Number.

Default The **ip forward-protocol udp** command is not enabled by default.

Mode Global Configuration

Usage Combined with the **ip helper-address** command on page 29.32 in interface mode, the **ip forward-protocol udp** command in Global Configuration mode allows control of which protocols (destination port numbers) are forwarded. The **ip forward-protocol udp** command configures protocols for forwarding, and the **ip helper-address** command configures the destination address(es).

Note The types of UDP broadcast packets that the switch will forward are ONLY those specified by the **ip forward-protocol** command(s). There are no other UDP packet types that the IP helper process forwards by default.

Note The **ip forward-protocol udp** command does not support BOOTP / DHCP Relay. The **ip dhcp-relay** command must be used instead. For this reason, you may not configure UDP ports 67 and 68 with the **ip forward-protocol udp** command.
See **"DHCP Relay Agent Introduction" on page 89.9** for information about DHCP Relay.

Examples To configure forwarding of packets on a UDP port, use the following commands:

```
awplus# configure terminal
awplus(config)# ip forward-protocol udp <port>
```

To delete a UDP port from the UDP ports that the switch forwards, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip forward-protocol udp <port>
```

Validation Commands **show running-config**

Related Commands **ip helper-address**
ip directed-broadcast

ip gratuitous-arp-link

This command sets the Gratuitous ARP time limit for all switchports. The time limit restricts the sending of Gratuitous ARP packets to one Gratuitous ARP packet within the time in seconds.

Note

This command specifies time between sequences of Gratuitous ARP packets, and time between individual Gratuitous ARP packets occurring in a sequence, to allow legacy support for older devices and interoperation between other devices that are not ready to receive and forward data until several seconds after linkup.

Additionally, jitter has been applied to the delay following linkup, so Gratuitous ARP packets applicable to a given port are spread over a period of 1 second so are not all sent at once. Remaining Gratuitous ARP packets in the sequence occur after a fixed delay from the first one.

Syntax

```
ip gratuitous-arp-link <0-300>

no ip gratuitous-arp-link
```

Parameter	Description
<0-300>	Specify the minimum time between sequences of Gratuitous ARPs and the fixed time between Gratuitous ARPs occurring in a sequence, in seconds. 0 disables the sending of Gratuitous ARP packets. The default is 8 seconds.

Default The default Gratuitous ARP time limit for all switchports is 8 seconds.

Mode Global Configuration

Usage Every switchport will send a sequence of 3 Gratuitous ARP packets to each VLAN that the switchport is a member of, whenever the switchport moves to the forwarding state. The first Gratuitous ARP packet is sent 1 second after the switchport becomes a forwarding switchport. The second and third Gratuitous ARP packets are each sent after the time period specified by the Gratuitous ARP time limit.

Additionally, the Gratuitous ARP time limit specifies the minimum time between the end of one Gratuitous ARP sequence and the start of another Gratuitous ARP sequence. When a link is flapping, the switchport's state is set to forwarding several times. The Gratuitous ARP time limit is imposed to prevent Gratuitous ARP packets from being sent undesirably often.

Examples To disable the sending of Gratuitous ARP packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip gratuitous-arp-link 0
```

To restrict the sending of Gratuitous ARP packets to one every 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip gratuitous-arp-link 20
```

Validation Commands **show running-config**

ip helper-address

This command adds a forwarding destination address for IP Helper to enable forwarding of User Datagram Protocol (UDP) broadcasts on an interface.

Use the **no** variant of this command to disable the forwarding of broadcast packets to specific addresses.

Syntax

```
ip helper-address <ip-addr>
no ip helper-address <ip-addr>
```

Parameter	Description
<ip-addr>	Forwarding destination IP address for IP Helper.

Default The destination address for the **ip helper-address** command is not configured by default.

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Usage Combined with the **ip forward-protocol udp** command in global configuration mode, the **ip helper-address** command in interface mode allows control of which protocols (destination port numbers) are forwarded. The **ip forward-protocol udp** command configures protocols for forwarding, and the **ip helper-address** command configures the destination address(es).

The destination address can be a unicast address or a subnet broadcast address. The UDP destination port is configured separately with the **ip forward-protocol udp** command. If multiple destination addresses are registered then UDP packets are forwarded to each IP address added to an IP Helper. Up to 32 destination addresses may be added using IP Helper.

Note

The types of UDP broadcast packets that the switch will forward are ONLY those specified by the **ip forward-protocol** command(s). There are no other UDP packet types that the IP helper process forwards by default.

Note

The **ip helper-address** command does not support BOOTP / DHCP Relay. The **ip dhcp-relay** command must be used instead. For this reason, you may not configure UDP ports 67 and 68 with the **ip forward-protocol** command. For information about DHCP Relay, see **"DHCP Relay Agent Introduction" on page 89.9**.

Examples The following example defines IPv4 address `192.168.1.100` as an IP Helper destination address to which to forward UDP broadcasts received on `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip helper-address 192.168.1.100
```

The following example removes IPv4 address `192.168.1.100` as an IP Helper destination address to which to forward UDP broadcasts received on `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip helper-address 192.168.1.100
```

Validation Commands **show running-config**

Related Commands **ip forward-protocol udp**
ip directed-broadcast

ip local-proxy-arp

This command allows you to stop MAC address resolution between hosts within a private VLAN edge interface. Local Proxy ARP works by intercepting ARP requests between hosts within a subnet and responding with your device's own MAC address details instead of the destination host's details. This stops hosts from learning the MAC address of other hosts within its subnet through ARP requests.

Local Proxy ARP ensures that devices within a subnet cannot send traffic that bypasses Layer 3 routing on your device. This lets you monitor and filter traffic between hosts in the same subnet, and enables you to have control over which hosts may communicate with one another.

When Local Proxy ARP is operating on an interface, your device does not generate or forward any ICMP-Redirect messages on that interface. This command does not enable proxy ARP on the interface; see the **ip proxy-arp** command for more information on enabling proxy ARP.

The **no** variant of this command disables Local Proxy ARP to stop your device from intercepting and responding to ARP requests between hosts within a subnet. This allows the hosts to use MAC address resolution to communicate directly with one another. Local Proxy ARP is disabled by default.

Syntax

```
ip local-proxy-arp
no ip local-proxy-arp
```

Default Local proxy ARP is disabled by default

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To enable your device to apply Local Proxy ARP on the interface `vlan7`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# ip local-proxy-arp
```

To disable your device to apply Local Proxy ARP on the interface `vlan7`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# no ip local-proxy-arp
```

Related Commands

ip proxy-arp
show arp
show running-config

ip name-server

This command adds IPv4 or IPv6 DNS server addresses. The DNS client on your device sends DNS queries to IP addresses in this list when trying to resolve a host name. Host names cannot be resolved until you have added at least one server to this list. A maximum of three name servers can be added to this list.

The **no** variant of this command removes the specified DNS name-server address.

Syntax

```
ip name-server <ip-addr>
no ip name-server <ip-addr>
```

Parameter	Description
`ip`	The Internet protocol, either IPv4 or IPv6.
<ip-addr>	The IP address to be advertised with the specified preference value, entered in the form `A.B.C.D` for an IPv4 address, or in the form `X:X::X:X` for an IPv6 address.

Mode Global Configuration

Usage When your device is using its DHCP client for an interface, it can receive Option 6 messages from the DHCP server. This option appends the name server list with more DNS servers. See **Chapter 89, Dynamic Host Configuration Protocol (DHCP) Introduction** for more information about DHCP and DHCP options.

See **"DNS Relay" on page 28.10** for more information about DNS Relay to map IPv4 and IPv6 addresses to name servers to maintain a database of hostname-to-address mappings. Also see **"DNS Client" on page 28.9** for information about DNS Client configuration commands.

Examples To allow a device to send DNS queries to a DNS server with the IPv4 address `10.10.10.5`, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server 10.10.10.5
```

To enable your switch to send DNS queries to a DNS server with the IPv6 address `2001:0db8:010d::1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server 2001:0db8:010d::1
```

Related Commands
ip domain-list
ip domain-lookup
ip domain-name
show ip name-server

ip proxy-arp

This command enables Proxy ARP responses to ARP requests on an interface. When enabled, your device intercepts ARP broadcast packets and substitutes its own physical address for that of the remote host. By responding to the ARP request, your device ensures that subsequent packets from the local host are directed to its physical address, and it can then forward these to the remote host.

Your device responds only when it has a specific route to the address being requested, excluding the interface route that the ARP request arrived from. It ignores all other ARP requests. See the **ip local-proxy-arp** command about enabling your device to respond to other ARP messages.

The **no** variant of this command disables Proxy ARP responses on an interface. Proxy ARP is disabled by default.

Syntax

```
ip proxy-arp
no ip proxy-arp
```

Default Proxy ARP is disabled by default.

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To enable your device to Proxy ARP on the interface `vlan13`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# ip proxy-arp
```

To disable your device to Proxy ARP on the interface `vlan13`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# no ip proxy-arp
```

Related Commands

arp (IP address MAC)
ip local-proxy-arp
show arp
show running-config

ip redirects

This command enables ICMP redirects for a device.

Use the **no** variant of this command to disable the sending of ICMP redirects for a device.

Syntax

```
ip redirects
no ip redirects
```

Default ICMP redirects are disabled by default.

Mode Global Configuration

Usage ICMP redirect messages are used to notify hosts that a better route is available to a destination. ICMP redirects are used when a packet is routed into the switch on the same interface that the packet is routed out of the switch. ICMP redirects are also used when the subnet or network of the source address is on the same subnet or network as the next-hop address for a packet.

Use the **ip redirects** command to allow the sending of ICMP redirects whenever the switch receives a packet that is routed on the same interface that the packet was sent on.

Use the **no** variant of this command to disallow the sending of ICMP redirects whenever the switch receives a packet that is routed on the same interface that the packet was sent on.

Examples To enable ICMP redirects, use the following commands:

```
awplus# configure terminal
awplus(config)# ip redirects
```

To disable ICMP redirects, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip redirects
```

optimistic-nd

Use this command to enable the optimistic neighbor discovery feature for both IPv4 and IPv6.

Use the **no** variant of this command to disable the optimistic neighbor discovery feature.

Syntax

```
optimistic-nd
no optimistic-nd
```

Default The optimistic neighbor discovery feature is enabled by default.

Mode Interface Configuration for a VLAN interface.

Usage The optimistic neighbor discovery feature allows the switch, after learning an IPv4 or IPv6 neighbor, to refresh the neighbor before the neighbor is deleted from the hardware L3 switching table. The neighbor is put into the 'stale' state in the software switching table if is it not refreshed, then the 'stale' neighbors are deleted from the hardware L3 switching table.

The optimistic neighbor discovery feature enables the switch to sustain L3 traffic switching to a neighbor without interruption. Without the optimistic neighbor discovery feature enabled L3 traffic is interrupted when a neighbor is 'stale' and is then deleted from the L3 switching table.

If a neighbor receiving optimistic neighbor solicitations does not answer optimistic neighbor solicitations with neighbor advertisements, then the neighbor will be put into the 'stale' state, and subsequently deleted from both the software and the hardware L3 switching tables.

Examples To enable the optimistic neighbor discovery feature on `vlan100`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan100
awplus(config-if)# optimistic-nd
```

To disable the optimistic neighbor discovery feature on `vlan100`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan100
awplus(config-if)# no optimistic-nd
```

Validation Commands **show running-config**

ping

This command sends a query to another IPv4 host (send Echo Request messages).

Syntax

```
ping [ip] <host> [broadcast] [df-bit {yes|no}] [interval <0-128>]
   [pattern <hex-data-pattern>] [repeat {<1-2147483647>|continuous}]
   [size <36-18024>] [source <ip-addr>] [timeout <1-65535>] [tos <0-
   255>]
```

Parameter	Description
<host>	The destination IP address or hostname.
broadcast	Allow pinging of a broadcast address.
df-bit	Enable or disable the do-not-fragment bit in the IP header.
interval *<0-128>*	Specify the time interval in seconds between sending ping packets. The default is 1.
pattern *<hex-data-pattern>*	Specify the hex data pattern.
repeat	Specify the number of ping packets to send.
<1-2147483647>	Specify repeat count. The default is 5.
continuous	Continuous ping
size *<36-18024>*	The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).
source *<ip-addr>*	The IP address of a configured IP interface to use as the source in the IP header of the ping packet.
timeout *<1-65535>*	The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.
tos *<0-255>*	The value of the type of service in the IP header.

Mode User Exec and Privileged Exec

Example To ping the IP address `10.10.0.5` use the following command:

```
awplus# ping 10.10.0.5
```

show arp

Use this command to display entries in the ARP routing and forwarding table—the ARP cache contains mappings of IP addresses to physical addresses for hosts. To have a dynamic entry in the ARP cache, a host must have used the ARP protocol to access another host.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show arp [security [interface [<interface-list>]]
show arp [statistics [detail][interface [<interface-list>]]
```

Mode User Exec and Privileged Exec

Usage Running this command with no additional parameters will display all entries in the ARP routing and forwarding table.

Example To display all ARP entries in the ARP cache, use the following command:

```
awplus# show arp
```

Output **Figure 29-2: Example output from the show arp command**

```
awplus#show arp

 IP Address       MAC Address     Interface    Port         Type
192.168.10.2     0015.77ad.fad8  vlan1        port1.0.1    dynamic
192.168.20.2     0015.77ad.fa48  vlan2        port1.0.2    dynamic
192.168.1.100    00d0.6b04.2a42  vlan2        port1.0.8    static
```

Table 29-2: Parameters in the output of the show arp command

Parameter	Meaning
IP Address	IP address of the network device this entry maps to.
MAC Address	Hardware address of the network device.
Interface	Interface over which the network device is accessed.
Port	Physical port that the network device is attached to.
Type	Whether the entry is a static or dynamic entry. Static entries are added using the **arp (IP address MAC)** command. Dynamic entries are learned from ARP request/reply message exchanges.

Related Commands

arp (IP address MAC)
clear arp-cache

show debugging ip dns forwarding

Use this command to display the DNS Relay debugging status. DNS Relay debugging is set using the **debug ip dns forwarding** command.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show debugging ip dns forwarding`

Mode User Exec and Privileged Exec

Example To display the DNS Relay debugging status, use the command:

```
awplus# show debugging ip dns forwarding
```

Output **Figure 29-3: Example output from the show debugging ip dns forwarding command**

```
awplus#show debugging ip dns forwarding
DNS Relay debugging status:
  debugging is on
```

Related Commands **debug ip dns forwarding**

show debugging ip packet

Use this command to show the IP interface debugging status. IP interface debugging is set using the **debug ip packet interface** command.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show debugging ip packet`

Mode User Exec and Privileged Exec

Example To display the IP interface debugging status when the terminal monitor off, use the command:

```
awplus# terminal no monitor
awplus# show debug ip packet
```

Output **Figure 29-4: Example output from the show debugging ip packet command with terminal monitor off**

```
awplus#terminal no monitor
awplus#show debug ip packet
IP debugging status:
interface all tcp (stopped)
interface vlan1 arp verbose (stopped)
```

Example To display the IP interface debugging status when the terminal monitor is on, use the command:

```
awplus# terminal monitor
awplus# show debug ip packet
```

Output **Figure 29-5: Example output from the show debugging ip packet command with terminal monitor on**

```
awplus#terminal monitor
awplus#show debug ip packet
IP debugging status:
interface all tcp (running)
interface vlan1 arp verbose (running)
```

Related Commands **debug ip packet interface**
terminal monitor

show hosts

This command shows the default domain, domain list, and name servers configured on your device.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show hosts
```

Mode

User Exec and Privileged Exec

Example

To display the default domain, use the command:

```
awplus# show hosts
```

Output

Figure 29-6: Example output from the show hosts command

```
awplus#show hosts
Default domain is mycompany.com
Domain list: company.com
Name/address lookup uses domain service
Name servers are 10.10.0.2 10.10.0.88
```

Related Commands

ip domain-list
ip domain-lookup
ip domain-name
ip name-server

show ip dns forwarding

Use this command to display the DNS Relay status.

Syntax `show ip dns forwarding`

Mode User Exec and Privileged Exec

Examples To display the DNS Relay status, use the command:

```
awplus# show ip dns forwarding
```

Output **Figure 29-7: Example output from the show ip dns forwarding command**

```
awplus#show ip dns forwarding
Max-Retry        : 2
Timeout          : 3 second(s)
Dead-Time        : 3600 second(s)
Source-Interface: not specified
DNS Cache        : disabled
```

Related Commands ip dns forwarding

show ip dns forwarding cache

Use this command to display the DNS Relay name resolver cache.

Syntax

```
show ip dns forwarding cache
```

Parameter	Description
`ip`	The Internet protocol, either IPv4 or IPv6.
`dns`	Domain Name Server
<ip-addr>	The IP address to be advertised with the specified preference value, entered in the form `A.B.C.D` for an IPv4 address, or in the form `X:X::X:X` for an IPv6 address.

Mode User Exec and Privileged Exec

Examples To display the DNS Relay name resolver cache, use the command:

```
awplus# show ip dns forwarding cache
```

Output **Figure 29-8: Example output from the show ip dns forwarding cache command**

```
awplus#show ip dns forwarding cache
Host                                    Address                 Expires Flags
www.example.com                         172.16.1.1.                 180
mail.example.com                        www.example.com             180 CNAME
www.example.com                         172.16.1.1.                 180 REVERSE
mail.example.com                        172.16.1.5.                 180
```

Related Commands ip dns forwarding cache

show ip dns forwarding server

Use this command to display the status of DNS forwarding name servers.

Syntax

```
show ip dns forwarding server
```

Parameter	Description
`show ip dns`	Display ip dns properties.
`forwarding server`	The DNS forwarding name server.

Mode User Exec and Privileged Exec

Examples To display the status of DNS Relay name servers, use the command:

```
awplus# show ip dns forwarding server
```

Output **Figure 29-9: Example output from the show ip dns forwarding server command**

```
awplus#show ip dns forwarding server
Servers           Forwards      Fails    Dead-Time
172.16.1.1              12          0       active
172.16.1.2               6          3         3900
```

Related Commands

ip dns forwarding
ip dns forwarding dead-time

show ip domain-list

This command shows the domains configured in the domain list. The DNS client uses the domains in this list to append incomplete hostnames when sending a DNS enquiry to a DNS server.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ip domain-list`

Mode User Exec and Privileged Exec

Example To display the list of domains in the domain list, use the command:

```
awplus# show ip domain-list
```

Output **Figure 29-10: Example output from the show ip domain-list command**

```
awplus#show ip domain-list
alliedtelesis.com
mycompany.com
```

Related Commands **ip domain-list**
ip domain-lookup

show ip domain-name

This command shows the default domain configured on your device. When there are no entries in the DNS list, the DNS client appends this domain to incomplete hostnames when sending a DNS enquiry to a DNS server.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ip domain-name`

Mode User Exec and Privileged Exec

Example To display the default domain configured on your device, use the command:

```
awplus# show ip domain-name
```

Output **Figure 29-11: Example output from the show ip domain-name command**

```
awplus#show ip domain-name
alliedtelesis.com
```

Related Commands **ip domain-name**
ip domain-lookup

show ip interface

Use this command to display information about interfaces and the IP addresses assigned to them. To display information about a specific interface, specify the interface name with the command.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip interface [<interface-list>] [brief]
```

Parameter	Description
<interface-list>	The interfaces to display information about. An interface-list can be: ■ an interface, e.g. `vlan2` ■ a continuous range of interfaces separated by a hyphen, e.g. `vlan2-8` or `vlan2-vlan5` ■ a comma-separated list of interfaces or interface ranges, e.g. `vlan2,vlan5,vlan8-10` The specified interfaces must exist.

Mode User Exec and Privileged Exec

Examples To show brief information for the assigned IP address for interface port1.0.2 use the command:

```
awplus# show ip interface port1.0.2 brief
```

To show the IP addresses assigned to vlan2 and vlan3, use the command:

```
awplus# show ip interface vlan2-3 brief
```

Output **Figure 29-12: Example output from the show ip interface brief command**

```
Interface              IP-Address      Status          Protocol
port1.0.2              unassigned      admin up        down
vlan1                  192.168.1.1     admin up        running
vlan2                  192.168.2.1     admin up        running
vlan3                  192.168.3.1     admin up        running
vlan8                  unassigned      admin up        down
```

show ip name-server

This command displays a list of IPv4 and IPv6 DNS server addresses that your switch will send DNS requests to. This is a static list configured using the **ip name-server** command.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip name-server
```

Mode

User Exec and Privileged Exec

Example

To display the list of DNS servers that your device sends DNS requests to, use the command:

```
awplus# show ip name-server
```

Output

Figure 29-13: Example output from the show ip name-server command

```
awplus# show ip name-server
 10.10.0.123
 10.10.0.124
 2001:0db8:010d::1
```

Related Commands

ip domain-lookup
ip name-server

show ip sockets

Use this command to display information about the IP or TCP sockets that are present on the switch. It includes TCP, UDP listen sockets, displaying associated IP address and port.

The information displayed for established TCP sessions includes the remote IP address, port, and session state. Raw IP protocol listen socket information is also displayed for protocols such as VRRP and ICMP6, which are configured to receive IP packets with the associated protocol number.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ip sockets`

Mode Privileged Exec

Usage Use this command to verify that the socket being used is opening correctly. If there is a local and remote endpoint, a connection is established with the ports indicated.

Note that this command does not display sockets that are used internally for exchanging data between the various processes that exist on the device and are involved in its operation and management. It only displays sockets that are present for the purposes of communicating with other external devices.

Example To display ip sockets currently present on the device, use the command:

```
awplus# show ip sockets
```

Output **Figure 29-14: Example output from the show ip sockets command**

```
Socket information

Not showing 40 local connections
Not showing 7 local listening ports

Typ Local Address            Remote Address          State
tcp 0.0.0.0:111              0.0.0.0:*               LISTEN

raw :::112                   :::*                    112
```

Table 29-3: Parameters in the output of the show ip sockets command

Parameter	Description
`Not showing <number> local connections`	This field refers to established sessions between processes internal to the device, that are used in its operation and management. These sessions are not displayed as they are not useful to the user. <number> is some positive integer.
`Not showing <number> local listening ports`	This field refers to listening sockets belonging to processes internal to the device, that are used in its operation and management. They are not available to receive data from other devices. These sessions are not displayed as they are not useful to the user. <number> is some positive integer.
`Typ`	This column displays the type of the socket. Possible values for this column are: `tcp` : IP Protocol 6. `udp` : IP Protocol 17. `raw` : Indicates that socket is for a non port-orientated protocol (i.e. a protocol other than TCP or UDP) where all packets of a specified IP protocol type are accepted. For raw socket entries the protocol type is indicated in subsequent columns.
`Local Address`	For TCP and UDP listening sockets this shows the destination IP address (either IPv4 or IPv6) and destination TCP or UDP port number for which the socket will receive packets. The address and port are separated by ':'. If the socket will accept packets addressed to any of the switch's IP addresses, the IP address will be 0.0.0.0 for IPv4 or :: for IPv6. For active TCP sessions the IP address will display which of the switches addresses the session was established with. For raw sockets this displays the IP address and IP protocol for which the socket will accept IP packets. The address and protocol are separated by ':'. If the socket will accept packets addressed to any of the switch's IP addresses, the IP address will be 0.0.0.0 for IPv4 and ::. IP Protocol assignments are described at: **http://www.iana.org/assignments/protocol-numbers**
`Remote Address`	For TCP and UDP listening sockets this shows the source IP address (either IPv4 or IPv6) and source TCP or UDP port number for which the socket will accept packets. The address and port are separated by ':'. If the socket will accept packets addressed from any IP address, the IP address will be 0.0.0.0 for IPv4 or :: for IPv6. This is the usual case for a listening socket. Normally for a listen socket any source port will be accepted. This is indicated by ". For active TCP sessions the IP address will display the remote address and port the session was established with. For raw sockets the entry in this column will be 0.0.0.0: or ::: for IPv4 and IPv6, respectively.

`State`	This column shows the state of the socket. For TCP sockets this shows the state of the TCP state machine. For UDP sockets this column is blank. For raw sockets it contains the IP protocol number. The possible TCP states are:
	`LISTEN`
	`SYN-SENT`
	`SYN-RECEIVED`
	`ESTABLISHED`
	`FIN-WAIT-1`
	`FIN-WAIT-2`
	`CLOSE-WAIT`
	`CLOSING`
	`LAST-ACK`
	`TIME-WAIT`
	`CLOSED`
	RFC793 contains the TCP state machine diagram with Section 3.2 describing each of the states.

show ip traffic

Use this command to display statistics regarding IP traffic sent and received by all interfaces on the switch, showing totals for IP and IPv6 and then broken down into sub-categories such as TCP, UDP, ICMP and their IPv6 equivalents when appropriate.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ip traffic`

Mode Privileged Exec

Example To display IP traffic statistics, use the command:

```
awplus# show ip traffic
```

Output **Figure 29-15: Example output from the show ip traffic command**

```
IP:
     261998 packets received
     261998 delivered
     261998 sent
     69721 multicast packets received
     69721 multicast packets sent
     23202841 bytes received
     23202841 bytes sent
     7669296 multicast bytes received
     7669296 multicast bytes sent
IPv6:
     28 packets discarded on transmit due to no route
ICMP6:
UDP6:
UDPLite6:
TCP:
     0 remote connections established
     40 local connections established
     7 remote listening ports
     7 local listening ports
     261 active connection openings
     247 passive connection openings
     14 connection attempts failed
     122535 segments received
     122535 segments transmitted
     14 resets transmitted
     227 TCP sockets finished time wait in fast timer
     155 delayed acks sent
     21187 headers predicted
     736 pure ACKs
     80497 pure ACKs predicted
UDP:
     139468 datagrams received
     139468 datagrams sent
UDPLite:
```

Table 29-4: Parameters in the output of the show ip traffic command :

Parameter	Description
IPv4	IPv4 counters
IPv6	IPv6 counters

Table 29-4: Parameters in the output of the show ip traffic command(cont.):

Parameter	Description
`received packets with no route`	Received packets with no route
`truncated packets received`	Truncated packets received
`multicast packets received`	Multicast packets received
`multicast packets sent`	Multicast packets sent
`broadcast packets received`	Broadcast packets received
`broadcast packets sent`	Broadcast packets sent
`bytes received`	Bytes received
`bytes sent`	Bytes sent
`multicast bytes received`	Multicast bytes received
`multicast bytes sent`	Multicast bytes sent
`broadcast bytes received`	Broadcast bytes received
`broadcast bytes sent`	Broadcast bytes sent
`packets received`	Packets received
`packets received with invalid headers`	Packets received with invalid headers
`oversize packets received`	Oversize packets received
`packets received with no route`	Packets received with no route
`packets received with invalid address`	Packets received with invalid address
`packets received with unknown protocol`	Packets received with unknown protocol
`truncated packets received`	Truncated packets received
`received packets discarded`	Received packets discarded
`received packets delivered`	Received packets delivered
`forwarded packets transmitted`	Forwarded packets transmitted
`packets transmitted`	Packets transmitted
`packets discarded on transmit`	Packets discarded on transmit
`packets discarded on transmit due to no route`	Packets discarded on transmit due to no route
`fragment reassembly timeouts`	Fragment reassembly timeouts
`fragment reassembly required`	Fragment reassembly required
`fragment reassembly OK`	Fragment reassembly OK
`fragment reassembly failures`	Fragment reassembly failures
`fragmentations succeeded`	Fragmentations succeeded

Table 29-4: Parameters in the output of the show ip traffic command(cont.):

Parameter	Description
`fragmentations failed`	Fragmentations failed
`fragments created`	Fragments created
`ICMP6`	ICMPv6 counters
`messages received`	Messages received
`errors received`	Errors received
`messages sent`	Messages sent
`TCP`	TCP counters
`remote connections established`	Remote connections established
`local connections established`	Local connections established
`remote listening ports`	Remote listening ports
`local listening ports`	Local listening ports
`active connection openings`	Active connection openings
`passive connection openings`	Passive connection openings
`connection attempts failed`	Connection attempts failed
`connection resets received`	Connection resets received
`segments received`	Segments received
`segments transmitted`	Segments transmitted
`retransmits`	Retransmits
`bad segments received`	Bad segments received
`resets transmitted`	Resets transmitted
`datagrams received`	Datagrams received
`received for unknown port`	Received for unknown port
`datagrams sent`	Datagrams sent
`syncookies sent`	Syncookies sent
`syncookies received`	Syncookies received
`syncookies failed`	Syncookies failed
`embryonic resets`	Embryonic resets
`sockets pruned`	Sockets pruned
`ICMPs out of window`	ICMPs out of window
`ICMPs dropped due to lock`	ICMPs dropped due to lock
`ARPs filtered`	ARPs filtered

Table 29-4: Parameters in the output of the show ip traffic command(cont.):

Parameter	Description
`TCP sockets finished time wait in fast timer`	TCP sockets finished time wait in fast timer
`time wait sockets recycled by time stamp`	Time wait sockets recycled by time stamp
`time wait sockets killed`	Time wait sockets killed
`delayed acks sent`	Delayed acks sent delayed acks further delayed because of locked socket
`delayed acks lost`	Delayed acks lost
`listening socket overflows`	Listening socket overflows
`listening socket drops`	Listening socket drops
`headers predicted`	Headers predicted
`pure ACKs`	Pure ACKs
`pure ACKs predicted`	Pure ACKs predicted
`losses recovered by TCP Reno`	Losses recovered by TCP Reno
`losses recovered by SACK`	Losses recovered by SACK
`SACKs renegged`	SACKs renegged
`detected reordering by FACK`	Detected reordering by FACK
`detected reordering by SACK`	Detected reordering by SACK
`detected reordering by TCP Reno`	Detected reordering by TCP Reno
`detected reordering by sequence`	Detected reordering by sequence
`full undos`	Full undos
`partial undos`	Partial undos
`SACK undos`	SACK undos
`loss undos`	Loss undos
`segments lost`	Segments lost
`lost retransmits`	Lost retransmits
`TCP Reno failures`	TCP Reno failures
`SACK failures`	SACK failures
`loss failures`	Loss failures
`fast retransmits`	Fast retransmits
`forward retransmits`	Forward retransmits
`retransmits in slow start`	Retransmits in slow start

Table 29-4: Parameters in the output of the show ip traffic command(cont.):

Parameter	Description
`timeouts`	Timeouts
`TCP Reno recovery failures`	TCP Reno recovery failures
`SACK recovery failures`	SACK recovery failures
`collapsed segments received`	Collapsed segments received
`DSACKs sent for old packets`	DSACKs sent for old packets
`DSACKs sent for out of order segments`	DSACKs sent for out of order segments
`DSACKs received`	DSACKs received
`DSACKs received for out of order segments`	DSACKs received for out of order segments
`connections reset due to unexpected SYN`	Connections reset due to unexpected SYN
`connections reset due to unexpected data`	Connections reset due to unexpected data
`connections reset due to early user close`	Connections reset due to early user close
`connections aborted due to lack of memory`	Connections aborted due to lack of memory
`connections aborted due to timeout`	Connections aborted due to timeout
`connections aborted due to lingering`	Connections aborted due to lingering
`connection aborts due to connection failure`	Connection aborts due to connection failure
`TCP memory pressure events`	TCP memory pressure events
`SACKs discarded`	SACKs discarded
`Old DSACKs ignored`	Old DSACKs ignored
`DSACKs ignored without undo`	DSACKs ignored without undo
`Spurious RTOs`	Spurious RTOs
`TCP MD5 Not Found`	TCP MD5 Not Found
`TCP MD5 Unexpected`	TCP MD5 Unexpected
`TCP SACKs shifted`	TCP SACKs shifted
`TCP SACKs merged`	TCP SACKs merged
`TCP SACK shift fallback`	TCP SACK shift fallback
`UDP`	UDP Counters
`UDPLite`	UDPLite Counters

Table 29-4: Parameters in the output of the show ip traffic command(cont.):

Parameter	Description
UDP6	UDPv6 Counters
UDPLite6	UDPLitev6 Counters
datagrams received	Datagrams received
datagrams received for unknown port	Datagrams received for unknown port
datagram receive errors	Datagram receive errors
datagrams transmitted	Datagrams transmitted
datagrams received	Datagrams received
datagrams received for unknown port	Datagrams received for unknown port
datagram receive errors	Datagram receive errors
datagrams transmitted	Datagrams transmitted

tcpdump

Use this command to start a tcpdump, which gives the same output as the Unix-like **tcpdump** command to display TCP/IP traffic. Press `<ctrl> + c` to stop a running tcpdump.

Syntax `tcpdump <line>`

Parameter	Description
<line>	Specify the dump options. For more information on the options for this placeholder see URL **http://www.tcpdump.org/tcpdump_man.html**

Mode Privileged Exec

Example To start a tcpdump running to capture IP packets, enter the command:

```
awplus# tcpdump ip
```

Output **Figure 29-16: Example output from the tcpdump command**

```
03:40:33.221337 IP 192.168.1.1 > 224.0.0.13: PIMv2, Hello,
length: 34
1 packets captured
2 packets received by filter
0 packets dropped by kernel
```

Related Commands **debug ip packet interface**

traceroute

Use this command to trace the route to the specified IPv4 host.

Syntax `traceroute {<ip-addr>|<hostname>}`

Parameter	Description
<ip-addr>	The destination IPv4 address. The IPv4 address uses the format A.B.C.D.
<hostname>	The destination hostname.

Mode User Exec and Privileged Exec

Example

```
awplus# traceroute 10.10.0.5
```

undebug ip packet interface

This command applies the functionality of the **no debug ip packet interface** command on page 29.13.

Chapter 30: IPv6 Introduction

Introduction

This chapter describes the main features of IPv6, the switch's implementation of IPv6 and how to configure and operate IPv6 on the switch.

This chapter describes the following IPv6 features:

- linking together networks that run IPv6.
- allowing address autoconfiguration of hosts connected to the switch.

Overview

IPv6 is the next generation of the Internet Protocol (IP). It has primarily been developed to solve the problem of the eventual exhaustion of the IPv4 address space, but also offers other enhancements. IPv6 addresses are 16 bytes long, in contrast to IPv4's 4 byte addresses. Other features of IPv6 include:

- Address structure improvements:
  - « globally unique addresses with more levels of addressing hierarchy to reduce the size of routing tables
  - « autoconfiguration of addresses by hosts
  - « improved scalability of multicast routing by adding a "scope" field to multicast addresses
  - « a new type of address, the "anycast address", which sends packets to any one of a group of devices
- Removes the need for packet fragmentation en-route, by dynamic determination of the largest packet size that is supported by every link in the path. A link's MTU (Maximum Transmission Unit) must be at least 1280 bytes, compared with 576 bytes for IPv4.
- Includes a Traffic Class that allow packets to be labelled with an appropriate priority. If the network becomes congested, the lowest priority packets are dropped.
- Includes Flow labels that indicate to intermediate switches and routers that packets are part of a flow, and that a particular flow requires a particular type of service. This feature enables, for example, real-time processing of data streams. It also increases routing speed because the forwarding router or switch needs only to check the flow label, not the rest of the header. The handling indicated by the flow label can be done by the IPv6 Hop-by-Hop header, or by a separate protocol such as RSVP.
- Mandatory authentication and data integrity protocols through IPsec. IPsec is optional in IPv4.

IPv6 Addresses and Prefixes

IPv6 addresses are hexadecimal, and are made up of eight pairs of octets separated by colons. An example of a valid address is **2001:0db8:0000:0000:0260:0000:97ff:64aa**. In the interests of brevity, addresses can be abbreviated in two ways:

- Leading zeros can be omitted, so this address can be written as **2001:db8:0:0:260:0:97ff:64aa**.
- Consecutive zeros can be replaced with a double colon, so this address can be written as **2001:db8::260:0:97ff:64a**. Note that a double colon can replace any number of consecutive zeros, but an address can contain only one double colon.

Like IPv4 addresses, a proportion of the leftmost bits of the IPv6 address can be used to indicate the subnet, rather than a single node. This part of the address is called the *prefix*. Prefixes provide the equivalent functionality to a subnet mask in IPv4, allowing a subnet to be addressed, rather than a single node. If a prefix is specified, the IPv6 address is followed by a slash and the number of bits that represent the prefix. For example, **2001::/16** indicates that the first 16 bits (**2001**) of the address **2001:0:0:0:0:0:0:0** represent the prefix.

Like IPv4 addresses, IPv6 addresses are attached to interfaces.

Address types

IPv6 supports the following address types:

- Unicast
- Multicast
- Anycast

Unicast addresses

A unicast address is attached to a single interface and delivers packets only to that interface. The following special addresses have been defined:

- IPv4-compatible and IPv4-mapped addresses. IPv4-compatible addresses are used to tunnel IPv6 packets across an IPv4 network. IPv4-mapped addresses are used by an IPv6 host to communicate with an IPv4 host. The IPv6 host addresses the packet to the mapped address.
- Link-local addresses can be used on the local network on which the interface is attached. The link-local prefix is **fe80::/10**. Different interfaces on a device may have the same link-local address. The switch will automatically generate a link-local address for all interfaces that are using IPv6. Commands entered to configure link-local addresses that match any automatically generated link-local addresses by the switch will not be executed.
  Enter the **show ipv6 interface** command to display automatically generated link-local addresses not shown in the **running-config**. Automatically generated link-local addresses contain the last six hexadecimal numbers of the MAC address for a given interface.

- The Loopback address, consisting of **::1**, which is the equivalent of the IPv4 loopback address, and allows a host to send packets to itself.
- The Unspecified address, consisting of **::**, which is the equivalent of the IPv4 unspecified address, and is used as a source address by hosts during the autoconfiguration process.

Multicast addresses

IPv6 multicast addresses provide the equivalent functionality to broadcast addresses in IPv4. Broadcast addresses are not supported in IPv6. A multicast address identifies a group of interfaces, and packets are sent to all interfaces in that group.

Among the special addresses that have been defined are addresses that allow multicasting to:

- All interfaces on a particular host (**ff01::1**)
- All nodes on a local network (**ff01::2**)
- All routers on the local link (**ff02::2**)
- All routers on the local site (**ff05::2**).

Anycast addresses

An *anycast* address is a unicast address that is attached to more than one interface. If a packet is sent to an anycast address it is delivered to the nearest interface with that address, with the definition of "nearest" depending on the protocol used for routing. If the protocol is RIPv6, the nearest interface is the one that is the shortest number of hops away.

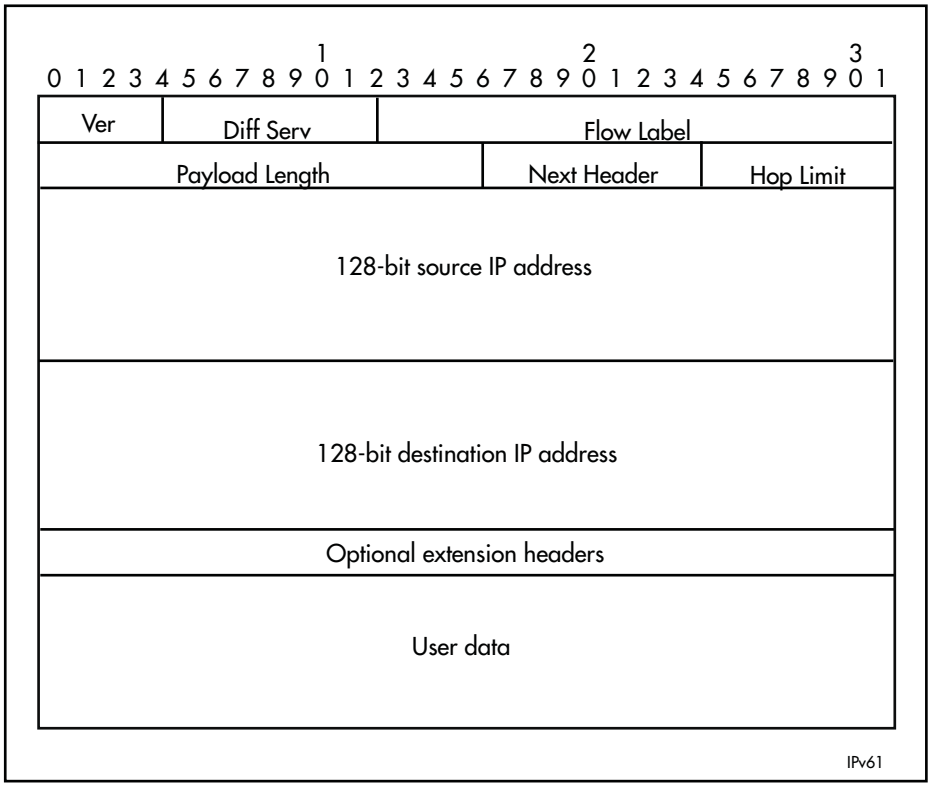
Anycast addresses can be assigned to routers only, and packets cannot originate from an anycast address. A router must be configured to know that it is using an anycast address because the address format cannot be distinguished from that of a unicast address.

Only one anycast address has been predefined: the subnet-router address. The subnet-router address sends messages to the nearest router on a subnet and consists of the subnet's prefix followed by zeros.

IPv6 Headers

The basic unit of data sent through an internet is called a *packet* in IPv6. A packet consists of a *header* followed by the *data*. The following figure shows the IPv6 packet.

Figure 30-1: IPv6 packet



.

Table 30-1: IPv6 packet - Field Description

Field	Function
Ver	Version of the IP protocol that created the packet. For IPv6, this field has a value of 6.
Differentiated Services	8-bit value that contains the 6-bit DSCP and is used to prioritize traffic as part of a Quality of Service system. For more information, see **"Differentiated Services Architecture" on page 62.4**. Additional information can be found in RFC 2474, *Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers*.
Flow Label	20-bit value that indicates the data flow to which this packet belongs.This flow may be handled in a particular way.
Payload Length	Length of the user data portion of the packet. If the data payload is larger than 64 kB, the length is given in the optional "Jumbo Payload" header and the Payload Length header is given a value of zero.

Table 30-1: IPv6 packet - Field Description(cont.)

Field	Function
Next Header	Number that indicates the type of header that immediately follows the basic IP header. This header type may be an optional IPv6 extension header, a relevant IPv4 option header, or another protocol, such as TCP or ICMPv6. The IPv6 extension header values are: **0** (Hop-by-Hop Options Header) **43** (IPv6 Routing Header) **44** (IPv6 Fragment Header) **50** (Encapsulating Security Payload) **51** (IPv6 Authentication Header) **59** (No Next Header) **60** (Destination Options Header)
Hop Limit	Field that is the equivalent of the IPv4 Time To Live field, measured in hops.
Source IP address	128-bit IPv6 address of the sender.
Destination IP address	128-bit IPv6 address of the recipient.
Optional extension headers	Headers for less-frequently used information.
User data	Payload.

Basic IPv6 header structure

The headers contain information necessary to move the packet across the internet. They must be able to cope with missing and duplicated packets as well as possible fragmentation (and reassembly) of the original packet.

IPv6 headers are twice as long as IPv4 headers (40 bytes instead of 20 bytes) and contain four times the address space size (128 bits instead of 32 bits).

They no longer contain the header length, identification, flags, fragment offset, and header checksum fields. Some of these options are placed in extension headers. The Time To Live field is replaced with a hop limit, and the IPv4 Type of Service field is replaced with a Differentiated Services field. The Differentiated Services field contains the DSCP bits, used in a Quality of Service (QoS) regime. The following table explains IPv4 header fields that changed in IPv6.

Changed Field	Description
Type of Service	The type of service that a connection should receive is indicated in IPv6 by the Flow Label field in the IPv6 header.
Fragmentation information (the Identification field, the Flags field and the Fragment Offset field)	In most cases fragmentation does not occur in IPv6. If it does, packets are fragmented at their source and not en route. Therefore, the fragmentation information is contained in an extension header to reduce the size of the basic IPv6 header.
Header Checksum	This option has not been provided in IPv6. This is because transport protocols implement checksums and because of the availability of the IPsec authentication header (AH) in IPv6.
Options	Extension headers handle all the optional values associated with IPv6 packets. The biggest advantage of this scheme is that the size of the basic IP header is a constant.

Extension headers

IPv6 implements many of the less commonly used fields in the IPv4 header (or their equivalents) as extension headers, which are placed after the basic IPv6 header. The length of each header must be a multiple of 8 bytes.

The first extension header is identified by the Next Header field in the basic IPv6 header. Any subsequent extension headers are identified by an 8-bit “Next Header” value at the beginning of the preceding extension header.

IPv6 nodes that originate packets are required to place extension headers in a specific order:

1. The basic IPv6 header. This must come immediately before the extension headers.
2. The Hop-by-Hop header. This specifies options that must be examined by every node in the routing path.
3. A Destination Options header. This is used to specify options to be processed by the first destination or final destination. The destination options header is the only extension header that may be present more than once in the IPv6 packet.
4. The Routing header. This enables a static path to be specified for the packet, if the dynamically-determined path is undesirable.
5. The Fragment header. This indicates that the source node has fragmented the packet, and contains information about the fragmentation.

6. The Authentication header (AH). This verifies the integrity of the packet and its headers.

7. The Encapsulating Security Payload (ESP) header. This encrypts a packet and verifies the integrity of its contents.

8. The Upper Layer Protocol header. This indicates which protocol a higher layer (such as the transport layer) is to process the packet with (for example, TCP).

The Internet Control Message Protocol (ICMPv6)

The Internet Control Message Protocol, ICMPv6, provides a mechanism for error reporting and route discovery and diagnostics. It also conveys information about multicast group membership, a function that is carried out by the Internet Group Management Protocol (IGMP) in IPv4, and performs address resolution, which the Address Resolution Protocol (ARP) performs in IPv4.

Significant aspects of ICMPv6 include neighbor discovery, which enables one device in a network to find out about other nearby devices; and stateless address autoconfiguration, which allows a device to dynamically determine its own IPv6 address.

ICMPv6 is also used to support the Ping v6 (*Packet Internet Groper*) and Trace route v6 functions that are used to verify the connections between networks and network devices. Ping is used to test the connectivity between two network devices to determine whether each network device can "see" the other device. Trace route is used to discover the route used to pass packets between two systems running the IP protocol.

Both of these functions operate almost identically in IPv4 and IPv6. For more information, see **"Ping" on page 28.14**.

Neighbor Discovery

Neighbor discovery is an ICMPv6 function that enables a router or a host to identify other devices on its links. This information is then used in address autoconfiguration, to redirect a node to use a more appropriate router if necessary, and to maintain reachability information with its neighbors.

The IPv6 Neighbor Discovery protocol is similar to a combination of the IPv4 protocols ARP, ICMP Router Discovery and ICMP Redirect.

The following table describes packet types involved with neighbor discovery.

Packet Type	Description
router solicitation	Packet in which a host sends out a request for routers to generate advertisements.
router advertisement	Allows routers to advertise their presence and other network parameters. A router sends an advertisement packet in response to a solicitation packet from a host.
neighbor solicitation	Packet in which a node sends a packet to determine the link layer address of a neighbor or to verify that a neighbor is still active.
neighbor advertisement	A response to a neighbor solicitation packet. These packets are also used to notify neighbors of link layer address changes.
redirect	Informs hosts of a better first hop.

To comply with Section 6.2.1 of RFC 2461, *IPv6 Neighbor Discovery*, the router does not generate router advertisements by default. See **"Neighbor Discovery" on page 30.8** for instructions about enabling advertisements.

The following table explains packet types and services.

Packet Type	Description
address resolution	A method for carrying out address autoconfiguration, and is achieved using the Neighbor Solicitation Message and the Neighbor Advertisement Message.
router and prefix discovery	On connection to a link, a node needs to know the address of a router that the node can use to reach the rest of the world. The node also needs to know the prefix (or prefixes) that define the range of IP addresses on its link that it can reach without going through a router. Routers use ICMP to convey this information to hosts, by means of router advertisements. The message may have an option attached (the *source link address* option), which enables the receiving node to respond directly to the router, without performing a neighbor solicitation.
immediate information	The configuration of a router includes a defined frequency at which unsolicited advertisements are sent. If a node wants to obtain information about the nearest router immediately, rather than waiting for the next unsolicited advertisement, the node can send a router solicitation message. Each router that receives the solicitation message sends a router advertisement specifically to the node that sent the solicitation.
redirection	If a node is aware of more than one router that it can use to connect to wider networks, the router to which it sends packets by default does not always represent the most desirable route. ICMPv6 uses the redirect packet to communicate a more effective path to the node.
Neighbor Unreachability Detection (NUD)	A node may issue solicitation requests to determine whether a path is still viable, or may listen in on acknowledgement packets of higher layer protocols, such as TCP. If the node determines that a path is no longer viable, it attempts to establish a new link to the neighbor, or to re-establish the previous link. NUD can be used between any two devices in the network, independent of whether the devices are acting as hosts or routers.

Stateless address autoconfiguration

Stateless address autoconfiguration allows an IPv6-aware device to be plugged into a network without manual configuration with an IP address. This plug and play functionality results in networks that are easier to set up and modify, and simplifies the process of shifting to use a new Internet Service Provider (ISP).

Stateless address autoconfiguration is achieved in a series of steps. Routers and hosts perform the first three steps, which autoconfigure a link-local address. A global address is autoconfigured in the last three steps, which only hosts perform.

On the router or host

1. During system start-up, the node begins autoconfiguration by generating a link-local address for the interface. A link-local address is formed by adding the interface ID to the link-local prefix **fe80::/10** (reference RFC 3513).

Note Different interfaces on a device may have the same link-local address. The switch will automatically generate a link-local address for all interfaces that are using IPv6. Commands entered to configure link-local addresses that match any automatically generated link-local addresses by the switch will not be executed. Enter the show ipv6 interface command to display automatically generated link-local addresses not shown in the running-config. Automatically generated link-local addresses contain the last six hexadecimal numbers of the MAC address for a given interface.

2. The node then transmits a neighbor solicitation message to this address. If the address is already in use, the node that the address belongs to replies with a neighbor advertisement message. The autoconfiguration process stops and manual configuration of the node is then required.

3. If no neighbor advertisement is received, the node concludes that the address is available and assigns it to the chosen interface.

On the host

1. The node then sends one or more router solicitations to detect if any routers are present. Any routers present responds with a router advertisement.

   If no router advertisement is received, the node tries to use DHCP to obtain an address and other configuration information. If no DHCP server responds, the node continues using the link-level address

   If a router advertisement is received, this message informs the node how to proceed with the auto configuration process. The prefix from the router advertisement, if received, is added to the link-level address to form the global unicast IP address.

2. This address is then assigned to the network interface.

   If routers are present, the node continues to receive router advertisements. The node updates its configuration when there are changes in the router advertisements.

IPv6 Routing

Routing in IPv6 is almost identical to IPv4 routing under CIDR, except that the addresses are 128-bit IPv6 addresses instead of 32-bit IPv4 addresses.

Routing Information Protocol (RIPv6)

RIP is a simple distance vector protocol that defines networks based on how many hops they are from the router. When a network is more than 15 hops away (one hop is one link), it is not included in the routing table.

RIPv6, also referred to as RIPng (for “next generation”) is similar to RIPv2. Extensions to RIPv2 to support IPv6 are:

- the address field of a routing entry is expanded to 128 bits to allow IPv6 prefixes
- the 32-bit RIPv2 subnet mask field is replaced by an 8-bit prefix length field
- authentication is removed in RIPv6
- the size of a routing packet is no longer arbitrarily limited
- RIPv6 specifies the next hop instead of simply allowing the recipient of the update to set the next hop to the sender of the update.

In RIPv6, each router uses a routing table to keep track of every destination that is reachable throughout the system. Each entry in the routing table contains:

- the IPv6 prefix of the destination
- a metric, which represents the total cost of getting a packet from the router to that destination
- the IPv6 address of the next router along the path to the destination
- a flag to indicate that information about the route has changed recently
- various timers associated with the route.

Integration of IPv4 and IPv6

IPv6 has been designed in such a way that a smooth transition from IPv4 is possible. The most effective way to ensure this is to use a *dual IP stack*. A node configured as a dual stack system has both a 128-bit IPv6 address and a 32-bit IPv4 address, and so can communicate with nodes running IPv4 and those running IPv6.

Another aspect of the transition is to *tunnel* IPv6 packets through an IPv4 network. IPv6 packets are tunnelled simply by encapsulating the IPv6 packet within an IPv4 datagram, and identifying that this datagram is an encapsulated IPv6 packet by giving the datagram a protocol value of 41.

IPv6 on your Switch

This section describes the switch's support for IPv6, and how to configure IPv6 on the switch.

Enabling IPv6

The switch's implementation of IPv6 is disabled by default. To enable IPv6 forwarding, use the **ipv6 forwarding** command on page 31.8.

To display information about IPv6 settings, use the **show ipv6 interface brief** command on page 31.25.

Because the switch implements IPv6 as a dual stack, implementing IPv6 does not affect IPv4 functionality.

IPv6 Stateless Address Autoconfiguration (SLAAC)

The switch's implementation of IPv6 supports SLAAC on an interface. To enable IPv6 SLAAC on an interface, use the **ipv6 address autoconfig** command on page 31.5. SLAAC automatically applies the MAC address of the interface to an IPv6 address for the interface specified.
ipv6 address autoconfig enables automatic configuration of IPv6 addresses on an interface using stateless autoconfiguration, and enables IPv6 processing on an interface.

IPv6 EUI-64 Addressing

The switch's implementation of IPv6 supports EUI-64 addressing. EUI-64 applies an IPv6 address that is based on the MAC address of the interface. The EUI-64 identifiers from the MAC address are used as the least significant 64 bits of a unicast address.

To enable IPv6 EUI-64, use the **ipv6 address** command on page 31.3 specifying the optional **eui64** parameter for an interface.

When configuring SLAAC you must ensure that you set the prefix length to 64 bits on the switch that is advertising the RAs used for address configuration via SLAAC.

Prefix information received in an RA (Router Advertisement) will not be applied to form an IPv6 address via SLAAC unless the prefix length is 64. Since the EUI is 64 bits long, the IPv6 prefix of the advertising device must also be 64 bits. This prefix length setting and behavior is in accordance with RFC 4864, section 5.5.3.

IPv6 Link-local Addresses

The switch's implementation of IPv6 supports IPv6 link-local addresses without global addresses for communications within the local subnetwork. Switches do not forward packets to link-local addresses. To enable IPv6 link-local addresses, use the **ipv6 enable** command on page 31.7. **ipv6 enable** automatically configures an IPv6 link-local address on the interface and enables IPv6 processing on the interface.

Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them. See the **Link-local addresses** glossary entry, and the **ipv6 enable** command for more information. Also note that the link-local address is retained in the system if the global address is removed using another command, which was not used to establish the link-local address. For example, if a link local address is established with the **ipv6 enable** command then it will not be removed using a **no ipv6 address** command.

IPv6 RA Guard

This section describes the switch's support for IPv6 RA Guard, and how to configure IPv6 RA Guard on the switch.

RA Guard Introduction

Router Advertisements (RAs) and Router Redirects are used to manage IPv6 networks. RA messages advertise a router's presence and specify network parameters that are used by hosts as part of address auto-configuration and setting next-hop routes for particular destinations.

RAs are periodically transmitted by switches allowing networks to be reconfigured by changes to the routers only. Switches can also send redirects to hosts suggesting that they use a different next-hop route for a particular traffic stream. But because the entire network configuration can be modified by what is contained in RAs and redirects, the network is vulnerable to rogue messages that are generated either through misconfiguration or due to a malicious attack.

RA Guard on the switch simply considers each of its ports as either trusted or untrusted. Any host connected to a port is considered trusted or untrusted depending on the port status. A trusted port will accept RAs and redirects and will forward RAs and redirects on trusted ports. An untrusted port will block and discard all RAs and redirects received from the untrusted host.

Enabling IPv6 RA Guard

The switch's implementation of IPv6 RA Guard is disabled by default. To enable IPv6 RA Guard on a port to block RAs from an untrusted host, use the **ipv6 nd raguard** command on page 31.16. Disable IPv6 RA Guard to allow RAs on a port using the **no ipv6 nd raguard** command.

Chapter 31: IPv6 Commands

Command List

This chapter provides an alphabetical reference of commands used to configure IPv6. For more information, see **Chapter 30, IPv6 Introduction**.

clear ipv6 neighbors

Use this command to clear all dynamic IPv6 neighbor entries.

Syntax `clear ipv6 neighbors`

Mode Privileged Exec

Example

```
awplus# clear ipv6 neighbors
```

ipv6 address

Use this command to set the IPv6 address of a VLAN interface and enable IPv6.

Use the optional eui64 parameter to derive the interface identifier of the IPv6 address from the MAC address of the interface. Note that the MAC address of the default VLAN is applied if the interface does not have a MAC address of its own when specifying the eui64 parameter.

Use the no variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

Syntax

```
ipv6 address <ipv6-addr/prefix-length> [eui64]
no ipv6 address <ipv6-addr/prefix-length> [eui64]
```

Parameter	Description
<ipv6-addr/prefix-length>	Specifies the IPv6 address to be set. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
`[eui64]`	A method of automatically deriving the lower 64 bits of an IPv6 address, based on the switch's MAC address.

Mode Interface Configuration for a VLAN interface.

Usage If the **eui64** parameter is specified then the lower 64 bits of the IPv6 address are appended with the same address that would be acquired through stateless address autoconfiguration (SLAAC) if the device received an RA (Router Advertisement) specifying this prefix. See **ipv6 address autoconfig** for a detailed command description and examples to enable and disable SLAAC. See also the **IPv6 EUI-64 Addressing** section in **Chapter 30, IPv6 Introduction** for further EUI-64 implementation information.

Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them. See the **Link-local addresses** glossary entry, and the **ipv6 enable** command for more information.

Also note that the link-local address is retained in the system if the global address is removed using another command, which was not used to establish the link-local address. For example, if a link local address is established with the **ipv6 enable** command then it will not be removed using a **no ipv6 address** command.

Examples To assign the IPv6 address `2001:0db8::a2/64` to the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address `2001:0db8::a2/64` from the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

To assign the **eui64** derived address in the prefix `2001:db8::/48` to VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-fr-subif)# ipv6 address 2001:0db8::/48 eui64
```

To remove the **eui64** derived address in the prefix `2001:db8::/48` from VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-fr-subif)# no ipv6 address 2001:0db8::/48 eui64
```

Validation Commands

show running-config
show ipv6 interface brief
show ipv6 route

Related Commands

ipv6 address autoconfig

ipv6 address autoconfig

Use this command to enable IPv6 stateless address autoconfiguration (SLAAC) for an interface. This configures an IPv6 address on an interface derived from the MAC address on the interface.

Use the **no** variant of this command to disable IPv6 SLAAC on an interface. Note that if no global addresses are left after removing all IPv6 autoconfigured addresses then IPv6 is disabled.

Syntax

```
ipv6 address autoconfig

no ipv6 address autoconfig
```

Mode Interface Configuration for a VLAN interface.

Usage The **ipv6 address autoconfig** command enables automatic configuration of IPv6 addresses using stateless autoconfiguration on an interface and enables IPv6, but does not enable IPv6 forwarding. See **ipv6 forwarding** command on page 31.8 for further description and examples.

IPv6 hosts can configure themselves when connected to an IPv6 network using ICMPv6 (Internet Control Message Protocol version 6) router discovery messages. Configured routers respond with a Router Advertisement (RA) containing configuration parameters for IPv6 hosts.

The SLAAC process derives the interface identifier of the IPv6 address from the MAC address of the interface. When applying SLAAC to an interface, note that the MAC address of the default VLAN is applied to the interface if the interface does not have its own MAC address.

If SLAAC is not suitable then a network can use stateful configuration with DHCPv6 (Dynamic Host Configuration Protocol version 6) Relay, or hosts can be configured statically. See **ip dhcp-relay server-address** for the DHCPv6 Relay server command description and examples. For introduction and configuration information about DHCPv6 Relay agent see **"DHCP Relay Agent Introduction" on page 89.9** and **"Configuring the DHCP Relay Agent" on page 89.9**.

Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them. See the **Link-local addresses** glossary entry, and the **ipv6 enable** command for more information.

Also note that the link-local address is retained in the system if the global address is removed using another command, which was not used to establish the link-local address. For example, if a link local address is established with the **ipv6 enable** command then it will not be removed using a **no ipv6 address** command.

Examples To enable SLAAC on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address autoconfig
```

To disable SLAAC on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address autoconfig
```

Validation Commands
show running-config
show ipv6 interface brief
show ipv6 route

Related Commands
ipv6 address
ipv6 enable

ipv6 enable

Use this command to enable IPv6 on an interface without an IPv6 global address for the interface. This enables IPv6 with a IPv6 link-local address, not an IPv6 global address.

Use the no variant of this command to disable IPv6 on an interface without a global address. Note the no variant of this command does not operate on an interface with an IPv6 global address or an interface configured for IPv6 stateless address autoconfiguration (SLAAC),

Syntax

```
ipv6 enable
no ipv6 enable
```

Mode Interface Configuration for a VLAN interface.

Usage The **ipv6 enable** command automatically configures an IPv6 link-local address on the interface and enables the interface for IPv6 processing. Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them. See the **Link-local addresses** glossary entry for more information.

Also note that the link-local address is retained in the system if the global address is removed using another command, which was not used to establish the link-local address. For example, if a link local address is established with the **ipv6 enable** command then it will not be removed using a **no ipv6 address** command.

Examples To enable IPv6 with only a link-local IPv6 address on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
```

To disable IPv6 with only a link-local IPv6 address on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 enable
```

Validation Commands
show running-config
show ipv6 interface brief
show ipv6 route

Related Commands
ipv6 address
ipv6 address autoconfig

ipv6 forwarding

Use this command to turn on IPv6 unicast routing for IPv6 packet forwarding. Issue this command globally on your switch prior to issuing **ipv6 enable** on individual interfaces.

Use this **no** variant of this command to turn off IPv6 unicast routing for IPv6 packet forwarding. Note IPv6 unicast routing for IPv6 packet forwarding is disabled by default.

Note

Use this command to enable IPv6 unicast routing before configuring either RIPng or OSPFv3 IPv6 routing protocols and static or multicast IPv6 routing. IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Syntax

```
ipv6 forwarding
no ipv6 forwarding
```

Mode Global Configuration

Default IPv6 unicast forwarding is disabled by default.

Usage Enable IPv6 unicast forwarding globally for all interface on your switch with this command. Use the **no** variant of this command to disable IPv6 unicast forwarding globally for all interfaces on your switch.

IPv6 unicast forwarding allows switches to communicate with devices that are more than one hop away, providing that there is a route to the destination address. If IPv6 forwarding is not enabled then pings to addresses on devices that are more than one hop away will fail, even if there is a route to the destination address.

Examples To enable IPv6 unicast routing, use this command as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
```

To disable IPv6 unicast routing, use the **no** variant of this command as shown below:

```
awplus# configure terminal
awplus(config)# no ipv6 forwarding
```

Related Commands

ipv6 enable
ipv6 multicast-routing

ipv6 nd managed-config-flag

Use this command to set the managed address configuration flag, contained within the router advertisement field.

Setting this flag indicates the operation of a stateful autoconfiguration protocol such as DHCPv6 for address autoconfiguration, and that address information (i.e. the network prefix) and other (non-address) information can be requested from the switch.

An unset flag enables hosts receiving the advertisements to use a stateless autoconfiguration mechanism to establish their IPv6 addresses. The default is flag unset.

Use the **no** variant of this command to reset this command to its default of, *flag unset*.

Syntax

```
ipv6 nd managed-config-flag
no ipv6 nd managed-config-flag
```

Default Unset

Mode Interface Configuration for a VLAN interface.

Usage Advertisement flags will not be transmitted unless you have applied the **no ipv6 nd suppress-ra** command on page 31.20. This step is included in the example below.

Example To set the managed address configuration flag on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd managed-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

Related Commands

ipv6 nd suppress-ra
ipv6 nd prefix
ipv6 nd other-config-flag

ipv6 nd minimum-ra-interval

Use this command in Interface Configuration mode to set a minimum Router Advertisement (RA) interval for a VLAN interface.

Use the **no** variant of this command in Interface Configuration mode to remove the minimum RA interval for a VLAN interface.

Syntax

```
ipv6 nd minimum-ra-interval <seconds>
no ipv6 nd minimum-ra-interval [<seconds>]
```

Parameter	Description
<seconds>	Specifies the number of seconds between IPv6 Router Advertisements (RAs). Valid values are from 3 to 1350 seconds.

Default The RA interval for a VLAN interface is unset by default.

Mode Interface Configuration for a VLAN interface.

Examples To set the minimum RA interval for the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd minimum-ra-interval 60
```

To remove the minimum RA interval for the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd minimum-ra-interval 60
```

Related Commands

ipv6 nd ra-interval
ipv6 nd suppress-ra
ipv6 nd prefix
ipv6 nd other-config-flag

ipv6 nd other-config-flag

Use this command to set the **other** stateful configuration flag (contained within the router advertisement field) to be used for IPv6 address auto-configuration. This flag is used to request the router to provide information in addition to providing addresses.

Note Setting the **ipv6 nd managed-config-flag** command on page 31.9 implies that the **ipv6 nd other-config-flag** will also be set.

Use **no** variant of this command to reset the value to the default.

Syntax

```
ipv6 nd other-config-flag
no ipv6 nd other-config-flag
```

Default Unset

Mode Interface Configuration for a VLAN interface.

Usage Advertisement flags will not be transmitted unless you have applied the **no ipv6 nd suppress-ra** command on page 31.20. This step is included in the example below.

Example To set the IPv6 other-config-flag on the VLAN interface `vlan4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd other-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

Related Commands

ipv6 nd suppress-ra
ipv6 nd prefix
ipv6 nd managed-config-flag

ipv6 nd prefix

Use this command in Interface Configuration mode for a VLAN interface to specify the IPv6 prefix information that is advertised by the router advertisement for IPv6 address auto-configuration.

Use the **no** parameter with this command to reset the IPv6 prefix for a VLAN interface in Interface Configuration mode.

Syntax

```
ipv6 nd prefix <ipv6-prefix/length>

ipv6 nd prefix <ipv6-prefix/length> [<valid-lifetime>]

ipv6 nd prefix <ipv6-prefix/length> <valid-lifetime>
   <preferred-lifetime> [no-autoconfig]

ipv6 nd prefix <ipv6-prefix/length> <valid-lifetime>
   <preferred-lifetime> off-link [no-autoconfig]

no ipv6 nd prefix [<ipv6-addr/prefix-length>|all]
```

Parameter	Description
<ipv6-prefix/length>	The prefix to be advertised by the router advertisement message. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.The default is X:X::/64.
<valid-lifetime>	The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 0 and 4294967295 seconds. The default is 2592000 (30 days). Note that this period should be set to a value greater than that set for the prefix preferred-lifetime.
<preferred-lifetime>	Specifies theIPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered a current (undeprecated) value. After this period, the command is still valid but should not be used in new communications. Set to a value between 0 and 4294967295 seconds. The default is 604800 seconds (7 days). Note that this period should be set to a value less than that set for the prefix valid-lifetime.
`off-link`	Specify the IPv6 prefix off-link flag. The default is *flag set*.
`no-autoconfig`	Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration. The default is *flag set*.
`all`	Specify all IPv6 prefixes associated with the VLAN interface.

Default Valid-lifetime default is 2592000 seconds (30 days). Preferred-lifetime default is 604800 seconds (7 days).

Usage This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

Examples The following example configures the switch to issue router advertisements on the VLAN interface `vlan4`, and advertises the address prefix of `2001:0db8::/64`.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64
```

The following example configures the switch to issue router advertisements on the VLAN interface `vlan4`, and advertises the address prefix of `2001:0db8::/64` with a valid lifetime of 10 days and a preferred lifetime of 5 days.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64 864000 432000
```

The following example configures the switch to issue router advertisements on the VLAN interface `vlan4`, and advertises the address prefix of `2001:0db8::/64` with a valid lifetime of 10 days, a preferred lifetime of 5 days and no prefix used for autoconfiguration.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64 864000 43200
no-autoconfig
```

The following example resets router advertisements on the VLAN interface `vlan4`, so the address prefix of `2001:0db8::/64` is not advertised from the switch.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/64
```

The following example resets all router advertisements on the VLAN interface `vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd prefix all
```

Related Commands **ipv6 nd suppress-ra**

ipv6 nd ra-interval

Use this command to specify the interval between IPv6 Router Advertisements (RA) transmissions.

Use **no** parameter with this command to reset the value to the default value (600 seconds).

Syntax

```
ipv6 nd ra-interval <seconds>

no ipv6 nd ra-interval
```

Parameter	Description
<*seconds*>	Specifies the number of seconds between IPv6 Router Advertisements (RAs). Valid values are from 4 to 1800 seconds.

Default 600 seconds.

Mode Interface Configuration for a VLAN interface.

Usage Advertisement flags will not be transmitted unless you have applied the **no ipv6 nd suppress-ra** command on page 31.20 as shown in the example below.

Example To set the advertisements interval on the VLAN interface `vlan4` to be 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd ra-interval 60
awplus(config-if)# no ipv6 nd suppress-ra
```

Related Commands

ipv6 nd minimum-ra-interval
ipv6 nd suppress-ra
ipv6 nd prefix

ipv6 nd ra-lifetime

Use this command to specify the time period that this router can usefully act as a default gateway for the network. Each router advertisement resets this time period.

Use **no** parameter with this command to reset the value to default.

Syntax

```
ipv6 nd ra-lifetime <seconds>
no ipv6 nd ra-lifetime
```

Parameter	Description
<seconds>	Time period in seconds. Valid values are from 0 to 9000. Note that you should set this time period to a value greater than the value you have set using the **ipv6 nd ra-interval** command.

Default 1800 seconds

Mode Interface Configuration for a VLAN interface.

Usage This command specifies the lifetime of the current router to be announced in IPv6 Router Advertisements.

Advertisement flags will not be transmitted unless you have applied the **no ipv6 nd suppress-ra** command. This instruction is included in the example shown below.

Examples To set the advertisement lifetime of 8000 seconds on the VLAN interface `vlan4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd ra-lifetime 8000
awplus(config-if)# no ipv6 nd suppress-ra
```

Related Commands **ipv6 nd suppress-ra**
ipv6 nd prefix

ipv6 nd raguard

Use this command to apply the Router Advertisements (RA) Guard feature from the Interface Configuration mode for a switch port. This blocks all RA messages received on a switch port. For introductory information about RA Guard see **"RA Guard Introduction" on page 30.14**.

Use the **no** parameter with this command to disable RA Guard for a specified switch port.

Syntax

```
ipv6 nd raguard
no ipv6 nd raguard
```

Default RA Guard is not enabled by default.

Mode Interface Configuration for a switch port interface.

Usage Router Advertisements (RAs) are used by Routers to announce themselves on the link. Applying RA Guard to a switch port disallows Router Advertisements and redirect messages. RA Guard blocks RAs from untrusted hosts. Blocking RAs stops untrusted hosts from flooding malicious RAs and stops any misconfigured hosts from disrupting traffic on the local network.

Enabling RA Guard on a port blocks RAs from a connected host and indicates the port and host are untrusted. Disabling RA Guard on a port allows RAs from a connected host and indicates the port and host are trusted. Ports and hosts are trusted by default to allow RAs.

Example To enable RA Guard on switch ports `port1.0.2-1.0.12`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-1.0.12
awplus(config-if)# ipv6 nd raguard
```

To verify RA Guard is enabled on switch port interface `port1.0.2`, use the command:

```
awplus# show running-config interface port1.0.2
```

To disable RA Guard on switch ports `port1.0.2-1.0.12`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.12
awplus(config-if)# no ipv6 nd raguard
```

When RA Guard is disabled on a switch port it is not displayed in **show running-config** output.

Output **Example output from a show running-config interface port1.0.2 to verify RA Guard:**

```
!
interface port1.0.2
 switchport mode access
 ipv6 nd raguard
!
```

Related Commands **show running-config interface**

ipv6 nd reachable-time

Use this command to specify the reachable time in the router advertisement to be used for detecting reachability of the IPv6 neighbor.

Use the **no** variant of this command to reset the value to default.

Syntax

```
ipv6 nd reachable-time <milliseconds>
no ipv6 nd reachable-time
```

Parameter	Description
<milliseconds>	Time period in milliseconds. Valid values are from 1000 to 3600000. Setting this value to 0 indicates an unspecified reachable-time.

Default 0 milliseconds

Mode Interface Configuration for a VLAN interface.

Usage This command specifies the reachable time of the current router to be announced in IPv6 Router Advertisements.

Advertisement flags will not be transmitted unless you have applied the **no ipv6 nd suppress-ra** command. This instruction is included in the example shown below.

Example To set the reachable-time in router advertisements on the VLAN interface `vlan4` to be 1800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd reachable-time 1800000
awplus(config-if)# no ipv6 nd suppress-ra
```

To reset the reachable-time in router advertisements on the VLAN interface `vlan4` to an unspecified reachable-time (0 milliseconds), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd reachable-time
```

Related Commands

ipv6 nd suppress-ra
ipv6 nd prefix

ipv6 nd retransmission-time

Use this command to specify the advertised retransmission interval for Neighbor Solicitation in milliseconds between IPv6 Routers.

Use the **no** variant of this command to reset the retransmission time to the default (1 second).

Syntax

```
ipv6 nd retransmission-time <milliseconds>
no ipv6 nd retransmission-time [<milliseconds>]
```

Parameter	Description
<milliseconds>	Time period in milliseconds. Valid values are from 1000 to 3600000.

Default 1000 milliseconds (1 second)

Mode Interface Configuration for a VLAN interface.

Examples To set the retransmission-time of Neighbor Solicitation on the VLAN interface `vlan2` to be 800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd retransmission-time 800000
```

To reset the retransmission-time of Neighbor Solicitation on the VLAN interface `vlan2` to the default 1000 milliseconds (1 second), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd retransmission-time
```

Related Commands **ipv6 nd suppress-ra**
ipv6 nd prefix

ipv6 nd suppress-ra

Use this command to inhibit IPv6 Router Advertisement (RA) transmission for the current interface. Router advertisements are used when applying IPv6 stateless auto-configuration.

Use **no** parameter with this command to enable Router Advertisement transmission.

Syntax

```
ipv6 nd suppress-ra
no ipv6 nd suppress-ra
```

Default Router Advertisement (RA) transmission is suppressed by default.

Mode Interface Configuration for a VLAN interface.

Example To enable the transmission of router advertisements from the VLAN interface `vlan4` on the switch, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd suppress-ra
```

Related Commands ipv6 nd ra-interval
ipv6 nd prefix

ipv6 neighbor

Use this command to add a static IPv6 neighbor entry.

Use the **no** variant of this command to remove a specific IPv6 neighbor entry.

Syntax

```
ipv6 neighbor <ipv6-address> <vlan-name> <mac-address> <port-list>
no ipv6 neighbor <ipv6-address> <vlan-name> <port-list>
```

Parameter	Description
<ipv6-address>	Specify the neighbor's IPv6 address in format `X:X::X:X`.
<vlan-name>	Specify the neighbor's VLAN name.
<mac-address>	Specify the MAC hardware address in hexadecimal notation with the format `HHHH.HHHH.HHHH`.
<port-list>	Specify the port number, or port range.

Mode Global Configuration

Usage Use this command to clear a specific IPv6 neighbor entry. To clear all dynamic address entries, use the **clear ipv6 neighbors** command.

Example To create a static neighbor entry for IPv6 address `2001:0db8::a2`, on `vlan 4`, MAC address `0000.cd28.0880`, on `port1.0.19`, use the command:

```
awplus# configure terminal
awplus(config)# ipv6 neighbor 2001:0db8::a2 vlan4
0000.cd28.0880 port1.0.19
```

Related Commands **clear ipv6 neighbors**

ipv6 opportunistic-nd

Use this command to enable opportunistic neighbor discovery for the global IPv6 ND cache. Opportunistic neighbor discovery changes the behavior for unsolicited ICMPv6 ND packet forwarding on the switch.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global IPv6 ND cache.

Syntax

```
ipv6 opportunistic-nd
no ipv6 opportunistic-nd
```

Default Opportunistic neighbor discovery is disabled by default.

Mode Global Configuration

Usage When opportunistic neighbor discovery is enabled, the switch will reply to any received unsolicited ICMPv6 ND packets. The source MAC address for the unsolicited ICMPv6 ND packet is added to the IPv6 ND cache, so the switch forwards the ICMPv6 ND packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ICMPv6 packet is not added to the IPv6 ND cache, so the ICMPv6 ND packet is not forwarded by the switch.

Examples To enable opportunistic neighbor discovery for the IPv6 ND cache, enter:

```
awplus# configure terminal
awplus(config)# ipv6 opportunistic-nd
```

To disable opportunistic neighbor discovery for the IPv6 ND cache, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 opportunistic-nd
```

Related Commands **arp opportunistic-nd**
show ipv6 neighbors

Validation Commands **show running-config interface**

ipv6 route

Use this command to establish the distance for static routes of a network prefix.

Use the **no** variant of this command to disable the distance for static routes of the network prefix.

Syntax

```
ipv6 route <dest-prefix> <dest-prefix/length>
   {<gateway-ip>|<gateway-name>} [<distvalue>]

no ipv6 route <dest-prefix> <dest-prefix/length>
   {<gateway-ip>|<gateway-name>} [<distvalue>]
```

Parameter	Description
<dest-prefix/length>	Specifies the IP destination prefix. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<gateway-ip>	Specifies the IP gateway (or next hop) address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<distvalue>	Specifies the administrative distance for the route. Valid values are from 1 to 255.
<gateway-name>	Specifies the name of the gateway (or next hop) interface.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ipv6 route 2001:0db8::1/128 myintname 32
```

Validation Commands **show running-config**
show ipv6 route

ping ipv6

This command sends a query to another IPv6 host (send Echo Request messages).

Note Use of the `interface` parameter keyword, plus an interface or an interface range, with this command is only valid when pinging an IPv6 link local address.

Syntax

```
ping ipv6 {<host>|<ipv6-address>} [repeat {<1-2147483647>|
   continuous}] [size <10-1452>] [interface <interface-list>]
   [timeout <1-65535>]
```

Parameter	Description
<ipv6-addr>	The destination IPv6 address. The IPv6 address uses the format X:X::X:X.
<hostname>	The destination hostname.
`repeat`	Specify the number of ping packets to send.
<1-2147483647>	Specify repeat count. The default is 5.
`size` *<10-1452>*	The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).
`interface` *<interface-list>*	The interface or range of configured IP interfaces to use as the source in the IP header of the ping packet.
`timeout` *<1-65535>*	The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.
`repeat`	Specify the number of ping packets to send.
<1-2147483647>	Specify repeat count. The default is 5.
`continuous`	Continuous ping.
`size` *<10-1452>*	The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).
`timeout` *<1-65535>*	The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.

Mode User Exec and Privileged Exec

Example

```
awplus# ping ipv6 2001:0db8::a2
```

Related Commands traceroute ipv6

show ipv6 forwarding

Use this command to display IPv6 forwarding status.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show ipv6 forwarding`

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 forwarding
```

Output **Figure 31-1: Example output from the show ipv6 forwarding command**

```
ipv6 forwarding is on
```

show ipv6 interface brief

Use this command to display brief information about interfaces and the IPv6 address assigned to them.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show ipv6 interface [brief]`

Parameter	Description
`brief`	Specify this optional parameter to display brief IPv6 interface information.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 interface brief
```

Output **Figure 31-2: Example output from the show ipv6 interface brief command**

```
awplus#show ipv6 interface brief
Interface     IPv6-Address                                  Status      Protocol
lo            unassigned                                    admin up    running
vlan1         2001:db8::1/48                                admin up    down
              fe80::215:77ff:fee9:5c50/64
```

Related Commands show interface brief

show ipv6 neighbors

Use this command to display all IPv6 neighbors.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 neighbors`

Mode User Exec and Privileged Exec

show ipv6 route

Use this command to display the IPv6 routing table for a protocol or from a particular table.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 route
   [connected|database|ospf|rip|static|summary|
   <ipv6-address>|<ipv6-addr/prefix-length>)]
```

Parameter	Description
`connected`	Displays only the routes learned from connected interfaces.
`database`	Displays only the IPv6 routing information extracted from the database.
`ospf`	Displays only the routes learned from IPv6 Open Shortest Path First (OSPFv3).
`rip`	Displays only the routes learned from IPv6 Routing Information Protocol (RIPng).
`static`	Displays only the IPv6 static routes you have configured.
`summary`	Displays summary information from the IPv6 routing table.
`<ipv6-address>`	Displays the routes for the specified address in the IP routing table. The IPv6 address uses the format X:X::X:X/ Prefix-Length. The prefix-length is usually set between 0 and 64.
`<ipv6-prefix/length>`	Displays only the routes for the specified IP prefix. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.

Mode User Exec and Privileged Exec

Example 1 To display an IP route with all parameters turned on, use the following command:

```
awplus# show ipv6 route
```

Output **Figure 31-3: Example output of the show ipv6 route command**

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF
S    ::/0 [1/0] via 2001::a:0:0:c0a8:a6, vlan10
C    2001:db8::a:0:0:0:0/64 via ::, vlan10
C    2001:db8::14:0:0:0:0/64 via ::, vlan20
C    2001:db8::0:0:0:0/64 via ::, vlan30
C    2001:db8::28:0:0:0:0/64 via ::, vlan40
C    2001:db8::fa:0:0:0:0/64 via ::, vlan250
C    2001:db8::/64 via ::, vlan250
C    2001:db8::/64 via ::, vlan40
C    2001:db8::/64 via ::, vlan20
C    2001:db8::/64 via ::, vlan10
```

Example 2 To display all database entries for an IP route, use the following command:

```
awplus# show ipv6 route database
```

Output **Figure 31-4: Example output of the show ipv6 route database command**

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF
       > - selected route, * - FIB route, p - stale info
Timers: Uptime

S   ::/0 [1/0] via 2001::a:0:0:c0a8:a01 inactive, 6d22h12m
         [1/0] via 2001::fa:0:0:c0a8:fa01 inactive, 6d22h12m
```

show ipv6 route summary

Use this command to display the summary of the current NSM RIB entries.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 route summary`

Mode User Exec and Privileged Exec

Example To display IP route summary, use the following command:

```
awplus# show ipv6 route summary
```

Output **Figure 31-5: Example output from the show ipv6 route summary command**

```
IPv6 routing table name is Default-IPv6-Routing-Table(0)
IPv6 routing table maximum-paths is 4
RouteSource     Networks
connected       4
ospf            5
Total           9
FIB             5
```

Related Commands **show ip route**
show ip route database

traceroute ipv6

Use this command to trace the route to the specified IPv6 host.

Syntax `traceroute ipv6 {<ipv6-addr>|<hostname>}`

Parameter	Description
<ipv6-addr>	The destination IPv6 address. The IPv6 address uses the format X:X::X:X.
<hostname>	The destination hostname.

Mode User Exec and Privileged Exec

Example To run a traceroute for the IPv6 address 2001:0db8::a2, use the following command:

```
awplus# traceroute ipv6 2001:0db8::a2
```

Related Commands **ping ipv6**

Chapter 32: IPv6to4 Tunneling Configuration

Introduction

This chapter contains a basic IPv6to4 automatic tunneling configuration example for reference.

To see details on the Tunneling commands used in this sample configuration, or to see the outputs of the Validation commands, refer to **Chapter 33, IPv6to4 Tunneling Commands**. Links to the Tunneling commands used in the examples are also provided below the examples.

6to4 Automatic Tunnel Configuration

IPv6 transition is required to migrate from IPv4 to IPv6. One method to connect to the global IPv6 network over the existing IPv4 network is called 6to4 automatic tunneling.

Although this method is called '6to4 tunneling', it does not involve discrete point-to-point tunnels. The 'tunneling' in '6to4 tunneling' refers to the fact that the IPv6 packets are encapsulated in IPv4 packets to be 'tunneled' across the IPv4 domain. Hence, '6to4 tunneling' is primarily a scheme for encapsulating IPv6 packets inside IPv4 headers.

Using 6to4 tunneling, you are not required to specify tunnel destination addresses. You only choose the interface that connects the switch to the IPv4 domain, and designate that interface to be the tunnel entry-point. As will be explained below, the IPv4 address that represents the point at which any given IPv6 packet will eventually exit the IPv4 domain is derived from the IPv6 packet itself. Note that the packet's destination IPv6 address itself contains the destination IPv4 address that is used for tunnel encapsulation.

The 6to4 tunneling implementation in AlliedWare Plus™ is used for routing only between IPv6 addresses that are of the form:

`2002: <valid-IPv4-unicast-address> : XX:XX:XX:XX:XX`

6to4 tunneling makes use of the fact that for every valid IPv4 unicast address `A.B.C.D`, there is always a corresponding valid IPv6 subnet `2002:<A.B.C.D>::/48`. So, for every global IP v4 address that has been allocated to an organization, there is immediately a global IPv6 subnet `2002:<ipv4-address>::/48` available to that organization.

Tunneling Operation

When an IPv4 interface on the switch is designated as a tunnel entry point, using the **tunnel source** command on page 33.5 command, an IPv6 tunnel interface is created. The interface is automatically allocated the IPv6 address: `2002:<ipv4-address>::1/128`.

Note

Other implementations of 6to4 tunneling might have a different scheme for deriving the IPv6 address of the tunnel interface, as there is no standardized scheme. This does not cause any interoperability problems, however, as the IPv6 address of the tunnel interface is not actually involved in the routing process.

This tunnel interface is the gateway used by the IPv6 packets to enter the IPv4 domain. As IPv6 packets enter the IPv4 domain, the switch must encapsulate them by pre-pending IPv6 packets with an IPv4 header. The source address of the encapsulating header is the IPv4 address that has been specified by the tunnel source command. The process for determining the destination IP address is explained in more detail below.

The key to routing across the IPv4 domain is that there is a connection between the IPv4 address of a tunnel endpoint and the IPv6 subnets which can be reached via that endpoint. The connection is that the tunnel interface with IP address `<ipv4-address>` is considered to be the gateway to **all** IPv6 subnets within the range `2002:<ipv4-address>::/48`.

When a switch is required to deliver packets, via a tunnel interface, to IPv6 addresses in the range `2002:<ipv4-address>::/48`, the switch knows that the IPv4 address to which the switch must deliver that packet is given by the 17th through 48th bits of the IPv6 destination address. So, the encapsulation process extracts those bits from the IPv6 destination address, and uses them as the IPv4 destination address in the encapsulating header.

For example, if `192.0.2.1` is the IPv4 address of a tunnel endpoint, then the IPv6 subnets in the range `2002:c000:201::/48` are automatically known to be reachable via that tunnel endpoint. If another tunnel endpoint has an IPv6 packet to deliver to `2002:c000:201:6::04:8d`, via the tunnel, then that switch will encapsulate the packet in an IPv4 header with a destination address of `192.0.2.1`

The corollary to this is the requirement that, to be reachable from other 6to4 networks, the IPv6 VLAN interfaces on the IPv6 side a tunneling switch will need to be configured with IPv6 addresses that are subnetted from the `2002:<ipv4-address>::/48` address.

For example, `2002:<ipv4-address>:1::/64`, `2002:<ipv4-address>:2::/64`, `2002:<ipv4-address>:3::/64`, etc.

Note `2002:<ipv4-address>::/64` cannot be used here, because it conflicts with the automatically configured tunnel address.

6to4 tunnels operation and configuration summary

1. When an IPv4 address is designated as the source address of a tunnel, that tunnel interface is automatically given the IPv6 address `2002:<ipv4-address>::1/128`

2. The switch does not automatically create any IPv6 routes via that tunnel interface, so you do need to explicitly create a route to direct traffic over the tunnel interface. Typically, you will create a route to `2002::/16` via the tunnel interface. There might be occasions, though, when you want to just create some more restricted routes, within the `2002::/16` range, over the tunnel interface.

3. Once routes have been created that direct traffic over the tunnel interface, it is not necessary to specify nexthop addresses for the individual remote IPv6 subnets that are reachable via the tunnel. The switch will automatically know the IPv4 nexthop via which to reach any IPv6 subnet in the range `2002:<ipv4-address>::/48`.

4. The only IPv6 addresses that can be routed to via the 6to4 tunnels on switches running AlliedWare Plus™ are IPv6 addresses of the form:

   `2002:<valid-IPv4-unicast-address>:xx:xx:xx:xx:xx`

Example 6to4 configuration

The following example shows the minimum configuration required for 6to4 automatic tunnel configuration. Follow the commands and descriptions in the tables below the sample network:

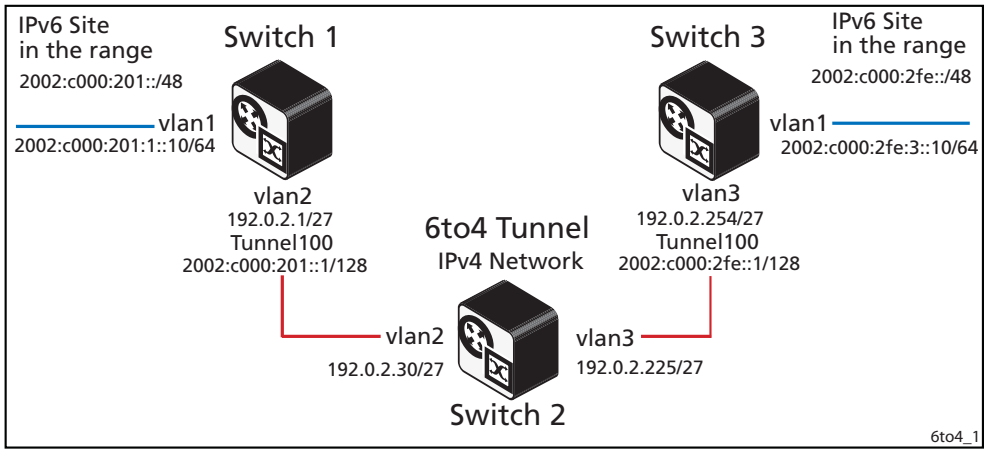


Table 32-1: Example configuration for 6to4 automatic tunneling: Switch 1

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) and enter the Interface Configuration mode.
`awplusa(config-if)#`	
`ip address 192.0.2.1/27`	Set the IPv4 address for the interface (`vlan2`).
`awplus(config-if)#`	
`exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#`	
`interface vlan1`	Specify the interface (`vlan1`) and enter the Interface Configuration mode.
`awplus(config-if)#`	
`ipv6 address 2002:c000:201:1::10/64`	Set the IPv6 address for the interface (`vlan1`).
`awplus(config-if)#`	
`exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#`	
`ipv6 forwarding`	Enable IPv6 routing.

Table 32-1: Example configuration for 6to4 automatic tunneling: Switch 1 (cont.)

`awplus(config)#` `interface tunnel 100`	Create a tunnel interface.
`awplus(config-if)#` `tunnel mode ipv6ip 6to4`	Set the tunnel mode.
`awplus(config-if)#` `tunnel source 192.0.2.1`	Define the IPv4 address to be used as the source address for the tunnel interface.
`awplus(config-if)#` `exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#` `ipv6 route 2002::/16 tunnel100`	Add a route to send traffic for other 6to4 subnets via the tunnel interface.

Table 32-2: Example configuration for 6to4 automatic tunneling: Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `interface vlan2`	Specify the interface (`vlan2`) and enter the Interface Configuration mode.
`awplus(config-if)#` `ip address 192.0.2.30/27`	Set the IPv4 address of the interface (`vlan2`).
`awplus(config-if)#` `exit`	Exit Interface mode and enter the Global Configuration mode.
`awplus(config)#` `interface vlan3`	Specify the interface (`vlan3`) and enter the Interface Configuration mode.
`awplus(config-if)#` `ip address 192.0.2.225/27`	Set the IPv4 address of the interface (`vlan3`).
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.

Table 32-3: Example configuration for 6to4 automatic tunneling: Switch 3

`awplus(config)#` `interface vlan3`	Specify interface (`vlan3`) and enter the Interface Configuration mode.
`awplus(config-if)#` `ip address 192.0.2.254/27`	Set the IPv4 address for the interface (`vlan3`).
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.
`awplus(config)#` `interface vlan1`	Specify the interface (`vlan1`) and enter the Interface Configuration mode.
`awplus(config-if)#` `ipv6 address 2002:c000:2fe:3::10/64`	Set the IPv6 address for the interface (`vlan1`).
`awplus(config-if)#` `exit`	Exit Interface mode and enter Global Configuration mode.

Table 32-3: Example configuration for 6to4 automatic tunneling: Switch 3 (cont.)

`awplus(config)#` `ipv6 forwarding`	Enable IPv6 routing.
`awplus(config)#` `interface tunnel 100`	Create a tunnel interface.
`awplus(config-if)#` `tunnel mode ipv6ip 6to4`	Set the tunnel mode.
`awplus(config-if)#` `tunnel source 192.0.2.254`	Define the IPv4 address to be used as the source address for the tunnel interface.
`awplus(config-if)#` `exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#` `ipv6 route 2002::/16 tunnel100`	Add a route to send traffic for other 6to4 subnets via the tunnel interface.
`awplus(config)#` `router ospf`	Create an OSPF routing instance.
`awplus(config-router)#` `router-id 10.70.0.76`	Specify a Router ID for the OSPF routing process.
`awplus(config-router)#` `network 192.0.2.224/27 area 0`	Enable OSPF routing with a specified Area ID on interfaces with IP addresses within the specified network address. The Area ID used in this case is 0, which specifies the backbone area.

Note

The IPv6 address which is automatically assigned to the tunnel interface in this example for **Switch 1** is **2002:<IPv4 address in hex>::1/128**, where <**IPv4 address in hex**> represents the IPv4 address of the tunnel source, converted to hexadecimal.

So, the tunnel interface is the gateway from the IPv4 network to the IPv6 subnet
2002:<IPv4 address in hex>::/48

Hence, the IPv6 address configured on **vlan1** must be in the subnet **2002:<IPv4 address in hex>::/48**. However, if the address on **vlan1** is given a / **64** prefix-length it must differ from the tunnel address somewhere in the 49-64th bits.

For example, in this scenario: **vlan2** IP address (which the tunnel will go over): **192.0.2.1 = c0000201 hex (shown as c000:201without leading zeros in the example).** Tunnel 100 IPv6 address will automatically use **2002:c000:0201:0000::1/128** as its IPv6 address.

So, configure the following address on **vlan1: 2002:c000:0201:<xxxx>::x/6** where <**xxxx**> is anything other than **0000** e.g. **2002:c000:0201:1::10/64**

Names of Commands Used

interface tunnel
ip address
ipv6 address
tunnel mode ipv6ip
tunnel source

Chapter 33: IPv6to4 Tunneling Commands

Command List

This chapter provides an alphabetical reference of commands used to configure automatic IPv6 tunneling over IPv4. For more information, see **Chapter 32, IPv6to4 Tunneling Configuration**.

interface tunnel

Use this command to create a new tunnel interface, which is identified by an integer (1-145).

This command is also used to enter interface configuration mode for existing tunnel interfaces.

Use the **no** variant of this command to destroy a previously created tunnel interface.

Note This command will function on your switch in the stand-alone mode. but is not supported when the switch forms part of a VCStack.

Syntax

```
interface tunnel <1-145>
no interface tunnel <1-145>
```

Default Disabled

Mode Global Configuration

Usage This command creates a new tunnel interface to configure in Interface mode.

Examples

```
awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)#

awplus# configure terminal
awplus(config)# no interface tunnel 100
awplus(config)#
```

Related Commands **tunnel dscp (6to4)**
tunnel source

tunnel dscp (6to4)

Use this command to configure the value (0-63) to use for the IPv4 DSCP (Differentiated Services Code Point) field in the IPv4 header that encapsulates the tunneled IPv6 packets. By default the IPv4 DSCP field value is 0.

Use the **no** variant of this command to reset the IPv4 DSCP field to the default (0).

Note This command will function on your switch in the stand-alone mode. but is not supported when the switch forms part of a VCStack.

Syntax

```
tunnel dscp <0-63>
no tunnel dscp
```

Default The default IPv4 DSCP field value is 0.

Mode Interface Configuration for 6to4 tunnel interfaces.

Usage This command controls the IPv4 DSCP field in the IPv4 headers that are prepended (or prefixed) to the tunneled IPv6 packets.

Examples

```
awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# tunnel source 192.0.2.1
awplus(config-if)# tunnel dscp 10

awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# tunnel source 192.0.2.1
awplus(config-if)# no tunnel dscp
```

Related Commands interface tunnel
tunnel mode ipv6ip
tunnel source

tunnel mode ipv6ip

Use this command to specify the IPv6 transition tunnel mode. In AlliedWare Plus™ 6to4 automatic tunneling is the only tunnel mode supported.

Use the **no** variant of this command to return the mode of the IPv6 transition tunnel to an undefined state.

Note This command will function on your switch in the stand-alone mode. but is not supported when the switch forms part of a VCStack.

Syntax

```
tunnel mode ipv6ip 6to4
no tunnel mode
```

Parameter	Description
`6to4`	`6to4` automatic tunnel mode.

Mode Interface Configuration for 6to4 tunnel interfaces.

Usage This command specifies a tunnel encapsulation mode for IPv6 in IPv4. Currently only 6to4 automatic tunneling is supported. Future releases may support alternative tunneling modes.

It is a requirement that the mode is set on a tunnel. The tunnel will not be operational until the tunnel mode has been set using the **tunnel mode ipv6ip 6to4** command.

Examples

```
awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# tunnel source 192.0.2.1
awplus(config-if)# tunnel mode ipv6ip

awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# tunnel source 192.0.2.1
awplus(config-if)# no tunnel mode
```

Related Commands

interface tunnel
tunnel dscp (6to4)
tunnel source

tunnel source

Use this command to specify the IPv4 source address for packets being encapsulated in the tunnel. It should be the IPv4 address on the interface that attaches the switch for the IPv4 domain through which the IPv6 packets are to be tunneled.

Use the **no** variant of this command to remove a tunnel source address for a tunnel interface.

Note This command will function on your switch in the stand-alone mode. but is not supported when the switch forms part of a VCStack.

Syntax

```
tunnel source <ipv4-addr>
no tunnel source
```

Parameter	Description
<ipv4-addr>	IPv4 tunnel source address.

Mode Interface Configuration for 6to4 tunnel interfaces.

Usage This command specifies an IPv4 source address for the tunnel.

Note There are constraints on the IPv4 source address specified for the tunnel. The IPv4 source address for the tunnel must be the IPv4 address of an interface on the switch, and it must be the interface for carrying the tunnel traffic.

Examples

```
awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# tunnel source 192.0.2.1
```

```
awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# no tunnel source
```

Related Commands interface tunnel
tunnel dscp (6to4)

tunnel ttl

Use this command to configure the value to use for the Time to Live (TTL) field in the IPv4 header that encapsulates the tunneled IPv6 packets.

Use the **no** variant of this command to inherit the TTL value from the encapsulated packet.

Note This command will function on your switch in the stand-alone mode. but is not supported when the switch forms part of a VCStack.

Syntax

```
tunnel ttl <1-255>
no tunnel ttl
```

Default By default the TTL value is inherited from the encapsulated packet.

Mode Interface Configuration for 6to4 tunnel interfaces.

Usage This command specifies a value of Time to Live (TTL) in the tunnel IPv4 encapsulation header.

Examples

```
awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# tunnel source 192.0.2.1
awplus(config-if)# tunnel ttl 255

awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# tunnel source 192.0.2.1
awplus(config-if)# no tunnel ttl
```

Related Commands **interface tunnel**
tunnel dscp (6to4)

Chapter 34: Routing Protocol Overview

Introduction

This chapter introduces the basic routing protocols supported within the AlliedWare Plus™ Operating System.

RIP

A distance-vector protocol, Routing Information Protocol (RIP) is an Interior Gateway Protocol (IGP) that uses hop counts as its metrics. The AlliedWare Plus™ RIP module supports RFCs 1058 and 1723; the RIPv2 module supports more fields in the RIP packets, and supports security authentication features.

At regular intervals of the routing update timer (which has a default value of 30 seconds), and at the time of change in the topology, the RIP router sends update messages to other routers. The listening routers update their route table with the new route, and increase the metric value of the path by one (referred to as a hop count). The router recognizes the IP address advertising router as the next hop, then sends the routing updates to other routers. A maximum allowable hop count is 15. If a router reaches a metric value of 16 or more (referred to as infinity), the destination is identified as unreachable. This avoids the indefinite routing loops. The split-horizon and hold-down features are used to avoid propagation incorrect routing information. The route becomes not valid when the route time-out timer expires; it remains in the table until the route-flush timer expires.

OSPF

A link-state routing protocol, Open Shortest Path First (OSPF) is an interior gateway protocol (IGP) that uses the Shortest Path First (SPF) Dijsktra algorithm.

OSPF sends link-state advertisements (LSAs) to all other routers within the same hierarchical area. Data on attached interfaces, metrics used, and other variables, are included in OSPF LSAs. As OSPF routers accumulate link-state data, they use the SPF algorithm to calculate the shortest path to each node.

An Autonomous System (AS) or Domain is defined as a group of networks with common routing infrastructure. OSPF can work in one AS; or receive or send routes from or to different AS systems. Autonomous systems consist of areas. An area is a group of neighboring networks or attached hosts. A router attached to multiple areas with its interfaces is called an Area Border Router (ABR). It creates a distinct topological database: a group of LSAs received from all routers in the same area, for each area. All the routers in the same area have an identical topological database. OSPF routing traffic is restricted in the area because areas are unknown to each other. The routing information is distributed between areas, area border routers, networks, and connected routers by the OSPF backbone.

All backbone OSPF area routers use the same procedures and algorithms to maintain routing information within the backbone that any area router would. The backbone topology is invisible to all routers within an area. The individual area topologies are invisible to the backbone. Sometimes the backbone is not a contiguous area. Virtual links function as if they were direct links, and are configured between backbone routers that share a link to a non-backbone area.

AS border routers running OSPF learn about exterior routes through exterior gateway protocols (EGPs) such as the Border Gateway Protocol (BGP).

During boot-up, an OSPF router initializes its routing-protocol-specific data structures and tables. When the lower layer protocols with which it interfaces are functional, it sends the OSPF Hello protocol packets to find neighboring routers. A router sends Hello packets as keep-alive packets, informing other routers about its continuing functionality. Two routers are adjacent when their link state databases are synchronized.

Multi-access networks have more than two routers. On multi-access networks, the hello protocol chooses a designated router and a designated backup-router. The designated router generates LSAs for the entire multi-access network, and reduces network traffic and the size of the topological database. The designated router also determines the adjacency of routers and the synchronization of their topological databases. The data on a router's adjacencies or state changes are provided by periodic transmission of an LSA. Failed routers are detected, and topology is changed quickly by comparison of adjacencies to link states. Each router calculates a shortest path tree, with itself as a root, from the topological database generated from these LSAs. This shortest path tree creates a routing table.

PIM-SM

The AlliedWare Plus™ Protocol Independent Multicast–Sparse Mode (PIM-SM) module is a multicast routing protocol module that uses the underlying unicast Routing Information Base (RIB) to determine the best next-hop neighbor to reach the root of the multicast data distribution tree, the Rendezvous Point (RP), or the source. It builds unidirectional-shared trees per group, and optionally creates shortest-path trees per source.

VRRP

Mission-critical applications running on fault-tolerant networking equipment, such as routers and switches, require redundancy and high availability. This section provides an architectural overview of Virtual Router Redundancy Protocol (VRRP) implementation in the AlliedWare Plus™ OS.

Typically, end hosts are connected to the enterprise network through a single router (first-hop router) that is in the same Local Area Network (LAN) segment. The most popular method of configuration is for the end hosts to statically configure this router as their default gateway. This minimizes configuration and processing overhead. The main problem with this configuration method is that it produces a single point of failure if the enterprise network's first-hop router fails.

VRRP attempts to solve this problem by introducing the concept of a virtual router, composed of two or more VRRP routers on the same subnet. The concept of a virtual IP address is also introduced, which is the address that end hosts configure as their default gateway. Only one of the routers (called the Master) forwards packets on behalf of this IP address. In the event that the Master fails, one of the other routers (Backups) assumes forwarding responsibility for it.

Chapter 35: Route Selection

Introduction

This chapter describes the route selection process used by the AlliedWare Plus™ Operating System. Understanding the route selection process helps in analyzing and troubleshooting route-related problems.

The process of routing packets consists of selectively forwarding data packets from one network to another. Your device must determine which network to send each packet to, and over which interface to send the packet in order to reach the desired network. This information is contained in your device routes. For each packet, your device chooses the best route it has for that packet and uses that route to forward the packet. In addition, you can define filters to restrict the way packets are sent.

Types of Routes

Your device learns routes from static information entered as part of the configuration process and by listening to any configured routing protocols. The following types of routes are available on your device:

Interface Routes

Your device creates an interface route when you create the interface. This route tells your device to send packets over that interface when the packets are addressed to the interface's subnet.

Static Routes

You can manually enter routes, which are then called static routes. You can use static routes to:

- specify the default route (to 0.0.0.0). If your device does not have a route to the packet's destination, it sends it out the default route. The default route normally points to an external network such as the Internet.
- set up multiple networks or subnets. In this case you define multiple routes for a particular interface, usually a LAN port. This is a method of supporting multiple subnets on a single physical media.

To create a static route, use the command:

```
awplus(config)# ip route <subnet&mask> {<gateway-ip>|
                <interface>} [<distance>]
```

Dynamic Routes

Your device learns dynamic routes from one or more routing protocols such as RIP, BGP, or OSPF. The routing protocol updates these routes as the network topology changes.

In all but the most simple networks, we recommend that you configure at least one dynamic routing protocol. Routing protocols enables your device to learn routes from other routers and switches on the network, and to respond automatically to changes in network topology.

Routing protocols use different metrics to calculate the best path for a destination. However, when two paths have an equal cost/metric and Equal Cost Multipath (ECMP) is enabled on a system, AlliedWare Plus™ may receive two paths from the same protocol.

- Routing Information Protocol (RIP)

  Routing Information Protocol (RIP) is a simple distance vector IPv4 routing protocol. It determines the number of hops between the destination and your device, where one hop is one link. Given a choice of routes, RIP uses the route that takes the lowest number of hops. If multiple routes have the same hop count, RIP chooses the first route it finds.

  See **Chapter 37, RIP Configuration** for further information about RIP Configuration.

- Routing Information Protocol next generation (RIPng)

  Routing Information Protocol next generation (RIPng) is a simple distance vector IPv6 routing protocol. It determines the number of hops between the destination and your device, where one hop is one link. Given a choice of routes, RIPng uses the route that takes the lowest number of hops. If multiple routes have the same hop count, RIPng chooses the first route it finds.

  RIPng (Routing Information Protocol next generation) is an extension of RIPv2 to support IPv6. RFC 2080 specifies RIPng. The differences between RIPv2 and RIPng are:

  « RIPng does not support RIP updates authentication

  « RIPng does not allow the attachment of arbitrary tags to routes

  « RIPng requires the encoding of the next-hop for a set of routes

  See **Chapter 39, RIPng for IPv6 Configuration** for further information about RIPng Configuration.

- Open Shortest Path First (OSPF)

  The Open Shortest Path First (OSPF) protocol is documented in RFC 1247. It has a number of significant benefits over RIP, including:

  « OSPF supports the concept of areas to allow networks to be administratively partitioned as they grow in size.

  « Load balancing, in which multiple routes exist to a destination, is also supported. OSPF distributes traffic over these links.

  See **Chapter 41, OSPF Introduction and Configuration** for further information about OSPF Configuration.

- Border Gateway Protocol (BGP)

  The Border Gateway Protocol (BGP) allows routers in different routing domains to exchange routing information. This facilitates the forwarding of data across the borders of the routing domains. BGP-4 is based on distance vector (DV) protocol algorithms.

RIB and FIB Routing Tables

Your device maintains its routing information in routing tables that tell your device how to find a remote network or host. Each route is uniquely identified in a table by its IP address, network mask, next hop, interface, protocol, and policy. There are two routing tables populated by your device: the **Routing Information Base** (RIB) and the **Forwarding Information Base** (FIB).

Note Routes in the FIB are used locally but are not advertised to neighbors if they are not also in the RIB.

Routing Information Base

The RIB records **all** the routes that your device has learnt. Your device uses the RIB to advertise routes to its neighbor devices and to populate the FIB. It adds routes to this table when:

- you add a static route using the **ip route** command
- one or more routing protocols, such as RIP or OSPF, exchange routing information with other routers or hosts
- your device receives route information from a connected interface
- your device gathers route information from an ICMP redirect message or DHCP message

Understanding the Routing Information Base (RIB)

Use the **show ipv6 route database** command to view the IPv6 RIB.

Use the **show ip route database** command to view the IPv4 RIB.

The RIB in AlliedWare Plus displays all the routes sent to the RIB by the routing protocols, plus all the static and connected routes.

The angle bracket > character in show output indicates which route has been selected as the best route. The best routes are installed in the Forwarding Information Base (FIB).

Routes which have been installed in the software FIB are marked with a star * symbol in show output.

The Administrative Distance and the Metric are seen in the square brackets with **AD** on the left of the backslash and **Metric** to the right of **AD**, so this is shown as: **[AD / Metric]**

See the below list of other information displayed in the RIB:

- Route type
- Prefix and Prefix Length
- Administrative Distance
- Metric
- Next-Hop
- Exit interface
- Uptime

Example RIB Output

See the sample output below for example RIB output, and note that all routes (including the non-best routes) are displayed in the RIB, but note only the best routes are selected:

Figure 35-1: Example RIB output after entering the show ipv6 route database command

```
awplus#show ipv6 route database
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP, D - DHCP
IA - OSPF inter area E1 - OSPF ext. type 1, E2 - OSPF ext. type 2
> - selected route, * - FIB route, p - stale info
Timers: Uptime
R *> 2001:db8:10::/64 [120/2] via fe80::eecd:6dff:fe20:c26b, vlan20, 20:42:47
R 2001:db8:20::/64 [0/1] via ::, vlan20, 21:18:42
C *> 2001:db8:20::/64 via ::, vlan20, 21:18:42
O 2001:db8:40::/64 [110/1] via ::, vlan40, 21:18:21
C *> 2001:db8:40::/64 via ::, vlan40, 21:18:22
O *> 2001:db8:50::/64 [110/2] via fe80::eecd:6dff:fe20:c073, vlan40, 21:17:29
O *> 2001:db8:60::/64 [110/2] via fe80::eecd:6dff:fe20:c073, vlan40, 20:31:06
```

Forwarding Information Base

The RIB populates the **Forwarding Information Base** (FIB) with the best route to each destination. When your device receives an IP packet, and no filters are active that would exclude the packet, it uses the FIB to find the most specific route to the destination. If your device does not find a direct route to the destination, and no default route exists, it discards the packet and sends an ICMP message to that effect back to the source.

A route is only deleted in the FIB if the corresponding prefix is removed from the RIB.

Changes to the software FIB are propagated to the hardware FIB, so the software and hardware FIB tables mirror each other.

The number of FIB table entries also mirror the best selected routes in the RIB.

Example FIB Output

See the sample output below for example FIB output, and note that only the best selected routes from the RIB are installed in the FIB:

Figure 35-2: Example FIB output after entering the show ipv6 route command

```
awplus#show ipv6 route
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP, D - DHCP
IA - OSPF inter area E1 - OSPF ext. type 1, E2 - OSPF ext. type 2
Timers: Uptime
R 2001:db8:10::/64 [120/2] via fe80::eecd:6dff:fe20:c26b, vlan20, 21:28:22
C 2001:db8:20::/64 via ::, vlan20, 22:04:17
C 2001:db8:40::/64 via ::, vlan40, 22:03:57
O 2001:db8:50::/64 [110/2] via fe80::eecd:6dff:fe20:c073, vlan40, 22:03:04
O 2001:db8:60::/64 [110/2] via fe80::eecd:6dff:fe20:c073, vlan40, 21:16:41
```

Viewing table entries

To view the routes in the RIB, use the commands:

```
awplus# show ip route database [connected|ospf|rip|static]
```

Administrative Distance

When multiple routes are available for the same prefix, the AlliedWare Plus™ Operating System adds the routes with the lowest **administrative distance** to the FIB. The administrative distance is a rank given to a route based on the protocol that the route was received from. The lower the administrative distance, the higher the route preference. For example, if the RIB has these routes

Route	Prefix	Protocol	Distance
1	192.168.1.0/24	Static	1
2	192.168.2.0/24	eBGP	20
3	192.168.2.0/24	OSPF	110
4	192.168.3.0/24	OSPF	110

then the AlliedWare Plus™ Operating System adds routes 1, 2, and 4 to the FIB. It does not add route 3, as this has a higher administrative distance than a route with the same prefix.

Note

Administrative distance indicates a level of trustworthiness of a route where the lower the administrative distance the higher the integrity of a route.

The following table lists the default administrative distances for routing protocols.

Protocols	Distance	Preference
Connected Routes directly connected to an interface.	-	1 (highest)
Static Routes added using the **ip route** command or learnt through DHCP options on interfaces using DHCP to obtain an IP address.	1	2
eBGP Routes learnt from BGP that are external to your network.	20	3
OSPF Routes learnt from OSPF.	110	4
RIP Routes learnt from RIP.	120	5
iBGP Routes learnt from BGP that are internal to your network.	200	6 (lowest)
Unknown No traffic will be passed to neighbors via this route.	255	(route is not advertised to neighbors)

For static routes, specify the distance when adding the route, use the command:

```
awplus(config)# ip route <subnet&mask> [<gateway-ip>]
                [<interface>] [<distance>]
```

To enter a separate administrative distance value for each OSPF route type, enter the Router Configuration mode and use the command:

```
awplus(config-router)# distance ospf {external <1-255>|
                       inter-area <1-255>|intra-area <1-255>}
```

To set the same value for all OSPF route types, use the command:

```
awplus(config-router)# distance <1-255>
```

For RIP routes, enter the Router Configuration mode, and use the command:

```
awplus(config-router)# distance <1-255> [<ip-addr/prefix-
                       length> [<access-list>]]
```

This sets the administrative distance for all RIP routes.

You cannot set an administrative distance for connected routes.

Note

AlliedWare Plus™ does not populate routes with an administrative distance of 255 in the FIB (Forwarding Information Base). But AlliedWare Plus™ does populate routes with an administrative distance of 255 in the RIB (Routing Information Base).
See the below examples showing the behavior of a static route with an administrative distance of 255, which is only added to the RIB, as seen from the below show output.

Output **Figure 35-3: Static route with an administrative distance of 255 that is added to the RIB**

```
awplus(config)#ip route 100.0.0.0/24 192.168.1.100 255
awplus(config)#end
awplus#show ip route database

Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       > - selected route, * - FIB route, p - stale info

S       100.0.0.0/24 [255/0] via 192.168.1.100, vlan1
C    *> 192.168.1.0/24 is directly connected, vlan1
```

Output **Figure 35-4: Static route with an administrative distance of 255 that is not added to the FIB**

```
awplus(config)#ip route 100.0.0.0/24 192.168.1.100 255
awplus(config)#end
awplus#show ip route

Codes: C - connected, S - static, R - RIP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       *   candidate default

C       192.168.1.0/24 is directly connected, vlan1
```

Metric

The Metric is used to find the best route from one routing source. In the routing table it is used as the next tie breaker if the Administrative Distance (AD) is equal for the routes in it.

Metrics Used by AlliedWare Plus Routing Protocols

The following metrics are used by AlliedWare IPv4 and IPv6 routing protocols:

IPv4 and IPv6 Routing Protocol	Metric
RIP for IPv4 / RIPng for IPv6	Hop-Count
OSPFv2 for IPv4 / OSPFv3 for IPv6	Cost
BGP for IPv4 / BGP4+ for IPv6	MULTI_EXIT-DISC / IGMP metric to Next-Hop

Equal Cost Multipath Routing

When multiple routes are available for the same prefix within the FIB, then your device uses Equal Cost Multipath Routing (ECMP) to determine how to forward packets.

ECMP allows the AlliedWare Plus™ Operating System to distribute traffic over multiple equal-cost routes to a destination. The software determines that two or more routes are equal cost if they have the same destination IP address and mask. When the software learns such multiple routes, it puts them in an ECMP route group. When it sends traffic to that destination, it distributes the traffic across all routes in the group.

The AlliedWare Plus™ Operating System distributes traffic over the routes one flow at a time, so all packets in a session take the same route. Each equal-cost route group can contain up to eight individual routes. ECMP is only used to select between routes already in the FIB.

By default, each equal-cost route group can contain four routes. You can change this setting by using the command:

```
awplus(config)# maximum-paths <1-8>
```

The maximum path setting determines how many routes with the same prefix value and the same administrative distance that the FIB can contain. Once an equal-cost route group has the maximum number of routes, then the RIB cannot add any further routes to the route group. The device only adds to the group if a route is deleted from the FIB.

To disable ECMP, set the maximum paths value to one.

How AlliedWare Plus Deletes Routes

When the AlliedWare Plus™ Operating System receives a route delete request from a routing protocol, it first deletes the specified route from its RIB. Then it checks if the specified route is in the FIB.

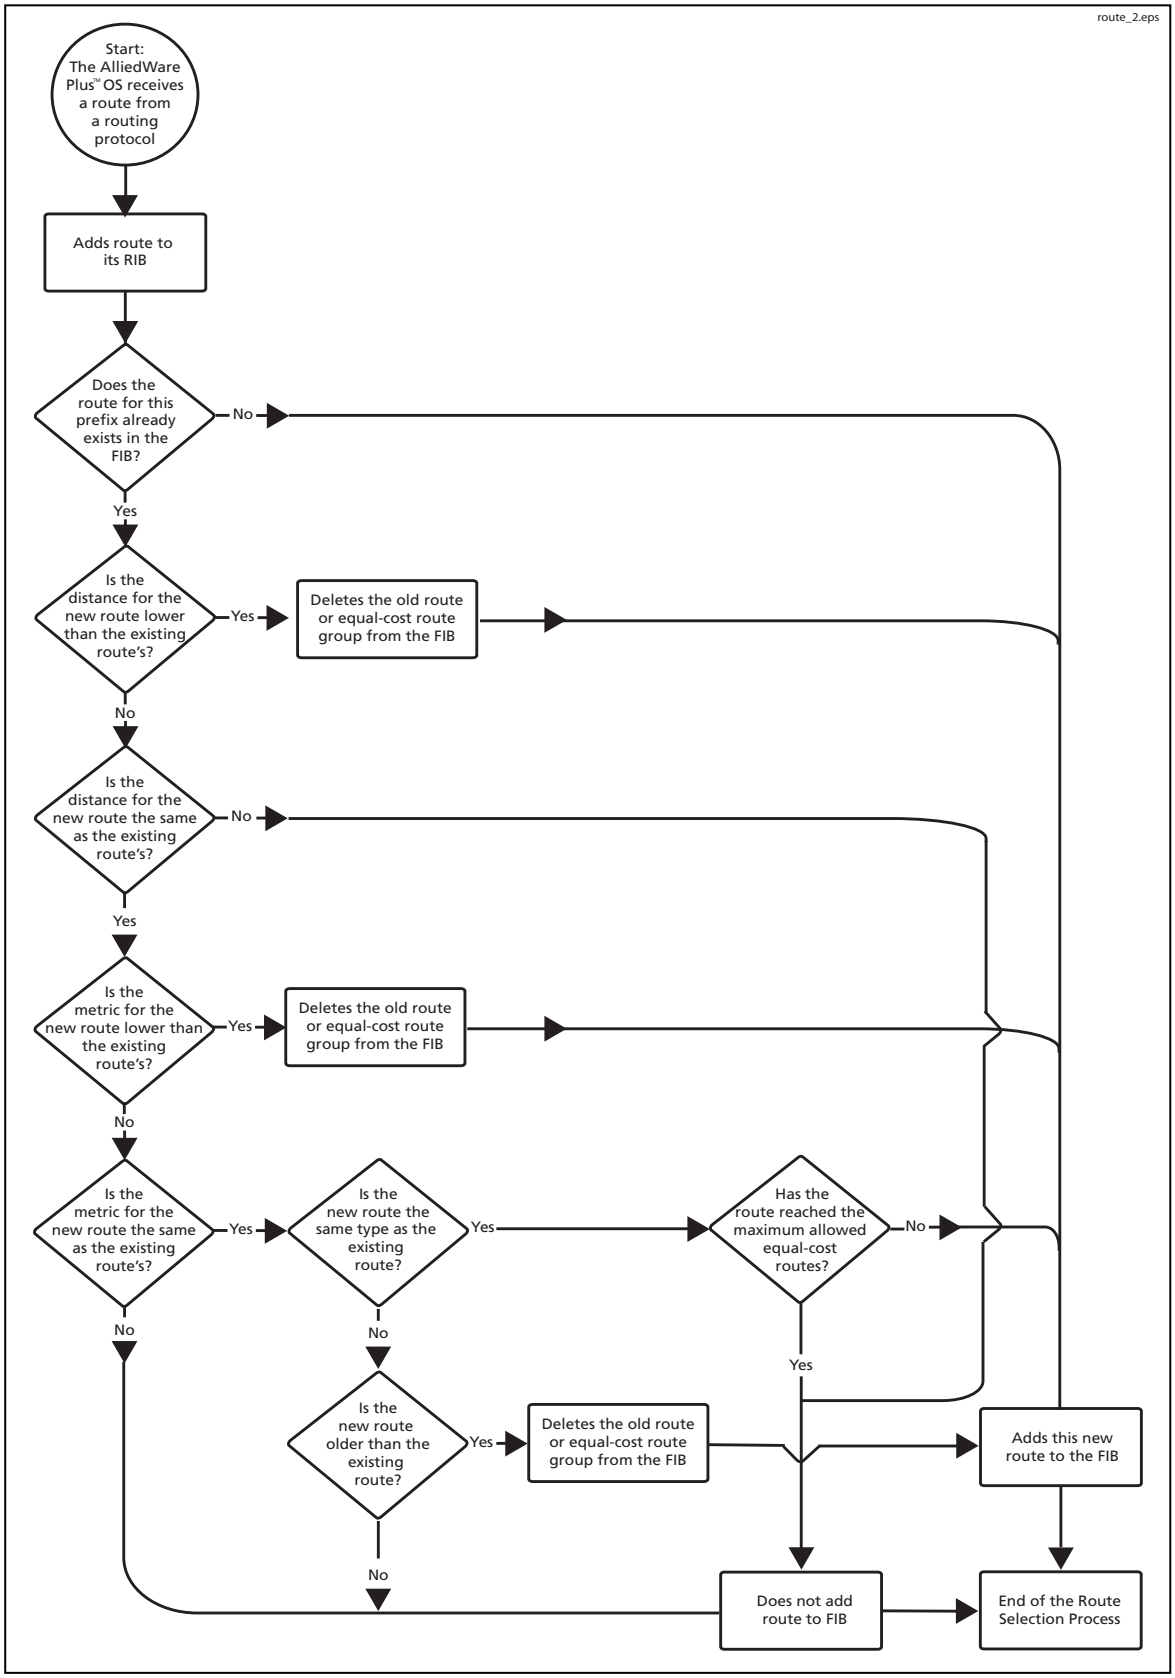
If the route is in the FIB, it deletes it from the FIB and checks if another route is available in its database for the same prefix.

If there is another route in the database, the software installs this route in the FIB. When multiple such routes exist, the software uses the route selection mechanism to choose the best route before adding it to the FIB.

How AlliedWare Plus Adds Routes

The following flow chart shows how the software adds a route to the FIB.

Figure 35-5: How AlliedWare Plus™ adds a route to the FIB



Troubleshooting routes not installed to the RIB

Possible reasons why a route is not installed in the RIB are:

- The layer 3 interface is not in the Up state.
- Route oscillation (route flap) is occurring with the route being added and removed frequently.
- The routing process from which the route is learned, has deleted the route.
- A routing protocol has learned the maximum number of routes allowed by the license, so the routes are not installed to the RIB.

See the **max-static-routes** command in the **System Configuration and Monitoring Commands** chapter for detailed command description and command example information, where static routes are applied before adding routes to the RIB.

Troubleshooting routes not installed to the FIB

Possible reasons why a route is not installed in the FIB are:

- The maximum-paths limit may have been reached (currently supports up to eight equal cost paths being installed).
- The maximum-paths command may be set to a lower value preventing more paths being selected as best.
- The desired route type has a higher AD over another route entry in the RIB, so is not preferred.
- The max-fib-routes command is configured and the maximum number of installed software FIB routes has been reached.

See the **max-fib-routes** command in the **System Configuration and Monitoring Commands** chapter for detailed command description and command example information to control the maximum number of FIB routes configured.

Chapter 36: Routing Commands

Introduction

This chapter provides an alphabetical reference of routing commands that are common across the routing IP protocols. For more information see **Chapter 34, Routing Protocol Overview** and **Chapter 35, Route Selection**.

Command List

ip route

This command adds a static route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

The **no** variant of this command removes the static route from the RIB and FIB.

Syntax

```
ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]
no ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]
```

Parameter	Description
<subnet&mask>	The IPv4 address of the destination subnet defined using either a prefix length or a separate mask specified in one of the following formats:
	The IPv4 subnet address in dotted decimal notation followed by the subnet mask, also in dotted decimal notation.
	The IPv4 subnet address in dotted decimal notation, followed by a forward slash, then the prefix length.
<gateway-ip>	The IPv4 address of the gateway device.
<interface>	The interface that connects your device to the network. Enter the name of the VLAN or its VID. You can also enter 'null' as an interface. Specify a 'null' interface to add a null or blackhole route to the switch. The gateway IP address or the interface is required. .
<distance>	The administrative distance for the static route in the range <1-255>. Static routes by default have an administrative distance of 1.

Mode Global Configuration

Default The default administrative distance for a static route is 1 for priority over non-static routes.

Usage Administrative distance can be modified so static routes do not take priority over other routes.

Specify a 'Null' interface to add a null or blackhole route to the switch. A null or blackhole route is a routing table entry that does not forward packets, so any packets sent to it are dropped.

Examples To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To remove the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# no ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To specify a null or blackhole route 192.168.4.0/24, so packets forwarded to this route are dropped, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.4.0/24 null
```

To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with an administrative distance of 128, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2 128
```

Related Commands **show ip route**

maximum-paths

This command enables ECMP on your device, and sets the maximum number of paths that each route has in the Forwarding Information Base (FIB). ECMP is enabled by default.

The **no** variant of this command sets the maximum paths to the default of 4.

Syntax

```
maximum-paths <1-8>
no maximum-paths
```

Parameter	Description
<1-8>	The maximum number of paths that a route can have in the FIB.

Default By default the maximum number of paths is 4.

Mode Global Configuration

Examples To set the maximum number of paths for each route in the FIB to 5, use the command:

```
awplus# configure terminal
awplus(config)# maximum-paths 5
```

To set the maximum paths for a route to the default of 4, use the command:

```
awplus# configure terminal
awplus(config)# no maximum-paths
```

show ip route

Use this command to display routing entries in the FIB (Forwarding Information Base). The FIB contains the best routes to a destination, and your device uses these routes when forwarding traffic. You can display a subset of the entries in the FIB based on protocol.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

Syntax

```
show ip route [connected|ospf|rip|static|<ip-addr>|<ip-addr/prefix-
    length>]
```

Parameter	Description
`connected`	Displays only the routes learned from connected interfaces.
`ospf`	Displays only the routes learned from OSPF.
`rip`	Displays only the routes learned from RIP.
`static`	Displays only the static routes you have configured.
<ip-addr>	Displays the routes for the specified address. Enter an IPv4 address.
<ip-addr/prefix-length>	Displays the routes for the specified network. Enter an IPv4 address and prefix length.

Mode User Exec and Privileged Exec

Example To display the static routes in the FIB, use the command:

```
awplus# show ip route static
```

To display the OSPF routes in the FIB, use the command:

```
awplus# show ip route ospf
```

Output Each entry in the output from this command has a code preceding it, indicating the source of the routing entry. For example, O indicates OSPF as the origin of the route. The first few lines of the output list the possible codes that may be seen with the route entries.

Typically, route entries are composed of the following elements:

- code
- a second label indicating the sub-type of the route
- network or host ip address
- administrative distance and metric
- nexthop ip address
- outgoing interface name
- time since route entry was added

Figure 36-1: Example output from the show ip route command

```
Codes: C - connected, S - static, R - RIP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       * - candidate default

O       10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
C       3.3.3.0/24 is directly connected, vlan1
C       10.10.31.0/24 is directly connected, vlan2
C       10.70.0.0/24 is directly connected, vlan4
O E2    14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
C       33.33.33.33/32 is directly connected, lo
```

To avoid repetition, only selected route entries comprised of different elements are described here:

OSPF Route

```
O       10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
```

This route entry denotes:

- This route in the network `10.10.37.0/24` was added by OSPF.
- This route has an administrative distance of 110 and metric/cost of 11.
- This route is reachable via nexthop `10.10.31.16`.
- The outgoing local interface for this route is `vlan2`.
- This route was added 20 minutes and 54 seconds ago.

Connected Route

```
C       10.10.31.0/24 is directly connected, vlan2
```

This route entry denotes:

- Route entries for network `10.10.31.0/24` are derived from the IP address of local interface `vlan2`.
- These routes are marked as Connected routes `(C)` and always preferred over routes for the same network learned from other routing protocols.

OSPF External Route

```
O E2    14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
```

This route entry denotes:

- This route is the same as the other OSPF route explained above; the main difference is that it is a Type 2 External OSPF route.

Related Commands

maximum-paths
show ip route database

show ip route database

This command displays the routing entries in the RIB (Routing Information Base).

When multiple entries are available for the same prefix, RIB uses the routes' administrative distances to choose the best route. All best routes are entered into the FIB (Forwarding Information Base). To view the routes in the FIB, use the **show ip route** command.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

Syntax

```
show ip route database [connected|ospf|rip|static]
```

Parameter	Description
`connected`	Displays only the routes learned from connected interfaces.
`ospf`	Displays only the routes learned from OSPF.
`rip`	Displays only the routes learned from RIP.
`static`	Displays only the static routes you have configured.

Mode User Exec and Privileged Exec

Example To display the static routes in the RIB, use the command:

```
awplus# show ip route database static
```

Output **Figure 36-2: Example output from the show ip route database command**

```
Codes: C - connected, S - static, R - RIP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
              > - selected route, * - FIB route, p - stale info

O     *> 9.9.9.9/32 [110/31] via 10.10.31.16, vlan2, 00:19:21
O        10.10.31.0/24 [110/1] is directly connected, vlan2, 00:28:20
C     *> 10.10.31.0/24 is directly connected, vlan2
S     *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O        10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
O     *> 10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:21:19
C     *> 10.30.0.0/24 is directly connected, vlan6
S     *> 11.22.11.0/24 [1/0] via 10.10.31.16, vlan2
O E2  *> 14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:19:21
O        16.16.16.16/32 [110/11] via 10.10.31.16, vlan2, 00:21:19

C     *> 45.45.45.45/32 is directly connected, lo
O     *> 55.55.55.55/32 [110/21] via 10.10.31.16, vlan2, 00:21:19
C     *> 127.0.0.0/8 is directly connected, lo
```

The routes added to the FIB are marked with a *. When multiple routes are available for the same prefix, the best route is indicated with the > symbol. All unselected routes have neither the * nor the > symbol.

```
S     *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
```

```
O       10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
```

These route entries denote:

- The same prefix was learned from OSPF and from static route configuration.
- Since this static route has a lower administrative distance than the OSPF route (110), the static route (1) is selected and installed in the FIB.

If the static route becomes unavailable, then the device automatically selects the OSPF route and installs it in the FIB.

Related Commands **maximum-paths**
show ip route

show ip route summary

This command displays a summary of the current RIB (Routing Information Base) entries.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

Syntax

```
show ip route summary
```

Mode

User Exec and Privileged Exec

Example

To display a summary of the current RIB entries, use the command:

```
awplus# show ip route summary
```

Output

Figure 36-3: Example output from the show ip route summary command

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source    Networks
connected       5
ospf            2
Total           8
```

Chapter 37: RIP Configuration

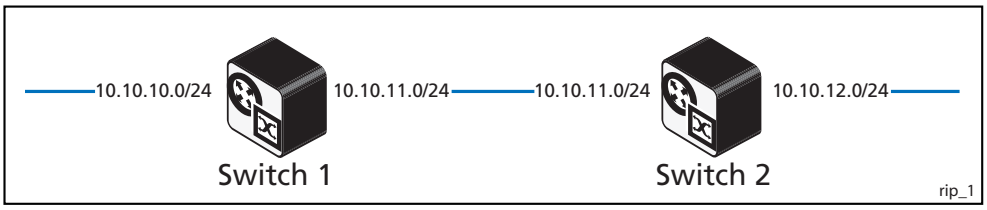
Introduction

This chapter contains basic RIP configuration examples. To see details on the RIP commands used in these examples, or to see the outputs of the Validation commands, refer to the **Chapter 38, RIP Commands**.

Enabling RIP

This example shows the minimum configuration required for enabling two devices to exchange routing information using RIP. The routing devices in this example are Allied Telesis managed Layer 3 Switches. `Switch 1` and `Switch 2` are two neighbors connecting to network 10.10.11.0/24. Switch 1 and Switch 2 are also connected to networks 10.10.10.0/24 and 10.10.12.0/24 respectively. This example assumes that the devices have already been configured with IP interfaces in those subnets.

To enable RIP, first define the RIP routing process and then associate a network with the routing process.



Switch 1

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router rip`	Define a RIP routing process and enter the Router Configuration mode.
`awplus(config-router)#`	
`network 10.10.10.0/24`	Associate network 10.10.10.0/24 with the RIP process.
`awplus#`	
`network 10.10.11.0/24`	Associate network 10.10.11.0/24 with the RIP process.

Switch 2

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router rip`	Define a RIP routing process and enter the Router Configuration mode.
`awplus(config-router)#`	
`network 10.10.11.0/24`	Associate networks with the RIP process
`awplus(config-router)#`	
`network 10.10.12.0/24`	Associate networks with the RIP process

Names of Commands Used

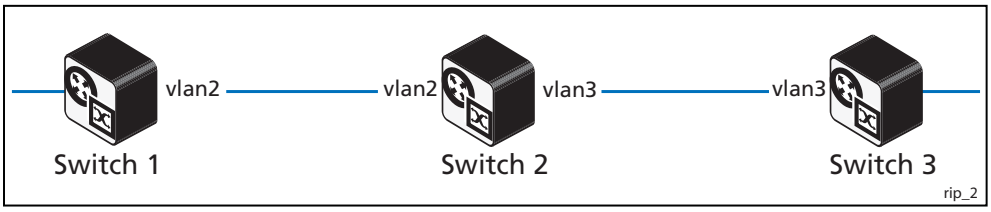
router rip
network (RIP)

Validation Commands

show ip rip
show running-config
show ip protocols rip
show ip rip interface
show ip route

Specifying the RIP Version

Configure a router to receive and send specific versions of RIP packets on a VLAN interface. The routing devices in this example are Allied Telesis managed Layer 3 Switches. In this example, Switch 2 is configured to receive and send RIP version 1 and version 2 information on both `vlan2` and `vlan3` interfaces.



Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router rip`	Enable the RIP routing process.
`awplus(config-router)#` `exit`	Return to the Global Configuration mode
`awplus(config)#` `interface vlan2`	Specify vlan2 as an interface you want to configure.
`awplus(config-if)#` `ip rip send version 1 2`	Allow sending RIP version 1 and version 2 packets out of this interface.
`awplus(config-if)#` `ip rip receive version 1 2`	Allow receiving of RIP version 1 and version 2 packets from the vlan2 interface.
`awplus(config-if)#` `exit`	Exit the Interface mode and return to Global Configuration mode to configure the next interface.
`awplus(config)#` `interface vlan3`	Specify interface vlan3 as the interface you want to configure.
`awplus(config-if)#` `ip rip send version 1 2`	Allow sending RIP version 1 and version 2 packets out of this interface.
`awplus(config-if)#` `ip rip receive version 1 2`	Allow receiving of RIP version 1 and version 2 packets from the vlan3 interface.

Names of Commands Used

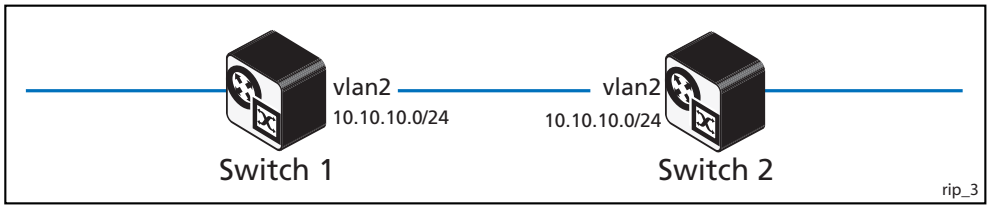
ip rip send version
ip rip receive version

Validation Commands

show ip rip
show running-config
show ip protocols rip
show ip rip interface
show ip route

RIPv2 Authentication (Single Key)

AlliedWare Plus™ RIP implementation provides the choice of configuring authentication for a single key or for multiple keys. This example illustrates authentication of the routing information exchange process for RIP using a single key. The routing devices in this example are Allied Telesis managed Layer 3 Switches. Switch 1 and Switch 2 are running RIP and exchange routing updates. To configure single key authentication on Switch 1, specify an interface and then define a key or password for that interface. Next, specify an authentication mode. Any receiving RIP packet on this specified interface should have the same string as password. For an exchange of updates between Switch 1 and Switch 2, define the same password and authentication mode on Switch 2.



Switch 1

`awplus#`	
`configure terminal`	Enter the Configure mode.
`awplus(config)#`	
`router rip`	Define a RIP routing process and enter the Router Configuration mode.
`awplus(config-router)#`	
`network 10.10.10.0/24`	Associate network 10.10.10.0/24 with the RIP process.
`awplus(config-router)#`	
`redistribute connected`	Enable redistributing from connected routes.
`awplus(config-router)#`	
`exit`	Exit the Router Configuration mode and return to the Configure mode.
`awplus(config)#`	
`interface vlan2`	Specify the VLAN interface (vlan2) for authentication.
`awplus(config-if)#`	
`ip rip authentication string Secret`	Specify the authentication string (Secret) for this interface.
`awplus(config-if)#`	
`ip rip authentication mode md5`	Specify the authentication mode to be MD5.

Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router rip`	Define a RIP routing process and enter the Router Configuration mode.
`awplus(config-router)#` `network 10.10.10.0/24`	Associate network 10.10.10.0/24 with the RIP process.
`awplus(config-router)#` `redistribute connected`	Enable redistributing from connected routes.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `interface vlan2`	Specify the VLAN interface (vlan2) for authentication.
`awplus(config-if)#` `ip rip authentication string Secret`	Specify the authentication string (Secret) on this interface.
`awplus(config-if)#` `ip rip authentication mode md5`	Specify the authentication mode to be MD5.

Names of Commands Used

ip rip authentication string
ip rip authentication mode
redistribute (RIP)
network (RIP)

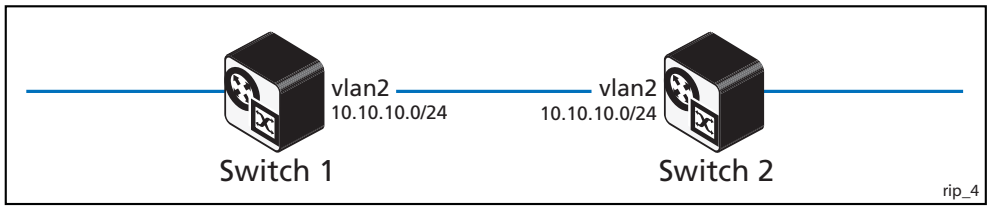
Validation Commands

show ip rip
show running-config
show ip protocols rip
show ip rip interface
show ip route

RIPv2 Text Authentication (Multiple Keys)

This example illustrates text authentication of the routing information exchange process for RIP using multiple keys. The routing devices in this example are Allied Telesis managed Layer 3 Switches. Switch 1 and Switch 2 are running RIP and exchanging routing updates. To configure authentication on Switch 1, define a key chain, specify keys in the key chain and then define the authentication string or passwords to be used by the keys. Set the time period during which it is valid to receive or send the authentication key by specifying the accept and send lifetimes. After defining the key string, specify the key chain (or the set of keys) that will be used for authentication on each interface and also the authentication mode to be used.

Switch 1 accepts all packets that contain any key string that matches one of the key strings included in the specified key chain (within the accept lifetime) on that interface. The key ID is not considered for matching. For additional security, the accept lifetime and send lifetime are configured such that every fifth day the key ID and key string changes. To maintain continuity, the accept lifetimes should be configured to overlap. This will accommodate different time-setup on machines. However, the send lifetime does not need to overlap and we recommend not configuring overlapping send lifetimes.



Switch 1

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router rip`	Define a RIP routing process and enter the Router Configuration mode.
`awplus(config-router)#`	
`network 10.10.10.0/24`	Associate network 10.10.10.0/24 with the RIP process.
`awplus(config-router)#`	
`redistribute connected`	Enable redistributing of connected routes.
`awplus(config-router)#`	
`exit`	Exit the Router Configuration mode and return to the Global Configuration mode.
`awplus(config)#`	
`key chain SUN`	Enter the key chain management mode to add keys to the key chain SUN.
`awplus(config-keychain)#`	
`key 10`	Add authentication key ID (10) to the key chain SUN.
`awplus(config-keychain-key)#`	
`key-string Secret`	Specify a password (Secret) to be used by the specified key.

Switch 1(cont.)

`awplus(config-keychain-key)#`	
`accept-lifetime 12:00:00 Mar 2 2007 14:00:00 Mar 7 2007`	Specify the time period during which authentication key string `Secret` can be received. In this case, key string `Secret` can be received from noon of March 2 to 2 pm March 7, 2007.
`awplus(config-keychain-key)#`	
`send-lifetime 12:00:00 Mar 2 2007 12:00:00 Mar 7 2007`	Specify the time period during which authentication key string `Secret` can be send. In this case, key string `Secret` can be received from noon of March 2 to noon of March 7, 2007.
`awplus(config-keychain-key)#`	
`exit`	Exit the keychain-key mode and return to keychain mode.
`awplus(config-keychain)#`	
`key 20`	Add another authentication key (`20`) to the key chain `SUN`.
`awplus(config-keychain-key)#`	
`key-string Earth`	Specify a password (`Earth`) to be used by the specified key.
`awplus(config-keychain-key)#`	
`accept-lifetime 12:00:00 Mar 7 2007 14:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be received. In this case, key string `Earth` can be received from noon of March 7 to 2 pm March 12, 2007.
`awplus(config-keychain-key)#`	
`send-lifetime 12:00:00 Mar 7 2007 12:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be sent. In this case, key string `Secret` can be received from noon of March 7 to noon of March 12, 2007.
`awplus(config-keychain-key)#`	
`end`	Enter Privileged Exec mode.
`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`interface vlan2`	Specify VLAN interface (vlan2) as the interface you want to configure on Switch 1.
`awplus(config-if)#`	
`ip rip authentication key-chain SUN`	Enable RIPv2 authentication on the `vlan2` interface and specify the key chain `SUN` to be used for authentication.
`awplus(config-if)#`	
`ip rip authentication mode text`	Specify text authentication mode to be used for RIP packets. This step is optional, as text is the default mode.

Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router rip`	Define a RIP routing process and enter the Router Configuration mode.
`awplus(config-router)#` `network 10.10.10.0/24`	Associate network 10.10.10.0/24 with the RIP process.
`awplus(config-router)#` `redistribute connected`	Enable redistributing from connected routes.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `key chain MOON`	Enter the key chain management mode to add keys to the key chain `MOON`.
`awplus(config-keychain)#` `key 30`	Add authentication key ID (`30`) to the key chain `MOON`.
`awplus(config-keychain-key)#` `key-string Secret`	Specify a password (`Secret`) to be used by the specified key.
`awplus(config-keychain-key)#` `accept-lifetime 12:00:00 Mar 2 2007 14:00:00 Mar 7 2007`	Specify the time period during which authentication key string `Secret` can be received. In this case, key string `Secret` can be received from noon of March 2 to 2 pm March 7, 2007.
`awplus(config-keychain-key)#` `send-lifetime 12:00:00 Mar 2 2007 12:00:00 Mar 7 2007`	Specify the time period during which authentication key string `Secret` can be send. In this case, key string `Secret` can be received from noon of March 2 to noon of March 7, 2007.
`awplus(config-keychain)#` `key 40`	Add another authentication key (`40`) to the key chain `MOON`.
`awplus(config-keychain-key)#` `key-string Earth`	Specify a password (`Earth`) to be used by the specified key.
`awplus(config-keychain-key)#` `accept-lifetime 12:00:00 Mar 7 2007 14:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be received. In this case, key string `Earth` can be received from noon of March 7 to 2 pm March 12, 2007.

Switch 2(cont.)

`awplus(config-keychain-key)#`	
`send-lifetime 12:00:00 Mar 7 2007 12:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be sent. In this case, key string `Secret` can be received from noon of March 7 to noon of March 12, 2007.
`awplus(config-keychain-key)#`	
`end`	Enter Privileged Exec mode.
`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`interface vlan2`	Specify the VLAN interface that you want to configure on Switch 2.
`awplus(config-if)#`	
`ip rip authentication key-chain MOON`	Enable RIPv2 authentication on the vlan2 interface, and specify the key chain MOON to be used for authentication.
`awplus(config-if)#`	
`ip rip authentication mode text`	Specify authentication mode to be used for RIP packets. This step is optional, as text is the default mode.

Names of Commands Used

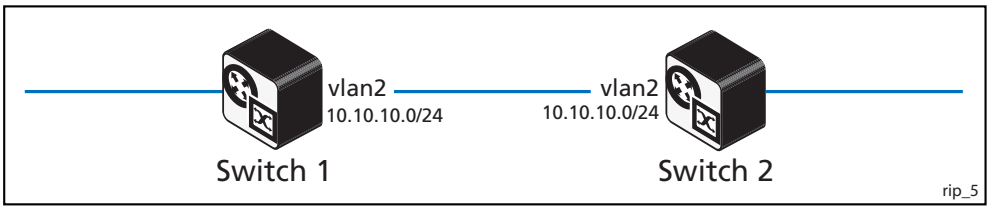
RIPv2 md5 authentication (Multiple Keys)

This example illustrates the md5 authentication of the routing information exchange process for RIP using multiple keys. The routing devices in this example are Allied Telesis managed Layer 3 Switches. Switch 1 and Switch 2 are running RIP and exchange routing updates. To configure authentication on Switch 1, define a key chain, specify keys in the key chain and then define the authentication string or passwords to be used by the keys. Then set the time period during which it is valid to receive or send the authentication key by specifying the accept and send lifetimes. After defining the key string, specify the key chain (or the set of keys) that will be used for authentication on the interface and the authentication mode to be used. Configure Switch 2 and Switch 3 to have the same key ID and key string as Switch 1 for the time that updates need to be exchanged.

In `md5` authentication, both the key ID and key string are matched for authentication. Switch 1 will receive only packets that match both the key ID and the key string in the specified key chain (within the accept lifetime) on that interface. In the following example, Switch 2 has the same key ID and key string as Switch 1. For additional security, the accept lifetime and send lifetime are configured such that every fifth day the key ID and key string changes. To maintain continuity, the accept lifetimes should be configured to overlap; however, the send lifetime should not be overlapping.



Switch 1

awplus# `configure terminal`	Enter the Global Configuration mode.
awplus(config)# `router rip`	Define a RIP routing process and enter the Router Configuration mode.
awplus(config-router)# `network 10.10.10.0/24`	Associate network `10.10.10.0/24` with the RIP process.
awplus(config-router)# `redistribute connected`	Enable redistributing from connected routes.
awplus(config-router)# `exit`	Exit the Router Configuration mode and return to the Global Configuration mode.
awplus(config)# `key chain SUN`	Enter the key chain management mode to add keys to the key chain `SUN`.
awplus(config-keychain)# `key 1`	Add authentication key ID (`1`) to the key chain `SUN`.

Switch 1(cont.)

`awplus(config-keychain-key)#`	
`key-string Secret`	Specify a password (`Secret`) to be used by the specified key.
`awplus(config-keychain-key)#`	
`accept-lifetime 12:00:00 Mar 2 2007 14:00:00 Mar 7 2007`	Specify the time period during which authentication key string `Secret` can be received. In this case, key string `Secret` can be received from noon of March 2 to 2 pm March 7, 2007.
`awplus(config-keychain-key)#`	
`send-lifetime 12:00:00 Mar 2 2007 12:00:00 Mar 7 2007`	Specify the time period during which authentication key string `Secret` can be send. In this case, key string `Secret` can be received from noon of March 2 to noon of March 7, 2007.
`awplus(config-keychain-key)#`	
`exit`	Exit the `keychain-key` mode and return to `keychain` mode.
`awplus(config-keychain)#`	
`key 2`	Add another authentication key (`2`) to the key chain `SUN`.
`awplus(config-keychain-key)#`	
`key-string Earth`	Specify a password (`Earth`) to be used by the specified key.
`awplus(config-keychain-key)#`	
`accept-lifetime 12:00:00 Mar 7 2007 14:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be received. In this case, key string `Earth` can be received from noon of March 7 to 2 pm March 12, 2007.
`awplus(config-keychain-key)#`	
`send-lifetime 12:00:00 Mar 7 2007 12:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be send. In this case, key string `Secret` can be received from noon of March 7 to noon of March 12, 2007.
`awplus(config-keychain-key)#`	
`end`	Enter Privileged Exec mode.
`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`interface vlan2`	Specify interface `vlan2` as the VLAN interface you want to configure on Switch 1.
`awplus(config-if)#`	
`ip rip authentication key-chain SUN`	Enable RIPv2 authentication on the `vlan2` interface and specify the key chain `SUN` to be used for authentication.
`awplus(config-if)#`	
`ip rip authentication mode md5`	Specify the `md5` authentication mode to be used for RIP packets.

Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router rip`	Define a RIP routing process and enter the Router Configuration mode.
`awplus(config-router)#` `network 10.10.10.0/24`	Associate network 10.10.10.0/24 with the RIP process.
`awplus(config-router)#` `redistribute connected`	Enable redistributing from connected routes.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `key chain MOON`	Enter the key chain management mode to add keys to the key chain `MOON`.
`awplus(config-keychain)#` `key 1`	Add authentication key ID (`1`) to the key chain `MOON`.
`awplus(config-keychain-key)#` `key-string Secret`	Specify a password (`Secret`) to be used by the specified key.
`awplus(config-keychain-key)#` `accept-lifetime 12:00:00 Mar 2 2007 14:00:00 Mar 7 2007`	Specify the time period during which authentication key string `Secret` can be received. In this case, key string `Secret` can be received from noon of March 2 to 2 pm March 7, 2007.
`awplus(config-keychain-key)#` `send-lifetime 12:00:00 Mar 2 2007 12:00:00 Mar 7 2007`	Specify the time period during which authentication key string `Secret` can be send. In this case, key string `Secret` can be received from noon of March 2 to noon of March 7, 2007.
`awplus(config-keychain)#` `key 2`	Add another authentication key (`2`) to the key chain `MOON`.
`awplus(config-keychain-key)#` `key-string Earth`	Specify a password (`Earth`) to be used by the specified key.
`awplus(config-keychain-key)#` `accept-lifetime 12:00:00 Mar 7 2007 14:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be received. In this case, key string `Earth` can be received from noon of March 7 to 2 pm March 12, 2007.

Switch 2(cont.)

`awplus(config-keychain-key)#`	
`send-lifetime 12:00:00 Mar 7 2007 12:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be send. In this case, key string `Secret` can be received from noon of March 7 to noon of March 12, 2007.
`awplus(config-keychain-key)#`	
`end`	Enter Privileged Exec mode.
`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`interface vlan2`	Specify vlan2 as the VLAN interface you want to configure on Switch 2.
`awplus(config-if)#`	
`ip rip authentication key-chain MOON`	Enable RIPv2 authentication on the `vlan2` interface and specify the key chain `MOON` to be used for authentication.
`awplus(config-if)#`	
`ip rip authentication mode md5`	Specify the md5 authentication mode to be used for RIP packets.

Names of Commands Used

Chapter 38: RIP Commands

Introduction

This chapter provides an alphabetical reference of commands used to configure RIP. For more information, see **Chapter 37, RIP Configuration**.

Command List

accept-lifetime

Use this command to specify the time period during which the authentication key on a key chain is received as valid.

Use the **no** variant of this command to remove a specified time period for an authentication key on a key chain as set previously with the **accept-lifetime** command.

Syntax `accept-lifetime <start-date>{<end-date>|duration <seconds>|infinite}`

`no accept-lifetime`

Parameter	Description	
`<start-date>`	`Specifies the start period - time and date in the format DD MMM YYYY or MMM DD YYYY: <hh:mm:ss> {<day> <month> <year> | <month> <day> <year>}`	
	`<hh:mm:ss>`	Time of the day when accept-lifetime starts, in hours, minutes and seconds
	`<day>`	`<1-31>` Specifies the day of the month to start.
	`<month>`	Specifies the month of the year to start (the first three letters of the month, for example, `Jan`).
	`<year>`	`<1993-2035>` Specifies the year to start.
`<end-date>`	`Specifies the end period - time and date in the format DD MMM YYYY or MMM DD YYYY: <hh:mm:ss> {<day> <month> <year> | <month> <day> <year>}`	
	`<hh:mm:ss>`	Time of the day when lifetime expires, in hours, minutes and seconds.
	`<day>`	`<1-31>` Specifies the day of the month to expire.
	`<month>`	Specifies the month of the year to expire (the first three letters of the month, for example, `Feb`).
	`<year>`	`<1993-2035>` Specifies the year to expire.
`<seconds>`	`<1-2147483646>` Duration of the key in seconds.	
`infinite`	Never expires.	

Mode Keychain-key Configuration

Examples The following examples show the setting of accept-lifetime for `key1` on the key chain

named `mychain`.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# accept-lifetime 03:03:01 Dec 3
2007 04:04:02 Oct 6 2008
```

or:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# accept-lifetime 03:03:01 3 Dec
2007 04:04:02 6 Oct 2008
```

cisco-metric-behavior (RIP)

Use this command to enable or disable the RIP routing metric update to conform to Cisco's implementation. This command is provided to allow inter-operation with older Cisco devices that do not conform to the RFC standard for RIP route metrics.

Use the **no** variant of this command to disable this feature.

Syntax

```
cisco-metric-behavior {enable|disable}
no cisco-metric-behavior
```

Parameter	Description
`enable`	Enables updating the metric consistent with Cisco.
`disable`	Disables updating the metric consistent with Cisco.

Default By default, the Cisco metric-behavior is disabled.

Mode Router Configuration

Examples To enable the routing metric update to behave as per the Cisco implementation, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# cisco-metric-behavior enable
```

To disable the routing metric update to behave as per the default setting, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no cisco-metric-behavior
```

Validation Commands **show running-config**

Related Commands **cisco-metric-behavior (IPv6 RIPng)**

clear ip rip route

Use this command to clear specific data from the RIP routing table.

Syntax

```
clear ip rip route {<ip-dest-network/prefix-length>|static|connected|
   rip|ospf|all}
```

Parameter	Description
<ip-dest-network/prefix-length>	Removes entries which exactly match this destination address from RIP routing table. Enter the IP address and prefix length of the destination network.
`static`	Removes static entries from the RIP routing table.
`connected`	Removes entries for connected routes from the RIP routing table.
`rip`	Removes only RIP routes from the RIP routing table.
`ospf`	Removes only OSPF routes from the RIP routing table.
`all`	Clears the entire RIP routing table.

Mode Privileged Exec

Usage Using this command with the `all` parameter, clears the RIP table of all the routes.

Examples To clear the route `10.0.0.0/8` from the RIP routing table, use the following command:

```
awplus# clear ip rip route 10.0.0.0/8
```

debug rip

Use this command to specify the options for the displayed debugging information for RIP events and RIP packets.

Use the **no** variant of this command to disable the specified debug option.

Syntax

```
debug rip {events|nsm|<packet>|all}
no debug rip {events|nsm|<packet>|all}
```

Parameter	Description
`events`	RIP events debug information is displayed.
`nsm`	RIP and NSM communication is displayed.
<packet>	`packet [recv|send] [detail]` Specifies RIP packets only.
`recv`	Specifies that information for received packets be displayed.
`send`	Specifies that information for sent packets be displayed.
`detail`	Displays detailed information for the sent or received packet.
`all`	Displays all RIP debug information.

Default Disabled

Mode Privileged Exec and Global Configuration

Example The following example displays information about the RIP packets that are received and sent out from the device.

```
awplus# debug rip packet
```

Related Commands undebug rip

default-information originate (RIP)

Use this command to generate a default route into the Routing Information Protocol (RIP).

Use the **no** variant of this command to disable this feature.

Syntax

```
default-information originate
no default-information originate
```

Default Disabled

Mode Router Configuration

Usage If routes are being redistributed into RIP and the router's route table contains a default route, within one of the route categories that are being redistributed, the RIP protocol will advertise this default route, irrespective of whether the **default-information originate** command has been configured or not. However, if the router has not redistributed any default route into RIP, but you want RIP to advertise a default route anyway, then use this command.

This will cause RIP to create a default route entry in the RIP database. The entry will be of type RS (Rip Static). Unless actively filtered out, this default route will be advertised out every interface that is sending RIP. Split horizon does not apply to this route, as it is internally generated. This operates quite similarly to the OSPF **default-information originate always** command.

Example

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-information originate
```

default-metric (RIP)

Use this command to specify the metrics to be assigned to redistributed RIP routes.

Use the **no** variant of this command to reset the RIP metric back to its default (1).

Syntax

```
default-metric <metric>
no default-metric [<metric>]
```

Parameter	Diagnostic
<metric>	<1-16> Specifies the value of the default metric.

Default By default, the RIP metric value is set to 1.

Mode RIP Router Configuration

Usage This command is used with the **redistribute (RIP)** command to make the routing protocol use the specified metric value for all redistributed routes, regardless of the original protocol that the route has been redistributed from.

Examples This example assigns the cost of 10 to the routes that are redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-metric 10
awplus(config-router)# redistribute ospf
awplus(config-router)# redistribute connected
```

Related Commands **redistribute (RIP)**

distance (RIP)

This command sets the administrative distance for RIP routes. Your device uses this value to select between two or more routes to the same destination obtained from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). See **"Administrative Distance" on page 35.6** for more information.

The **no** variant of this command sets the administrative distance for the RIP route to the default of 120.

Syntax

```
distance <1-255> [<ip-addr/prefix-length> [<access-list>]]
no distance [<1-255>] [<ip-addr/prefix-length> [<access-list>]]
```

Parameter	Description
<1-255>	The administrative distance value you are setting for this RIP route.
<ip-addr/ prefix-length>	The network IP address and prefix-length that you are changing the administrative distance for.
<access-list>	Specifies the access-list name. This access list specifies which routes within the network *<ip-address/m>* this command applies to.

Mode RIP Router Configuration

Examples To set the administrative distance to `8` for the RIP routes within the `10.0.0.0/8` network that match the access-list `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distance 8 10.0.0.0/8 mylist
```

To set the administrative distance to the default of `120` for the RIP routes within the `10.0.0.0/8` network that match the access-list `mylist`, use the commands:

```
awplus# configure terminal
awplus (config)# router rip
awplus(config-router)# no distance 8 10.0.0.0/8 mylist
```

distribute-list (RIP)

Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list.

Use the **no** variant of this command to disable this feature.

Syntax

```
distribute-list {<access-list> |prefix <prefix-list>} {in|out}
   [<interface>]

no distribute-list {<access-list> |prefix <prefix-list>} {in|out}
   [<interface>]
```

Parameter	Description
`prefix`	Filter prefixes in routing updates.
`<access-list>`	Specifies the IPv4 access-list number or name to use.
`<prefix-list>`	Specifies the name of the IPv4 prefix-list to use.
`in`	Filter incoming routing updates.
`out`	Filter outgoing routing updates.
`<interface>`	The interface on which distribute-list applies. For instance: `vlan2`

Default Disabled

Mode RIP Router Configuration

Usage Filter out incoming or outgoing route updates using access-list or prefix-list. If you do not specify the name of the interface, the filter will be applied to all interfaces.

Examples In this example the following commands are used to apply an access list called myfilter to filter incoming routing updates in `vlan2`

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list prefix myfilter in
vlan2
```

Related Commands **access-list extended (named)**
ip prefix-list

fullupdate (RIP)

Use this command to specify which routes RIP should advertise when performing a triggered update. By default, when a triggered update is sent, RIP will only advertise those routes that have changed since the last update. When **fullupdate** is configured, the switch advertises the full RIP route table in outgoing triggered updates, including routes that have not changed. This enables faster convergence times, or allow inter-operation with legacy network equipment, but at the expense of larger update messages.

Use the **no** variant of this command to disable this feature.

Syntax

```
fullupdate
no fullupdate
```

Default By default this feature is disabled.

Mode RIP Router Configuration

Example Use the following commands to enable the fullupdate (RIP) function:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# fullupdate
```

ip rip authentication key-chain

Use this command to enable RIPv2 authentication on an interface and specify the name of the key chain to be used.

Use the **no** variant of this command to disable this function.

Syntax

```
ip rip authentication key-chain <key-chain-name>
no ip rip authentication key-chain
```

Parameter	Description
<key-chain-name>	Specify the name of the key chain. This is an alpha-numeric string, but it cannot include spaces.

Mode Interface Configuration for a VLAN interface.

Usage This command can only be used on VLAN interfaces. Use this command to perform authentication on the interface. Not configuring the key chain results in no authentication at all.

The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use the **ip rip authentication string** command for single key authentication. Use the **ip rip authentication key-chain** command for multiple keys authentication. See **Chapter 37, RIP Configuration** for illustrated RIP configuration examples.

For multiple key authentication, use the following steps to configure a route to enable RIPv2 authentication using multiple keys at different times:

Step 1: Define a key chain:

In the Configure mode, identify a key chain with a key chain name using the following command:

```
awplus# configure terminal
awplus(config)# key chain <key-chain-name>
```

where *<key-chain-name>* is the name of the chain to manage, and should not include spaces.

Step 2: Define the key or keys:

In the Keychain mode, specify a key on this key chain using the following command:

```
awplus(config-keychain)# key <keyid>
```

where *<keyid>* (a decimal number in the range 1 to 2147483647) is the Key Identifier number.

Step 3: Define the authentication string or password:

In the Keychain-key mode, define the password used by a key, using the following command:

```
awplus(config-keychain-key)# key-string <key-password>
```

where *<key-password>* is a string of characters that can contain spaces, to be used as a password by the key.

Step 4: Set key management options:

This step can be performed at this stage or later when multiple keys are used.
The options are configured in the keychain-key command mode.

Set the time period during which the authentication key on a key chain is received as valid, using the **accept-lifetime** command:

```
awplus(config-keychain-key)# accept-lifetime <START> <END>
```

where *<START>* and *<END>* are the beginning and end of the time period.

Set the time period during which the authentication key on a key chain can be sent, using the **send-lifetime** command:

```
awplus(config-keychain-key)# send-lifetime <START> <END>
```

where *<START>* and *<END>* are the beginning and end of the time period.

Step 5: Enable authentication on an interface:

In the Interface Configuration mode, enable authentication on the VLAN interface `vlan3` and specify the key chain to be used, using the following commands:

```
awplusawpluls# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip rip authentication key-chain <key-chain-name>
```

where *<key-chain-name>* is a set of valid authentication keys.

Step 6: Specify the mode of authentication for the given interface:

In the Interface Configuration mode for a VLAN interface, specify whether the interface uses text or MD5 authentication using:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

Example In the following sample multiple keys authentication RIP configuration, a password `toyota` is set for key 1 in key chain `cars`. Authentication is enabled on `vlan2` and the authentication mode is set to MD5:

```
awplus# configure terminal
awplus(config)# key chain cars
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string toyota
awplus(config-keychain-key)# accept-lifetime 10:00:00 Apr 08
2008 duration 43200
awplus(config-keychain-key)# send-lifetime 10:00:00 Apr 08
2008 duration 43200
awplus(config-keychain-key)# exit
awplus(config-keychain)# exit
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication key-chain
cars
awplus(config-if)# ip rip authentication mode md5
awplus(confi-if)# exit
awplus(config)# exit
awplus#
```

Example In the following example, the VLAN interface `vlan23` is configured to use key-chain authentication with the keychain `mykey`. See the **key** command for a description of how a key chain is created.

```
awplus# configure terminal
awplus(config)# interface vlan23
awplus(config-if)# ip rip authentication key-chain mykey
```

Related Commands

accept-lifetime
send-lifetime

key chain

ip rip authentication mode

Use this command to specify the type of authentication mode used for RIP v2 packets.

Use the **no** variant of this command to restore clear text authentication.

Syntax

```
ip rip authentication mode {md5|text}
no ip rip authentication mode
```

Parameter	Description
`md5`	Uses the keyed MD5 authentication algorithm.
`text`	Specifies clear text or simple password authentication.

Default Text authentication is enabled

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces. The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use the **ip rip authentication string** command for single key authentication. Use the **ip rip authentication key-chain** command for multiple keys authentication. See **Chapter 37, RIP Configuration** for illustrated RIP configuration examples.

Use the following steps to configure a route to enable RIPv2 authentication using a single key or password:

Step 1: Define the authentication string or password

In the Interface Configuration mode for the VLAN interface `vlan2`, specify the authentication string or password used by the key, using the following command:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string <auth-string>
```

where *<auth-string>* is the authentication string or password and it can include spaces.

Step 2: Specify the mode of authentication for the given interface:

In the Interface Configuration mode for VLAN interface `vlan2`, specify if the interface will use text or MD5 authentication, using the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication mode {md5|text}
```

See the sample below to specify `mykey` as the authentication string with MD5 authentication, for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string mykey
awplus(config-if)# ip rip authentication mode md5
```

For multiple keys authentication, use the following steps to configure a route to enable RIPv2 authentication using multiple keys at different times:

Step 1: Define a key chain:

In the Global Configuration mode, identify a key chain with a key chain name using the following command:

```
awplus# configure terminal
awplus(config)# key chain <key-chain-name>
```

where *<key-chain-name>* is the name of the chain to manage, a text string with no spaces.

Step 2: Define the key or keys:

In the Keychain Configuration mode, specify a key on this key chain using the following command:

```
awplus(config-keychain)# key <keyid>
```

where *<keyid>* (a decimal number in the range 1 to 2147483647) is the Key Identifier number.

Step 3: Define the authentication string or password:

In the Keychain-key Configuration mode, define the password used by a key, using the following command:

```
awplus(config-keychain-key)# key-string <key-password>
```

where *<key-password>* is a string of characters that can include spaces, to be used as a password by the key.

Step 4: Set key management options:

This step can be performed at this stage or later when multiple keys are used.
The options are configured in the Keychain-key Configuration mode.

Set the time period during which the authentication key on a key chain is received as valid, using the **accept-lifetime** command:

```
awplus(config-keychain-key)# accept-lifetime <start> <end>
```

where *<start>* and *<end>* are the beginning and end of the time period.

Set the time period during which the authentication key on a key chain can be sent, using the **send-lifetime** command:

```
awplus(config-keychain-key)# send-lifetime <start> <end>
```

where <*start*> and <*end*> are the beginning and end of the time period.

Step 5: Enable authentication on an interface:

In the Interface Configuration mode, enable authentication on an interface and specify the key chain to be used, using the following command:

```
awplus(config-if)# ip rip authentication key-chain <key-
                   chain-name>
```

where <*key-chain-name*> is a set of valid authentication keys, as defined in Step 1.

Step 6: Specify the mode of authentication for the given interface:

In the Interface Configuration mode, specify whether the interface uses text or MD5 authentication using:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

Example-1 In the following sample multiple keys authentication RIP configuration, a password `toyota` is set for key 1 in key chain `cars`. Authentication is enabled on `vlan2` and the authentication mode is set to MD5:

```
                  awplus# configure terminal
            awplus(config)# key chain cars
     awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string toyota
awplus(config-keychain-key)# accept-lifetime 10:00:00 Apr 08
                            2008 duration 43200
awplus(config-keychain-key)# send-lifetime 10:00:00 Apr 08 2008
                            duration 43200
awplus(config-keychain-key)# exit
     awplus(config-keychain)# exit
            awplus(config)# interface vlan2
          awplus(config-if)# ip rip authentication key-chain
                            cars
          awplus(config-if)# ip rip authentication mode md5
           awplus(confi-if)# exit
            awplus(config)# exit
                  awplus#
```

Example-2 The following example shows md5 authentication configured on VLAN interface `vlan2`, ensuring authentication of rip packets received on this interface.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication mode md5
```

Related Commands **ip rip authentication string**
ip rip authentication key-chain

ip rip authentication string

Use this command to specify the authentication string or password used by a key.

Use the **no** variant of this command to remove the authentication string.

Syntax

```
ip rip authentication string <auth-string>
no ip rip authentication string
```

Parameter	Description
<auth-string>	The authentication string or password used by a key. It is an alpha-numeric string and can include spaces.

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces. The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use this command to specify the password for a single key on an interface. Use the **ip rip authentication key-chain** command for multiple keys authentication. See **Chapter 37, RIP Configuration** for further RIP configuration examples.

Use the following steps to configure a route to enable RIPv2 authentication using a single key or password:

Step 1: Define the authentication string or password:

In the Interface Configuration mode, specify the authentication string or password used by the key, using the following commands to configure the authentication string on the VLAN interface `vlan3`:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip rip authentication string <auth-string>
```

where *<auth-string>* is the authentication string or password.

Step 2: Specify the mode of authentication for the given interface:

In the Interface Configuration mode for a VLAN, specify if the interface will use text or MD5 authentication, using the following command:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

Example See the example below to specify `mykey` as the authentication string with MD5 authentication for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string mykey
awplus(config-if)# ip rip authentication mode md5
```

Example In the following example, the VLAN interface `vlan2` is configured to have an authentication string as `guest`. Any received RIP packet in that interface should have the same string as password.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string guest
```

Related commands **ip rip authentication key-chain**
ip rip authentication mode

ip rip receive-packet

Use this command to configure the interface to enable the reception of RIP packets.

Use the **no** variant of this command to disable this feature.

Syntax

```
ip rip receive-packet
no ip rip receive-packet
```

Default Receive-packet is enabled

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces.

Example This example shows packet receiving being turned on for the VLAN interface `vlan3`:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip rip receive-packet
```

Related Commands ip rip send-packet

ip rip receive version

Use this command to specify the version of RIP packets accepted on an interface and override the setting of the version command.

Use the **no** variant of this command to use the setting specified by the **version** command on page 38.49.

Syntax

```
ip rip receive version {[1][2]}
no ip rip receive version
```

Parameter	Description
1	Specifies acceptance of RIP version 1 packets on the interface.
2	Specifies acceptance of RIP version 2 packets on the interface.

Default Version 2

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces. This command applies to a specific VLAN interface and overrides any the version specified by the **version** command.

RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Example In the following example, the VLAN interface `vlan3` is configured to receive both RIP version 1 and 2 packets:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip rip receive version 1 2
```

Related Commands **version**

ip rip send-packet

Use this command to enable sending RIP packets through the current interface.

Use the **no** variant of this command to disable this feature.

Syntax

```
ip rip send-packet
no ip rip send-packet
```

Default Send packet is enabled

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces.

Example This example shows packet sending being turned on for the VLAN interface `vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send-packet
```

Related Commands ip rip receive-packet

ip rip send version

Use this command in Interface Configuration mode to specify the version of RIP packets sent on an interface and override the setting of the **version** command. This mechanism causes RIP version 2 interfaces to send multicast packets instead of broadcasting packets.

Use the **no** variant of this command to use the setting specified by the **version** command.

Syntax

```
ip rip send version {1|2|1 2|2 1}
no ip rip send version
```

Parameter	Description
1	Specifies the sending of RIP version 1 packets out of an interface.
2	Specifies the sending of RIP version 2 packets out of an interface.
1 2	Specifies the sending of both RIP version 1 and RIP version 2 packets out of an interface.
2 1	Specifies the sending of both RIP version 2 and RIP version 1 packets out of an interface.

Default RIP version 2 is enabled by default.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to a specific interface and overrides the version specified by the **version** command.

RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces. Selecting version parameters `1 2` or `2 1` sends RIP version 1 and 2 packets.

Use the **ip rip send version 1-compatible** command in an environment where you cannot send multicast packets. For example, in environments where multicast is not enabled and where hosts do not listen to multicast.

Examples In the following example, the VLAN interface `vlan4` is configured to send both RIP version 1 and 2 packets.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 1 2
```

In the following example, the VLAN interface `vlan4` is configured to send both RIP version 2 and 1 packets.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 2 1
```

In the following example, the VLAN interface `vlan4` is configured to send RIP version 1 packets only.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 1
```

In the following example, the VLAN interface `vlan4` is configured to send RIP version 2 packets only.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 2
```

In the following example, the VLAN interface `vlan3` is configured to use the RIP version specified by the **version** command.

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# no ip rip send version
```

Related Commands **ip rip send version 1-compatible**
version

ip rip send version 1-compatible

Use this command in Interface Configuration mode to send RIP version 1 compatible packets from a RIP version 2 interfaces to other RIP Interfaces. This mechanism causes RIP version 2 interfaces to send broadcast packets instead of multicasting packets, and is used in environments where multicast is not enabled or where hosts do not listen to multicast.

Use the **no** variant of this command to use the setting specified by the **version** command, and disable the broadcast of RIP version 2 packets that are sent as broadcast packets.

Syntax

```
ip rip send version 1-compatible
no ip rip send version
```

Parameter	Description
`1-compatible`	Specify this parameter to send RIP version 1 compatible packets from a version 2 RIP interface to other RIP interfaces. This mechanism causes version 2 RIP interfaces to broadcast packets instead of multicasting packets.

Default RIP version 2 is enabled by default.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to a specific interface and overrides the version specified by the **version** command.

RIP can be run in version 1 compatible mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Use the **ip rip send version** command in an environment where you can send multicast packets. For example, in environments where multicast is enabled and where hosts listen to multicast.

Examples In the following example, the VLAN interface `vlan2` is configured to send RIP version 1-compatible packets.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip send version 1-compatible
```

In the following example, the VLAN interface `vlan3` is configured to use the RIP version specified by the **version** command.

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# no ip rip send version
```

Related Commands **ip rip send version**
version

ip rip split-horizon

Use this command to perform the split-horizon action on the interface. The default is split-horizon poisoned.

Use the **no** variant of this command to disable this function.

Syntax

```
ip rip split-horizon [poisoned]
no ip rip split-horizon
```

Parameter	Description
`poisoned`	Performs split-horizon with poisoned reverse.

Default Split horizon poisoned is the default.

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces. Use this command to avoid including routes in updates sent to the same gateway from which they were learned. Using the **split horizon** command omits routes learned from one neighbor, in updates sent to that neighbor. Using the **poisoned** parameter with this command includes such routes in updates, but sets their metrics to infinity. Thus, advertising that these routes are not reachable.

Example To perform the split-horizon action on, use the following command:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip split-horizon poisoned
```

key

Use this command to manage, add and delete authentication keys in a key-chain.

Use the **no** variant of this command to delete the authentication key.

Syntax

```
key <keyid>
no key <keyid>
```

Parameter	Description
<keyid>	<0-2147483647> Key identifier number.

Mode Keychain Configuration

Usage This command allows you to enter the keychain-key mode where a password can be set for the key.

Example The following example configures a key number 1 and shows the change into a **keychain-key** command mode prompt.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)#
```

Related Commands

key chain

key chain

Use this command to enter the key chain management mode and to configure a key chain with a key chain name.

Use the **no** variant of this command to remove the key chain and all configured keys.

Syntax

```
key chain <key-chain-name>
no key chain <key-chain-name>
```

Parameter	Description
<key-chain-name>	Specify the name of the key chain to manage.

Mode Global Configuration

Usage This command allows you to enter the keychain mode from which you can specify keys on this key chain.

Example The following example shows the creation of a key chain named `mychain` and the change into **keychain** mode prompt.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)#
```

Related Commands

key
key-string
accept-lifetime
send-lifetime

key-string

Use this command to define the password to be used by a key.

Use the **no** variant of this command to remove a password.

Syntax

```
key-string <key-password>
no key-string
```

Parameter	Description
<key-password>	A string of characters to be used as a password by the key.

Mode Keychain-key Configuration

Usage Use this command to specify passwords for different keys.

Examples In the following example, the password for `key1` in the key chain named `mychain` is set to password **prime**:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string prime
```

In the following example, the password for `key1` in the key chain named `mychain` is removed:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# no key-string
```

Related Commands

key
key chain
accept-lifetime
send-lifetime

maximum-prefix

Use this command to configure the maximum number of RIP routes stored in the routing table.

Use the **no** variant of this command to disable all limiting of the number of RIP routes stored in the routing table.

Syntax

```
maximum-prefix <maxprefix> [<threshold>]
no maximum-prefix
```

Parameter	Description
<maxprefix>	<1-65535> The maximum number of RIP routes allowed.
<threshold>	<1-100> Percentage of maximum routes to generate a warning. The default threshold is 75%.

Mode Router Configuration

Example To configure the maximum number of RIP routes to 150, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# maximum-prefix 150
```

neighbor (RIP)

Use this command to specify a neighbor router. It is used for each router to which you wish to send unicast RIP updates.

Use the **no** variant of this command to stop sending unicast updates to the specific router.

Syntax

```
neighbor <ip-address>
no neighbor <ip-address>
```

Parameter	Description
<ip-address>	The IP address of a neighboring router with which the routing information will be exchanged.

Default Disabled

Mode Router Configuration

Usage Use this command to exchange nonbroadcast routing information. It can be used multiple times for additional neighbors.

The **passive-interface (RIP)** command disables sending routing updates on an interface. Use the `neighbor` command in conjunction with the **passive-interface (RIP)** to send routing updates to specific neighbors.

Example To specify the neighbor router to 1.1.1.1, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan1
awplus(config-router)# neighbor 1.1.1.1
```

Related Commands **passive-interface (RIP)**

network (RIP)

Use this command to activate the transmission of RIP routing information on the defined network.

Use the **no** variant of this command to remove the specified network or VLAN as one that runs RIP.

Syntax

```
network {<network-address>[/<subnet-prefix-length>]|<vlan-name>}
no network {<network-address>[/<subnet-mask>]|<vlan-name>}
```

Parameter	Description
<network-address> [/<subnet-prefix-length>]	Specifies the network address to run RIP. Entering a subnet mask (or prefix length) for the network address is optional. Where no mask is entered, the switch will attempt to apply a mask that is appropriate to the class (A, B, or C) of the address entered, i.e. an IP address of 10.0.0.0 will have a prefix length of 8 applied to it.
<vlan-name>	Specify a VLAN name with up to 32 alphanumeric characters to run RIP.

Default Disabled

Mode RIP Router Configuration

Usage Use this command to specify networks, or VLANs, to which routing updates will be sent and received. The connected routes corresponding to the specified network, or VLANs, will be automatically advertised in RIP updates. RIP updates will be sent and received within the specified network or VLAN.

Example Use the following commands to activate RIP routing updates on network 172.16.20.0/24:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# network 172.16.20.0/24
```

Related Commands

show ip rip
show running-config
clear ip rip route

offset-list (RIP)

Use this command to add an offset to the **in** and **out** metrics of routes learned through RIP.

Use the **no** variant of this command to remove the offset list.

Syntax

```
offset-list <access-list> {in|out} <offset> [<interface>]
no offset-list <access-list> {in|out} <offset> [<interface>]
```

Parameter	Description
<access-list>	Specifies the access-list number or names to apply.
`in`	Indicates the access list will be used for metrics of incoming advertised routes.
`out`	Indicates the access list will be used for metrics of outgoing advertised routes.
<offset>	`<0-16>` Specifies that the offset is used for metrics of networks matching the access list.
<interface>	An alphanumeric string that specifies the interface to match.

Default The default `offset value` is the metric value of the interface over which the updates are being exchanged.

Mode RIP Router Configuration

Usage Use this command to specify the offset value that is added to the routing metric. When the networks match the access list the offset is applied to the metrics. No change occurs if the offset value is zero.

Examples In this example the router examines the RIP updates being sent out from interface `vlan2` and adds `5` hops to the routes matching the ip addresses specified in the access list `8`.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# offset-list 8 in 5 vlan2
```

Related Commands **access-list (extended numbered)**

passive-interface (RIP)

Use this command to block RIP broadcasts on the VLAN interface.

Use the **no** variant of this command to disable this function.

Syntax

```
passive-interface <interface>
no passive-interface <interface>
```

Parameter	Description
<interface>	Specifies the interface name.

Default Disabled

Mode RIP Router Configuration

Usage This command can only be configured for VLAN interfaces.

Examples Use the following commands to block RIP broadcasts on vlan20:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan20
```

Related Commands show ip rip

recv-buffer-size (RIP)

Use this command to run-time configure the RIP UDP (User Datagram Protocol) receive-buffer size to improve UDP reliability by avoiding UDP receive buffer overrun.

Use the **no** variant of this command to reset the configured RIP UDP receive-buffer size to the system default (196608 bits).

Syntax

```
recv-buffer-size <8192-2147483647>

no recv-buffer-size [<8192-2147483647>]
```

Parameter	Description
<8192-2147483647>	Specify the RIP UDP (User Datagram Protocol) buffer size value in bits.

Default 196608 bits is the system default when reset using the **no** variant of this command.

Mode Router Configuration

Examples To run-time configure the RIP UDP, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# recv-buffer-size 23456789

awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no recv-buffer-size 23456789
```

redistribute (RIP)

Use this command to redistribute information from other routing protocols into RIP.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **routemap** may be used on this command, but have no effect.

Syntax

```
redistribute {connected|static|ospf} [metric <0-16>] [routemap
   <routemap>]
no redistribute {connected|static|ospf} [metric] [routemap]
```

Parameter	Description
`routemap`	Optional. Specifies route-map that controls how routes are redistributed.
`<routemap>`	Optional. The name of the route map.
`connected`	Redistribute from connected routes.
`static`	Redistribute from static routes.
`ospf`	Redistribute from Open Shortest Path First (OSPF).
`metric <0-16>`	Optional. Sets the value of the metric that will be applied to routes redistributed into RIP from other protocols. If a value is not specified, and no value is specified using the **default-metric (RIP)** command, the default is one.

Default By default, the RIP metric value is set to 1.

Mode RIP Router Configuration

Example To apply the metric value 15 to static routes being redistributed into RIP, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# redistribute static metric 15
```

Related Commands **default-metric (RIP)**

restart rip graceful

Use this command to force the RIP process to restart, and optionally set the grace-period.

Syntax `restart rip graceful [grace-period <1-65535>]`

Mode Privileged Exec

Default The default RIP grace-period is 60 seconds.

Usage After this command is executed, the RIP process immediately shuts down. It notifies the system that RIP has performed a graceful shutdown. Routes that have been installed into the route table by RIP are preserved until the specified grace-period expires.

When a **restart rip graceful** command is issued, the RIP configuration is reloaded from the last saved configuration. Ensure you first enter the command **copy running-config startup-config**.

When a master failover happens on a VCStack, the RIP grace-period will apply the larger value of either, the setting's configured value, or its default of 60 seconds.

Example To apply a restart rip graceful setting, grace-period to 100 seconds use the following commands:

```
awplus# copy running-config startup-config
awplus# restart rip graceful grace-period 100
```

rip restart grace-period

Use this command to change the grace period of RIP graceful restart.

Use the **no** variant of this command to disable this function.

Syntax

```
rip restart grace-period <1-65535>
no rip restart grace-period <1-65535>
```

Mode Global Configuration

Default The default RIP grace-period is 60 seconds.

Usage Use this command to enable the **Graceful Restart** feature on the RIP process. Entering this command configures a grace period for RIP.

Example

```
awplus# configure terminal
awplus(config)# rip restart grace-period 200
```

route (RIP)

Use this command to configure static RIP routes.

Use the **no** variant of this command to disable this function.

Syntax

```
route <ip-addr/prefix-length>
no route <ip-addr/prefix-length>
```

Parameter	Description
<ip-addr/prefix-length>	The IPv4 address and prefix length.

Default No static RIP route is added by default.

Mode RIP Router Configuration

Usage Use this command to add a static RIP route. After adding the RIP route, the route can be checked in the RIP routing table.

Example To create a static RIP route to IP subnet `192.168.1.0/24`, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# route 192.168.1.0/24
```

Related Commands

show ip rip
clear ip rip route

router rip

Use this global command to enter Router Configuration mode to enable the RIP routing process.

Use the **no** variant of this command to disable the RIP routing process.

Syntax

```
router rip
no router rip
```

Mode Global Configuration

Example This command is used to begin the RIP routing process:

```
                awplus# configure terminal
        awplus(config)# router rip
  awplus(config-router)# version 1
  awplus(config-router)# network 10.10.10.0/24
  awplus(config-router)# network 10.10.11.0/24
  awplus(config-router)# neighbor 10.10.10.10
```

Related Commands network (RIP)
version

send-lifetime

Use this command to specify the time period during which the authentication key on a key chain can be sent.

Syntax

```
send-lifetime <start-date>{<end-date>|duration <seconds>|infinite}
no send-lifetime
```

Parameter	Description	
<start-date>	Specifies the start period - time and date in the format DD MMM YYYY or MMM DD YYYY: *<hh:mm:ss> {<day> <month> <year> | <month> <day> <year>}*	
	<hh:mm:ss>	Time of the day when send-lifetime starts, in hours, minutes and seconds
	<day>	<1-31> Specifies the day of the month to start.
	<month>	Specifies the month of the year to start (the first three letters of the month, for example, Jan).
	<year>	<1993-2035> Specifies the year to start.
<end-date>	Specifies the end period - time and date in the format DD MMM YYYY or MMM DD YYYY: *<hh:mm:ss> {<day> <month> <year> | <month> <day> <year>}*	
	<hh:mm:ss>	Time of the day when lifetime expires, in hours, minutes and seconds.
	<day>	<1-31> Specifies the day of the month to expire.
	<month>	Specifies the month of the year to expire (the first three letters of the month, for example, Feb).
	<year>	<1993-2035> Specifies the year to expire.
<seconds>	<1-2147483646> Duration of the key in seconds.	
infinite	Never expires.	

Mode Keychain-key Configuration

Example The following example shows the setting of send-lifetime for key1 on the key chain named mychain.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# send-lifetime 03:03:01 Jan 3 2004
04:04:02 Dec 6 2006
```

show debugging rip

Use this command to display the RIP debugging status for these debugging options: nsm debugging, RIP event debugging, RIP packet debugging and RIP nsm debugging.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show debugging rip`

Mode User Exec and Privileged Exec

Usage Use this command to display the debug status of RIP.

Example

```
awplus# show debugging rip
```

show ip protocols rip

Use this command to display RIP process parameters and statistics.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ip protocols rip`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip protocols rip
```

Output **Figure 38-1: Example output from the show ip protocols rip command:**

```
Routing Protocol is "rip"
Sending updates every 30 seconds with +/-50%, next due in 12
seconds
Timeout after 180 seconds, garbage collect after 120 seconds
Outgoing update filter list for all interface is not set
Incoming update filter list for all interface is not set
Default redistribution metric is 1
Redistributing: connected static
Default version control: send version 2, receive version 2
Interface        Send  Recv   Key-chain
   vlan25          2     2
Routing for Networks:
  10.10.0.0/24
Routing Information Sources:
  Gateway          BadPackets BadRoutes  Distance Last Update
Distance: (default is 120
```

show ip rip

Use this command to show RIP routes.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip rip
```

Mode

User Exec and Privileged Exec

Example

```
awplus# show ip rip
```

Output

Figure 38-2: Example output from the show up rip command

```
awplus#show ip rip
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
       C - Connected, S - Static, O - OSPF
Network        Next Hop Metric From If   Time
C 10.0.1.0/24             1      vlan20
S 10.10.10.0/24           1      vlan20
C 10.10.11.0/24           1      vlan20
S 192.168.101.0/24        1      vlan20
R 192.192.192.0/24        1      --
```

Related Commands

route (RIP)
network (RIP)
clear ip rip route

show ip rip database

Use this command to display information about the RIP database.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show ip rip database [full]`

Parameter	Description
`full`	Specify the full RIP database including sub-optimal RIP routes.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip rip database
awplus# show ip rip database full
```

Related Commands show ip rip

show ip rip interface

Use this command to display information about the RIP interfaces. You can specify an interface name to display information about a specific interface.

Syntax `show ip rip interface [<interface>]`

Parameter	Description
<interface>	The interface to display information about. For instance: `vlan2`.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip rip interface
```

timers (RIP)

Use this command to adjust routing network timers.

Use the **no** variant of this command to restore the defaults.

Syntax

```
timers basic <update> <timeout> <garbage>
no timers basic
```

Parameter	Description
<update>	<5-2147483647> Specifies the period at which RIP route update packets are transmitted. The default is 30 seconds.
<timeout>	<5-2147483647> Specifies the routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid.
<garbage>	<5-2147483647> Specifies the routing garbage collection timer in seconds. The default is 120 seconds.

Default Enabled

Mode RIP Router Configuration

Usage This command adjusts the RIP timing parameters.

The update timer is the time between sending out updates, that contain the complete routing table, to every neighboring router.

If an update for a given route has not been seen for the time specified by the timeout parameter, that route is no longer valid. However, it is retained in the routing table for a short time, with metric 16, so that neighbors are notified that the route has been dropped.

When the time specified by the garbage parameter expires the metric 16 route is finally removed from the routing table. Until the garbage time expires, the route is included in all updates sent by the router.

All the routers in the network must have the same timers to ensure the smooth operation of RIP throughout the network.

Examples To adjust router network timers to 30 180 120, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# timers basic 30 180 120
```

To adjust router network timers to 30 180 120 with VRF, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# timers basic 30 180 120
```

undebug rip

Use this command to disable the options set for debugging information of RIP events, packets and communication between RIP and NSM.

This command has the same effect as the **no debug rip** command.

Syntax `undebug rip {all|events|nsm|<packet>}`

Parameter	Description
`all`	Disables all RIP debugging.
`events`	Disables the logging of RIP events.
`nsm`	Disables the logging of RIP and NSM communication.
<packet>	`packet [recv|send] [detail]` Disables the debugging of RIP packets.
`recv`	Disables the logging of received packet information.
`send`	Disables the logging of sent packet information.
`detail`	Disables the logging of sent or received RIP packets.

Mode Privileged Exec

Example To disable the options set for debugging RIP information events, use the following command:

```
awplus# undebug rip packet
```

Related Commands debug rip

version

Use this command to specify a RIP version used globally by the router.

Use the **no** variant of this command to restore the default version.

Syntax

```
version {1|2}
no version
```

Parameter	Description
1|2	Specifies the version of RIP processing.

Default Version 2

Mode RIP Router Configuration

Usage RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Setting the version command has no impact on receiving updates, only on sending them. The **ip rip send version** command overrides the value set by the **version** command on an interface-specific basis. The **ip rip receive version** command allows you to configure a specific interface to accept only packets of the specified RIP version. The **ip rip receive version** command and the **ip rip send version** command override the value set by this command.

Examples To specify a RIP version, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
```

Validation Commands **show running-config**

```
awplus#show running-config
!
router rip
 version 1
!
```

Related Commands **ip rip receive version**
ip rip send version

Chapter 39: RIPng for IPv6 Configuration

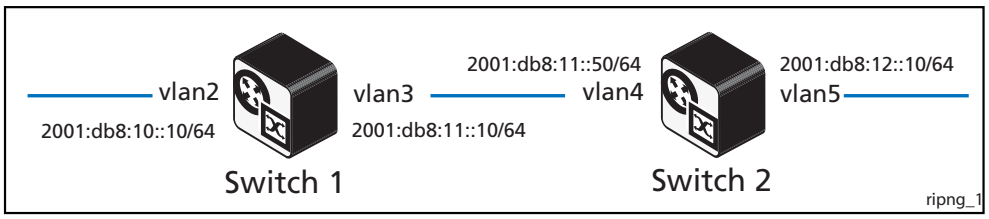
Introduction

This chapter contains a basic RIPng configuration example. To see details on the RIPng commands used in these examples, or to see the outputs of the Validation commands, refer to **Chapter 40, RIPng for IPv6 Commands**.

Enabling RIPng

This example shows the minimum configuration required for enabling RIPng on an interface. Switch 1 and Switch 2 are two switches connected via network **2001:db8:11::/64**.

To enable RIPng, first add IPv6 addresses to interfaces and then enable RIPng on each interface.



Switch 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ipv6 rip`	Globally enable RIPng routing on `Switch 1` and enter Router Configuration mode.
`awplus(config-router)#` `exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#` `interface vlan2`	Specify the interface (`vlan2`) and enter the Interface Configuration mode.
`awplus(config-if)#` `ipv6 address 2001db8:10::10/64`	Configure the IPv6 address on interface `vlan2`.
`awplus(config-if)#` `ipv6 router rip`	Enable RIPng routing on interface `vlan2`.
`awplus(config-if)#` `exit`	Exit Interface mode and enter Global Configuration mode.
`awplus(config)#` `interface vlan3`	Specify the interface (`vlan3`) and enter the Interface Configuration mode.

Switch 1(cont.)

`awplus(config-if)#`	
`ipv6 address 2001db8:11::10/64`	Configure the IPv6 address on interface `vlan3`.
`awplus(config-if)#`	
`ipv6 router rip`	Enable RIPng routing on interface `vlan3`.
`awplus(config-if)#`	
`exit`	Exit Interface mode and enter Global Configuration mode.
`awplus(config)#`	
`router ipv6 rip`	Define a RIPng routing process and enter Router Configuration mode.
`awplus(config-router)#`	
`exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#`	
`exit`	Exit Global Configuration mode and return to Privileged Exec mode.

Switch 2

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router ipv6 rip`	Globally enable RIPng routing on `Switch 2` and enter Router Configuration mode.
`awplus(config-router)#`	
`exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#`	
`interface vlan5`	Specify the interface (`vlan5`) and enter the Interface Configuration mode.
`awplus(config-if)#`	
`ipv6 address 2001db8:12::10/64`	Configure the IPv6 address on interface `vlan5`.
`awplus(config-if)#`	
`ipv6 router rip`	Enable RIPng routing on interface `vlan5`
`awplus(config-if)#`	
`exit`	Exit Interface mode and enter Global Configuration mode.
`awplus(config)#`	
`interface vlan4`	Specify the interface (`vlan4`) and enter the Interface Configuration mode.

Switch 2 (cont.)

`awplus(config-if)#`	
`ipv6 address 2001db8:11::50/64`	Configure the IPv6 address on interface `vlan4`.
`awplus(config-if)#`	
`ipv6 router rip`	Enable RIPng routing on interface `vlan4`.
`awplus(config-if)#`	
`exit`	Exit Interface mode and enter Global Configuration mode.
`awplus(config)#`	
`router ipv6 rip`	Define a RIPng routing process and enter Router Configuration mode.
`awplus(config-router)#`	
`exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#`	
`exit`	Exit Global Configuration mode and return to Privileged Exec mode.

Names of Commands Used

router ipv6 rip
ipv6 router rip

Validation Commands

show ipv6 rip

Troubleshooting RIPng Adjacency

Follow the steps below to troubleshoot RIPng adjacency:

Step 1. Confirm the Interface is not shutdown

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router ipv6 rip`	Globally enable RIPng routing on the Switch and enter Router Configuration mode.
`awplus(config-router)#`	
`exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) and enter the Interface mode.
`awplus(config-if)#`	
`no shutdown`	Ensure the interface is not administratively shutdown.
`awplus(config-if)#`	
`exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#`	
`exit`	Exit Global Configuration mode and return to Privileged Exec mode.
`awplus#`	
`show ipv6 interface brief`	Use the `show interface` command to make sure that the interface is not administratively shutdown.

Step 2. Confirm RIPng is enabled on the interface

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router ipv6 rip`	Globally enable RIPng routing on the Switch.
`awplus(config-router)#`	
`exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) and enter the Interface Configuration mode.

Step 2. Confirm RIPng is enabled on the interface(cont.)

`awplus(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) and enter the Interface Configuration mode.
`awplus(config-if)#`	
`ipv6 router rip`	Enable RIPng routing on interface `vlan2`.
`awplus(config-if)#`	
`exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#`	
`router ipv6 rip`	Define a RIPng routing process and enter Router Configuration mode.
`awplus(config-router)#`	
`exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#`	
`exit`	Exit Global Configuration mode and return to Privileged Exec mode.
`awplus#`	

`show ipv6 rip interface vlan2`	Check the configuration. E.g.:
	`vlan2 is up, line protocol is up`
	`  Routing Protocol: RIPng`
	`  Passive interface: Disabled`
	`  Split horizon: Enabled with Poisoned Reversed`
	`  IPv6 interface address:`
	`  2001:db8:1::10/64`
	`  2001:db8:204:76ff:fec8::/10`

Step 3. Check the Interface is not a Passive Interface

awplus#	

show running-config	Check that the interface is not configured as a passive interface.
	If it is configured to be passive, this is displayed in the output from the **show running config** command, e.g.:
	`!`
	`router ipv6 rip`
	`passive interface vlan2`
	`!`

awplus#	
configure terminal	Enter the Global Configuration mode.
awplus(config)#	
router ipv6 rip	Enter the Router Configuration mode.
awplus(config-router)#	
no passive interface port1.0.1	Remove the passive interface.

Step 4. Ensure RIPng Advertisements get exchanged

awplus#	
configure terminal	Enter the Global Configuration mode.
awplus(config)#	
router ipv6 rip	Globally enable RIPng routing on the Switch and enter Router Configuration mode.
awplus(config-router)#	
exit	Exit Router Configuration mode and return to Global Configuration mode.
awplus(config)#	
debug ipv6 rip event	Check on the interface to make sure that RIPng advertisements are being sent and received.
awplus(config)#	
debug ipv6 rip packet detail	Check on the interface to make sure that RIPng advertisements are being sent and received.
awplus(config)#	
exit	Exit Global Configuration mode to enter Privileged Exec mode.
awplus#	
terminal monitor	View log messages, or use a packet sniffer such as Ethereal or Wireshark, to verify RIPng advertisements.

Chapter 40: RIPng for IPv6 Commands

Introduction

This chapter contains RIPng commands. RIPng (Routing Information Protocol next generation) is an extension of RIPv2 to support IPv6. RFC 2080 specifies RIPng. The differences between RIPv2 and RIPng are:

- RIPng does not support RIP updates authentication
- RIPng does not allow the attachment of arbitrary tags to routes
- RIPng requires the encoding of the next-hop for a set of routes

For more information, see **Chapter 39, RIPng for IPv6 Configuration**.

Command List

This section provides an alphabetical reference of commands used to configure RIPng for IPv6.

aggregate-address (IPv6 RIPng)

Use this command to add an aggregate route to RIPng.

Use the **no** variant of this command to remove the aggregate route from RIPng.

Syntax

```
aggregate-address <ipv6-addr/prefix-length>
no aggregate-address <ipv6-addr/prefix-length>
```

Parameter	Description
<ipv6-addr/prefix-length>	Specify the IPv6 Address in the format *X:X::X:X/Prefix-Length*. The prefix-length is a decimal integer between 1 and 128.

Mode Router Configuration

Usage The route will not be added to the RIPng database unless the database contains at least one route which is contained within the address range covered by the aggregate route. As soon as there are any such component routes in the RIPng database, then the following occurs:

- the aggregate route is added to the RIPng database
- all the component routes that are within the address range covered by the aggregate route are retained in the RIPng database, but are marked as suppressed routes. The aggregate route will be advertised in RIPng updates, and the component route will no longer be advertised.

Note that simply having a component route in the IPv6 route database is not a sufficient condition for the aggregate route to be included into the RIPng database. The component route(s) must be in the RIPng database before the aggregate route will be included in the RIPng database. There is no restriction on the method by which the component routes have arrived into the RIPng database, it can be by being connected RIP interfaces, by redistribution or by direct inclusion using the **route** command in router IPv6 RIP configuration mode.

Example

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# aggregate-address 2001:db8::/32
```

cisco-metric-behavior (IPv6 RIPng)

Use this command to enable or disable the RIPng routing metric update to conform to Cisco's implementation. This command is provided to allow inter-operation with older Cisco devices that do not conform to the RFC standard for RIP route metrics.

Use the **no** variant of this command to disable this feature.

Syntax

```
cisco-metric-behavior {enable|disable}
no cisco-metric-behavior
```

Parameter	Description
`enable`	Enables updating the metric consistent with Cisco.
`disable`	Disables updating the metric consistent with Cisco.

Default By default, the Cisco metric-behavior is disabled.

Mode Router Configuration

Examples To enable the routing metric update to behave as per the Cisco implementation, enter the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# cisco-metric-behavior enable
```

To disable the routing metric update to behave as per the default setting, enter the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no cisco-metric-behavior
```

Validation Commands **show running-config**

Related Commands **cisco-metric-behavior (RIP)**

clear ipv6 rip route

Use this command to clear specific data from the RIPng routing table.

Syntax

```
clear ipv6 rip route {<ipv6-addr/prefix-length>|all|connected|rip|
   static|ospf}
```

Parameter	Description
<ipv6-addr/prefix-length>	Specify the IPv6 Address in format *X:X::X:X/Prefix-Length*. The prefix-length is a decimal integer between 1 and 128. Removes entries which exactly match this destination address from the RIPng routing table.
`connected`	Removes redistributed connected entries from RIPng routing table.
`static`	Removes redistributed static entries from the RIPng routing table.
`rip`	Removes RIPng routes from the RIPng routing table.
`ospf`	Removes redistributed OSPFv3 routes from the RIPng routing table.
`all`	Clears the entire RIPng routing table.

Mode Privileged Exec

Example

```
awplus# clear ipv6 rip route all
awplus# clear ipv6 rip route 2001:db8::/32
```

debug ipv6 rip

Use this command to enable RIPng debugging and specify debugging for RIPng events, RIPng packets, or RIPng communication with NSM processes.

Use the **no** variant of this command to disable RIPng debugging.

Syntax

```
debug ipv6 rip [all|events|nsm|packet [detail]|recv [detail]|
    send [detail]]

no debug ipv6 rip [all|events|nsm|packet [detail]|recv [detail]|
    send [detail]]
```

Parameter	Description
`all`	Displays all RIPng debugging showing RIPng events debug information, RIPng received packets information, and RIPng sent packets information.
`events`	Displays RIPng events debug information.
`nsm`	Displays RIPng and NSM communication.
`packet`	Displays RIPng packets only.
`recv`	Displays information for received packets.
`send`	Displays information for sent packets.
`detail`	Displays detailed information for the sent or received packet.

Default RIPng debugging is disabled by default.

Mode Privileged Exec and Global Configuration

Example

```
awplus# debug ipv6 rip events
awplus# debug ipv6 rip packet send detail
awplus# debug ipv6 rip nsm
```

Related Commands **undebug ipv6 rip**

default-information originate (IPv6 RIPng)

Use this command to generate a default route into RIPng.

Use the **no** variant of this command to disable this feature.

Syntax

```
default-information originate
no default-information originate
```

Default Disabled

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# default-information originate
```

default-metric (IPv6 RIPng)

Use this command to specify the metrics to be assigned to redistributed RIPng routes.

Use the **no** variant of this command to reset the RIPng metric back to its default (1).

Syntax

```
default-metric <1-16>
no default-metric [<1-16>]
```

Parameter	Description
<1-16>	Metric value.

Default By default, the RIPng metric value is set to 1.

Mode Router Configuration

Usage This command is used with the **redistribute (IPv6 RIPng)** command to make the routing protocol use the specified metric value for all redistributed RIPng routes, regardless of the original protocol that the route has been redistributed from.

Note, this metric is not applied to routes that are brought into RIPng by using the **route** command in router IPv6 RIP configuration mode. This metric is, though, applied to any RIPng aggregate routes that have been brought into the RIPng database due to the presence of a component route that was redistributed into RIPng.

Also note that the default-metric is applied to routes redistributed into RIPng with no metric assignment in the routemap associated with redistribution.

Example

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# default-metric 8
```

Related Commands **ipv6 rip metric-offset**
redistribute (IPv6 RIPng)

distribute-list (IPv6 RIPng)

Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list.

Use the **no** variant of this command to disable this feature.

Syntax

```
distribute-list [<access-list>|prefix <prefix-list-name>] [in|out]
    [<interface>]
no distribute-list [<access-list>|prefix <prefix-list-name>] [in|out]
    [<interface>]
```

Parameter	Description
<access-list>	Specifies the IPv6 access-list number or name to use.
<prefix-list-name>	Filter prefixes in routing updates. Specify the name of the IPv6 prefix-list to use.
<interface>	The interface for which distribute-list applies. For instance: `vlan2`.
`in`	Filter incoming routing updates.
`out`	Filter outgoing routing updates.

Default Disabled

Mode Router Configuration

Usage Filter out incoming or outgoing route updates using the access-list or the prefix-list. If you do not specify the name of the interface, the filter is applied to all the interfaces.

Example To filter incoming or outgoing route updates, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# distribute-list prefix myfilter in vlan2
```

Related Commands **ipv6 access-list extended (named)**
ipv6 nd prefix

ipv6 rip metric-offset

Use this command to increment the metric value on incoming routes for a specified interface. This command can be used to artificially inflate the metric value for routes learnt on the specified interface. Routes learnt on the specified interface are only used if the routes to the same destination with a lower metric value in the routing table are down.

Use the **no** variant of this command to reset the metric value on incoming routes to the default value (1). You can set the metric value for redistributed routes with **default-metric (IPv6 RIPng)** and **redistribute (IPv6 RIPng)** commands in Router Configuration mode.

Syntax

```
ipv6 rip metric-offset <1-16>
no ipv6 rip metric-offset <1-16>
```

Parameter	Description
<1-16>	Specify an increment to the metric value on an incoming route. The metric value for RIPng routes is the hop count for the route.

Default The default RIPng metric value is 1.

Mode Interface Configuration for a VLAN interface only.

Usage When a RIPng route is received on a VLAN interface, the metric value for the interface set by this command is added to the metric value of the route in the routing table. Note this command only increments the metric for incoming routes on a specified interface. Increasing the metric value for a VLAN interface increases the metric value of routes received on that VLAN interface. This changes the route selected from the routing table.

The RIPng metric is the hop count. At regular intervals of the routing update timer (which has a default value of 30 seconds), and at the time of change in the topology, the RIPng router sends update messages to other routers. The listening routers update their route table with the new route, and increase the metric value of the path by one (referred to as a hop count). The router recognizes the IPv6 address advertising router as the next hop, then sends the routing updates to other routers. A maximum allowable hop count is 15. If a router reaches a metric value of 16 or more, the destination is identified as unreachable.

See how AlliedWare Plus adds routes in the **Chapter 35, How AlliedWare Plus Adds Routes** in **Chapter 35, Route Selection**. See also the **default-metric (IPv6 RIPng)** and **redistribute (IPv6 RIPng)** commands to specify the metric for redistributed RIPng routes.

Examples To increment the metric-offset on the VLAN interface vlan2, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 rip metric-offset 1
```

To reset the metric-offset on the VLAN interface `vlan2` to the default value, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 rip metric-offset 1
```

Validation Commands **show running-config**

Related Commands **default-metric (IPv6 RIPng)**

ipv6 rip split-horizon

Use this command to perform the split-horizon action on the interface. The default is split-horizon with poisoned reverse.

Use the **no** variant of this command to disable this function.

Syntax

```
ipv6 rip split-horizon [poisoned]
no ipv6 rip split-horizon
```

Parameter	Description
`split-horizon`	Perform split-horizon without poisoned reverse
`poisoned`	Performs split-horizon with poisoned reverse.

Default Split-horizon with poisoned reverse is the default.

Mode Interface Configuration for a VLAN interface.

Usage Use this command to avoid including routes in updates sent to the same gateway from which they were learned. Using the **split horizon** command omits routes learned from one neighbor, in updates sent to that neighbor. Using the **poisoned** parameter with this command includes such routes in updates, but sets their metrics to infinity. Thus, advertising that these routes are not reachable.

Examples To perform split-horizon with poisoned reverse on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 rip split-horizon poisoned
```

To disable split-horizon on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 rip split-horizon
```

Validation Commands **show running-config**

ipv6 router rip

Use this command to enable RIPng routing on an interface.

Use the **no** variant of this command to disable RIPng routing on an interface.

Syntax

```
ipv6 router rip
no ipv6 router rip
```

Default RIPng routing is disabled by default.

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces.

Examples To enable RIPng routing on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 router rip
```

To disable RIPng routing on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 router rip
```

neighbor (IPv6 RIPng)

Use this command to specify a neighbor router.

Use the **no** variant of this command to disable the specific router.

Syntax

```
neighbor <ipv6-link-local-addr> <interface>
no neighbor <ipv6-link-local-addr> <interface>
```

Parameter	Description
<ipv6-link-local-addr>	Specify the link-local IPv6 address (in the format *X:X::X:X*) of a neighboring router to exchange routing information with.
<interface>	The interface. For instance: `vlan2`.

Mode Router Configuration

Usage Use this command to exchange non broadcast routing information. It can be used multiple times for additional neighbors.

The **passive-interface (IPv6 RIPng)** command disables sending routing updates on an interface. Use the `neighbor` command in conjunction with the **passive-interface (IPv6 RIPng)** command to send routing updates to specific neighbors.

Examples

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# neighbor 2001:db8:1::1 vlan2

awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no neighbor 2001:db8:1::1 vlan2
```

Related Commands **passive-interface (IPv6 RIPng)**

offset-list (IPv6 RIPng)

Use this command to add an offset to in and out metrics to routes learned through RIPng.

Use the **no** variant of this command to remove an offset list.

Syntax

```
offset-list {<access-list-number>|<access-list-name>} {in|out}
    <offset> [<interface>]

no offset-list {<access-list-number>|<access-list-name>} {in|out}
    <offset> [<interface>]
```

Parameter	Description
<access-list-number>	Specify an access-list number to apply to an offset-list.
<access-list-name>	Specify and access-list name to apply to an offset-list.
`in`	Indicates the access-list will be used for metrics of incoming advertised routes
`out`	Indicates the access-list will be used for metrics of outgoing advertised routes
<offset>	`<0-16>` Specifies that the offset is used for metrics of networks matching the access-list
<interface>	The interface to match. For instance: `vlan2`.

Default The default offset value is the metric value of the interface over which the updates are being exchanged.

Mode Router Configuration

Usage Use this command to specify the offset value that is added to the routing metric. When the networks match the access list the offset is applied to the metrics. No change occurs if the offset value is zero.

Example In this example the router examines the RIPng updates being sent out from interface `vlan2` and adds `8` hops to the routes matching the ip addresses specified in the access list `2`.

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# offset-list mylist in 8 vlan2
```

passive-interface (IPv6 RIPng)

Use this command to enable suppression of routing updates on an interface.

Use the **no** variant of this command to disable this function.

Syntax

```
passive-interface <interface>
no passive-interface <interface>
```

Parameter	Description
<interface>	The interface. For instance: `vlan2`.

Default Disabled

Mode Router Configuration

Examples To enable suppression of routing updates, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# passive-interface vlan2

awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no passive-interface vlan2
```

recv-buffer-size (IPv6 RIPng)

Use this command to configure the RIPng UDP (User Datagram Protocol) receive-buffer size. This should improve UDP reliability by avoiding UDP receive buffer overruns.

Use the **no** variant of this command to unset the configured RIPng UDP receive-buffer size and set it back to the system default of 196608 bits.

Syntax

```
recv-buffer-size <8192-2147483647>
no recv-buffer-size [<8192-2147483647>]
```

Default The RIPng UDP receive-buffer-size is 196608 bits by default, and is reset to the default using the **no** variant of this command.

Mode Router Configuration

Examples To configure the RIPng UPD, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# recv-buffer-size 23456789

awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no recv-buffer-size 23456789

awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no recv-buffer-size
```

redistribute (IPv6 RIPng)

Use this command to redistribute information from other routing protocols into RIPng.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **routemap** may be used on this command, but have no effect.

Syntax

```
redistribute {connected|static|ospf} [metric <0-16>]
    [route-map <route-map>]

no redistribute {connected|static|ospf} [metric <0-16>]
    [route-map <route-map>]
```

Parameter	Description
<0-16>	Optional. Specifies the metric value to be used when redistributing information. If a value is not specified, and no value is specified using the **default-metric (IPv6 RIPng)** command, the default is one.
<route-map>	Optional. Specifies route-map to be used to redistribute information.
`connected`	Redistribute from connected routes.
`static`	Redistribute from static routes.
`ospf`	Redistribute from Open Shortest Path First (OSPF).

Default By default, the RIPng metric value is set to 1.

Mode Router Configuration

Example To redistribute information from other routing protocols into RIPng, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# redistribute static route-map mymap
awplus(config-router)# redistribute static metric 8
```

Related Commands **default-metric (IPv6 RIPng)**

route (IPv6 RIPng)

Use this command to configure static RIPng routes.

Use the **no** variant of this command to disable this function.

Syntax

```
route <ipv6-addr/prefix-length>
no route <ipv6-addr/prefix-length>
```

Parameter	Description
<ipv6-addr/prefix-length>	Specify the IPv6 Address in format *X:X::X:X/Prefix-Length*. The prefix-length is a decimal integer between 1 and 128.

Mode Router Configuration

Usage Use this command to add a static RIPng route. After adding the RIPng route, the route can be checked in the RIPng routing table.

Example To configure static RIPng routes, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# route 2001:db8::1/64
```

Related Commands **show ipv6 rip**
clear ipv6 rip route

router ipv6 rip

Use this global command to enter Router Configuration mode to enable a RIPng routing process.

Use the **no** variant of this command to disable the RIPng routing process.

Syntax

```
router ipv6 rip
no router ipv6 rip
```

Mode Global Configuration

Example To enable a RIPng routing process, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)#
```

show debugging ipv6 rip

Use this command to display the RIPng debugging status for the debugging options of: nsm debugging, RIPng event debugging, RIPng packet debugging, and RIPng nsm debugging.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show debugging ipv6 rip`

Mode User Exec and Privileged Exec

Usage Use this command to display the debug status of RIPng.

Example To display the RIPng debugging status, use the following command:

```
awplus# show debugging ipv6 rip
```

show ipv6 protocols rip

Use this command to display RIPng process parameters and statistics.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**

Syntax `show ipv6 protocols rip`

Mode User Exec and Privileged Exec

Example To display RIPng process parameters and statistics, use the following command:

```
awplus# show ipv6 protocols rip
```

Output

```
awplus#show ipv6 protocols rip
Routing Protocol is "RIPng"
  Sending updates every 30 seconds with +/-5 seconds, next due
in 6 seconds
  Timeout after 180 seconds, garbage collect after 120 seconds
  Outgoing update filter list for all interface is not set
  Incoming update filter list for all interface is not set
  Default redistribute metric is 1
  Redistributing:
  Interface
    vlan3
  Routing for Networks:
    fe80::200:cdff:fe27:c086 vlan1
```

show ipv6 rip

Use this command to show RIPng routes.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 rip
```

Mode

User Exec and Privileged Exec

Example

To display RIPng routes, use the following command:

```
awplus# show ipv6 rip
```

Output

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, Ra - RIP
aggregated, Rcx - RIP connect suppressed, Rsx - RIP static
suppressed, C - Connected, S - Static, O - OSPF

   Network            Next Hop          If      Met Tag   Time

R  2001:db8:1::/48    2001:db8:2::/48   vlan3    3   0    02:28
C  2001:db8:3::/48    ::                vlan2    1   0
Ra 2001:db8:4::/48                      --       1   0
Rs 2001:db8:5::/48    2001:db8:1::/48   vlan3    3   0    02:32
Cs 2001:db8:6::/48    ::                vlan3    1   0
```

Related Commands

show ipv6 rip database

show ipv6 rip database

Use this command to display information about the RIPng database.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 rip database [full]`

Parameter	Description
`full`	Display all IPv6 RIPng full database entries including sub-optimal routes.

Mode User Exec and Privileged Exec

Example To display information about the RIPng database, use the following command:

```
awplus# show ipv6 rip database
```

Output

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, Ra - RIP
aggregated, Rcx - RIP connect suppressed, Rsx - RIP static
suppressed, C - Connected, S - Static, O - OSPF

   Network            Next Hop          If      Met Tag   Time

R  2001:db8:1::/48    2001:db8:2::/48   vlan3    3   0    02:28
C  2001:db8:3::/48    ::                vlan2    1   0
Ra 2001:db8:4::/48                      --       1   0
Rs 2001:db8:5::/48    2001:db8:1::/48   vlan3    3   0    02:32
Cs 2001:db8:6::/48    ::                vlan3    1   0
```

Related Commands **show ipv6 rip**

show ipv6 rip interface

Use this command to display information about the RIPng interfaces. You can specify an interface name to display information about a specific interface.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 rip interface [<interface>]`

Parameter	Description
<interface>	The interface to display information about. For instance: `vlan2`.

Mode User Exec and Privileged Exec

Example To display RIPng interface information, use the following command:

```
awplus# show ipv6 rip interface
```

Output

```
lo is up, line protocol is up
RIPng is not enabled on this interface
vlan1 is up, line protocol is up
RIPng is not enabled on this interface
vlan2 is down, line protocol is down
RIPng is not enabled on this interface
vlan3 is up, line protocol is up
Routing Protocol: RIPng
Passive interface: Disabled
Split horizon: Enabled with Poisoned Reversed
IP interface address:
2001:db8:1::1/64
2001:db8:1::2/64
```

timers (IPv6 RIPng)

Use this command to adjust the RIPng routing network timers.

Use the **no** variant of this command to restore the defaults.

Syntax

```
timers basic <update> <timeout> <garbage>
no timers basic
```

Parameter	Description
<update>	<5-2147483647> Specifies the RIPng routing table update timer in seconds. The default is 30 seconds.
<timeout>	<5-2147483647> Specifies the RIPng routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid.
<garbage>	<5-2147483647> Specifies the RIPng routing garbage collection timer in seconds. The default is 120 seconds.

Default The default RIPng routing table update timer default is 30 seconds, the default RIPng routing information timeout timer is 180 seconds, and the default RIPng routing garbage collection timer is 120 seconds. The **no** variant of this command restores the default RIPng routing timers.

Mode Router Configuration

Example To adjust the RIPng routing network timers, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# timers basic 30 180 120
```

undebug ipv6 rip

Use this command to disable debugging options of RIPng events, RIPng packets, and communication between RIPng and NSM processes.

Syntax `undebug ipv6 rip [all|events|nsm|packet [recv|send][detail]]`

Parameter	Description
`all`	Disables all RIPng debugging.
`events`	Disable the display of RIPng events information.
`nsm`	Disable the display of RIPng and NSM communication.
`packet`	Disable debugging of specified RIPng packets only.
`recv`	Disable the display of information for received packets.
`send`	Disable the display of information for sent packets.
`detail`	Disable the display of detailed information for sent or received packets.

Mode Privileged Exec and Global Configuration

Example To disable debugging options, use the following command:

```
awplus# undebug ipv6 rip events

awplus# undebug ipv6 rip all

awplus# undebug ipv6 rip packet send

awplus# undebug ipv6 rip packet recv detail
```

Related Commands **debug ipv6 rip**

Chapter 41: OSPF Introduction and Configuration

OSPF Introduction

This chapter introduces OSPF followed by basic configuration examples. To see details on the OSPF commands used in these examples, or to see the outputs of the validation commands, refer to **Chapter 42, OSPF Commands**.

Features

Open Shortest Path First (OSPF) is an Interior Gateway Routing Protocol, based on Shortest Path First (SPF) or link-state technology. OSPF is defined in RFCs 1245–1247, 1253 and 1583. OSPF was designed specifically for the TCP/IP Internet environment, and supports the following features:

- Authentication of routing updates.
- Tagging of externally-derived routes.
- Fast response to topology changes with low overhead.
- Load sharing over meshed links.

OSPF Components

Autonomous Systems

In SPF-based routing protocols, routers combine to form an Autonomous Systems (AS). These are router systems which operate under a common administration and usually share common routing protocols. Each router maintains a database describing the AS's topology. Each router has an identical database, each component of which describes a particular router and its current state. This includes the state of the interfaces, reachable neighbors, and other information. Information about the AS is distributed between the routers by a process known as "flooding".

Each router runs a routing algorithm, and from the information exchanged about the other AS routers, creates an internal tree-like database of shortest paths with itself as the root. The tree contains a route to each destination in the AS. External routes are added to the tree as "leaves".

Another feature of OSPF is that it enables IP subnets to be configured in a very flexible way. Each route distributed by OSPF has a destination and a mask. During the routing process, routes with the longest mask to a destination are used in preference to those with shorter masks. Host routes are also supported by OSPF; these are considered to be subnets with masks of all ones.

All OSPF protocol exchanges can be authenticated so that only trusted routers participate in the creation of the topology database, and hence the AS's routing. Authentication is disabled by default.

Externally derived routing data can be passed into the AS transparently. The externally derived routing information is kept separate from the OSPF protocol's link state data.

Routing Areas

OSPF allows the grouping of networks into a set, called an **Area**. The internal topology of an area is hidden from the rest of the AS. This technique minimizes the routing traffic required for the protocol. When multiple areas are used, each area has its own copy of the topological database.

Routing can be between areas (inter-area routing) or within areas (intra-area routing). To link together multiple areas, OSPF uses the concept of a **backbone area**. The backbone area forms a central network that links to the other areas within the AS. The backbone must have contiguous connectivity with the its other areas. Virtual links can be used to make the backbone contiguous.

At the junction of each area and its backbone is a **border router**. Packets travelling between areas will do so via the backbone area. Packets are first sent to the area's border router where they will be routed onto the backbone. They will then travel through the backbone to another area border router at the connection to the destination area. The packets are then routed through the destination area to their specific destination.

Adjacencies and Designated Routers

OSPF creates adjacencies between neighboring routers. The reason for forming adjacencies is to exchange topological information. Not every router needs to become adjacent to every other router. Adjacencies are established and maintained with **hello packets**. These packets are sent periodically on all router interfaces. Bidirectional communication is determined by a router seeing itself listed in hello packets from its neighbors. On broadcast multi-access networks, one of the routers becomes a designated router.

The designated router maintains adjacencies with all the routers within the area by issuing link state advertisements for its area and subnet.

The designated router becomes adjacent to all other routers within the area. Since the topological database is spread over adjacencies, the designated router coordinates the synchronization of the topological database on all the routers within its area.

Selecting the Designated Router

The designated router for a broadcast network is determined dynamically via hello packets. Each router is configured with a priority number, which is advertised in the hello packet. The routers compare their priority numbers, and the router with the highest priority number is elected the designated router. Where routers share the same priority number, as could happen with a common default setting, then the designated router is the router with the highest router ID. On non-broadcast multi-access networks, static configuration information is used to initiate the search for a designated router.

To help in dynamic fallover, OSPF also determines a backup designated router for a network via hello packets. The backup designated router, like the designated router maintains an adjacency to all other routers on the network. If the designated router fails for any reason, the backup designated router takes over.

Link State Advertisements

Link state advertisements are records in the topological database. Routers may generate five different types of link state advertisements **Table 41-1 on page 41.4**. Each type of link state advertisement describes a different set of features of the Autonomous System (AS).

Link state advertisements age to a maximum age called MaxAge (3600 seconds) while stored in the topological database. When a link state advertisement reaches MaxAge, the router tries to flush it from the routing domain by reflooding the advertisement. A link state advertisement that has reached MaxAge is not used in further routing table calculations. The MaxAge link state advertisement is removed totally from the topological database when it is no longer contained on a neighbor link state retransmission list or none of the neighbors are in exchange or loading state. It is relatively rare for a link state advertisement to reach MaxAge because advertisements are usually replaced by more recent instances by normal refresh processes.

Table 41-1: OSPF link state advertisement type

LSA Type	Meaning
Router Links	The router originates a router links advertisement for each area to which it belongs. The advertisement describes the collected states of the router's links to the area. This advertisement also indicates whether the router is an area border router or an AS boundary router.
Network Links	A network link advertisement is originated for every transit multi-access network. This advertisement is originated by the designated router for the transit network, and describes all the OSPF routers fully adjacent to the designated router.
Summary Links	Summary Link advertisements describe a single route to a destination. The destinations described are external to the area, but internal to the AS. Some condensing of routing information occurs when creating these summary link state advertisements.
AS Summary Links	These are like summary link advertisements, but they describe routes to AS boundary routers.
AS External Links	AS external advertisements describe routes external to the AS.

OSPF Packet Types

The OSPF protocol runs directly over IP, using the assigned number 89. The following table describes OSPF packet types.

Table 41-2: OSPF Packet Types

Packet Type	Purpose
Hello	Used to discover and maintain neighbors.
Link State Request	Used to form adjacencies. The router summarizes all its link state advertisements and passes this information, via database description packets, to the router it is forming an adjacency with.
Link State Update	Used for transmission of link state advertisements between routers. This could be in response to a link state request packet or to flood a new or more recent link state advertisement.
Link State Acknowledgement	Used to make the flooding of link state advertisements reliable. Each link state advertisement received is explicitly acknowledged.

OSPF States

The following table describes the states that neighbors can be in:

Table 41-3: OSPF States

Packet Type	Purpose
Down	This is the initial state. No hello packets have been received from the neighbor recently or at all.
Attempt	This state applies to non-broadcast multi-access networks. The router is making a determined attempt to contact a statically configured neighbor. Hello packets are sent every hello interval.
Init	A hello packet has been seen from the neighbor. However, the hello packet does not list the router as known.
2-Way	This state is entered when the communication between to neighbors is bidirectional (the hello packet from the neighbor lists this router as a neighbor).
ExStart	This is the first step in creating an adjacency between two routers. The two routers decide which is going to control the exchange between them.
Exchange	In this state, the neighbors exchange database description packets. Each packet summarizes the link state advertisements held by that router.
Loading	After all the database description information has been exchanged, the routers exchange link state advertisements required to update or complete each router's topological database thereby synchronizing the two router's databases.
Full	This is the final state and the adjacency is complete. Reaching this state in itself may cause new instances of some link state advertisements, such as the network and router advertisements related to the two routers.

The following table describes the interface states that the router can be in.

Table 41-4: OSPF Interface States

Packet Type	Purpose
Down	The initial state. No traffic can be routed with the interface in this state.
Loopback	The router's interface to the network is looped back.
Waiting	Interfaces to broadcast and non-broadcast multi-access networks enter this state when they are started. In this state the router tries to determine the designated or backup designated router. The router is not allowed to elect a backup or designated router while in the waiting state. This stops unnecessary changes in the designated router.
Point-to-Point	The interface is operational and is connected to a point-to-point network.
DROther	The interface to a broadcast or a non-broadcast multi-access network has not been selected as either the designated router or backup designated router for the network.
Backup	The interface to a broadcast or a non-broadcast multi-access network has been selected as the backup designated router for the network.
DR	The interface to a broadcast or a non-broadcast multi-access network has been selected as the designated router for the network.

OSPF Metrics

The metrics used by OSPF are not simple distance metrics, such as used by RIP for example, but are measurements of the path bandwidth. Interface metrics are normally set using the formula 10^8 / interface speed (in bps). This gives metrics such as 1 for a 100 Mbps Ethernet interface, and 1562 for a 64 kbps serial line.

When no metric is defined, the default metric for routes redistributed into OSPF is 20. You can define the metric using the **redistribute (OSPF)** command.

You can also define the metric using the **set metric** command for a route map. If a route map is configured, but no OSPF metric is defined using a **redistribute (OSPF)** command, then a default metric of 20 is used. If a route map is configured and the metric is defined using the **set metric** command, this supersedes a metric defined using the **redistribute (OSPF)** command.

How to set the OSPF metric when redistributing routes

You can determine the OSPF metric using the following methods:

- use the default OSPF metric, which is 20.
- change it using the **metric** parameter of the **redistribute (OSPF)** command

The following example sets the metric to `5` for `connected` redistributed routes:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# redistribute connected metric 5
```

- change it using the **metric-value** parameter of the **set metric** command for a route map

Note that changing the metric using a route map supersedes the metric defined using the **redistribute (OSPF)** command. The following example for entry `3` of the route map called `rmap1` give matching routes a metric of `5`:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric 5
```

Automatic Cost Calculation

OSPF interfaces can automatically set the OSPF metric of an IP interface based on its bandwidth, instead of the system administrator having to manually set the OSPF metric. Automatic setting takes into account that the speed of an interface can change over time, when ports change link state or change speed via auto-negotiation or manual setting. If metrics are manually set, some interfaces are preferred when they should be changing to match dynamically changing network configurations.

Routing with OSPF

To route an IP packet, the router looks up the routing table for the entry that best matches the destination of the packet. This entry contains the interface and nexthop router required to forward the IP packet to its destination. The entry that best matches the destination is determined first by the path type, then the longest (most specific) network mask. At this point there may still be multiple routing entries to the destination; if so, then equi-cost multi-path routes exist to the destination. Table **Table 41-5 on page 41.7** shows the available path types used when routing packets.

Table 41-5: OSPF Path Types

Path Type	Description
Intra	Route to the destination is within a single OSPF area.
Inter	Route to the destination is within the AS, but spans more than one OSPF area.
Ext1	Route to the destination is via an AS router within the AS. This is an OSPF external route of Type 1. Type 1 external routes add the external metric (as received by the AS router), and the internal OSPF metric to reach the AS router, to determine the final metric to the destination.
Ext2	Route to the destination is via an AS router within the AS. This is an OSPF external route of Type 2. Type 2 external routes use only the external path cost to determine the preferred route. Internal metrics are only used where two or more interfaces present the same external path cost.

Network Types

OSPF treats the networks attached to OSPF interfaces as one of the following network types, depending on the physical media:

- broadcast
- non-broadcast multi-access (nbma)
- point-to-point
- point-to-multipoint
- virtual

By default, VLAN and Ethernet networks are treated as broadcast networks. You can use the **ip ospf network** command to configure a VLAN interface to be other network types. Configure a VLAN or Ethernet interface as an NBMA interface when:

- Some devices on the network do not support multicast addressing.
- You want to select which devices on the network are to become OSPF neighbors, rather than allow all the devices on the network to become OSPF neighbors.

Passive Interfaces

A passive interface does not take part in normal OSPF interface operations:

- OSPF does not transmit or receive Hello messages via the interface.
- The interface does not experience interface state transitions.
- OSPF does not associate neighbors with the interface.

If the interface is up, OSPF adds the network attached to the interface as a stub network to the router LSA of the area in which the interface resides.

Usage Configure an interface to be passive if you wish its connected route to be treated as an OSPF route (rather than an AS-external route), but do not wish to actually exchange any OSPF packets via this interface.

Examples To configure passive interface mode on interface **vlan2**, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# passive-interface vlan2
```

To configure passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# passive-interface
```

Authenticating OSPF

OSPF packet authentication is described in Appendix D of RFC 2328, and in RFC 1583. RFC 2328 describes authentication set for an interface, whilst RFC 1583 describes authentication set per area. Refer to the RFCs for a detailed description of these methods of authentication.

There are two ways to authenticate an OSPF packet:

- password authentication
- cryptographic authentication

Use the following commands to configure authentication on a specific VLAN interface:

- **ip ospf authentication**
- **ip ospf authentication-key**
- **ip ospf message-digest-key**

Use the following commands to configure authentication for a specific OSPF area.

- **area authentication**
- **ip ospf message-digest-key**

Redistributing External Routes

OSPF can import and redistribute RIP, non-OSPF interface, and statically configured routes. It can also optionally assign any of the following settings to all routes it imports:

- a route metric
- the External metric type
- a tag—a number to label the route

Alternatively, you can assign a route map to select particular routes and set their route parameters. A route map can also filter out a subset of routes, so you do not have to import all routes.

The import settings also allow you to select whether to redistribute subnets (classless network routes), or only classful network routes.

To import and redistribute external routes into OSPF, create a route redistribution definition for the source routing protocol, using the **redistribute (OSPF)** command.

Summarizing Routes for Redistribution

OSPF can summaries external routes to be redistributed using a list of administratively defined summary addresses specified as network/mask pairs. The summary addresses replace the original routes in AS external LSAs. Use summary addresses to reduce the number of AS external routes advertised by the router.

You can set the following attributes for summary addresses:

- Whether the summary address is advertised.
- The tag to be inserted in the AS external LSA. The tag overrides tags set by the original route used to select the original routes for redistribution.

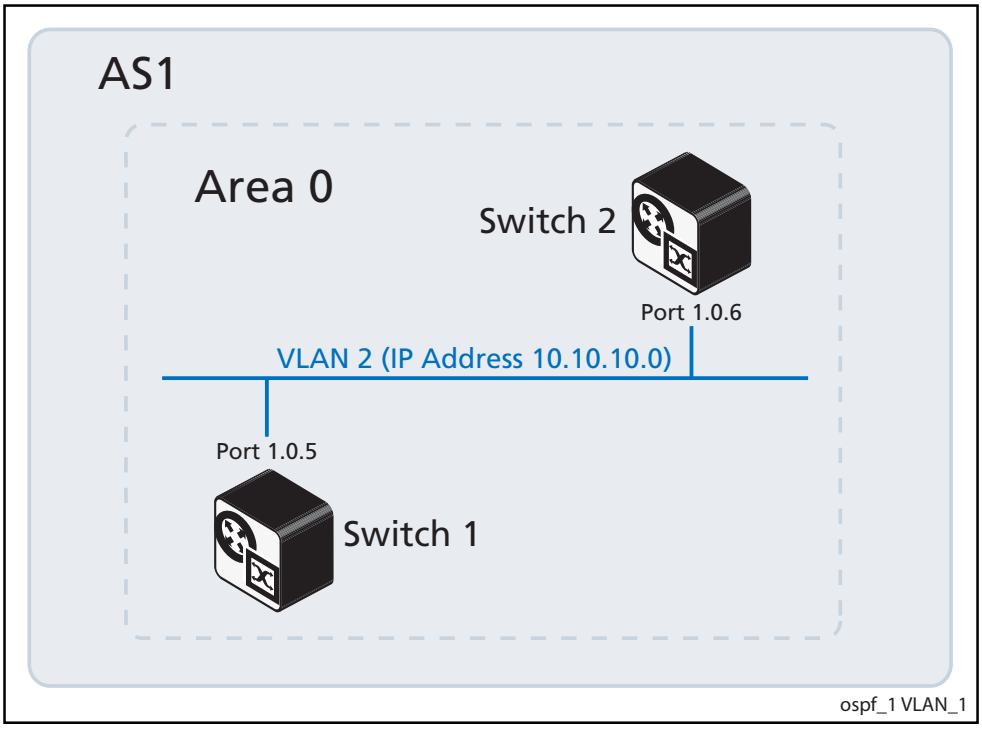
To create summary addresses for route redistribution, use the **summary-address** command.

Enabling OSPF on an Interface

This example shows the minimum configuration required for enabling OSPF on an interface. In this example, the OSPF routers are Allied Telesis managed Layer 3 switches. `Switch 1` and `Switch 2` are two OSPF routers in `Area 0` connecting to network 10.10.10.0/24.

Note

Configure one interface so that it belongs to only one area. However, you can configure different interfaces on an OSPF router to belong to different areas.



Switch 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `interface port1.0.5`	Set the switchport mode to **access**
`awplus#` `switchport access vlan2`	Assign port 1.0.5 to VLAN 2
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`)
`awplus(config-router)#` `network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).

Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode
`awplus(config)#` `interface port1.0.6`	Set the switchport mode to **access**
`awplus#` `switchport access vlan2`	Assign port 1.0.6 to VLAN 2
`awplus(config)#` `router ospf 200`	Configure the Routing process and specify the Process ID `(200)`. The Process ID should be a unique positive integer identifying the routing process. Note that the process ID used on this switch is different to that used on Switch 1. This is correct configuration as the process ID is a value that is only used within a single OSPF router. Therefore there is no requirement for the process IDs used on one OSPF router to have any relationship with the process IDs used on the other OSPF routers that it interacts with.
`awplus(config-router)#` `network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (`0`) with the interface.

Names of Commands Used

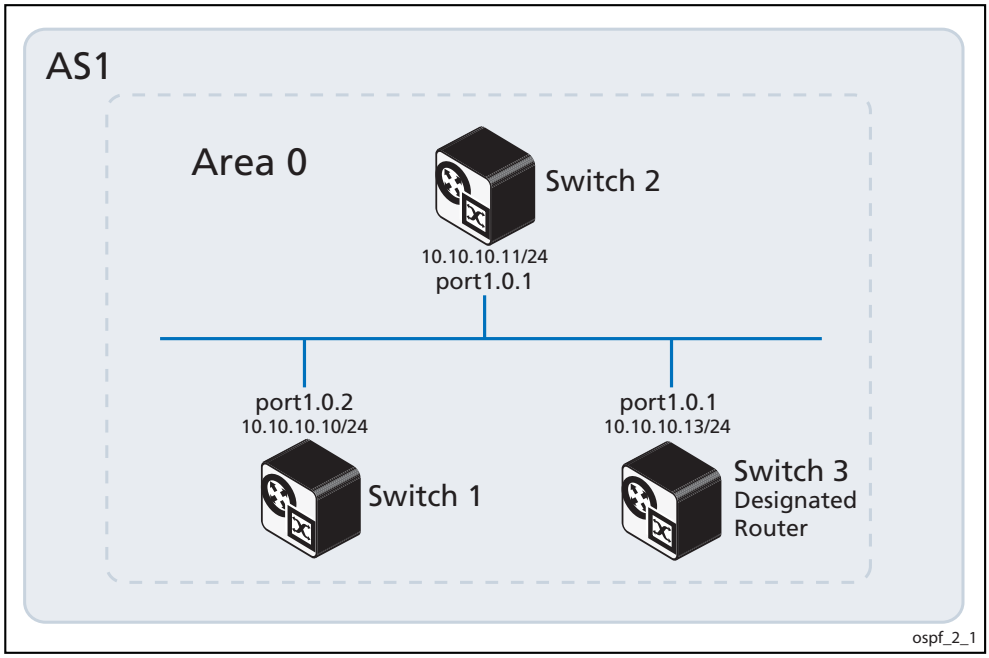
network area
router ospf

Validation Commands

show ip ospf
show ip ospf interface
show ip ospf neighbor
show ip ospf route

Setting priority

This example shows the configuration for setting the priority for an interface. You can set a high priority for an OSPF router to make it the Designated Router (DR). In this example, the OSPF routers are Allied Telesis managed Layer 3 switches. Switch 3 is configured to have a priority of 10, which is higher than the default priority (default priority is 1) of Switch 1 and Switch 2; making it the DR. In this example network the back-up DR would be Switch 2 as it has a higher router ID than Switch 1.



Switch 3

`awplus(config)#` `interface vlan2`	Specify the interface (`vlan2`) to be configured.
`awplus(config-if)#` `ip ospf priority 10`	Specify the router priority to a higher priority (`10`) to make Switch 3 the Designated Router (DR).
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (`0`) with the interface.

Switch 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (`0`) with the interface (area ID 0 specifies the backbone area).

Switch 2

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router ospf 200`	Configure the Routing process and specify the Process ID (200). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#`	
`network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (`0`) with the interface.

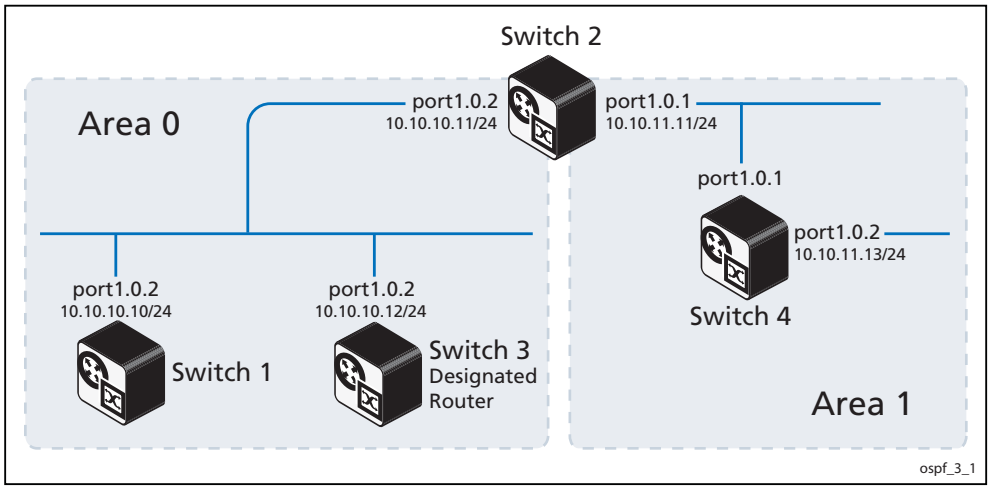
ip ospf priority

Validation Commands

show ip ospf neighbor
show ip ospf interface

Configuring an Area Border Router

This example shows configuration for an Area Border Router (ABR). In this example, the OSPF routers are Allied Telesis managed Layer 3 switches. `Switch 2` is an ABR, where interface `vlan2` is in `Area 0` and interface `vlan3` is in `Area 1`.



Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `network 10.10.10.0/24 area 0`	Define one interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (`0`) with the interface.
`awplus(config-router)#` `network 10.10.11.0/24 area 1`	Define the other interface `(10.10.11.0/24)` on which OSPF runs and associate the area ID `(1)` with the interface.

Names of Commands Used

network area

Validation Commands

show ip ospf
show ip ospf interface

OSPF Cost

You can make a route the preferred route by changing its cost. In this example, the OSPF routers are Allied Telesis managed Layer 3 switches. The cost has been configured to make `Switch 2` the next hop for `Switch 1`.

The default cost on each interface is 10. Interface `vlan2` on `Switch 2` has a cost of 100 and interface `vlan3` on Switch 3 has a cost of 150. The total cost for Switch 1 to reach 10.10.14.0/24 (Switch 4) `Switch 2` or via `Switch 3` is:

Switch 2: 10+100 = 110

Switch 3: 10+150 = 160

Therefore, `Switch 1` chooses `Switch 2` as its next hop for destination 10.10.14.0/24, as that path has the lower cost.

Switch 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.

`awplus(config-router)#`
`network 10.10.9.0/24 area 0`
`awplus(config-router)#`
`network 10.10.10.0/24 area 0`
`awplus(config-router)#`
`network 10.10.12.0/24 area 0`
	Define interfaces on which OSPF runs and associate the area ID `(0)` with the interface (area ID 0 specifies the backbone area).

Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `interface vlan2`	Specify the interface (`vlan2`) to be configured.
`awplus(config-if)#` `ip ospf cost 100`	Set the OSPF cost of this link to `100`.
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `network 10.10.10.0/24 area 0`	Define interfaces on which OSPF runs and associate the area ID `(0)` with the interface.
`awplus(config-router)#` `network 10.10.11.0/24 area 0`	Define interfaces on which OSPF runs and associate the area ID `(0)` with the interface.

Switch 3

`awplus(config)#` `interface vlan3`	Specify the interface (`vlan3`) to be configured.
`awplus(config-if)#` `ip ospf cost 150`	Set the OSPF cost of this link to `100`.
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `network 10.10.12.0/24 area 0`	Define interfaces on which OSPF runs and associate the area ID `(0)` with the interface.
`awplus(config-router)#` `network 10.10.13.0/24 area 0`	

Switch 4

`awplus(config)#`	
`router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#`	
`network 10.10.11.0/24 area 0`	Define interfaces on which OSPF runs and associate the area ID (`0`) with the interface.
`awplus(config-router)#`	
`network 10.10.13.0/24 area 0`	
`awplus(config-router)#`	
`network 10.10.14.0/24 area 0`

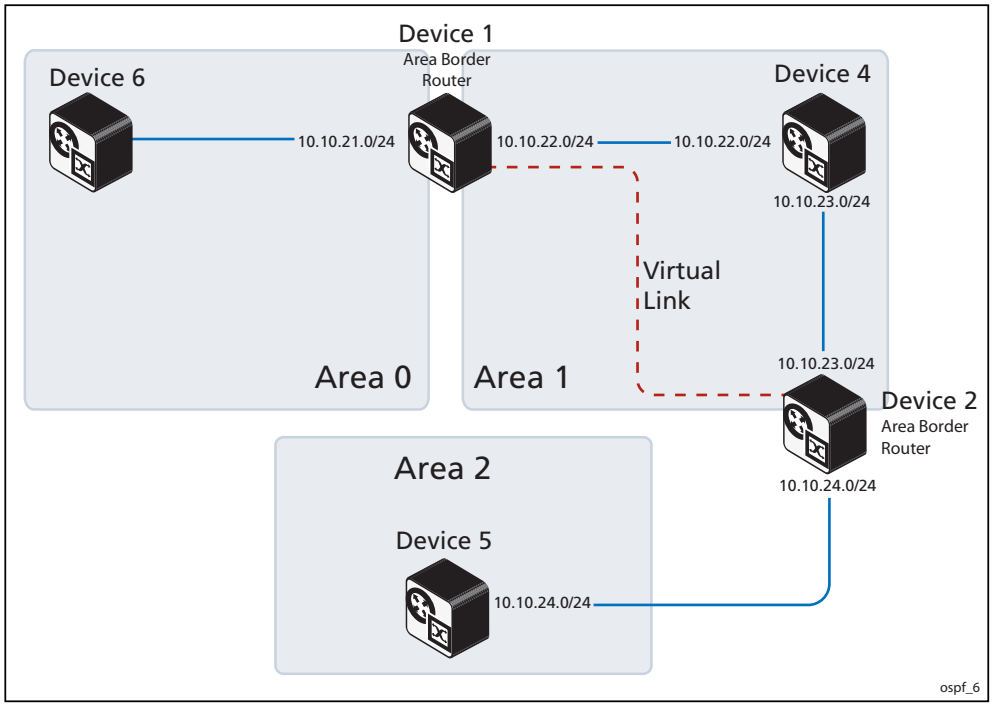
Configuring Virtual Links

Virtual links are used to connect a disjointed non-backbone area to the backbone area, or to repair a non-contiguous backbone area. In this example, the OSPF routers shown represent any Allied Telesis managed Layer 3 switches or Allied Telesis routers.

In the network below, there is no area border router that connects Area2 to the backbone. So a virtual link needs to be created between ABR Device 1 and ABR Device 2 to connect `Area 2` to `Area 0`. Area 1 is used as a transit area.



Device 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `ospf router-id 10.10.21.1`	Configure OSPF Router ID (`10.10.21.1`) for this router.

`awplus(config-router)#`
`network 10.10.21.0/24 area 0`
`awplus(config-router)#`
`network 10.10.22.0/24 area 1`
	Define interfaces on which OSPF runs and associate the area IDs (`0` and `1`) with the interface.

`awplus(config-router)#` `area 1 virtual-link 10.10.23.2`	Configure a virtual link between Device 1 and Device 2 (`10.10.23.2`) through transit area 1.

Device 2

`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `ospf router-id 10.10.23.2`	Configure OSPF Router ID (`10.10.23.2`) for this router.

`awplus(config-router)#`
`network 10.10.23.0/24 area 1`
`awplus(config-router)#`
`network 10.10.24.0/24 area 2`
	Define interfaces on which OSPF runs and associate the area IDs (`1` and `2`) with the interface.

`awplus(config-router)#` `area 1 virtual-link 10.10.21.1`	Configure a virtual link between Device 2 and Device 1 (`10.10.21.1`) through transit area 1.

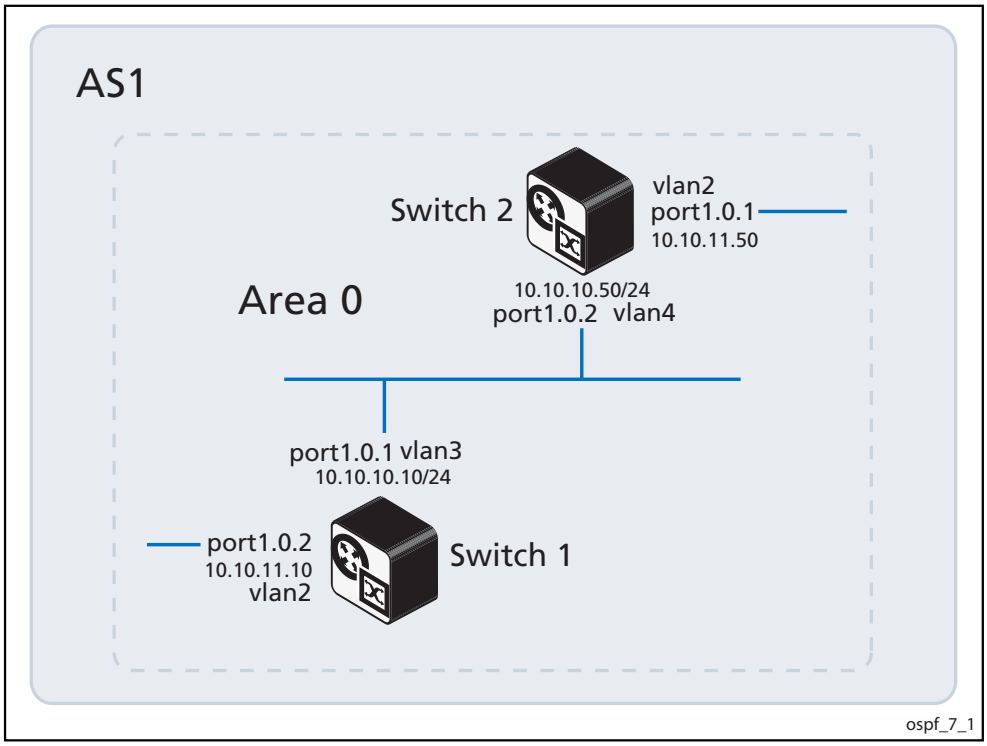
OSPF Authentication

In the AlliedWare Plus™ implementation there are three types of OSPF authentications--Null authentication (Type 0), Simple Text (Type 1) authentication and MD5 (Type 2) authentication. With null authentication, routing exchanges over the network are not authenticated. In Simple Text authentication, the authentication type is the same for all OSPF routers that communicate using OSPF in a network. For MD5 authentication, you configure a key and a key-id on each OSPF router. The OSPF router generates a message digest on the basis of the key, key ID and the OSPF packet and adds it to the OSPF packet.

The Authentication type can be configured on a per-interface basis or a per-area basis. Additionally, Interface and Area authentication can be used together. Area authentication is used for an area and interface authentication is used for a specific interface in the area. If the Interface authentication type is different from Area authentication type, Interface authentication type overrides the Area authentication type. If the Authentication type is not specified for an interface, the Authentication type for the area is used. The authentication command descriptions contain details of each type of authentication. Refer to **Chapter 42, OSPF Commands** for OSPF authentication commands.

In this example, the OSPF routers are Allied Telesis managed Layer 3 switches. Switch 1 and Switch 2 are configured for both the interface and area authentications. The authentication type of interface `vlan2` on Switch 1 and interface `vlan2` on Switch 2 is md5 mode and is defined by the **area authentication** command on page 42.3; however, the authentication type of interface vlan3 on Switch 1 and interface vlan4 on Switch 2 is plain text mode and is defined by the **ip ospf authentication** command on page 42.33. This interface command overrides the area authentication command.



Switch 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.

`awplus(config-router)#`
`network 10.10.10.0/24 area 0`
`awplus(config-router)#`
`network 10.10.11.0/24 area 0`
	Define interfaces on which OSPF runs and associate the area ID `(0)` with the interface (area ID 0 specifies the backbone area).

`awplus(config-router)#` `area 0 authentication message-digest`	Enable MD5 authentication on area 0.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `interface vlan2`	Specify the interface (`vlan2`) you are configuring.
`awplus(config-if)#` `ip ospf message-digest-key 1 md5 test`	Register MD5 key `test` for OSPF authentication. The Key ID is 1.
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to Global Configuration mode
`awplus(config)#` `interface vlan3`	Specify the interface (`vlan3`) you are configuring.
`awplus(config-if)#` `ip ospf authentication`	Enable OSPF packet to use text authentication on the current interface (`vlan3`).
`awplus(config-if)#` `ip ospf authentication-key test`	Specify an OSPF authentication password test for the neighboring OSPF routers.

Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.

`awplus(config-router)#`
`network 10.10.10.0/24 area 0`
`awplus(config-router)#`
`network 10.10.11.0/24 area 0`
	Define interfaces on which OSPF runs and associate the area ID `(0)` with the interface (area ID 0 specifies the backbone area).

`awplus(config-router)#` `area 0 authentication message-digest`	Enable MD5 authentication on area 0.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `interface vlan2`	Specify the interface (`vlan2`) you are configuring.
`awplus(config-if)#` `ip ospf message-digest-key 1 md5 test`	Register MD5 key `test` for OSPF authentication. The Key ID is 1.
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to Global Configuration mode
`awplus(config)#` `interface vlan4`	Specify the interface (`vlan4`) you are configuring.
`awplus(config-if)#` `ip ospf authentication`	Enable OSPF packet to use text authentication on the current interface (`vlan4`).
`awplus(config-if)#` `ip ospf authentication-key test`	Specify an OSPF authentication password `test` for the neighboring OSPF routers.

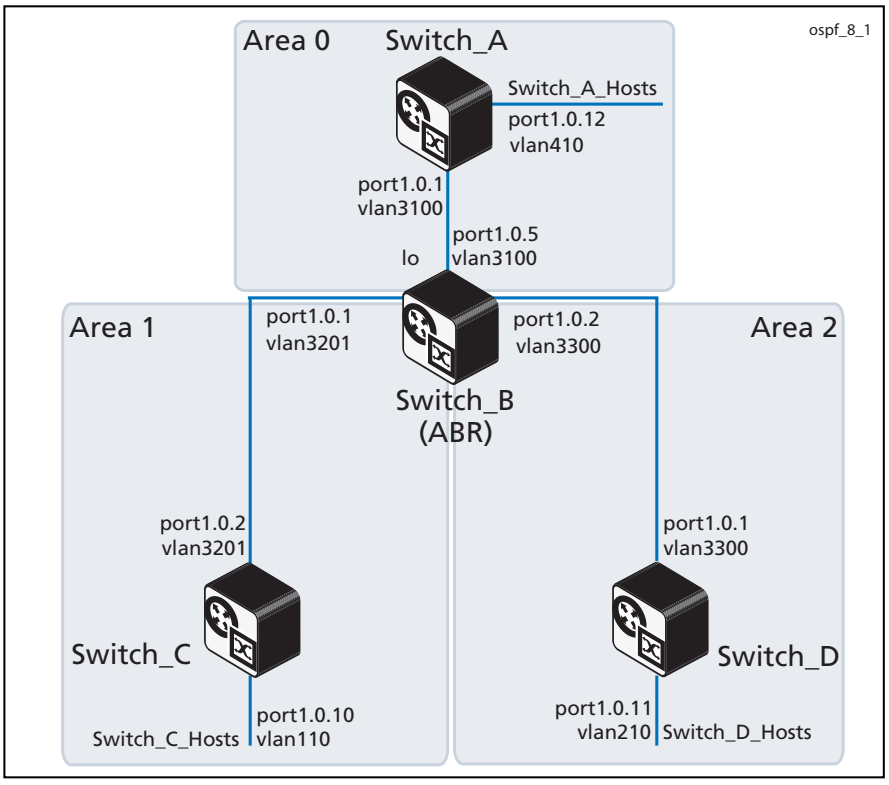
OSPF Multi-Area Loopback Configuration

When a switch is connected to more than two areas, and area 0 interfaces go down, then all routing between the remaining areas will stop. This is due to how OSPF processes inter-area routes as they pass through area 0, even if they are destined for another area. This is a globally recognized issue. Configuring a loopback interface on area 0 resolves this issue.

This example OSPF multiple area configuration applies the best practice of configuring a loopback interface in area 0. This is done so that the ABR (Area Border Router), which in this example is Switch_B, remains available to help connected areas exchange traffic. If the physical link fails between Switch_A and Switch_B, area 0 remains available on Switch_B.

An ABR is a member of both the OSPF backbone and the attached areas. ABRs maintain routing tables describing both the backbone topology and the topology of other areas.

LDS (Long Distance Stacking) enables networks where multiple switches may connect to multiple areas with more than two areas configured on an ABR. Configuring a loopback on the ABR prevents all the inter-area and intra-area OSPF area routing from stopping if the interfaces in an area go down. The area stays up when the interfaces of the area go down.



Switch_A Configuration

See the below OSPF configuration for a device with the hostname **Switch_A**:

```
hostname Switch_A

Chapter 42: OSPF Commands

Introduction

This chapter provides an alphabetical reference of commands used to configure OSPF. For more information, see **Chapter 41, OSPF Introduction and Configuration**.

Command List

area authentication

Use this command to enable authentication for an OSPF area. Specifying the area authentication sets the authentication to Type 1 authentication or the Simple Text password authentication (details in RFC 2328).

The **no** variant of this command removes the authentication specification for an area.

Syntax

```
area <area-id> authentication [message-digest]
no area <area-id> authentication
```

Parameter	Description	
<area-id>	The OSPF area that you are enabling authentication for. This can be entered in either dotted decimal format or normal decimal format.	
	<ip-addr>	OSPF Area ID expressed in IPv4 address, entered in the form A.B.C.D.
	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area OSPF Area ID.	
message-digest	Enables MD5 authentication in the OSPF area.	

Default By default, no authentication occurs.

Mode Router Configuration

Usage All OSPF packets transmitted in this **area** must have the same password in their OSPF header. This ensures that only routers that have the correct password may join the routing domain.

Give all routers that are to communicate with each other through OSPF the same authentication password.

Use the **ip ospf authentication-key** command to specify a Simple Text password. Use the **ip ospf message-digest-key** command to specify MD5 password.

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 authentication
```

Related Commands

ip ospf authentication
ip ospf message-digest-key

area default-cost

This command specifies a cost for the default summary route sent into a stub or NSSA area.

The **no** variant of this command removes the assigned default-route cost.

Syntax

```
area <area-id> default-cost <0-16777215>
no area <area-id> default-cost
```

Parameter	Description	
<area-id>	The OSPF area that you are specifying the default summary route cost for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.	
	<ip-addr>	OSPF Area ID expressed in IPv4 address format A.B.C.D.
	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	
default-cost	Indicates the cost for the default summary route used for a stub or NSSA area. Default: **1**	

Mode Router Configuration

Usage The default-cost option provides the metric for the summary default route, generated by the area border router, into the NSSA or stub area. Use this option only on an area border router that is attached to the NSSA or stub area. Refer to the RFC 3101 for information on NSSA.

Example To set the default cost to 10 in area 1 for the OSPF instance 100, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 default-cost 10
```

Related Commands **area nssa**
area stub

area filter-list

This command configures filters to advertise summary routes on Area Border Routers (ABR).

This command is used to suppress particular intra-area routes from/to an area to/from the other areas. You can use this command in conjunction with either the access-list or prefix-list command.

The **no** variant of this command removes the filter configuration.

Syntax

```
area <area-id> filter-list {access <access-list>|prefix <prefix-
    list>} {in|out}

no area <area-id> filter-list {access <access-list>|prefix <prefix-
    list>} {in|out}
```

Parameter	Description	
<area-id>	The OSPF area that you are configuring the filter for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.	
	<ip-addr>	OSPF Area ID expressed in IPv4 address format `A.B.C.D`.
	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	
access	Use access-list to filter summary.	
prefix	Use prefix-list to filter summary.	
<access-list>	Name of an access-list.	
<prefix-list>	Name of a prefix-list.	
in	Filter routes from the other areas to this area.	
out	Filter routes from this area to the other areas.	

Mode Router Configuration

Example To configure filters to advertise summary routes, use the following commands:

```
awplus# configure terminal
awplus(config)# access-list 1 deny 172.22.0.0
awplus(config)# router ospf 100
awplus(config-router)# area 1 filter-list access 1 in
```

area nssa

This command sets an area as a Not-So-Stubby-Area (NSSA). By default, no NSSA area is defined.

Use this command to simplify administration if you are connecting a central site using OSPF to a remote site that is using a different routing protocol. You can extend OSPF to cover the remote connection by defining the area between the central router and the remote router as an NSSA.

There are no external routes in an OSPF stub area, so you cannot redistribute from another protocol into a stub area. A NSSA allows external routes to be flooded within the area. These routes are then leaked into other areas. Although, the external routes from other areas still do not enter the NSSA. You can either configure an area to be a stub area or an NSSA, not both.

The **no** variant of this command removes this designation.

Syntax

```
area <area-id> nssa [default-information-originate <metric> |
   no-redistribution | no-summary | translator-role <role> ]

no area <area-id> nssa [default-information-originate |
   no-redistribution | no-summary | translator-role ]
```

Parameter	Description	
<area-id>	The OSPF area that you are configuring as an NSSA. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.	
	<ip-addr>	OSPF Area ID expressed in IPv4 address format `A.B.C.D`.
	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	
default-information-originate	Originate Type-7 default LSA into NSSA.	
<metric>	The external or internal metric. Specify the following:	
	`metric` *<0-16777214>*	The metric value.
	`metric-type` *<1-2>*	External metric type.
no-redistribution	Do not redistribute external route into NSSA.	
no-summary	Do not inject inter-area route into NSSA.	
translator-role	Specify NSSA-ABR translator-role.	

Parameter(cont.)	Description(cont.)	
<role>	The role type. Specify one of the following keywords:	
	`always`	Router always translate NSSA-LSA to Type-5 LSA.
	`candidate`	Router may translate NSSA-LSA to Type-5 LSA if it is elected.
	`never`	Router never translate NSSA-LSA.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 0.0.0.51 nssa
awplus(config-router)# area 3 nssa translator-role candidate
no-redistribution default-information-
originate metric 34 metric-type 2
```

Related Commands **area default-cost**

area range

Use this command to summarize OSPF routes at an area boundary, configuring an IPv4 address range which consolidates OSPF routes. By default, this feature is not enabled.

A summary route created by this command is then advertised to other areas by the Area Border Routers (ABRs). In this way, routing information is condensed at area boundaries and outside the area so that routes are exchanged between areas in an efficient manner.

If the network numbers in an area are arranged into sets of contiguous routes, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

The **no** variant of this command disables this function and restores default behavior.

Syntax

```
area <area-id> range <ip-addr/prefix-length> [advertise|not-
    advertise]

no area <area-id> range <ip-addr/prefix-length>
```

Parameter	Description	
<area-id>	The OSPF area that you summarizing the routes for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.	
	<ip-addr>	OSPF Area ID expressed in IPv4 address format `A.B.C.D`.
	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	
<ip-addr/prefix-length>	The area range prefix and length.	
advertise	Advertise this range as a summary route into other areas.	
not-advertise	Does not advertise this range.	

Default The area range is not configured by default. The area range is advertised if it is configured.

Mode Router Configuration

Usage You can configure multiple ranges on a single area with multiple instances of this command, so OSPF summarizes addresses for different sets of IPv4 address ranges.

Ensure OSPF IPv4 routes exist in the area range for advertisement before using this command.

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 range 192.16.0.0/16
awplus(config-router)# area 1 range 203.18.0.0/16
```

area stub

This command defines an OSPF area as a stub area. By default, no stub area is defined.

Use this command when routers in the area do not require learning about summary LSAs from other areas. You can define the area as a totally stubby area by configuring the Area Border Router of that area using the **area stub no-summary** command.

There are two stub area router configuration commands: the **area stub** and **area default-cost** commands. In all routers attached to the stub area, configure the area by using the **area stub** command. For an area border router (ABR) attached to the stub area, also use the **area default-cost** command.

The **no** variant of this command removes this definition.

Syntax

```
area <area-id>  stub [no-summary]
no area <area-id> stub [no-summary]
```

Parameter	Description	
<area-id>	The OSPF area that you are configuring as a stub area. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	
	<ip-addr>	OSPF Area ID expressed in IPv4 address in the format `A.B.C.D`.
	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	
no-summary	Stops an ABR from sending summary link advertisements into the stub area.	

Mode Router Configuration

Example

```
                awplus# configure terminal
       awplus(config)# router ospf 100
awplus(config-router)# area 1 stub
```

Related Commands area default-cost

area virtual-link

This command configures a link between two backbone areas that are physically separated through other non-backbone areas.

In OSPF, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection.

The **no** variant of this command removes the virtual link.

Syntax

```
area <area-id> virtual-link <ip-addr> [<auth-key>|<msg-key>]

no area <area-id>  virtual-link <ip-addr>[<auth-key>|<msg-key>]

area <area-id>  virtual-link <ip-addr> authentication
    [message-digest|null] [<auth-key>|<msg-key>]

no area <area-id>  virtual-link <ip-addr> authentication
    [message-digest|null] [<auth-key>|<msg-key>]

area <area-id>  virtual-link <ip-addr> [authentication]
    [dead-interval <1-65535>] [hello-interval <1-65535>]
    [retransmit-interval <1-3600>] [transmit-delay <1-3600>]

no area <area-id>  virtual-link <ip-addr>[authentication]
    [dead-interval] [hello-interval] [retransmit-interval] [transmit-
    delay]
```

Parameter	Description	
<area-id>	The area ID of the transit area that the virtual link passes through. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.	
	<ip-addr>	OSPF Area ID expressed in IPv4 address format `A.B.C.D`.
	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	
<ip-address>	The OSPF router ID of the virtual link neighbor.	
<auth-key>	Specifies the password used for this virtual link. Use the format: **authentication-key** *<pswd-short>*	
	<pswd-short>	An 8 character password.
<msg-key>	Specifies a message digest key using the MD5 encryption algorithm. Use the following format: **message-digest-key** *<1-255>* md5 *<pswd-long>*	
	<1-255>	The key ID.
	<pswd-long>	Authentication password of 16 characters.
authentication	Enables authentication on this virtual link.	
message-digest	Use message-digest authentication.	

Parameter(cont.)	Description(cont.)	
null	Use null authentication to override password or message digest.	
dead-interval	If no packets are received from a particular neighbor for dead-interval seconds, the router considers that neighboring router as being off-line. Default: 40 seconds	
	<1-65535>	The number of seconds in the interval.
hello-interval	The interval the router waits before it sends a hello packet. Default: 10 seconds	
	<1-65535>	The number of seconds in the interval.
retransmit-interval	The interval the router waits before it retransmits a packet. Default: 5 seconds	
	<1-3600>	The number of seconds in the interval.
transmit-delay	The interval the router waits before it transmits a packet. Default: 1 seconds	
	<1-3600>	The number of seconds in the interval.

Mode Router Configuration

Usage You can configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these two routers, joined by a virtual link, as if they were connected by an unnumbered point-to-point network. To configure a virtual link, you require:

- The transit area ID, i.e. the area ID of the non backbone area that the two backbone routers are both connected to.
- The corresponding virtual link neighbor's router ID. To see the router ID use the **show ip ospf** command.

Configure the **hello-interval** to be the same for all routers attached to a common network. A short **hello-interval** results in the router detecting topological changes faster but also an increase in the routing traffic.

The **retransmit-interval** is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The **transmit-delay** is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet, are incremented by this amount. Set the **transmit-delay** to be greater than zero. Also, take into account the transmission and propagation delays for the interface.

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 virtual-link 10.10.11.50 hello 5
dead 10
```

Related Commands **area authentication**
show ip ospf
show ip ospf virtual-links

auto-cost reference bandwidth

This command controls how OSPF calculates default metrics for the interface.

Use the **no** variant of this command to assign cost based only on the interface bandwidth.

Syntax

```
auto-cost reference-bandwidth <1-4294967>
no auto-cost reference-bandwidth
```

Parameter	Description
<1-4294967>	The reference bandwidth in terms of Mbits per second (Mbps).

Default 1000 Mbps

Usage By default, OSPF calculates the OSPF metric for an interface by dividing the reference bandwidth by the interface bandwidth. The default for the reference bandwidth is 1000 Mbps. As a result, if this default is used, there is very little difference between the metrics applied to interfaces of increasing bandwidth beyond 1000 Mbps.

The auto-cost command is used to alter this reference bandwidth in order to give a real difference between the metrics of high bandwidth links of differing bandwidths. In a network that has multiple links with high bandwidths, specify a larger reference bandwidth value to differentiate the costs on those links.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# auto-cost reference-bandwidth 1000
```

Related Commands ip ospf cost

bandwidth

Use this command to specify the maximum bandwidth to be used for each VLAN interface.
The bandwidth value is in bits. OSPF uses this to calculate metrics for the VLAN interface.

Use the **no** variant of this command to remove the maximum bandwidth.

Syntax

```
bandwidth  <bandwidth-setting>

no bandwidth
```

Parameter	Description
<bandwidth-setting>	Sets to bandwidth for the interface. Enter a value in the range 1 to 10000000000 bits.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# bandwidth 1000000
```

Related Commands

show running-config
show running-config access-list
show interface

capability opaque

This command enables opaque-LSAs. Opaque-LSAs are Type 9, 10 and 11 LSAs that deliver information used by external applications.

By default, opaque-LSAs are enabled.

Use the **no** variant of this command to disables opaque-LSAs.

Syntax

```
capability opaque
no capability opaque
```

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no capability opaque
```

capability restart

This command enables OSPF Graceful Restart or restart signaling features. By default, this is enabled.

Use the **no** variant of this command to disable OSPF Graceful Restart and restart signalling features.

Syntax

```
capability restart [graceful|signaling]
no capability restart
```

Parameter	Description
`graceful`	Enable graceful OSPF restart.
`signaling`	Enable OSPF restart signaling.

Default Graceful restart

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# capability restart graceful
```

clear ip ospf process

This command clears and restarts the OSPF routing process. Specify the Process ID to clear one particular OSPF process. When no Process ID is specified, this command clears all running OSPF processes.

Syntax `clear ip ospf [<0-65535>] process`

Parameter	Description
<0-65535>	The Routing Process ID.

Mode Privileged Exec

Example

```
awplus# clear ip ospf process
```

compatible rfc1583

This command changes the method used to calculate summary route to the that specified in RFC 1583. By default, OSPF uses the method specified in RFC 2328.

RFC 1583 specifies a method for calculating the metric for summary routes based on the minimum metric of the component paths available. RFC 2328 specifies a method for calculating metrics based on maximum cost.

It is possible that some ABRs in an area might conform to RFC 1583 and others support RFC 2328, which could lead to incompatibility in their interoperation. This command addresses this issue by allowing you to selectively disable compatibility with RFC 2328.

Use the **no** variant of this command to disable RFC 1583 compatibility.

Syntax `compatible rfc1583`

`no compatible rfc1583`

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# compatible rfc1583
```

debug ospf events

This command enables OSPF debugging for OSPF event troubleshooting.

To enable all debugging options, specify **debug ospf event** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF debugging. Use this command without parameters to disable all the options.

Syntax

```
debug ospf events [abr] [asbr] [lsa] [nssa] [os] [router] [vlink]
no debug ospf events [abr] [asbr] [lsa] [nssa] [os] [router] [vlink]
```

Parameter	Description
`abr`	Shows ABR events.
`asbr`	Shows ASBR events.
`lsa`	Shows LSA events.
`nssa`	Shows NSSA events.
`os`	Shows OS interaction events.
`router`	Shows other router events.
`vlink`	Shows virtual link events.

Mode Privileged Exec and Global Configuration

Example

```
awplus# debug ospf events asbr lsa
```

Related Commands terminal monitor
undebug ospf events

debug ospf ifsm

This command specifies debugging options for OSPF Interface Finite State Machine (IFSM) troubleshooting.

To enable all debugging options, specify **debug ospf ifsm** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF IFSM debugging. Use this command without parameters to disable all the options.

Syntax

```
debug ospf ifsm [status] [events] [timers]
no debug ospf ifsm [status] [events] [timers]
```

Parameter	Description
events	Displays IFSM event information.
status	Displays IFSM status information.
timers	Displays IFSM timer information.

Mode Privileged Exec and Global Configuration

Example

```
awplus# no debug ospf ifsm events status
awplus# debug ospf ifsm status
awplus# debug ospf ifsm timers
```

Related Commands terminal monitor
undebug ospf ifsm

debug ospf lsa

This command enables debugging options for OSPF Link State Advertisements (LSA) troubleshooting. This displays information related to internal operations of LSAs.

To enable all debugging options, specify **debug ospf lsa** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF LSA debugging. Use this command without parameters to disable all the options.

Syntax

```
debug ospf lsa [flooding] [generate] [install] [maxage] [refresh]
no debug ospf lsa [flooding] [generate] [install] [maxage] [refresh]
```

Parameter	Description
`flooding`	Displays LSA flooding.
`generate`	Displays LSA generation.
`install`	Show LSA installation.
`maxage`	Shows maximum age of the LSA in seconds.
`refresh`	Displays LSA refresh.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# undebug ospf lsa refresh
```

Output **Figure 42-1: Example output from the debug ospf lsa command**

```
2002/05/09 14:08:11 OSPF: LSA[10.10.10.10:10.10.10.70]: instance(0x8139cd0)
created with Link State Update
2002/05/09 14:08:11 OSPF: RECV[LS-Upd]: From 10.10.10.70 via vlan5:10.10.10.50
(10.10.10.10 -> 224.0.0.5)
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: Begin send queue
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: # of LSAs 1, destination 224.0.0.5
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: End send queue
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: To 224.0.0.5 via vlan5:10.10.10.50
```

Related Commands terminal monitor
undebug ospf lsa

debug ospf nfsm

This command enables debugging options for OSPF Neighbor Finite State Machines (NFSMs).

To enable all debugging options, specify **debug ospf nfsm** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF NFSM debugging. Use this command without parameters to disable all the options.

Syntax

```
debug ospf nfsm [events] [status] [timers]
no debug ospf nfsm [events] [status] [timers]
```

Parameter	Description
events	Displays NFSM event information.
status	Displays NSFM status information.
timers	Displays NFSM timer information.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# debug ospf nfsm events
awplus# no debug ospf nfsm timers
awplus# undebug ospf nfsm events
```

Related Commands terminal monitor
undebug ospf nfsm

debug ospf nsm

This command enables debugging options for the OSPF Network Service Module.

To enable both debugging options, specify **debug ospf nsm** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF NSM debugging. Use this command without parameters to disable both options.

Syntax

```
debug ospf nsm [interface] [redistribute]
no debug ospf nsm [interface] [redistribute]
```

Parameter	Description
interface	Specify NSM interface information.
redistribute	Specify NSM redistribute information.

Mode Priviledged Exec and Global Configuration

Examples

```
awplus# debug ospf nsm interface
awplus# no debug ospf nsm redistribute
awplus# undebug ospf nsm interface
```

Related Commands **terminal monitor**
undebug ospf nsm

debug ospf packet

This command enables debugging options for OSPF packets.

To enable all debugging options, specify **debug ospf packet** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF packet debugging. Use this command without parameters to disable all options.

Syntax

```
debug ospf packet [dd] [detail] [hello] [ls-ack] [ls-request]
    [ls-update] [recv] [send]
```

```
no debug ospf packet [dd] [detail] [hello] [ls-ack] [ls-request]
    [ls-update] [recv] [send]
```

Parameter	Description
`dd`	Specifies debugging for OSPF database descriptions.
`detail`	Sets the debug option to detailed information.
`hello`	Specifies debugging for OSPF hello packets.
`ls-ack`	Specifies debugging for OSPF link state acknowledgments.
`ls-request`	Specifies debugging for OSPF link state requests.
`ls-update`	Specifies debugging for OSPF link state updates.
`recv`	Specifies the debug option set for received packets.
`send`	Specifies the debug option set for sent packets.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# debug ospf packet detail
awplus# debug ospf packet dd send detail
awplus# no debug ospf packet ls-request recv detail
awplus# undebug ospf packet ls-request recv detail
```

Related Commands **terminal monitor**
undebug ospf packet

debug ospf route

This command enables debugging of route calculation. Use this command without parameters to turn on all the options.

To enable all debugging options, specify **debug ospf route** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF route debugging. Use this command without parameters to disable all options.

Syntax

```
debug ospf route [ase] [ia] [install] [spf]
no debug ospf route [ase] [ia] [install] [spf]
```

Parameter	Description
ia	Specifies the debugging of Inter-Area route calculation.
ase	Specifies the debugging of external route calculation.
install	Specifies the debugging of route installation.
spf	Specifies the debugging of SPF calculation.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# debug ospf route
awplus# no debug ospf route ia
awplus# debug ospf route install
awplus# undebug ospf route install
```

Related Commands **terminal monitor**
undebug ospf route

default-information originate (OSPF)

This command creates a default external route into an OSPF routing domain.

When you use the **default-information originate** command to redistribute routes into an OSPF routing domain, then the system acts like an Autonomous System Boundary Router (ASBR). An ASBR does not by default, generate a default route into the OSPF routing domain.

When using this command, also specify the **route-map** <***route-map***> option to avoid a dependency on the default network in the routing table.

The **metric-type** is an external link type associated with the default route advertised into the OSPF routing domain. The value of the external route could be either Type 1 or 2. The default is Type 2.

The **no** variant of this command disables this feature.

Syntax

```
default-information originate [always] [metric <metric>]
    [metric-type <1-2>] [route-map <route-map>]

no default-information originate [always] [metric] [metric-type]
    [route-map]
```

Parameter	Description
`always`	Used to advertise the default route regardless of whether there is a default route.
`metric <metric>`	The metric value used in creating the default route. Enter a value in the range 0 to 16777214. The default metric value is 10. The value used is specific to the protocol.
`metric-type <1-2>`	External metric type for default routes, either OSPF External Type 1 or Type 2 metrics. Enter the value 1 or 2.
`route-map`	Specifies to use a specific route-map.
`<route-map>`	The route-map name. It is a string comprised of any characters, numbers or symbols.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# default-information originate
always metric 23 metric-type 2
route-map myinfo
```

Related Commands route-map

default-metric (OSPF)

This command sets default metric values for the OSPF routing protocol.

The **no** variant of this command returns OSPF to using built-in, automatic metric translations, as appropriate for each routing protocol.

Syntax

```
default-metric <1-16777214>
no default-metric [<1-16777214>]
```

Parameter	Description
<1-16777214>	Default metric value appropriate for the specified routing protocol.

Mode Router Configuration

Usage A default metric facilitates redistributing routes even with incompatible metrics. If the metrics do not convert, the default metric provides an alternative and enables the redistribution to continue. The effect of this command is that OSPF will use the same metric value for **all** redistributed routes. Use this command in conjunction with the **redistribute (OSPF)** command.

Examples

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# default-metric 100

awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no default-metric
```

Related commands **redistribute (OSPF)**

distance (OSPF)

This command sets the administrative distance for OSPF routes based on the route type. Your switch uses this value to select between two or more routes to the same destination from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). See **"Administrative Distance" on page 35.6** for more information.

Use the command **distance ospf** to set the distance for an entire category of OSPF routes, rather than the specific routes that pass an access list.

Use the command **distance <1-255>**, with no other parameter, to set the same distance for all OSPF route types.

The **no** variant of this command sets the administrative distance for all OSPF routes to the default of 110.

Syntax

```
distance <1-255>

distance ospf
   {external <1-255>|inter-area <1-255>|intra-area <1-255>}

no distance {ospf|<1-255>}
```

Parameter	Description
`<1-255>`	Specify the Administrative Distance value for OSPF routes.
`external`	Sets the distance for routes from other routing domains, learned by redistribution. Specify an OSPF external distance in the range `<1-255>`.
`inter-area`	Sets the distance for all routes from one area to another area. Specify an OSPF inter-area distance in the range `<1-255>`.
`intra-area`	Sets the distance for all routes within an area. Specify an OSPF intra-area distance in the range `<1-255>`.

Default The default OSPF administrative distance is 110. The default Administrative Distance for each type of route (intra, inter, or external) is 110.

Mode Router Configuration

Usage The administrative distance rates the trustworthiness of a routing information source. The distance could be any integer from 0 to 255. A higher distance value indicates a lower trust rating. For example, an administrative distance of 255 indicates that the routing information source cannot be trusted and should be ignored.

Use this command to set the distance for an entire group of routes, rather than a specific route that passes an access list.

Examples To set the following administrative distances for route types in OSPF 100:

- 20 for inter-area routes
- 10 for intra-area routes
- 40 for external routes

use the commands:

```
awplus(config)# router ospf 100
awplus(config-router)# distance ospf inter-area 20 intra-area
10 external 40
```

To set the administrative distance for all routes in OSPF 100 back to the default of 110, use the commands:

```
awplus(config)# router ospf 100
awplus(config-router)# no distance ospf
```

distribute-list (OSPF)

Use this command to apply filtering to the transfer of routing information between OSPF and the IP route table. You can apply filtering in either direction, from OSPF to the IP route table using an **in** distribute-list, or from the IP route table to OSPF using an **out** distribute-list.

The effect of an **in** filter is that some route information that OSPF has learnt from LSA updates will not be installed into the IP route table. The effect of an **out** filter is that some route information that could be redistributed to OSPF will not be redistributed to OSPF. See the **Usage** section below for the distinction between the **in** and **out** distribute-lists.

The entities that are used to perform filtering are ACLs or route-maps, which match on certain attributes in the routes that are being transferred. See **Access Control Lists Introduction** and **Route Map Configuration** chapters to define ACLs and route-maps.

The **no** variant of this command removes the configured distribute-list command entry.

Syntax

```
distribute-list {<access-list-name>|route-map <route-map-name>} in
distribute-list <access-list-name> out {connected|rip|static}
no distribute-list <access-list-name> in
no distribute-list <access-list-name> out {connected|rip|static}
```

Parameter	Description
<access-list-name>	Specifies the name of the access list. The access list defines which networks are received and which are suppressed.
in	Indicates that this applies to incoming advertised routes.
out	Indicates that this applies to outgoing advertised routes.
<route-map-name>	The name of the route-map that the distribute-list applies. This defines which networks are installed in the IP route table and which networks are filtered from the IP route table.
connected	Specify the redistribution of connected routes.
rip	Specify the redistribution of RIP routes.
static	Specify the redistribution of static routes.

Mode Router Configuration

Usage There are **in** and **out** distribute-lists, which carry out different route filtering activities:

- The **in** distribute list is applied to the process of installing OSPF routes into the IP route table. The SPF calculation generate a set of routes calculated from the LSA database. By default, all of these routes become OSPF's candidate routes for inclusion into the IP route table.

- An **in** distribute-list can be used to control whether or not certain routes generated by the SPF calculation are included into the set of candidates for inclusion into the IP route table. Those routes that match **deny** entries in the distribute-list will not be considered for inclusion into the IP route table.
- The **out** distribute-list applies the process of redistributing non-OSPF routes into OSPF. If OSPF redistribution is configured, and an **out** distribute-list is also configured, then routes that match deny entries in the distribute-list will not be redistributed into OSPF.

Examples The following example shows the installation of OSPF routes into the IP route table with route map `mymap1` applied, which will process routes that have been tagged `100`:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# distribute-list route-map mymap1 in
```

Use the following commands to configure a route-map to specifically prevent OSPF from offering `192.168.1.0/24` as a candidate for inclusion into the IP route table:

```
awplus# configure terminal
awplus(config)# ip prefix-list 100 seq 5 permit
192.168.1.0/24
awplus(config)# route-map 100 deny 10
awplus(config-route-map)# match ip address prefix-list 100
awplus(config-route-map)# exit
awplus(config)# route-map 100 permit 20
awplus(config-router)# router ospf 1
awplus(config-router)# distribute-list route-map 100 in
```

Related Commands **match interface**
redistribute (OSPF)
route-map

enable db-summary-opt

This command enables OSPF database summary list optimization.

The **no** variant of this command disables database summary list optimization.

Syntax

```
enable db-summary-opt
no enable db-summary-opt
```

Default The default setting is disabled.

Mode Router Configuration

Usage When this feature is enabled, the database exchange process is optimized by removing the LSA from the database summary list for the neighbor, if the LSA instance in the database summary list is the same as, or less recent than, the listed LSA in the database description packet received from the neighbor.

Examples To enable OSPF database summary list optimization, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf
awplus(config-router)# enable db-summary-opt
```

To disable OSPF database summary list optimization, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf
awplus(config-router)# no enable db-summary-opt
```

Validation Commands **show running-config**

host area

This command configures a stub host entry belonging to a particular area. You can use this command to advertise specific host routes in the router-LSA as stub link. Since stub host belongs to the specified router, specifying cost is optional.

The **no** variant of this command removes the host area configuration.

Syntax

```
host <ip-address> area <area-id> [cost <0-65535>]
no host <ip-address> area <area-id> [cost <0-65535>]
```

Parameter	Description
<ip-address>	The IPv4 address of the host, in dotted decimal notation.
<area-id>	The OSPF area ID of the transit area that configuring the stub host entry for. Use one of the following formats: ■ dotted decimal format, e.g., 0.0.1.2. ■ normal decimal format in the range <0-4294967295>, e.g., 258.
`cost <0-65535>`	The cost for the stub host entry.

Default By default, no host entry is configured.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# host 172.16.10.100 area 1
awplus(config-router)# host 172.16.10.101 area 2 cost 10
```

ip ospf authentication

This command sets the authentication method used when sending and receiving OSPF packets on the current VLAN interface. The default is to use no authentication. If no authentication method is specified in this command, then plain text authentication will be used.

The **no** variant of this command disables the authentication.

Syntax

```
ip ospf [<ip-address>] authentication [message-digest|null]
no ip ospf [<ip-address>] authentication
```

Parameter	Description
<ip-address>	The IP address of the interface.
message-digest	Use the message digest authentication.
null	Use no authentication. It overrides password or message-digest authentication of the interface.

Mode Interface Configuration for a VLAN interface.

Usage Use the **ip ospf authentication** command on page 42.33 to specify a Simple Text password. Use the **ip ospf message-digest-key** command on page 42.40 to specify MD5 password.

Example In this example, VLAN interface `vlan2` is configured to have no authentication. This will override any text or MD5 authentication configured on this interface.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf authentication null
```

Related Commands
ip ospf authentication-key
area authentication
ip ospf message-digest-key

ip ospf authentication-key

This command specifies an OSPF authentication password for the neighboring routers.

The **no** variant of this command removes the OSPF authentication password.

Syntax

```
ip ospf [<ip-address>] authentication-key <pswd-long>
no ip ospf [<ip-address>] authentication-key
```

Parameter	Description
<ip-address>	The IPv4 address of the interface, in dotted decimal notation.
<pswd-long>	Specifies the authentication password. The string by the end of line will be used.

Default By default, an authentication password is not specified.

Mode Interface Configuration for a VLAN interface.

Usage This command creates a password (key) that is inserted into the OSPF header when AlliedWare Plus™ software originates routing protocol packets. Assign a separate password to each network for different VLAN interfaces. All neighboring routers on the same network with the same password exchange OSPF routing data.

The key can be used only when authentication is enabled for an area. Use the **area authentication** command to enable authentication.

Simple password authentication allows a password to be configured for each area. Configure the routers in the same routing domain with the same password.

Example In the following example, an authentication key test is created on VLAN interface `vlan2` in area 0. Note that first authentication is enabled for area 0.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# network 10.10.10.0/24 area 0
awplus(config-router)# area 0 authentication
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ip ospf 3.3.3.3 authentication-key test
```

Related Commands **area authentication**
ip ospf authentication

ip ospf cost

This command explicitly specifies the cost of the link-state metric in a router-LSA.

The **no** variant of this command resets the VLAN interface cost to the default.

Syntax

```
ip ospf [<ip-address>] cost <1-65535>
no ip ospf [<ip-address>] cost
```

Parameter	Description
<ip-address>	The IPv4 address of the interface, in dotted decimal notation.
<1-65535>	The link-state metric.

Default By default the reference bandwidth is 1000 Mbps, but can be set to a different value by the command, **auto-cost reference bandwidth** command on page 42.14.

Mode Interface Configuration for a VLAN interface.

Usage The interface cost indicates the overhead required to send packets across a certain VLAN interface. This cost is stated in the Router-LSA's link. Typically, the cost is inversely proportional to the bandwidth of an interface. By default, the cost of a VLAN interface is calculated according to the following formula:

reference bandwidth/interface bandwidth

To set the VLAN interface cost manually, use this command.

Example The following example shows setting ospf cost to 10 on VLAN interface `vlan25` for IP address 10.10.10.50

```
awplus# configure terminal
awplus(config)# interface vlan25
awplus(config-if)# ip ospf 10.10.10.50 cost 10
```

Related Commands

show ip ospf interface
auto-cost reference bandwidth

ip ospf database-filter

This command turns on the LSA database-filter for a particular VLAN interface.

The **no** variant of this command turns off the LSA database-filter.

Syntax

```
ip ospf [<ip-address>] database-filter all out
no ip ospf [<ip-address>] database-filter
```

Parameter	Description
<ip-address>	The IPv4 address of the interface, in dotted decimal notation.

Default By default, all outgoing LSAs are flooded to the interface.

Mode Interface Configuration for a VLAN interface.

Usage OSPF floods new LSAs over all interfaces in an area, except the interface on which the LSA arrives. This redundancy ensures robust flooding. However, too much redundancy can waste bandwidth and might lead to excessive link and CPU usage in certain topologies, resulting in destabilizing the network. To avoid this, use the **ip ospf database-filter** command to block flooding of LSAs over specified interfaces.

Example

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if# ip ospf database-filter all out
```

ip ospf dead-interval

This command sets the interval during which no hello packets are received and after which a neighbor is declared dead.

The dead-interval is the amount of time that OSPF waits to receive an OSPF hello packet from the neighbor before declaring the neighbor is down. This value is advertised in the router's hello packets. It must be a multiple of the hello-interval and be the same for all routers on a specific network.

The **no** variant of this command returns the interval to the default of 40 seconds. If you have configured this command specifying the IP address of the interface and want to remove the configuration, specify the IP address (**no ip ospf** `<ip-address>` **dead-interval**).

Syntax

```
ip ospf [<ip-address>] dead-interval <1-65535>
no ip ospf [<ip-address>] dead-interval
```

Parameter	Description
`<ip-address>`	The IPv4 address of the interface, in dotted decimal notation.
`<1-65545>`	The interval in seconds. Default: **40**

Mode Interface Configuration for a VLAN interface.

Example The following example shows configuring the dead-interval to 10 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf dead-interval 10
```

Related Commands

ip ospf hello-interval
show ip ospf interface

ip ospf disable all

This command completely disables OSPF packet processing on a VLAN interface. It overrides the **network area** command and disables the processing of packets on the specific interface.

Use the **no** variant of this command to restore OSPF packet processing on a selected interface.

Syntax

```
ip ospf disable all
no ip ospf disable all
```

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf disable all
```

ip ospf hello-interval

This command specifies the interval between hello packets.

The hello-interval is advertised in the hello packets. Configure the same hello-interval for all routers on a specific network. A shorter hello interval ensures faster detection of topological changes, but results in more routing traffic.

The **no** variant of this command returns the interval to the default of 10 seconds.

Syntax

```
ip ospf [<ip-address>] hello-interval <1-65535>
no ip ospf [<ip-address>] hello-interval
```

Parameter	Description
<ip-address>	The IP address of the interface, in dotted decimal notation.
<1-65535>	The interval in seconds. Default: **10**

Default The default interval is 10 seconds.

Mode Interface Configuration for a VLAN interface.

Example The following example shows setting the hello-interval to 3 seconds on VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf hello-interval 3
```

Related Commands

ip ospf dead-interval
show ip ospf interface

ip ospf message-digest-key

This command registers an MD5 key for OSPF MD5 authentication.

Message Digest Authentication is a cryptographic authentication. A key (password) and key-id are configured on each router. The router uses an algorithm based on the OSPF packet, the key, and the key-id to generate a ***message digest*** that gets appended to the packet.

The **no** variant of this command removes the MD5 key.

Syntax

```
ip ospf [<ip-address>] message-digest-key <key-id> md5 <pswd-long>
no ip ospf [<ip-address>] message-digest-key <key-id>
```

Parameter	Description
<ip-address>	The IPv4 address of the interface, in dotted decimal notation.
<key-id>	A key ID number specified as an integer between 1 and 255.
md5	Use the MD5 algorithm.
<pswd-long>	The OSPF password. This is a string of 1 to 16 characters including spaces.

Default By default, there is no MD5 key registered.

Mode Interface Configuration for a VLAN interface.

Usage Use this command for uninterrupted transitions between passwords. It allows you to add a new key without having to delete the existing key. While multiple keys exist, all OSPF packets will be transmitted in duplicate; one copy of the packet will be transmitted for each of the current keys. This is helpful for administrators who want to change the OSPF password without disrupting communication. The system begins a rollover process until all the neighbors have adopted the new password. This allows neighboring routers to continue communication while the network administrator is updating them with a new password. The router will stop sending duplicate packets once it detects that all of its neighbors have adopted the new password.

Maintain only one password per interface, removing the old password whenever you add a new one. This will prevent the local system from continuing to communicate with the system that is using the old password. Removing the old password also reduces overhead during rollover. All neighboring routers on the same network must have the same password value to enable exchange of OSPF routing data.

Examples The following example shows OSPF authentication on the VLAN interface `vlan5` when IP address has not been specified.

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip ospf authentication message-digest
awplus(config-if)# ip ospf message-digest-key 1 md5 yourpass
```

The following example shows configuring OSPF authentication on the VLAN interface `vlan2` for the IP address `1.1.1.1`. (If the interface has two IP addresses assigned--`1.1.1.1` & `2.2.2.2`, OSPF authentication will be enabled only for the IP address `1.1.1.1`).

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf 1.1.1.1 authentication message-
digest
awplus(config-if)# ip ospf 1.1.1.1 message-digest-key 2 md5
yourpass
```

ip ospf mtu

This command sets the MTU size for OSPF. Whenever OSPF constructs packets, it uses VLAN interface MTU size as Maximum IP packet size. This command forces OSPF to use the specified value, overriding the actual VLAN interface MTU size.

Use the **no** variant of this command to return the MTU size to the default.

Syntax

```
ip ospf mtu <576-65535>
no ip ospf mtu
```

Default By default, OSPF uses interface MTU derived from the VLAN interface.

Mode Interface Configuration for a VLAN interface.

Usage This command allows an administrator to configure the MTU size recognized by the OSPF protocol. It does not configure the MTU settings on the VLAN interface. OSPF will not recognize MTU size configuration changes made to the kernel until the MTU size is updated through the CLI.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf mtu 1480
```

ip ospf mtu-ignore

Use this command to configure OSPF so that OSPF does not check the MTU size during DD (Database Description) exchange.

Use the **no** variant of this command to make sure that OSPF checks the MTU size during DD exchange.

Syntax

```
ip ospf [<ip-address>] mtu-ignore
no ip ospf [<ip-address>] mtu-ignore
```

Parameter	Description
<ip-address>	IPv4 address of the interface, in dotted decimal notation.

Mode Interface Configuration for a VLAN interface.

Usage By default, during the DD exchange process, OSPF checks the MTU size described in the DD packets received from the neighbor. If the MTU size does not match the interface MTU, the neighbor adjacency is not established. Using this command makes OSPF ignore this check and allows establishing of adjacency regardless of MTU size in the DD packet.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf mtu-ignore
```

ip ospf network

This command configures the OSPF network type to a type different from the default for the particular VLAN interface.

The **no** variant of this command returns the network type to the default for the particular VLAN interface.

Syntax

```
ip ospf network [broadcast|non-broadcast|point-to-point|
   point-to-multipoint]

no ip ospf network
```

Parameter	Description
broadcast	Sets the network type to broadcast.
non-broadcast	Sets the network type to NBMA.
point-to-multipoint	Sets the network type to point-to-multipoint.
point-to-point	Sets the network type to point-to-point.

Default The default is the `broadcast` OSPF network type for a VLAN interface.

Mode Interface Configuration for a VLAN interface.

Usage This command forces the interface network type to the specified type. Depending on the network type, OSPF changes the behavior of the packet transmission and the link description in LSAs.

Example The following example shows setting the network type to `point-to-point` on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf network point-to-point
```

ip ospf priority

This command sets the router priority, which is a parameter used in the election of the designated router for the network.

The **no** variant of this command returns the router priority to the default of 1.

Syntax

```
ip ospf [<ip-address>] priority <priority>
no ip ospf [<ip-address>] priority
```

Parameter	Description
<ip-address>	The IP address of the interface.
<priority>	*<0-255>* Specifies the Router Priority of the interface.

Default The router priority for an interface is set to 1 by default.

Mode Interface Configuration for a VLAN interface.

Usage Set the priority to help determine the OSPF Designated Router (DR) for a network. If two routers attempt to become the DR, the router with the higher router priority becomes the DR. If the router priority is the same for two routers, the router with the higher router ID takes precedence.

Only routers with nonzero router priority values are eligible to become the designated or backup designated router.

Configure router priority for multiaccess networks only and not for point-to-point networks.

Example The following example shows setting the OSPF priority value to 3 on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf priority 3
```

Related Commands ip ospf network

ip ospf resync-timeout

Use this command to set the interval after which adjacency is reset if out-of-band resynchronization has not occurred. The interval period starts from the time a restart signal is received from a neighbor.

Use the **no** variant of this command to return to the default.

Syntax

```
ip ospf [<ip-address>] resync-timeout <1-65535>
no ip ospf [<ip-address>] resync-timeout
```

Parameter	Description
<ip-address>	The IP address of the interface.
<1-65535>	Specifies the resynchronization timeout value of the interface in seconds.

Mode Interface Configuration for a VLAN interface.

Example The following example shows setting the OSPF resynchronization timeout value to 65 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf resync-timeout 65
```

ip ospf retransmit-interval

Use this command to specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface.

Use the **no** variant of this command to return to the default of 5 seconds.

Syntax

```
ip ospf [<ip-address>] retransmit-interval <1-65535>
no ip ospf [<ip-address>] retransmit-interval
```

Parameter	Description
<ip-address>	The IP address of the interface.
<1-65535>	Specifies the interval in seconds.

Default The default interval is 5 seconds.

Mode Interface Configuration for a VLAN interface.

Usage After sending an LSA to a neighbor, the router keeps the LSA until it receives an acknowledgement. In case the router does not receive an acknowledgement during the set time (the retransmit interval value) it retransmits the LSA. Set the retransmission interval value conservatively to avoid needless retransmission. The interval should be greater than the expected round-trip delay between two routers.

Example The following example shows setting the `ospf retransmit interval` to 6 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf retransmit-interval 6
```

ip ospf transmit-delay

Use this command to set the estimated time it takes to transmit a link-state-update packet on the VLAN interface.

Use the **no** variant of this command to return to the default of 1 second.

Syntax

```
ip ospf [<ip-address>] transmit-delay <1-65535>
no ip ospf [<ip-address>] transmit-delay
```

Parameter	Description
<ip-address>	The IP address of the VLAN interface.
<1-65535>	Specifies the time, in seconds, to transmit a link-state update.

Default The default interval is 1 second.

Mode Interface Configuration for a VLAN interface.

Usage The transmit delay value adds a specified time to the age field of an update. If the delay is not added, the time in which the LSA transmits over the link is not considered. This command is especially useful for low speed links. Add transmission and propagation delays when setting the transmit delay value.

Example The following example shows setting the OSPF transmit delay time to 3 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf transmit-delay 3
```

max-concurrent-dd

Use this command to set the limit for the number of Database Descriptors (DD) that can be processed concurrently.

Use the **no** variant of this command to reset the limit for the number of Database Descriptors (DD) that can be processed concurrently.

Syntax

```
max-concurrent-dd <1-65535>
no max-concurrent-dd
```

Parameter	Description
<1-65535>	Specify the number of DD processes.

Mode Router Configuration

Usage This command is useful when a router's performance is affected from simultaneously bringing up several OSPF adjacencies. This command limits the maximum number of DD exchanges that can occur concurrently per OSPF instance, thus allowing for all of the adjacencies to come up.

Example The following example sets the max-concurrent-dd value to 4, so that only 4 DD exchanges will be processed at a time.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router# max-concurrent-dd 4
```

maximum-area

Use this command to set the maximum number of OSPF areas.

Use the **no** variant of this command to set the maximum number of OSPF areas to the default.

Syntax

```
maximum-area <1-4294967294>
no maximum-area
```

Parameter	Description
<1-4294967294>	Specify the maximum number of OSPF areas.

Default The default for the maximum number of OSPF areas is 4294967294.

Mode Router Configuration

Usage Use this command in router OSPF mode to specify the maximum number of OSPF areas.

Examples The following example sets the maximum number of OSPF areas to 2:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# maximum-area 2
```

The following example removes the maximum number of OSPF areas and resets to default:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no maximum-area
```

neighbor (OSPF)

Use this command to inform the router of other neighboring routers that are connected to the same NBMA network.

Use the **no** variant of this command to remove a configuration.

Syntax

```
neighbor <ip-address> [<cost>]{<priority>|<poll-interval>}
no neighbor <ip-address> [<cost>]{<priority>|<poll-interval>}
```

Parameter	Description
<ip-address>	Specifies the interface IP address of the neighbor.
<priority>	*priority <0-255>* Specifies the router priority value of the non-broadcast neighbor associated with the specified IP address. The default is 0. This keyword does not apply to point-to-multipoint interfaces.
<poll-interval>	*poll-interval <1-2147483647>* Dead neighbor polling interval in seconds. It is recommended to set this value much higher than the hello interval. The default is 120 seconds.
<cost>	*cost <1-65535>* Specifies the link-state metric to this neighbor.

Mode Router Configuration

Usage To configure a neighbor on an NBMA network manually, use the `neighbor` command and include one neighbor entry for each known nonbroadcast network neighbor. The IP address used in this command is the neighbor's primary IP address on the interface where that neighbor connects to the NBMA network.

The poll interval is the reduced rate at which routers continue to send hello packets, when a neighboring router has become inactive. Set the poll interval to be much larger than hello interval.

Examples This example shows a neighbor configured with a priority value, poll interval time, and cost.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# neighbor 1.2.3.4 priority 1 poll-
interval 90
awplus(config-router)# neighbor 1.2.3.4 cost 15
```

network area

Use this command to enable OSPF routing with a specified Area ID on any interfaces with IP addresses that match the specified network address.

Use the **no** variant of this command to disable OSPF routing on the interfaces.

Syntax

```
network <network-address> area <area-id>
no network <network-address> area <area-id>
```

Parameter	Description
<network-address>	{*<ip-network/m>*|*<ip-addr>* *<reverse-mask>*}
<ip-network/m>	IP address of the network, entered in the form A.B.C.D/M. Dotted decimal notation followed by a forward slash, and then the subnet mask length.
<ip-addr>	IPv4 network address, entered in the form A.B.C.D.
<reverse-mask>	Reverse mask in dotted decimal format. Note that the term reverse-mask is sometimes referred to as a Wildcard mask.
<area-id>	{*<ip-addr>*|*<0-4294967295>*}
<ip-addr>	OSPF Area ID in IPv4 address format, in the form A.B.C.D.
<0-4294967295>	OSPF Area ID as 4 octets unsigned integer value.

Default No **network area** is configured by default.

Mode Router Configuration

Usage OSPF routing can be enabled per IPv4 subnet. The network address can be defined using either the prefix length or a wild card mask. A wild card mask is comprised of consecutive `0's` as network bits and consecutive `1's` as host bits.

Examples The following commands show the use of the **network area** command with OSPF multiple instance support disabled:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# network 10.0.0.0/8 area 3
awplus(config-router)# network 10.0.0.0/8 area 1.1.1.1
```

The following commands disable OSPF routing with Area ID 3 on all interfaces:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no network 10.0.0.0/8 area3
```

ospf abr-type

Use this command to set an OSPF Area Border Router (ABR) type.

Use the **no** variant of this command to revert the ABR type to the default setting (Cisco).

Syntax

```
ospf abr-type {cisco|ibm|standard}
no ospf abr-type {cisco|ibm|standard}
```

Parameter	Description
`cisco`	Specifies an alternative ABR using Cisco implementation (RFC 3509). This is the default ABR type.
`ibm`	Specifies an alternative ABR using IBM implementation (RFC 3509).
`standard`	Specifies a standard behavior ABR (RFC 2328).

Default ABR type `Cisco`

Mode Router Configuration

Usage Specifying the ABR type allows better interoperation between different implementations. This command is specially useful in a multi-vendor environment. The different ABR types are:

- Cisco ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached to it.

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# ospf abr-type ibm
```

ospf restart grace-period

Use this command to configure the grace-period for restarting OSPF routing.

Use the **no** variant of this command to revert to the default grace-period.

Syntax

```
ospf restart grace-period <1-1800>
no ospf restart grace-period
```

Parameter	Description
<1-1800>	Specifies the grace period in seconds.

Default In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

Mode Global Configuration

Usage Use this command to enable the OSPF Graceful Restart feature and set the restart grace-period. Changes from the default restart grace-period are displayed in the running-config. The restart grace-period is not displayed in the running-config if it has been reset to the default using the **no** variant of this command.

When a master failover happens on a VCStack, the OSPF grace-period will be the longest period between the default value (180 seconds is the default OSPF grace-period) and the configured OSPF grace-period value from this command. So the configured OSPF grace-period value will not be used for a VCStack master failover if it is shorter than the default OSPF grace-period.

Example To set the OSPF restart grace-period to 250 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ospf restart grace-period 250
```

To reset the OSPF restart grace-period to the default (180 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no ospf restart grace-period
```

Validation Commands **show running-config**

Related Commands **ospf restart helper**
restart ospf graceful

ospf restart helper

Use this command to configure the **helper** behavior for the OSPF Graceful Restart feature.

Use the **no** variant of this command to revert to the default grace-period.

Syntax

```
ospf restart helper
   {max-grace-period <grace-period>|only-reload|only-upgrade}

ospf restart helper {never router-id <router-id>}

no ospf restart helper [max-grace-period]
```

Parameter	Description
`max-grace-period`	Specify help if received grace-period is less than a specified value.
<grace-period>	Maximum grace period accepted in seconds in range *<1-1800>*.
`never`	Specify the local policy to never to act as a helper for this feature.
`only-reload`	Specify help only on software reloads not software upgrades.
`only-upgrade`	Specify help only on software upgrades not software reloads.
`router-id`	Enter the router-id keyword to specify the OSPF Router ID that is never to act as a helper for the OSPF Graceful Restart feature.
<router-id>	*<A.B.C.D>* Specify the OSPF Router ID in dotted decimal format A.B.C.D

Default In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

Mode Global Configuration

Usage The **ospf restart helper** command requires at least one parameter, but you may use more than one in the same command (excluding parameter **never**).

The **no** version of this command turns off the OSPF restart helper, while the **no ospf restart helper max-grace-period** command resets the max-grace-period, rather than the helper policy itself.

Example

```
awplus# configure terminal
awplus(config)# ospf restart helper only-reload

awplus# configure terminal
awplus(config)# ospf restart helper never router-id 10.10.10.1

awplus# configure terminal
awplus(config)# no ospf restart helper max-grace-period
```

Related Commands **ospf restart grace-period**
restart ospf graceful

ospf router-id

Use this command to specify a router ID for the OSPF process.

Use the **no** variant of this command to disable this function.

Syntax

```
ospf router-id <ip-address>
no ospf router-id
```

Parameter	Description
<ip-address>	Specifies the router ID in IPv4 address format.

Mode Router Configuration

Usage Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id takes effect at the next reload or when you restart OSPF manually.

Example The following example shows a specified router ID 2.3.4.5.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# ospf router-id 2.3.4.5
```

Related Commands **show ip ospf**

overflow database

Use this command to limit the maximum number of Link State Advertisements (LSAs) that can be supported by the current OSPF instance.

Use the **no** variant of this command to have no limit on the maximum number of LSAs.

Syntax

```
overflow database <0-4294967294> {hard|soft}
no overflow database
```

Parameter	Description
<0-4294967294>	The maximum number of LSAs.
`hard`	Shutdown occurs if the number of LSAs exceeds the specified value.
`soft`	Warning message appears if the number of LSAs exceeds the specified value.

Mode Router Configuration

Usage Use **hard** with this command if a shutdown is required if the number of LSAs exceeds the specified number. Use **soft** with this command if a shutdown is not required, but a warning message is required, if the number of LSAs exceeds the specified number.

Example The following example shows setting the database overflow to 500, and a shutdown to occur, if the number of LSAs exceeds 500.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# overflow database 500 hard
```

overflow database external

Use this command to configure the size of the external database and the time the router waits before it tries to exit the overflow state.

Use the **no** variant of this command to revert to default.

Syntax

```
overflow database external <max-lsas> <recover-time>
no overflow database external
```

Parameter	Description
<max-lsas>	*<0-2147483647>* The maximum number of Link State Advertisements (LSAs). Note that this value should be the same on all routers in the AS.
<recover-time>	*<0-65535>* the number of seconds the router waits before trying to exit the database overflow state. If this parameter is 0, router exits the overflow state only after an explicit administrator command.

Mode Router Configuration

Usage Use this command to limit the number of AS-external-LSAs a router can receive, once it is in the wait state. It takes the number of seconds specified as the *<recover-time>* to recover from this state.

Example The following example shows setting the maximum number of LSAs to 5 and the time to recover from overflow state to be 3:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# overflow database external 50 3
```

passive-interface (OSPF)

Use this command to suppress the sending of Hello packets on all interfaces, or on a specified interface. If you use the **passive-interface** command without the optional parameters then **all** interfaces are put into passive mode.

Use the **no** variant of this command to allow the sending of Hello packets on all interfaces, or on the specified interface. If you use the **no** variant of this command without the optional parameters then **all** interfaces are removed from passive mode.

Syntax

```
passive-interface [<interface>][<ip-address>]
no passive-interface [<interface>][<ip-address>]
```

Parameter	Description
<interface>	The name of the interface.
<ip-address>	IP address of the interface, entered in the form A.B.C.D.

Mode Router Configuration

Usage Configure an interface to be passive if you wish its connected route to be treated as an OSPF route (rather than an AS-external route), but do not wish to actually exchange any OSPF packets via this interface.

Examples To configure passive interface mode on interface **vlan2**, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# passive-interface vlan2
```

To configure passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# passive-interface
```

To remove passive interface mode on interface **vlan2**, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# no passive-interface vlan2
```

To remove passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# no passive-interface
```

redistribute (OSPF)

Use this command to redistribute routes from other routing protocols, static routes and connected routes into an ospf routing table.

Use the **no** variant of this command to disable this function.

Syntax

```
redistribute {connected|rip|static} {metric|metric-type|route-map|
    tag}

no redistribute {connected|rip|static} {metric|metric-type|route-map|
    tag}
```

Parameter	Description
connected	Specifies that this applies to the redistribution of connected routes.
rip	Specifies that this applies to the redistribution of RIP routes.
static	Specifies that this applies to the redistribution of static routes.
metric	metric <*0-16777214*> Specifies the external metric.
metric-type	metric-type {1|2} Specifies the external metric-type.
route-map	route-map *WORD* Specifies name of the route-map.
tag	tag <*0-4294967295*> Specifies the external route tag.

Default The default metric value for routes redistributed into OSPF is 20. The metric can also be defined using the **set metric** command for a route map. Note that a metric defined using the **set metric** command for a route map overrides a metric defined with this command.

Mode Router Configuration

Usage You use this command to inject routes, learnt from other routing protocols, into the OSPF domain to generate AS-external-LSAs. If a route-map is configured by this command, then that route-map is used to control which routes are redistributed and can set metric and tag values on particular routes.

The metric, metric-type, and tag values specified on this command are applied to any redistributed routes that are not explicitly given a different metric, metric-type, or tag value by the route map.

See the section **OSPF Metrics** in the **OSPF Introduction and Configuration** chapter for more information about metrics, and about behavior when configured in route maps.

Example The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command, so routes learnt via interface vlan1 can be redistributed as type-1 external LSAs:

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute rip route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which routes are distributed from another routing protocol (such as RIP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

Validation Commands **show ip ospf database external**

Related Commands **distribute-list (OSPF)**
match interface
route-map

restart ospf graceful

Use this command to force the OSPF process to restart, and optionally set the grace-period.

Syntax

```
restart ospf graceful [grace-period <1-1800>]
```

Parameter	Description
`grace-period`	Specify the grace period.
<1-1800>	The grace period in seconds.

Default In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

Mode Privileged Exec

Usage After this command is executed, the OSPF process immediately shuts down. It notifies the system that OSPF has performed a graceful shutdown. Routes installed by OSPF are preserved until the grace-period expires.

When a **restart ospf graceful** command is issued, the OSPF configuration is reloaded from the last saved configuration. Ensure you first enter the command **copy running-config startup-config**.

When a master failover happens on a VCStack, the OSPF grace-period will be the longest period between the default value (180 seconds is the default OSPF grace-period) and the configured OSPF grace-period value from this command. So the configured OSPF grace-period value will not be used for a VCStack master failover if it is shorter than the default OSPF grace-period.

Example

```
awplus# copy running-config startup-config
awplus# restart ospf graceful grace-period 200
```

Related Commands **ospf restart grace-period**
ospf restart helper

router ospf

Use this command to enter Router Configuration mode to configure an OSPF routing process. You must specify the process ID with this command for multiple OSPF routing processes on the switch.

Use the **no** variant of this command to terminate an OSPF routing process.

Use the **no** parameter with the **process-id** parameter, to terminate and delete a specific OSPF routing process. If no **process-id** is specified on the **no** variant of this command, then all OSPF routing processes are terminated, and all OSPF configuration is removed.

Syntax

```
router ospf [<process-id>]
no router ospf [<process-id>]
```

Parameter	Description
<process-id>	A positive number from 1 to 65535, that is used to define a routing process.

Default No routing process is defined by default.

Mode Global Configuration

Usage The process ID of OSPF is an optional parameter for the **no** variant of this command only. When removing all instances of OSPF, you do not need to specify each Process ID, but when removing particular instances of OSPF you must specify each Process ID to be removed.

Example To enter Router Configuration mode to configure an existing OSPF routing process `100`, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)#
```

router-id

Use this command to specify a router ID for the OSPF process.

Use the **no** variant of this command to force OSPF to use the previous OSPF router-id behavior.

Syntax

```
router-id <ip-address>
no router-id
```

Parameter	Description
<ip-address>	Specifies the router ID in IPv4 address format.

Mode Router Configuration

Usage Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id is used at the next reload or when you restart OSPF manually.

Example The following example shows a fixed router ID 10.10.10.60

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# router-id 10.10.10.60
```

Related Commands show ip ospf

show debugging ospf

Use this command to display which OSPF debugging options are currently enabled.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show debugging ospf
```

Mode

User Exec and Privileged Exec

Example

```
awplus# show debugging ospf
```

Output

Figure 42-2: Example output from the show debugging ospf command

```
OSPF debugging status:
  OSPF packet Link State Update debugging is on
  OSPF all events debugging is on
```

show ip ospf

Use this command to display general information about all OSPF routing processes. Include the process ID parameter with this command to display information about specified instances.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip ospf
show ip ospf <process-id>
```

Parameter	Description
<process-id>	*<0-65535>* The ID of the router process for which information will be displayed. If this parameter is included, only the information for the specified routing process is displayed.

Mode User Exec and Privileged Exec

Examples To display general information about all OSPF routing processes, use the command:

```
awplus# show ip ospf
```

To display general information about OSPF routing process `100`, use the command:

```
awplus# show ip ospf 100
```

Table 42-1: Example output from the show ip ospf command

```
Route Licence: Route : Limit=0, Allocated=0, Visible=0, Internal=0
Route Licence: Breach: Current=0, Watermark=0
Routing Process "ospf 10" with ID 192.168.1.1
Process uptime is 10 hours 24 minutes
Process bound to VRF default
Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Graceful Restart
SPF schedule delay min 0.500 secs, SPF schedule delay max 50.0 secs
Refresh timer 10 secs
Number of incomming current DD exchange neighbors 0/5
Number of outgoing current DD exchange neighbors 0/5
Number of external LSA 0. Checksum 0x000000
Number of opaque AS LSA 0. Checksum 0x000000
Number of non-default external LSA 0
External LSA database is unlimited.
Number of LSA originated 0
Number of LSA received 0
Number of areas attached to this router: 2
   Area 0 (BACKBONE) (Inactive)
        Number of interfaces in this area is 0(0)
        Number of fully adjacent neighbors in this area is 0
        Area has no authentication
        SPF algorithm executed 0 times
        Number of LSA 0. Checksum 0x000000
```

Table 42-1: Example output from the show ip ospf command (cont.)

```
    Area 1 (Inactive)
        Number of interfaces in this area is 0(0)
        Number of fully adjacent neighbors in this area is 0
        Number of fully adjacent virtual neighbors through this area is 0
        Area has no authentication
        SPF algorithm executed 0 times
        Number of LSA 0. Checksum 0x000000
```

Table 42-2: Example output from the show ip ospf <process-id> command

```
Routing Process "ospf 100" with ID 10.10.11.146
Process uptime is 0 minute
Conforms to RFC2328, and RFC1583Compatibility flag is disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Refresh timer 10 secs
Number of external LSA 0. Checksum Sum 0x0
Number of non-default external LSA 0
External LSA database is unlimited.
Number of areas attached to this router: 1
   Area 1
        Number of interfaces in this area is 1(1)
        Number of fully adjacent neighbors in this area is 0
        Number of fully adjacent virtual neighbors through this area is 0
        Area has no authentication
        SPF algorithm executed 0 times
        Number of LSA 1. Checksum Sum 0x00e3e2
```

Table 42-3: Parameters in the output of the show ip ospf command

Output Parameter		Meaning
`Route Licence: Route:`	`Limit`	The maximum number of OSPF routes which may be used for forwarding.
	`Allocated`	The current total number of OSPF routes allocated in the OSPF module.
	`Visible`	The current number of OSPF routes which may be used for forwarding.
	`Internal`	The number of OSPF internal routes used for calculating paths to ASBRs.
`Number of external LSA`		The number of external link-state advertisements
`Number of opaque AS LSA`		Number of opaque link-state advertisements

Related Commands router ospf

show ip ospf border-routers

Use this command to display the ABRs and ASBRs for all OSPF instances. Include the process ID parameter with this command to view data about specified instances.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip ospf border-routers
show ip ospf <process-id> border-routers
```

Parameter	Description
<process-id>	*<0-65535>* The ID of the router process for which information will be displayed.

Mode User Exec and Privileged Exec

Output **Figure 42-3: Example output from the show ip ospf border-routers command**

```
OSPF process 1 internal Routing Table
Codes: i - Intra-area route, I - Inter-area route
i 10.15.0.1 [10] via 10.10.0.1, vlan2, ASBR, Area 0.0.0.0
i 172.16.10.1 [10] via 10.10.11.50, vlan3, ABR, ASBR, Area
0.0.0.0
```

show ip ospf database

Use this command to display a database summary for OSPF information. Include the process ID parameter with this command to display information about specified instances.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip ospf [<process-id>] database [self-originate|max-age|adv
   router <adv-router-id>]
```

Parameter	Description
<process-id>	*<0-65535>* The ID of the router process for which information will be displayed.
`self-originate`	Displays self-originated link states.
`max-age`	Displays LSAs in MaxAge list. It maintains the list of the all LSAs in the database which have reached the max-age which is 3600 seconds.
`adv-router`	Advertising Router LSA.
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.

Mode User Exec and Privileged Exec

Examples To display the ABRs and ASBRs for all OSPF instances, use the command:

```
awplus# show ip ospf border-routers
```

To display the ABRs and ASBRs for the specific OSPF instance `721`, use the command:

```
awplus# show ip ospf 721 border-routers
```

Output **Figure 42-4: Example output from the show ip ospf database command**

```
       OSPF Router process 1 with ID (10.10.11.60)
                Router Link States (Area 0.0.0.1)
Link ID         ADV Router      Age  Seq#       CkSum  Link
count
10.10.11.60     10.10.11.60       32 0x80000002 0x472b 1
       OSPF Router process 100 with ID (10.10.11.60)
                Router Link States (Area 0.0.0.0)
Link ID         ADV Router      Age  Seq#       CkSum  Link
count
10.10.11.60     10.10.11.60      219 0x80000001 0x4f5d 0
```

Example

```
awplus# show ip ospf database external 1.2.3.4 self-originate

awplus# show ip ospf database self-originate
```

Figure 42-5: Example output from the show ip ospf database self-originate command

```
       OSPF Router process 100 with ID (10.10.11.50)
                Router Link States (Area 0.0.0.1 [NSSA])
Link ID         ADV Router      Age  Seq#       CkSum  Link
count
10.10.11.50     10.10.11.50     20  0x80000007  0x65c3 2
                Area-Local Opaque-LSA (Area 0.0.0.1 [NSSA])
Link ID         ADV Router      Age  Seq#       CkSum Opaque ID
67.1.4.217      10.10.11.50     37 0x80000001  0x2129 66777
                AS-Global Opaque-LSA
Link ID         ADV Router      Age  Seq#       CkSum Opaque ID
67.1.4.217      10.10.11.50     37 0x80000001  0x2daa 66777
```

show ip ospf database asbr-summary

Use this command to display information about the Autonomous System Boundary Router (ASBR) summary LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip ospf database asbr-summary [<ip-addr>]
   [self-originate|<advrouter>]
```

Parameter	Description
<advrouter>	adv-router **<***ip-address***>**
adv-router	Displays all the LSAs of the specified router.
<ip-addr>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database asbr-summary 1.2.3.4 self-
originate

awplus# show ip ospf database asbr-summary self-originate

awplus# show ip ospf database asbr-summary 1.2.3.4 adv-router
2.3.4.5
```

show ip ospf database external

Use this command to display information about the external LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip ospf database external adv-router[<adv-router-id>]
   [self-originate|adv-router<adv-router-id>]
```

Parameter	Description
`adv-router`	Displays all the LSAs of the specified router.
`self-originate`	Displays self-originated link states.
`<adv-router-id>`	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database external 1.2.3.4 self-originate

awplus# show ip ospf database external self-originate

awplus# show ip ospf database external 1.2.3.4 adv-router
        2.3.4.5
```

Output **Figure 42-6: Example output from the show ip ospf database external self-originate command**

```
      OSPF Router process 100 with ID (10.10.11.50)
                AS External Link States
LS age: 298
Options: 0x2 (*|-|-|-|-|-|E|-)
LS Type: AS-external-LSA
Link State ID: 10.10.100.0 (External Network Number)
Advertising Router: 10.10.11.50
LS Seq Number: 80000001
Checksum: 0x7033
Length: 36
Network Mask: /24
      Metric Type: 2 (Larger than any link state path)
      TOS: 0
      Metric: 20
      Forward Address: 10.10.11.50
      External Route Tag: 0
```

Output

Figure 42-7: Example output from the show ip ospf database external adv-router command

```
awplus#show ip ospf database external adv-router 1.1.1.1

                  AS External Link States
LS age: 273
Options: 0x2 (-|-|-|-|-|-|E|-)
LS Type: AS-external-LSA
Link State ID: 172.16.0.0 (External Network Number)
Advertising Router: 1.1.1.1
LS Seq Number: 80000004
Checksum: 0x02f8
Length: 36
Network Mask: /24
      Metric Type: 2 (Larger than any link state path)
      TOS: 0
      Metric: 20
      Forward Address: 0.0.0.0
      External Route Tag: 0
```

show ip ospf database network

Use this command to display information about the network LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip ospf database network [<adv-router-id>]
   [self-originate|<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address.
`self-originate`	Displays self-originated link states.
`adv-router`	Displays all the LSAs of the specified router.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database network 1.2.3.4 self-originate

awplus# show ip ospf database network self-originate

awplus# show ip ospf database network 1.2.3.4 adv-router
        2.3.4.5
```

Output **Figure 42-8: Example output from the show ip ospf database network command**

```
      OSPF Router process 200 with ID (192.30.30.2)
              Net Link States (Area 0.0.0.0)
LS age: 1387

```

show ip ospf database nssa-external

Use this command to display information about the NSSA external LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip ospf database nssa-external [<ip-address>]
   [self-originate|<advrouter>]
```

Parameter	Description
<advrouter>	`adv-router` **<***ip-address***>**
`adv-router`	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
`self-originate`	Displays self-originated link states.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database nssa-external 1.2.3.4
       self-originate

awplus# show ip ospf database nssa-external self-originate

awplus# show ip ospf database nssa-external 1.2.3.4
       adv-router 2.3.4.5
```

Output

Figure 42-10: Example output from the show ip ospf database nssa-external adv-router command

```
      OSPF Router process 100 with ID (10.10.11.50)
               NSSA-external Link States (Area 0.0.0.0)
               NSSA-external Link States (Area 0.0.0.1 [NSSA])
 LS age: 78
 Options: 0x0 (*|-|-|-|-|-|-|-)

```

show ip ospf database opaque-area

Use this command to display information about the area-local (link state type 10) scope LSAs. Type-10 Opaque LSAs are not flooded beyond the borders of their associated area.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip ospf database opaque-area [<ip-address>]
   [self-originate|<advrouter>]
```

Parameter	Description
<advrouter>	adv-router **<***ip-address***>**
adv-router	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database opaque-area 1.2.3.4 self-
originate

awplus# show ip ospf database opaque-area self-originate

awplus# show ip ospf database opaque-area 1.2.3.4 adv-router
2.3.4.5
```

Output **Figure 42-11: Example output from the show ip ospf database opaque-area command**

```
      OSPF Router process 100 with ID (10.10.11.50)
                Area-Local Opaque-LSA (Area 0.0.0.0)
LS age: 262
Options: 0x2 (*|-|-|-|-|-|E|-)
LS Type: Area-Local Opaque-LSA
Link State ID: 10.0.25.176 (Area-Local Opaque-Type/ID)
Opaque Type: 10
Opaque ID: 6576
Advertising Router: 10.10.11.50
LS Seq Number: 80000001
Checksum: 0xb413
Length: 26
```

show ip ospf database opaque-as

Use this command to display information about the link-state type 11 LSAs. This type of link-state denotes that the LSA is flooded throughout the Autonomous System (AS).

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip ospf database opaque-as [<ip-address>]
   [self-originate|<advrouter>]
```

Parameter	Description
<advrouter>	adv-router **<***ip-address***>**
adv-router	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database opaque-as 1.2.3.4 self-
        originate

awplus# show ip ospf database opaque-as self-originate

awplus# show ip ospf database opaque-as 1.2.3.4 adv-router
        2.3.4.5
```

Output **Figure 42-12: Example output from the show ip ospf database opaque-as command**

```
       OSPF Router process 100 with ID (10.10.11.50)
              AS-Global Opaque-LSA
  LS age: 325
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: AS-external Opaque-LSA
  Link State ID: 11.10.9.23 (AS-external Opaque-Type/ID)
  Opaque Type: 11
  Opaque ID: 657687
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0xb018
  Length: 25
```

show ip ospf database opaque-link

Use this command to display information about the link-state type 9 LSAs. This type denotes a link-local scope. The LSAs are not flooded beyond the local network.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip ospf database opaque-link [<ip-address>]
   [self-originate|<advrouter>]
```

Parameter	Description
<advrouter>	adv-router **<***ip-address***>**
adv-router	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database opaque-link 1.2.3.4 self-
        originate

awplus# show ip ospf database opaque-link self-originate

awplus# show ip ospf database opaque-link 1.2.3.4 adv-router
        2.3.4.5
```

Output **Figure 42-13: Example output from the show ip ospf database opaque-link command**

```
       OSPF Router process 100 with ID (10.10.11.50)
                Link-Local Opaque-LSA (Link hme0:10.10.10.50)
  LS age: 276
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: Link-Local Opaque-LSA
  Link State ID: 10.0.220.247 (Link-Local Opaque-Type/ID)
  Opaque Type: 10
  Opaque ID: 56567
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0x744e
  Length: 26
                Link-Local Opaque-LSA (Link hme1:10.10.11.50)
```

show ip ospf database router

Use this command to display information only about the router LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip ospf database router [<adv-router-id> self-originate|<adv-
    router-id>]
```

Parameter	Description
`adv-router`	Displays all the LSAs of the specified router.
`self-originate`	Displays self-originated link states.
`<adv-router-id>`	The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database router 1.2.3.4 self-originate

awplus# show ip ospf database router self-originate

awplus# show ip ospf database router 1.2.3.4 adv-router
        2.3.4.5
```

Output **Figure 42-14: Example output from the show ip ospf database router command**

```
      OSPF Router process 100 with ID (10.10.11.50)
                Router Link States (Area 0.0.0.0)
LS age: 878
Options: 0x2 (*|-|-|-|-|-|E|-)
Flags: 0x3 : ABR ASBR

```

show ip ospf database summary

Use this command to display information about the summary LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip ospf database summary [<ip-address>]
   [self-originate|<advrouter>]
```

Parameter	Description
<advrouter>	adv-router **<***ip-address***>**
adv-router	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database summary 1.2.3.4 self-originate

awplus# show ip ospf database summary self-originate

awplus# show ip ospf database summary 1.2.3.4 adv-router
        2.3.4.5
```

Output **Figure 42-15: Example output from the show ip ospf database summary command**

```
      OSPF Router process 100 with ID (10.10.11.50)
                Summary Link States (Area 0.0.0.0)

```

show ip ospf interface

Use this command to display interface information for OSPF.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ip ospf interface [<interface-name>]`

Parameter	Description
<interface-name>	The VLAN name, for example vlan3.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf interface vlan2
```

Output **Figure 42-18: Example output from the show ip ospf interface command**

```
vlan2 is up, line protocol is up
  Internet Address 1.1.1.1/24, Area 0.0.0.0, MTU 1500
  Process ID 0, Router ID 33.33.33.33, Network Type BROADCAST, Cost: 10
  Transmit Delay is 1 sec, State Waiting, Priority 1, TE Metric 0
  No designated router on this network
  No backup designated router on this network
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    Hello due in 00:00:02
  Neighbor Count is 0, Adjacent neighbor count is 0
  Crypt Sequence Number is 1106347721
  Hello received 0 sent 1, DD received 0 sent 0
  LS-Req received 0 sent 0, LS-Upd received 0 sent 0
  LS-Ack received 0 sent 0, Discarded 0
```

show ip ospf neighbor

Use this command to display information on OSPF neighbors. Include the **ospf-id** parameter with this command to display information about specified instances.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip ospf [<ospf-id>] neighbor <neighbor-ip-addr> [detail]
show ip ospf [<ospf-id>] neighbor detail [all]
show ip ospf [<ospf-id>] neighbor [all]
show ip ospf [<ospf-id>] neighbor interface <ip-addr>
```

Parameter	Description
<ospf-id>	<0-65535> The ID of the router process for which information will be displayed.
<neighbor-ip-addr>	The Neighbor ID, entered as an IP address.
all	Include downstatus neighbor.
detail	Detail of all neighbors.
<ip-addr>	IP address of the interface.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf neighbor detail
awplus# show ip ospf neighbor 1.2.3.4
awplus# show ip ospf neighbor interface 10.10.10.50 detail
       all
```

Output Note that before a device enters OSPF Graceful Restart it first informs its OSPF neighbors. In the **show** output, the * symbol beside the **Dead Time** parameter indicates that the switch has been notified of a neighbor entering the graceful restart state, as shown in **Figure 42-20**.

Figure 42-19: Example output from the show ip ospf neighbor command

```
OSPF process 1:

   Thread Link State Update Retransmission on
```

show ip ospf route

Use this command to display the OSPF routing table. Include the `process ID` parameter with this command to display the OSPF routing table for specified instances.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ip ospf [<ospf-id>] route`

Parameter	Description
<ospf-id>	<0-65535> The ID of the router process for which information will be displayed. If this parameter is included, only the information for this specified routing process is displayed.

Mode User Exec and Privileged Exec

Examples To display the OSPF routing table, use the command:

```
awplus# show ip ospf route
```

Output **Figure 42-22: Example output from the show ip ospf route command for a specific process**

```
OSPF process 1:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
O  10.10.0.0/24 [10] is directly connected, vlan1, Area 0.0.0.0
O  10.10.11.0/24 [10] is directly connected, vlan2, Area 0.0.0.0
O  10.10.11.100/32 [10] is directly connected, lo, Area 0.0.0.0
E2 10.15.0.0/24 [10/50] via 10.10.0.1, vlan1
IA 172.16.10.0/24 [30] via 10.10.11.50, vlan2, Area 0.0.0.0
E2 192.168.0.0/16 [10/20] via 10.10.11.50, vlan2
```

show ip ospf virtual-links

Use this command to display virtual link information.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip ospf virtual-links
```

Mode

User Exec and Privileged Exec

Examples

To display virtual link information, use the command:

```
awplus# show ip ospf virtual-links
```

Output

Figure 42-23: Example output from the show ip ospf virtual-links command

```
Virtual Link VLINK0 to router 10.10.0.9 is up
  Transit area 0.0.0.1 via interface vlan5
  Transmit Delay is 1 sec, State Point-To-Point,
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
    Hello due in 00:00:02
    Adjacency state Full
Virtual Link VLINK1 to router 10.10.0.123 is down
  Transit area 0.0.0.1 via interface *
  Transmit Delay is 1 sec, State Down,
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
    Hello due in inactive
    Adjacency state Down
```

show ip protocols ospf

Use this command to display OSPF process parameters and statistics.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ip protocols ospf`

Mode User Exec and Privileged Exec

Examples To display OSPF process parameters and statistics, use the command:

```
awplus# show ip protocols ospf
```

Output **Figure 42-24: Example output from the show ip protocols ospf command**

```
Routing Protocol is "ospf 200"
  Invalid after 0 seconds, hold down 0, flushed after 0
  Outgoing update filter list for all interfaces is
    Redistributed kernel filtered by filter1
  Incoming update filter list for all interfaces is
  Redistributing: kernel
  Routing for Networks:
    192.30.30.0/24
    192.40.40.0/24
  Routing Information Sources:
    Gateway         Distance      Last Update
  Distance: (default is 110)
    Address         Mask            Distance List
```

summary-address

Use this command to summarize, or possibly suppress, external routes that have the specified address range.

Use the **no** variant of this command to stop summarizing, or suppressing, external routes that have the specified address range.

Syntax

```
summary-address <ip-addr/prefix-length> [not-advertise]
    [tag <0-4294967295>]

no summary-address <ip-addr/prefix-length> [not-advertise]
    [tag <0-4294967295>]
```

Parameter	Description
<ip-addr/prefix-length>	Specifies the base IP address of the summary address.The range of addresses given as IPv4 starting address and a prefix length.
`not-advertise`	Set the **not-advertise** option if you do not want OSPF to advertise either the summary address or the individual networks within the range of the summary address.
`tag <0-4294967295>`	The tag parameter specifies the tag value that OSPF places in the AS external LSAs created as a result of redistributing the summary route. The tag overrides tags set by the original route.

Default The default tag value for a summary address is 0.

Mode Router Configuration

Usage An address range is a pairing of an address and a mask that is almost the same as IP network number. For example, if the specified address range is 192.168.0.0/255.255.240.0, it matches: 192.168.1.0/24, 192.168.4.0/22, 192.168.8.128/25 and so on.

Redistributing routes from other protocols into OSPF requires the router to advertise each route individually in an external LSA. Use the `summary address` command to advertise one summary route for all redistributed routes covered by a specified network address and mask. This helps decrease the size of the OSPF link state database.

Ensure OSPF routes exist in the summary address range for advertisement before using this command.

Example The following example uses the `summary-address` command to aggregate external LSAs that match the network 172.16.0.0/16 and assign a Tag value of 3.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# summary-address 172.16.0.0/16 tag 3
```

timers spf exp

Use this command to adjust route calculation timers using exponential back-off delays.

Use **no** form of this command to return to the default exponential back-off timer values.

Syntax

```
timers spf exp <min-holdtime> <max-holdtime>
no timers spf exp
```

Parameter	Description
<min-holdtime>	*<0-2147483647>* Specifies the minimum delay between receiving a change to the SPF calculation in milliseconds. The default SPF min-holdtime value is 50 milliseconds.
<max-holdtime>	*<0-2147483647>* Specifies the maximum delay between receiving a change to the SPF calculation in milliseconds. The default SPF max-holdtime value is 50 seconds.

Mode Router Configuration

Default The default SPF min-holdtime is 50 milliseconds. The default SPF max-holdtime is 40 seconds.

Usage This command configures the minimum and maximum delay time between the receipt of a topology change and the calculation of the Shortest Path First (SPF).

Examples To set the minimum delay time to 5 milliseconds and maximum delay time to 10 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# timers spf exp 5 10
```

To reset the minimum and maximum delay times to the default values, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no timers spf exp
```

Related Commands timers spf exp

Chapter 43: OSPFv3 for IPv6 Introduction and Configuration

OSPFv3 Introduction

This chapter introduces OSPFv3 followed by basic configuration examples. OSPFv3 is documented in RFC 2740 and is in essence OSPFv2 with changes and additions necessary for OSPF's operation within an IPv6 network. This introduction focuses on the differences between the two protocol versions, rather than to re-introduce OSPF as a routing method. See the chapter, **Chapter 41, OSPF Introduction and Configuration** for an introductory overview of OSPF on AlliedWare Plus™ switches.

To see details on the OSPF commands used in the examples, refer to the chapter, **Chapter 44, OSPFv3 for IPv6 Commands**.

Features

Not version-specific

Open Shortest Path First (OSPF) is an Interior Gateway Routing Protocol, based on Shortest Path First (SPF) or link-state technology. OSPF is defined in RFCs 1245–1247, 1253 and 1583. The protocol was designed specifically for the TCP/IP Internet environment, and supports the following features:

- Authentication of routing updates - authentication for OSPFv3 is achieved using IPsec AH and IPsec ESP header capabilities available in the IPv6 protocol.
- Tagging of externally-derived routes.
- Fast response to topology changes with low overhead.
- Load sharing over meshed links.

Specific to OSPFv3

The specific features and enhancements of OSPFv3 are introduced to enable OSPF to run over IPv6 networks. These aspects are covered later in this chapter.

Licensing

OSPF is a licensed feature, and can be obtained either with a "**Base License**" or a "**Full License.**" The table below shows the basic licensing structure for running OSPFv3. Note that licensing structures can vary with sales regions. We therefore recommend that you discuss your licensing options with your local Allied Telesis distributor or reseller.

OSPF Version	Base License	Full License
OSPFv3	Not bundled as part of the AlliedWare Plus release, but is separately available as a basic license pack that will support up to 64 routes.	Purchased separately. There is no licensed route limit, but route numbers are limited by switch specifications. See your switch's Datasheet for details.

Routing Overview

The basic function of a routing protocol is to establish the best path for packets to travel in order to reach their destination. The method of establishing the best path can be based on various different network measurements, such as the hop-count, bandwidth, or delay that a particular path may present, or could be based on static routes that are manually entered. This information is then fed into a mathematical algorithm such as those invented by Belman-Ford (for RIP), or Dijkstra (for OSPF), in order to calculate a best path to the destination.

A very brief overview of OSPF's general principles and components is presented in this chapter. For a further explanation refer to **Chapter 41, OSPF Introduction and Configuration**.

OSPF Components

Autonomous Systems

Routers combine to form Autonomous Systems (AS) that share a common management and protocol suite. Each router within an area has an identical database, which contains components that describe other routers, their paths and states.

Routing Areas

OSPF allows the grouping of networks into a set, called an **Area**. The internal topology of an area is hidden from the rest of the AS. This technique minimizes the routing traffic required for the protocol. When multiple areas are used, each area has its own copy of the topological database. Routing can be between areas (inter-area routing) or within areas (intra-area routing). A backbone area forms the central path between all other areas. A router that forms a connection between an area and the backbone is known as an area border router.

Relationships Between Routers

Neighbors and Adjacencies

By transmitting hello messages, routers that share a common physical connection initially form neighbor relationships. Neighbors that meet a common set of configuration factors can then form adjacent relationships through which they can exchange topological information.

Designated Router

On broadcast multi-access networks, one of the routers becomes a **designated router**. By issuing its link state advertisements, the designated router maintains adjacencies with all the routers within a broadcast domain. The designated router therefore coordinates and synchronizes the topological databases for all routers on the link.

The designated router is selected through the exchange of hello packets. The router transmitting the highest priority number will be elected the designated router. Where a tie exists, selection will be based on the highest transmitted router ID.

Backup Designated Router

For network efficiency and resiliency, the routers also elect a backup designated router, which is able to act as the designated router in the event of failure of the designated router.

OSPFv3 Packet Types

The OSPF protocol contains five basic packet types for its messages. The OSPFv3 protocol retains these basic types, although the structure of some of them has changed slightly. The basic message packet types are:

- hello packet
- database description packet
- link state request packet
- link state update packet
- link state acknowledgment packet

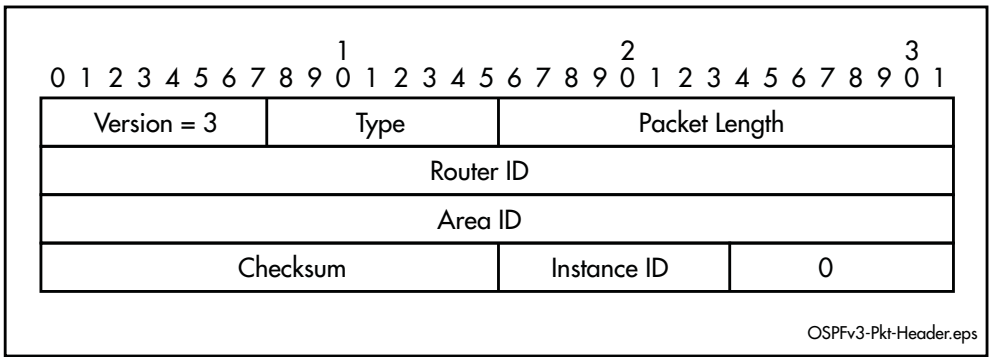
Also note that at the IP packet level, protocol number 89, previously assigned to OSPFv2 is now shared by both OSPFv2 and OSPFv3. These are the values contained within the protocol field of the IPv4 packets, and the Next Header field of IPv6 packets.

The five OSPFv3 message types are now described in greater detail.

OSPFv3 packet header

All OSPFv3 packets carry the common header component shown in **Figure 43-1**.

Figure 43-1: OSPFv3 common packet header



Because this packet component forms a common prefix for all the OSPFv3 packets, its components are expanded in greater detail than for the specific packet types that follow. **Table 43-1** shows the meaning of each field within the common header component.

Table 43-1: OSPFv3 common packet header components

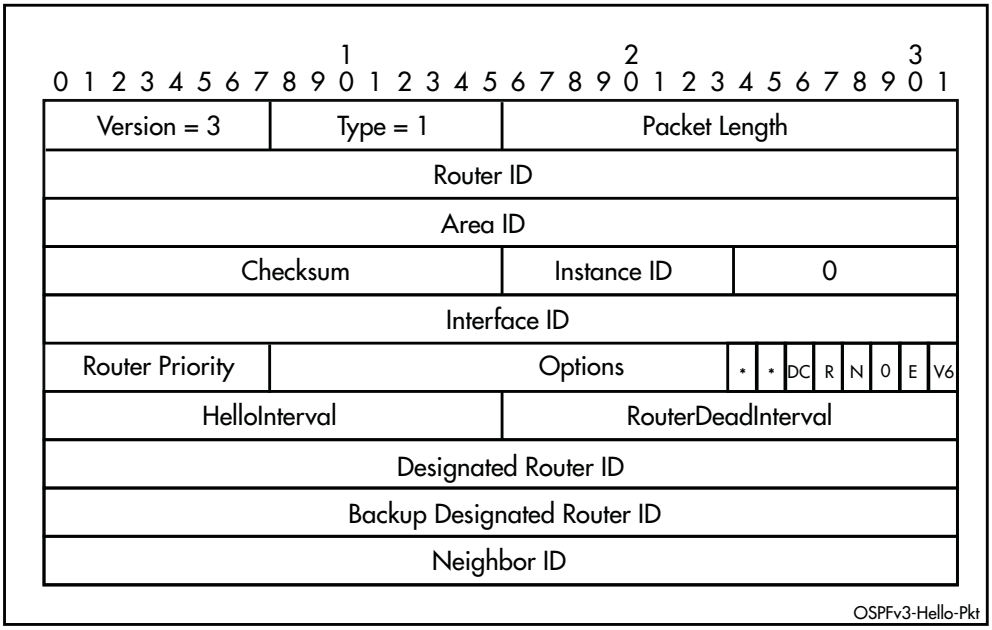
Packet Field	Purpose
Version	Denotes the OSPF version, i.e. 2 for OSPFv2, and 3 for OSPFv3.
Type	Denotes the packet type: « 1 = Hello packet « 2 = Database Description packet « 3 = Link State Request « 4 = Link State Update « 5 = Link State Acknowledgment
Packet Length	The packet length, in bytes, including the standard OSPFv3 header.
Router ID	The ID of the transmitting router.
Area ID	A 32 bit number that identifies the (single) area to which the packet belongs.
Checksum	The standard IPv6 packet checksum.
Instance ID	OSPFv3 is capable of running multiple OSPF instances over a single link. Each Instance is identified by its Instance ID. Note that the Instance ID is only of local (link) significance. Also note that the term “instance” is sometimes used in a totally different context in referring to specific LSA element components.
0	Reserved and normally set to 0.

Hello message packet

These messages are sent on all links. Their function is to establish and maintain neighbor relationships between routers.

Figure 43-2 shows the structure and content of the Hello packet. It follows the same basic format as the OSPFv2 hello packet, but without the Authentication or Network Mask fields, and with an additional field for the Instance ID.

Figure 43-2: OSPFv3 hello message type

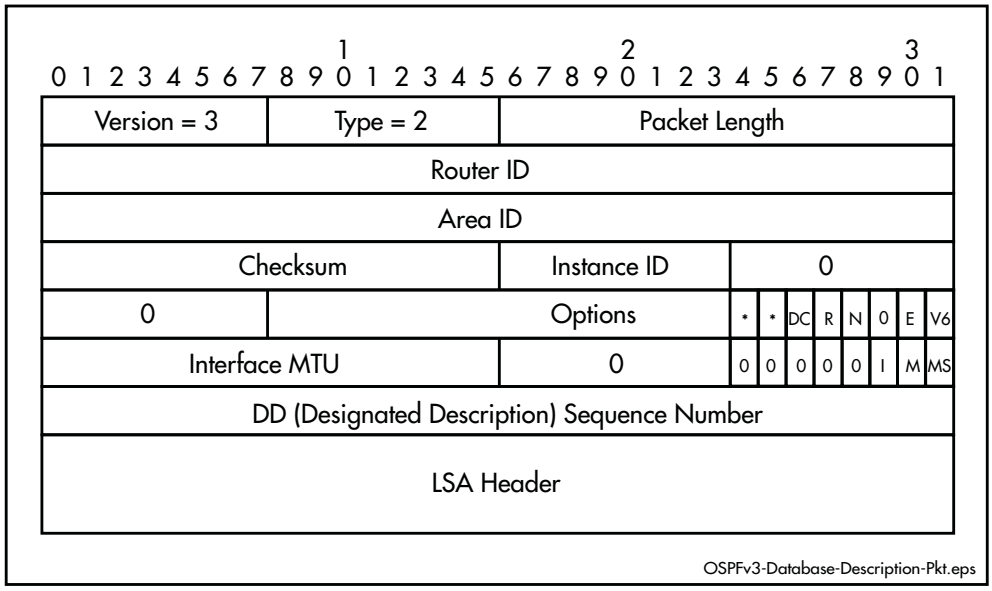


Database description packet

These packet types are exchanged as router adjacencies are established. They contain descriptions that define the link-state.

Figure 43-3 shows the structure and content of the database description packet. It follows the same basic format as that used for OSPFv2, but without the Authentication or Network Mask fields, and with an additional field for the Instance ID.

Figure 43-3: OSPFv3 database description packet

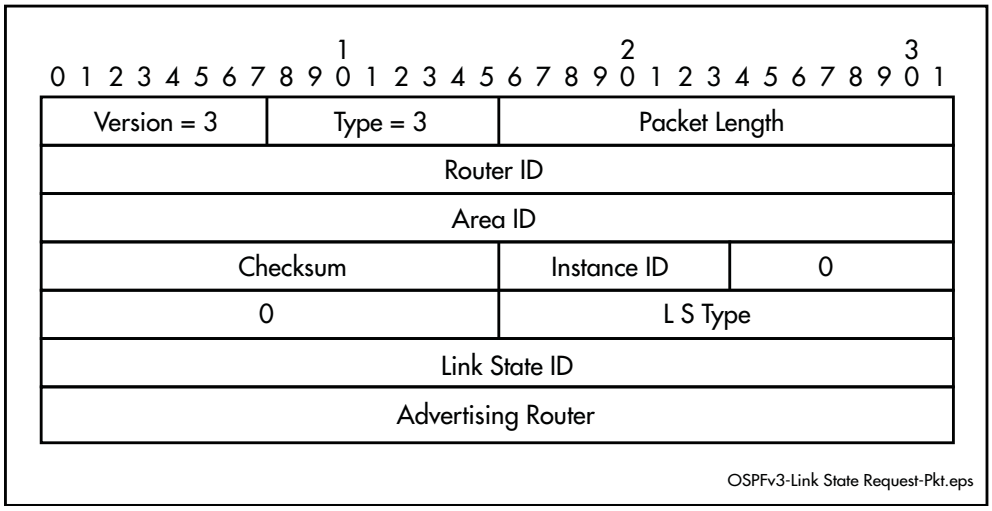


Link state request packet

Routers use these packets to request transmissions of specific portions (instances) of the Link State database, usually to replace out-of-date components. The requesting router knows exactly which database components it requires, based on their link state ID, sequence number, age, and checksum.

Figure 43-4 shows the structure and content of the a link state request packet. It follows the same basic format as that used for OSPFv2, but without the AuType, Authentication and network-mask fields, and with an additional field for the Instance ID.

Figure 43-4: OSPFv3 link-state request packet

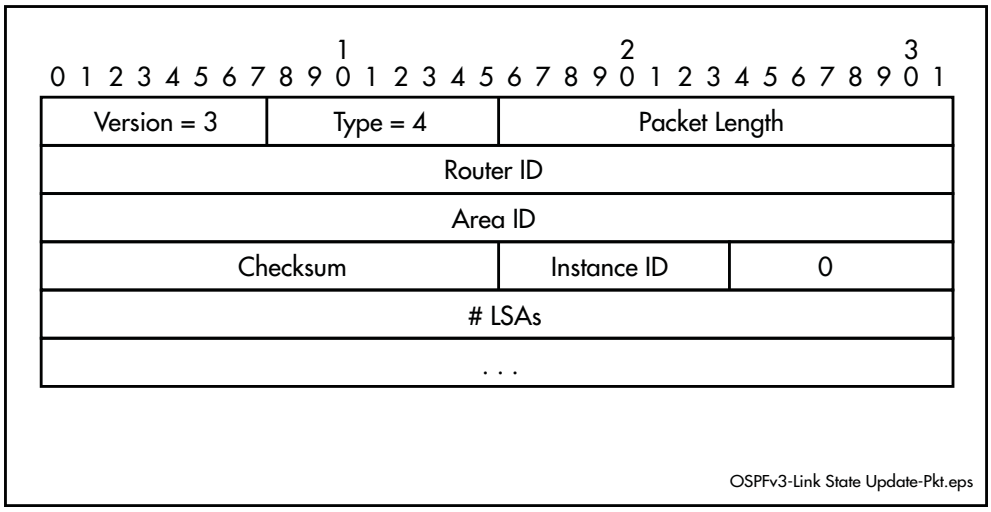


Link state update packet

These packet types are used to implement LSA flooding. They carry LSA information between a router and its immediate neighbors, often in response to link state requests.

Figure 43-5 shows the structure and content of the link state update packet. It follows the same basic format as that used for OSPFv2, but without the Authentication or Network-Mask fields, and with an additional field for the Instance ID.

Figure 43-5: OSPFv3 link-state update packet

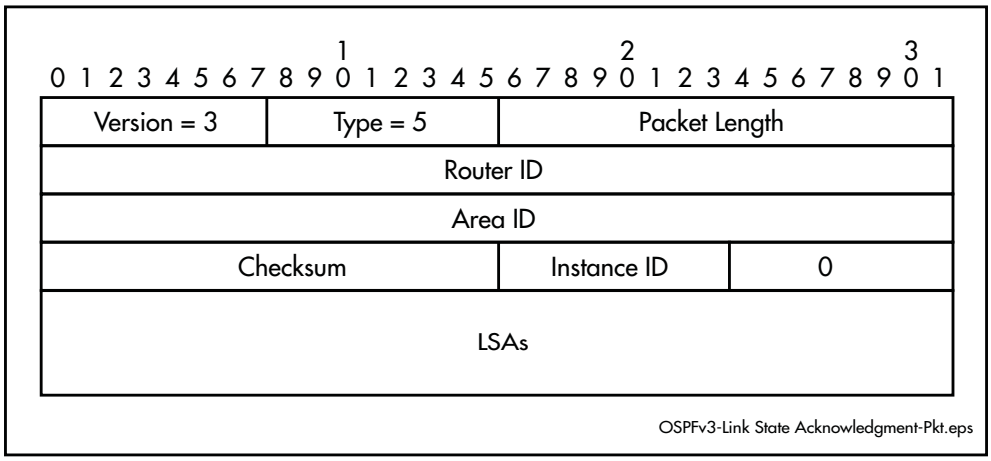


Link state acknowledgment packet

These multicast packet types are used to provide explicit acknowledgment of flooded LSAs. If a router transmits a link-state update, but does not receive acknowledgments from all neighbors, it will continue to retransmit the link state update until all neighbors have acknowledged it. This constitutes the guaranteed delivery mechanism within OSPF. A single packet can acknowledge multiple LSAs.

Figure 43-6 shows the structure and content of the link state acknowledgment packet. It follows the same basic format as that used for OSPFv2, but without the Authentication or Network Mask fields, and with an additional field for the Instance ID.

Figure 43-6: OSPFv3 link state acknowledgment packet



Link State Advertisements (LSAs)

Link state advertisements (LSAs) are records in the topological database. Nine different types of link state advertisements exist, see **Table 43-2**. Only the common header components are documented. A description of the LSAs themselves is outside the scope of this document.

Link state advertisements age to a maximum (MaxAge) of 3600 seconds, which limits their storage period in the topological database. When a link state advertisement reaches MaxAge, the router tries to flush it from the routing domain by reflooding the advertisement. A link state advertisement that has reached MaxAge is not used in further routing table calculations.

LSA types

Table 43-2 shows the LSA types supported by OSPFv3. Each type of link state advertisement describes a different set of features of the Autonomous System (AS).

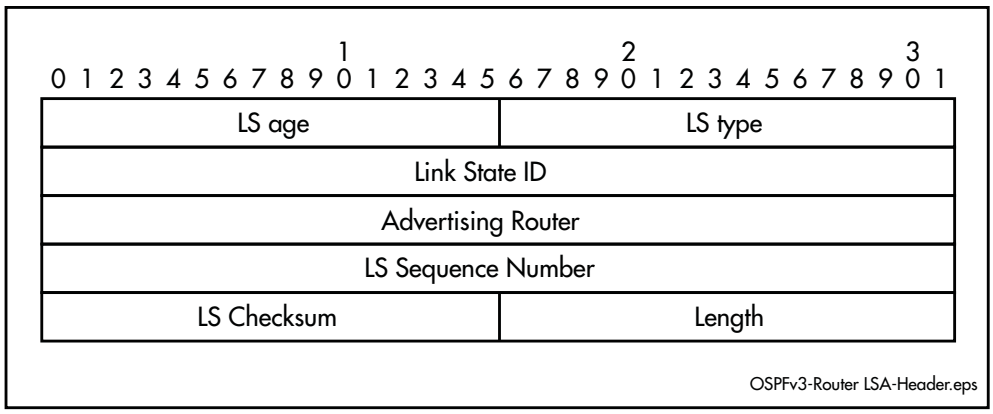
Table 43-2: OSPFv3 LSA header types

LSA Function Code	LS Type	Description
1	0x2001	Router LSA
2	0x2002	Network LSA
3	0x2003	Inter-Area-Prefix-LSA
4	0x2004	Inter-Area-Router-LSA
5	0x4005	AS-External-LSA
6	0x2006	Deprecated (may be reassigned)
7	0x2007	NSSA-LSA
8	0x0008	Link-LSA
9	0x2009	Intra-Area-Prefix-LSA
11	0x000b	Grace-LSA

LSA Header

Figure 43-7 shows the structure and content of the 20 byte header that is common to all OSPFv3 Link State Advertisements (LSAs). This header provides sufficient information to identify the link state type, its ID, and its advertising router.

Figure 43-7: OSPFv3 LSA header



OSPFv3 States

The following table describes the eight states that routers can pass through as they establish their neighbor relationships.

Table 43-3: OSPF states

Packet Type	Purpose
Down	This is the initial state. No hello packets have been received from the neighbor recently, or at all.
Attempt	This state applies to non-broadcast multi-access networks. The router is making a determined attempt to contact a statically configured neighbor. Hello packets are sent every hello interval.
Init	A hello packet has been seen from the neighbor, however the hello packet does not list the router as known.
2-Way	This state is entered when the communication between two neighbors is bidirectional (the hello packet from the neighbor lists this router as a neighbor).
ExStart	This is the first step in creating an adjacency between two routers. The two routers decide which is going to control the exchange between them.
Exchange	In this state, the neighbors exchange database description packets. Each packet summarizes the link state advertisements held by that router.
Loading	After all the database description information has been exchanged, the routers exchange link state advertisements required to update or complete each router's topological database, thereby synchronizing the two routers' databases.
Full	This is the final state, and the adjacency is complete. Reaching this state in itself may cause new instances of some link state advertisements, such as the network and router advertisements related to the two routers.

OSPFv3 Metrics

The metrics used by OSPF are not simple distance metrics, such as used by RIP for example, but are measurements of the path bandwidth. Interface metrics are normally set using the formula 10^8 / interface speed (in bps). This gives metrics such as 1 for a 100 Mbps Ethernet interface, and 1562 for a 64 kbps serial line.

When no metric is defined, the default metric for routes redistributed into OSPF is 20. You can define the metric using the **redistribute (IPv6 OSPF)** command.

You can also define the metric using the **set metric** command for a route map. If a route map is configured, but no OSPF metric is defined using a **redistribute (IPv6 OSPF)** command, then a default metric of 20 is used. If a route map is configured and the metric is defined using the **set metric** command, this supersedes a metric defined using the **redistribute (IPv6 OSPF)** command.

How to set the OSPFv3 metric when redistributing routes

You can determine the OSPFv3 metric using the following methods:

- use the default OSPFv3 metric, which is 20.
- change it using the **metric** parameter of the **redistribute (IPv6 OSPF)** command

The following example sets the metric to `5` for `connected` redistributed routes:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# redistribute connected metric 5
```

- change it using the **metric-value** parameter of the **set metric** command for a route map

Note that changing the metric using a route map supersedes the metric defined using the **redistribute (IPv6 OSPF)** command. The following example for entry `3` of the route map called `rmap1` give matching routes a metric of `5`::

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric 5
```

Automatic Cost Calculation

OSPF interfaces can automatically set the OSPF metric of an IP interface based on its bandwidth, instead of the system administrator having to manually set the OSPF metric. Automatic setting takes into account that the speed of an interface can change over time, when ports change link state or change speed via auto-negotiation or manual setting. If metrics are manually set, some interfaces are preferred when they should be changing to match dynamically changing network configurations.

Network Types

OSPF treats the networks attached to OSPF interfaces as one of the following network types, depending on the physical media:

- broadcast
- non-broadcast multi-access (NBMA)
- point-to-point
- point-to-multipoint
- virtual

By default, Ethernet networks are treated as broadcast networks. You can use the **ip ospf network** command on page 42.43 to configure a VLAN interface to be a different network type. Configure a VLAN or Ethernet interface as an Non-Broadcast Multi-Access (NBMA) interface when:

- some devices on the network do not support multicast addressing.
- you want to select which devices on the network are to become OSPF neighbors, rather than allow all the devices on the network to become OSPF neighbors.

Passive Interfaces

A passive interface does not take part in normal OSPF interface operations:

- OSPF does not transmit or receive Hello messages via the interface.
- The interface does not experience interface state transitions.
- OSPF does not associate neighbors with the interface.

If the interface is up, OSPF adds the network that is attached to the interface, as a stub network to the router LSA of the area in which the interface resides.

Examples To configure the passive interface mode on interface vlan2, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# passive-interface vlan2
```

To configure the passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# passive-interface
```

Redistributing External Routes

OSPFv3 can import and redistribute RIP, non-OSPF interface, and statically configured routes. It can also optionally assign the following settings to all routes it imports:

- a route metric
- the External metric type

Alternatively, you can assign a route map to select particular routes and set their route parameters. A route map can also filter out a subset of routes, so you do not have to import all routes.

The import settings also allow you to select whether to redistribute subnets (classless network routes), or only classful network routes.

To import and redistribute external routes into OSPF, create a route redistribution definition for the source routing protocol, using the **redistribute (IPv6 OSPF)** command on page 44.50.

Differences between OSPFv2 and OSPFv3

Whilst the fundamental principles of OSPFv2 are maintained from those standardized for OSPF with IPv6 (OSPFv3), the following items, listed below, represent the major areas that are applied differently for OSPFv3. For more detail refer to RFC 2740 (OSPF for IPv6).

- Protocol processing applied per-link rather than per-subnet
- Removed address semantics
- Neighbors are identified by Router ID
- New link-local flooding scope for link state advertisements
- Uses link-local addresses
- Support provided for multiple instances per link
- OSPF-specific authentication has been removed
- Unknown LSAs are handled more effectively
- Authentication relies on IPsec features within the IPv6 protocol, rather than integrate authorization within the OSPF protocol itself (as is done for OSPFv2).
- Modified packet types
- Modified LSA types

The following sections expand on these points.

Protocol processing applied per-link rather than per-subnet

OSPFv3 nodes use links to communicate at the link layer. You can also assign multiple subnets, and multiple IPv6 addresses, to a single link. In addition, two nodes can be assigned to and communicate over the same link without having to share the same subnet.

Thus the term **link** can be compared with the OSPFv2 terms **network** and **subnet.** This change has resulted in changes within the Hello packets and Network Link State Advertisements (LSAs).

Removed address semantics

Address semantics have been removed from OSPFv3 protocol packets and network Link State Advertisements (LSAs).

The intention of this change is to enable the core features to be protocol independent. The major changes in this respect are described below:

Although the 32 bit Router and ID fields still exist in IPv6 packets, and can still be entered in dotted decimal format, for OSPFv3, they are simply 32-bit-long labels, which no longer represent IP addresses.

Neighbors are identified by Router ID

OSPFv2 neighbors were identified by IPv4 addresses on multipoint networks and by router ID on point-to-point networks. OSPFv3 removes this inconsistency by identifying all neighbors by their router ID.

New link-local flooding scope for link state advertisements

OSPFv3 contains the following flooding scopes:

- Area scope flooding (in OSPFv2)
- Autonomous System (AS) flooding (in OSPFv2)
- Link-local flooding (new in OSPFv3)

Uses link-local unicast addresses

On all OSPF interfaces except virtual links, OSPF packets are sent using the interface's associated link-local unicast address as the source address.

Support provided for multiple OSPF instances per link

An Instance field has been added to OSPFv3 hello and LSA packets. By assigning separate **instances**, multiple routers to be attached to a single broadcast link in such a way that separate adjacencies may be configured for selected router groups. See **"Configuring Instances and Processes" on page 43.30**.

Unknown LSAs are handled more effectively

In OSPFv2 routers discarded unknown LSA types. In OSPFv3 unknown LSA types are given either link-local flooding scope, or are stored and flooded as if being understood. The options determining which action to take, and flooding scope, is contained in components within the LSA type field.

OSPFv3 Authentication and Encryption Overview

To ensure that OSPFv3 packets are not modified, and are not being spoofed, configure OSPFv3 Authentication and Encryption on your devices, if they are running Version 5.4.3 or later AlliedWare Plus software.

OSPFv2 defines the AuType and Authentication fields in its protocol header to provide security. In OSPFv3, these OSPFv2 authentication fields were removed from OSPF headers. OSPFv3 requires the IPv6 AH (Authentication Header) header to provide authentication of routing information exchanges, and OSPFv3 requires the IPv6 ESP (Encapsulating Security Payload) header to provide encryption of routing information exchanges.

OSPFv3 Authentication and Encryption is specified in RFC 4552 'Authentication/ Confidentiality for OSPFv3'. RFC 4552 describes the AH/ESP extension headers.

See the section **Configuring OSPFv3 Authentication and Encryption** for OSPFv3 Authentication and Encryption configurations and topologies.

Also refer to **Chapter 44, OSPFv3 for IPv6 Commands** for OSPFv3 Authentication and Encryption command syntaxes, parameters, descriptions, and command examples.

OSPFv3 Authentication and Encryption Support

The IPv6 ESP header may be applied alone or in combination with the IPv6 AH header. When IPv6 ESP is used, both encryption and authentication are provided.

- Apply the IPsec AH header for OSPFv3 authentication using the **ipv6 ospf authentication spi** command.
- Apply the IPsec ESP header for OSPFv3 encryption using the **ipv6 ospf encryption spi esp** command.
- Confirm OSPFv3 authentication and encryption configuration using the **show ipv6 ospf** and **show debugging ipv6 ospf** commands.

When you only configure the IPv6 ESP header alone with the **ipv6 ospf encryption spi esp** command, note that both encryption and authentication are provided in IPsec ESP headers. You can apply IPv6 ESP headers alone or in combination with IPv6 AH headers.

If you configure IPv6 AH or IPv6 ESP headers for an OSPFv3 area, note that authentication or encryption is applied to all of the interfaces in the OSPFv3 area, except for any interfaces which had direct configuration of OSPFv3 authentication and/or encryption.

The below Authentication algorithms are supported in AlliedWare Plus OSPFv3 Authentication as parameter options in the **ipv6 ospf authentication spi** command:

- **MD5** (Message Digest Algorithm 5)
- **SHA-1** (Secure Hash Algorithm 1)

The below Encryption algorithms are supported in the AlliedWare Plus OSPFv3 Encryption as parameter options the **ipv6 ospf encryption spi esp** command:

- **AES** (Advanced Encryption Standard)
- **3DES** (Triple Data Encryption Standard)
- **NULL** (ESP without encryption)

See the sections listed below when configuring OSPFv3 Authentication and Encryption:

- **Configuring OSPFv3 Authentication on a VLAN**
- **Configuring OSPFv3 Encryption on a VLAN**
- **Configuring OSPFv3 Authentication in an OSPFv3 Area**
- **Configuring OSPFv3 Encryption in an OSPFv3 Area**

See sample configurations listed below with topologies that accompany these sections:

- **OSPFv3 Authentication in an OSPFv3 Area**
- **OSPFv3 Encryption in an OSPFv3 Area**
- **OSPFv3 Authentication on a VLAN**
- **OSPFv3 Encryption on a VLAN**
- **OSPFv3 Authentication with two VLANs**
- **OSPFv3 Encryption with two VLANs**

OSPFv3 Virtual Links

OSPFv3 Authentication and Encryption on virtual links requires some restriction on how the source IPv6 address that is used on packets sent over the virtual link is chosen.

For non-virtual links, IPv6 link-local addresses are used in packet headers. For virtual links, OSPFv3 uses non-link-local addresses, since packets are routed over intermediate routers.

A router does not necessarily have just one IPv6 address to choose from when deciding the source IPv6 address to use. A router may have more than one IPv6 address on the interfaces that connect it to the virtual link's transit area.

Without OSPFv3 Authentication and Encryption, multiple IPv6 addresses are not a problem. But multiple IPv6 addresses are a problem with OSPFv3 Authentication and Encryption, because the calculation of security parameters depends on knowing the addresses being used on both ends of the link.

Before IPv6 packets are exchanged over an OSPFv3 virtual link, the security parameters for the virtual link must be calculated. To calculate the security parameters, the router must know the source and destination addresses that will be used for OSPFv3 packets sent over the link.

A router knows what source IPv6 address it will use, and it knows the destination IPv6 address that it will send the packets to, since RFC 2740 (OSPF for IPv6) defines which of a virtual neighbor's addresses to use. However, a router cannot be sure what IPv6 address its virtual neighbor will use, since RFC 2740 does not specify the choice of source IPv6 address.

So to remove any uncertainty, routers that implement OSPFv3 Authentication and Encryption over virtual links ensure that the source IPv6 address of the packets they send over the virtual link is the same IPv6 address that their neighbor will use as a destination IPv6 address for its packets. Then IPv6 addresses that will be used over the virtual link are predictable. So, the security parameters can be calculated before the packet exchange begins.

If the IPv6 address at either end of the OSPFv3 virtual link changes, then the existing security parameters are discarded, before new security parameters are calculated.

- Apply the OSPFv3 authentication virtual link authentication using the **area virtual-link authentication ipsec spi** command.
- Apply the OSPFv3 virtual link encryption using the **area virtual-link encryption ipsec spi** command.
- Confirm OSPFv3 virtual link authentication and encryption configuration using the **show ipv6 ospf virtual-links** command.

See the section listed below when configuring OSPFv3 Virtual Links:

- **Configuring OSPFv3 Authentication and Encryption for a Virtual Link**

See sample configurations listed below with topologies that accompany this section:

- **OSPFv3 Authentication for a Virtual Link**
- **OSPFv3 Encryption for a Virtual Link**

Configuring OSPFv3

The following examples show firstly the configuration for a basic three-switch single-area OSPFv3 network. This network is then modified to become a two-area network.

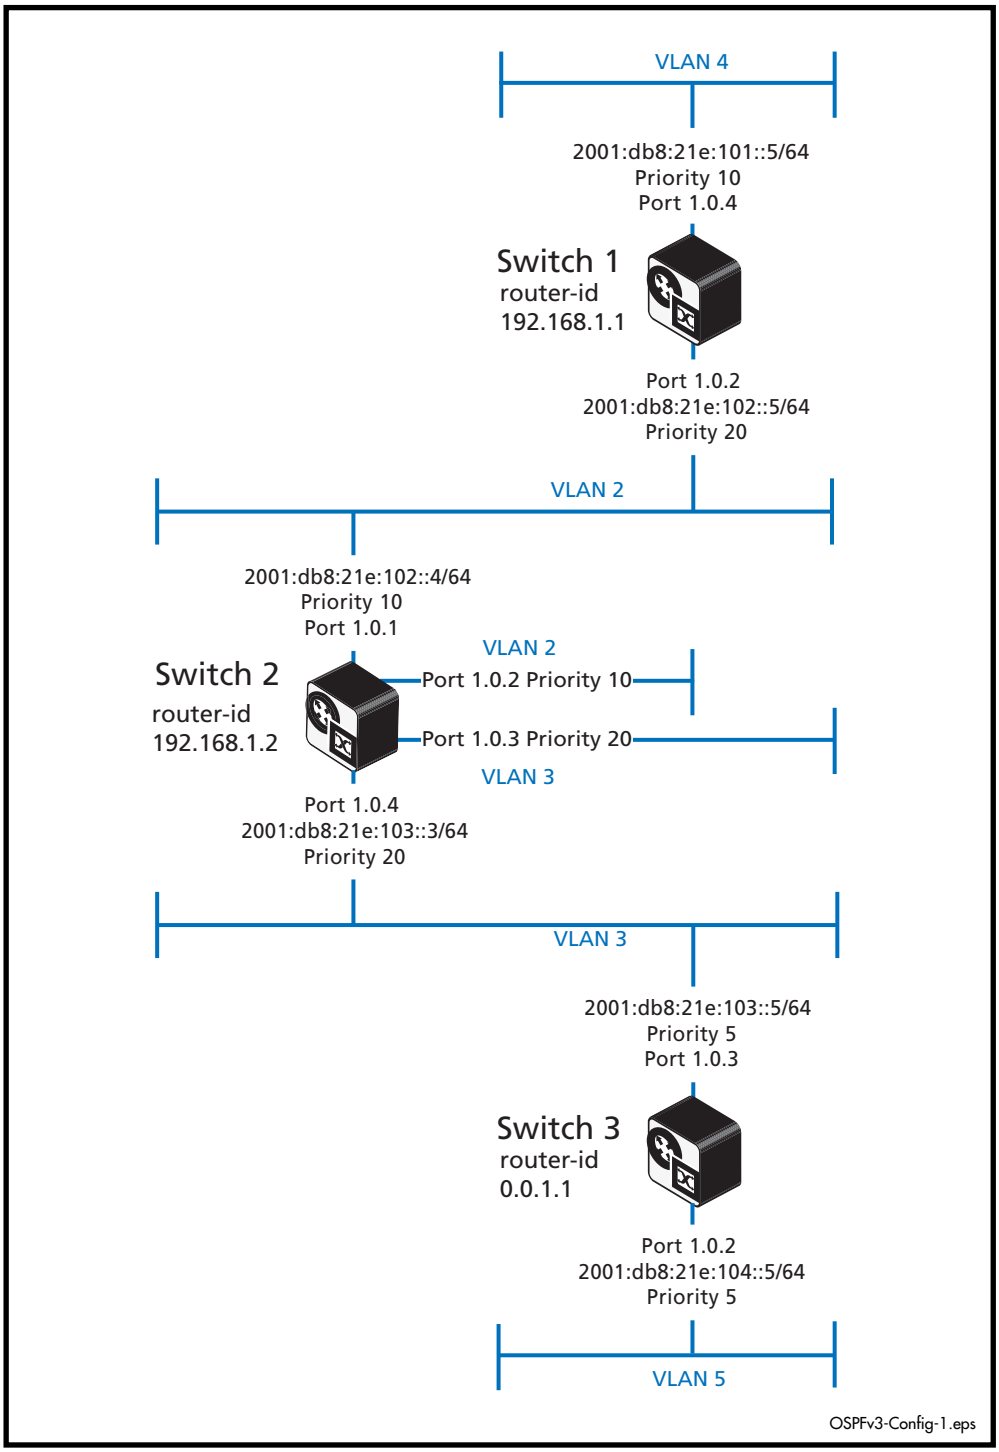
The configuration command sequences shown are presented for understanding, and do not necessarily represent the most efficient configuration method.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

Example 1: Single-Area Network Configuration

Figure 43-8 shows a basic three-switch, single-area configuration. Setting the priority value of 20 to VLAN 2 on switch 1 and to the value 10 on switch 2 will ensure that switch 1 will become the designated router for this VLAN. Similarly, the priority settings on VLAN 3, of 20 on switch 2, and 5 on switch 3, will ensure that switch 2 becomes the designated router for VLAN 3.

Figure 43-8: Basic single-area OSPFv3 configuration



Switch 1 Configuration (Single-Area Network)

Table 43-4: Example 1—single-area network configuration—Switch 1

Create and enable VLANs	
`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `vlan database`	Enter VLAN database mode.
`awplus(config-vlan)#` `vlan 2,4 state enable`	Create and enable VLANs 2 and 4.
`awplus(config-vlan)#` `exit`	Return to Global Configuration mode.
For VLAN 4, assign IPv6 addresses and configure OSPF	
`awplus(config)#` `interface vlan4`	Select VLAN 4 for configuring.
`awplus(config-if)#` `ipv6 address 2001:db8:21e:101::5/64`	Assign an IPv6 address to VLAN 4.
`awplus(config-if)#` `ipv6 router ospf area 0 tag process1`	Assign VLAN 4 to OSPF area 0. In this configuration, any address within the subnet 2001:db8:21e:101::/64 will be part of OSPF area 0.
Note that the tag named "process1" denotes a separate router process. Its name can comprise any string of alphanumeric characters. Also note that this tag is local to the router on which it is set and does not appear in any OSPF packets or LSAs. For more information on processes and instances, see **"Configuring Instances and Processes" on page 43.30**.	
`awplus(config-if)#` `ipv6 ospf priority 10`	Set the priority for the router to become the designated router for a particular VLAN. The router with the highest priority becomes the designated router for that VLAN. Defaults to 1.
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
For VLAN 2, assign IPv6 addresses and configure OSPF	
`awplus(config)#` `interface vlan2`	Select VLAN 2 for configuring.
`awplus(config-if)#` `ipv6 address 2001:db8:21e:102::5/64`	Assign an IPv6 address to VLAN 2.
`awplus(config-if)#` `ipv6 router ospf area 0 tag process1`	Assign VLAN 2 to OSPF area 0. In this configuration, any address within the subnet 2001:db8:21e:102::/64 will be part of OSPF area 0.

Table 43-4: Example 1—single-area network configuration—Switch 1(cont.)

`awplus(config-if)#`	
`ipv6 ospf priority 20`	Set the priority for the router to become the designated router for a particular VLAN. The router with the highest priority becomes the designated router for that VLAN. Defaults to 1.
Configure switch ports and assign them to their VLANs	
`awplus(config)#`	
`interface port1.0.4`	Select port 1.0.4 for configuring.
`awplus(config-if)#`	
`switchport access vlan 4`	Assign port 1.0.4 to VLAN 4.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2`	Select port1.0.2 for configuring.
`awplus(config-if)#`	
`switchport access vlan 2`	Assign port 1.0.2 to VLAN 2.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
Set router ID and allocate memory to IPv6	
`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router ipv6 ospf process1`	Configure an IPv6 OSPF routing process.
`awplus(config-router)#`	
`router-id 192.168.1.1`	Set the router ID.
`awplus(config-router)#`	
`passive-interface vlan4`	Configure VLAN 4 as a passive interface to suppress IPv6 OSPF routing updates.
`awplus(config-router)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`ipv6 forwarding`	Turn on IPv6 forwarding.
`awplus(config)#`	
`exit`	Return to Privileged Exec mode.

Switch 2 Configuration (Single-Area Network)

Table 43-5: Example 1—single-area network configuration—Switch 2

Create and enable VLANs 2 and 3	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`vlan database`	Enter VLAN database mode.
`awplus(config-vlan)#`	
`vlan 2,3 state enable`	Create and enable VLANs 2 and 3.
`awplus(config-vlan)#`	
`exit`	Return to Global Configuration mode.
For VLAN 2, assign IPv6 addresses and configure OSPF	
`awplus(config)#`	
`interface vlan2`	Select VLAN 2 for configuring.
`awplus(config-if)#`	
`ipv6 address 2001:db8:21e:102::4/64`	Assign an IPv6 address to VLAN 2.
`awplus(config-if)#`	
`ipv6 router ospf area 0 tag process1`	Assign VLAN 2 to OSPF area 0. In this configuration, any address within the subnet 2001:db8:21e:102 will be part of OSPF area 0.
`awplus(config-if)#`	
`ipv6 ospf priority 10`	Set the priority for the router to become the designated router for a particular VLAN. The router with the highest priority becomes the designated router for that VLAN. Defaults to 1.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
For VLAN 3, assign IPv6 addresses and configure OSPF	
`awplus(config)#`	
`interface vlan3`	Select VLAN 3 for configuring.
`awplus(config-if)#`	
`ipv6 address 2001:db8:21e:103::3/64`	Assign an IPv6 address to VLAN 3.
`awplus(config-if)#`	
`ipv6 router ospf area 0 tag process1`	Assign VLAN 3 to OSPF area 0. In this configuration, any address within the subnet 2001:db8:21e:103 will be part of OSPF area 0.
`awplus(config-if)#`	
`ipv6 ospf priority 20`	Set the priority for the router to become the designated router for a particular VLAN. The router with the highest priority becomes the designated router for that VLAN. Defaults to 1.

Table 43-5: Example 1—single-area network configuration—Switch 2(cont.)

Configure switch ports and assign them to their VLANs	
`awplus(config)#` `interface port1.0.1`	Select port 1.0.1 for configuring.
`awplus(config-if)#` `switchport access vlan 2`	Assign port 1.0.1 to VLAN 2.
`awplus(config-if)#` `exit`	Return to Global Config mode.
`awplus(config)#` `interface port1.0.2`	Select port1.0.2 for configuring.
`awplus(config-if)#` `switchport access vlan 2`	Assign port 1.0.2 to VLAN 2.
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
`awplus(config)#` `interface port1.0.3`	Select port1.0.3 for configuring.
`awplus(config-if)#` `switchport access vlan 3`	Assign port 1.0.3 to VLAN 3.
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
`awplus(config)#` `interface port1.0.4`	Select port1.0.4 for configuring.
`awplus(config-if)#` `switchport access vlan 3`	Assign port 1.0.4 to VLAN 3.
Set router ID and allocate memory to IPv6	
`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `router ipv6 ospf process1`	Configure an IPv6 routing process.
`awplus(config-router)#` `router-id 192.168.1.2`	Set the router ID. Note that: ■ In this configuration, the router-id value 192.168.1.2 makes this switch most likely to be selected as the designated router.
`awplus(config)#` `ipv6 forwarding`	Turn on IPv6 forwarding.
`awplus(config)#` `exit`	Return to Privileged Exec mode.

Switch 3 Configuration (Single-Area Network)

Table 43-6: Example 1—single-area network configuration—Switch 3

Create and enable VLANs 3 and 5	
`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `vlan database`	Enter VLAN database mode.
`awplus(config-vlan)#` `vlan 3,5 state enable`	Create and enable VLANs 3 and 5.
`awplus(config-vlan)#` `exit`	Return to Global Configuration mode.
For VLAN 3, assign IPv6 addresses and configure OSPF	
`awplus(config)#` `interface vlan 3`	Select VLAN 3 for configuring.
`awplus(config-if)#` `ipv6 address 2001:db8:21e:103::5/64`	Assign an IPv6 address to VLAN 3.
`awplus(config-if)#` `ipv6 router ospf area 0 tag process1`	Assign VLAN 3 to OSPF area 0. In this configuration, any address within the subnet 2001:db8:21e:103::/64 will be part of OSPF area 0.
`awplus(config-if)#` `ipv6 ospf priority 5`	Set the priority for the router to become the designated router for a particular VLAN. The router with the highest priority becomes the designated router for that VLAN. Defaults to 1.
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
For VLAN 5, assign IPv6 addresses and configure OSPF	
`awplus(config)#` `interface vlan5`	Select VLAN 5 for configuring.
`awplus(config-if)#` `ipv6 address 2001:db8:21e:104::5/64`	Assign an IPv6 address to VLAN 5.
`awplus(config-if)#` `ipv6 router ospf area 0 tag process1`	Assign VLAN 5 to OSPF area 0. In this configuration, any address within the subnet 2001:db8:21e:104::/64 will be part of OSPF area 0.
`awplus(config-if)#` `ipv6 ospf priority 5`	Set the priority for the router to become the designated router for a particular VLAN. The router with the highest priority becomes the designated router for that VLAN. Defaults to 1.

Table 43-6: Example 1—single-area network configuration—Switch 3(cont.)

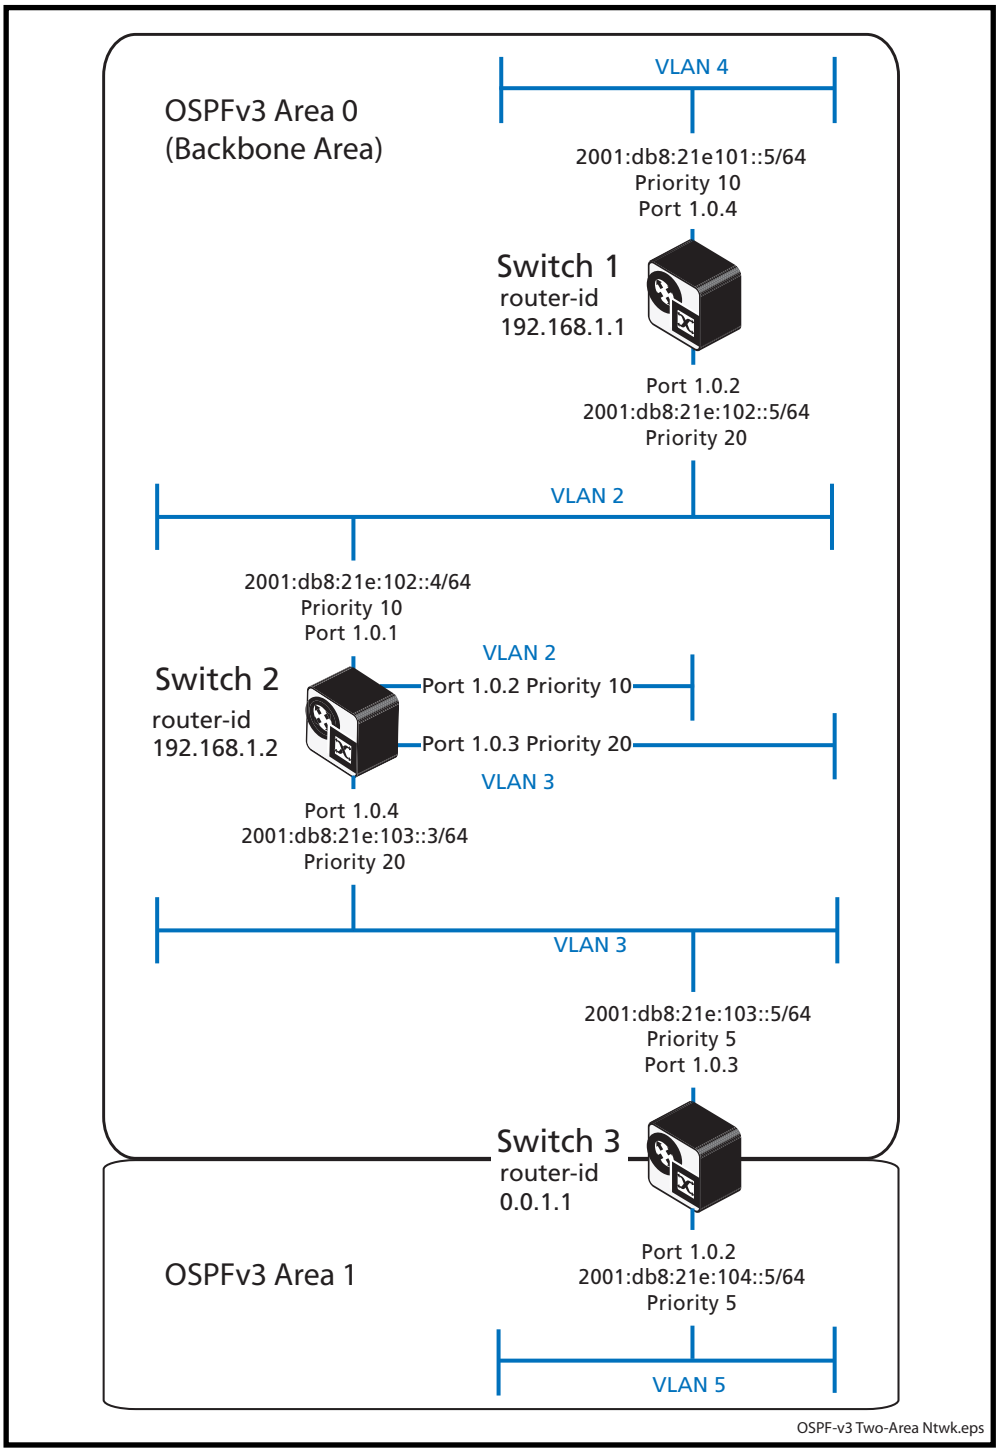
Configure switch ports and assign them to their VLANs	
`awplus(config)#`	
`interface port1.0.3`	Select port 1.0.3 for configuring.
`awplus(config-if)#`	
`switchport access vlan 3`	Assign port 1.0.3 to VLAN 3
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2`	Select port1.0.2 for configuring.
`awplus(config-if)#`	
`switchport access vlan 5`	Assign port 1.0.2 to VLAN 5.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
Set router ID and allocate memory to IPv6	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`router ipv6 ospf process1`	Configure an IPV6 routing process.
`awplus(config-router)#`	
`router-id 0.0.1.1`	Set the router ID. Note that the router-id value 0.0.1.1 has been selected for the following reasons: ■ so that it is unlikely to be selected as a designated router. ■ to illustrate that it, although it has an IPv4 address format, it is not an IPv4 address.
`awplus(config-router)#`	
`passive-interface vlan5`	Configure VLAN 5 as a passive interface to suppress IPv6 OSPF routing updates.
`awplus(config-router)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`ipv6 forwarding`	Turn on IPv6 forwarding.
`awplus(config)#`	
`exit`	Return to Privileged Exec mode.

Example 2: Two-Area Network Configuration

Figure 43-9 shows a basic three-switch, two-area configuration. Setting the priority value of 20 to VLAN 2 on Switch 1 and to the value 10 on Switch 2 will ensure that Switch 1 will become the designated router for this VLAN. Similarly the priority settings on VLAN 3 of 20 on Switch 2, and 5 on Switch 3 will ensure that Switch 2 will become the designated router for VLAN 3.

Note that Switch 3 now becomes the area border router for areas 0 and 1.

Figure 43-9: Basic two-area OSPFv3 configuration



The commands used to configure this two-area network are the same as those used in the previous example, except for the configuration of VLAN 5 on switch 3, which now becomes part of Area 1. The revised configuration for switch 3 and VLAN 5 is shown in below.

Table 43-7: Example 2—two-area network—revised configuration for Switch 3

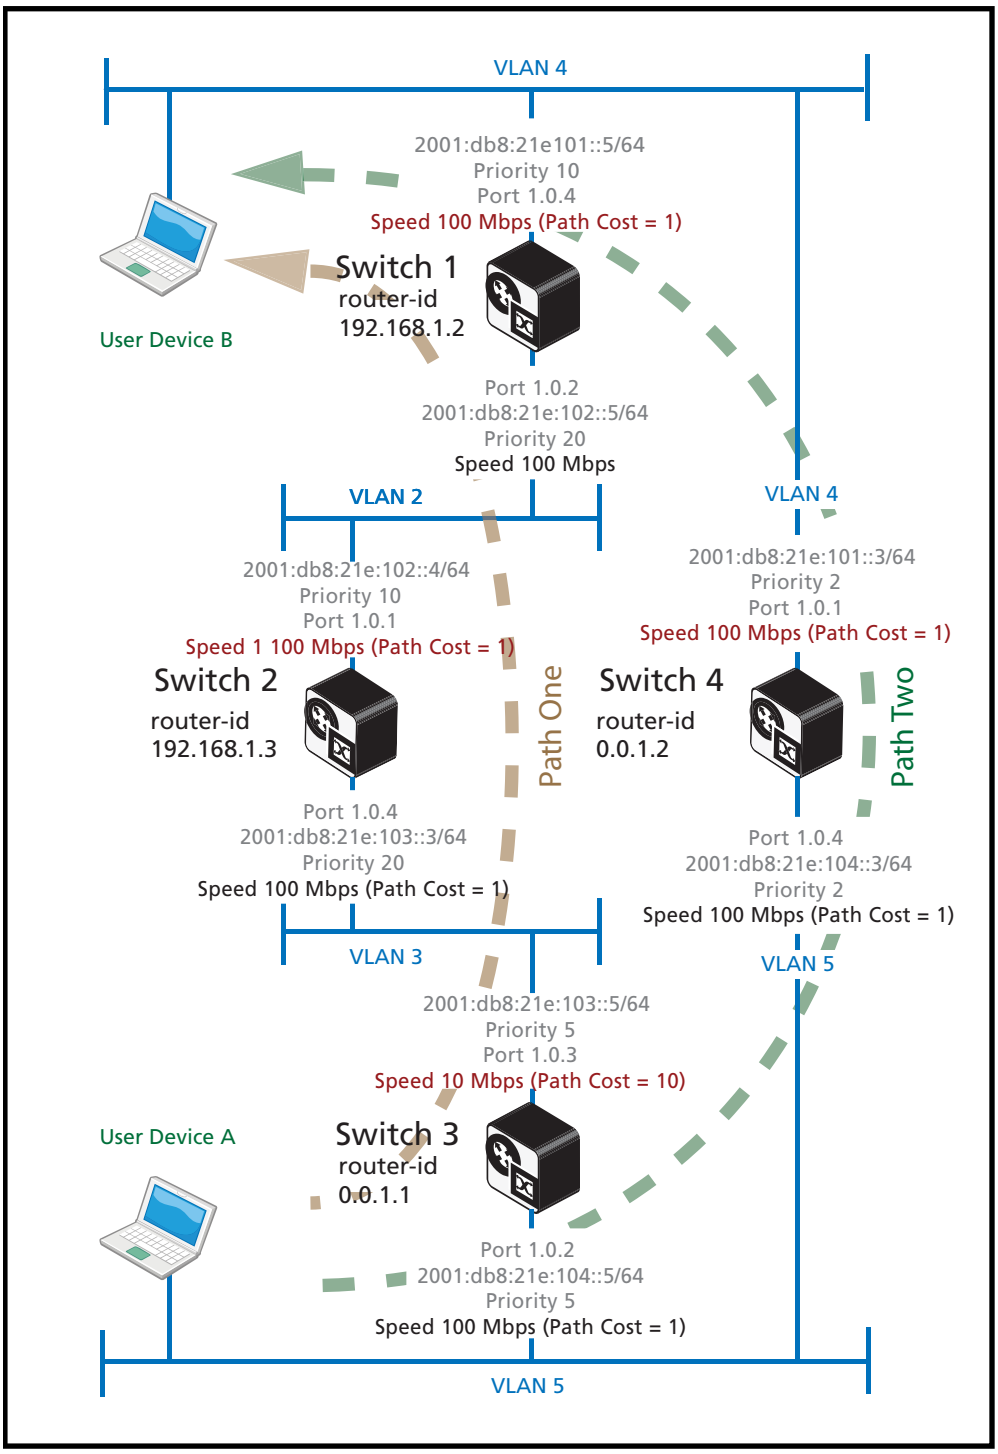
Set VLANs 3 and 5 to be part of area 1	
`awplus(config)#`	
`interface vlan5`	Select VLAN 5 for configuring.
`awplus(config-if#`	
`ipv6 address 2001:db8:21e:104::5/64`	Assign IPv6 address to VLAN 5.
`awplus(config-if)#`	
`ipv6 router ospf area 1`	Assign VLAN 5 to OSPF area 1. In this configuration, any address within the subnet 2001:db8:21e:104 will be part of OSPF area 1.

Setting Up the Metrics

OSPF selects its preferred routes by measuring the cost of each path to a given destination. Each path (or link) has a metric value applied, which by default is 100 000 000 divided by the link bandwidth. The preferred route will be the one that presents the lowest total path cost.

Figure 43-10 shows the previously configured single-area network of **Figure 43-10**, but with an additional path provided by Switch 4. The diagram also shows port speeds and their resultant path costs.

Figure 43-10: OSPFv3 multipath metrics example



Using the procedure shown in **"Switch 1 Configuration (Single-Area Network)" on page 43.20**, add Switch 4 to the configuration, applying the port numbers, VLANs, and settings shown in **Figure 43-10 on page 43.28**.

Setting the metric values

The metric values shown are derived from the data rate configured for each port and (unless manually changed) use the formula 10^8 / port bandwidth in bps.

Example To set the speed of a tri-speed port to 100 Mbps, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# speed 100
```

The above example will produce a path cost of 100 000 000 / port speed (in bps), or 100 000 000 /100 000 000 = 1

If the port speed and its resultant metric value does not produce the required best paths and you do not want to change the port speed, you can change the metric by using the **ipv6 ospf cost** command on page 44.36. The following section explains how to do this.

Best path selection

Figure 43-10 on page 43.28 shows two paths from User Device A to User Device B, labeled Path One and Path Two. The metric cost for each of these paths is found by adding the individual output path costs: For traffic flowing from User Device A, to User Device B, these are:

Path Cost for Path One = 10 + 1 + 1 = 12

Path Cost for Path Two = 1

The preferred route will be via the paths that offer the lowest total path cost. Traffic will therefore travel from User Device A, to User Device B via Path Two.

However, you can manually adjust the cost metrics to favour one path over another. For example, you can apply the **ipv6 ospf cost** command on page 44.36 to manually force the preference for a particular path.

Example Using the configuration shown in **Figure 43-10 on page 43.28** use the **ipv6 ospf cost** command on page 44.36 set Path One to be the preferred path.

Existing path cost for Path One is, 10 + 1 + 1 = 12

Existing path cost for Path Two = 1

Setting the cost of Path Two to be greater than 12, will force OSPF's path selection algorithm to select Path One as the preferred path between User Device A and User Device B.

Use the following commands on switch 4 to force the path cost on switchport 1.0.1 to have the metric value of 20:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 ospf 2001:0db8:21e:101::5/64 cost 20
```

This has set a higher metric cost for data traveling from Device A to Device B, via Path Two. You now need to set the same metric cost for data traveling in the direction from Device B, to Device A.

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ipv6 ospf 2001:0db8:21e:104::5/64 cost 20
```

Traffic traveling from devices A to B, and B to A, will now use Path One in preference to Path Two.

Configuring Instances and Processes

OSPFv3 introduces the capability of sharing physical links (or VLANs) with multiple OSPF routing instances. This is achieved by inserting an Instance ID field in the OSPFv3 **Hello**, and **Link State** packets, see **"OSPFv3 packet header" on page 43.5**. In a multi-instance network, the OSPF hello and LSA frames belonging to different instances can coexist alongside each other, each sharing a physical link and each establishing its own set of metric values and path preferences. New instances are created using the **ipv6 router ospf area** command on page 44.47.

There are solutions where multiple OSPF routers are attached to a single link, but should not form an adjacency between OSPF routers. For example, four OSPF routers are attached to an Ethernet link. OSPF routers 1 and 2 belong to one OSPF domain, and OSPF routers 3 and 4 belong to a different OSPF domain. There should be adjacencies between OSPF routers 1 and 2, and between OSPF routers 3 and 4. But there should not be adjacencies between OSPF routers 1 and 3 or between OSPF routers 2 and 4 in this example.

This type of separation of adjacencies is often accomplished in the case of OSPFv2 by the use of manipulated OSPF authentication. However, this is not ideal since OSPF routers may log authentication failures of any rejected hello packets associated with the OSPF domain.

OSPFv3 allows for multiple OSPF routing instances per link by adding the new Instance ID field to the OSPF packet header to distinguish OSPF routing instances. An interface assigned to a given interface ID will drop OSPF packets whose Instance IDs do not match.

Some OSPFv2 (and OSPFv3) switches and routers also have a similar (and older) function called processes. Processes enable more than one OSPF environment to be configured on the same switch (or router), but not the same VLAN. Processes exist only within the switch or router on which they are created. Although their existence is not explicitly conveyed between OSPF routers, the packets from each process contains its own router ID and will thus appear as if generated by a different OSPF router. New processes are created also using the **ipv6 router ospf area** command on page 44.47.

Although instances and processes apply a similar function and each can be individually created, there are interactions between them that require you to apply some specific rules when creating multi-instance networks. The following table shows those combinations of instances and processes that are workable, and those that are not.

Table 43-8: Functional combinations of OSPFv3 instances and processes

VLAN	Instances	Processes	Workable Combination
VLAN 5	Instance 1	Process A	Yes
VLAN 5 & VLAN 7	Instance 1	Process D	Yes
VLAN 5	Instance 1	Process D	Yes
If you now add a second instance so that VLAN 5 shares both instances using Process D			
VLAN 5	Instance 2	Process D	No
To make the above configuration work requires adding a new process.			
VLAN 5	Instance 1	Process D	Yes
VLAN 5	Instance 2	Process E	Yes

Example 1 To apply the settings shown in the last two rows of Table 43-8, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ipv6 router ospf area 1 tag D instance-id 1
awplus(config-if)# ipv6 router ospf area 2 tag E instance-id 2
```

Example 2 See the below entries for another supported combination of OSPFv3 instances and processes:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ipv6 router ospf area 1 tag D instance-id 1
awplus(config-if)# ipv6 router ospf area 1 tag E instance-id 2
awplus(config-if)# ipv6 router ospf area 2 tag F instance-id 3
awplus(config-if)# exit
awplus(config)# interface vlan7
awplus(config-if)# ipv6 router ospf area 1 tag D instance-id 1
```

Example 3 See the below entries for an unsupported combination of OSPFv3 instances and processes. Note the console error message shown after completing the entries with the

same instance ID (**1**) on different processes (**D** and **E**) on the same interface (**vlan5**):

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ipv6 router ospf area 1 tag D instance-id 1
awplus(config-if)# ipv6 router ospf area 1 tag E instance-id 1
% Interface enabled in another process with
the same instance ID
```

Example 4 See the below entries for an unsupported combination of OSPFv3 instances and processes. Note the console error message shown after completing the entries with different instances IDs (**1** and **2**) on the same process (**A**) on the same interface (**vlan5**):

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ipv6 router ospf area 1 tag A instance-id 1
awplus(config-if)# ipv6 router ospf area 2 tag A instance-id 2
% Interface enabled in the same process with
a different instance ID
```

Configuring OSPFv3 Authentication and Encryption

See the section **OSPFv3 Authentication and Encryption Overview** earlier in this chapter for introductory OSPFv3 Authentication and OSPFv3 Encryption information.

Also refer to **Chapter 44, OSPFv3 for IPv6 Commands** for detailed OSPFv3 Authentication and OSPFv3 Encryption command syntaxes, parameters, descriptions, and command examples.

Once you configure OSPFv3 and decide on using authentication or encryption, you need to define a security policy on each OSPFv3 interface of each device in the network.

A security policy consists of:

- An SPI (Security Parameter Index), the identification number for the security policy
- An authentication algorithm, either MD5 (Message Digest 5) or SHA-1 (Secure Hash Algorithm 1) authentication, if the security policy is to perform authentication
- An authentication key, which is a 32 or 40 bit hexadecimal value used with the authentication algorithm, if the security policy is to perform authentication
- An encryption algorithm, either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) encryption, if the security policy is to perform encryption.
- An encryption key, which is a 32 to 64 bit hexadecimal value used with the encryption algorithm, if the security policy is to perform encryption

You can configure authentication and encryption on virtual links, on VLAN interfaces, and on OSPFv3 areas. When you configure authentication or encryption for an area, the security policy is applied to all of the VLAN interfaces in the OSPFv3 area. Note that you should use a different security policy on each VLAN interface to improve the security.

See the sections listed below when configuring OSPFv3 Authentication:

- **Configuring OSPFv3 Authentication on a VLAN**
- **Configuring OSPFv3 Encryption on a VLAN**
- **Configuring OSPFv3 Authentication in an OSPFv3 Area**
- **Configuring OSPFv3 Encryption in an OSPFv3 Area**
- **Configuring OSPFv3 Authentication and Encryption for a Virtual Link**

See sample configurations listed below with topologies that accompany these sections:

- **OSPFv3 Authentication in an OSPFv3 Area**
- **OSPFv3 Encryption in an OSPFv3 Area**
- **OSPFv3 Authentication on a VLAN**
- **OSPFv3 Encryption on a VLAN**
- **OSPFv3 Authentication with two VLANs**
- **OSPFv3 Encryption with two VLANs**
- **OSPFv3 Authentication for a Virtual Link**
- **OSPFv3 Encryption for a Virtual Link**

Configuring OSPFv3 Authentication on a VLAN

Enter the below commands to configure OSPFv3 Authentication on a VLAN interface. Note you need to configure OSPFv3 on a VLAN before configuring OSPFv3 Authentication.

Note the links in the list are for the command name in the relevant command chapter. The links in the table below the list take you to the command syntax of the relevant command.

Commands Applied

1. **enable (Privileged Exec mode)**
2. **configure terminal**
3. **interface (to configure)**
4. **ipv6 ospf authentication spi**
5. **exit**
6. **exit**

Table 43-9: Configuring the DHCPv6 Configuration Pool

1.	`awplus>enable [<privilege-level>]`	Enter Privileged Exec mode.
2.	`awplus#configure terminal`	Enter Global Configuration mode.
3.	`awplus(config)# interface <interface-list>`	Specify a VLAN interface, and enter Interface Configuration mode.
4.	`awplus(config-if)#ipv6 ospf authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}`	Specifies an OSPFv3 Authentication type (MD5 or SHA-1) for a specified VLAN interface.
5.	`awplus(config-if)# exit`	Return to Global Configuration mode.
6.	`awplus(config)# exit`	Return to Privileged Exec mode.

Configuring OSPFv3 Encryption on a VLAN

Enter the below commands to configure OSPFv3 Encryption on a VLAN interface. Note you need to configure OSPFv3 on a VLAN before configuring OSPFv3 Encryption.

Note the links in the list are for the command name in the relevant command chapter. The links in the table below the list take you to the command syntax of the relevant command.

Commands Applied

1. **enable (Privileged Exec mode)**
2. **configure terminal**
3. **interface (to configure)**
4. **ipv6 ospf encryption spi esp**
5. **exit**
6. **exit**

Table 43-10: Configuring the DHCPv6 Configuration Pool

1.	`awplus>enable (Privileged Exec mode)`	Enter Privileged Exec mode.
2.	`awplus#configure terminal`	Enter Global Configuration mode.
3.	`awplus(config)#interface <interface-list>`	Specify a VLAN interface, and enter Interface Configuration mode.
4.	`awplus(config-if)#ipv6 ospf encryption ipsec spi <256-4294967295> esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null} {md5 <MD5-key>|sha1 <SHA1-key>}`	Specifies an OSPFv3 Encryption type (AES-CBC or 3DES) and an OSPFv3 Authentication type (MD5 or SHA-1) for a specified VLAN interface.
5.	`awplus(config-if)#exit`	Return to Global Configuration mode.
6.	`awplus(config)#exit`	Return to Privileged Exec mode.

Configuring OSPFv3 Authentication in an OSPFv3 Area

Enter the below commands to configure OSPFv3 Authentication in an OSPFv3 Area. Note you need to configure an OSPFv3 Area before configuring OSPFv3 Authentication.

Note the links in the list are for the command name in the relevant command chapter. The links in the table below the list take you to the command syntax of the relevant command.

Commands Applied

1. **enable (Privileged Exec mode)**
2. **configure terminal**
3. **interface (to configure)**
4. **ipv6 router ospf area**
5. **area authentication ipsec spi**
6. **exit**
7. **exit**
8. **exit**

Table 43-11: Configuring the DHCPv6 Configuration Pool

1.	`awplus>enable (Privileged Exec mode)`	Enter Privileged Exec mode.
2.	`awplus#configure terminal`	Enter Global Configuration mode.
3.	`awplus(config)#interface <interface-list>`	Specify a VLAN interface, and enter Interface Configuration mode.
4.	`awplus(config-if)#ipv6 router ospf area <area-id> [tag <process-id>] [instance <inst-id>]`	Specify an OSPFv3 Area and, and enter Router Configuration mode.
5.	`awplus(config-router)#area <area-id> authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}`	Specifies an OSPFv3 Authentication type (MD5 or SHA-1) for a specified OSPFv3 Area.
6.	`awplus(config-router)#exit`	Return to Interface Configuration mode.
7.	`awplus(config-if)#exit`	Return to Global Configuration mode.
8.	`awplus(config)#exit`	Return to Privileged Exec mode.

Configuring OSPFv3 Encryption in an OSPFv3 Area

Enter the below commands to configure OSPFv3 Encryption in an OSPFv3 Area. Note you need to configure an OSPFv3 Area before configuring OSPFv3 Encryption.

Note the links in the list are for the command name in the relevant command chapter. The links in the table below the list take you to the command syntax of the relevant command.

Commands Applied

1. **enable (Privileged Exec mode)**
2. **configure terminal**
3. **interface (to configure)**
4. **ipv6 router ospf area**
5. **area encryption ipsec spi esp**
6. **exit**
7. **exit**
8. **exit**

Table 43-12: Configuring the DHCPv6 Configuration Pool

1.	`awplus>enable (Privileged Exec mode)`	Enter Privileged Exec mode.
2.	`awplus#configure terminal`	Enter Global Configuration mode.
3.	`awplus(config)#interface <interface-list>`	Specify a VLAN interface, and enter Interface Configuration mode.
4.	`awplus(config-if)#ipv6 router ospf area <area-id> [tag <process-id>] [instance <inst-id>]`	Specify an OSPFv3 Area and, and enter Router Configuration mode.
5.	`awplus(config-router)#area <area-id> encryption ipsec spi <256-4294967295> esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null} {md5 <MD5-key>|sha1 <SHA1-key>}`	Specifies an OSPFv3 Encryption type (AES-CBC or 3DES) and an OSPFv3 Authentication type (MD5 or SHA-1) for a specified OSPFv3 Area.
6.	`awplus(config-router)#exit`	Return to Interface Configuration mode.
7.	`awplus(config-if)#exit`	Return to Global Configuration mode.
8.	`awplus(config)#exit`	Return to Privileged Exec mode.

Configuring OSPFv3 Authentication and Encryption for a Virtual Link

Enter the below commands to configure OSPFv3 Authentication and OSPFv3 Encryption for a OSPFv3 Area Virtual Link. Note you need to configure an OSPFv3 Area and an OSPFv3 Area Virtual Link before configuring OSPFv3 Authentication and OSPFv3 Encryption for an OSPFv3 Area Virtual Link.

Note the links in the list are for the command name in the relevant command chapter. The links in the table below the list take you to the command syntax of the relevant command.

Commands Applied

1. **enable (Privileged Exec mode)**
2. **configure terminal**
3. **interface (to configure)**
4. **ipv6 router ospf area**
5. **area virtual-link (IPv6 OSPF)**
6. **area virtual-link authentication ipsec spi**
7. **area virtual-link encryption ipsec spi**
8. **exit**
9. **exit**
10. **exit**

Table 43-13: Configuring the DHCPv6 Configuration Pool

1.	`awplus>enable (Privileged Exec mode)`	Enter Privileged Exec mode.
2.	`awplus#configure terminal`	Enter Global Configuration mode.
3.	`awplus(config)#interface <interface-list>`	Specify a VLAN interface, and enter Interface Configuration mode.
4.	`awplus(config-if)#ipv6 router ospf area <area-id> [tag <process-id>] [instance <inst-id>]`	Specify an OSPFv3 Area and, and enter Router Configuration mode.
5.	`awplus(config-router)#area <area-id> virtual-link <router-id>`	Specifies an OSPFv3 Area Virtual Link.
6.	`awplus(config-router)#area <area-id> virtual-link <router-ID> authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}`	Specifies an OSPFv3 Encryption type (AES-CBC or 3DES) and an OSPFv3 Authentication type (MD5 or SHA-1) for a specified OSPFv3 Area.
7.	`awplus(config-router)#area <area-id> virtual-link <router-ID> encryption ipsec spi <256-4294967295> esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null} {md5 <MD5-key>|sha1 <SHA1-key>}`	Specifies an OSPFv3 Encryption type (AES-CBC or 3DES) and an OSPFv3 Authentication type (MD5 or SHA-1) for a specified OSPFv3 Area.
8.	`awplus(config-router)#exit`	Return to Interface Configuration mode.
9.	`awplus(config-if)#exit`	Return to Global Configuration mode.
10.	`awplus(config)#exit`	Return to Privileged Exec mode.

OSPFv3 Authentication in an OSPFv3 Area

This example shows how to configure two devices to form an adjacency to each other with OSPFv3 authentication in an OSPFv3 backbone area 0. Both devices are configured to use the same process name test1, which is not advertised between peers.

See section **Configuring OSPFv3 Authentication in an OSPFv3 Area** for the sequence of console command entries. For command information, see the **area authentication ipsec spi** command.

Note that **bold** command entries in configuration output show hostnames and interfaces.

Figure 43-11: OSPFv3 Authentication in an OSPFv3 Area topology:

OSPFv3 Encryption in an OSPFv3 Area

This example shows how to configure two devices to form an adjacency to each other with OSPFv3 encryption in an OSPFv3 backbone area 0. Both devices are also configured to use the same internal process name test1. Additionally, both devices insert instance-id 1 into their advertised hello messages to control adjacency between the two devices.

See section **Configuring OSPFv3 Encryption in an OSPFv3 Area** for the sequence of console command entries. For command information, see the **area encryption ipsec spi esp** command.

Note that **bold** command entries in configuration output show hostnames and interfaces.

OSPFv3 Encryption with two VLANs

This example shows how to configure three devices with OSPFv3 encryption on a per VLAN basis. Note that to increase security, rather than using a single SPI for the entire area, this example uses a different security profile for each VLAN in the topology shown.

See section **Configuring OSPFv3 Encryption on a VLAN** for the sequence of console command entries. For detailed command information, see the **ipv6 ospf encryption spi esp** command.

Note that **bold** command entries in configuration output show hostnames and interfaces.

Figure 43-16: OSPFv3 Encryption with two VLANs topology:

OSPFv3 Authentication for a Virtual Link

In this example, there is an OSPFv3 virtual link configured from area 2.2.2.2 to the OSPFv3 backbone area 0, via transit area 1.1.1.1, with OSPFv3 authentication configured.

See section **Configuring OSPFv3 Authentication and Encryption for a Virtual Link** for the sequence of console command entries. For detailed command information, see the **area virtual-link authentication ipsec spi** command.

Note that **bold** command entries in configuration output show hostnames and interfaces.

Figure 43-17: OSPFv3 Authentication for a Virtual Link topology:

Chapter 44: OSPFv3 for IPv6 Commands

Command List

This chapter provides an alphabetical reference of commands used to configure OSPFv3 for IPv6. For more information on this topic, see **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration**.

abr-type

Use this command to set an OSPF Area Border Router (ABR) type.

Use the **no** variant of this command to revert the ABR type to the default setting (Cisco).

Syntax

```
abr-type {cisco|ibm|standard}
no abr-type {cisco|ibm|standard}
```

Parameter	Description
`cisco`	Specifies an alternative ABR using Cisco implementation (RFC 3509). This is the default ABR type.
`ibm`	Specifies an alternative ABR using IBM implementation (RFC 3509).
`standard`	Specifies a standard behavior ABR (RFC 2328).

Default ABR type `cisco`

Mode Router Configuration

Usage Specifying the ABR type allows better interoperation between different implementations. This command is specially useful in a multi-vendor environment. The different ABR types are:

- Cisco ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached to it.

Example

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# abr-type ibm
```

area authentication ipsec spi

Use this command in Router Configuration mode to enable either MD5 (Message-Digest 5) or SHA1 (Secure Hash Algorithm 1) authentication for a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable the authentication configured for a specified OSPF area.

Syntax

```
area <area-id> authentication ipsec spi <256-4294967295>
    {md5 <MD5-key>|sha1 <SHA1-key>}

no area <area-id> authentication ipsec spi <256-4294967295>
```

Parameter	Description	
<area-id>	The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats:	
	<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.	
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.	
md5	Specify the MD5 (Message-Digest 5) hashing algorithm.	
<MD5-key>	Enter an MD5 key containing up to 32 hexadecimal characters.	
sha1	Specify the SHA-1 (Secure Hash Algorithm 1) hashing algorithm.	
<SHA1-key>	Enter an SHA-1 key containing up to 40 hexadecimal characters.	

Mode Router Configuration

Usage Use this command on an OSPFv3 area, use the **area virtual-link authentication ipsec spi** command on an OSPFv3 area virtual link. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the section **OSPFv3 Authentication and Encryption Overview** in **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration** for introductory OSPFv3 Authentication and Encryption information.

Also see the section **Configuring OSPFv3 Authentication and Encryption** in **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration** for configuration examples and topologies.

Note

You can configure an authentication security policy (SPI) on an OSPFv3 area with this command, or on a VLAN interface with the **ipv6 ospf authentication spi** command.

When you configure authentication for an area, the security policy is applied to all VLAN interfaces in the area. However, Allied Telesis recommends a different authentication security policy is applied to each interface for higher security.

If you apply the `ipv6 ospf authentication null` command this affects authentication configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area authentication, not being authenticated. So neighbors time out.

Example To enable MD5 authentication with a 32 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 40 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 authentication ipsec spi 1000 sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 authentication ipsec spi 1000
```

Related Commands

area encryption ipsec spi esp
area virtual-link authentication ipsec spi
area virtual-link encryption ipsec spi
ipv6 ospf authentication spi
ipv6 ospf encryption spi esp
show ipv6 ospf

area default-cost (IPv6 OSPF)

This command specifies a cost for the default summary route sent into a stub area.

The **no** variant of this command removes the assigned default-route cost.

Syntax

```
area <area-id> default-cost <0-16777215>
no area <area-id> default-cost
```

Parameter	Description	
<area-id>	The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats:	
	<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.	
`default-cost`	Indicates the cost for the default summary route used for a stub area. Default: **1**	

Mode Router Configuration

Usage The default-cost option provides the metric for the summary default route, generated by the area border router, into the stub area. Use this option only on an area border router that is attached to the stub area.

Example To set the default cost to 10 in area 1 for the OSPF process P2, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf P2
awplus(config-router)# area 1 default-cost 10
```

Related Commands area stub (IPv6 OSPF)

area encryption ipsec spi esp

Use this command in Router Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable the encryption configured for a specified OSPF area.

Syntax

```
area <area-id> encryption ipsec spi <256-4294967295>
    esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null}
    {md5 <MD5-key>|sha1 <SHA1-key>}

no area <area-id> encryption ipsec spi <256-4294967295>
```

Parameter	Description	
<area-id>	The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats:	
	<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.	
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.	
esp	Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption.	
aes-cbc	Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption.	
<AES-CBC-key>	Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters.	
3des	Specify 3DES (Triple Data Encryption Standard) encryption.	
<3DES-key>	Enter a 3DES key containing 48 hexadecimal characters.	
null	Specify ESP without AES-CBC or 3DES encryption applied.	
md5	Specify the MD5 (Message-Digest 5) encryption algorithm.	
<MD5-key>	Enter an MD5 key containing 32 hexadecimal characters.	
sha1	Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.	
<SHA1-key>	Enter an SHA-1 key containing 40 hexadecimal characters.	

Mode Router Configuration

Usage When you issue this command, authentication and encryption are both enabled.

Use this command on an OSPFv3 area, use the **area virtual-link encryption ipsec spi** command on an OSPFv3 area virtual link. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. The IPv6 ESP extension header is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers, so applying IPv6 ESP extension headers are required for integrity, authentication, and confidentiality.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the section **OSPFv3 Authentication and Encryption Overview** in **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration** for introductory OSPFv3 Authentication and Encryption information.

Also see the section **Configuring OSPFv3 Authentication and Encryption** in **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration** for configuration examples and topologies.

Note

You can configure an encryption security policy (SPI) on an OSPFv3 area with this command, or on a VLAN interface with the **ipv6 ospf encryption spi esp** command.

When you configure encryption for an area, the security policy is applied to all VLAN interfaces in the area. However, Allied Telesis recommends a different encryption security policy is applied to each interface for higher security.

If you apply the `ipv6 ospf encryption null` command this affects encryption configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area encryption, not being being encrypted. So neighbors time out.

Example To enable ESP encryption, but not apply an AES-CBC key or an 3DES key, and MD5 authentication with a 32 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp null
md5 1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or an 3DES key, and SHA-1 authentication with a 40 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp null
sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 48 hexadecimal character 3DES key and a 32 hexadecimal character MD5 authentication for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp 3des
1234567890ABCDEF1234567890ABCDEF12345678
90ABCDEF md5
1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption with a 32 hexadecimal character AES-CBC key, and a 40 hexadecimal character SHA-1 authentication key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp aes-
cbc 1234567890ABCDEF1234567890ABCDEF
sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable ESP encryption for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 encryption ipsec spi 1000
```

Related Commands

ipv6 ospf authentication spi
ipv6 ospf encryption spi esp
show ipv6 ospf

area range (IPv6 OSPF)

Use this command to summarize OSPFv3 routes at an area boundary, configuring an IPv6 address range which consolidates OSPFv3 routes. By default, this feature is not enabled.

A summary route created by this command is then advertised to other areas by the Area Border Routers (ABRs). In this way, routing information is condensed at area boundaries and outside the area so that routes are exchanged between areas in an efficient manner.

If the network numbers in an area are arranged into sets of contiguous routes, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

The **no** variant of this command disables this function and restores default behavior.

Syntax

```
area <area-id> range <ipv6address/prefix-length> [advertise|not-
    advertise]

no area <area-id> range <ipv6address/prefix-length>
```

Parameter	Description	
<area-id>	The OSPFv3 area that you summarizing the routes for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.	
	<A.B.C.D>	OSPF area-ID expressed in IPv4 address format A.B.C.D.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example the values 0.0.1.2 and decimal 258 would both define the same area-ID.	
<ip-addr/ prefix-length>	The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.	
`advertise`	Advertise this range as a summary route into other areas.	
`not-advertise`	Do not advertise this range.	

Default The area range is not configured by default. The area range is advertised if it is configured.

Mode Router Configuration

Usage You can configure multiple ranges on a single area with multiple instances of this command, so OSPFv3 summarizes addresses for different sets of IPv6 address ranges.

Ensure OSPFv3 IPv6 routes exist in the area range for advertisement before using this command.

Example

```
awplus# configure terminal
awplus(config)# router ipv6 ospf P2
awplus(config-router)# area 1 range 2000::/3
```

area stub (IPv6 OSPF)

This command defines an OSPF area as a stub area. By default, no stub area is defined.

Use this command when routers in the area do not require learning about external LSAs. You can define the area as a totally stubby area by configuring the Area Border Router of that area using the **area stub no-summary** command.

The **no** variant of this command removes this definition.

Syntax

```
area <area-id> stub [no-summary]
no area <area-id> stub [no-summary]
```

Parameter	Description	
<area-id>	The OSPF area that you are configuring as a stub area. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID.	
	<A.B.C.D>	OSPF area-ID, expressed in the IPv4 address format *<A.B.C.D>*.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID.	
no-summary	Stops an ABR from sending summary link advertisements into the stub area.	

Mode Router Configuration

Usage There are two stub area router configuration commands: the **area stub** and **area default-cost** commands. In all routers attached to the stub area, configure the area by using the **area stub** command. For an area border router (ABR) attached to the stub area, also use the **area default-cost** command.

Example

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# area 100 stub
```

Related Commands area default-cost (IPv6 OSPF)

area virtual-link (IPv6 OSPF)

This command configures a link between a non-backbone area and the backbone, through other non-backbone areas.

In OSPF, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection.

The **no** variant of this command removes the virtual link.

Syntax

```
area <area-id> virtual-link <router-id>

no area <area-id>  virtual-link <router-id>

area <area-id>  virtual-link <router-id>

no area <area-id>  virtual-link <router-id>

area <area-id>  virtual-link <router-id> [hello-interval <1-65535>]
   [retransmit-interval <1-65535>] [transmit-delay <1-65535>]

no area <area-id>  virtual-link <router-id> [hello-interval]
   [retransmit-interval] [transmit-delay]
```

Parameter	Description	
<area-id>	The area-ID of the transit area that the virtual link passes through. This can be entered in either dotted decimal format or normal decimal format as shown below.	
	<A.B.C.D>	OSPF area-ID, expressed in the IPv4 address format *<A.B.C.D>*.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID.	
<router-id>	The OSPF router ID of the virtual link neighbor.	
dead-interval	If no packets are received from a particular neighbor for dead-interval seconds, the router considers the neighbor router to be off-line. Default: 40 seconds	
	<1-65535>	The number of seconds in the interval.
hello-interval	The interval the router waits before it sends a hello packet. Default: 10 seconds	
	<1-65535>	The number of seconds in the interval.
retransmit-interval	The interval the router waits before it retransmits a packet. Default: 5 seconds	
	<1-65535>	The number of seconds in the interval.
transmit-delay	The interval the router waits before it transmits a packet. Default: 1 seconds	
	<1-65535>	The number of seconds in the interval.

Mode Router Configuration

Usage You can configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these two routers, joined by a virtual link, as if they were connected by an unnumbered point-to-point network. To configure a virtual link, you require:

- The transit area-ID, i.e. the area-ID of the non-backbone area that the two backbone routers are both connected to.
- The corresponding virtual link neighbor's router ID. To see the router ID use the **show ipv6 ospf** command.

Configure the **hello-interval** to be the same for all routers attached to a common network. A short **hello-interval** results in the router detecting topological changes faster but also an increase in the routing traffic.

The **retransmit-interval** is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The **transmit-delay** is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet, are incremented by this amount. Set the **transmit-delay** to be greater than zero. Also, take into account the transmission and propagation delays for the interface.

Example To configure a virtual link through area 1to the router with router-ID 10.10.11.50, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# area 1 virtual-link 10.10.11.50 hello 5
dead 10
```

Related Commands **show ipv6 ospf**

area virtual-link authentication ipsec spi

Use this command in Router Configuration mode to enable authentication for virtual links in a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable authentication for virtual links in a specified OSPF area.

Syntax

```
area <area-id> virtual-link <router-ID> authentication ipsec
    spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}

no area <area-id> virtual-link <router-ID> authentication ipsec
    spi <256-4294967295>
```

Parameter	Description	
<area-id>	The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats:	
	<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.	
`virtual-link`	Specify a virtual link and its parameters.	
<router-ID>	Enter a router ID associated with a virtual link neighbor in IPv4 address format A.B.C.D.	
`authentication`	Specify this keyword to enable authentication.	
`ipsec`	Specify this keyword to use IPsec authentication.	
`spi`	Specify this keyword to set the SPI (Security Parameters Index).	
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.	
`md5`	Specify the MD5 (Message-Digest 5) encryption algorithm.	
<MD5-key>	Enter an MD5 key containing 32 hexadecimal characters.	
`sha1`	Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.	
<SHA1-key>	Enter an SHA-1 key containing 40 hexadecimal characters.	

Mode Router Configuration

Usage Use this command on an OSPFv3 area virtual link, use the **area authentication ipsec spi** command on an OSPFv3 area. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

OSPFv3 areas are connected to a backbone area. Virtual links can be configured to repair lost connections to a backbone area for OSPFv3 areas. To configure an OSPFv3 virtual link, use a router ID instead of the IPv6 prefix of the router.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the section **OSPFv3 Virtual Links** in **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration** for introductory OSPFv3 Authentication and Encryption information.

Also see the section **Configuring OSPFv3 Authentication and Encryption for a Virtual Link** in **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration** for configuration examples and topologies.

Example To enable MD5 authentication with a 32 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 40 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000 sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 virtual-link ipsec spi 1000
```

Related Commands
area authentication ipsec spi
area encryption ipsec spi esp
area virtual-link encryption ipsec spi
show ipv6 ospf virtual-links

area virtual-link encryption ipsec spi

Use this command in Router Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for virtual links in a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable encryption configured for virtual links in a specified OSPF area.

Syntax

```
area <area-id> virtual-link <router-ID> encryption ipsec
    spi <256-4294967295>
    esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null}
    {md5 <MD5-key>|sha1 <SHA1-key>}

no area <area-id> encryption ipsec spi <256-4294967295>
```

Parameter	Description	
<area-id>	The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats:	
	<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.	
`virtual-link`	Specify a virtual link and its parameters.	
<router-ID>	Enter a router ID associated with a virtual link neighbor in IPv4 address format A.B.C.D.	
`encryption`	Specify this keyword to enable encryption.	
`ipsec`	Specify this keyword to use IPsec authentication.	
`spi`	Specify this keyword to set the SPI (Security Parameters Index).	
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.	
`esp`	Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption.	
`aes-cbc`	Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption.	
<AES-CBC-key>	Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters.	
`3des`	Specify 3DES (Triple Data Encryption Standard) encryption.	
<3DES-key>	Enter a 3DES key containing 48 hexadecimal characters.	
`null`	Specify ESP without AES-CBC or 3DES encryption applied.	
`md5`	Specify the MD5 (Message-Digest 5) encryption algorithm.	
<MD5-key>	Enter an MD5 key containing 32 hexadecimal characters.	
`sha1`	Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.	
<SHA1-key>	Enter an SHA-1 key containing 40 hexadecimal characters.	

Mode Router Configuration

Usage When you issue this command, authentication and encryption are both enabled.

Use this command on an OSPFv3 area virtual link, use the **area encryption ipsec spi esp** command on an OSPFv3 area. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. ESP is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers. The IPv6 ESP extension header is required for integrity, authentication, and confidentiality.

Note that interface configuration takes priority over area configuration. If an interface configuration is removed then an area configuration is applied to an interface instead.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the section **OSPFv3 Virtual Links** in **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration** for introductory OSPFv3 Authentication and Encryption information.

Also see the section **Configuring OSPFv3 Authentication and Encryption for a Virtual Link** in **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration** for configuration examples and topologies.

Example To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, and MD5 authentication with a 32 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp null md5
1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, and SHA-1 authentication with a 40 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp null sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 32 hexadecimal character AES-CBC key and a 40 hexadecimal character SHA-1 authentication key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp aes-cbc
1234567890ABCDEF1234567890ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 48 hexadecimal character 3DES key and a 40 hexadecimal character SHA-1 authentication key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp 3des
1234567890ABCDEF1234567890ABCDEF12345678
90ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000
```

Related Commands

area authentication ipsec spi
area encryption ipsec spi esp
area virtual-link authentication ipsec spi

auto-cost reference bandwidth (IPv6 OSPF)

This command controls how OSPF calculates default metrics for the interface.

Use the **no** variant of this command to assign cost based only on the interface bandwidth.

Syntax

```
auto-cost reference-bandwidth <1-4294967>
no auto-cost reference-bandwidth
```

Parameter	Description
<1-4294967>	The reference bandwidth, measured in Mbits per second (Mbps).

Default 1000 Mbps

Usage By default, OSPF calculates the OSPF metric for an interface by dividing the reference bandwidth by the interface bandwidth. The default for the reference bandwidth is 1000 Mbps. As a result, if this default is used, there is very little difference between the metrics applied to interfaces of increasing bandwidth beyond 1000 Mbps.

The auto-cost command is used to alter this reference bandwidth in order to give a real difference between the metrics of high bandwidth links of differing bandwidths. In a network that has multiple links with high bandwidths, specify a larger reference bandwidth value to differentiate the costs on those links.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 20
awplus(config-router)# auto-cost reference-bandwidth 1000
```

Related Commands ipv6 ospf cost

bandwidth (duplicate)

This command is a copy of the **bandwidth** command on page 42.15. It specifies the maximum bandwidth to be used for each VLAN interface.

Use the **no** variant of this command to remove the maximum bandwidth.

Syntax

```
bandwidth  <bandwidth-setting>
no bandwidth
```

Parameter	Description
<bandwidth-setting>	Sets to bandwidth for the interface. Enter a value in the range 1 to 10000000000. The bandwidth value is in bits.

Default 100000000 (for OSPF configuration this is often considered as 100 Mbps)

Mode Interface Configuration for a VLAN interface.

Usage This value is used when calculating the metrics for the VLAN interface.

Example To set the bandwidth command for VLAN2 to be 1 Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# bandwidth 1000000
```

Related Commands

show running-config
show running-config as-path access-list
show interface

clear ipv6 ospf process

This command clears and restarts the IPv6 OSPF routing process. Specify the Process ID to clear one particular OSPF process. When no Process ID is specified, this command clears all running OSPF processes.

Syntax `clear ipv6 ospf [<0-65535>] process`

Parameter	Description
`<0-65535>`	The routing process ID.

Mode Privileged Exec

Example

```
awplus# clear ipv6 ospf process
```

debug ipv6 ospf events

This command enables IPv6 OSPF debugging for event troubleshooting.

To enable all debugging options, specify **debug ipv6 ospf event** with no additional parameters.

The **no** and **undebug** variants of this command disable OSPF debugging. Using this command with no parameters entered, will disable debugging for all parameter options.

Syntax `debug ipv6 ospf events [abr] [asbr] [os][router] [vlink]`

`no debug ipv6 ospf events [abr] [asbr] [os] [router] [vlink]`

Parameter	Description
`abr`	Shows ABR events.
`asbr`	Shows ASBR events.
`router`	Shows other router events.
`os`	Shows OS events.
`vlink`	Shows virtual link events.

Mode Privileged Exec and Global Configuration

Example To enable IPv6 event debugging and show ABR events, use the following command:

```
awplus# debug ipv6 ospf events asbr
```

debug ipv6 ospf ifsm

This command specifies debugging options for IPv6 OSPF Interface Finite State Machine (IFSM) troubleshooting.

To enable all debugging options, specify **debug ipv6 ospf ifsm** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF IFSM debugging. Use these commands without parameters to disable all the options.

Syntax

```
debug ipv6 ospf ifsm [events] [status] [timers]
no debug ipv6 ospf ifsm [events] [status] [timers]
```

Parameter	Description
`events`	Displays IFSM event information.
`status`	Displays IFSM status information.
`timers`	Displays IFSM timer information.

Mode Privileged Exec and Global Configuration

Example To specify IPv6 OSPF debugging options to display IPv6 OSPF IFSM events information, use the following commands:

```
awplus# debug ipv6 ospf ifsm events
```

Related Commands **terminal monitor**
undebug ipv6 ospf ifsm

debug ipv6 ospf lsa

This command enables debugging options for IPv6 OSPF Link State Advertisements (LSA) troubleshooting. This displays information related to internal operations of LSAs.

To enable all debugging options, specify **debug ipv6 ospf lsa** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF LSA debugging. Use this command without parameters to disable all the options.

Syntax

```
debug ipv6 ospf lsa [flooding] [generate] [install] [maxage]
    [refresh]

no debug ipv6 ospf lsa [flooding] [generate] [install] [maxage]
    [refresh]
```

Parameter	Description
`flooding`	Displays LSA flooding.
`generate`	Displays LSA generation.
`install`	Show LSA installation.
`maxage`	Shows maximum age of the LSA in seconds.
`refresh`	Displays LSA refresh.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for IPv6 OSPF refresh LSA, use the following commands:

```
awplus# debug ipv6 ospf lsa refresh
```

Related Commands terminal monitor
undebug ipv6 ospf lsa

debug ipv6 ospf nfsm

This command enables debugging options for IPv6 OSPF Neighbor Finite State Machines (NFSMs).

To enable all debugging options, specify **debug ipv6 ospf nfsm** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF NFSM debugging. Use this command without parameters to disable all the options.

Syntax

```
debug ipv6 ospf nfsm [events] [status] [timers]
no debug ipv6 ospf nfsm [events] [status] [timers]
```

Parameter	Description
`events`	Displays NFSM event information.
`status`	Displays NSFM status information.
`timers`	Displays NFSM timer information.

Mode Privileged Exec and Global Configuration

Examples To enable IPv6 debugging option to display timer information, use the following command:

```
awplus# debug ipv6 ospf nfsm timers
```

Related Commands **terminal monitor**
undebug ipv6 ospf nfsm

debug ipv6 ospf packet

This command enables debugging options for IPv6 OSPF packets.

To enable all debugging options, specify **debug ipv6 ospf packet** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF packet debugging. Use this command without parameters to disable all options.

Syntax

```
debug ipv6 ospf packet [dd] [detail] [hello] [ls-ack] [ls-request]
    [ls-update] [recv] [send]

no debug ipv6 ospf packet [dd] [detail] [hello] [ls-ack] [ls-request]
    [ls-update] [recv] [send]
```

Parameter	Description
`dd`	Specifies debugging for IPv6 OSPF database descriptions.
`detail`	Sets the debug option to detailed information.
`hello`	Specifies debugging for IPv6 OSPF hello packets.
`ls-ack`	Specifies debugging for IPv6 OSPF link state acknowledgments.
`ls-request`	Specifies debugging for IPv6 OSPF link state requests.
`ls-update`	Specifies debugging for IPv6 OSPF link state updates.
`recv`	Specifies the debug option set for received packets.
`send`	Specifies the debug option set for sent packets.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for hello packets, use the following command:

```
awplus# debug ipv6 ospf packet hello
```

Related Commands **terminal monitor**
undebug ipv6 ospf packet

debug ipv6 ospf route

This command enables debugging of route calculation. Use this command without parameters to turn on all the options.

The **no** and **undebug** variants of this command disable IPv6 OSPF route debugging. Use this command without parameters to disable all options.

Syntax

```
debug ipv6 ospf route [ase] [ia] [install] [spf]
no debug ipv6 ospf route [ase] [ia] [install] [spf]
```

Parameter	Description
ase	Specifies the debugging of external route calculation.
ia	Specifies the debugging of inter-area route calculation.
install	Specifies the debugging of route installation.
spf	Specifies the debugging of SPF calculation.

Mode Privileged Exec and Global Configuration

Examples To enable IPv6 route debugging of inter-area route calculations, use the following command:

```
awplus# debug ipv6 ospf route ia
```

Related Commands terminal monitor
undebug ipv6 ospf route

default-metric (IPv6 OSPF)

This command sets default metric value for routes redistributed into the IPv6 OSPF routing protocol.

The **no** variant of this command returns IPv6 OSPF to using built-in, automatic metric translations, as appropriate for each routing protocol.

Syntax

```
default-metric <0-16777214>
no default-metric [<0-16777214>]
```

Parameter	Description
<1-16777214>	Default metric value appropriate for the specified routing protocol.

Mode Router Configuration

Usage A default metric facilitates redistributing routes even with incompatible metrics. If the metrics do not convert, the default metric provides an alternative and enables the redistribution to continue. The effect of this command is that IPv6 OSPF will use the same metric value for **all** redistributed routes. Use this command in conjunction with the **redistribute (IPv6 OSPF)** command.

Examples

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# default-metric 100

awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# no default-metric
```

Related commands **redistribute (IPv6 OSPF)**

distance (IPv6 OSPF)

This command sets the administrative distance for OSPFv3 routes based on the route type. Your switch uses this value to select between two or more routes to the same destination from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). See **"Administrative Distance" on page 35.6** for more information.

Use the command **distance ospfv3** to set the distance for an entire category of OSPFv3 routes, rather than the specific routes that pass an access list.

Use the command **distance <1-254>**, with no other parameter, to set the same distance for all OSPFv3 route types.

The **no** variant of this command sets the administrative distance for OSPFv3 routes to the default of 110.

Syntax

```
distance <1-254>

distance ospfv3
   {external <1-254>|inter-area <1-254>|intra-area <1-254>}

no distance {ospfv3|<1-254>}
```

Parameter	Description
<1-254>	Specify the Administrative Distance value for OSPFv3 routes.
`external`	Sets the distance for routes from other routing domains, learned by redistribution. Specify an OSPFv3 external distance in the range *<1-254>*.
`inter-area`	Sets the distance for all routes from one area to another area. Specify an OSPFv3 inter-area distance in the range *<1-254>*.
`intra-area`	Sets the distance for all routes within an area. Specify an OSPFv3 intra-area distance in the range *<1-254>*.

Default The default OSPFv3 administrative distance is 110. The default Administrative Distance for each type of route (intra, inter, or external) is 110.

Mode Router Configuration

Usage The administrative distance rates the trustworthiness of a routing information source. The distance could be any integer from 0 to 254. A higher distance value indicates a lower trust rating. For example, an administrative distance of 254 indicates that the routing information source cannot be trusted and should be ignored.

Use this command to set the distance for an entire group of routes, rather than a specific route that passes an access list.

Examples To set the following administrative distances for route types in OSPF 100:

- 20 for inter-area routes
- 10 for intra-area routes
- 40 for external routes

use the commands:

```
awplus(config)# router ipv6 ospf 100
awplus(config-router)# distance ospfv3 inter-area 20 intra-area 10
external 40
```

To set the administrative distance for all routes in OSPFv3 100 back to the default of 110, use the commands:

```
awplus(config)# router ipv6 ospf 100
awplus(config-router)# no distance ospfv3
```

distribute-list (IPv6 OSPF)

Use this command in Router Configuration mode to filter incoming or outgoing OSPFv3 route updates from the networks as defined in an associated access-list.

See **Usage** for detailed information about the **in** and **out** distribution list parameters.

The entities that are used to perform filtering are ACLs (Access Control Lists), which match on certain attributes in the routes that are being transferred. See **Chapter 57, Access Control Lists Introduction** for further access list overview and configuration information.

Use the **no** variant of this command in Router Configuration mode to disable this feature for networks as defined in an associated access-list.

Syntax

```
distribute-list <access-list> in

no distribute-list [<access-list>] in

distribute-list <access-list> out
   {connected|ospf [<process-tag>]|rip|static}

no distribute-list <access-list> out
    {connected|ospf [<process-tag>]|rip|static}
```

Parameter	Description
<access-list>	Specifies the IPv6 access-list number or name to use. The specified access list defines which networks are received and which are suppressed.
`in`	Indicates that this applies to incoming advertised routes.
`out`	Indicates that this applies to outgoing advertised routes.
`connected`	Specify the redistribution of connected routes.
`ospf`	Specify the redistribution of OSPFv3 routes.
<process-tag>	Optionally specify an OSPFv3 process tag for OSPFv3 routes.
`rip`	Specify the redistribution of RIPng routes.
`static`	Specify the redistribution of connected routes.

Default Disabled

Mode Router Configuration

Usage This command applies filtering to the transfer of routing information between OSPFv3 and the IPv6 route table. You can apply filtering in either direction, from OSPFv3 to the IPv6 route table using an **in** distribute-list, or from the IPv6 route table to OSPFv3 using an **out** distribute-list.

The effect of an **in** filter is that some route information that OSPFv3 has learnt from LSA updates will not be installed into the IPv6 route table. The effect of an **out** filter is that some route information that could be redistributed to OSPFv3 will not be redistributed to OSPFv3.

There are **in** and **out** distribute-lists, which carry out different route filtering activities:

- The **in** distribute list is applied to the process of installing OSPFv3 routes into the IPv6 route table. The SPF calculation generate a set of routes calculated from the LSA database. By default, all of these routes become OSPFv3 candidate routes for inclusion into the IPv6 route table.
- An **in** distribute-list can be used to control whether or not certain routes generated by the SPF calculation are included into the set of candidates for inclusion into the IP route table. Those routes that match **deny** entries in the distribute-list will not be considered for inclusion into the IPv6 route table.
- The **out** distribute-list applies the process of redistributing non-OSPFv3 routes into OSPFv3. If OSPFv3 redistribution is configured, and an **out** distribute-list is also configured, then routes that match deny entries in the distribute-list will not be redistributed into OSPFv3.

Example The below commands redistribute incoming route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard myacl permit
2001:db8:1::/64
awplus(config)# router ipv6 ospf
awplus(config-router)# distribute-list myacl in
```

The below commands redistribute outgoing connected route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard myacl permit
2001:db8:1::/64
awplus(config)# router ipv6 ospf
awplus(config-router)# distribute-list myacl out connected
```

The below commands disable incoming route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no distribute-list myacl in
```

The below commands disable outgoing connected route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no distribute-list myacl out connected
```

Related Commands **ipv6 access-list extended (named)**
ipv6 access-list standard (named)

ipv6 ospf authentication spi

Use this command in Interface Configuration mode to enable either MD5 (Message-Digest 5) or SHA1 (Secure Hash Algorithm 1) authentication for a specified interface.

Use the **no** variant of this command in Interface Configuration mode to disable the authentication configured for a specified interface.

Syntax

```
ipv6 ospf authentication ipsec spi <256-4294967295>
    {md5 <MD5-key>|sha1 <SHA1-key>}
```

ipv6 ospf authentication null

```
no ipv6 ospf authentication ipsec spi <256-4294967295>
```

Parameter	Description
`authentication`	Specify this keyword to enable authentication.
`ipsec`	Specify this keyword to use IPsec authentication.
`spi`	Specify this keyword to set the SPI (Security Parameters Index).
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.
`md5`	Specify the MD5 (Message-Digest 5) hashing algorithm.
<MD5-key>	Enter an MD5 key containing up to 32 hexadecimal characters.
`sha1`	Specify the SHA-1 (Secure Hash Algorithm 1) hashing algorithm.
<SHA1-key>	Enter an SHA-1 key containing up to 40 hexadecimal characters.
`null`	Specify no authentication is applied when no other parameters are applied after this keyword (`ipv6 ospf authentication null`). Note this overrides any existing area authentication configured.

Mode Interface Configuration

Default Authentication is not configured on an interface by default.

Usage Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

Use the **null** keyword to override existing area authentication. Apply the null keyword if area authentication is already configured to configure authentication on an interface.

Use the **null** keyword to override existing area authentication. Apply the **null** keyword if area authentication is already configured to configure authentication on an interface.

See the section **OSPFv3 Authentication and Encryption Overview** in **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration** for introductory OSPFv3 Authentication and Encryption information.

Also see the section **Configuring OSPFv3 Authentication and Encryption** in **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration** for configuration examples and topologies.

Note

You can configure an authentication security policy (SPI) on a VLAN interface with this command, or an OSPFv3 area with the **area authentication ipsec spi** command.

When you configure authentication for an area, the security policy is applied to all VLAN interfaces in the area. Allied Telesis recommends a different authentication security policy is applied to each interface for higher security.

If you apply the `ipv6 ospf authentication null` command this affects authentication configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area authentication, not being authenticated. So neighbors time out.

Example To enable MD5 authentication with a 32 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# area 1 authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 32 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf authentication ipsec spi 1000
sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To specify no authentication is applied to interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf authentication null
```

To disable authentication for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 ospf authentication ipsec spi 1000
```

Related Commands

area authentication ipsec spi
area encryption ipsec spi esp
ipv6 ospf encryption spi esp
show ipv6 ospf interface

ipv6 ospf cost

This command explicitly specifies the cost of the link-state metric in a router-LSA.

The interface cost indicates the overhead required to send packets across a certain VLAN interface. Use this command to set the VLAN interface cost manually.

The **no** variant of this command resets the VLAN interface cost to the default.

Syntax

```
ipv6 ospf cost <1-65535>
no ipv6 ospf cost
```

Parameter	Description
<1-65535>	The link-state metric.

Default By default the reference bandwidth is 1000 Mbps, but can be set to a different value by the command, **auto-cost reference bandwidth (IPv6 OSPF)** command on page 44.21.

Mode Interface Configuration for a VLAN interface.

Usage The link-state metric cost is stated in the Router-LSA's link. Typically, the cost is inversely proportional to the bandwidth of an interface. By default, the cost of a VLAN interface is calculated according to the following formula:

reference bandwidth / interface bandwidth

The reference bandwidth is set by default at 1000000000 (or 1000 Mbps), but can be changed by the **auto-cost reference bandwidth (IPv6 OSPF)** command on page 44.21.

The interface bandwidth is set by default to 1000000000 (or 1000 Mbps), but can be changed by the **bandwidth (duplicate)** command on page 44.22.

Example To set the IPv6 OSPF cost to 10 on the VLAN interface `vlan25`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan25
awplus(config-if)# ipv6 ospf cost 10
```

Related Commands

show ipv6 ospf interface
auto-cost reference bandwidth (IPv6 OSPF)
bandwidth (duplicate)

ipv6 ospf dead-interval

This command sets the interval during which no hello packets are received and after which a neighbor is declared dead.

The dead-interval is the amount of time that OSPF waits to receive an OSPF hello packet from the neighbor before declaring the neighbor is down. This value is advertised in the router's hello packets. It must be a multiple of the hello-interval and be the same for all routers on a specific network.

The **no** variant of this command returns the interval to the default of 40 seconds.

Syntax

```
ipv6 ospf dead-interval <1-65535> [<inst-id>]
no ipv6 ospf  dead-interval
```

Parameter	Description
<1-65535>	The interval in seconds. Default: `40`
<inst-id>	The instance ID Default: `0`

Mode Interface Configuration for a VLAN interface.

Example The following example shows configuring the dead-interval to 10 seconds on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf dead-interval 10
```

Related Commands

ipv6 ospf hello-interval
show ipv6 ospf interface

ipv6 ospf display route single-line

Use this command to change the result of the **show ipv6 route** command to display each route entry on a single line.

Syntax

```
ipv6 ospf display route single-line
no ipv6 ospf display route single-line
```

Mode Global Configuration

Example To display each route entry on a single line.

```
awplus# configure terminal
awplus(config)# ipv6 ospf display route single-line
```

Related Commands show ipv6 ospf route

ipv6 ospf encryption spi esp

Use this command in Interface Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for a specified interface.

Use the **no** variant of this command in Interface Configuration mode to disable the encryption configured for a specified interface.

Syntax

```
ipv6 ospf encryption ipsec spi <256-4294967295>
   esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null}
   {md5 <MD5-key>|sha1 <SHA1-key>}

ipv6 ospf encryption null

no ipv6 ospf encryption ipsec spi <256-4294967295>
```

Parameter	Description
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.
`esp`	Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption.
`aes-cbc`	Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption.
<AES-CBC-key>	Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters.
`3des`	Specify 3DES (Triple Data Encryption Standard) encryption.
<3DES-key>	Enter a 3DES key containing 48 hexadecimal characters.
`null`	Specify ESP without AES-CBC or 3DES encryption applied.
`md5`	Specify the MD5 (Message-Digest 5) encryption algorithm.
<MD5-key>	Enter an MD5 key containing 32 hexadecimal characters.
`sha1`	Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.
<SHA1-key>	Enter an SHA-1 key containing 40 hexadecimal characters.
`null`	Specify no encryption is applied when no other parameters are applied after this keyword (`ipv6 ospf encryption null`).

Default Authentication is not configured on an interface by default.

Mode Interface Configuration

Usage When you issue this command, authentication and encryption are both enabled. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. The IPv6 ESP extension header is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers, so applying IPv6 ESP extension headers are required for integrity, authentication, and confidentiality.

Use the **null** keyword to override existing area encryption. Apply the **null** keyword if area encryption is already configured to then configure encryption on an interface instead.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the section **OSPFv3 Authentication and Encryption Overview** in **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration** for introductory OSPFv3 Authentication and Encryption information.

Also see the section **Configuring OSPFv3 Authentication and Encryption** in **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration** for configuration examples and topologies.

Note

You can configure an encryption security policy (SPI) on a VLAN interface with this command, or an OSPFv3 area with the **area encryption ipsec spi esp** command.

When you configure encryption for an area, the security policy is applied to all VLAN interfaces in the area. Allied Telesis recommends a different encryption security policy is applied for each interface for higher security.

If you apply the `ipv6 ospf encryption null` command this affects encryption configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area encryption, not being being encrypted. So neighbors time out.

Example To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, for interface VLAN 2 and MD5 authentication with a 32 hexadecimal character key, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp
null md5
1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, for interface VLAN 2 and SHA-1 authentication with a 40 hexadecimal character key, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp
null sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with an 3DES key with a 48 hexadecimal character key and MD5 authentication with a 32 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp
3des
1234567890ABCDEF1234567890ABCDEF12345678
90ABCDEF md5
1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption with an AES-CBC key with a 32 hexadecimal character key and SHA-1 authentication with a 40 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp
aes-cbc 1234567890ABCDEF1234567890ABCDEF
sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To specify no ESP encryption is applied to interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption null
```

To disable ESP encryption for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 ospf encryption ipsec spi 1000
```

Related Commands

area authentication ipsec spi
area encryption ipsec spi esp
ipv6 ospf authentication spi
show ipv6 ospf interface

ipv6 ospf hello-interval

This command specifies the interval between hello packets.

The hello-interval is advertised in the hello packets. Configure the same hello-interval for all routers on a specific network. A shorter interval ensures faster detection of topological changes, but results in more routing traffic.

The **no** variant of this command returns the interval to the default of 10 seconds.

Syntax

```
ipv6 ospf hello-interval <1-65535>
no ipv6 ospf hello-interval
```

Parameter	Description
<1-65535>	The hello-interval in seconds. Default: `10`

Default The default interval is 10 seconds.

Mode Interface Configuration for a VLAN interface.

Example The following example shows setting the `hello-interval` to 3 seconds on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf hello-interval 3
```

Related Commands **ipv6 ospf dead-interval**
show ipv6 ospf interface

ipv6 ospf network

This command configures the OSPF network type to a type different from the default for the particular VLAN interface.

The **no** variant of this command returns the network type to the default for the particular VLAN interface.

Syntax

```
ipv6 ospf network [broadcast | non-broadcast | point-to-point |
   point-to-multipoint]

no ipv6 ospf network
```

Parameter	Description
`broadcast`	Sets the network type to broadcast.
`non-broadcast`	Sets the network type to NBMA.
`point-to-multipoint`	Sets the network type to point-to-multipoint.
`point-to-point`	Sets the network type to point-to-point.

Default The default is the `broadcast` OSPF network type for a VLAN interface.

Mode Interface Configuration for a VLAN interface.

Usage This command forces the interface network type to the specified type. Depending on the network type, OSPF changes the behavior of the packet transmission and the link description in LSAs.

Example The following example shows setting the network type to `point-to-point` on the VLAN interface `vlan1`:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 ospf network point-to-point
```

ipv6 ospf priority

This command sets the router priority, which is a parameter used in the election of the designated router for the link.

The **no** variant of this command returns the router priority to the default of 1.

Syntax

```
ipv6 ospf priority <priority>
no ipv6 ospf priority
```

Parameter	Description
<priority>	*<0-255>* Specifies the router priority of the interface. The larger the value, the greater the priority level. The value 0 defines that the switch cannot become either the DR, or backup DR for the link.

Default The default priority is 1.

Mode Interface Configuration for a VLAN interface.

Usage Set the priority to help determine the OSPF Designated Router (DR) for a link. If two routers attempt to become the DR, the router with the higher router priority becomes the DR. If the router priority is the same for two routers, the router with the higher router ID takes precedence.

Routers with zero router priority values cannot become the designated or backup designated router.

Example The following example shows setting the OSPFv3 priority value to 3 on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf priority 3
```

ipv6 ospf retransmit-interval

Use this command to specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface.

Use the **no** variant of this command to return to the default of 5 seconds.

Syntax

```
ipv6 ospf retransmit-interval <1-65535>
no ipv6 ospf retransmit-interval
```

Parameter	Description
<1-65535>	Specifies the interval in seconds.

Default The default interval is 5 seconds.

Mode Interface Configuration for a VLAN interface.

Usage After sending an LSA to a neighbor, the router keeps the LSA until it receives an acknowledgement. In case the router does not receive an acknowledgement during the set time (the retransmit interval value) it retransmits the LSA. Set the retransmission interval value conservatively to avoid needless retransmission. The interval should be greater than the expected round-trip delay between two routers.

Example The following example shows setting the `ospf retransmit interval` to 6 seconds on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf retransmit-interval 6
```

ipv6 ospf transmit-delay

Use this command to set the estimated time it takes to transmit a link-state-update packet on the VLAN interface.

Use the **no** variant of this command to return to the default of 1 second.

Syntax

```
ipv6 ospf transmit-delay <1-65535>
no ipv6 ospf transmit-delay
```

Parameter	Description
<1-65535>	Specifies the time, in seconds, to transmit a link-state update.

Default The default interval is 1 second.

Mode Interface Configuration for a VLAN interface.

Usage The transmit delay value adds a specified time to the age field of an update. If the delay is not added, the time in which the LSA transmits over the link is not considered. This command is especially useful for low speed links. Add transmission and propagation delays when setting the transmit delay value.

Example To set the IPv6 OSPF transmit delay time to 3 seconds on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf transmit-delay 3
```

ipv6 router ospf area

Use this command to enable IPv6 OSPF routing on an interface.

Use the **no** variant of this command to disable IPv6 OSPF routing on an interface.

Syntax

```
ipv6 router ospf area <area-id> [tag <process-id>]
   [instance <inst-id>]

no ipv6 router ospf area <area-id>
```

Parameter	Description
<area-id>	The ID of the IPv6 OSPF routing area. Can be entered as either an IPv4 A.B.C.D address format, or as an unsigned integer in the range, 0 to 4294967295. Use either of the following forms when entering an area-ID: ■ `area-id` *<A.B.C.D>* Where A.B.C.D is a number entered in IPv4 address format. ■ `area-id` <0 to 4294967295>.
<process-id>	The process tag denotes a separate router process. It can comprise any string of alphanumeric characters. Note that this tag is local to the router on which it is set and does not appear in any OSPF packets or LSA.
<instance-id>	The OSPF instance ID, entered as an integer between 0 and 255. This is the value that will appear in the instance field of the IPv6 OSPF hello packet, see **Figure 43-2 on page 43.6**.

Defaults IPv6 OSPF routing is disabled by default.

When enabling IPv6 OSPF routing:

- the process-tag will default to a null value if not set.
- the Instance ID defaults to 0 if not set.

Mode Interface Configuration for a VLAN interface.

Usage When enabling IPv6 OSPF routing on an interface, specifying the area-ID is mandatory, but the Process tag and Instance are optional.

For more information see **"Configuring Instances and Processes" on page 43.30**.

Examples The following commands enable IPv6 OSPF on VLAN interface `vlan2`, OSPF area 1, tag PT2, and instance 2.:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 router ospf area 1 tag PT2 instance-id 2
```

The following commands disable IPv6 OSPF on VLAN interface `vlan2` and OSPF area 1:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 router ospf area 1
```

max-concurrent-dd (IPv6 OSPF)

Use this command to limit the number of neighbors that can be concurrently processed in the database exchange. The specified value limits the number of neighbors from all interfaces, not per interface.

Use the **no** variant of this command to have no limit on the maximum number of LSAs.

Syntax `max-concurrent-dd <max-neighbors>`

no max-concurrent-dd

Parameter	Description
<max-neighbors>	<1-65535> The maximum number of neighbors.

Mode Router Configuration

Usage This command is useful where bringing up several adjacencies on a router is affecting performance. In this situation, you can often enhance the system performance by limiting the number of neighbors that can be processed concurrently.

Example The following example sets the max-concurrent-dd value to allow only 4 neighbors to be processed at a time.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# max-concurrent-dd 4
```

Related Commands **router ipv6 ospf**

passive-interface (IPv6 OSPF)

Use this command to suppress the sending of Hello packets on a specified interface. If you use the **passive-interface** command without the optional parameters then **all** interfaces are put into passive mode.

Use the **no** variant of this command to allow the sending of Hello packets on all interfaces, or on the specified interface. If you use the **no** variant of this command without the optional parameters then **all** interfaces are removed from passive mode.

Syntax

```
passive-interface [<interface>]
no passive-interface [<interface>]
```

Parameter	Description
<interface>	The name or the VID of the VLAN interface.

Mode Router Configuration

Usage Configure an interface to be passive if you wish its connected route to be treated as an OSPF route (rather than an AS-external route), but do not wish to actually exchange any OSPF packets via this interface.

Examples To configure passive interface mode on interface **vlan2**, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# passive-interface vlan2
```

To configure passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# passive-interface
```

To remove passive interface mode on interface **vlan2**, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# no passive-interface vlan2
```

To remove passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# no passive-interface
```

redistribute (IPv6 OSPF)

Use this command to redistribute routes from other routing protocols, static routes and connected routes into an IPv6 OSPF routing table.

Use the **no** variant of this command to disable this function.

Syntax

```
redistribute <protocol>} [metric <0-16777214>] [metric-type {1|2}]
   [route-map <route-map-entry>]
```

no redistribute <protocol>

Parameter	Description	
<protocol>	The routing protocol to be redistributed, can be one of:	
	`connected`	Connected routes
	`rip`	Routing Internet Protocol
	`static`	Static Routes
`metric`	*<0-16777214>* Specifies the external metric.	
`metric-type`	Specifies the external metric-type, either type 1 or type 2. ■ For Metric Type 1 The best route is based on the external redistributed path cost plus the internal path cost presented by the native routing protocol. ■ For Metric Type 2 The best route is based only on the external redistributed path cost. The internal path cost is only used to break a “tie” situation between two identical external path costs.	
`route-map`	*<route-map-entry>* Where the route-map-entry specifies the pointer to the specific route-map.	

Default The default metric value for routes redistributed into OSPFv3 is 20. The metric can also be defined using the **set metric** command for a route map. Note that a metric defined using the **set metric** command for a route map overrides a metric defined with this command.

Mode Router Configuration

Usage IPv6 OSPF advertises routes learnt from the RIP routing protocol including static or connected routes. Each injected prefix is put into the AS-external-LSA with a specified metric and metric type.

See the section **OSPFv3 Metrics** in the **OSPFv3 for IPv6 Introduction and Configuration** chapter for more information about metrics, and about behavior when configured in route maps.

Example The following example shows the redistribution of RIP routes into the IPv6 OSPF routing table, with a metric of 10 and a metric type of 1.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# redistribute rip metric 10 metric-type 1
```

restart ipv6 ospf graceful

Use this command to force the OSPFv3 process to restart. You may optionally specify a grace-period value. If a grace-period is not specified then a default value of 120 seconds is applied.

You should specify a grace-period value of 120 seconds or more. Low grace-period values may cause the graceful restart process on neighboring routers to terminate with routes missing.

Syntax `restart ipv6 ospf graceful [grace-period <1-1800>]`

Parameter	Description
`grace-period`	Specify the grace period.
<1-1800>	The grace period in seconds.

Default The default OSPF grace-period is 120 seconds.

Mode Privileged Exec

Usage After this command is executed, the OSPFv3 process immediately shuts down. It notifies the system that OSPF has performed a graceful shutdown. Routes installed by OSPF are preserved until the grace-period expires.

When a **restart ospf graceful** command is issued, the OSPF configuration is reloaded from the last saved configuration. Ensure you first enter the **copy running-config startup-config** command.

Example To restart OSPFv3, use the following commands:

```
awplus# copy running-config startup-config
awplus# restart ipv6 ospf graceful grace-period 200
```

To apply the default grace-period (120 seconds), use the following commands:

```
awplus# copy running-config startup-config
awplus# restart ipv6 ospf graceful
```

router ipv6 ospf

Use this command to create or remove an IPv6 OSPF routing process, or to enter the Router Configuration mode to configure a specific IPv6 OSPF routing process. Use the **no** variant of this command to terminate an IPv6 OSPF routing process.

Use the **no** parameter with the **process-id** parameter, to terminate and delete a specific IPv6 OSPF routing process.

Syntax

```
router ipv6 ospf [<process-id>]
no router ipv6 ospf [<process-id>]
```

Parameter	Description
<process-id>	A character string that identifies a routing process. If you do not specify the process-id a "null" process ID will be applied. Note that this will appear in show output as *null* However you cannot select the null process by using the character string *null* as command entry characters.

Default No routing process is defined by default.

Mode Global Configuration

Usage The process ID enables you to run more than one OSPF session within the same router, then configure each session to a different router port. Note that this function is internal to the router, other routers (neighbors etc.) have no knowledge of these different processes. The hello and LSAs issued from each process will appear as if coming from a separate physical router.

To a large extent the requirement for multiple processes has been replaced by the ability within IPv6 OSPF of running simultaneous router instances.

The process ID of IPv6 OSPF is an optional parameter for the **no** variant of this command only. When removing all IPv6 OSPF processes on the switch, you do not need to specify each Process ID, but when removing particular IPv6 OSPF processes, you must specify each Process ID to be removed.

For a description of processes and instances and their configuration relationships, see **"Configuring Instances and Processes" on page 43.30**.

Example This example shows the use of this command to enter Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf P100
awplus(config-router)#
```

router-id (IPv6 OSPF)

Use this command to specify a router ID for the IPv6 OSPF process.

Use the **no** variant of this command to disable this function.

Syntax

```
router-id <router-id>
no router-id
```

Parameter	Description
<router-id>	Specifies the router ID in IPv4 address format.

Mode Router Configuration

Usage Configure each router with a unique router-id. In an IPv6 OSPF router process that has active neighbors, a new router-id takes effect at the next reload or when you restart OSPF manually.

Example The following example shows a specified router ID 0.0.4.5.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# router-id 0.0.4.5
```

Related Commands show ipv6 ospf

show debugging ipv6 ospf

Use this command in User Exec or Privileged Exec modesto display which OSPFv3 debugging options are currently enabled.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show debugging ipv6 ospf`

Mode User Exec and Privileged Exec

Example

```
awplus# show debugging ipv6 ospf
```

Output **Figure 44-1: Example output from the show debugging ipv6 ospf command**

```
OSPFv3 debugging status:
  OSPFv3 all packet detail debugging is on
  OSPFv3 all IFSM debugging is on
  OSPFv3 all NFSM debugging is on
  OSPFv3 all LSA debugging is on
  OSPFv3 all NSM debugging is on
  OSPFv3 all route calculation debugging is on
  OSPFv3 all event debugging is on
```

show ipv6 ospf

Use this command in User Exec or Privileged Exec modes to display general information about all IPv6 OSPF routing processes, including OSPFv3 Authentication configuration and status information.

Include the process ID parameter with this command to display information about specified processes.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 ospf
show ipv6 ospf <process-id>
```

Parameter	Description
<process-id>	*<0-65535>* The ID of the router process for which information will be displayed. If this parameter is included, only the information for the specified routing process is displayed.

Mode User Exec and Privileged Exec

Examples To display general information about all IPv6 OSPF routing processes, use the command:

```
awplus# show ipv6 ospf
```

To display general information about IPv6 OSPF (OSPFv3) routing process `P10`, use the command:

```
awplus# show ipv6 ospf P10
```

Output **Figure 44-2: Example output from the show ipv6 ospf command for process P10 showing OSPFv3 Authentication configuration information highlighted in bold**

```
 awplus#show ipv6 ospf
  Routing Process "OSPFv3 (10)" with ID 192.168.1.2
  Route Licence: Route : Limit=Unlimited, Allocated=0, Visible=0,
Internal=0
  Route Licence: Breach: Current=0, Watermark=0
  Process uptime is 6 minutes
  Current grace period is 120 secs (default)
  SPF schedule delay min 0.500 secs, SPF schedule delay max 50.0
secs
  Minimum LSA interval 5 secs, Minimum LSA arrival 1 secs
  Number of incoming current DD exchange neighbors 0/5
  Number of outgoing current DD exchange neighbors 0/5
  Number of external LSA 0. Checksum Sum 0x0000
  Number of AS-Scoped Unknown LSA 0
  Number of LSA originated 4
  Number of LSA received 10
  Number of areas in this router is 1
     Area BACKBONE(0)
          Number of interfaces in this area is 1(1)
          MD5 Authentication SPI 1000
    NULL Encryption SHA-1 Auth, SPI 1001
          SPF algorithm executed 9 times
          Number of LSA 3.  Checksum Sum 0xF9CC
          Number of Unknown LSA 0
```

Related Commands

area authentication ipsec spi
area encryption ipsec spi esp
router ipv6 ospf

show ipv6 ospf database

Use this command in User Exec or Privileged Exec modes to display a database summary for IPv6 OSPF information. Include the process ID parameter with this command to display information about specified processes.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 ospf <process-id> database [self-originate|max-age|adv
   router <adv-router-id>]
```

Parameter	Description
<process-id>	*<0-65535>* The ID of the router process for which information will be displayed.
`self-originate`	Displays self-originated link states.
`max-age`	Displays LSAs in MaxAge list. It maintains the list of the all LSAs in the database which have reached the max-age which is 3600 seconds.
`adv-router`	Advertising Router LSA.
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.

Mode User Exec and Privileged Exec

Example To display the database summary for IPv6 OSPF information on process `P10`, use the command:

```
awplus# show ipv6 ospf P10 database
```

Figure 44-3: Example output from the show ipv6 ospf P10 database command

```

show ipv6 ospf database external

Use this command in User Exec or Privileged Exec modes to display information about the external LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 ospf database external <adv-router-id>
   [self-originate|adv-router<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
`self originate`	Self-originated link states.
`adv-router`	Displays all the LSAs of the specified router.

Mode User Exec and Privileged Exec

Examples To display information about the external LSAs, use the following command:

```
awplus# show ipv6 ospf database external adv-router 10.10.10.1
```

```

show ipv6 ospf database grace

Use this command in User Exec or Privileged Exec modes to display information about the grace LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 ospf database grace <adv-router-id>
   [self-originate|adv-router<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
`adv-router`	Displays all the LSAs of the specified router.
`self originate`	Self-originated link states.

Mode User Exec and Privileged Exec

Examples To display information about the grace LSAs, use the following command:

```
awplus# show ipv6 ospf database grace adv-router 10.10.10.1
```

```
LS age: 1087

```

show ipv6 ospf database inter-router

Use this command in User Exec or Privileged Exec modes to display information about the inter-router LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 ospf database inter-router <adv-router-id>
   [self-originate| adv-router<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
`adv-router`	Displays all the LSAs of the specified router.
`self originate`	Self-originated link states.

Mode User Exec and Privileged Exec

Examples To display information about the inter-router LSAs, use the following command:

```
awplus# show ipv6 ospf database inter-router adv-router
       10.10.10.1
```

```
LS age: 1087
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.13
  Advertising Router: 0.0.1.1
  LS Seq Number: 0x8000000C
  Checksum: 0xCE9D

show ipv6 ospf database intra-prefix

Use this command in User Exec or Privileged Exec modes to display information about the intra-prefix LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 ospf database intra-prefix <adv-router-id> [self-originate|
   adv-router<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
adv-router	Displays all the LSAs of the specified router.
self originate	Self-originated link states.

Mode User Exec and Privileged Exec

Examples To display information about the intra-prefix LSAs, use the following command:

```
awplus# show ipv6 ospf database intra-prefix adv-router
       10.10.10.1
```

```
LS age: 1087
  LS Type: AS-External-LSA

```

show ipv6 ospf database link

Use this command in User Exec or Privileged Exec modes to display information about the link LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 ospf database link <adv-router-id> [self-originate|adv-
   router<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
`adv-router`	Displays all the LSAs of the specified router.
`self originate`	Self-originated link states.

Mode User Exec and Privileged Exec

Examples To display information about the link LSAs, use the following command:

```
awplus# show ipv6 ospf database link adv-router 10.10.10.1
```

```
LS age: 1087
  LS Type: AS-External-LSA

    Prefix Options: 0 (-|-|-|-)
    Forwarding Address: 2003:1111::1
```

show ipv6 ospf database network

Use this command in User Exec or Privileged Exec modes to display information about the network LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 ospf database network <adv-router-id>
   [self-originate|adv-router<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address.
`self-originate`	Self-originated link states.
`adv-router`	The advertising router selected.

Mode User Exec and Privileged Exec

Examples To display information about the OSPFv3 network LSAs, use the following command:

```
awplus# show ipv6 ospf database network
```

Output **Figure 44-4: Example output from the show ipv6 ospf database network command**

```
OSPFv3 Router with ID (0.0.1.1) (Process P10)

                Network-LSA (Area 0.0.0.0)

    Attached Router: 0.0.1.1
```

show ipv6 ospf database router

Use this command in User Exec or Privileged Exec modes to display information only about the router LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 ospf database router <adv-router-id>
   [self-originate|adv-router<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address.
`self-originate`	Self-originated link states.
`adv-router`	The advertising router selected.

Mode User Exec and Privileged Exec

show ipv6 ospf interface

Use this command in User Exec or Privileged Exec modes to display interface information for OSPF for all interfaces or a specified interface, including OSPFv3 Authentication status for all interfaces or for a specified interface.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 ospf interface [<interface-name>]
```

Parameter	Description
<interface-name>	An alphanumeric string that is the interface name. Omit the optional interface to display OSPF

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 ospf interface vlan2
```

Output **Figure 44-5: Example output from the show ipv6 ospf interface command showing OSPFv3 Authentication configuration information highlighted in bold**

```
awplus#show ipv6 ospf interface
 vlan2 is up, line protocol is up
   Interface ID 302
   IPv6 Prefixes
     fe80::215:77ff:fead:f87e/64 (Link-Local Address)
 Security Policy
  MD5 Authentication SPI 1000
  NULL Encryption SHA-1 Auth, SPI 1001

   OSPFv3 Process (10), Area 0.0.0.0, Instance ID 0
     Router ID 192.168.1.2, Network Type BROADCAST, Cost: 1
     Transmit Delay is 1 sec, State Backup, Priority 1
     Interface state Backup
     Designated Router (ID) 192.168.1.1
       Interface Address fe80::21d:e5ff:fec9:cfbe
     Backup Designated Router (ID) 192.168.1.2
       Interface Address fe80::215:77ff:fead:f87e
     Timer interval configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
       Hello due in 00:00:07
     Neighbor Count is 1, Adjacent neighbor count is 1
```

Figure 44-6: Example output from the show ipv6 ospf interface vlan3 command

```
awplus#show ipv6 ospf interface vlan3
vlan3 is up, line protocol is up
  Interface ID 203
  IPv6 Prefixes
    fe80::200:cdff:fe24:daae/64 (Link-Local Address)
    2003:1111::2/64
  OSPFv3 Process (P1), Area 0.0.0.0, Instance ID 0
    Router ID 0.0.1.1, Network Type BROADCAST, Cost: 1
    Transmit Delay is 1 sec, State DR, Priority 1
    Designated Router (ID) 0.0.1.1
      Interface Address fe80::200:cdff:fe24:daae
    No backup designated router on this link
    Timer interval configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
      Hello due in 00:00:02

show ipv6 ospf neighbor

Use this command in User Exec or Privileged Exec modes to display information on OSPF neighbors. Include the process ID parameter with this command to display information about specified processes.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 ospf [<process-id>] neighbor <neighbor-id>
show ipv6 ospf [<process-id>] neighbor detail
show ipv6 ospf [<process-id>] neighbor <interface> [detail]
```

Parameter	Description
<process-id>	*<character string>* The ID of the OSPF process for which information will be displayed.
<neighbor-id>	The Neighbor ID, entered in IP address (A.B.C.D) format.
detail	Detail of all neighbors.
<interface>	IP address of the interface.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 ospf neighbor
```

Output **Figure 44-7: Example output from the show ipv6 ospf neighbor command**

```
awplus#show ipv6 ospf P1 neighbor 2.2.2.2
OSPFv3 Process (P1)
Neighbor ID     Pri       State                 Dead Time   Interface Instance ID
2.2.2.2         5         2-Way/DROther         00:00:33    vlan3              0
```

Figure 44-8: Example output from the show ipv6 ospf neighbor detail command

```
awplus#show ipv6 ospf neighbor detail
Neighbor 0.0.1.2, interface address fe80::215:77ff:fec9:7472
   In the area 0.0.0.0 via interface vlan2
   Neighbor priority is 1, State is Full, 6 state changes

show ipv6 ospf route

Use this command in User Exec or Privileged Exec modes to display the OSPF routing table. Include the process ID parameter with this command to display the OSPF routing table for specified processes.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 ospf [<process-id>] route`

Parameter	Description
<process-id>	A character string that specifies the router process. If this parameter is included, only the information for this specified routing process is displayed.

Mode User Exec and Privileged Exec

Examples To display the OSPF routing table, use the command:

```
awplus# show ipv6 ospf route
```

Output **Figure 44-9: Example output from the show ipv6 ospf P10 route command for a specific process**

```
OSPFv3 Process (P1)
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter
area
       E1 - OSPF external type 1, E2 - OSPF external type 2

   Destination                                        Metric
     Next-hop
O  2002:1111::/64                                        2
     via fe80::200:cdff:fe24:daae, vlan3, Area 0.0.0.0
C  2003:1111::/64                                        1
     directly connected, vlan3, Area 0.0.0.0
O  2004:1111::/64                                        3
     via fe80::200:cdff:fe24:daae, vlan3, Area 0.0.0.0
C  2005:1111::/64                                        1
     directly connected, vlan5, Area 0.0.0.0
E2 2010:2222::/64                                    1/20
     via 2003:1111::1, vlan3
E2 2011:2222::/64                                    1/20
     via 2003:1111::1, vlan3
E2 2012:2222::/64                                    1/20
     via 2003:1111::1, vlan3
E2 2013:2222::/64                                    1/20
     via 2003:1111::1, vlan3
E2 2014:2222::/64                                    1/20
     via 2003:1111::1, vlan3
E2 2015:2222::/64                                    1/20
     via 2003:1111::1, vlan3
```

show ipv6 ospf virtual-links

Use this command in User Exec or Privileged Exec modes to display virtual link information, including OSPFv3 Authentication status for virtual links.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 ospf virtual-links`

Mode User Exec and Privileged Exec

Usage See the section **OSPFv3 Virtual Links** in **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration** for introductory OSPFv3 Authentication and Encryption information.

Also see the section **Configuring OSPFv3 Authentication and Encryption for a Virtual Link** in **Chapter 43, OSPFv3 for IPv6 Introduction and Configuration** for configuration examples and topologies.

Examples To display virtual link information, use the command:

```
awplus# show ipv6 ospf virtual-links
```

Output **Figure 44-10: Example output from the show ipv6 ospf virtual-links command showing OSPFv3 Authentication configuration information highlighted in bold**

```
awplus#show ipv6 ospf virtual-links
 Virtual Link VLINK1 to router 192.168.1.10 is down
   Transit area 0.0.0.1 via interface *, instance ID 0
   Local address
   Remote address
 MD5 Authentication SPI 1000
 NULL encryption SHA-1 auth SPI 1001
   Transmit Delay is 1 sec, State Down,
   Timer intervals configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
     Hello due in inactive
     Adjacency state Down
```

Related Commands **area virtual-link authentication ipsec spi**
area virtual-link encryption ipsec spi

summary-address (IPv6 OSPF)

Use this command in Router Configuration mode to summarize, or possibly suppress, external redistributed OSPFv3 routes within the specified address range.

Use the **no** variant of this command in Router Configuration mode to stop summarizing, or suppressing, external redistributed OSPFv3 routes within the specified address range.

Syntax

```
summary-address <ipv6-addr/prefix-length>
   [not-advertise] [tag <0-4294967295>]

no summary-address <ipv6-addr/prefix-length>
   [not-advertise] [tag <0-4294967295>]
```

Parameter	Description
<ipv6-addr/prefix-length>	Specifies the base IPv6 address of the IPv6 summary address. The range of addresses given as IPv6 starting address and an IPv6 prefix length.
`not-advertise`	Set the **not-advertise** option if you do not want OSPFv3 to advertise either the summary address or the individual networks within the range of the summary address.
`tag <0-4294967295>`	The tag parameter specifies the tag value that OSPFv3 places in the AS external LSAs created as a result of redistributing the summary route. The tag overrides tags set by the original route.

Default The default tag value for a summary address is 0.

Mode Router Configuration

Usage An address range is a pairing of an address and a prefix length. Redistributing routes from other protocols into OSPFv3 requires the router to advertise each route individually in an external LSA. Use this command to advertise one summary route for all redistributed routes covered by a specified prefix to decrease the size of the OSPFv3 link state database.

For example, if the specified address range is 2001:0db8:44::/48, then summary-address functionality will match 2001:0db8:4400:0000::1/128 through 2001:0db8:44ff:ffff::1/128.

Ensure OSPFv3 routes exist in the summary address range for advertisement before using this command.

Example The following example uses the `summary-address` command to aggregate external LSAs that match the IPv6 prefix `2001:0db8::/32` and assigns a tag value of `3`.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# summary-address 2001:0db8::/32 tag 3
```

The following example uses the `no summary-address` command to stop summarizing IPv6 addresses in the address range covered within the IPv6 prefix `2001:0db8::/32`.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no summary-address 2001:0db8::/32
```

timers spf (IPv6 OSPF) (deprecated)

Use this command to adjust route calculation timers.

Use the **no** variant of this command to return to the default timer values.

Syntax

```
timers spf <spf-delay> <spf-holdtime>
no timers spf
```

Parameter	Description
<spf-delay>	*<0-2147483647>* Specifies the delay between receiving changed routing information and embarking on an SPF calculation.
<spf-holdtime>	*<0-2147483647>* Specifies the hold time between consecutive SPF calculations.

Default The default spf-delay value is 5 seconds. The default spf-holdtime value is 10 seconds.

Mode Router Configuration

Usage This command configures the delay time between the receipt of a topology change and the calculation of the Shortest Path First (SPF). This command also configures the hold time between two consecutive SPF calculations.

Examples

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# timers spf 7 12
```

Related Commands timers spf exp (IPv6 OSPF)

timers spf exp (IPv6 OSPF)

Use this command to adjust route calculation timers using exponential back-off delays.

Use **no** form of this command to return to the default exponential back-off timer values.

Syntax

```
timers spf exp <min-holdtime> <max-holdtime>
no timers spf exp <min-holdtime> <max-holdtime>
```

Parameter	Description
<min-holdtime>	*<0-2147483647>* Specifies the minimum delay between receiving a change to the SPF calculation in milliseconds. The default SPF min-holdtime value is 50 milliseconds.
<max-holdtime>	*<0-2147483647>* Specifies the maximum delay between receiving a change to the SPF calculation in milliseconds. The default SPF max-holdtime value is 50 seconds.

Mode Router Configuration

Usage This command configures the minimum and maximum delay time between the receipt of a topology change and the calculation of the Shortest Path First (SPF).

Examples To set the minimum delay time to 5 milliseconds and maximum delay time to 10 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# timers spf exp 5 20
```

Related Commands **timers spf (IPv6 OSPF) (deprecated)**

Chapter 45: Route Map Configuration

Introduction

This chapter introduces route maps for filtering in OSPF. For details about the commands used in these examples, or the outputs from validation commands, see **Chapter 46, Route Map Commands**.

Route maps offer a complex combination of match criteria and actions. They can be used to filter OSPF routes.

Structure of a route map

There are various levels of structure within a route map:

- A route map is an entity with a name
- Each route map consists of multiple entries, identified by sequence numbers
- Each entry can consist of multiple clauses

In effect, an entry defines an individual filter. It can have a **match** clause that defines what it will match on, and it can have multiple **set** clauses that can specify actions to be taken.

A route is matched against each entry in turn. Once an entry is found that matches the route, the action(s) associated with that entry is (are) performed, and no further entries are considered.

For example, if you create an entry that will permit a route, followed by an entry that would deny that route, the route is permitted. As another example, if you create two conflicting *set* clauses, the first change is applied, not the second.

There is an implicit "match all" filter at the end of the route map. The action on that implicit entry is **deny**. By default, any route that does not explicitly match any particular entry in the route map will be dropped.

You can change this by ending the route map with a "permit all" clause, such as the following:

```
awplus(config)# route-map <map-name> permit 65535
```

Clauses

There are two types of clauses that can be present in a route map entry:

- *match clauses*, which specify attributes or prefixes to match on
- *set clauses*, which specify the changes to be made to attribute values

A given route map entry can never have more than one match clause, but it can have multiple set clauses.

Configuring route maps for filtering and modifying OSPF routes

OSPF route maps can be applied to importing:

- OSPF-learnt routes into the main IP route table, or
- static or RIP routes into OSPF

Filtering **cannot**:

- remove an entry from the LSA database once the entry has been added
- prevent the switch from advertising an entry to interfaces in the same area that the entry is relevant to
- prevent updates that OSPF learns from being put into the LSA database
- change the properties of an entry in the LSA database

This is because OSPF shares LSAs between all the routers in an area. The protocol assumes that all the routers in the area have shared all the advertisements among each other, and that all agree on the state of the complete link state database for the area. If some routers in the area are learning, but not advertising, that breaks the OSPF model.

Configuring a match clause

A match clause can match on the following clauses.

When configuring a match clause, make sure you are in route map mode. The prompt should look like:

```
awplus(config-route-map)#
```

Metric

The entry will match all routes whose metric is equal to that specified in the clause.

To match a metric value, use the command:

```
match metric <value>
```

Interface

The entry will match all routes learnt via the specified VLAN.

To match a VLAN, use the command:

```
match interface <vlan>
```

External route type

The entry will match all routes of either Type 1 External or Type 2 External.

To match a route type, use the command:

```
match external {type-1|type-2}
```

A prefix, by using a prefix list

The entry will match one or more route prefixes.

Once you have made the prefix list, apply it to the match clause of a route map entry by using the command:

```
match ip address prefix-list <list-name>
```

A prefix, by using an ACL

An ACL is an alternative to a prefix list for matching route prefixes.

Once you have made the ACL, apply it to the match clause of a route map entry by using the command:

```
match ip address <acl-number-or-name>
```

A next hop address

The entry will match the route's next hop.

You can use either a prefix list or an ACL to specify a next hop address. Once you have made the prefix list or ACL, apply it to the match clause of a route map entry by using one of the commands:

```
match ip next-hop prefix-list <list-name>
```

```
match ip next-hop <acl-number-or-name>
```

Configuring a set clause

If a route matches the **match** clause, then the action of the route map entry will be applied to that route. The action might simply be to permit or deny the route, or it might be to update its parameters by applying one or more **set** clauses.

When configuring a set clause, make sure you are in route map mode for the same route map name sequence number as you used for the match clause. The prompt should look like:

```
awplus(config-route-map)#
```

A set clause can alter the following parameters on a route.

Metric This changes the route metric. You can:

- Set the metric, by using the command:

```
set metric <0-4294967295>
```

- Increase or decrease the metric by a specified amount, by using one of the commands:

```
set metric +<amount>
```

```
set metric -<amount>
```

For example, to increase the metric by 2, use the command:

```
set metric +2
```

Note defining the OSPF metric in a route map supersedes the metric defined using a **redistribute (OSPF)** or a **redistribute (IPv6 OSPF)** command.

See the section **OSPF Metrics** in the **OSPF Introduction and Configuration** chapter for more information about OSPF metrics.

See the section **OSPFv3 Metrics** in the **OSPFv3 for IPv6 Introduction and Configuration** chapter for more information about OSPFv3 metrics.

Next hop This specifies the next hop for matching routes.

Use the command:

```
set ip next-hop <ipadd>
```

Type This sets the route type to either Type 1 External or Type 2 External.

Use the command:

```
set metric-type {type-1|type-2}
```

Applying route maps in OSPF

To specify a route map to be applied to static, RIP or connected routes as they are imported to OSPF, use the commands:

```
router ospf
redistribute {rip|connected|static} route-map <map-name>
```

Note that if you want to filter OSPF routes as they are imported into the main IP route table, you need to use a distribute filter instead of a route map.

Use commands like the following:

```
router ospf 88
distribute-list list1 in
```

Chapter 46: Route Map Commands

Command List

This chapter provides an alphabetical reference for route map commands. These commands can be divided into the following categories:

- **route-map** command, used to create a route map and/or route map entry, and to put you into route map mode
- **match** commands, used to determine which routes the route map applies to
- **set** commands, used to modify matching routes

match interface

Use this command to add an interface match clause to a route map entry. Specify the interface name to match.

A route matches the route map if its interface matches the interface name.

Each entry of a route map can only match against one interface in one interface match clause. If the route map entry already has an interface match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the interface match clause from the route map entry. Use the **no** variant of this command without a specified interface to remove all interfaces.

Syntax

```
match interface <interface>
no match interface [<interface>]
```

Parameter	Description
<interface>	The VLAN to match, e.g. `vlan2`.

Mode Route-map Configuration

Usage This command is valid for RIP and OSPF routes only.

Example To add entry `10` to the route map called `mymap1`, which will process routes if they use the interface `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match interface vlan1
```

To remove all interfaces from the route map called `mymap1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# no match interface
```

Related Commands

match ip address
match ip next-hop
match route-type
match tag
route-map
show route-map

match ip address

Use this command to add an IP address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map entry if the route's prefix matches the access list or prefix list.

Each entry of a route map can have at most one access list-based IP address match clause and one prefix list-based IP address match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks routes for a given prefix. The route map action and its **set** clauses determine what the route map does with routes that contain that prefix.

Use the **no** variant of this command to remove the IP address match clause from a route map entry. To remove a prefix list-based match clause you must also specify the **prefix-list** parameter.

Syntax

```
match ip address {<accesslistID>|prefix-list <prefix-listname>}
no match ip address [<accesslistID>]
no match ip address prefix-list <prefix-listname>
```

Parameter	Description
<accesslistID>	{*<access-list-name>*|<1-199>|<1300-2699>} The IP access list name or number.
<access-list-name>	The IP access list name.
<1-199>	The IP access list number.
<1300-2699>	The IP access list number (expanded range).
prefix-list	Use an IP prefix list to specify which prefixes to match.
<prefix-listname>	The prefix list name.

Mode Route-map Configuration

Usage The `match ip address` command specifies the IP address to be matched. If there is a match for the specified IP address, and `permit` is specified, the route is redistributed or controlled, as specified by the set action. If the match criteria are met, and `deny` is specified then the route is `not` redistributed or controlled. If the match criteria are `not` met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

This command is valid for OSPF and RIP routes.

Examples

To add entry `3` to the route map called `myroute`, which will process routes that match the ACL called `List1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match ip address List1
```

To add entry `3` to the route map called `rmap1`, which will process routes that match the prefix list called `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip address prefix-list mylist
```

Related Commands

access-list (extended numbered)
access-list (standard numbered)
ip prefix-list
route-map
show ip access-list
show route-map

match ip next-hop

Use this command to add a next-hop match clause to a route map entry. You can specify the next hop to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map if the route's next hop matches the access list or prefix list.

Each entry of a route map can have at most one access list-based next-hop match clause and one prefix list-based next-hop match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks routes for a given next-hop value. The route map action and its **set** clauses determine what the route map does with routes that contain that next hop.

Use the **no** variant of this command to remove the next-hop match clause from a route map entry. To remove a prefix list-based match clause you must also specify the prefix-list parameter.

Syntax

```
match ip next-hop {<accesslistID>|prefix-list <prefix-listname>}
no match ip next-hop [<accesslistID>]
no match ip next-hop prefix-list [<prefix-listname>]
```

Parameter	Description
<accesslistID>	{*<access-list-name>*|<1-199>|<1300-2699>} The IP access list name or number.
<access-list-name>	The IP access list name.
<1-199>	The IP access list number.
<1300-2699>	The IP access list number (expanded range).
prefix-list	Use an IP prefix list to specify which next hop to match.
<prefix-listname>	The prefix list name.

Mode Route-map Configuration

Usage This command is valid for OSPF and RIP routes.

Examples To add entry 3 to the route map called rmap1, which will process routes whose next hop matches the ACL called mylist, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip next-hop mylist
```

To add entry `3` to the route map called `mymap`, which will process routes whose next hop matches the prefix list called `list1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# match ip next-hop prefix-list list1
```

Related Commands

access-list (extended numbered)
access-list (standard numbered)
ip prefix-list
route-map
show ip access-list
show ip prefix-list
show route-map

match ipv6 address

Use this command to specify the match address of route.

Use the **no** variant of this command to remove the `match ipv6 address` entry.

Syntax

```
match ipv6 address {<access-list-name>|prefix-list <prefix-listname>}
no match ipv6 address [<access-list-name>|prefix-list <prefix-
    listname>]
```

Parameter	Description
<access-list-name>	The name of the IPv6 access list that specifies criteria for the addresses to match. Valid only with RIPng.
<prefix-listname>	The name of the IPv6 prefix list that specifies criteria for the addresses to be matched. Valid only with RIPng.

Mode Route-map Configuration

Usage The **match ipv6 address <access-list>** command specifies the IPv6 address to be matched. If there is a match for the specified IPv6 address, and `permit` is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The **match ipv6 address prefix-list** command specifies the entries of prefix-lists to be matched. If there is a match for the specified prefix-list entries, and `permit` is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

Examples

```
awplus# configure terminal
awplus(config)# route-map rmap1 deny 1
awplus(config-route-map)# match ipv6 address rmap1

awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 address prefix-list mylist
```

match metric

Use this command to add a metric match clause to a route map entry. Specify the metric value to match.

A route matches the route map if its metric matches the route map's metric.

Each entry of a route map can only match against one metric value in one metric match clause. If the route map entry already has a metric match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the metric match clause from the route map entry.

Syntax

```
match metric <metric>
no match metric [<metric>]
```

Parameter	Description
<metric>	*<0-4294967295>* Specifies the metric value.

Mode Route-map Configuration

Usage This command is valid for OSPF and RIP routes.

Example To stop entry `3` of the route map called `myroute` from processing routes with a metric of `888999`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no match metric 888999
```

Related Commands

route-map
set metric
show route-map

match route-type

Use this command to add an external route-type match clause to a route map entry. Specify whether to match OSPF type-1 external routes or OSPF type-2 external routes.

An OSPF route matches the route map if its route type matches the route map's route type.

Each entry of a route map can only match against one route type in one match clause. If the route map entry already has a route type match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the route type match clause from the route map entry.

Syntax

```
match route-type external {type-1|type-2}
no match route-type external [type-1|type-2]
```

Parameter	Description
type-1	OSPF type-1 external routes.
type-2	OSPF type-2 external routes.

Mode Route-map Configuration

Usage Use the **match route-type external** command to match specific external route types. AS-external LSA is either Type-1 or Type-2. **external type-1** matches only Type 1 external routes, and **external type-2** matches only Type 2 external routes.

This command is valid for OSPF routes only.

Example To add entry `10` to the route map called `mymap1`, which will process type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match route-type external type-1
```

Related Commands

match interface
match ip address
match ip next-hop
match tag
route-map
set metric-type
show route-map

match tag

Use this command to add a tag match clause to a route map entry. Specify the route tag value to match.

An OSPF route matches the route map if it has been tagged with the route map's tag value. Routes can be tagged through OSPF commands or through another route map's set clause.

Each entry of a route map can only match against one tag in one match clause. If the route map entry already has a tag match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the tag match clause from the route map entry.

Syntax

```
match tag <0-4294967295>
no match tag [<0-4294967295>]
```

Mode Route-map Configuration

Usage This command is valid for OSPF routes only.

Example To add entry 10 to the route map called `mymap1`, which will process routes that are tagged `100`, use the following commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
```

Related Commands

match interface
match ip address
match ip next-hop
match route-type
route-map
set tag
show route-map

route-map

Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes.

The switch uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

Syntax

```
route-map <mapname> {deny|permit} <seq>
no route-map <mapname>
no route-map <mapname> {deny|permit} <seq>
```

Parameter	Description
<mapname>	A name to identify the route map.
`deny`	The route map causes a routing process to discard matching routes.
`permit`	The route map causes a routing process to use matching routes.
<seq>	<1-65535> The sequence number of the entry. You can use this parameter to control the order of entries in this route map.

Mode Global Configuration

Usage Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols

When a routing protocol passes a route through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route. This means that route maps end with an implicit deny entry. To permit all non-matching routes, end your route map with an entry that has an action of **permit** and no match clause.

Examples To enter route-map mode for entry 2 of the route map called `route1`, and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface vlan2
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

Related Commands

show route-map

For OSPF:
distribute-list (OSPF)
default-information originate (OSPF)
redistribute (OSPF)

For RIP:
redistribute (RIP)

set ip next-hop (route map)

Use this command to add a next-hop set clause to a route map entry.

When a route matches the route map entry, the device sets the route's next hop to the specified IP address.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set ip next-hop <ip-address>
no set ip next-hop [<ip-address>]
```

Parameter	Description
<ip-address>	The IP address of the next hop, entered in the form A.B.C.D.

Mode Route-map Configuration

Usage Use this command to set the next-hop IP address to the routes.

This command is valid for OSPF and RIP routes.

Example To use entry 3 of the route map called `mymap` to give matching routes a next hop of 10.10.0.67, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# set ip next-hop 10.10.0.67
```

Related Commands
match ip next-hop
route-map
show route-map

set metric

Use this command to add a metric set clause to a route map entry.

When a route matches the route map entry, the device takes one of the following actions:

- changes the metric to the specified value, or
- adds or subtracts the specified value from the metric, if you specify **+** or **-** before the value (for example, to increase the metric by 2, enter +2)

Use the **no** variant of this command to remove the set clause.

Syntax

```
set metric {+<metric-value>|-<metric-value>|<metric-value>}
no set metric [+<metric-value>|-<metric-value> |<metric-value>]
```

Parameter	Description
+	Increase the metric by the specified amount.
–	Decrease the metric by the specified amount.
<metric-value>	<0-4294967295> The new metric value, or the amount by which to increase or decrease the existing value.

Default The default metric value for routes redistributed into OSPF and OSPFv3 is 20.

Mode Route-map Configuration

Usage This command is valid for OSPF and RIP routes.

Note that defining the OSPF metric in a route map supersedes the metric defined using a **redistribute (OSPF)** or a **redistribute (IPv6 OSPF)** command.

See the section **OSPF Metrics** in the **OSPF Introduction and Configuration** chapter for more information about OSPF metrics, and see the section **OSPFv3 Metrics** in the **OSPFv3 for IPv6 Introduction and Configuration** chapter for more information about OSPFv3 metrics.

Examples To use entry `3` of the route map called `rmap1` to give matching routes a metric of `600`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric 600
```

To use entry 3 of the route map called rmap1 to increase the metric of matching routes by 2, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric +2
```

Related Commands

match metric
route-map
show route-maps

set metric-type

Use this command to add a metric-type set clause to a route map entry.

When a route matches the route map entry, the device sets its route type to the specified value.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set metric-type {type-1|type-2}
no set metric-type [type-1|type-2]
```

Parameter	Description
`type-1`	Redistribute matching routes into OSPF as type-1 external routes.
`type-2`	Redistribute matching routes into OSPF as type-2 external routes.

Mode Route-map Configuration

Usage This command is valid for OSPF routes only.

Example To use entry `3` of the route map called `rmap1` to redistribute matching routes into OSPF as type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric-type 1
```

Related Commands

default-information originate (OSPF)
redistribute (OSPF)
match route-type
route-map
show route-map

set tag

Use this command to add a tag set clause to a route map entry.

When a route matches the route map entry, the device sets its tag to the specified value when it redistributes the route into OSPF.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set tag <tag-value>
no set tag [<tag-value>]
```

Parameter	Description
<tag-value>	*<0-4294967295>* Value to tag matching routes with.

Mode Route-map Configuration

Usage This command is valid only when redistributing routes into OSPF.

Example To use entry 3 of the route map called `rmap1` to tag matching routes with the number 6, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set tag 6
```

Related Commands

default-information originate (OSPF)
redistribute (OSPF)
match tag
route-map
show route-map

show route-map

Use this command to display information about one or all route maps.

Syntax `show route-map <map-name>`

Parameter	Description
<map-name>	A name to identify the route map.

Mode User Exec and Privileged Exec

Example To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

Output **Figure 46-1: Example output from the show route-map command**

```
route-map example-map, permit, sequence 1

Part 4: Multicast Applications

Chapter 47: Multicast Introduction and Commands

Multicast Introduction

Multicasting is a technique developed to send packets from one location in a network to many other locations without any unnecessary packet duplication. In multicasting, one packet is sent from a source and is replicated as needed in the network to reach as many end-users as necessary.

Multicasting is different from broadcasting; while broadcast packets are sent to every possible receiver, multicast packets need only be forwarded to receivers that want them. The benefit of this technique is bandwidth conservation - it is the most economical technique for sending a packet stream to many locations simultaneously.

The IPv4 and IPv6 addressing for multicast packets works differently from unicast and broadcast packets. A multicast stream sends packets out with a destination IPv4 or IPv6 address that identifies a specific multicast group. It does not at all specify an end host, like unicast; or a whole subnet, like broadcast.

This makes multicasting a connectionless process. The server simply sends out its multicast UDP packets, with no idea who will receive them, or whether they are successfully received. In an IPv4 network, IGMP allows hosts to tell the network that they wish to receive a multicast stream, using the Internet Group Management Protocol (IGMP). This is a Layer 3 protocol; however Layer 2 switches can also conserve bandwidth within their LAN by using IGMP snooping to track which hosts require the data stream. For more information about IGMP and IGMP snooping, see **Chapter 48, IGMP and IGMP Snooping Introduction**.

Similar to IGMP for IPv4, Multicast Listener Discovery (MLD) for IPv6 is used to exchange membership status information between IPv6 routers that support multicasting and members of multicast groups on a network segment. Host membership in a multicast group is reported by individual member hosts, and membership status is periodically polled by multicast routers. For an overview of MLD and MLD command descriptions, see **Chapter 56, MLD and MLD Snooping Introduction and Commands**.

Note

IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Note

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306.The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Note

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

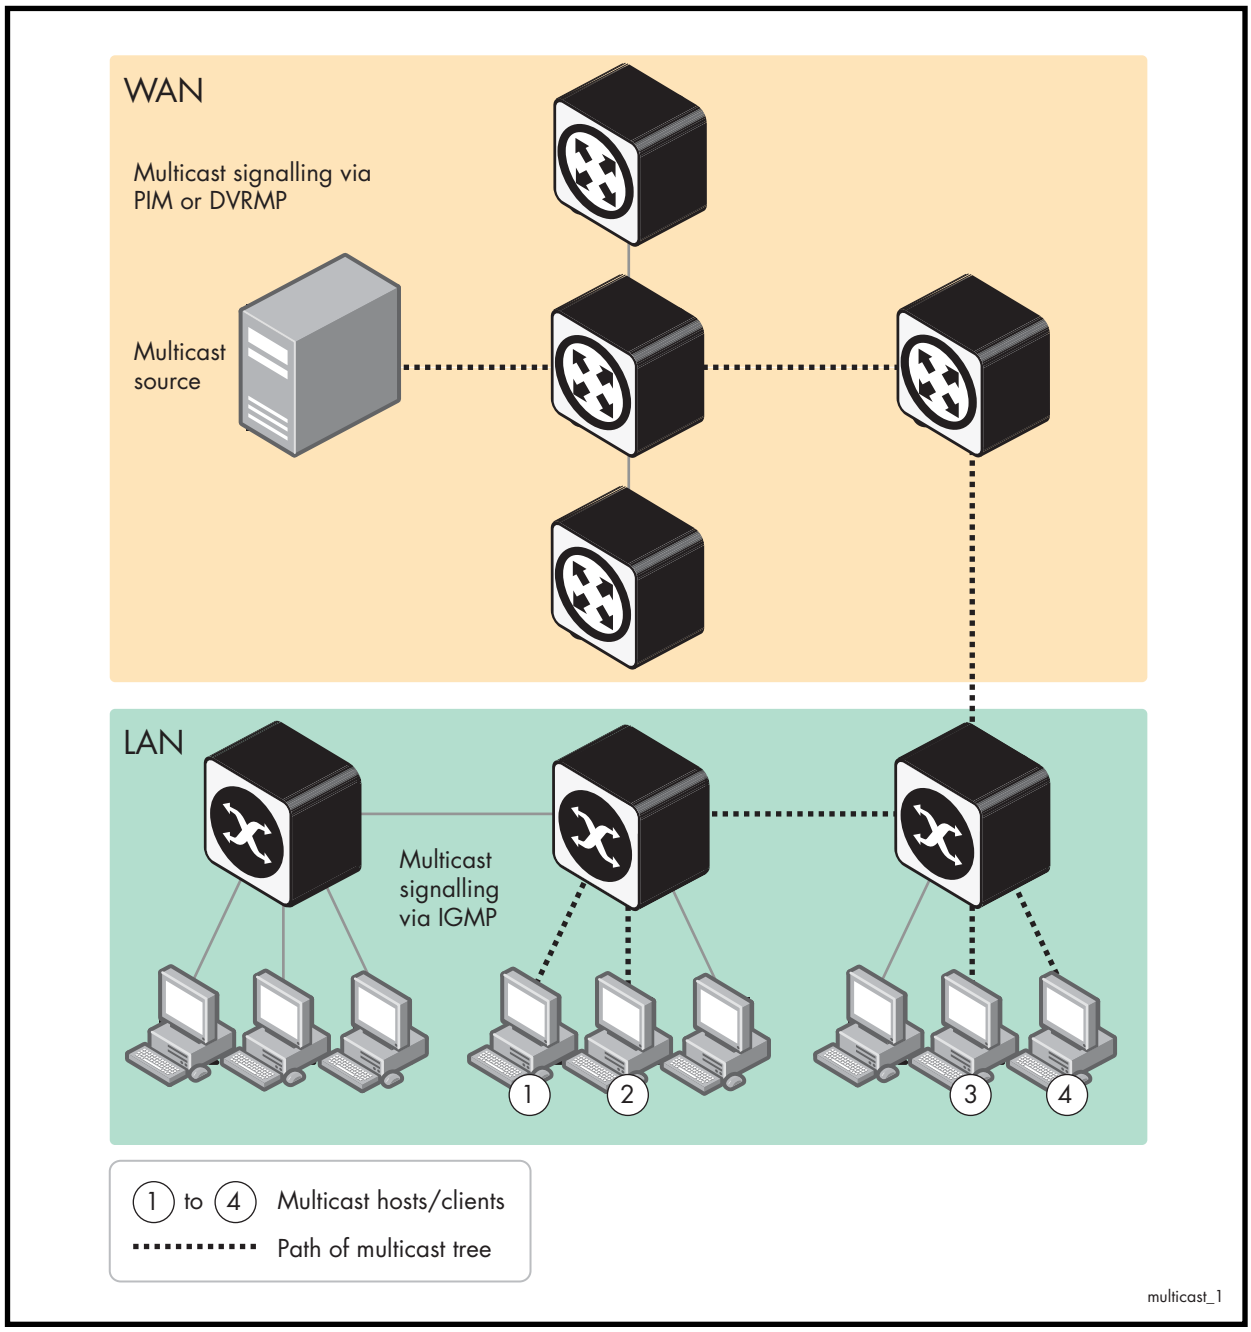
Multicast groups

The concept of a group is crucial to multicasting. A group is the set of hosts that wish to receive a particular multicast stream, and is identified by a multicast IP address at Layer 3 and matching multicast MAC address at Layer 2. The multicast sender transmits the stream to the group address, and only members of the group can receive the multicast data.

Components in a multicast network

There are several protocols and roles required in a multicast network, as shown in **Figure 47-1 on page 47.4**. This section describes the end-to-end process of transporting multicast data through a network.

Figure 47-1: Components in a multicast network



At the two ends of a multicast data transmission are:

- **the source**
  This is typically a server or video encoder. It sends the stream of multicast data out through its network interface. It is unaware of where the recipients of the stream are, or if there are any recipients.
- **the recipients**
  These are storage or display devices, such as PCs, set-top boxes, or security video archivers. The recipients signal their desire to receive a particular multicast stream by sending out IGMP messages requesting the stream.

The role of the network in-between is to deliver the multicast stream to the recipients as efficiently as possible. The devices achieve this by exchanging signalling information between themselves in order to establish a forwarding path along which the multicast stream will flow. Each node informs the next node up the chain that it needs to receive the multicast stream. Once this series of requests reaches the router nearest the multicast source, then that router will start to forward the stream. All the nodes between the source and the recipients are ready to forward the stream, due to their having received the signalled requests. In this way, the stream is efficiently forwarded right through to the recipients.

The type of signalling that the network uses falls into two categories:

- in the local area network where the recipients are located, the signalling consists of the exchange of IGMP or MLD packets.
- as soon as the signalling needs to leave the VLAN containing the recipients and cross into other VLANs and subnets, then a Layer 3 multicasting protocol like PIM is used between the routers in the Layer 3 network.

In every Layer 2 multicast network, there needs to be a device that is sending IGMP or MLD queries into the network. This is essential to maintain multicast flows once they have been established (see **"Staying in the multicast group (Query message)" on page 48.4** for more information). Typically, the device that is configured to send the queries is the router that is the gateway from the local network into a Layer 3 network.

Command List

This chapter provides an alphabetical reference of multicast commands common to PIM Sparse Mode and PIM Dense Mode. See also **Chapter 56, MLD and MLD Snooping Introduction and Commands**, **Chapter 55, PIM-DM Commands**, **Chapter 51, PIM-SM Commands** and **Chapter 49, IGMP and IGMP Snooping Commands**.

Note

IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Note

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306.The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Note

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

clear ip mroute

Use this command to delete entries from the IPv4 multicast routing table.

Note If you use this command, you should also use the **clear ip igmp group** command to clear IGMP group membership records.

Syntax

```
clear ip mroute {*|<ipv4-group-address> [<ipv4-source-address>]}
   [pim sparse-mode]
```

Parameter	Description
*	Deletes all multicast routes.
<ipv4-group-address>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-source-address>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
pim sparse-mode	Clear specified IPv4 multicast route(s) for PIM Sparse Mode only.

Mode Privileged Exec

Usage When this command is used, the Multicast Routing Information Base (MRIB) clears the IPv4 multicast route entries in its IPv4 multicast route table, and removes the entries from the multicast forwarder. The MRIB sends a “clear” message to the multicast protocols. Each multicast protocol has its own “clear” multicast route command. The protocol-specific “clear” command clears multicast routes from PIM Sparse Mode, and also clears the routes from the MRIB.

Examples

```
awplus# clear ip mroute 225.1.1.1 192.168.3.3
```

```
awplus# clear ip mroute *
```

Related Commands **ip multicast route**
show ip mroute

clear ip mroute statistics

Use this command to delete multicast route statistics entries from the IP multicast routing table.

Syntax `clear ip mroute statistics {*|<ipv4-group-addr> [<ipv4-source-addr>]}`

Parameter	Description
*	All multicast route entries.
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format `A.B.C.D`.
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format `A.B.C.D`.

Mode Privileged Exec

Example

```
awplus# clear ip mroute statistics 225.1.1.2 192.168.4.4

awplus# clear ip mroute statistics *
```

clear ipv6 mroute

Use this command to delete one or more dynamically-added route entries from the IPv6 multicast routing table. You need to do this, for example, if you want to create a static route instead of an existing dynamic route.

Syntax `clear ipv6 mroute {*|<ipv6-group-address> [<ipv6-source-address>]}`

Parameter	Description
*	Deletes all dynamically-learnt IPv6 multicast routes.
<ipv6-group-address>	Group IPv6 address, in hexadecimal notation in the format `X.X::X.X`.
<ipv6-source-address>	Source IPv6 address, in hexadecimal notation in the format `X.X::X.X`.

Mode Privileged Exec

Usage When this command is used, the Multicast Routing Information Base (MRIB) clears the relevant IPv6 multicast route entries in its IPv6 multicast route table, and removes the entries from the multicast forwarder. The MRIB sends a "clear" message to the multicast protocols. Each multicast protocol has its own "clear" multicast route command.

This command does not remove static routes from the routing table or the configuration. To remove static routes, use the `no` parameter of the command **ipv6 multicast route**.

Example

```
awplus# clear ipv6 mroute 2001::2 ff08::1
```

Related Commands **ipv6 multicast route**
show ipv6 mroute

clear ipv6 mroute statistics

Use this command to delete multicast route statistics entries from the IPv6 multicast routing table.

Note Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax

```
clear ipv6 mroute statistics {*|<ipv6-group-address>
   [<ipv6-source-address>]}
```

Parameter	Description
*	All multicast route entries.
<ipv6-group-addr>	Group IPv6 address, in hexadecimal notation in the format `X.X::X.X`.
<ipv6-source-addr>	Source IPv6 address, in hexadecimal notation in the format `X.X::X.X`.

Mode Privileged Exec

Examples

```
awplus# clear ipv6 mroute statistics 2001::2 ff08::1
```

```
awplus# clear ipv6 mroute statistics *
```

debug nsm mcast

Use this command to debug IPv4 events in the Multicast Routing Information Base (MRIB).

Syntax

```
debug nsm mcast
   {all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}
```

Parameter	Description
`all`	All IPv4 multicast debugging.
`fib-msg`	Forwarding Information Base (FIB) messages.
`mrt`	Multicast routes.
`mtrace`	Multicast traceroute.
`mtrace-detail`	Multicast traceroute detailed debugging.
`register`	Multicast PIM register messages.
`stats`	Multicast statistics.
`vif`	Multicast interface.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# debug nsm mcast all

awplus# configure terminal
awplus(config)# debug nsm mcast fib-msg

awplus# configure terminal
awplus(config)# debug nsm mcast mrt

awplus# configure terminal
awplus(config)# debug nsm mcast mtrace

awplus# configure terminal
awplus(config)# debug nsm mcast mtrace-detail

awplus# configure terminal
awplus(config)# debug nsm mcast register

awplus# configure terminal
awplus(config)# debug nsm mcast stat

awplus# configure terminal
awplus(config)# debug nsm mcast vif
```

debug nsm mcast6

Use this command to debug IPv6 events in the Multicast Routing Information Base (MRIB).

Syntax

```
debug nsm mcast6
   {all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}
```

Parameter	Description
`all`	All IPv4 multicast debugging.
`fib-msg`	Forwarding Information Base (FIB) messages.
`mif`	Multicast interfaces.
`mrt`	Multicast routes.
`register`	Multicast PIM register messages.
`stats`	Multicast statistics.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 all

awplus# configure terminal
awplus(config)# debug nsm mcast6 fib-msg

awplus# configure terminal
awplus(config)# debug nsm mcast6 mif

awplus# configure terminal
awplus(config)# debug nsm mcast6 mrt

awplus# configure terminal
awplus(config)# debug nsm mcast6 register

awplus# configure terminal
awplus(config)# debug nsm mcast6 stats
```

ip mroute

Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv4 multicast source.

Use the **no** variant of this command to delete a route to an IPv4 multicast source.

Syntax

```
ip mroute [vrf <vrf-name>] <ipv4-source-address/mask-length>
    [bgp|ospf|rip|static] <rpf-address> [<admin-distance>]

no ip mroute [vrf <vrf-name>] <ipv4-source-address/mask-length>
    [bgp|ospf|rip|static]
```

Parameter	Description
<ipv4-source-address/mask-length>	A multicast source IPv4 address and mask length, in dotted decimal notation in the format `A.B.C.D/M`.
`ospf`	OSPF unicast routing protocol.
`rip`	RIP unicast routing protocol.
`static`	Specifies a static route.
<rpf-address>	`A.B.C.D` The closest known address on the multicast route back to the specified source. This host IPv4 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the nexthop address on the path to this host.
<admin-distance>	The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is `0` and the range available is `0-255`.

Mode Global Configuration

Usage Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to an IPv4 multicast source, it uses the unicast route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the switch with “multicast routes” back to given sources. When performing the RPF check on a stream from a given IPv4 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest administrative distance - whether a static “multicast route” or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term “multicast route” does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

Examples

The following example creates a static multicast IPv4 route back to the sources in the `10.10.3.0/24` subnet. The multicast route is via the host `192.168.2.3`, and has an administrative distance of `2`:

```
awplus# configure terminal
awplus(config)# ip mroute 10.10.3.0/24 static 2 192.168.2.3 2
```

The following example creates a static multicast IPv4 route back to the sources in the `192.168.3.0/24` subnet. The multicast route is via the host `10.10.10.50`. The administrative distance on this route has the default value of `0`:

```
awplus# configure terminal
awplus(config)# ip mroute 192.168.3.0/24 10.10.10.50
```

Validation Commands

show ip rpf

ip multicast forward-first-packet

Use this command to enable multicast to forward the first multicast packets coming to the device.

Use the **no** variant of this command to disable this feature.

Syntax

```
ip multicast forward-first-packet
no ip multicast forward-first-packet
```

Default By default, this feature is disabled.

Mode Global Configuration

Usage If this command is enabled, the device will forward the first packets in a multicast stream that create the multicast route, possibly causing degradation in the quality of the multicast stream, such as the pixilation of video and audio data.

If you use this command, ensure that the **ip igmp snooping** command is enabled, the default setting, otherwise the device will not process the first packets of the multicast stream correctly.

Examples To enable the forwarding of the first multicast packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-first-packet
```

To disable the forwarding of the first multicast packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast forward-first-packet
```

ip multicast route

Use this command to add an IPv4 static multicast route for a specific multicast source and group IPv4 address to the multicast Routing Information Base (RIB). This IPv4 multicast route is used to forward multicast traffic from a specific source and group ingressing on an upstream VLAN to a single or range of downstream VLANs.

Use the **no** variant of this command to either remove an IPv4 static multicast route set with this command or to remove a specific downstream VLAN interface from an IPv4 static multicast route for a specific multicast source and group IPv4 address.

Syntax

```
ip multicast route <ipv4-source-addr> <ipv4-group-addr>
   <upstream-vlan-id> [<downstream-vlan-id>]

no ip multicast route <ipv4-source-addr> <ipv4-group-addr>
   [<upstream-vlan-id> <downstream-vlan-id>]
```

Parameter	Description
`<ipv4-source-addr>`	Source IPv4 address, in dotted decimal notation in the format `A.B.C.D`.
`<ipv4-group-addr>`	Group IPv4 address, in dotted decimal notation in the format `A.B.C.D`.
`<upstream-vlan-id>`	Upstream VLAN interface on which the multicast packets ingress.
`<downstream-vlan-id>`	Downstream VLAN interface or range of VLAN interfaces to which the multicast packets are sent.

Default By default, this feature is disabled.

Mode Global Configuration

Usage Only one multicast route entry per IPv4 address and multicast group can be specified. Therefore, if one entry for a static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists you cannot create a static multicast route with same source IPv4 address, group IPv4 address, upstream VLAN and downstream VLANs. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to timeout or clear the dynamic multicast route with the **clear ip mroute** command.

To update an existing static multicast route entry with more or a new set of downstream VLANs, you must firstly remove the existing static multicast route and then add the new static multicast route with all downstream VLANs specified. If you attempt to update an existing static multicast route entry with an additional VLAN or VLANs an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream VLAN are dropped rather than forwarded, do not specify the optional *`<downstream-vlan-id>`* parameter when entering this command.

To remove a specific downstream VLAN from an existing static multicast route entry, specify the VLAN you want to remove with the <*downstream-vlan-id*> parameter when entering the **no** variant of this command.

Examples

To create a static multicast route for the multicast source IPv4 address `2.2.2.2` and group IPv4 address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN interface as `vlan20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20
```

To create a blackhole route for the multicast source IPv4 address `2.2.2.2` and group IPv4 address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
```

To create an IPv4 static multicast route for the multicast source IPv4 address `2.2.2.2` and group IP address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN range as `vlan20-25`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20-25
```

To remove the downstream VLAN `23` from the IPv4 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
vlan10 vlan23
```

To delete an IPv4 static multicast route for the multicast source IP address `2.2.2.2` and group IP address `224.9.10.11`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
```

Related Commands

clear ip mroute
show ip mroute

ip multicast route-limit

Use this command to limit the number of multicast routes that can be added to an IPv4 multicast routing table.

Use the **no** variant of this command to return the IPv4 route limit to the default.

Syntax

```
ip multicast route-limit <limit> [<threshold>]
no ip multicast route-limit
```

Parameter	Description
<limit>	*<1-2147483647>* Number of routes.
<threshold>	*<1-2147483647>* Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit.

Default The default limit and threshold value is 2147483647.

Mode Global Configuration

Usage This command limits the number of multicast IPv4 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

Examples

```
awplus# configure terminal
awplus(config)# ip multicast route-limit 34 24

awplus# configure terminal
awplus(config)# no ip multicast route-limit
```

ip multicast wrong-vif-suppression

Use this command to prevent unwanted multicast packets received on an unexpected VLAN being trapped to the CPU.

Use the **no** variant of this command to disable wrong VIF suppression.

Syntax

```
ip ip multicast wrong-vif-suppression
no ip multicast wrong-vif-suppression
```

Default By default, this feature is disabled.

Mode Global Configuration

Usage Use this command if there is excessive CPU load and multicast traffic is enabled. To confirm that VIF messages are being sent to the CPU use the **debug nsm mcast6** command.

Examples To enable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast wrong-vif-suppression
```

To disable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast wrong-vif-suppression
```

ip multicast-routing

Use this command to turn on/off IPv4 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv4 multicast routing after enabling it. Note the default stated below.

Syntax

```
ip multicast-routing
no ip multicast-routing
```

Default By default, IPv4 multicast routing is off.

Mode Global Configuration

Usage When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), stops IGMP operation, and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

Example

```
awplus# configure terminal
awplus(config)# ip multicast-routing
```

Validation Commands **show running-config**

ipv6 multicast route

Use this command to add an IPv6 static multicast route for a specific multicast source and group IPv6 address to the multicast Routing Information Base (RIB). This IPv6 multicast route is used to forward IPv6 multicast traffic from a specific source and group ingressing on an upstream VLAN to a single or range of downstream VLANs.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to either remove an IPv6 static multicast route set with this command or to remove a specific downstream VLAN interface from an IPv6 static multicast route for a specific IPv6 multicast source and group address.

Syntax

```
ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>
    <upstream-vlan-id> [<downstream-vlan-id>]

no ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>
    [<upstream-vlan-id> <downstream-vlan-id>]
```

Parameter	Description
<ipv6-source-addr>	Source IPv6 address, in dotted decimal notation in the format X.X::X.X.
<ipv6-group-addr>	Group IP address, in dotted decimal notation in the format X.X::X.X.
<*upstream-vlan-id*>	Upstream VLAN interface on which the multicast packets ingress.
<*downstream-vlan-id*>	Downstream VLAN interface or range of VLAN interfaces to which the multicast packets are sent.

Default By default, no static routes exist.

Mode Global Configuration

Usage Only one multicast route entry per IPv6 address and multicast group can be specified. Therefore, if one entry for an IPv6 static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists, you cannot create a static multicast route with the same source IPv6 address and group IPv6 address. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to time out or clear the dynamic multicast route with the **clear ipv6 mroute** command.

To update an existing IPv6 static multicast route entry with new or additional downstream VLANs, you must firstly remove the existing static multicast route and then add the new static multicast route with all downstream VLANs specified. If you attempt to update an existing static multicast route entry with an additional VLAN or VLANs an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream VLAN are dropped rather than forwarded, do not specify the optional <*downstream-vlan-id*> parameter when entering this command.

To remove a specific downstream VLAN from an existing static multicast route entry, specify the VLAN you want to remove with the <*downstream-vlan-id*> parameter when entering the **no** variant of this command.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if `port1.0.1` and `port1.0.14` are ports on an EPSR data VLAN `vlan101`, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

Output

Figure 47-2: Example ipv6 mld snooping mrouter commands when static IPv6 multicast routing is being used and the destination VLAN is an ESPR data VLAN:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.14
```

See **ipv6 mld snooping mrouter** for a command description and command examples.

Examples

To create an IPv6 static multicast route for the multicast source IPv6 address `2001::1` and group IPv6 address `ff08::1`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN interface as `vlan20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20
```

To create a blackhole route for the IPv6 multicast source IP address `2001::1` and group IP address `ff08::1`, specifying the upstream VLAN interface as `vlan10`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
```

To create an IPv6 static multicast route for the multicast source IPv6 address `2001::1` and group IPv6 address `ff08::1`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN range as `vlan20-25`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20-25
```

To remove the downstream VLAN `23` from the IPv6 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1 vlan10
vlan23
```

To delete an IPv6 static multicast route for the multicast source IPv6 address `2001::1` and group IPv6 address `ff08::1`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1
```

Related Commands

clear ipv6 mroute
ipv6 mld snooping mrouter
show ipv6 mroute

ipv6 multicast route-limit

Use this command to limit the number of multicast routes that can be added to an IPv6 multicast routing table.

Use the **no** variant of this command to return the IPv6 route limit to the default.

Syntax

```
ipv6 multicast route-limit <limit> [<threshold>]
no ipv6 multicast route-limit
```

Parameter	Description
<limit>	*<1-2147483647>* Number of routes.
<threshold>	*<1-2147483647>* Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit.

Default The default limit and threshold value is 2147483647.

Mode Global Configuration

Usage This command limits the number of multicast IPv6 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 multicast route-limit 34 24

awplus# configure terminal
awplus(config)# no ipv6 multicast route-limit
```

ipv6 multicast-routing

Use this command to turn on/off IPv6 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv6 multicast routing after enabling it. Note the default stated below.

Syntax

```
ipv6 multicast-routing
no ipv6 multicast-routing
```

Default By default, IPv6 multicast routing is off.

Mode Global Configuration

Usage When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT, and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 multicast-routing

awplus# configure terminal
awplus(config)# no ipv6 multicast-routing
```

Validation Commands show running-config

multicast

Use this command to enable a switch port to route multicast packets that ingress the port.

Use the **no** variant of this command to stop the switch port from routing multicast packets that ingress the port. Note that this does not affect Layer 2 forwarding of multicast packets. If you enter **no multicast** on a port, multicast packets received on that port will not be forwarded to other VLANs, but ports in the same VLANs as the receiving port will still receive the multicast packets.

Syntax

```
multicast
no multicast
```

Default By default, all switch ports route multicast packets.

Mode Interface Configuration

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# multicast
```

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no multicast
```

Validation Commands **show running-config**

show ip mroute

Use this command to display the contents of the IPv4 multicast routing (mroute) table.

Syntax

```
show ip mroute [<ipv4-group-addr>] [<ipv4-source-addr>] [{dense|
   sparse] [{count|summary}]
```

Parameter	Description
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format `A.B.C.D`.
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format `A.B.C.D`.
`dense`	Display dense IPv4 multicast routes.
`sparse`	Display sparse IPv4 multicast routes.
`count`	Display the route and packet count from the IPv4 multicast routing (mroute) table.
`summary`	Display the contents of the IPv4 multicast routing (mroute) table in an abbreviated form.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip mroute 10.10.3.34 224.1.4.3
```

```
awplus# show ip mroute 10.10.5.24 225.2.2.2 count
```

```
awplus# show ip mroute 10.10.1.34 summary
```

Output The following is a sample output of this command displaying the IPv4 multicast routing table, with and without specifying the group and source IPv4 address:

Figure 47-3: Example output from the show ip mroute command

```
awplus# show ip mroute
IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry

show ip mvif

Use this command to display the contents of the IPv4 Multicast Routing Information Base (MRIB) VIF table.

Syntax `show ip mvif [<interface>]`

Parameter	Description
<interface>	The interface to display information about.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip mvif vlan2
```

Output **Figure 47-7: Example output from the show ip mvif command**

```
Interface     Vif   Owner     TTL  Local             Remote          Uptime

vlan2        0     PIM-SM    1    192.168.1.53      0.0.0.0           00:05:17
```

show ip rpf

Use this command to display Reverse Path Forwarding (RPF) information for the specified IPv4 source address.

Syntax `show ip rpf <source-addr>`

Parameter	Description
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format `A.B.C.D`.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip rpf 10.10.10.50
```

show ipv6 mroute

Use this command to display the contents of the IPv6 multicast routing (mroute) table.

Syntax

```
show ipv6 mroute [<ipv6-group-addr>] [<ipv6-source-addr>]
    [{count|summary}]
```

Parameter	Description
<ipv6-group-addr>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<ipv6-source-addr>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.
count	Display the route and packet count from the IPv6 multicast routing (mroute) table.
summary	Display the contents of the IPv6 multicast routing (mroute) table in an abbreviated form.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 mroute

awplus# show ipv6 mroute count

awplus# show ipv6 mroute summary

awplus# show ipv6 mroute 2001::2 ff08::1 count

awplus# show ipv6 mroute 2001::2 ff08::1

awplus# show ipv6 mroute 2001::2 summary
```

Output The following is a sample output of this command displaying the IPv6 multicast routing table for a single static IPv6 Multicast route:

Figure 47-9: Example output from the show ipv6 mroute command

```
awplus#show ipv6 mroute

```

Chapter 48: IGMP and IGMP Snooping Introduction

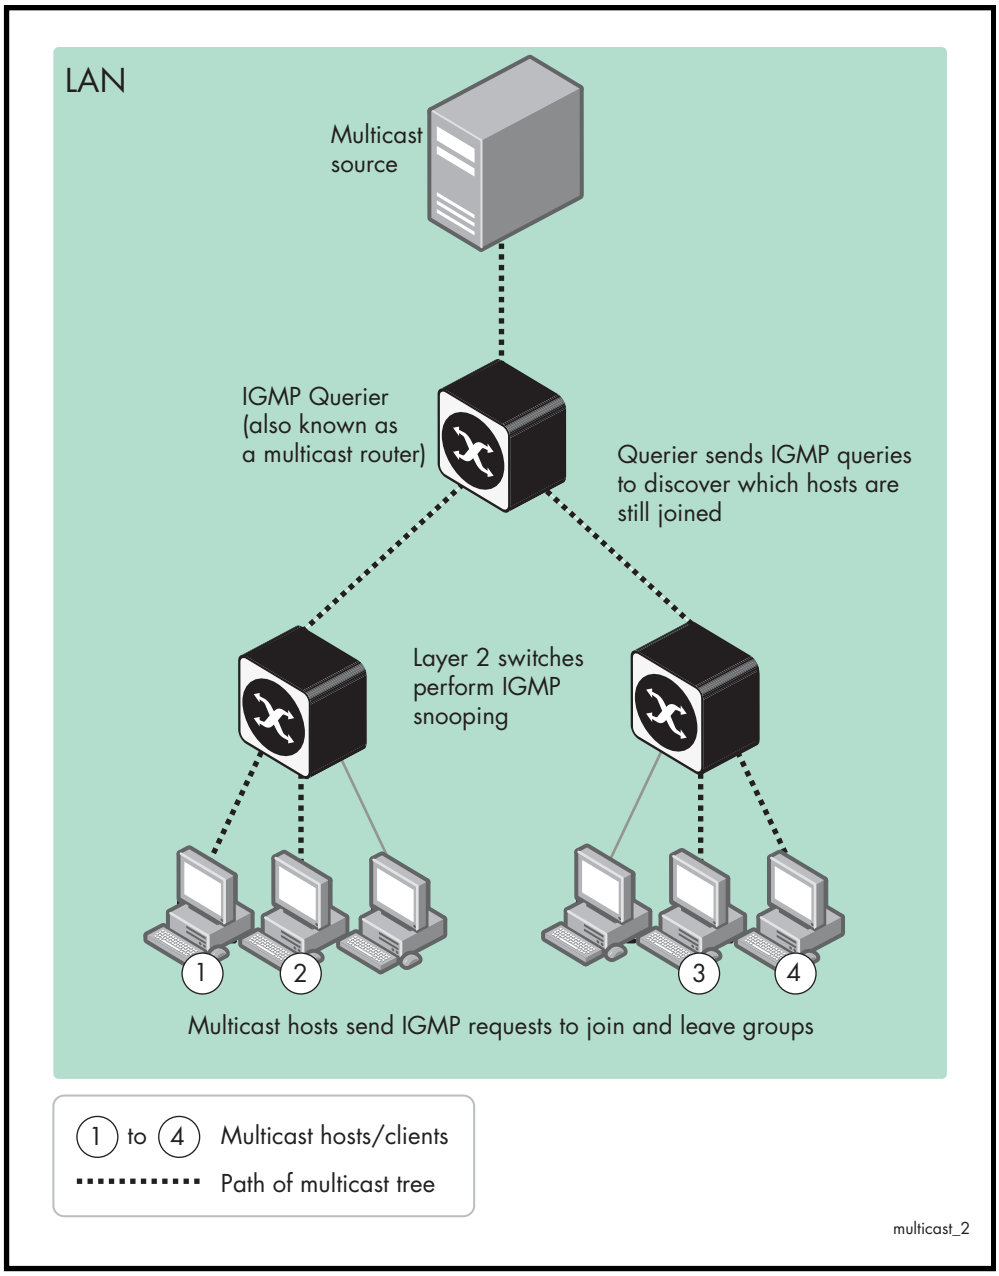
Introduction

This chapter provides information about Internet Group Management Protocol (IGMP), IGMP Snooping, and an introduction to the Query Solicitation feature when used with IGMP Snooping. To see details on the commands used in this example, or to see the outputs of the validation commands, refer to **Chapter 49, IGMP and IGMP Snooping Commands**. For a general overview of multicasting, see **Chapter 47, Multicast Introduction and Commands**.

IGMP

Internet Group Management Protocol (IGMP) is the protocol that hosts use to indicate that they are interested in receiving a particular multicast stream. An example of a multicast system within a single Layer 2 LAN is shown in **Figure 48-1**.

Figure 48-1: Multicast system within a single LAN



Joining a multicast group (Membership report)

When a host wants to receive a stream, referred to as “joining a group”, it sends out an IGMP packet containing the address of the group it wants to join. This packet is called an IGMP Membership report, often referred to as a “join packet”. This packet is forwarded through the LAN to the local IGMP querier, which is typically a router. Once the querier has received an IGMP join message, it knows to forward the multicast stream to the host. If it is not already receiving the stream, it must tell the devices between itself and the multicast source, which may be some hops away from the querier, that it wishes to receive the stream. This might involve a process of using Layer 3 multicast protocols to signal across a WAN, or it might be as simple as receiving a stream from a locally connected multicast server.

Staying in the multicast group (Query message)

The Query message is used by a querier to determine whether hosts are still interested in an IGMP group. At certain time intervals (the default is 125 seconds), the querier sends an IGMP query message onto the local LAN. The destination address of the query message is a special “all multicast groups” address. The purpose of this query is to ask “Are there any hosts on the LAN that wish to remain members of multicast groups?” After receiving an IGMP query, any host that wants to remain in a multicast group must send a new join packet for that group. If a host is a member of more than one group, then it sends a join message for each group it wants to remain a member of. The querier looks at the responses it receives to its query, and compares these to the list of multicast streams that it is currently registered to forward. If there are any items in that list for which it has not received query responses, it will stop forwarding those streams. Additionally, if it is receiving those streams through a Layer 3 network, it will send a Layer 3 routing protocol message upstream, asking to no longer receive that stream.

Leaving the multicast group (Leave message)

How a host leaves a group depends on the IGMP version that it is using. Under IGMP version 1, when a host has finished with a data stream, the local querier continues to send the stream to the host until it sends out the next query message and receives no reply back from the host. IGMP version 2 introduced the Leave message. This allows a host to explicitly inform its querier that it wants to leave a particular multicast group. When the querier receives the Leave message, it sends out a group specific query asking whether any hosts still want to remain members of that specific group. If no hosts respond with join messages for that group, then the querier knows that there are no hosts on its LAN that are still members of that group. This means that for that specific group, it can ask to be pruned from the multicast tree. IGMP version 3 removed the Leave message. Instead a host leaves a group by sending a join message with no source specified.

IGMP Snooping

IGMP Snooping is a way for Layer 2 switches to reduce the amount of multicast traffic on a LAN. The AlliedWare Plus implementation of IGMP Snooping is compatible with networks running all IGMP versions.

Without IGMP Snooping, Layer 2 switches handle IP multicast traffic in the same manner as broadcast traffic and forward multicast frames received on one port to all other ports in the same VLAN. IGMP Snooping allows switches to monitor network traffic, and determine hosts to receive multicast traffic, by looking into IGMP packets to learn which attached hosts need to receive which multicast groups. This allows the switch to forward multicast traffic only out the appropriate ports. If it sees multiple reports sent for one group, it will forward only one of them.

How IGMP Snooping operates

IGMP Snooping operates similarly to the multicast protocols. When a switch hears an IGMP report from a host for a given multicast group, the switch adds the host's port number to the list of ports that are listening to the multicast group. When the switch hears an IGMP leave, it removes the host's port from the list, after the completion of the leave process as described in **"Leaving the multicast group (Leave message)" on page 48.4**. When there are no hosts listening to a group, the switch informs the local querier to stop sending that group's multicast stream.

IGMP Snooping allows query messages to be forwarded to all ports. The hosts that still require the stream respond to the queries by sending reports. The switch intercepts these. Depending on configuration settings, the switch may just forward the reports directly on to the querier, or it may proxy report on behalf of the group, only forwarding on one consolidated report for each group.

By default, IGMP Snooping is enabled both globally and on all VLANs.

Note

IGMP Snooping cannot be disabled on an interface if IGMP Snooping has already been disabled globally. IGMP Snooping can be disabled on both an interface and globally if disabled on the interface first and then disabled globally.

To disable IGMP Snooping either		
1.	`awplus#`	
	`configure terminal`	Enter Global Configuration mode.
2.	`awplus(config)#`	
	`no ip igmp snooping`	Disable IGMP Snooping globally.
or		
1.	`awplus#`	
	`configure terminal`	Enter Global Configuration mode.
2.	`awplus(config)#`	
	`interface <vlan-name>`	Enter Interface Configuration mode for a specific VLAN.
3.	`awplus(config-if)#`	
	`no ip igmp snooping`	Disable IGMP Snooping for a specific VLAN.

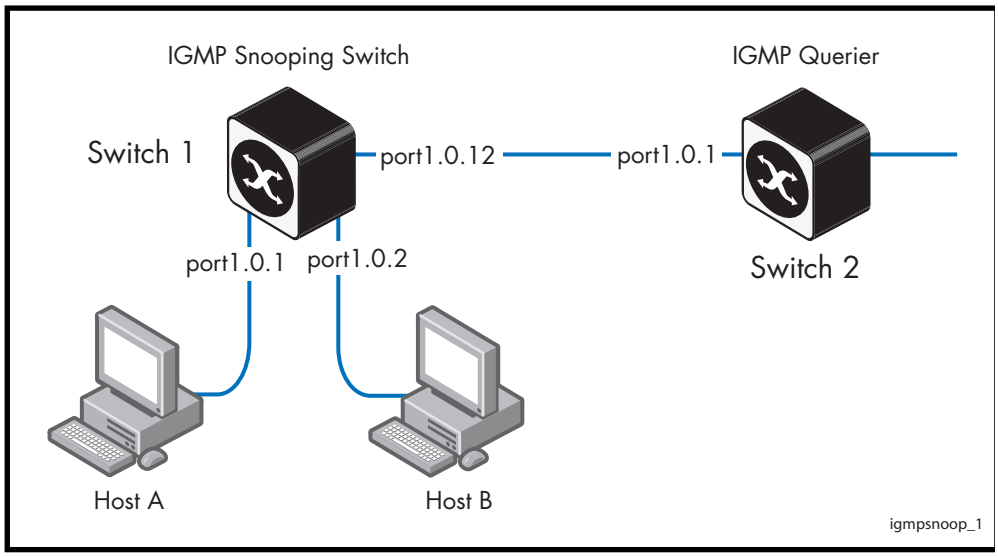
IGMP Snooping and Querier configuration example

This example describes the configuration of IGMP Snooping on an Allied Telesis managed Layer 3 switch (Switch 1) and the configuration of IGMP Querier (Switch 2). The interface port1.0.12 is configured as a multicast router port. Host A and Host B are both members of the same multicast group.

To enable IGMP Snooping on an interface:

- Enable IGMP Snooping globally, if necessary. IGMP Snooping is enabled by default.
- Enable IGMP Snooping on the desired interfaces, if necessary. IGMP Snooping is enabled on all interfaces by default.
- Statically configure ports that are connected to routers if necessary.

Figure 48-2: IGMP Snooping configuration example



As a result of this configuration:

- Membership reports are generated by hosts. The IGMP Snooping switch will forward the membership reports to its router port. Queries received by the IGMP Snooping switch from the IGMP Querier on port1.0.12 are forwarded by the IGMP Snooping switch.
- Because Host A and Host B are members of the same multicast group, the switch does not notify the IP IGMP routing device (IGMP Querier) when Host A leaves the group, because the group still has another member Host B remaining. When Host B also leaves the group, the switch forwards the leave message to the IP IGMP Querier.
- The addition of a static mrouter port is only required when there is no upstream IGMP querier or an upstream router does not send topology discovery or maintenance messages (like IGMP General Queries or OSPF Hello packets).
- In this example, the configuration of a static mrouter port on port1.0.12 is provided to illustrate the **ip igmp snooping mrouter** command. However, this command would probably not be necessary, since the switch should dynamically set port1.0.12 to be

an mrouter port as it receives IGMP Queries arriving from the IGMP Querier attached to port1.0.12.

- In this example, it is not necessary to explicitly configure the switch to work with IGMPv2 or IGMPv3. When the IGMP version is not configured then the switch will work with both versions of IGMP.

Table 48-1: Configuring IGMP Snooping on Switch 1 and IGMP Querier on Switch 2

Configure IGMP Snooping (Switch 1)		
1.	`awplus#` `configure terminal`	Enter Global Configuration mode.
2.	`awplus(config)#` `ip igmp snooping`	Enable IGMP Snooping globally. Snooping is enabled by default. Use this command only if you have previously disabled it.
3.	`awplus(config)#` `ip igmp snooping`	Enter Interface Configuration mode for VLAN 1.
4.	`awplus(config-if)#` `ip igmp snooping mrouter interface port1.0.12`	Configure port1.0.12 as a multicast router port to the IGMP Querier.
5.	`awplus(config-if)#` `exit`	Return to Global Configuration mode.
Validate the configuration		
6.	`awplus#` `exit`	Return to Privileged Exec mode.
7.	`awplus#` `show ip igmp interface vlan1`	Display the state of IGMP Snooping for VLAN 1.
8.	`awplus#` `show ip igmp groups`	Display the multicast groups with receivers directly connected to the router.
9.	`awplus#` `show ip igmp snooping mrouter interface vlan1`	Display the multicast router ports, both static and dynamic, in VLAN 1.
Configure IGMP Querier (Switch 2)		
1.	`awplus#` `configure terminal`	Enter Global Configuration mode.
2.	`awplus(config)#` `interface vlan1`	Enter Interface Configuration mode for VLAN 1.
3.	`awplus(config-if)#` `ip igmp`	Enable IGMP on VLAN 1 and configure the switch as an IGMP Querier.
Validate the configuration		
4.	`awplus#` `exit`	Return to Privileged Exec mode.
5.	`awplus#` `show ip igmp interface vlan1`	Display the state of IGMP Querier for VLAN 1.

Table 48-1: Configuring IGMP Snooping on Switch 1 and IGMP Querier on Switch 2

6.	`awplus#`	
	`show running-config`	Display the current dynamic configuration of Switch 2.

Query Solicitation

Query Solicitation minimizes the loss of multicast data after a topology change on networks that use EPSR or spanning tree (STP, RSTP, or MSTP) for loop protection. Without Query Solicitation, when the underlying link layer topology changes, multicast data flow can stop for up to several minutes, depending on which port goes down and how much of the IGMP query interval remained at the time of the topology change. Query Solicitation greatly reduces this disruption.

Query Solicitation operates without configuration in AlliedWare Plus™ switches running STP, RSTP, MSTP or EPSR. However, you may find it useful to manually enable Query Solicitation in loop-free networks running IGMP (see **Speeding up IGMP convergence in a non-looped topology**) and networks where not all switches support Query Solicitation (see **Enabling Query Solicitation on multiple switches in a looped topology**).

How Query Solicitation Works

Query Solicitation monitors STP, RSTP, MSTP and EPSR messages for topology changes. When it detects a change, it generates a special IGMP Leave message called a Query Solicit. The switch floods the Query Solicit message to all ports in every VLAN that Query Solicitation is enabled on. When the Querier receives the Query Solicit message, it sends out a General Query and waits for clients to respond with Membership Reports. These Reports update the snooping information throughout the network.

Query Solicit messages have a group address of 0.0.0.0.

Query Solicitation works by default (without you enabling it) on all VLANs on the root bridge in an STP instance and on all data VLANs on the master node in an EPSR instance. By default, the root bridge or master node always sends a Query Solicit message when any of the following events occur:

- an STP BPDU packet with the Topology Change (TC) flag arrives at the root bridge
- an STP port on a switch goes from a Discarding to Forwarding state
- the FDB gets flushed by EPSR

If necessary, you can make clients respond more quickly to the General Query by tuning the IGMP timers, especially the maximum response time advertised in IGMP queries using the **ip igmp query-max-response-time** command.

Query Solicitation Operation

When IGMP Snooping is enabled and EPSR or Spanning Tree changes the underlying link layer topology, this can interrupt multicast data flow for a significant length of time. This is because there is no way for switches in a network with interested clients to know where the traffic is available, due to the change in network topology. This change in network topology may take up to two IGMP Query intervals from the IGMP Querier, until the switches will know where to forward membership reports received by client hosts. During this time, those hosts will not receive multicast traffic.

Query solicitation prevents this by monitoring for any topology changes. When it detects a change, it generates a special IGMP Leave message known as a Query Solicit, and floods the Query Solicit message to all ports in every VLAN that query solicitation is enabled on. When the IGMP Querier receives the message, it responds by sending a General Query, which all IGMP listeners respond to. This refreshes snooped group membership information in the network.

Query solicitation reduces downtime to a negligible amount by triggering on topology changes. The generation of query solicitation messages in the network causes the IGMP Querier to send an IGMP Query immediately following a topology change. This enables the switches to know where to look for the traffic and thus to send reports to the correct switch upstream. This allows the multicast data traffic to be recovered instantly.

Query solicitation functions by default (without you enabling it) on all VLANs on the root bridge in an STP instance and on all data VLANs on the master node in an EPSR instance. By default, the root bridge or master node always sends a Query Solicit message when the topology changes.

If you have multiple STP or EPSR instances, query solicitation only sends Query Solicit messages on VLANs in the instance that experienced a topology change.

In switches other than the STP root bridge or EPSR master node, query solicitation is disabled by default, but you can enable it by using the **ip igmp snooping tcn query solicit** command.

If you enable query solicitation on a switch other than the STP root bridge or EPSR master node, both that switch and the root or master send a Query Solicit message.

Once the Querier receives the Query Solicit message, it sends out a General Query and waits for responses, which update the snooping information throughout the network.

The **ip igmp query-holdtime** command can be configured on the IGMP Querier. This command introduces a brief delay between when the IGMP Querier receives the query solicit, and when it sends out the general query. Although this slightly reduces the speed with which the network recovers from the topology change, its does guard against a DoS (Denial of Service) attack. Without this delay, a malign host sending a stream of query solicits could cause the IGMP Querier to flood the network with IGMP Queries.

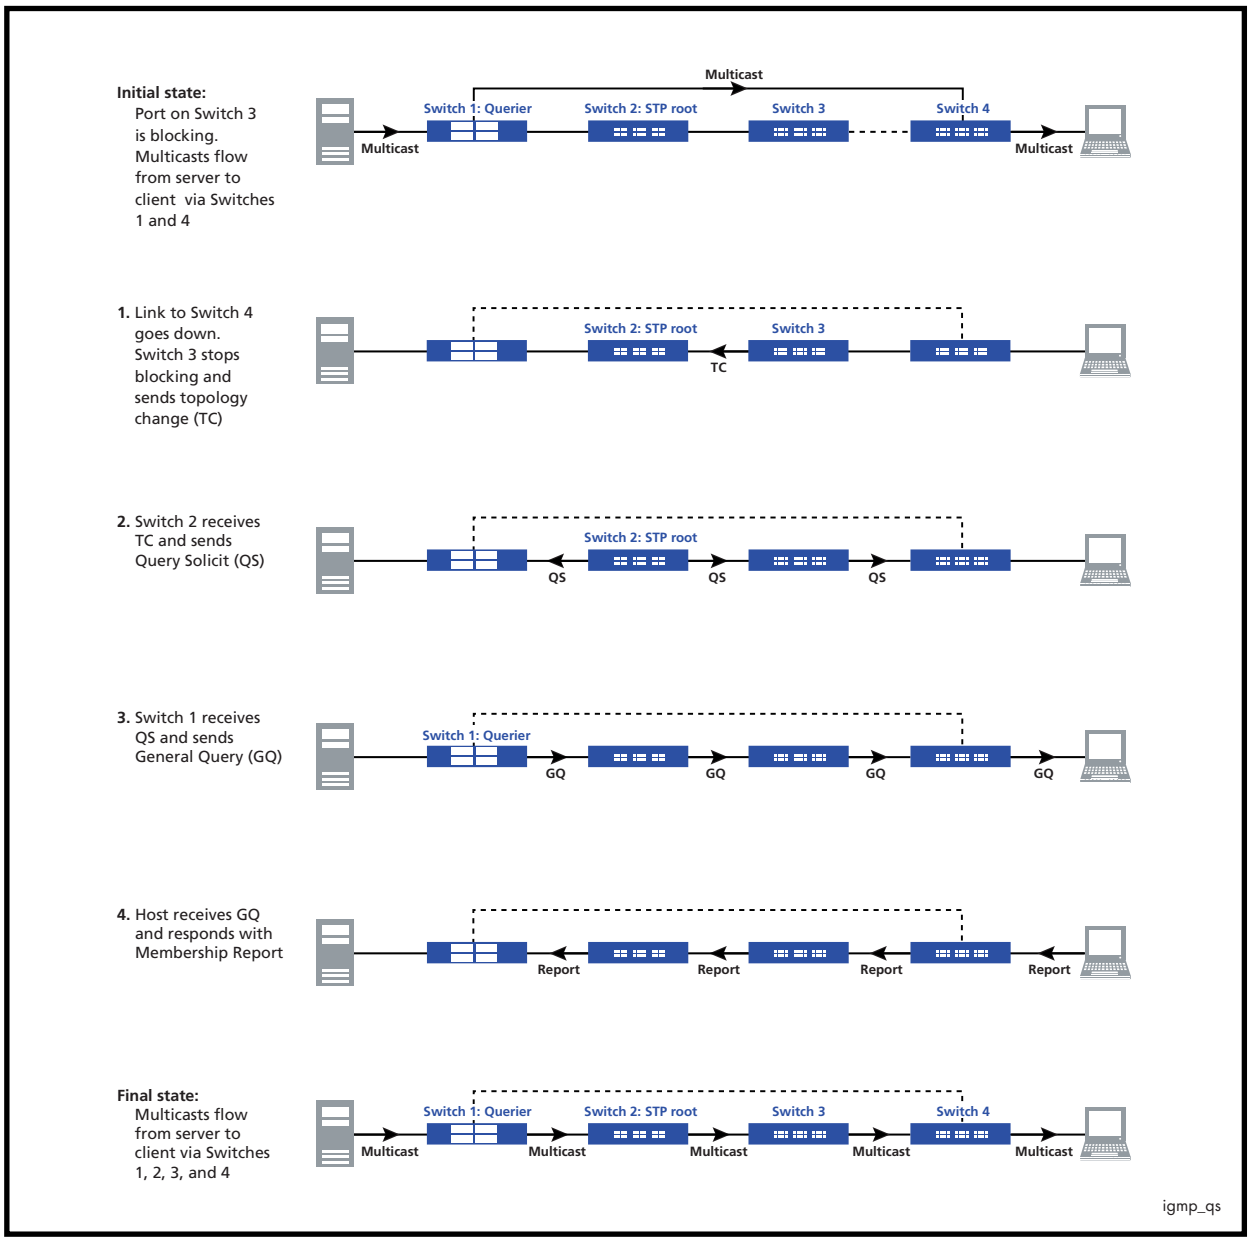
To get the network to converge faster, use the **ip igmp query-max-response-time** command and set a low response time value, such as one or two seconds, so that the clients will respond immediately with a report as a response to the IGMP Queries

On switches other than the STP root bridge or the EPSR master node, you can disable query solicitation by using the no variant of the **ip igmp snooping tcn query solicit** command. In addition, on all switches, you can disable query solicitation on a per-vlan basis using the no variant of the **ip igmp snooping tcn query solicit** command in Interface Configuration mode, after specifying a VLAN first in Interface Configuration mode.

To see whether query solicitation is on or off, check the Query Solicitation field in output of the **show ip igmp interface** command. You can view running and startup configurations with **show running-config** and **show startup-config** commands to see if Query Solicitation is enabled.

The following figure shows how Query Solicitation works when a port goes down.

Figure 48-3: Query Solicitation when a port goes down



Speeding up IGMP convergence in a non-looped topology

For loop-free networks running IGMP, where it may take up to two minutes for multicasting to recover in a non-looped topology after a port comes back up, you can speed up convergence by enabling RSTP using the **spanning-tree mode** and **spanning-tree enable** commands.

RSTP enables the network to use Query Solicitation by default, and means that multicasting should resume within seconds, not minutes, of the link coming up.

Enabling Query Solicitation on multiple switches in a looped topology

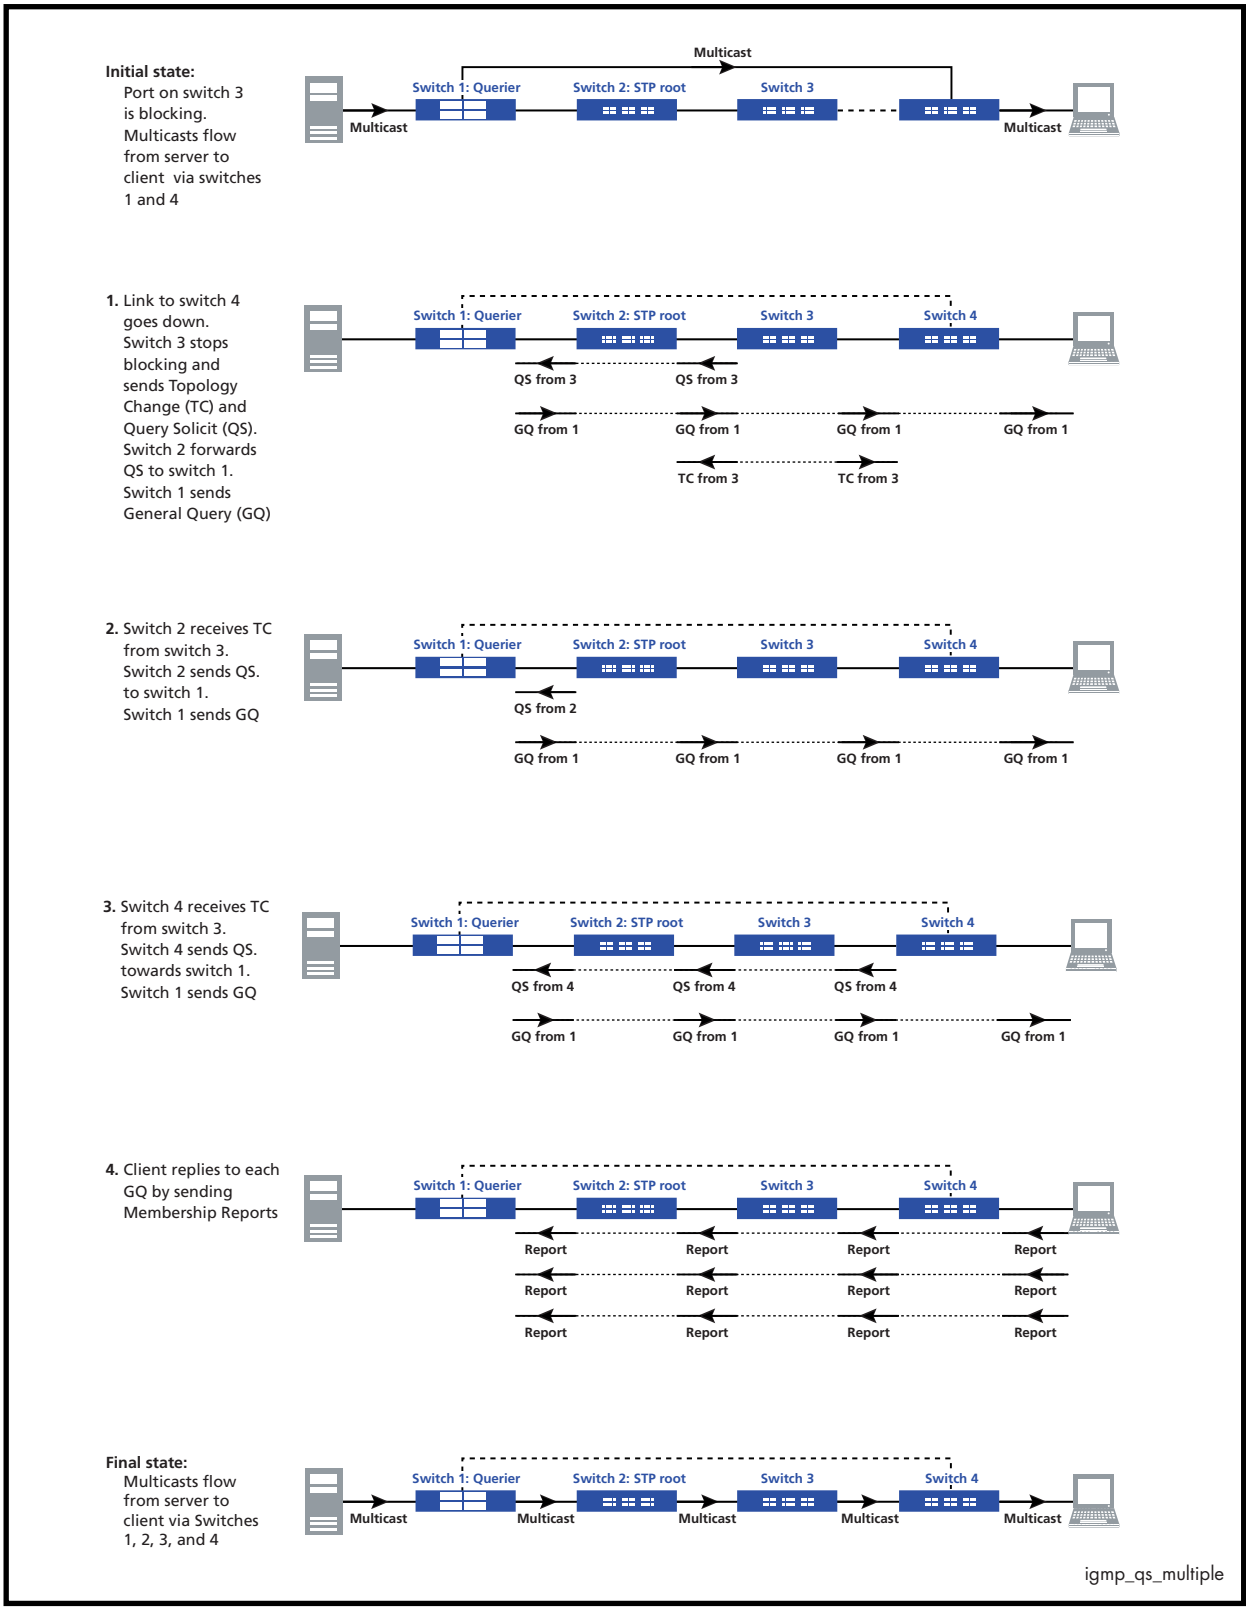
On networks that use spanning tree or EPSR, Query Solicitation is not normally required on switches other than the STP root bridge or EPSR master node. Therefore, it is only enabled by default on the root bridge and the master node.

However, in some networks you may need to turn on Query Solicitation on all switches - for example, if the network includes other switches that do not support Query Solicitation and therefore the STP root bridge may be a switch that does not send Query Solicit messages. To enable Query Solicitation, use the **ip igmp snooping tcn query solicit** command.

Every switch that has Query Solicitation enabled sends a Query Solicit message when it detects a topology change. Enabling it on multiple switches means you get multiple messages, but has no other disadvantage.

The following figure shows the packet flow for a four-switch network with Query Solicitation enabled on all the switches.

Figure 48-4: Packet flow for a four switch network with Query Solicitation enabled



Chapter 49: IGMP and IGMP Snooping Commands

Introduction

The Internet Group Management Protocol (IGMP) module includes the IGMP Proxy service and IGMP Snooping functionality. Some of the following commands may have commonalities and restrictions. These are described under the Usage section for each command.

Command List

This chapter provides an alphabetical reference of configure, clear, and show commands related to Internet Group Management Protocol (IGMP).

clear ip igmp

Use this command to clear all IGMP group membership records on all VLAN interfaces.

Syntax `clear ip igmp`

Mode Privileged Exec

Usage This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example

```
awplus# clear ip igmp
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **clear ip igmp group**
clear ip igmp interface

clear ip igmp group

Use this command to clear IGMP group membership records for a specific group on either all VLAN interfaces, a single VLAN interface, or for a range of VLAN interfaces.

Syntax

```
clear ip igmp group *
clear ip igmp group <ip-address> <interface>
```

Parameter	Description
*	Clears all groups on all VLAN interfaces. This is an alias to the **clear ip igmp** command.
<ip-address>	Specifies the group whose membership records will be cleared from all VLAN interfaces, entered in the form A.B.C.D.
<interface>	Specifies the name of the VLAN interface; all groups learned on this VLAN interface are deleted.

Mode Privileged Exec

Usage This command applies to groups learned by IGMP, IGMP Snooping, or IGMP Proxy.

In addition to the group a VLAN interface can be specified. Specifying this will mean that only entries with the group learnt on the interface will be deleted.

Examples

```
awplus# clear ip igmp group *
awplus# clear ip igmp group 224.1.1.1 vlan1
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **clear ip igmp**
clear ip igmp interface

clear ip igmp interface

Use this command to clear IGMP group membership records on a particular VLAN interface.

Syntax

```
clear ip igmp interface <interface>
```

Parameter	Description
<interface>	Specifies the name of the VLAN interface. All groups learned on this VLAN interface are deleted.

Mode Privileged Exec

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example

```
awplus# clear ip igmp interface vlan1
```

Validation Commands show ip igmp interface
show running-config

Related Commands clear ip igmp
clear ip igmp group

debug igmp

Use this command to enable debugging of either all IGMP or a specific component of IGMP.

Use the **no** variant of this command to disable all IGMP debugging, or debugging of a specific component of IGMP.

Syntax

```
debug igmp {all|decode|encode|events|fsm|tib}
no debug igmp {all|decode|encode|events|fsm|tib}
```

Parameter	Description
`all`	Enable or disable all debug options for IGMP
`decode`	Debug of IGMP packets that have been received
`encode`	Debug of IGMP packets that have been sent
`events`	Debug IGMP events
`fsm`	Debug IGMP Finite State Machine (FSM)
`tib`	Debug IGMP Tree Information Base (TIB)

Modes

Privileged Exec and Global Configuration

Usage

This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example

```
awplus# configure terminal
awplus(config)# debug igmp all
```

Related Commands

show debugging igmp
undebug igmp

ip igmp

Use this command to enable IGMP on an interface. The command configures the device as an IGMP querier.

Use the **no** variant of this command to return all IGMP related configuration to the default on this interface.

Syntax

```
ip igmp
no ip igmp
```

Default Disabled

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces, and will have no effect on IGMP Proxy or IGMP Snooping configuration.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Note An IP address must be assigned to the VLAN first, before this command will work.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp
```

Validation Commands **show ip igmp interface**
show running-config

ip igmp access-group

This command adds an access control list to a VLAN interface configured for IGMP, IGMP Snooping, or IGMP Proxy. The access control list is used to control and filter the multicast groups learnt on the VLAN interface.

The **no** variant of this command disables the access control filtering on the interface.

Syntax

```
ip igmp access-group {<access-list-number>|<access-list-name>}
no ip igmp access-group
```

Parameter	Description
<access-list-number>	Standard IP access-list number, in the range <1-99>.
<access-list-name>	Standard IP access-list name.

Default By default there are no access lists configured on any interface.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

This command applies to VLAN interfaces configured for IGMP or IGMP Snooping.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example In the following example, hosts serviced by VLAN interface `vlan2` can only join the group `225.2.2.2`:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 225.2.2.2 0.0.0.0
awplus(config)# interface vlan2
awplus(config-if)# ip igmp access-group 1
```

ip igmp immediate-leave

In IGMP version 2, use this command to minimize the leave latency of IGMP memberships for specified multicast groups. The specified access list number or name defines the multicast groups in which the immediate leave feature is enabled.

Use the **no** variant of this command to disable this feature.

Syntax

```
ip igmp immediate-leave group-list {<access-list-number>|<access-
    list-number-expanded>|<access-list-name>}

no ip igmp immediate-leave
```

Parameter	Description
<access-list-number>	Access-list number, in the range <1-99>.
<access-list-number-expanded>	Access-list number (expanded range), in the range <1300-1999>.
<access-list-name>	Standard IP access-list name.

Default Disabled by default.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example The following example shows how to enable the immediate-leave feature on the VLAN interface `vlan2` for a specific range of multicast groups

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp immediate-leave group-list 34
awplus(config-if)# exit
awplus(config)# access-list 34 permit 225.192.20.0 0.0.0.255
```

Related Commands **ip igmp last-member-query-interval**

ip igmp last-member-query-count

Use this command to set the last-member query-count value for an interface.

Use the **no** variant of this command to return to the default on an interface.

Syntax

```
ip igmp last-member-query-count <2-7>
no ip igmp last-member-query-count
```

Parameter	Description
<2-7>	Last member query count value.

Default The default last member query count value is 2.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-count 3
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **ip igmp last-member-query-interval**
ip igmp startup-query-count

ip igmp last-member-query-interval

Use this command to configure the frequency at which the router sends IGMP group specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

Syntax

```
ip igmp last-member-query-interval <interval>
no ip igmp last-member-query-interval
```

Parameter	Description
<interval>	The frequency in milliseconds, in the range <1000-25500>, at which IGMP group-specific host query messages are sent.

Default 1000 milliseconds

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example The following example changes the IGMP group-specific host query message interval to 2 seconds (`2000` milliseconds) for VLAN interface `vlan1`:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp last-member-query-interval 2000
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **ip igmp immediate-leave**
ip igmp last-member-query-count

ip igmp limit

Use this command to configure the limit on the maximum number of group membership entries for the device as a whole or for the specified interface (if in interface mode). Once the specified number of group memberships is reached, all further membership reports will be ignored. Optionally, you can configure an access-list to stop certain address(es) from being subject to the limit.

The limit is dependent on the MTU (Maximum Transmission Unit) of the interface, which is the size in bytes of the largest packet that a network protocol can transmit. Typically for an ethernet channel with an MTU of 1500 the igmp group membership limit will be 183 groups, because each igmp group membership is 8 bytes.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

Syntax

```
ip igmp limit <limitvalue> [except {<access-list-number>|<access-
    list-number-expanded>|<access-list-name>}]

no ip igmp limit
```

Parameter	Description
<limitvalue>	<2-512> Maximum number of group membership entries.
<access-list-number>	Access-list number, in the range <1-99>.
<access-list-number-expanded>	Access-list number (expanded range), in the range <1300-1999>.
<access-list-name>	Standard IP access-list name.

Default The default limit, which is reset by the **no** variant of this command, is the same as maximum number of group membership entries that can be learned with the **ip igmp limit** command.

The default limit of group membership entries that can be learned is 512 entries.

Mode Global Configuration and Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples The following example configures an IGMP limit of `100` group membership entries across all interfaces on which IGMP is enabled, and excludes group `224.1.1.1` from this limitation:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp limit 100 except 1
```

The following example configures an IGMP limit of 100 group membership entries on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp limit 100
```

ip igmp mroute-proxy

Use this command to enable IGMP mroute proxy on this downstream interface and associate it with the upstream proxy service interface.

Use the **no** variant of this command to remove the association with the proxy-service interface.

Syntax

```
ip igmp mroute-proxy <interface>
no ip igmp mroute-proxy
```

Parameter	Description
<interface>	The name of the VLAN interface.

Mode Interface Configuration for a VLAN interface.

Usage You must also enable the IGMP proxy service on the upstream interface, using the **ip igmp proxy-service** command. You can associate one or more downstream mroute proxy interfaces on the device with a single upstream proxy service interface. This downstream mroute proxy interface listens for IGMP reports, and forwards them to the upstream IGMP proxy service interface.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM. This command applies to interfaces configured for IGMP Proxy.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example The following example configures the VLAN interface `vlan2` interface as the upstream proxy-service interface for the downstream interface, VLAN interface `vlan3`.

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp mroute-proxy vlan2
```

Related Commands **ip igmp proxy-service**

ip igmp proxy-service

Use this command to enable the VLAN interface to be the upstream IGMP proxy-service interface for the device. All associated downstream IGMP mroute proxy interfaces on this device will have their memberships consolidated on this proxy service interface, according to IGMP host-side functionality.

Use the **no** variant of this command to remove the designation of the VLAN interface as an upstream proxy-service interface.

Syntax

```
ip igmp proxy-service
no ip igmp proxy-service
```

Mode Interface Configuration for a VLAN interface.

Usage This command is used with the **ip igmp mroute-proxy** command to enable forwarding of IGMP reports to a proxy service interface for all forwarding entries for this interface. You must also enable the downstream IGMP mroute proxy interfaces on this device using the command **ip igmp mroute-proxy**.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example The following example designates the VLAN interface `vlan2` interface as the upstream proxy-service interface.

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp proxy-service
```

Related Commands **ip igmp mroute-proxy**

ip igmp querier-timeout

Use this command to configure the timeout period before the device takes over as the querier for the VLAN interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

Syntax

```
ip igmp querier-timeout <timeout>
no ip igmp querier-timeout
```

Parameter	Description
<timeout>	IGMP querier timeout interval value in seconds, in the range <1-65535>.

Default The default timeout interval is 255 seconds.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to VLAN interfaces configured for IGMP. The timeout value should not be less than the current active querier's general query interval.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example The following example configures the device to wait `130` seconds from the time it received the last query before it takes over as the querier for the VLAN interface `vlan20`:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp querier-timeout 130
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **ip igmp query-interval**

ip igmp query-holdtime

This command sets the time that an IGMP Querier waits after receiving a query solicitation before it sends an IGMP Query. IGMP General Query messages will not be sent during the hold time interval.

Use the **no** variant of this command to return to the default query hold time period.

Syntax

```
ip igmp query-holdtime <interval>
no ip igmp query-holdtime
```

Parameter	Description
<interval>	Query interval value in milliseconds, in the range <100-5000>.

Default By default the delay before sending IGMP General Query messages is 500 milliseconds.

Mode Interface Configuration for a VLAN interface.

Usage Use this command to configure a value for the IGMP query hold time in the current network. IGMP Queries can be generated after receiving Query Solicitation (QS) packets and there is a possibility of a DoS (Denial of Service) attack if a stream of Query Solicitation (QS) packets are sent to the IGMP Querier, eliciting a rapid stream of IGMP Queries. This command applies to interfaces on which the switch is acting as an IGMP Querier.

Use the **ip igmp query-interval** command when a delay for IGMP general query messages is required and IGMP general query messages are required. The **ip igmp query-holdtime** command stops IGMP query messages during the configured holdtime interval, so the rate of IGMP Queries that can be sent out of an interface can be restricted.

See **"Query Solicitation" on page 48.9** for introductory information about the Query Solicitation feature.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Note

This command will function on your switch in the stand-alone mode. but is not supported when the switch forms part of a VCS Stack.

Examples To set the IGMP query holdtime to `900` ms for `vlan20`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-holdtime 900
```

To reset the IGMP query holdtime to the default (500 ms) for `vlan10`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-holdtime
```

Validation Commands

show ip igmp interface
show running-config

Related Commands

ip igmp query-interval
ip igmp snooping tcn query solicit

ip igmp query-interval

Use this command to configure the period for sending IGMP General Query messages. The IGMP query interval specifies the time between IGMP General Query messages being sent.

Use the **no** variant of this command to return to the default query interval period.

Note The IGMP query interval must be greater than IGMP query maximum response time.

Syntax

```
ip igmp query-interval <interval>
no ip igmp query-interval
```

Parameter	Description
<interval>	Query interval value in seconds, in the range <2-18000>.

Default The default IGMP query interval is 125 seconds.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP. Note that the IGMP query interval is automatically set to a greater value than the IGMP query max response time.

For example, if you set the IGMP query max response time to 2 seconds using the **ip igmp query-max-response-time** command, and the IGMP query interval is currently less than 3 seconds, then the IGMP query interval period will be automatically reconfigured to be 3 seconds, so it is greater than the IGMP query maximum response time.

Use the **ip igmp query-interval** command when a non-default interval for IGMP General Query messages is required.

The **ip igmp query-holdtime** command can occasionally delay the sending of IGMP Queries.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples The following example changes the period between IGMP host-query messages to 3 minutes (180 seconds) for VLAN interface vlan20:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-interval 180
```

The following example resets the period between sending IGMP host-query messages to the default (125 seconds) for VLAN interface `vlan20`:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# no ip igmp query-interval
```

Validation Commands
show ip igmp interface
show running-config

Related Commands
ip igmp query-holdtime
ip igmp query-max-response-time
ip igmp startup-query-interval

ip igmp query-max-response-time

Use this command to configure the maximum response time advertised in IGMP Queries.

Use the **no** variant of this command to restore the default.

Note The IGMP query maximum response time must be less than the IGMP query interval.

Syntax

```
ip igmp query-max-response-time <response-time>
no ip igmp query-max-response-time
```

Parameter	Description
<response-time>	Response time value in seconds, in the range <1-3180>.

Default The default IGMP query maximum response time is 10 seconds.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP. Note that the IGMP query interval is automatically set to a greater value than the IGMP query maximum response time.

For example, if you set the IGMP query interval to 3 seconds using the **ip igmp query-interval** command, and the current IGMP query interval is less than 3 seconds, then the IGMP query maximum response time will be automatically reconfigured to be 2 seconds, so it is less than the IGMP query interval time.

To get the network to converge faster, use the **ip igmp query-max-response-time** command and set a low response time value, such as one or two seconds, so that the clients will respond immediately with a report as a response to the IGMP Queries.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples The following example configures a maximum response time of `8` seconds for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp query-max-response-time 8
```

The following example restores the default maximum response time of `10` seconds for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp query-max-response-time
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **ip igmp query-interval**

ip igmp ra-option (Router Alert)

Use this command to enable strict Router Alert (RA) option validation. With strict RA option enabled, IGMP packets without RA options are ignored.

Syntax

```
ip igmp ra-option
no ip igmp ra-option
```

Default The default state of RA validation is unset.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP and IGMP Snooping.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp ra-option
```

ip igmp robustness-variable

Use this command to change the robustness variable value on a VLAN interface.

Use the **no** variant of this command to return to the default on an interface.

Syntax

```
ip igmp robustness-variable <1-7>
no ip igmp robustness-variable
```

Parameter	Description
<1-7>	The robustness variable value.

Default The default robustness variable value is 2.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP and IGMP Snooping.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp robustness-variable 3

awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# no ip igmp robustness-variable 3
```

Validation Commands **show ip igmp interface**
show running-config

ip igmp snooping

Use this command to enable IGMP Snooping. When this command is used in the Global Configuration mode, IGMP Snooping is enabled at the switch level. When this command is used in Interface Configuration mode, IGMP Snooping is enabled for the specified VLANs.

Use the **no** variant of this command to either globally disable IGMP Snooping, or disable IGMP Snooping on a specified interface.

Note IGMP snooping cannot be disabled on an interface if IGMP snooping has already been disabled globally. IGMP snooping can be disabled on both an interface and globally if disabled on the interface first and then disabled globally.

Syntax

```
ip igmp snooping
no ip igmp snooping
```

Default By default, IGMP Snooping is enabled both globally and on all VLANs.

Mode Global Configuration and Interface Configuration for a VLAN interface.

Usage For IGMP snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default.)

Both IGMP snooping and MLD snooping must be enabled globally on the switch for IGMP snooping to operate. MLD snooping is also enabled by default. To enable it if it has been disabled, use the **ipv6 mld snooping** command on page 56.22 in Global Configuration mode.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples

```
awplus# configure terminal
awplus(config)# ip igmp snooping

awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping
```

Related Commands

ipv6 mld snooping
show ip igmp interface
show running-config

ip igmp snooping fast-leave

Use this command to enable IGMP Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing. The IGMP group-membership entry is removed as soon as an IGMP leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

Syntax

```
ip igmp snooping fast-leave
no ip igmp snooping fast-leave
```

Default IGMP Snooping fast-leave processing is disabled.

Mode Interface Configuration for a VLAN interface.

Usage This IGMP Snooping command can only be configured on VLAN interfaces.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example This example shows how to enable fast-leave processing on the VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping fast-leave
```

Validation Commands **show ip igmp interface**
show running-config

ip igmp snooping mrouter

Use this command to statically configure the specified port as a multicast router port for IGMP Snooping for an interface. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to remove the static configuration of the port as a multicast router port.

Syntax

```
ip igmp snooping mrouter interface <port>
no ip igmp snooping mrouter interface <port>
```

Parameter	Description
<port>	The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode Interface Configuration for a VLAN interface.

Usage Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example This example shows the switch port interface `port1.0.2` statically configured to be a multicast router interface for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping mrouter interface port1.0.2
```

Related Commands **show ip igmp snooping mrouter**

ip igmp snooping querier

Use this command to enable IGMP querier operation when no multicast routing protocol is configured. When enabled, the IGMP Snooping querier sends out periodic IGMP queries for all interfaces. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to disable IGMP querier configuration.

Syntax

```
ip igmp snooping querier
no ip igmp snooping querier
```

Mode Interface Configuration for a VLAN interface.

Usage The IGMP Snooping querier uses the `0.0.0.0` Source IP address because it only masquerades as a proxy IGMP querier for faster network convergence.

It does not start, or automatically cease, the IGMP Querier operation if it detects query message(s) from a multicast router.

If an IP address is assigned to a VLAN, which has IGMP querier enabled on it, then the IGMP Snooping querier uses the VLAN's IP address as the Source IP Address in IGMP queries.

The IGMP Snooping Querier will not stop sending IGMP Queries if there is another IGMP Snooping Querier in the network with a lower Source IP Address.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Note Do not enable the IGMP Snooping Querier feature on a Layer 2 switch when there is an operational IGMP Querier in the network.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping querier
```

Validation Commands **show ip igmp interface**
show running-config

ip igmp snooping report-suppression

Use this command to enable report suppression for IGMP versions 1 and 2. This command applies to interfaces configured for IGMP Snooping.

Report suppression stops reports being sent to an upstream multicast router port when there are already downstream ports for this group on this interface.

Use the **no** variant of this command to disable report suppression.

Syntax

```
ip igmp snooping report-suppression
no ip igmp snooping report-suppression
```

Default Report suppression does not apply to IGMPv3, and is turned on by default for IGMPv1 and IGMPv2 reports.

Mode Interface Configuration for a VLAN interface.

Usage Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example This example shows how to enable report suppression for IGMPv2 reports for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
awplus(config-if)# ip igmp snooping report-suppression
```

Validation Commands **show ip igmp interface**
show running-config

ip igmp snooping routermode

Use this command to set the destination IP addresses as a router multicast address, according to the routermode (all multicast addresses, default multicast addresses, specified multicast addresses).

Use the **no** variant of this command to the default. You can also remove a specified IP address from a custom list of multicast addresses.

Syntax

```
ip igmp snooping routermode {all|default|ip|multicastrouter|address
   <ip-address>}
```

```
no ip igmp snooping routermode [address <ip-address>]
```

Parameter	Description
`all`	All reserved multicast addresses (224.0.0.x). Packets from all possible addresses in range 224.0.0.x are set as routers.
`default`	Default set of reserved multicast addresses. Packets from 224.0.0.1, 224.0.0.2, 224.0.0.4, 224.0.0.5, 224.0.0.6, 224.0.0.9, 224.0.0.13, 224.0.0.15 and 224.0.0.24 are set as routers.
`ip`	Custom reserved multicast addresses. Custom IP address in the 224.0.0.x range are set as router multicast addresses using the **ip igmp snooping routermode address** command.
`multicastrouter`	DVMRP (224.0.0.4) and PIM (224.0.0.13) multicast addresses are set as routers.
`address`	Specify the multicast address in the 224.0.0.x range for use after issuing an **ip igmp snooping routermode ip** command
`<ip-address>`	IPv4 multicast address (224.0.0.x)

Default The default routermode is **default** not **all** and shows the below reserved multicast addresses:

```
Router mode.............Def
Reserved multicast address
          224.0.0.1
          224.0.0.2
          224.0.0.4
          224.0.0.5
          224.0.0.6
          224.0.0.9
          224.0.0.13
          224.0.0.15
          224.0.0.24
```

Mode Global Configuration

Examples To set **ip igmp snooping routermode** for all default reserved addresses enter:

```
awplus(config)# ip igmp snooping routermode default
```

To remove the multicast address 224.0.0.5 from the custom list of multicast addresses enter:

```
awplus(config)# no ip igmp snooping routermode address
                224.0.0.5
```

Related commands **show ip igmp snooping routermode**

ip igmp snooping tcn query solicit

Use this command to enable IGMP (Internet Group Management Protocol) Snooping TCN (Topology Change Notification) Query Solicitation feature. When this command is used in the Global Configuration mode, Query Solicitation is enabled.

Use the **no** variant of this command to disable IGMP Snooping TCN Query Solicitation. When the no variant of this command is used in Interface Configuration mode, this overrides the Global Configuration mode setting and Query Solicitation is disabled.

Syntax

```
ip igmp snooping tcn query solicit

no ip igmp snooping tcn query solicit
```

Default IGMP Snooping TCN Query Solicitation is disabled by default on the switch, unless the switch is the Master Node in an EPSR ring, or is the Root Bridge in a Spanning Tree.

When the switch is the Master Node in an EPSR ring, or the switch is the Root Bridge in a Spanning Tree, then IGMP Snooping TCN Query Solicitation is enabled by default and cannot be disabled using the Global Configuration mode command. However, Query Solicitation can be disabled for specified VLANs using this command from the Interface Configuration mode. Select the VLAN you want to disable in Interface Configuration mode then issue the no variant of this command to disable the specified VLAN without disabling this feature for other VLANs.

Mode Global Configuration and Interface Configuration for a VLAN interface.

Usage Once enabled, if the switch is not an IGMP Querier, on detecting a topology change, the switch generates IGMP Query Solicit messages that are sent to all the ports of the vlan configured for IGMP Snooping on the switch.

On a switch that is not the Master Node in an EPSR ring or the Root Bridge in a Spanning Tree, Query Solicitation can be disabled using the **no** variant of this command after being enabled.

If the switch that detects a topology change is an IGMP Querier then the switch will generate an IGMP Query message.

Note that the **no** variant of this command when issued in Global Configuration mode has no effect on a switch that is the Master Node in an EPSR ring or on a switch that is a Root Bridge in a Spanning Tree. Query Solicitation is not disabled for the switch these instances. However, Query Solicitation can be disabled on a per-vlan basis from the Interface Configuration mode.

See the below state table that shows when Query Solicit messages are sent in these instances:

Command issued from Global Configuration	Switch is STP Root Bridge or the EPSR Master Node	Command issued from Interface Configuration	IGMP Query Solicit message sent on VLAN
No	Yes	Yes	Yes
Yes	Yes	No	No
Yes	Yes	Yes	Yes

See **"Query Solicitation" on page 48.9** for introductory information about the Query Solicitation feature.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Note This command will function on your switch in the stand-alone mode. but is not supported when the switch forms part of a VCS Stack.

Examples This example shows how to enable IGMP Snooping TCN Query Solicitation on a switch:

```
awplus# configure terminal
awplus(config)# ip igmp snooping tcn query solicit
```

This example shows how to disable IGMP Snooping TCN Query Solicitation on a switch:

```
awplus# configure terminal
awplus(config)# no ip igmp snooping tcn query solicit
```

This example shows how to enable IGMP Snooping TCN Query Solicitation for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping tcn query solicit
```

This example shows how to disable IGMP Snooping TCN Query Solicitation for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp snooping tcn query solicit
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **ip igmp query-holdtime**

ip igmp source-address-check

This command enables the checking of the Source Address for an IGMP Report, rejecting any IGMP Reports originating on devices outside of the local subnet.

Use the **no** variant of this command to disable the checking of the Source Address for an IGMP Report, which allows IGMP Reports from devices outside of the local subnet.

Syntax

```
ip igmp source-address-check
no ip igmp source-address-check
```

Default Source address checking for IGMP Reports is enabled by default.

Mode Interface Configuration for a VLAN interface.

Usage This is a security feature, and should be enabled unless IGMP Reports from outside the local subnet are expected, for example, if Multicast VLAN Registration is active in the network.

The **no** variant of this command is required to disable the IGMP Report source address checking feature in networks that use Multicast VLAN Registration to allow IGMP Reports from devices outside of the local subnet.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples To deny IGMP Reports from outside the current subnet for the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp source-address-check
```

To allow IGMP Reports from outside the current subnet for the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp source-address-check
```

Validation Commands **show ip igmp interface**
show running-config

ip igmp ssm

Use this command to define a non-default Source Specific Multicast (SSM) range of IP multicast addresses in IGMP. Incoming IGMPv1 and IGMPv2 join requests are ignored if the multicast IP address is in the SSM range and no SSM mapping is configured for these addresses. By default, the SSM range is 232/8. To define the SSM range to be other than the default, use one of the access-list parameter options.

Use the **no** variant of this command to change the SSM range in IGMP back to the default.

Syntax

```
ip igmp ssm range {<access-list-number>|<access-list-name>}
no ip igmp ssm
```

Parameter	Description
<access-list-number>	Access-list number, in the range <1-99>.
<access-list-name>	Standard IP access-list name.

Default By default the SSM range is 232/8.

Mode Global Configuration

Examples To configure a non-default SSM range to be used in IGMP enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 224.1.1.0 0.0.0.255
awplus(config)# ip igmp ssm range 10
```

To return to the default configuration enter the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp ssm
```

Related Commands **access-list (standard numbered)**

ip pim ssm

ip igmp ssm-map enable

Use this command to enable Source Specific Multicast (SSM) mapping on the device.

Use the **no** variant of this command to disable SSM mapping.

Syntax

```
ip igmp ssm-map enable
no ip igmp ssm-map enable
```

Mode Global Configuration

Usage This command applies to VLAN interfaces configured for IGMP.

Example To enable SSM on the switch enter the commands:

```
awplus# configure terminal
awplus(config)# ip igmp ssm-map enable
```

Related Commands ip igmp ssm-map static

ip igmp ssm-map static

Use this command to specify the static mode of defining Source Specific Multicast (SSM) mapping. SSM statically assigns sources to IGMPv1 and IGMPv2 groups to translate such (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.

Use the **no** variant of this command to remove the SSM map association.

Syntax

```
ip igmp ssm-map static {<access-list-number>|<access-list-number-expanded>|<access-list-name>} <ip-address>
no ip igmp ssm-map static {<access-list-number>|<access-list-number-expanded>|<access-list-name>} <ip-address>
```

Parameter	Description
<access-list-number>	Access-list number, in the range <1-99>.
<access-list-number-expanded>	Access-list number (expanded range), in the range <1300-1999>.
<access-list-name>	Standard IP access-list name.
<ip-address>	Source address to use for static map group, entered in the form A.B.C.D.

Mode Global Configuration

Usage This command applies to VLAN interfaces configured for IGMP. You can use Standard numbered and Standard named ACLs plus Expanded Numbered ACLs.

Examples This example shows how to configure an SSM static mapping for group-address `224.1.1.1`, using a standard numbered ACL shown as `10`:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static 10 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address `224.1.1.1`, using an expanded numbered ACL shown as `1301`:

```
awplus# configure terminal
awplus(config)# access-list 1301 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static 1301 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address `224.1.1.1`, using a standard named ACL shown as `sales`:

```
awplus# configure terminal
awplus(config)# access-list sales permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static sales 1.2.3.4
```

Related Commands ip igmp ssm-map enable

ip igmp static-group

Use this command to statically configure multicast group membership entries on a VLAN interface, or to statically forward a multicast channel out a particular port or port range.

To statically add only a group membership, do not specify any parameters.

To statically add a (*,g) entry to forward a channel out of a port, specify only the multicast group address and the switch port range.

To statically add an (s,g) entry to forward a channel out of a port, specify the multicast group address, the source IP address, and the switch port range.

To use Source Specific Multicast mapping to determine the source IP address of the multicast server use the **ssm-map** parameter instead of specifying the source IP address.

Use the **no** variant of this command to delete static group membership entries.

Syntax

```
ip igmp static-group <ip-address> [source {<ip-source-addr>|ssm-map}]
    [interface <port>]

no ip igmp static-group <ip-address> [source {<ip-source-addr>|
    ssm-map}] [interface <port>]
```

Parameter	Description
<ip-address>	Standard IP Multicast group address, entered in the form A.B.C.D, to be configured as a static group member.
`source`	Optional.
<ip-source-addr>	Standard IP source address, entered in the form A.B.C.D, to be configured as a static source from where multicast packets originate.
`ssm-map`	This parameter uses Source Specific Multicast (SSM) Mapping to determine the source IP address associated with the specified IP Multicast group address. SSM mappings are configured using the **ip igmp ssm-map static** command.
`interface`	Use this parameter to specify a specific switch port or switch port range to statically forward the multicast group out of. If not used, static configuration is applied on all ports in the VLAN.
<port>	The port or port range to statically forward the group out of. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode Interface Configuration for a VLAN interface.

Usage This command applies to IGMP operation on a specific interface to statically add group and/or source records, or to IGMP Snooping on a VLAN interface to statically add group and/or source records.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example The following example show how to statically add group and source records for IGMP on the VLAN interface `vlan3`:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp static-group 226.1.2.4 source
10.2.3.4
```

ip igmp startup-query-count

Use this command to configure the IGMP startup query count for an interface. The IGMP startup query count is the number of IGMP General Query messages sent by a querier at startup. The default IGMP startup query count is 2.

Use the **no** variant of this command to return an interface's configured IGMP startup query count to the default.

Syntax

```
ip igmp startup-query-count <startup-query-count>
no ip igmp startup-query-count
```

Parameter	Description
<startup-query-count>	Specify the IGMP startup query count for a VLAN interface in the range <2-10> where 2 is the default IGMP query count.

Default The default IGMP startup query count is 2.

Mode Interface Configuration for a VLAN interface.

Usage Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples The following example shows how to configure the IGMP startup query count to 4 for the VLAN interface vlan3:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp startup-query-count 4
```

The following example shows how to remove the IGMP startup query count for the VLAN interface vlan3:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# no ip igmp startup-query-count
```

Related Commands

ip igmp last-member-query-count
ip igmp startup-query-interval

ip igmp startup-query-interval

Use this command to configure the IGMP startup query interval for an interface. The IGMP startup query interval is the amount of time in seconds between successive IGMP General Query messages sent by a querier during startup. The default IGMP startup query interval is one quarter of the IGMP query interval value.

Use the **no** variant of this command to return an interface's configured IGMP startup query interval to the default.

Syntax

```
ip igmp startup-query-interval <startup-query-interval>
no ip igmp startup-query-interval
```

Parameter	Description
<startup-query-interval>	Specify the IGMP startup query interval for a VLAN interface in Interface Configuration mode in the range of <2-1800> seconds to be one quarter of the IGMP query interval value.

Default The default IGMP startup query interval is one quarter of the IGMP query interval value.

Note The IGMP startup query interval must be one quarter of the IGMP query interval.

Mode Interface Configuration for a VLAN interface.

Usage Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples The following example shows how to configure the IGMP startup query interval to `15` seconds for the VLAN interface `vlan2` to be one quarter of the IGMP query interval value of 60 seconds:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp startup-query-interval 15
awplus(config-if)# ip igmp query-interval 60
```

The following example shows how to remove the IGMP startup query interval for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp startup-query-interval
```

Related Commands
ip igmp last-member-query-interval
ip igmp query-interval
ip igmp startup-query-count

ip igmp version

Use this command to set the current IGMP version (IGMP version 1, 2 or 3) on an interface.

Use the **no** variant of this command to return to the default version.

Syntax

```
ip igmp version <1-3>
no ip igmp version
```

Parameter	Description
<1-3>	IGMP protocol version number

Default The default IGMP protocol version number is 3.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to VLAN interfaces configured for IGMP.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip igmp version 2
```

Validation Commands **show ip igmp interface**

show debugging igmp

Use this command to display the IGMP debugging options set.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show debugging igmp`

Mode User Exec and Privileged Exec

Example To display the IGMP debugging options set, enter the command:

```
awplus# show debugging igmp
```

Output **Figure 49-1: Example output from the show debugging igmp command**

```
IGMP Debugging status:
  IGMP Decoder debugging is on
  IGMP Encoder debugging is on
  IGMP Events debugging is on
  IGMP FSM debugging is on
  IGMP Tree-Info-Base (TIB) debugging is on
```

Related Commands **debug igmp**

show ip igmp groups

Use this command to display the multicast groups with receivers directly connected to the router, and learned through IGMP.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ip igmp groups [<ip-address>|<interface> detail]`

Parameter	Description
<ip-address>	Address of the multicast group, entered in the form A.B.C.D.
<interface>	Interface name for which to display local information.

Mode User Exec and Privileged Exec

Example The following command displays local-membership information for all ports in all interfaces:

```
awplus# show ip igmp groups
```

Output **Figure 49-2: Example output from the show ip igmp groups command**

```
IGMP Connected Group Membership
Group Address    Interface       Uptime    Expires   Last
Reporter
224.0.1.1        port1.0.1       00:00:09  00:04:17  10.10.0.82

```

Table 49-1: Parameters in the output of the show ip igmp groups command

Parameter	Description
`Group Address`	Address of the multicast group.
`Interface`	Port through which the group is reachable.
`Uptime`	The time in weeks, days, hours, minutes, and seconds that this multicast group has been known to the device.
`Expires`	Time (in hours, minutes, and seconds) until the entry expires.
`Last Reporter`	Last host to report being a member of the multicast group.

show ip igmp interface

Use this command to display the state of IGMP, IGMP Proxy service, and IGMP Snooping for a specified VLAN, or all VLANs. IGMP is shown as Active or Disabled in the show output.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ip igmp interface [<interface>]`

Parameter	Description
<interface>	The name of the VLAN interface.

Mode User Exec and Privileged Exec

Examples The following output shows IGMP interface status for **vlan2** (with IGMP Snooping enabled):

```
awplus#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
awplus(config)#interface vlan2
awplus(config-if)#ip igmp snooping
awplus(config-if)#exit
awplus(config)#exit
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
 IGMP Disabled, Inactive, Version 3 (default)
 IGMP interface has 0 group-record states
 IGMP activity: 0 joins, 0 leaves
 IGMP robustness variable is 2
 IGMP last member query count is 2
 IGMP query interval is 125 seconds
 IGMP query holdtime is 500 milliseconds
 IGMP querier timeout is 255 seconds
 IGMP max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 Strict IGMPv3 ToS checking is disabled on this interface
 Source Address checking is enabled
 IGMP Snooping is globally enabled
 IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
 IGMP Snooping is enabled on this interface
 IGMP Snooping fast-leave is not enabled
 IGMP Snooping querier is not enabled
 IGMP Snooping report suppression is enabled
awplus#
```

The following output shows IGMP interface status for **vlan2** (with IGMP Snooping disabled):

```
awplus#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
awplus(config)#interface vlan2
awplus(config-if)#no ip igmp snooping
awplus(config-if)#exit
awplus(config)#exit
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
 IGMP Disabled, Inactive, Version 3 (default)
 IGMP interface has 0 group-record states
 IGMP activity: 0 joins, 0 leaves
 IGMP robustness variable is 2
 IGMP last member query count is 2
 IGMP query interval is 125 seconds
 IGMP query holdtime is 500 milliseconds
 IGMP querier timeout is 255 seconds
 IGMP max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 Strict IGMPv3 ToS checking is disabled on this interface
 Source Address checking is enabled
 IGMP Snooping is globally enabled
 IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
 IGMP Snooping is not enabled on this interface
 IGMP Snooping fast-leave is not enabled
 IGMP Snooping querier is not enabled
 IGMP Snooping report suppression is enabled
awplus#
```

The following command displays the IGMP interface status and Query Solicitation for **vlan3**:

```
awplus#show ip igmp interface vlan3
Interface vlan3 (Index 203)
 IGMP Enabled, Active, Querier, Version 3 (default)
 Internet address is 192.168.9.1
 IGMP interface has 256 group-record states
 IGMP activity: 51840 joins, 0 leaves
 IGMP robustness variable is 2
 IGMP last member query count is 2
 IGMP query interval is 125 seconds
 IGMP query holdtime is 500 milliseconds
 IGMP querier timeout is 250 seconds
 IGMP max query response time is 1 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 251 seconds
 Strict IGMPv3 ToS checking is disabled on this interface
 IGMP Snooping is globally enabled
 IGMP Snooping query solicitation is globally enabled
  Num. query-solicit packets: 1 sent, 10 recvd
 IGMP Snooping is enabled on this interface
 IGMP Snooping fast-leave is not enabled
 IGMP Snooping querier is not enabled
 IGMP Snooping report suppression is enabled
awplus#
```

Note

Query Solicitation status information is highlighted in **bold** in the above output.

Use the **show ip igmp interface** command to validate that Query Solicitation is enabled and to show the number of query-solicit message packets sent and received on a VLAN.

show ip igmp proxy

Use this command to display the state of IGMP Proxy services for a specified interface or for all interfaces.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip igmp proxy
show ip igmp proxy groups [detail]
show ip igmp proxy groups <multicast-group> [detail]
show ip igmp proxy groups <vlan> [detail]
show ip igmp proxy groups <vlan> <multicast-group> [detail]
```

Parameter	Description
`groups`	Specify IGMP proxy group membership information.
`detail`	Specify detailed IGMPv3 source information.
<vlan>	Specify the name of a single VLAN interface, for example **vlan1**.
<multicast-group>	Specify the IPv4 address in of the multicast group, in the format A.B.C.D.

Mode User Exec and Privileged Exec

Example To display the state of IGMP Proxy services for all interfaces, enter the command:

```
awplus# show ip igmp proxy
```

To display the state of IGMP Proxy services for VLAN interface **vlan1**, enter the command:

```
awplus# show ip igmp proxy groups vlan1
```

To display the detailed state of IGMP Proxy services for VLAN interface **vlan1**, enter the command:

```
awplus# show ip igmp proxy groups vlan1 detail
```

Related Commands **ip igmp proxy-service**

show ip igmp snooping mrouter

Use this command to display the multicast router ports, both static and dynamic, in a VLAN.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ip igmp snooping mrouter [interface <interface>]`

Parameter	Description
`interface`	A specific interface.
`<interface>`	The name of the VLAN interface.

Mode User Exec and Privileged Exec

Example To show all multicast router interfaces, use the command:

```
awplus# show ip igmp snooping mrouter
```

To show the multicast router interfaces in `vlan1`, use the command:

```
awplus# show ip igmp snooping mrouter interface vlan1
```

Output **Figure 49-3: Example output from the show ip igmp snooping mrouter command**

```
VLAN    Interface   Static/Dynamic
1       port1.0.5   Statically configured
200     port1.0.2   Statically configured
```

Figure 49-4: Example output from the show ip igmp snooping mrouter interface vlan1 command

```
VLAN    Interface   Static/Dynamic
1       port1.0.5   Statically configured
```

Related Commands **ip igmp snooping mrouter**

show ip igmp snooping routermode

Use this command to display the current routermode and the list of IP addresses set as router multicast addresses from the **ip igmp snooping routermode** command.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip igmp snooping routermode
```

Mode

User Exec and Privileged Exec

Example

To show the routermode and the list of router multicast addresses, use the command:

```
awplus# show ip igmp snooping routermode
```

Output

Figure 49-5: Example output from the show ip igmp snooping routermode command

```
Router mode.............Def
Reserved multicast address
         224.0.0.1
         224.0.0.2
         224.0.0.4
         224.0.0.5
         224.0.0.6
         224.0.0.9
         224.0.0.13

```

Related Commands

ip igmp snooping routermode

show ip igmp snooping statistics

Use this command to display IGMP Snooping statistics data.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip igmp snooping statistics interface <interface-range>
   [group [<ip-address>]]
```

Parameter	Description
<ip-address>	Optionally specify the address of the multicast group, entered in the form A.B.C.D.
<interface>	Specify the name of the VLAN interface or interface range.

Mode User Exec and Privileged Exec

Example To display IGMP statistical information for **vlan1** and **vlan2**, use the command:

```
awplus# show ip igmp snooping statistics interface
       vlan1-vlan2
```

Output **Figure 49-6: Example output from the show ip igmp snooping statistics command**

```
IGMP Snooping statistics for vlan1

```

undebug igmp

This command applies the functionality of the **no debug igmp** command on page 49.5.

Chapter 50: PIM-SM Introduction and Configuration

Introduction

This chapter provides information about Protocol Independent Multicast - Sparse Mode (PIM-SM) and Protocol Independent Multicast - Source Specific Multicast (PIM-SSM).

PIM-SM

Protocol Independent Multicast - Sparse Mode (PIM-SM) provides efficient communication between members of sparsely distributed groups - the type of groups that are most common in wide-area internetworks.

For details of the commands used to configure PIM-SM, see **Chapter 51, PIM-SM Commands**. For a general overview of multicasting, see **Chapter 47, Multicast Introduction and Commands**.

Characteristics of PIM-SM

PIM Sparse Mode (PIM-SM) is designed on the principle that several hosts wishing to participate in a multicast conference does not justify flooding the entire internetwork with periodic multicast traffic. PIM-SM is designed to limit multicast traffic so that only those switches interested in receiving traffic for a particular group receive the traffic.

Switches with directly attached or downstream members are required to join a Sparse Mode distribution tree by transmitting explicit join messages. If a switch does not become part of the predefined distribution tree, it does not receive multicast traffic addressed to the group. In contrast, dense mode multicast routing protocols assume downstream group membership and continue to forward multicast traffic on downstream links until explicit prune messages are received. The default forwarding action of a sparse mode multicast routing protocol is to block traffic unless it is explicitly requested, while the default action of the dense mode multicast routing protocols is to forward traffic.

PIM-SM employs the concept of a Rendezvous Point (RP) where receivers “meet” sources. The initiator of each multicast group selects a primary RP and a small ordered set of alternative RPs, known as the RP-list. For each multicast group, there is only a single active RP. Each receiver wishing to join a multicast group contacts its directly attached switch, which in turn joins the multicast distribution tree by sending an explicit join message to the group’s primary RP. A source uses the RP to announce its presence and to find a path to members that have joined the group. This model requires Sparse Mode switches to maintain some state information (the RP-list) prior to the arrival of data packets. In contrast, Dense Mode multicast routing protocols are data driven, since they do not define any state for a multicast group until the first data packet arrives.

Roles in PIM-SM

A multicast sender does not need to know the addresses of the members of the group in order to send to them, and the members of the group need not know the address of the sender. Group membership can change at any time. When PIM is enabled on the switch, and before the switch can route multicast traffic, it must establish which of the PIM routers in the network are performing some key roles:

- Designated Router.
- Rendezvous Point.
- Bootstrap Router.

Designated Router

There must be one PIM Designated Router (DR) in the subnetwork to which the IP hosts are connected. Any PIM-SM interfaces on the subnetwork elect the DR with the highest DR priority. If there is more than one router with the same priority, or no priority, they choose the interface with the highest IP address number. The DR performs all the PIM functionality for the subnetwork. If the current DR becomes unavailable, the remaining switches elect a new DR on the interface by DR priority or IP address.

Rendezvous Point

Each multicast group must have a Rendezvous Point (RP). The RP forms the root of the group's distribution tree. The DR for a multicast sender sends multicast packets towards the RP. DRs with group members connected to them send join messages towards the group's RP. The RP candidate with the lowest priority is elected from all the RP candidates for a group. If the RP becomes unavailable, the remaining RP candidates elect a new RP.

Bootstrap Router

Each PIM-SM network must have at least one Bootstrap Router (BSR) candidate, unless all switches in the domain are configured statically with information about all RPs in the domain. Every switch that is a BSR candidate periodically sends a Bootstrap Candidate Advertisement message to advertise that it is available as a BSR candidate. The BSR candidates in the network elect the switches with the highest preference value to be the BSR. The elected BSR listens to PIM Candidate RP Advertisement messages specifying RP candidates for multicast groups. It maintains a list of RP candidates and sends a bootstrap message every BSM interval, specifying all the multicast groups in the PIM network, and their RP candidates. Each switch uses this information and a standardized hash mechanism to determine the RP for each group.

In summary:

- Each multicast group must have at least one RP candidate
- Each PIM-SM domain must have at least one BSR candidate, unless all routers in the domain are configured statically with information about all RPs in the domain
- Each subnetwork must have at least one DR candidate.

PIM hello messages

When PIM is enabled on a switch, it sends out a PIM Hello message on all its PIM enabled interfaces, and listens for Hello messages from its PIM neighbors. When a switch receives a Hello message, it records the interface, IP address, priority for becoming a DR, and the timeout for the neighbor's information. The switch sends Hello messages regularly at the Hello Time interval.

Operation of PIM-SM

Once roles are established, multicast routing follows specific phases:

1. **Rendezvous Point Tree**
2. **Register stop**
3. **Shortest Path Tree**

While multicast routing always begins with phase 1, the Designated Router (DR) for a receiver determines whether and when to move on to phases 2 and 3, depending on the amount of traffic from the source.

Rendezvous Point Tree

Phase 1 establishes and uses a shared tree rooted at the Rendezvous Point (RP) to forward all multicast data to group members.

When an IP host sends an IGMP join message to the local PIM DR, which is not the RP for the group, the DR sends a PIM join message towards the RP for the group ("upstream"). The DR determines which switch is the RP for the group from the most recent bootstrap message. Every switch the join message passes through records that there is a group member on the incoming interface. Eventually, the join message reaches either the RP, or another switch that already knows that it has a group member downstream. If the group has many members, the join messages converge on the RP to form a Rendezvous Point Tree (RPT). This is called a shared tree because multicast data that is sent to the group by any sender shares the tree. The multicast receiver's DR sends join messages periodically according to the upstream join timer as long as the IP host is a member of the group. When the last receiver on a subnetwork leaves the group, the join messages stop, and their entries timeout on routers that are closer to the RP.

The sender's DR encapsulates the multicast data in a unicast packet in a process called **registering**, and sends these register packets to the group's RP. When the RP receives the data, it decapsulates them, and forwards them onto the shared tree.

Register stop

Phase 2 improves efficiency and performance by using register stop. In this phase the RP joins the shortest path tree between the source and receiver. This allows the original (unencapsulated) packets to be forwarded from the sender, instead of encapsulated packets. It also allows shorter paths to receivers that are close to the sender, making it more efficient in some circumstances.

When the RP for a group receives the first encapsulated data packet from a source, it joins the shortest path tree towards the sender. Once data is able to flow along the shortest path from the sender to the RP, packets do not need to be registered. The RP sends a register stop message in reply to the next encapsulated message. When the sender's DR receives the register stop message, it stops registering. The DR sends a null register message to the RP to find whether the RP still does not need to receive registered packets. If it receives another register stop message, the DR continues to forward only the native data packets. If the DR does not receive another register stop message within the register probe time, it resumes registering the data packets and sending them to the RP.

When the RP starts receiving native data packets from the source, it starts to discard the encapsulated packets, and starts forwarding native packets on the shared tree to all the group members. If the path from the source to the RP intersects the shared RP tree for the group, then the packets also take a short-cut onto the shared tree for delivery to the group members down its branches.

Shortest Path Tree

This phase further optimizes routing by using Shortest Path Trees (SPT). In phase 3 the receiver joins the shortest path tree between the source and receiver. This allows a multicast group member to receive multicast data by the shortest path from the sender, instead of from the shared RP tree. When the receiver's DR receives multicast data from a particular sender, it sends a join message towards the sender. When this message reaches the sender's DR, the DR starts forwarding the multicast data directly towards the receiver. As several receivers all initiate shortest paths to the sender, these paths converge, creating a SPT.

When the multicast packets start arriving from the SPT at the receiver's DR or an upstream router common to the SPT and the RPT, it starts discarding the packets from the RPT, and sends a prune message towards the RP. The prune message travels up the RPT until it reaches the RP or a switch that still needs to forward multicast packets from this sender to other receivers. Every time a switch receives a prune message, it waits a short time so that other switches on the LAN have the opportunity to override the prune message.

Multi-Access LANs

If the PIM-SM network includes multi-access LAN links for transit, as well as point-to-point links, then a mechanism is needed to prevent multiple trees forwarding the same data to the same group member. Two or more switches on a LAN may have different information about how to reach the RP or the multicast sender. They could each send a join message to two different switches closer to the RP for an RPT or the sender for an SPT. This could potentially cause two copies of all the multicast traffic towards the receiver.

When PIM switches notice duplicate data packets on the LAN, they elect a single switch to forward the data packets, by each sending PIM Assert messages. If one of the upstream switches is on an SPT and the other is on an RPT, the switch on the SPT has the shortest path to the sender, and wins the Assert election. If both switches are on RPTs the switch with the shortest path to the RP (the lowest sum of metrics to the RP) wins the Assert. If both switches are on an SPT, then the switch with the shortest path to the sender (the lowest sum of metrics to the sender's DR) wins the Assert.

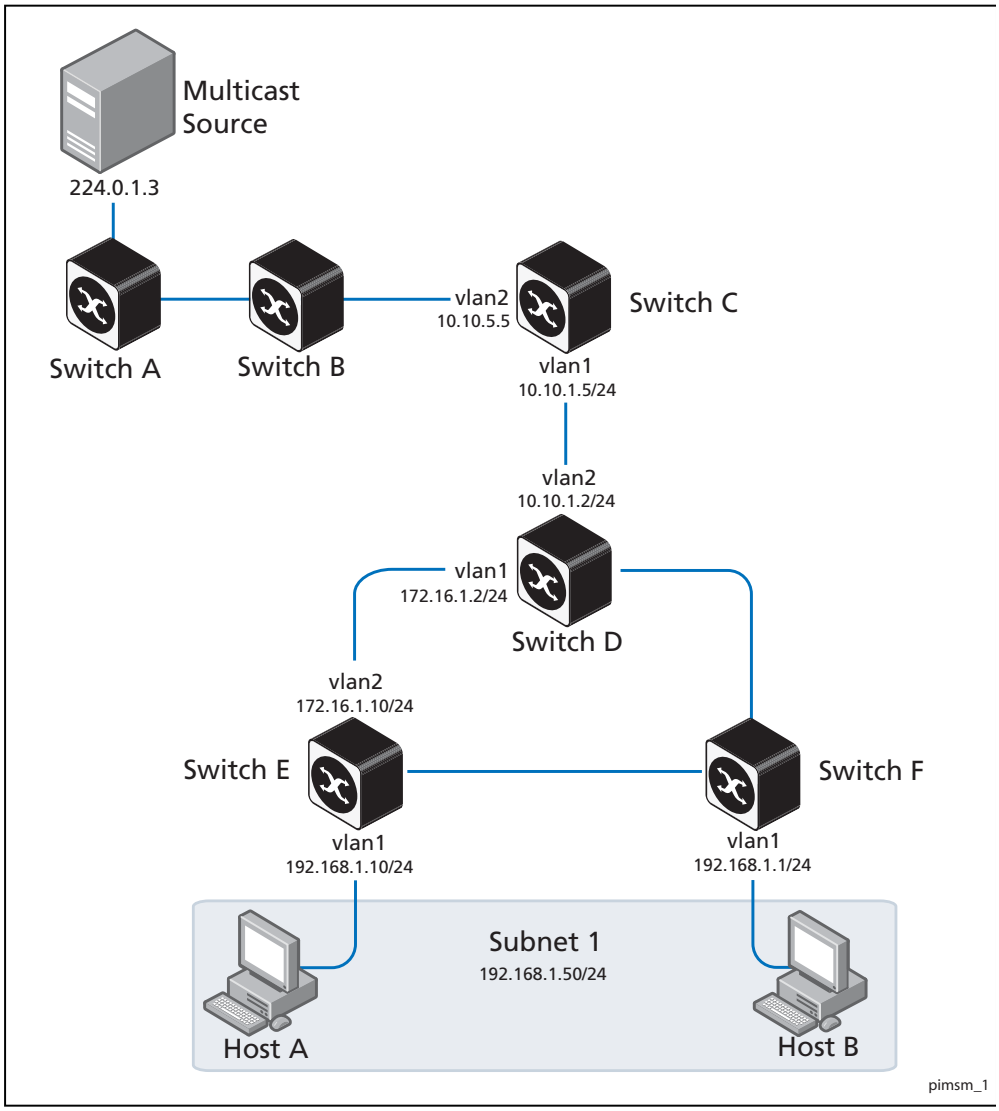
The switch that won the Assert election forwards these data packets, and acts as the local Designated Router for any IGMP members on the LAN. The downstream switches on the LAN also receive the Assert messages, and send all their join messages to the Assert winner. The result of an Assert election will timeout after the Assert Time. As long as the situation causing the duplication remains unchanged, the Assert winner sends an Assert message at a the Assert time interval, before the previous Assert messages time out. When the last downstream switch leaves the SPT, the Assert winner sends an Assert Cancel message saying that it is about to stop forwarding data on the SPT. Any RPT downstream switches then switch back to the RP tree.

PIM-SM Configuration

This section provides three PIM-SM configuration examples:

- **Static Rendezvous Point configuration**
- **Dynamic Rendezvous Point configuration**
- **Bootstrap Router configuration**

Both Rendezvous Point (RP) configuration examples refer to the network topology in the following graphic and use Allied Telesis managed Layer 3 Switches as the PIM routers. For details on the commands used in the following examples, refer to **Chapter 51, PIM-SM Commands**.



Static Rendezvous Point configuration

In this example using the above network topology, Switch C is the Rendezvous Point (RP) and all switches are statically configured with RP information. Host A and Host B join group `224.0.1.3` for all the sources. They send the IGMP membership report to Subnet 1. Two switches are attached to Subnet 1, Switch E and Switch F. Both of these switches have default Designated Router (DR) priority on `vlan1`. Because Switch E has a higher IP address on `vlan1`, Switch E becomes the DR and is responsible for sending Join messages to the RP (Switch C).

While configuring the RP, ensure that:

- Every switch includes the **ip pim rp-address 10.10.1.5** statement, even if it does not have any source or group member attached to it.
- There is only one RP address for the whole multicast group.
- All interfaces running PIM-SM must have sparse-mode enabled. In the configuration sample output below, both **vlan1** and **vlan2** are pim sparse-mode enabled.

See the following configuration output for **Switch D**:

```
hostname Switch D
!!
interface vlan1
 ip pim sparse-mode
!
interface vlan2
 ip pim sparse-mode
!
interface lo
!
!
ip multicast-routing
ip pim rp-address 10.10.1.5
!
```

Configure all the switches with the same **ip pim rp-address 10.10.1.5** statement as shown above.

Verifying configuration

Use the following commands to verify the RP configuration, interface details, and the multicast routing table.

RP details

For **Switch D**, the **show ip pim sparse-mode rp mapping** command shows that `10.10.1.5` is the RP for all multicast groups `224.0.0.0/4`, and is statically configured. All other switches will have a similar output.

```
awplus#show ip pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4, Static
    RP: 10.10.1.5
         Uptime: 5d02h15m
```

For **Switch D**, the **show ip pim sparse-mode rp-hash** command displays the selected RP for the specified group, in this example `224.0.1.3`.

```
awplus#show ip pim sparse-mode rp-hash 224.0.1.3
    RP: 10.10.1.5
```

Interface details

For **Switch E**, the **show ip pim sparse-mode interface** command displays the interface details and shows that Switch E is the DR on Subnet 1.

```
awplus#show ip pim sparse-mode interface
Total configured interfaces: 16   Maximum allowed: 31
Total active interfaces:     12

Address      Interface VIFindex Ver/   Nbr      DR    DR
                                       Mode    Count  Prior
192.168.1.10    vlan2  0       v2/S    1          1   192.168.1.10
172.16.1.10     vlan3  2       v2/S    1          1   172.16.1.10
```

IP multicast routing table

Note that the multicast routing table displayed for an RP switch is different to that displayed for other switches. For **Switch C**, because this switch is the RP and the root of this multicast tree, the **show ip pim sparse-mode mroute** command shows **RPF nbr** (next-hop to reach RP) as **0.0.0.0** and **RPF idx** (incoming interface for this (*, G) state) as **None**.

```
awplus#show ip pim sparse-mode mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, 224.0.1.3)
RP: 10.10.1.5
RPF nbr: 0.0.0.0
RPF idx: None
Upstream State: JOINED
 Local      ..............................
 Joined     j..............................
 Asserted   ..............................
 Outgoing   o..............................
```

For **Switch E**, the **show ip pim sparse-mode mroute** command displays the IP multicast routing table.

```
awplus#show ip pim sparse-mode mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, 224.0.1.3)
RP: 10.10.1.5
RPF nbr: 172.16.1.2
Upstream State: JOINED
 Local      ..............................
 Joined     j..............................
 Asserted   ..............................
 Outgoing   o..............................
```

On Switch E, `port1.0.2` is the incoming interface of the (*, G) entry, and `port1.0.1` is on the outgoing interface list of the (*, G) entry. This means that there is a group member through `port1.0.1`, and RP is reachable through `port1.0.2`.

Dynamic Rendezvous Point configuration

A static RP configuration works for a small, stable PIM domain. However, it is not practical for a large and not so stable internetwork. In such a network, if the RP fails, the network administrator may have to change the static configurations on all PIM switches. An additional reason for choosing dynamic configuration high routing traffic leading to a change in the RP.

The Bootstrap Router (BSR) mechanism is used to dynamically maintain the RP information. To configure the RP dynamically in the above network topology, Switch C on `port1.0.1` and Switch D on `vlan1` are configured as RP candidates using the **ip pim rp-candidate** command. Switch D on `vlan1` is also configured as the BSR candidate. Since no other device has been configured as a BSR candidate, Switch D becomes the BSR router and is responsible for sending group-to-RP mapping information to all other PIM switches in this PIM domain.

The following output displays the complete configuration at **Switch C**.

```
awplus#show run
!
interface vlan1
 ip pim sparse-mode
!
interface vlan2
 ip pim sparse-mode
!
interface lo
!
ip multicast-routing
ip pim rp-candidate vlan1
```

The following output displays the complete configuration at **Switch D**.

```
awplus#show run
!
interface vlan1
 ip pim sparse-mode
!
interface vlan2
 ip pim sparse-mode
!
interface lo
!
ip multicast-routing
ip pim bsr-candidate vlan1
ip pim rp-candidate vlan1 priority 2
!
```

The highest priority switch is chosen as the RP. If two or more switches have the same priority, a hash function in the BSR mechanism is used to choose the RP to make sure that all devices in the PIM domain have the same RP for the same multicast group.

Use the `<interface> [priority <priority>]` parameters of the **ip pim rp-candidate** command to change the default priority of any RP candidate.

PIM group-to-RP mappings

The **show ip pim sparse-mode rp mapping** command displays the group-to-RP mapping details. The output shows information about RP candidates. There are two RP candidates for the group range `224.0.0.0/4`. RP candidate `10.10.1.5` has a default priority of `192`, whereas RP candidate `172.16.1.2` has been configured to have a priority of `2`. Since RP candidate `172.16.1.2` has a higher priority, it is selected as the RP for the multicast group `224.0.0.0/4`.

See the following configuration output for **Switch D**.

```
awplus#show ip pim sparse-mode rp mapping
This system is the Bootstrap Router (v2)
Group(s): 224.0.0.0/4
  RP: 10.10.1.5
    Info source: 172.16.1.2, via bootstrap, priority 192
         Uptime: 00:00:13, expires: 00:02:29
  RP: 172.16.1.2
    Info source: 172.16.1.2, via bootstrap, priority 2
         Uptime: 00:34:42, expires: 00:01:49
```

RP details

The **show ip pim sparse-mode rp-hash** command displays information about the RP router for a particular group. See the following configuration output for **Switch D**. This output shows that `172.16.1.2` has been chosen as the RP for the multicast group `224.0.1.3`.

```
awplus#show ip pim sparse-mode rp-hash 224.0.1.3
Group(s): 224.0.0.0/4
    RP: 172.16.1.2
    Info source: 172.16.1.2, via bootstrap
```

After RP information reaches all PIM switches in the domain, various state machines maintain all routing states as the result of Join/Prune messages from members of the multicast group.

Bootstrap Router configuration

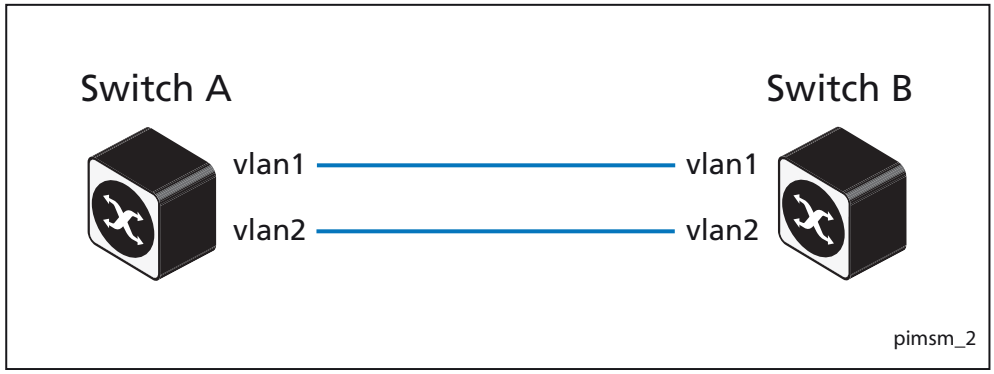
Every PIM multicast group needs to be associated with the IP address of a Rendezvous Point (RP). This address is used as the root of a group-specific distribution tree, whose branches extend to all nodes in the domain that want to receive traffic sent to the group. For all senders to reach all receivers, all devices in the domain use the same mappings of group addresses to RP addresses. In order to determine the RP for a multicast group, a PIM device maintains a collection of group-to-RP mappings, called the RP-Set.

The Bootstrap Router (BSR) mechanism for the class of multicast routing protocols in the PIM domain uses the concept of an RP as a means for receivers to discover the sources that send to a particular multicast group. The BSR mechanism is one way that a multicast router can learn the set of group-to-RP mappings required in order to function.

Some of the PIM devices within a PIM domain are configured as RP candidates. A subset of the RP candidates will eventually be used as the actual RPs for the domain. An RP configured with a lower value in the priority field has higher a priority.

Some of the PIM devices in the domain are configured to be BSR candidates. One of these BSR candidates is elected to be the BSR for the domain, and all PIM devices in the domain learn the result of this election through Bootstrap messages (BSM). The BSR candidate with highest value in the priority field is the elected BSR.

The RP candidates then report their candidacy to the elected BSR, which chooses a subset of the RP candidates, and distributes corresponding group-to-RP mappings to all the devices in the domain through Bootstrap messages.



Switch A Enter the following commands to configure `vlan1` on Switch A as the BSR candidate. The default priority is 64.

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan1
awplus(config)# exit
```

Switch B Enter the following commands to configure `vlan1` on Switch B as the BSR candidate with a hash mask length of 10 and a priority of 25 and to configure `vlan1` as the RP candidate with a priority of 0.

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan1 10 25
awplus(config)# ip pim rp-candidate vlan1 priority 0
awplus(config)# exit
```

Validation Commands

Use the **show ip pim sparse-mode bsr-router** command to verify the BSR candidate state on **Switch A**.

```
awplus#show ip pim sparse-mode bsr-router
PIMv2 Bootstrap information
This system is the Bootstrap Router (BSR)
  BSR address: 20.0.1.21
  Uptime:      00:37:12, BSR Priority: 64, Hash mask length: 10
  Expires:     00:01:32
  Role: Candidate BSR
  State: Elected BSR
```

Use the **show ip pim sparse-mode bsr-router** command to verify the BSR candidate state on **Switch B**. The initial state of the BSR candidate is pending before transitioning to BSR candidate.

```
awplus#show ip pim sparse-mode bsr-router
PIMv2 Bootstrap information
  BSR address: 20.0.1.21
  Uptime:      00:02:39, BSR Priority: 64, Hash mask length: 10
  Expires:     00:00:03
  Role: Candidate BSR
  State: Pending BSR

awplus#show ip pim sparse-mode bsr-router
PIMv2 Bootstrap information
 BSR address: 20.0.1.21
 Uptime:      00:40:20, BSR Priority: 64, Hash mask length: 10
 Expires:     00:02:07
 Role: Candidate BSR
 State: Candidate BSR
```

Use the **show ip pim sparse-mode rp mapping** command to verify RP-set information on **Switch A**.

```
awplus#show ip pim sparse-mode rp mapping
PIM Group-to-RP Mappings
This system is the Bootstrap Router (v2)
Group(s): 224.0.0.0/4
 RP: 20.0.1.11
 Info source: 20.0.1.11, via bootstrap, priority 0
 Uptime: 00:00:30, expires: 00:02:04
```

Use the **show ip pim sparse-mode rp mapping** command to verify RP-set information on **Switch B**.

```
awplus#show ip pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4
 RP: 20.0.1.11
 Info source: 20.0.1.21, via bootstrap, priority 0
 Uptime: 00:00:12, expires: 00:02:18
```

PIM-SSM

Protocol Independent Multicast - Source Specific Multicast (PIM-SSM) is derived from Protocol Independent Multicast - Sparse Mode (PIM-SM) and is a simplified version of PIM-SM.

For details of the commands used to configure PIM-SSM, see **Chapter 51, PIM-SM Commands** and **Chapter 49, IGMP and IGMP Snooping Commands**.

Characteristics of PIM-SSM

While PIM-SM supports both a “many-to-many” and a “one-to-many” model, PIM-SSM only supports the “one-to-many” model, also known as a “broadcast application”. It is possible for devices in a network to support both PIM-SM and PIM-SSM at the same time, even on the same interfaces.

Instead of multicast groups being initially sent to a Rendezvous Point (RP), PIM-SSM builds shortest path trees (SPT) that are directly rooted at the source. This is because PIM-SSM relies on the multicast client informing the closest multicast router of the source IP address of the multicast server, as well as the multicast group IP address for the group it wants to join.

This approach removes some of the complexity in the multicast routing process and also improves security. Because a multicast client sends a join that includes the specific source IP address of the server it is no longer possible for an attacker to broadcast to the same group IP address from a different source IP address and cause a Denial of Service (DoS) attack. With PIM-SSM the attacker's traffic is discarded at the edge of the PIM domain.

PIM-SSM IP Address Range

The Internet Assigned Numbers Authority (IANA) has reserved the address range 232.0.0.0 through 232.255.255.255 for SSM applications. Although PIM-SSM can technically be configured to use the entire 224/4 multicast address range, PIM-SSM operation is guaranteed only in the 232/8 range (232.0.0/24 is reserved).

IGMPv3 and SSM-Mapping

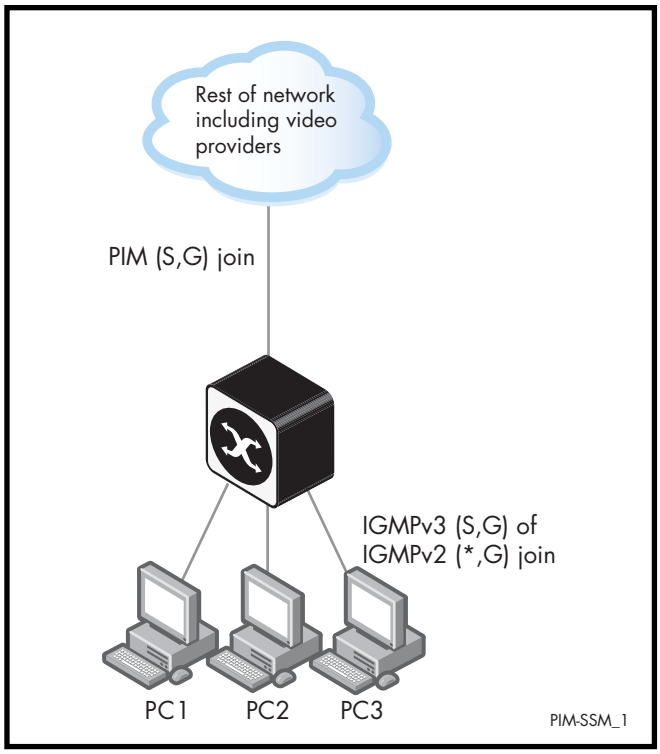
A restriction of PIM-SSM is that it requires a “Source, Group” (S,G) join and only IGMPv3 supports this. Source Specific Multicast Mapping is required to use PIM-SSM when you have older multicast client devices that do not support IGMPv3. This additional feature allows you to statically map IGMPv1/v2 (*,G) joins into PIM (S,G) joins, which in turn allows the device to talk to an upstream PIM-SSM network.

Note that IGMPv3 (*,G) joins cannot be mapped by SSM-Mapping.

How PIM-SSM Works

To join multicast group `232.1.1.1` each PC must send an IGMPv3 join with the source IP address specified. The join will be a (S,G) join, for example (`85.1.1.1,232.1.1.1`). The router will receive the IGMP join and check if the group address is in the SSM range. Then:

- If the group address is in the SSM range, the router will verify that a specific source or sources have been included in the IGMP join.
- If a specific source or sources has been included in the IGMP join, then the router will forward a PIM (S,G) join towards the source IP address.
- If the source IP address is not specified, then the router will discard the IGMP join and the PC will not join the group.
- If an IGMPv2 join is received for the SSM range then by default the join is discarded because no source IP address is specified. IGMP joins for group addresses that are not in the SSM range do not need to specify a specific source IP address.



How IGMP SSM-Mapping Works

In the example above (**"How PIM-SSM Works"**), if an IGMPv2 join is sent it is discarded because IGMPv2 only supports (*,G) joins. To resolve this issue, IGMP SSM-Mapping allows the router to be statically configured with source IP addresses for each group address or range of group addresses. This allows the router to receive a (*,G) join, match the group address via a software ACL, and based on this, insert the matching source IP address. The router then treats the join as a normal (S,G) join. If no match is found then the (*,G) is used. If the group address is in the SSM range then the join is discarded.

Configure PIM-SSM

Table 50-1: General configuration procedure for PIM-SSM

To enable SSM on the device	
`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `ip igmp ssm-map enable`	This command applies to VLAN interfaces configured for IGMP.
To specify the static mode of defining SSM	
`awplus#` `configure terminal`	Enter Global Configuration mode.

`awplus(config)#`
`access-list {<1-99>|<1300-1999>} permit <source>`
OR
`access-list standard <standard-access-list-name> permit <source>`
	Configure either a Standard Numbered ACL, Expanded Numbered ACL, or Standard Named ACL. Specify a multicast group address range and wildcard mask with the *source* parameter.

`awplus(config)#` `ip igmp ssm-map static {<access-list-number>|<access-list-number-expanded>|<access-list-name>} <ip-address>`	This command applies to VLAN interfaces configured for IGMP. SSM statically assigns sources to IGMPv1 and IGMPv2 groups to translate such (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.
To define a non-default SSM range of IP multicast addresses in IGMP	
`awplus#` `configure terminal`	Enter Global Configuration mode.

`awplus(config)#`
`access-list {<1-99>} permit <source>`
OR
`access-list standard <standard-access-list-name> permit <source>`
	Configure either a Standard Numbered ACL or Standard Named ACL.

Table 50-1: General configuration procedure for PIM-SSM(cont.)

`awplus(config)#`	
`ip igmp ssm range {<access-list-number>|<access-list-name>}`	Incoming IGMPv1 and IGMPv2 join requests are ignored if the multicast IP address is in the SSM range and no SSM mapping is configured for these addresses. By default, the SSM range is 232/8. To define the SSM range to be other than the default, specify either an access-list name or and access-list number.
To define the Source Specific Multicast (SSM) range of IP multicast addresses	
`awplus#`	
	Enter Global Configuration mode.
`awplus(config)#`	
`ip pim ssm default`	The default keyword defines the SSM range as 232/8. OR
`awplus(config)#`	
`ip pim ssm range {<access-list>|<named-access-list>}`	To define the SSM range to be other than the default, use the access-list parameter option.

Chapter 51: PIM-SM Commands

Command List

This chapter provides an alphabetical reference of PIM-SM commands. For commands common to PIM-SM and PIM-DM, see **Chapter 47, Multicast Introduction and Commands**.

clear ip pim sparse-mode bsr rp-set *

Use this command to clear all Rendezvous Point (RP) sets learned through the PIMv2 Bootstrap Router (BSR).

Syntax

```
clear ip pim sparse-mode bsr rp-set *
```

Parameter	Description
*	Clears all RP sets.

Mode Privileged Exec

Usage For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

Example

```
awplus# clear ip pim sparse-mode bsr rp-set *
```

clear ip mroute pim sparse-mode

Use this command to clear all multicast route table entries learned through PIM-SM for a specified multicast group address, and optionally a specified multicast source address.

Syntax

```
clear ip mroute <Group-IP-address> pim sparse-mode
clear ip mroute <Group-IP-address> <Source-IP-address> pim sparse-mode
```

Parameter	Description
<Group-IP-address>	Specify a multicast group IPv6 address, entered in the form `A.B.C.D`.
<Source-IP-address>	Specify a source group IP address, entered in the form `A.B.C.D`.

Mode Privileged Exec

Example

```
awplus# clear ip mroute 224.0.0.0 pim sparse-mode
awplus# clear ip mroute 224.0.0.0 192.168.7.1 pim sparse-mode
```

debug pim sparse-mode

Use this command to activate/de-activate all PIM-SM debugging.

Syntax

```
debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm]
    [packet] [state] [mtrace]

no debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm]
    [packet] [state] [mtrace]
```

Parameter	Description
`all`	Activates/deactivates all PIM-SM debugging.
`events`	Activates debug printing of events.
`mfc`	Activates debug printing of MFC (Multicast Forwarding Cache in kernel) add/delete/updates.
`mib`	Activates debug printing of PIM-SM MIBs.
`nexthop`	Activates debug printing of PIM-SM nexthop communications.
`nsm`	Activates debugging of PIM-SM Network Services Module communications.
`packet`	Activates debug printing of incoming and/or outgoing packets.
`state`	Activates debug printing of state transition on all PIM-SM FSMs.
`mtrace`	Activates debug printing of multicast traceroute.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim sparse-mode all
```

Related Commands **show debugging pim sparse-mode**
undebug all pim sparse-mode

debug pim sparse-mode timer

Use this command to enable debugging for the specified PIM-SM timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SM timers.

Syntax

```
debug pim sparse-mode timer assert [at]
no debug pim sparse-mode timer assert [at]
debug pim sparse-mode timer bsr [bst|crp]
no debug pim sparse-mode timer bsr [bst|crp]
debug pim sparse-mode timer hello [ht|nlt|tht]
no debug pim sparse-mode timer hello [ht|nlt|tht]
debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
debug pim sparse-mode timer register [rst]
no debug pim sparse-mode timer register [rst]
```

Parameter	Description
`assert`	Enable or disable debugging for the Assert timers.
`at`	Enable or disable debugging for the Assert Timer.
`bsr`	Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers.
`bst`	Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.
`crp`	Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.
`hello`	Enable or disable debugging for the specified Hello timer, or all Hello timers.
`ht`	Enable or disable debugging for the Hello timer: Hello Timer.
`nlt`	Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.
`tht`	Enable or disable debugging for the Hello timer: Triggered Hello Timer.
`joinprune`	Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.
`jt`	Enable or disable debugging for the JoinPrune timer: upstream Join Timer.
`et`	Enable or disable debugging for the JoinPrune timer: Expiry Timer.
`ppt`	Enable or disable debugging for the JoinPrune timer: PrunePending Timer.
`kat`	Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.

Parameter	Description
`ot`	Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.
`register`	Enable or disable debugging for the Register timers.
`rst`	Enable or disable debugging for the Register timer: Register Stop Timer.

Default By default, all debugging is disabled.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for the PIM-SM Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SM Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SM Joinprune expiry timer, use the command:

```
awplus# debug pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SM Register timer, use the command:

```
awplus# no debug pim sparse-mode timer register
```

Related Commands **show debugging pim sparse-mode**

ip pim accept-register list

Use this command to configure the ability to filter out multicast sources specified by the given access-list at the Rendezvous Point (RP), so that the RP will accept/refuse to perform the register mechanism for the packets sent by the specified sources. By default, the RP accepts register packets from all multicast sources.

Use the **no** variant of this command to revert to default.

Syntax

```
ip pim accept-register list{<simplerange>|<exprange>|<access-list>}
no ip pim accept-register
```

Parameter	Description
<simplerange>	<100-199> IP extended access-list.
<exprange>	<2000-2699> IP extended access list (expanded range).
<access-list>	IP Named Standard Access list.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim accept-register list 121
awplus(config)# access-list 121 permit ip 100.1.1.1 0.0.0.0 any
```

ip pim anycast-rp

Use this command to configure Anycast RP (Rendezvous Point) in a RP set.

Use the **no** variant of this command to remove the configuration.

Syntax

```
ip pim anycast-rp <anycast-rp-address> <member-rp-address>
no ip pim anycast-rp <anycast-rp-address> [<member-rp-address>]
```

Parameter	Description
<anycast-rp-address>	<A.B.C.D> Specify an anycast IP address to configure an Anycast RP (Rendezvous Point) in a RP set.
<member-rp-address>	<A.B.C.D> Specify an Anycast RP (Rendezvous Point) address to configure an Anycast RP in a RP set.

Mode Global Configuration

Usage Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

Examples The following example shows how to configure the Anycast RP address with **ip pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ip pim anycast-rp 1.1.1.1 10.10.10.10
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ip pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ip pim anycast-rp 1.1.1.1
```

ip pim bsr-border

Use the **ip pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through a VLAN interface. The BSR border is the border of the PIM domain.

Use the **no** variant of this command to disable the configuration set with **ip pim bsr-border**.

Syntax

```
ip pim bsr-border
no ip pim bsr-border
```

Mode Interface Configuration for a VLAN interface.

Usage When this command is configured on a VLAN interface, no PIM version 2 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM domain with this command to avoid BSR messages from being exchanged between the two PIM domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM protocol from working as intended.

Examples The following example configures the VLAN interface `vlan2` to be the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim bsr-border
```

The following example removes the VLAN interface `vlan2` from the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim bsr-border
```

ip pim bsr-candidate

Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IP address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

Syntax

```
ip pim bsr-candidate <interface> [<hash>] [<priority>]
no ip pim bsr-candidate [<interface>]
```

Parameter	Description
<interface>	The interface. For instance, `vlan2`.
<hash>	`<0-32>` configure hash mask length for RP selection. The default hash value if you do not configure this parameter is 10.
<priority>	`<0-255>` configure priority for a BSR candidate. Note that you must also specify the <*hash*> (mask length) when specifying the <*priority*>. The default priority if you do not configure this parameter is 64.

Mode Global Configuration

Default The default hash parameter value is 10 and the default priority parameter value is 64.

Examples

To set the BSR candidate to the VLAN interface `vlan2`, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan2 20 30
```

To withdraw the address of `vlan2` from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ip pim bsr-candidate vlan2
```

ip pim cisco-register-checksum

Use this command to configure the option to calculate the Register checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

Syntax

```
ip pim cisco-register-checksum
no ip pim cisco-register-checksum
```

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim cisco-register-checksum
```

ip pim cisco-register-checksum group-list

Use this command to configure the option to calculate the Register checksum over the whole packet on multicast groups specified by the access-list. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax

```
ip pim cisco-register-checksum group-list
   [<simplerange>|<exprange>|<access-list>]
no ip pim cisco-register-checksum group-list
   [<simplerange>|<exprange>|<access-list>]
```

Parameter	Description
<simplerange>	<1-99> Simple access-list.
<exprange>	<1300-1999> Simple access-list (expanded range).
<access-list>	IP Named Standard Access list.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim cisco-register-checksum group-list 34
awplus(config)# access-list 34 permit 224.0.1.3
```

ip pim crp-cisco-prefix

Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0. RP advertisements for the default IPv4 multicast group range 224/4 are sent with a prefix of 1.

Use the **no** variant of this command to revert to the default settings.

Syntax

```
ip pim crp-cisco-prefix
no ip pim crp-cisco-prefix
```

Mode Global Configuration

Usage Cisco's BSR code does not conform to the latest BSR draft, it does not accept candidate RPs with a group prefix number of zero. To make the candidate RP work with a Cisco BSR, use the **ip pim crp-cisco-prefix** command when interoperating with older versions of Cisco IOS.

Examples

```
awplus# configure terminal
awplus(config)# ip pim crp-cisco-prefix

awplus# configure terminal
awplus(config)# no ip pim crp-cisco-prefix
```

Related Commands ip pim rp-candidate

ip pim dr-priority

Use this command to set the Designated Router priority value.

Use the **no** variant of this command to disable this function.

Syntax

```
ip pim dr-priority  <priority>
no ip pim dr-priority [<priority>]
```

Parameter	Description
<priority>	<0-4294967294> The Designated Router priority value. A higher value has a higher preference.

Default The default is 1. The negated form of this command restores the value to the default.

Mode Interface Configuration for a VLAN interface.

Examples To set the Designated Router priority value to `11234` for the VLAN interface `vlan2`, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface `vlan2`, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim dr-priority
```

Related Commands ip pim ignore-rp-set-priority

ip pim exclude-genid

Use this command to exclude the GenID option from Hello packets sent out by the PIM module on a particular interface.This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax

```
ip pim exclude-genid
no ip pim exclude-genid
```

Default By default, this command is disabled; the GenID option is included.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim exclude-genid
```

ip pim ext-srcs-directly-connected (PIM-SM)

Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

Syntax

```
ip pim ext-srcs-directly-connected
no ip pim ext-srcs-directly-connected
```

Default The **no** variant of this command is the default behavior.

Mode Interface Configuration for a VLAN interface.

Examples To configure PIM to treat all sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

ip pim hello-holdtime (PIM-SM)

This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 * the current hello-interval.

Syntax

```
ip pim hello-holdtime <holdtime>
no ip pim hello-holdtime
```

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

Default The default hello-holdtime value is 3.5 * the current hello-interval. The default hello-holdtime is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage Each time the hello interval is updated, the hello holdtime is also updated, according to the following rules:

If the hello holdtime is not configured; or if the hello holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 * hello interval). Otherwise, it retains the configured value.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-holdtime 123
```

ip pim hello-interval (PIM-SM)

This command configures a hello-interval value.

Use the **no** variant of this command to reset the hello-interval to the default.

Syntax

```
ip pim hello-interval <interval>
no ip pim hello-interval
```

Parameter	Description
<interval>	<1-65535> The value in seconds (no fractional seconds accepted).

Default The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage When the hello interval is configured, and the hello holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 * hello interval). Otherwise, the hello-holdtime value is the configured value.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
```

ip pim ignore-rp-set-priority

Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this setting.

Syntax

```
ip pim ignore-rp-set-priority
no ip pim ignore-rp-set-priority
```

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim ignore-rp-set-priority
```

ip pim jp-timer

Use this command to set the PIM-SM join/prune timer. Note that the value set by the join/prune timer is the value that the switch puts into the holdtime field of the join/prune packets it sends to its neighbors.

Use the **no** variant of this command to return the PIM-SM join/prune timer to its default value of 210 seconds.

Syntax

```
ip pim jp-timer <1-65535>
no ip pim jp-timer [<1-65535>]
```

Parameter	Description
<1-65535>	Specifies the join/prune timer value. The default value is 210 seconds.

Default The default join/prune timer value is 210 seconds.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim jp-timer 300

awplus# configure terminal
awplus(config)# no ip pim jp-timer
```

ip pim neighbor-filter (PIM-SM)

This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

Syntax

```
ip pim neighbor-filter {<number>|<accesslist>}
no ip pim neighbor-filter {<number>|<accesslist>}
```

Parameter	Description
<number>	<1-99> Standard IP access-list number.
<accesslist>	IP access list name.

Default By default, there is no filtering.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim neighbor-filter 14
```

ip pim register-rate-limit

Use this command to configure the rate of register packets sent by this DR, in units of packets per second.

Use the **no** variant of this command to remove the limit.

Syntax

```
ip pim register-rate-limit <1-65535>
no ip pim register-rate-limit
```

Parameter	Description
<1-65535>	Specifies the maximum number of packets that can be sent per second.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-rate-limit 3444
```

ip pim register-rp-reachability

Use this command to enable the RP reachability check for PIM Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

Syntax

```
ip pim register-rp-reachability
no ip pim register-rp-reachability
```

Default This command is disabled; by default, there is no checking for RP-reachability.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-rp-reachability
```

ip pim register-source

Use this command to configure the source address of register packets sent by this DR, overriding the default source address, which is the address of the RPF interface toward the source host.

Use the **no** variant of this command to un-configure the source address of Register packets sent by this DR, reverting back to use the default source address that is the address of the RPF interface toward the source host.

Syntax

```
ip pim register-source [<sourceaddress>|<interface>]
no ip pim register-source
```

Parameter	Description
<sourceaddress>	The IP address, entered in the form `A.B.C.D`, to be used as the source of the register packets.
<interface>	The name of the interface to be used as the source of the register packets.

Usage The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback interface address, but can also be a physical address. This address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM enabled.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-source 10.10.1.3
```

ip pim register-suppression

Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds. Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the **ip pim rp-register-kat** command on page 51.25 is not used.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

Syntax

```
ip pim register-suppression <1-65535>
no ip pim register-suppression
```

Parameter	Description
<1-65535>	Register suppression on time in seconds.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-suppression 192
```

ip pim rp-address

Use this command to statically configure RP (Rendezvous Point) address for multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for multicast groups.

Syntax

```
ip pim rp-address <ip-address>
    [<simplerange>|<expandedrange> |<accesslist>] [<override>]

no ip pim rp-address <ip-address>
    [<simplerange>|<expandedrange>| <accesslist>] [override>]
```

Parameter	Description
<ip-address>	IP address of Rendezvous Point, entered in the form `A.B.C.D`.
<simplerange>	`<1-99>` IP Standard Access-list.
<expandedrange>	`<1300-1999>` IP Standard Access-list (expanded range).
<accesslist>	IP extended Access-list name.
<override>	Enables statically defined RPs to override dynamically learned RPs.

Mode Global Configuration

Usage The AlliedWare Plus™ PIM-SM implementation supports multiple static RPs. It also supports usage of static-RP and BSR mechanism simultaneously. The **ip pim rp-address** command is used to statically configure the RP address for multicast groups.

You need to understand the following information before using this command.

If the RP-address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP-address configured through BSR is chosen over the statically configured RP-address.

A single static-RP can be configured for multiple group ranges using Access Lists. However, configuring multiple static RPs (using **ip pim rp-address** command) with the same RP address is not allowed. The static-RP can either be configured for the whole multicast group range `224.0.0.0/4` (without ACL) or for specific group ranges (using ACL).

For example, configuring **ip pim rp-address 192.168.3.4** will configure static-RP 192.168.3.4 for the default group range 224.0.0.0/4. Configuring i**p pim rp-address 192.168.7.8 grp-list** will configure static-RP 192.168.7.8 for all the group ranges represented by permit filters in grp-list ACL.

If multiple static-RPs are available for a group range, then one with the highest IP address is chosen.

Only `Permit` filters in ACL are considered as valid group ranges. The default `Permit` filter `0.0.0.0/0` is converted to the default multicast filter `224.0.0.0/4`.

After configuration, the RP-address is inserted into a static-RP group tree based on the configured group ranges. For each group range, multiple static-RPs are maintained in a linked list. This list is sorted in a descending order of IP addresses. When selecting static-RPs for a group range, the first element (which is the static-RP with highest IP address) is chosen.

RP-address deletion is handled by removing the static-RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by the **ip pim rp-address** command. Commands with the **override** keyword take precedence over dynamically learned mappings.

Example

```
awplus# configure terminal
awplus(config)# ip pim rp-address 192.168.3.4 4
```

Related Commands

ip pim rp-candidate
ip pim rp-register-kat

ip pim rp-candidate

Use this command to give the router the candidate RP (Rendezvous Point) status using the IP address of the specified interface.

Use the **no** variant of this command to remove the RP status set using the **ip pim rp-candidate** command.

Syntax

```
ip pim rp-candidate <interface>
   [priority <priority>|interval <interval>| grouplist <grouplist>]

no ip pim rp-candidate [<interface>]
```

Parameter	Description
<interface>	Interface name
<priority>	<0-255> configure priority for an RP candidate.
<interval>	advertisement interval specified in the range <1-16383> (in seconds).
<grouplist>	IP access list specifier for standard, expanded or named access lists in their respective ranges: [<1-99>|*WORD*]

Default The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

Mode Global Configuration

Usage Note that issuing the command **ip pim rp-candidate** *<interface>* without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

Examples

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 priority 3
```

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 priority 3
               group-list 3
```

```
awplus# configure terminal
awplus(config)# no ip pim rp-candidate vlan2
```

Related Commands **ip pim rp-address**
ip pim rp-register-kat

ip pim rp-register-kat

Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SM Register packets.

Use the **no** variant of this command to return the PIM-SM KAT timer to its default value of 210 seconds.

Syntax

```
ip pim rp-register-kat <1-65535>
no ip pim rp-register-kat
```

Parameter	Description
<1-65536>	Specify the KAT timer in seconds. The default value is 210 seconds.

Mode Global Configuration

Default The default PIM-SM KAT timer value is 210 seconds.

Examples

```
awplus# configure terminal
awplus(config)# ip pim rp-register-kat 3454

awplus# configure terminal
awplus(config)# no ip pim rp-register-kat
```

Related Commands ip pim rp-address
ip pim rp-candidate

ip pim sparse-mode

Use this command to enable PIM-SM on the VLAN interface.

Use the **no** variant of this command to disable PIM-SM on the VLAN interface.

Syntax

```
ip pim sparse-mode
no ip pim sparse-mode
```

Mode Interface Configuration for a VLAN interface.

Examples

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode

awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode
```

ip pim sparse-mode passive

Use this command to enable and disable passive mode operation for local members on the VLAN interface.

Use the **no** variant of this command to disable passive mode operation for local members on the VLAN interface.

Syntax

```
ip pim sparse-mode passive
no ip pim sparse-mode passive
```

Mode Interface Configuration for a VLAN interface.

Usage Passive mode essentially stops PIM transactions on the interface, allowing only IGMP mechanism to be active. To turn off passive mode, use the **no ip pim sparse-mode passive** or the **ip pim sparse-mode** command. To turn off PIM activities on the VLAN interface, use the **no ip pim sparse-mode** command.

Examples

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode passive

awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode passive
```

ip pim spt-threshold

This command turns on the ability for the last-hop PIM router to switch to SPT.

The **no** variant of this command turns off the ability for the last-hop PIM router to switch to SPT.

Note The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Syntax

```
ip pim spt-threshold
no ip pim spt-threshold
```

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ip pim spt-threshold

awplus# configure terminal
awplus(config)# no ip pim spt-threshold
```

ip pim spt-threshold group-list

Use this command to turn on/off the ability for the last-hop PIM router to switch to SPT for multicast group addresses specified by the given access-list.

The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Use the **no** variant of this command to turn off switching to the SPT.

Syntax

```
ip pim spt-threshold group-list {<simplerange>|<expandedrange>|
   <named-accesslist>}
no ip pim spt-threshold group-list [<simplerange>|<expandedrange>|
   <named-accesslist>]
```

Parameter	Description
<simplerange>	<1-99> IP Standard Access-list.
<expandedrange>	<1300-1999> IP Standard Access-list (expanded range).
<named-accesslist>	IP Access-list name.

Mode Global Configuration

Usage Turn on/off the ability for the last-hop PIM router to switch to SPT for multicast group addresses specified by the given access-list.

Example

```
awplus# configure terminal
awplus(config)# ip pim spt-threshold group-list 1
awplus(config)# access-list 1 permit 224.0.1.3
```

ip pim ssm

Use this command to define the Source Specific Multicast (SSM) range of IP multicast addresses. The default keyword defines the SSM range as 232/8. To define the SSM range to be other than the default, use the access-list parameter option.

Use the **no** variant of this command to disable the SSM range.

Syntax

```
ip pim ssm default
ip pim ssm range {<access-list>|<named-access-list>}
no ip pim ssm
```

Parameter	Description
<access-list>	<1-99> Simple access-list.
<named-access-list>	Named Standard Access List.

Default By default, the command is disabled.

Mode Global Configuration

Usage When an SSM range of IP multicast addresses is defined by the ip pim ssm command, the no (*,G) or (S,G,rpt) state will be initiated for groups in the SSM range.

The messages corresponding to these states will not be accepted or originated in the SSM range.

Examples The following commands show how to configure SSM service for the IP address range defined by access list 10:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 225.1.1.1
awplus(config)# ip pim ssm range 10
```

The following commands show how to disable PIM-SSM:

```
awplus# configure terminal
awplus(config)# no ip pim ssm
```

show debugging pim sparse-mode

This command displays the status of the debugging of the system.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show debugging pim sparse-mode`

Mode User Exec and Privileged Exec

Example To display PIM-SM debugging settings, use the command:

```
awplus# show debugging pim sparse-mode
```

Figure 51-1: output from the show debugging pim sparse-mode command

```
Debugging status:
  PIM event debugging is on
  PIM Hello THT timer debugging is on
  PIM event debugging is on
  PIM MFC debugging is on
  PIM state debugging is on
  PIM packet debugging is on
  PIM incoming packet debugging is on
  PIM outgoing packet debugging is on
```

Related Commands debug pim sparse-mode

show ip pim sparse-mode bsr-router

Use this command to show the Bootstrap Router (BSR) (v2) address.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show ip pim sparse-mode bsr-router`

Mode User Exec and Privileged Exec

Output **Figure 51-2: output from the show ip pim sparse-mode bsr-router command**

```
PIMv2 Bootstrap information
  BSR address: 10.10.11.35 (?)
  Uptime:      00:00:38, BSR Priority: 0, Hash mask length: 10
  Expires:     00:01:32
  Role: Non-candidate BSR
  State: Accept Preferred
```

Related Commands show ip pim sparse-mode rp mapping
show ip pim sparse-mode neighbor

show ip pim sparse-mode interface

Use this command to show PIM-SM interface information.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show ip pim sparse-mode interface`

Mode User Exec and Privileged Exec

Example To display information about PIM-SM interfaces, use the command:

```
awplus# show ip pim sparse-mode interface
```

Figure 51-3: Example output from the show ip pim sparse-mode interface command

```
Total configured interfaces: 16   Maximum allowed: 31
Total active interfaces:     12

```

1. **Only the top entries output by this command are shown in this example.**

Table 51-1: Parameters in the output from the show ip pim sparse-mode interface command

Parameters	Description
`Total configured interfaces`	The number of configured PIM Sparse Mode interfaces.
`Maximum allowed`	The maximum number of PIM Sparse Mode interfaces that can be configured.
`Total active interfaces`	The number of active PIM Sparse Mode interfaces.
`Address`	Primary PIM-SM address.
`Interface`	Name of the PIM-SM interface.
`VIF Index`	The Virtual Interface index of the VLAN.
`Ver/Mode`	PIM version/Sparse mode.
`Nbr Count`	Neighbor count of the PIM-SM interface.
`DR Priority`	Designated Router priority.
`DR`	The IP address of the Designated Router.

Related Commands
ip pim sparse-mode
show ip pim sparse-mode rp mapping
show ip pim sparse-mode neighbor

show ip pim sparse-mode interface detail

Use this command to show detailed information on a PIM-SM interface.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ip pim sparse-mode interface detail`

Mode User Exec and Privileged Exec

Output **Figure 51-4: s Example output from the show ip pim sparse-mode interface detail command**

```
vlan3 (vif 3):
  Address 192.168.1.149, DR 192.168.1.149
  Hello period 30 seconds, Next Hello in 15 seconds
  Triggered Hello period 5 seconds
  Neighbors:
   192.168.1.22

vlan2 (vif 0):
  Address 10.10.11.149, DR 10.10.11.149
  Hello period 30 seconds, Next Hello in 18 seconds
  Triggered Hello period 5 seconds
  Neighbors:
   10.10.11.4
```

show ip pim sparse-mode local-members

Use this command to show detailed local member information on a VLAN interface configured for PIM-SM. If you do not specify a VLAN interface then detailed local member information is shown for all VLAN interfaces configured for PIM-SM.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 pim sparse-mode local-members [<interface>]`

Parameter	Description
<interface>	Optional Specify the interface. For instance, VLAN interface `vlan2`.

Mode User Exec and Privileged Exec

Example To show detailed PIM-SM information for all PIM-SM configured VLAN interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode local-members
```

Output **Figure 51-5: Example output from the show ip pim sparse-mode local-members command**

```
awplus#show ip pim sparse-mode local-members
PIM Local membership information

vlan1:

    (*, 224.0.0.4) : Include

vlan203:

    (*, 223.0.0.3) : Include
```

Example To show detailed PIM-SMv6 information for the PIM-SM configured interface `vlan1`, use the command:

```
awplus# show ipv6 pim sparse-mode local-members vlan1
```

Output **Figure 51-6: Example output from the show ip pim sparse-mode local-members vlan1 command**

```
awplus#show ip pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:

    (*, 224.0.0.4) : Include
```

show ip pim sparse-mode mroute

This command displays the IP multicast routing table, or the IP multicast routing table based on the specified address or addresses.

Two group addresses cannot be used simultaneously; two source addresses cannot be used simultaneously.

Note that when a feature license is enabled, the output for the **show ip pim sparse-mode mroute** command will only show 32 interfaces because of the terminal display width limit. Use the **show ip pim sparse-mode mroute detail** command to display detailed entries of the IP multicast routing table.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip pim sparse-mode mroute [<group-address>|<source-address>]
show ip pim sparse-mode mroute [<source-address> <group-address>]
show ip pim sparse-mode mroute [<group-address> <source-address>]
```

Parameter	Description
<group-address>	Group IP address, entered in the form A.B.C.D. Based on the group and source address, the output is the selected route if present in the multicast route tree.
<source-address>	Source IP address, entered in the form A.B.C.D. Based on the source and group address, the output is the selected route if present in the multicast route tree.

Mode User Exec and Privileged Exec

Usage Note that when a feature license is enabled, the output for **show ip pim sparse-mode mroute** command will only show 32 interfaces because of the terminal display width limit. Use the **show ip pim sparse-mode mroute detail** command to display detailed entries of the IP multicast routing table.

Examples

```
awplus# show ip pim sparse-mode mroute
awplus# show ip pim sparse-mode mroute 40.40.40.11
awplus# show ip pim sparse-mode mroute 235.0.0.1
awplus# show ip pim sparse-mode mroute 235.0.0.1 40.40.40.11
```

Figure 51-7: Example output from the show ip pim sparse-mode mroute command

```
IP Multicast Routing Table

```

show ip pim sparse-mode mroute detail

This command displays detailed entries of the IP multicast routing table, or detailed entries of the IP multicast routing table based on the specified address or addresses.

Two group addresses cannot be used simultaneously; two source addresses cannot be used simultaneously.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip pim sparse-mode mroute [<group-address>|<source-address>]
   detail

show ip pim sparse-mode mroute [<group-address> <source-address>]
   detail

show ip pim sparse-mode mroute [<source-address> <group-address>]
   detail
```

Parameter	Description
<group-address>	Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.
<source-address>	Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source.
`detail`	Show detailed information.

Usage Based on the group and source address, the output is the selected route if present in the multicast route tree.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip pim sparse-mode mroute detail

awplus# show ip pim sparse-mode mroute 40.40.40.11 detail

awplus# show ip pim sparse-mode mroute 224.1.1.1 detail

awplus# show ip pim sparse-mode mroute 224.1.1.1 40.40.40.11
       detail
```

```

show ip pim sparse-mode neighbor

Use this command to show the PIM-SM neighbor information.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax

```
show ip pim sparse-mode neighbor [<interface>] [<ip-address>]
   [detail]
```

Parameter	Description
<interface>	Interface name (e.g. `vlan2`). Show neighbors on an interface.
<ip-address>	Show neighbors with a particular address on an interface. The IP address entered in the form A.B.C.D.
`detail`	Show detailed information.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip pim sparse-mode neighbor
```

```
awplus# show ip pim sparse-mode neighbor vlan5 detail
```

Figure 51-9: Example output from the show ip pim sparse-mode neighbor command

```

show ip pim sparse-mode nexthop

Use this command to see the nexthop information as used by PIM-SM.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show ip pim sparse-mode nexthop`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim sparse-mode nexthop
```

Figure 51-11: Example output from the show ip pim sparse-mode nexthop command

```
Flags: N = New, R = RP, S = Source, U = Unreachable

```

Table 51-2: Parameters in output of the show ip pim sparse-mode nexthop command

Parameter	Description
`Destination`	The destination address for which PIM-SM requires nexthop information.
`Type`	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
`Nexthop Num`	The number of nexthops to the destination. PIM-SM always uses only 1 nexthop.
`Nexthop Addr`	The address of the primary nexthop gateway.
`Nexthop IfIndex`	The interface on which the nexthop gateway can be reached.
`Nexthop Name`	The name of nexthop interface.
`Metric`	The metric of the route towards the destination.
`Preference`	The preference of the route towards destination.
`Refcnt`	Only used for debugging.

show ip pim sparse-mode rp-hash

Use this command to display the Rendezvous Point (RP) to be chosen based on the group selected.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show ip pim sparse-mode rp-hash <group-addr>`

Parameter	Description
<group-addr>	The group address for which to find the RP, entered in the form A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim sparse-mode rp-hash 224.0.1.3
```

Figure 51-12: output from the show ip pim sparse-mode rp-hash command

```
RP: 10.10.11.35
Info source: 10.10.11.35, via bootstrap
```

Related Commands show ip pim sparse-mode rp mapping

show ip pim sparse-mode rp mapping

Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show ip pim sparse-mode rp mapping`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim sparse-mode rp mapping
```

Figure 51-13: output from the show ip pim sparse-mode rp mapping command

```
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4
  RP: 10.10.0.9
    Info source: 10.10.0.9, via bootstrap, priority 0
         Uptime: 16:52:39, expires: 00:02:50
```

Related Commands show ip pim sparse-mode rp-hash

undebug all pim sparse-mode

Use this command to disable all PIM-SM debugging.

Syntax `undebug all pim sparse-mode`

Mode Privileged Exec

Example

```
awplus# undebug all pim sparse-mode
```

Related Commands **debug pim sparse-mode**

Chapter 52: PIM-SMv6 Introduction and Configuration

Introduction

This chapter provides information about Protocol Independent Multicast - Sparse Mode for IPv6 (PIM-SMv6).

PIM-SMv6

Protocol Independent Multicast - Sparse Mode for IPv6 (PIM-SMv6) provides efficient communication between members of sparsely distributed groups - the type of groups that are most common in wide-area internetworks.

PIM-SMv6 helps geographically dispersed network nodes to conserver bandwidth and reduce traffic by simultaneously delivering a single stream of information to multiple locations. PIM-SMv6 uses the IPv6 multicast model of receiver-initiated membership, supporting both shared and shorted-path trees and uses mechanisms to adapt to changing network conditions. PIM-SMv6 uses a topology gathering approach to populate a multicast routing table with routes.

Note 

IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Note 

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306.The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Note 

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

For details of the commands used to configure PIM-SMv6, see **Chapter 53, PIM-SMv6 Commands**. For an overview of multicasting and multicasting commands, see **Chapter 47, Multicast Introduction and Commands**. For an overview of MLD and MLD commands, see **Chapter 56, MLD and MLD Snooping Introduction and Commands**.

Characteristics of PIM-SMv6

PIM Sparse Mode for IPv6 (PIM-SMv6) is designed on the principle that several hosts wishing to participate in a multicast conference does not justify flooding the entire internetwork with periodic multicast traffic. PIM-SMv6 is designed to limit multicast traffic so that only those switches interested in receiving traffic for a particular group receive the traffic.

Switches with directly attached or downstream members are required to join a Sparse Mode distribution tree by transmitting explicit join messages. If a switch does not become part of the predefined distribution tree, it does not receive multicast traffic addressed to the group. The default forwarding action of a sparse mode multicast routing protocol is to block traffic unless it is explicitly requested.

PIM-SMv6 employs the concept of a Rendezvous Point (RP) where receivers “meet” sources. The initiator of each multicast group selects a primary RP and a small ordered set of alternative RPs, known as the RP-list. For each multicast group, there is only a single active RP. Each receiver wishing to join a multicast group contacts its directly attached switch, which in turn joins the multicast distribution tree by sending an explicit join message to the group’s primary RP.

A source uses the RP to announce its presence and to find a path to members that have joined the group. This model requires Sparse Mode switches to maintain some state information (the RP-list) prior to the arrival of data packets.

Roles in PIM-SMv6

A multicast sender does not need to know the addresses of the members of the group in order to send to them, and the members of the group need not know the address of the sender. Group membership can change at any time. When PIM-SMv6 is enabled on the switch, and before the switch can route multicast traffic, it must establish which of the PIM-SMv6 routers in the network are performing some key roles:

- Designated Router.
- Rendezvous Point.
- Bootstrap Router.

Designated Router

There must be one PIM-SMv6 Designated Router (DR) in the subnetwork to which the IPv6 hosts are connected. Any PIM-SMv6 interfaces on the subnetwork elect the DR with the highest DR priority. If there is more than one router with the same priority, or no priority, they choose the interface with the highest IPv6 address number.

The DR performs all the PIM-SMv6 functionality for the subnetwork. If the current DR becomes unavailable, the remaining switches elect a new DR on the interface by DR priority or IPv6 address.

Rendezvous Point

Each multicast group must have a Rendezvous Point (RP). The RP forms the root of the group's distribution tree. The DR for a multicast sender sends multicast packets towards the RP.

DRs with group members connected to them send join messages towards the group's RP. The RP candidate with the lowest priority is elected from all the RP candidates for a group. If the RP becomes unavailable, the remaining RP candidates elect a new RP.

An RP router is configured as the root of the non-source-specific distribution tree for a multicast group. Join messages from receivers for a group are sent towards the RP. Data from senders is sent to the RP so that receivers can discover who the senders are, and receive traffic destined for the group.

Bootstrap Router

Each PIM-SMv6 network must have at least one Bootstrap Router (BSR) candidate, unless all switches in the domain are configured statically with information about all RPs in the domain. Every switch that is a BSR candidate periodically sends a Bootstrap Candidate Advertisement message to advertise that it is available as a BSR candidate.

The BSR candidates in the network elect the switches with the highest preference value to be the BSR. The elected BSR listens to PIM-SMv6 Candidate RP Advertisement messages specifying RP candidates for multicast groups. It maintains a list of RP candidates and sends a bootstrap message every BSM interval, specifying all the multicast groups in the PIM-SMv6 network, and their RP candidates. Each switch uses this information and a standardized hash mechanism to determine the RP for each group. In summary:

- Each multicast group must have at least one RP candidate
- Each PIM-SMv6 domain must have at least one BSR candidate, unless all routers in the domain are configured statically with information about all RPs in the domain
- Each subnetwork must have at least one DR candidate.

PIM-SMv6 Terminology

PIM-SMv6 hello messages

When PIM-SMv6 is enabled on a switch, it sends out a PIM-SMv6 Hello message on all its PIM-SMv6 enabled interfaces, and listens for Hello messages from its PIM-SMv6 neighbors. When a switch receives a Hello message, it records the interface, IPv6 address, priority for becoming a DR, and the timeout for the neighbor's information. The switch sends Hello messages regularly at the Hello Time interval.

Multicast Routing Information Base (MRIB)

The MRIB is a multicast topology table derived from the unicast routing table. In PIM-SMv6, the MRIB decides where to send Join/Prune messages. It also provides routing metrics for destination addresses. These metrics are used when sending and processing Assert messages.

Tree Information Base (TIB)

The TIB is the collection of states at a PIM-SMv6 router storing the state of all multicast distribution trees at that PIM-SMv6 router. It is created by receiving Join/Prune messages, Assert messages, and MLD information from local hosts.

Upstream

Upstream specifies when traffic is going towards the root of the tree. The root of the tree may be either the Source or the RP (Rendezvous Point).

Downstream

Upstream specifies when traffic is going away from the root of the tree. The root of the tree may be either the Source or the RP (Rendezvous Point).

Source-Based Trees

In the Source-Based Trees concept, the forwarding paths are based on the shortest unicast path to the source. If the unicast routing metric is the hop count, then the branches of the multicast Source-Based Trees are the minimum hop. If the routing metric is the delay, then the branches of the multicast Source-Based Trees are the minimum delay.

A corresponding multicast tree directly connects the source to all receivers for every multicast source. All traffic to the members of an associated group passes along the tree made for their source. Source-Based Trees has two entries with a list of outgoing interfaces - the source address and the multicast group.

Shared Trees

Shared Trees, or RP trees (RPT), rely on a central router called the Rendezvous Point (RP) that receives all traffic from the sources, and forwards that traffic to the receivers. Not all hosts may be receivers.

There is a single tree for each multicast group, regardless of the number of sources. Only the routers on the tree know about the group, and information is only sent to interested receivers.With an RP, receivers have a place to join, even if no source exists. The shared tree is unidirectional, and information flows only from the RP to the receivers. If a host other than the RP has to send data on the tree, then the data must first be tunneled to the RP, then multicast to the members. This means that even if a receiver is also a source, it can only use the tree to receive packets from the RP, and to send packets to the RP (unless the source is located between the RP and the receivers).

(*,G)

A 'star G entry' is a PIM-SMv6 or MLD join message that is requesting to join group G (e.g ff0e::1) from any (*) source IPv6 address.

(S,G)

An 'S G entry' is a PIM-SMv6 or MLD join message that is requesting to join group G (e.g ff0e::1) from source IPv6 address (e.g. 2001::1), where S is the source IPv6 address that is generating the multicast data for G. Note that PIM-SMv6 supports (S,G) entries, but MLDv1 does not support (S,G) entries.

BSM

Boot Strap Messages, as issued by the BSR (Boot Strap Router), which is an elected router that distributes information about the RP (Rendezvous Point), where an RP is a router in a multicast network domain that acts as a shared route for a multicast shared tree.

MLD

Multicast Listener Discovery. There are two versions: MLDv1 and MLDv2. MLDv1 is used by an IPv6 router to discover the presence of multicast listeners. MLDv2 provides additional features such as the ability to specify a source IPv6 address when sending a join.

Operation of PIM-SMv6

Once roles are established, multicast routing follows specific phases:

1. **Rendezvous Point Tree**
2. **Register Stop**
3. **Shortest Path Tree**

While multicast routing always begins with phase 1, the Designated Router (DR) for a receiver determines whether and when to move on to phases 2 and 3, depending on the amount of traffic from the source.

Rendezvous Point Tree

Phase 1 establishes and uses a shared tree rooted at the Rendezvous Point (RP) to forward all multicast data to group members.

When an IPv6 host sends an MLD join message to the local PIM DR, which is not the RP for the group, the DR sends a PIM-SMv6 join message towards the RP for the group ("upstream"). The DR determines which switch is the RP for the group from the most recent bootstrap message. Every switch the join message passes through records that there is a group member on the incoming interface.

Eventually, the join message reaches either the RP, or another switch that already knows that it has a group member downstream. If the group has many members, the join messages converge on the RP to form a Rendezvous Point Tree (RPT). This is called a shared tree because multicast data that is sent to the group by any sender shares the tree.

The multicast receiver's DR sends join messages periodically according to the upstream join timer as long as the IPv6 host is a member of the group. When the last receiver on a subnetwork leaves the group, the join messages stop, and their entries timeout on routers that are closer to the RP.

The sender's DR encapsulates the multicast data in a unicast packet in a process called **registering**, and sends these register packets to the group's RP. When the RP receives the data, it decapsulates them, and forwards them onto the shared tree.

Register Stop

Phase 2 improves efficiency and performance by using register stop. In this phase the RP joins the shortest path tree between the source and receiver. This allows the original (unencapsulated) packets to be forwarded from the sender, instead of encapsulated packets. It also allows shorter paths to receivers that are close to the sender, making it more efficient in some circumstances.

When the RP for a group receives the first encapsulated data packet from a source, it joins the shortest path tree towards the sender. Once data is able to flow along the shortest path from the sender to the RP, packets do not need to be registered. The RP sends a register stop message in reply to the next encapsulated message. When the sender's DR receives the register stop message, it stops registering.

The DR sends a null register message to the RP to find whether the RP still does not need to receive registered packets. If it receives another register stop message, the DR continues to forward only the native data packets. If the DR does not receive another register stop message within the register probe time, it resumes registering the data packets and sending them to the RP.

When the RP starts receiving native data packets from the source, it starts to discard the encapsulated packets, and starts forwarding native packets on the shared tree to all the group members. If the path from the source to the RP intersects the shared RP tree for the group, then the packets also take a short-cut onto the shared tree for delivery to the group members down its branches.

Shortest Path Tree

This phase further optimizes routing by using Shortest Path Trees (SPT). In phase 3 the receiver joins the shortest path tree between the source and receiver. This allows a multicast group member to receive multicast data by the shortest path from the sender, instead of from the shared RP tree. When the receiver's DR receives multicast data from a particular sender, it sends a join message towards the sender. When this message reaches the sender's DR, the DR starts forwarding the multicast data directly towards the receiver. As several receivers all initiate shortest paths to the sender, these paths converge, creating a SPT.

When the multicast packets start arriving from the SPT at the receiver's DR or an upstream router common to the SPT and the RPT, it starts discarding the packets from the RPT, and sends a prune message towards the RP. The prune message travels up the RPT until it reaches the RP or a switch that still needs to forward multicast packets from this sender to other receivers. Every time a switch receives a prune message, it waits a short time so that other switches on the LAN have the opportunity to override the prune message.

Multi-Access LANs

If the PIM-SMv6 network includes multi-access LAN links for transit, as well as point-to-point links, then a mechanism is needed to prevent multiple trees forwarding the same data to the same group member. Two or more switches on a LAN may have different information about how to reach the RP or the multicast sender. They could each send a join message to two different switches closer to the RP for an RPT or the sender for an SPT. This could potentially cause two copies of all the multicast traffic towards the receiver.

When PIM -SMv6 switches notice duplicate data packets on the LAN, they elect a single switch to forward the data packets, by each sending PIM-SMv6 Assert messages. If one of the upstream switches is on an SPT and the other is on an RPT, the switch on the SPT has the shortest path to the sender, and wins the Assert election. If both switches are on RPTs the switch with the shortest path to the RP (the lowest sum of metrics to the RP) wins the Assert. If both switches are on an SPT, then the switch with the shortest path to the sender (the lowest sum of metrics to the sender's DR) wins the Assert.

The switch that won the Assert election forwards these data packets, and acts as the local Designated Router for any MLD members on the LAN. The downstream switches on the LAN also receive the Assert messages, and send all their join messages to the Assert winner. The result of an Assert election will timeout after the Assert Time. As long as the situation causing the duplication remains unchanged, the Assert winner sends an Assert message at a the Assert time interval, before the previous Assert messages time out. When the last downstream switch leaves the SPT, the Assert winner sends an Assert Cancel message saying that it is about to stop forwarding data on the SPT. Any RPT downstream switches then switch back to the RP tree.

Packet Types

See the below list of PIM-SMv6 IPv6 packet types:

- **Register Packets** - unicast encapsulated multicast packets sent to the RP.
- **Hello Messages** - periodic messages sent by PIM-SMv6 routers.
- **Register-Stop Messages** - send to stop the flow of register encapsulated packets to the RP from a source.
- **Join/Prune Messages** - sent when a client joins/leaves a group to maintain PIM-SMv6.
- **Assert Messages** - sent to resolve route conflicts.

RFCs

PIM-SMv6 implements the service model from **RFC 1112** to route packets from sources to receivers with either the source or the receiver knowing of each other. This is done in three phases, which may be done at the same time. Clients join or leave multicast groups using MLD protocols. See **Chapter 56, MLD and MLD Snooping Introduction and Commands**

The operation of PIM-SMv4 and PIM-SMv6 protocols is the same. Only the addresses change from IPv4 to IPv6. See **RFC 4601** for further details about the operation of PIM-SM.

Data Flow from Source to Receivers for PIM-SMv6

See the details below for the data flow from Source to Receivers to establish the phases of the Rendezvous Point Tree, Register Stop and Shortest Path Tree as described previously:

1. **Sending out Hello Messages**
2. **Electing a Designated Router**
3. **Determining the RP**
4. **Joining the Shared Tree**
5. **Registering with the RP**
6. **Sending Register-Stop Messages**
7. **Pruning the Interface**
8. **Forwarding Multicast Packets**

Sending out Hello Messages

PIM-SMv6 router periodically send Hello messages to discover neighboring PIM-SMv6 routers. PIM-SMv6 routers do not send any acknowledgement that a Hello message was received. A holdtime value determines the length of time for which the information is valid. In PIM-SMv6, a downstream receiver must join a group before traffic is forwarded on the interface.

Electing a Designated Router

In a multi-access network with multiple PIM-SMv6 routers connected, one of the PIM-SMv6 routers is selected to act as a Designated Router (DR) for a given period. The DR is responsible for sending Join/Prune messages to the RP for local members.

Determining the RP

PIM-SMv6 uses a Boot Strap Router (BSR) to originate Boot Strap Messages (BSM, and to disseminate RP information.

The BSM messages are multicast to the group on each link. If the BSR is not apparent, then the router flood the domain with advertisements. The router with the highest priority (if priorities are the same, the highest IPv6 address is applied) is selected to be the RP. PIM-SMv6 routers receive and store BSM messages originated by the BSR.

When a DR gets a membership indication from MLD for (or a data packet from) a directly connected host, for a a group for which it has no entry, the DR maps the group address to one of the candidate RPs that can service that group. The DR then sends a Join/Prune message towards that RP. In a small domain, the RP can also be configured statically.

Joining the Shared Tree

To join a multicast group, a host sends an MLD message to its upstream PIM-SMv6 router, after which the PIM-SMv6 router can accept multicast traffic for that group. The PIM-SMv6 router sends a Join message to its upstream PIM-SMv6 neighbor in the direction of the RP.

When a PIM-SMv6 router receive a Join message from a downstream PIM-SMv6 router, it checks to see if a state exists for the group in its multicast routing table.

If a state already exists, the Join message has reached the shared tree, and the interface from which the message was received is entered in the Outgoing Interface list.

If no state exists, an entry is created, the interface is entered in the Outgoing Interface lists, and the Join message is again sent towards the RP.

Registering with the RP

A DR can begin receiving traffic from a source without having a Source or Group state for that source. In this case, the DR has no information on how to get multicast traffic to the RP through a tree. When the source DR receives the initial multicast packet, it encapsulates it in a Register message, and unicasts it to the RP for that group. The RP de-encapsulates each Register message, and forwards the extracted data packet to downstream members on the RPT.

Once the path is established from the source to the RP, the DR begins sending traffic to the RP as standard IP multicast packets, as well as encapsulated within Register messages. The RP temporarily receives packets twice. The RP detects the normal multicast packets, it sends a Register-Stop message to the source DR, meaning it should stop sending register packets.

Sending Register-Stop Messages

When the RP begins receiving traffic from the source, both as Register messages and as unencapsulated IPv6 packets, it sends a Register-Stop message to the DR. This notifies the DR that the traffic is now being received as standard IPv6 multicast packets on the SPT. When the DR receives this message, it stops encapsulating traffic in Register messages.

Pruning the Interface

PIM-SMv6 Routers attached to receivers send Prune messages to the RP to disassociate the source from the RP. When an RP receives a Prune message, it no longer forwards traffic from the source indicated in the Prune message.

If all members of a multicast group are pruned, then the MLD state of the DR is deleted, and the interface is removed from the Source and Group lists of the group.

Forwarding Multicast Packets

PIM-SMv6 routers forward multicast traffic onto all interfaces that lead to receivers that have explicitly joined a multicast group. Messages are sent to a group address in the local subnetwork, and have a Time to Live (TTL) of 1. The PIM-SMv6 router performs an RPF check, and forwards the packet.

If a downstream PIM-SMv6 router has sent a join to this PIM-SMv6 router, or is a member of this group, then traffic that arrives on the correct interface is sent to all outgoing interfaces that lead to downstream receivers.

PIM-SMv6 Embedded RP, RP and BSR Candidate Configurations

This section provides two PIM-SMv6 configuration examples:

- **Embedded RP Configuration**
- **RP and BSR Candidate Configuration**

For details on the commands used in the following examples, refer to **Chapter 53, PIM-SMv6 Commands**.

Embedded RP Configuration

RFC 3956 describes a multicast address allocation policy, in which the address of the Rendezvous Point (RP) is encoded in the IPv6 multicast group address, and specifies a PIM-SMv6 group-to-RP mapping to use the encoding, leveraging and extending unicast-prefix-based addressing.

Embedded RP Multicast Group Address Format

RFC 3956 specifies a modification to the unicast-prefix-based address format by specifying the second high-order bit (R-bit) as follows:

Table 52-1: RFC3956 modification to the unicast-prefix-based IPv6 address format

11111111	flgs	scop	rsvd	RIID	plen	network prefix	group ID
8 bits	4 bits	4 bits	4 bits	4 bits	8 bits	64 bits	32 bits

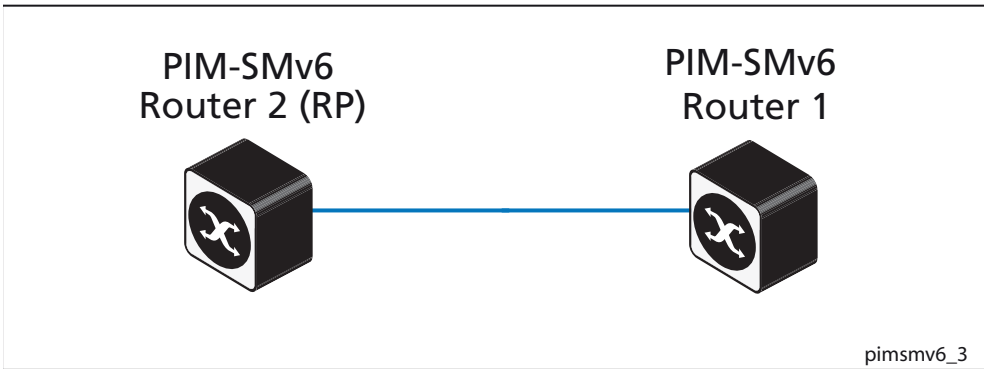
Note: **flgs** is a set of four flags - **0** - **R** - **P** - **T**

flgs the highest-order bit is 0, flag R is 1. This indicates a multicast address that embeds the address on the RP. In this case, the **P** flag must be set to 1 and the **T** flag must be set to 1. In effect, this implies the prefix **ff70::/12**. This means that the last 4 bits of the previously reserved field are interpreted as the embedded RP interface ID.

RP Address in Embedded RP Multicast Address

The address of the RP can only be embedded in unicast-prefix-based Any Source Multicast (ASM) addresses. To identify whether it is an embedded RP multicast address, and to be processed any further, an IPv6 address must satisfy all of the following criteria:

- It must be an IPv6 multicast address with **flgs** set to **0111** to be of the prefix **ff70::/12,** or with **flgs** set to **1111** to be of the prefix **fff0::/12**
- **plen** must not be set to 0 and **plen** must not be set to greater than 64.



Enable Embedded RP

Enter the following commands to enable embedded-RP to group mapping (ipv6 pim rp embedded) then configure an access-list to permit a multicast group (ipv6 access-list) and use this access-list to limit valid groups with a configured static RP (ipv6 pim rp-address):

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp embedded
awplus(config)# ipv6 access-list embedrp1 permit
ff70:2:2001:0db8:12::2::/96
awplus(config)# ipv6 pim rp-address ff70:2001:0db8:12::2/12
embedrp1
awplus(config)# exit
```

Disable Embedded RP

Enter the following commands to disable embedded-RP to group mapping (no ipv6 pim rp embedded) after enabling embedded RP (as shown in the previous example above):

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp embedded
awplus(config)# exit
```

PIM-SMv6 Commands Used

ipv6 pim rp-address
ipv6 pim rp embedded

Verify Embedded RP Configuration

Use the following commands to verify the embedded-RP configuration. Note that the group-to-RP mapping for embedded-RP addresses is created when the group is first seen at a PIM-SMv6 router. This can be due to the MLD local receiver report, Join/Prune and Register message processing.

Verify RP-mapping in RP:

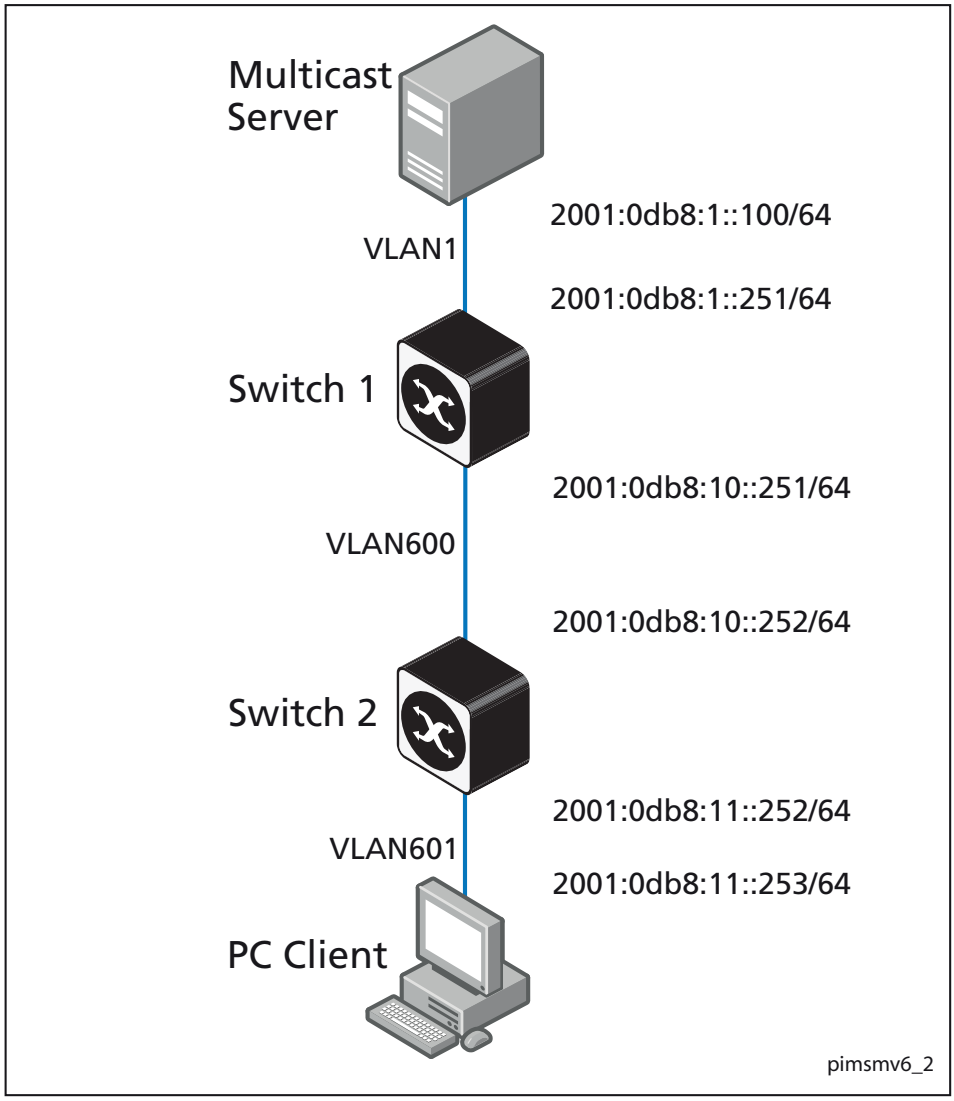
```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff7e:240:3ffe:172:31:12::/96, Static
    RP: 3ffe:172:31:12::2
         Uptime: 00:04:12
Embedded RP Groups:
Group(s): ff7e:240:3ffe:172:31:12::/96
    RP: 3ffe:172:31:12::2, Uptime: 00:00:33
```

Verify RP-mapping in non-RP:

```
mv66#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Embedded RP Groups:
Group(s): ff7e:240:3ffe:172:31:12::/96
    RP: 3ffe:172:31:12::2, Uptime: 00:00:27
```

RP and BSR Candidate Configuration

Apply the configurations for **Switch 1** and **Switch 2** shown following the topology to configure **Switch 1** and **Switch 2** as RP and BSR candidates.



Note the **Multicast Server** serves multiple streams on addresses **ff0e:1:1::3** and **ff0e:3:1::4**. Also note **Switch 1** and **Switch 2** are configured as BSR Candidates with **Switch 2** elected.

Switch 1 Enter this configuration to configure **Switch 1** as an RP candidate and a BSR candidate:

```
!
no ip multicast-routing
!
ipv6 multicast-routing
!
vlan database
 vlan 600 state enable
!
ipv6 pim bsr-candidate vlan600
ipv6 pim rp-candidate vlan600
!
!
interface port2.0.17
 switchport
 switchport mode access
 switchport access vlan 1
!
interface port2.0.24
 switchport
 switchport mode access
 switchport access vlan 600
!
interface vlan1
 ip address 192.168.1.101/24
 ipv6 address 2001:0db8:1::251/64
 ipv6 enable
 ipv6 router rip
 ipv6 pim sparse-mode passive
!
interface vlan600
 ipv6 address 2001:0db8:10::251/64
 ipv6 enable
 ipv6 router rip
 ipv6 pim sparse-mode
!
ipv6 forwarding
!
```

Switch 2 Enter this configuration to configure **Switch 2** as an RP candidate and a BSR candidate:

```
!
ipv6 access-list standard testacl permit ff0e:1::3/128
!
no ip multicast-routing
!
ipv6 multicast-routing
!
vlan database
 vlan 600-601 state enable
!
ipv6 pim bsr-candidate vlan600
ipv6 pim rp-candidate vlan601 group-list testacl
!
interface port1.0.11
 switchport
 switchport mode access
 switchport access vlan 600
!
interface port1.0.13-1.0.14
 switchport
 switchport mode access
 switchport access vlan 603
!
interface port1.0.15-1.0.19
 switchport
 switchport mode access
!
interface port1.0.20
 switchport
 switchport mode access
 switchport access vlan 601
!
interface port1.0.21-1.0.24
 switchport
 switchport mode access
!
interface vlan600
 ipv6 address 2001:0db8:10::252/64
 ipv6 enable
 ipv6 router rip
 ipv6 pim sparse-mode
!
interface vlan601
 ipv6 address 2001:0db8:11::252/64
 ipv6 enable
 ipv6 mld
 ipv6 router rip
 ipv6 pim sparse-mode
!
ipv6 forwarding
!
```

Verify RP and RP Candidate Configuration

Use the following commands to verify the RP candidate configuration for **Switch 1** and **Switch 2**. Note both **Switch 1** and **Switch 2** are BSR candidates and **Switch 2** is elected.

Also note **Switch 1** is a candidate RP for all multicast groups, while **Switch 2** is a candidate for only the multicast group **ff0e:1::3/128**. Therefore, **Switch 1** and **Switch 2** overlap and **Switch 1** has become the RP for **ff0e:1::4** while Switch 2 is now the RP for **ff0e:1::3**.

Verify Switch 1 Configuration:

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
  BSR address: 2001:0db8:10::252 (?)
  Uptime:      01:09:46, BSR Priority: 64, Hash mask length: 126
  Expires:     00:01:44
  Role: Candidate BSR
  State: Candidate BSR

  Candidate RP: 2001:0db8:10::251(vlan600)
    Advertisement interval 60 seconds
    Next C-RP advertisement in 00:00:21

awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff00::/8
  RP: 2001:0db8:10::251
    Info source: 2001:0db8:10::252, via bootstrap, priority 192
         Uptime: 01:24:33, expires: 00:02:24
Group(s): ff0e:1::3/128
  RP: 2001:11::252
    Info source: 2001:0db8:10::252, via bootstrap, priority 192
         Uptime: 00:34:06, expires: 00:02:24
Embedded RP Groups:

awplus#show ipv6 pim sparse-mode rp-hash ff0e:1::3
    RP: 2001:0db8:11::252
    Info source: 2001:0db8:10::252, via bootstrap
```

Verify Switch 2 Configuration (Switch 2 is the elected BSR):

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
This system is the Bootstrap Router (BSR)
  BSR address: 2001:0db8:10::252 (?)
  Uptime:      01:08:31, BSR Priority: 64, Hash mask length: 126
  Next bootstrap message in 00:00:49
  Role: Candidate BSR
  State: Elected BSR

  Candidate RP: 2001:0db8:11::252(vlan601)
    Advertisement interval 60 seconds
    Next C-RP advertisement in 00:00:44

awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
This system is the Bootstrap Router (v2)
Group(s): ff00::/8
  RP: 2001:0db8:10::251
    Info source: 2001:0db8:10::251, via bootstrap, priority 192
         Uptime: 01:17:06, expires: 00:01:46
Group(s): ff0e:1::3/128
  RP: 2001:11::252
    Info source: 2001:0db8:10::252, via bootstrap, priority 192
         Uptime: 00:37:41, expires: 00:01:54
Embedded RP Groups:

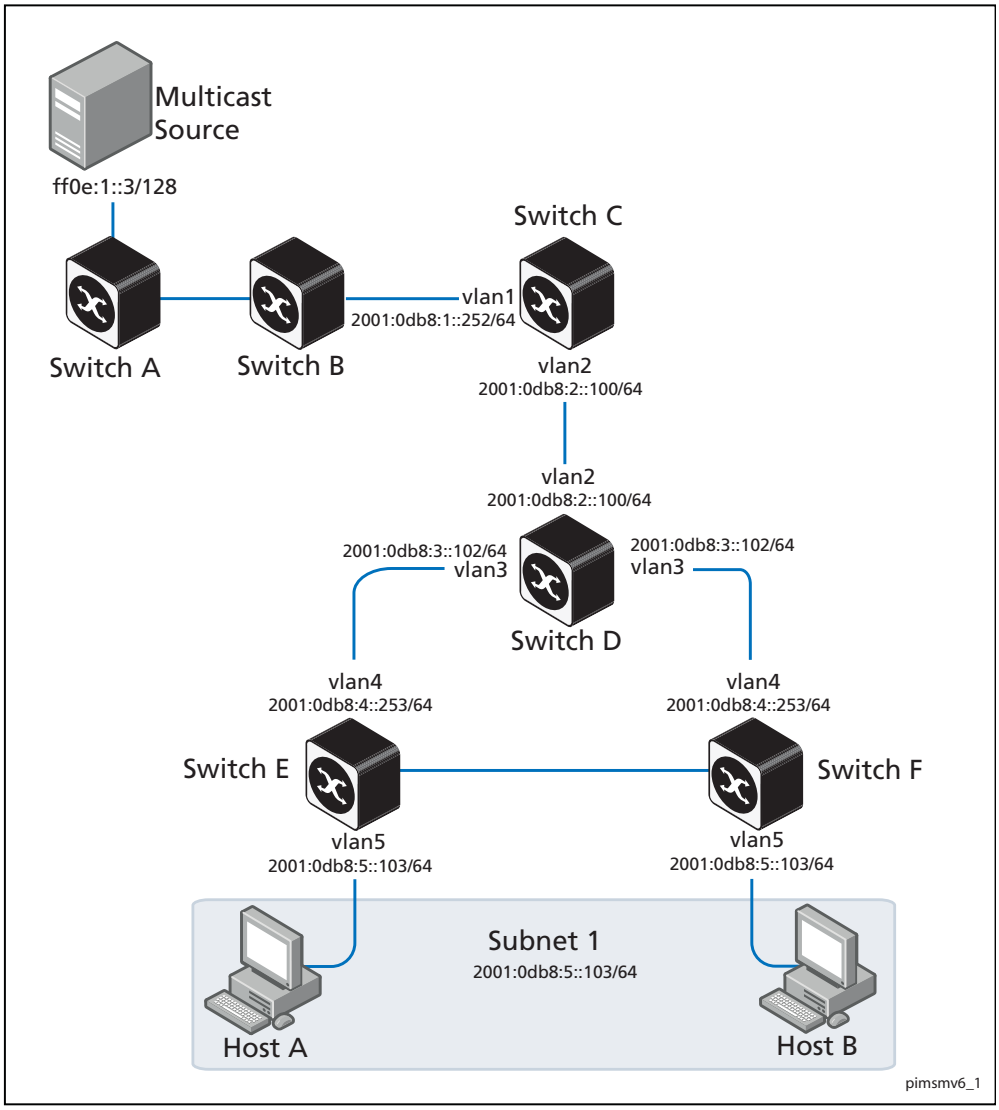
awplus#show ipv6 pim sparse-mode rp-hash ff0e:1::4
    RP: 2001:0db8:10::251
    Info source: 2001:0db8:10::252, via bootstrap
```

PIM-SMv6 Static RP, DR, BSR Configurations

This section provides three PIM-SMv6 configuration examples:

- **Static Rendezvous Point Configuration**
- **Dynamic Rendezvous Point Configuration**
- **Boot Strap Router Configuration**

Both Rendezvous Point (RP) configuration examples refer to the network topology in the following graphic and use Allied Telesis managed Layer 3 Switches as the PIM routers. For details on the commands used in the following examples, refer to **Chapter 53, PIM-SMv6 Commands**.



Static Rendezvous Point Configuration

In this example using the above network topology, Switch C is the Rendezvous Point (RP) and all switches are statically configured with RP information. Host A and Host B join group `ff0e:1::3/128` for all the sources. They send the MLD membership report to Subnet 1. Two switches are attached to Subnet 1, Switch E and Switch F. Both of these switches have default Designated Router (DR) priority on `vlan1`. Because Switch E has a higher IP address on `vlan1`, Switch E becomes the DR and is responsible for sending Join messages to the RP (Switch C).

While configuring the RP, ensure that:

- Every switch includes the **ipv6 pim rp-address 2001:0db8:1::100/64** statement, even if it does not have any source or group member attached to it.
- There is only one RP address for the whole multicast group.
- All interfaces running PIM-SMv6 must have sparse-mode enabled. In the configuration sample output below, both **vlan1** and **vlan2** are pim sparse-mode enabled.

See the following configuration output for **Switch D**:

```
hostname Switch D
!
interface vlan2
 ipv6 enable
 ipv6 pim sparse-mode
 ipv6 address 2001:0db8:2::100/64
!
interface vlan3
 ipv6 enable
 ipv6 pim sparse-mode
 ipv6 address 2001:0db8:3::102/64
!
interface lo
!
!
ipv6 multicast-routing
ipv6 pim rp-address 2001:0db8:1::100/64
!
ipv6 forwarding
!
```

Configure all the switches with the same **ipv6 pim rp-address 2001:0db8:1::100/64** statement as shown above.

Verify Static Rendezvous Point Configuration

Use the following commands to verify the RP configuration, interface details, and the multicast routing table.

RP details

For **Switch D**, the **show ipv6 pim sparse-mode rp mapping** command shows that `2001:0db8:1::100/64` is the RP for all multicast groups `ff0e:1::3/128`, and is statically configured. All other switches will have a similar output.

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff0e:1::3/128, Static
    RP: 2001:0db8:1::100/64
         Uptime: 5d02h15m
```

For **Switch D**, the **show ipv6 pim sparse-mode rp-hash** command displays the selected RP for the specified group, in this example `ff0e:1::3/128`.

```
awplus#show ipv6 pim sparse-mode rp-hash ff0e:1::3/128
    RP: 2001:0db8:1::100/64
```

Interface details

For **Switch E**, the **show ipv6 pim sparse-mode interface** command displays the interface details and shows that Switch E is the DR on Subnet 1.

```
awplus#show ipv6 pim sparse-mode interface
Total configured interfaces: 16   Maximum allowed: 31
Total active interfaces:     12

Address             Interface VIFindex Ver/   Nbr      DR       DR
                                       Mode   Count    Prior
2001:0db8:1::251    vlan2      0       v2/S   1        1        2001:0db8:1::100
```

IP multicast routing table

Note that the multicast routing table displayed for an RP switch is different to that displayed for other switches. For **Switch C**, because this switch is the RP and the root of this multicast tree, the **show ipv6 pim sparse-mode mroute** command shows **RPF nbr** (next-hop to reach RP) as **0.0.0.0** and **RPF idx** (incoming interface for this (*, G) state) as **None**.

```
awplus#show ipv6 pim sparse-mode mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, ff0e:1::3/128)
RP: 2001:0db8:1::100/64
RPF nbr: 0.0.0.0
RPF idx: None
Upstream State: JOINED
 Local     ..............................
 Joined    j..............................
 Asserted  ..............................
 Outgoing  o..............................
```

For **Switch E**, the **show ipv6 pim sparse-mode mroute** command displays the IP multicast routing table.

```
awplus#show ipv6 pim sparse-mode mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, ff0e:1::3/128)
RP: 2001:0db8:1::100/64
RPF nbr: 2001:0db8:1::100/64
RPF idx: port1.0.2
Upstream State: JOINED
 Local      ...............................
 Joined     j...............................
 Asserted   ...............................
 Outgoing   o...............................
```

On Switch E, `port1.0.2` is the incoming interface of the (*, G) entry, and `port1.0.1` is on the outgoing interface list of the (*, G) entry. This means that there is a group member through `port1.0.1`, and RP is reachable through `port1.0.2`.

Dynamic Rendezvous Point Configuration

A static RP configuration works for a small, stable PIM domain. However, it is not practical for a large and not so stable internetwork. In such a network, if the RP fails, the network administrator may have to change the static configurations on all PIM switches. An additional reason for choosing dynamic configuration high routing traffic leading to a change in the RP.

The Bootstrap Router (BSR) mechanism is used to dynamically maintain the RP information. To configure the RP dynamically in the above network topology, Switch C on `port1.0.1` and Switch D on `vlan1` are configured as RP candidates using the **ipv6 pim rp-candidate** command. Switch D on `vlan1` is also configured as the BSR candidate. Since no other device has been configured as a BSR candidate, Switch D becomes the BSR router and is responsible for sending group-to-RP mapping information to all other PIM switches in this PIM domain.

The following output displays the complete configuration at **Switch C**.

```
awplus#show run
!
interface vlan1
 ipv6 enable
 ipv6 pim sparse-mode
 ipv6 address 2001:0db8:1::252/64
!
interface vlan2
 ipv6 enable
 ipv6 pim sparse-mode
 ipv6 address 2001:0db8:2::100/64
!
interface lo
!
ipv6 multicast-routing
ipv6 pim rp-candidate vlan1
```

The following output displays the complete configuration at **Switch D**.

```
awplus#show run
!
interface vlan2
 ipv6 enable
 ipv6 pim sparse-mode
 ipv6 address 2001:0db8:2::100/64
!
interface vlan3
 ipv6 enable
 ipv6 pim sparse-mode
 ipv6 address 2001:0db8:3::102/64
!
interface lo
!
ipv6 multicast-routing
ipv6 pim bsr-candidate vlan1
ipv6 pim rp-candidate vlan1 priority 2
!
```

The highest priority switch is chosen as the RP. If two or more switches have the same priority, a hash function in the BSR mechanism is used to choose the RP to make sure that all devices in the PIM domain have the same RP for the same multicast group.

Use the `<interface> [priority <priority>]` parameters of the **ipv6 pim rp-candidate** command to change the default priority of any RP candidate.

Verify PIM group-to-RP mappings

The **show ipv6 pim sparse-mode rp mapping** command displays the group-to-RP mapping details. The output shows information about RP candidates. There are two RP candidates for the group range `ff0e:1::3/128`. RP candidate `2001:1::100/64` has a default priority of `192`, whereas RP candidate `2001:1::251/64` has been configured to have a priority of `2`. Since RP candidate `2001:1::251/64` has a higher priority, it is selected as the RP for the multicast group `ff0e:1::3/128`.

See the following configuration output for **Switch D**.

```
awplus#show ipv6 pim sparse-mode rp mapping
This system is the Bootstrap Router (v2)
Group(s): ff0e:1::3/128
  RP: 2001:0db8:1::100/64
    Info source: 2001:0db8:1::251/64, via bootstrap, priority 192
         Uptime: 00:00:13, expires: 00:02:29
```

Verify RP details

The **show ipv6 pim sparse-mode rp-hash** command displays information about the RP router for a particular group. See the following configuration output for **Switch D**. This output shows that `2001:0db8:1::251/64` has been chosen as the RP for the multicast group `ff0e:1::3/128`.

```
awplus#show ipv6 pim sparse-mode rp-hash ff0e:1::3/128
Group(s): ff0e:1::3/128
    RP: 2001:0db8:1::251/64
    Info source: 2001:0db8:1::251/64, via bootstrap
```

After RP information reaches all PIM switches in the domain, various state machines maintain all routing states as the result of Join/Prune messages from members of the multicast group.

Boot Strap Router Configuration

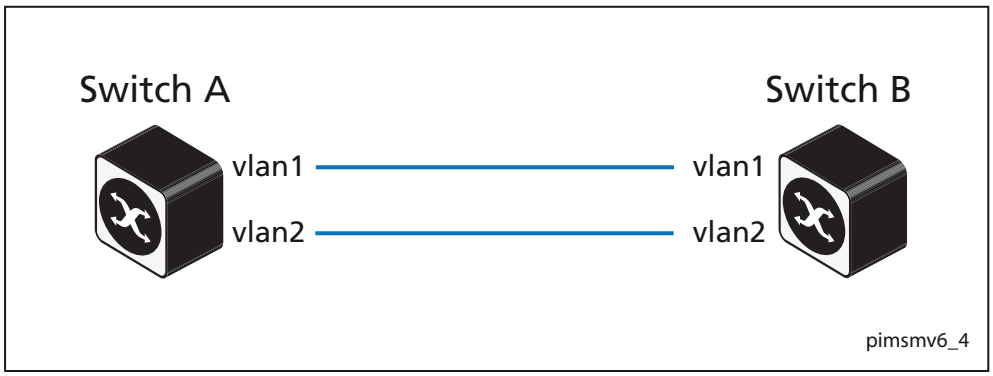
Every PIM multicast group needs to be associated with the IP address of a Rendezvous Point (RP). This address is used as the root of a group-specific distribution tree, whose branches extend to all nodes in the domain that want to receive traffic sent to the group. For all senders to reach all receivers, all devices in the domain use the same mappings of group addresses to RP addresses. In order to determine the RP for a multicast group, a PIM device maintains a collection of group-to-RP mappings, called the RP-Set.

The Boot Strap Router (BSR) mechanism for the class of multicast routing protocols in the PIM domain uses the concept of an RP as a means for receivers to discover the sources that send to a particular multicast group. The BSR mechanism is one way that a multicast router can learn the set of group-to-RP mappings required in order to function.

Some of the PIM devices within a PIM domain are configured as RP candidates. A subset of the RP candidates will eventually be used as the actual RPs for the domain. An RP configured with a lower value in the priority field has higher a priority.

Some of the PIM devices in the domain are configured to be BSR candidates. One of these BSR candidates is elected to be the BSR for the domain, and all PIM devices in the domain learn the result of this election through Bootstrap messages (BSM). The BSR candidate with highest value in the priority field is the elected BSR.

The RP candidates then report their candidacy to the elected BSR, which chooses a subset of the RP candidates, and distributes corresponding group-to-RP mappings to all the devices in the domain through Bootstrap messages.



Switch A Enter the following commands to configure `vlan1` on Switch A as the BSR candidate. The default priority is 64.

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan1
awplus(config)# exit
```

Switch B Enter the following commands to configure `vlan1` on Switch B as the BSR candidate with a hash mask length of 10 and a priority of 25 and to configure `vlan1` as the RP candidate with a priority of 0.

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan1 10 25
awplus(config)# ipv6 pim rp-candidate vlan1 priority 0
awplus(config)# exit
```

Verify Boot Strap Router Configuration

Use the **show ipv6 pim sparse-mode bsr-router** command to verify the BSR candidate state on **Switch A**.

```
awplus#show ipv6 pim sparse-mode bsr-router
PIMv2 Bootstrap information
This system is the Bootstrap Router (BSR)
  BSR address: 2001:0db8:1::251/64
  Uptime:      00:37:12, BSR Priority: 64, Hash mask length: 10
  Expires:     00:01:32
  Role: Candidate BSR
  State: Elected BSR
```

Use the **show ipv6 pim sparse-mode bsr-router** command to verify the BSR candidate state on **Switch B**. The initial state of the BSR candidate is pending before transitioning to BSR candidate.

```
awplus#show ipv6 pim sparse-mode bsr-router
PIMv2 Bootstrap information
  BSR address: 2001:0db8:1::251/64
  Uptime:      00:02:39, BSR Priority: 64, Hash mask length: 10
  Expires:     00:00:03
  Role: Candidate BSR
  State: Pending BSR

awplus#show ipv6 pim sparse-mode bsr-router
PIMv2 Bootstrap information
 BSR address: 2001:0db8:1::251/64
 Uptime:      00:40:20, BSR Priority: 64, Hash mask length: 10
 Expires:     00:02:07
 Role: Candidate BSR
 State: Candidate BSR
```

Use the **show ipv6 pim sparse-mode rp mapping** command to verify RP-set information on **Switch A**.

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
This system is the Bootstrap Router (v2)
Group(s): ff0e:1::3/128
 RP: 2001:db8:1::251/64
 Info source: 2001:db8:1::251/64, via bootstrap, priority 0
 Uptime: 00:00:30, expires: 00:02:04
```

Use the **show ipv6 pim sparse-mode rp mapping** command to verify RP-set information on **Switch B**.

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff0e:1::3/128
 RP: 2001:db8:1::251/64
 Info source: 2001:db8:1::251/64, via bootstrap, priority 0
 Uptime: 00:00:12, expires: 00:02:18
```

Chapter 53: PIM-SMv6 Commands

Command List

This chapter provides an alphabetical reference of PIM-SMv6 commands. For IPv6 Multicast commands, see **Chapter 47, Multicast Introduction and Commands**. For an overview of PIM-SMv6, see **Chapter 52, PIM-SMv6 Introduction and Configuration**.

Note

IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous IPv6 static multicast routes.

Note

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306.The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Note

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

clear ipv6 mroute pim

Use this command to clear all Multicast Forwarding Cache (MFC) entries in PIM-SMv6.

Note Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax

```
clear ipv6 mroute [*] pim sparse-mode
```

Parameter	Description
*	Clears all PIM-SMv6 multicast routes. Using this command without this optional operator only deletes the multicast router table entries.

Mode Privileged Exec

Examples

```
awplus# clear ipv6 mroute pim sparse-mode
```

```
awplus# clear ipv6 mroute * pim sparse-mode
```

clear ipv6 pim sparse-mode bsr rp-set *

Use this command to clear all Rendezvous Point (RP) sets learned through the PIM-SMv6 Bootstrap Router (BSR).

Note Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax

```
clear ipv6 pim sparse-mode bsr rp-set *
```

Parameter	Description
*	Clears all RP sets.

Mode Privileged Exec

Usage For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

Example

```
awplus# clear ipv6 pim sparse-mode bsr rp-set *
```

clear ipv6 mroute pim sparse-mode

Use this command to clear all multicast route table entries learned through PIM-SMv6 for a specified multicast group address, and optionally a specified multicast source address.

Note

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax

```
clear ipv6 mroute <Group-IPv6-add> pim sparse-mode
clear ipv6 mroute <Group-IPv6-add> <Source-IPv6-add> pim sparse-mode
```

Parameter	Description
<Group-IPv6-add>	Specify a multicast group IPv6 address, entered in the form X:X::X:X.
<Source-IPv6-add>	Specify a source group IPv6 address, entered in the form X:X::X:X.

Mode Privileged Exec

Examples

```
awplus# clear ipv6 mroute 2001:db8:: pim sparse-mode
```

```
awplus# clear ipv6 mroute 2001:db8:: 2002:db8:: pim
sparse-mode
```

debug ipv6 pim sparse-mode

Use this command to activate PIM-SMv6 debugging.

Use the **no** variant of this command to deactivate PIMv6 debugging. Note that the **undebug ipv6 pim sparse-mode** command is an alias of the **no** variant of this command.

Syntax

```
debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm]
    [state] [timer]

no debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop]
    [nsm] [state] [timer]
```

Parameter	Description
`all`	Activates/deactivates all PIM-SMv6 debugging.
`events`	Activates debug printing of PIM-SMv6 events.
`mfc`	Activates debug printing of MFC (Multicast Forwarding Cache).
`mib`	Activates debug printing of PIM-SMv6 MIBs.
`nexthop`	Activates debug printing of PIM-SMv6 nexthop communications.
`nsm`	Activates debugging of PIM-SMv6 NSM (Network Services Module) communications.
`state`	Activates debug printing of state transition on all PIM-SMv6 FSMs.
`timer`	Activates debug printing of PIM-SMv6 timers.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode all

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode events

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode nexthop
```

Validation Output

Figure 53-1: Example output from the show debugging ipv6 pim sparse-mode command after issuing multiple debug ipv6 pim sparse-mode commands

```
awplus#debug ipv6 pim sparse-mode state
awplus#debug ipv6 pim sparse-mode events
awplus#debug ipv6 pim sparse-mode packet
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:
  PIM event debugging is on
  PIM MFC debugging is off
  PIM state debugging is on
  PIM packet debugging is on
  PIM Hello HT timer debugging is off
  PIM Hello NLT timer debugging is off
  PIM Hello THT timer debugging is off
  PIM Join/Prune JT timer debugging is off
  PIM Join/Prune ET timer debugging is off
  PIM Join/Prune PPT timer debugging is off
  PIM Join/Prune KAT timer debugging is off
  PIM Join/Prune OT timer debugging is off
  PIM Assert AT timer debugging is off
  PIM Register RST timer debugging is off
  PIM Bootstrap BST timer debugging is off
  PIM Bootstrap CRP timer debugging is off
  PIM mib debugging is off
  PIM nsm debugging is off
  PIM nexthop debugging is off
```

Related Commands

show debugging ipv6 pim sparse-mode
undebug all ipv6 pim sparse-mode
undebug ipv6 pim sparse-mode

debug ipv6 pim sparse-mode packet

Use this command to activate PIM-SMv6 packet debugging.

Use the **no** variant of this command to deactivate PIMv6 packet debugging.

Syntax

```
debug ipv6 pim sparse-mode packet {in|out}
no debug ipv6 pim sparse-mode packet {in|out}
```

Parameter	Description
`packet`	Activates debug printing of incoming and/or outgoing IPv6 packets.
`in`	Specify incoming packet debugging.
`out`	Specify outgoing packet debugging.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet in

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet out

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet in

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet out
```

Related Commands **show debugging ipv6 pim sparse-mode**
undebug all ipv6 pim sparse-mode

debug ipv6 pim sparse-mode timer

Use this command to enable debugging for the specified PIM-SMv6 timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SMv6 timers.

Syntax

```
debug ipv6 pim sparse-mode timer assert [at]
no debug ipv6 pim sparse-mode timer assert [at]
debug pim ipv6 sparse-mode timer bsr [bst|crp]
no debug pim ipv6 sparse-mode timer bsr [bst|crp]
debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
no debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
debug pim ipv6 sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim ipv6 sparse-mode timer joinprune [jt|et|ppt|kat|ot]
debug pim ipv6 sparse-mode timer register [rst]
no debug pim ipv6 sparse-mode timer register [rst]
```

Parameter	Description
`assert`	Enable or disable debugging for the Assert timers.
`at`	Enable or disable debugging for the Assert Timer.
`bsr`	Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers.
`bst`	Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.
`crp`	Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.
`hello`	Enable or disable debugging for the specified Hello timer, or all Hello timers.
`ht`	Enable or disable debugging for the Hello timer: Hello Timer.
`nlt`	Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.
`tht`	Enable or disable debugging for the Hello timer: Triggered Hello Timer.
`joinprune`	Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.
`jt`	Enable or disable debugging for the JoinPrune timer: upstream Join Timer.
`et`	Enable or disable debugging for the JoinPrune timer: Expiry Timer.
`ppt`	Enable or disable debugging for the JoinPrune timer: PrunePending Timer.
`kat`	Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.

Parameter	Description
`ot`	Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.
`register`	Enable or disable debugging for the Register timers.
`rst`	Enable or disable debugging for the Register timer: Register Stop Timer.

Default By default, all debugging is disabled.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for the PIM-SMv6 Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug ipv6 pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SMv6 Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug ipv6 pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SMv6 Joinprune expiry timer, use the command:

```
awplus# debug ipv6 pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SMv6 Register timer, use the command:

```
awplus# no debug ipv6 pim sparse-mode timer register
```

Related Commands **show debugging ipv6 pim sparse-mode**

ipv6 pim accept-register

Use this command to configure the ability to filter out multicast sources specified by the given software IPv6 access-list at the Rendezvous Point (RP), so that the RP will accept/ refuse to perform the register mechanism for the packets sent by the specified sources. By default, the RP accepts register packets from all multicast sources.

Use the **no** variant of this command to revert to default.

Syntax

```
ipv6 pim accept-register list{<access-list>}
no ipv6 pim accept-register
```

Parameter	Description
<access-list>	Specify a Standard or an Extended software IPv6 Access list. See **Chapter 61, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim accept-register list G2
awplus(config)# ipv6 access-list standard G2 permit 2001:db8::/
128

awplus# configure terminal
awplus(config)# no ipv6 pim accept-register
```

ipv6 pim anycast-rp

Use this command to configure Anycast RP (Rendezvous Point) in an RP set.

Use the **no** variant of this command to remove the configuration.

Syntax

```
ipv6 pim anycast-rp <anycast-rp-address> <member-rp-address>
no ipv6 pim anycast-rp <anycast-rp-address> [<member-rp-address>]
```

Parameter	Description
<anycast-rp-address>	<X:X::X:X> Specify an Anycast IPv6 address to configure an Anycast RP (Rendezvous Point) in a RP set.
<member-rp-address>	<A:B::C:D> Specify an Anycast RP (Rendezvous Point)IPv6 address to configure an Anycast RP in a RP set.

Mode Global Configuration

Usage Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

Examples The following example shows how to configure the Anycast RP address with **ipv6 pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ipv6 pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

ipv6 pim bsr-border

Use the **ipv6 pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through a VLAN interface. The BSR border is the border of the PIM-SMv6 domain.

Use the **no** variant of this command to disable the configuration set with **ipv6 pim bsr-border**.

Syntax

```
ipv6 pim bsr-border
no ipv6 pim bsr-border
```

Mode Interface Configuration for a VLAN interface.

Usage When this command is configured on a VLAN interface, no PIM-SMv6 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM-SMv6 domain with this command to avoid BSR messages from being exchanged between the two PIM-SMv6 domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM-SMv6 protocol from working as intended.

Examples The following example configures the VLAN interface `vlan2` to be the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim bsr-border
```

The following example removes the VLAN interface `vlan2` from the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim bsr-border
```

ipv6 pim bsr-candidate

Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IPv6 address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

Syntax

```
ipv6 pim bsr-candidate <interface> [<hash>] [<priority>]
no ipv6 pim bsr-candidate [<interface>]
```

Parameter	Description
<interface>	Specify the interface. For instance, VLAN interface `vlan2`.
<hash>	`<0-128>` configure the hash mask length used for RP selection. The default hash value if you do not configure this parameter is 126.
<priority>	`<0-255>` configure priority for a BSR candidate. Note that you must also specify the *<hash>* (mask length) when specifying the *<priority>*. The default priority if you do not configure this parameter is 64.

Mode Global Configuration

Default The default hash parameter value is 126 and the default priority parameter value is 64.

Examples

To set the BSR candidate to the VLAN interface `vlan2`, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan2 20 30
```

To withdraw the address of `vlan2` from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 pim bsr-candidate vlan2
```

ipv6 pim cisco-register-checksum

Use this command to configure the option to calculate the Register Checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

Syntax

```
ipv6 pim cisco-register-checksum
no ipv6 pim cisco-register-checksum
```

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum

awplus# configure terminal
awplus(config)# no ipv6 pim cisco-register-checksum
```

ipv6 pim cisco-register-checksum group-list

Use this command to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by the software IPv6 access-list. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax

```
ipv6 pim cisco-register-checksum group-list <IPv6-access-list>
no ipv6 pim cisco-register-checksum group-list <IPv6-access-list>
```

Parameter	Description
<IPv6-access-list>	Optional. Specify a Standard or Extended software IPv6 access list. See **Chapter 61, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs. Use this parameter to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by an IPv6 access list entered after this command.

Mode Global Configuration

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum group-list G1
awplus(config)# ipv6 access-list standard G1 permit
ff0x::db8:0:0/96
```

ipv6 pim crp-cisco-prefix

Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0.

Use the **no** variant of this command to revert to the default settings.

Syntax

```
ipv6 pim crp-cisco-prefix
no ipv6 pim crp-cisco-prefix
```

Mode Global Configuration

Usage Cisco's BSR code does not conform to the latest BSR draft, it does not accept candidate RPs with a group prefix number of zero. To make the candidate RP work with a Cisco BSR, use the **ipv6 pim crp-cisco-prefix** command when interoperating with older versions of Cisco IOS.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim crp-cisco-prefix

awplus# configure terminal
awplus(config)# no ipv6 pim crp-cisco-prefix
```

Related Commands ipv6 pim rp-candidate

ipv6 pim dr-priority

Use this command to set the Designated Router priority value.

Use the **no** variant of this command to disable this function.

Syntax

```
ipv6 pim dr-priority  <priority>
no ipv6 pim dr-priority [<priority>]
```

Parameter	Description
<priority>	<0-4294967294> Specify the Designated Router priority value. Note that a higher value has a higher preference or higher priority.

Default The default value is 1. The negated form of this command restores the value to the default.

Mode Interface Configuration for a VLAN interface.

Examples To set the Designated Router priority value to `11234` for the VLAN interface `vlan2`, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface `vlan2`, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim dr-priority
```

Related Commands **ipv6 pim ignore-rp-set-priority**

ipv6 pim exclude-genid

Use this command to exclude the GenID option from Hello packets sent out by the PIM-SMv6 module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax

```
ipv6 pim exclude-genid
no ipv6 pim exclude-genid
```

Default By default, this command is disabled; the GenID option is included.

Mode Interface Configuration for a VLAN interface.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim exclude-genid
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim exclude-genid
```

ipv6 pim ext-srcs-directly-connected

Use this command to configure PIM-SMv6 to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM-SMv6 to treat only directly connected sources as directly connected.

Syntax

```
ipv6 pim ext-srcs-directly-connected
no ipv6 pim ext-srcs-directly-connected
```

Default The **no** variant of this command is the default behavior.

Mode Interface Configuration for a VLAN interface.

Examples To configure PIM-SMv6 to treat all sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim ext-srcs-directly-connected
```

To configure PIM-SMv6 to treat only directly connected sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim ext-srcs-directly-connected
```

ipv6 pim hello-holdtime

This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 * the current hello-interval.

Syntax

```
ipv6 pim hello-holdtime <holdtime>
no ipv6 pim hello-holdtime
```

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

Default The default hello-holdtime value is 3.5 * the current hello-interval. The default hello-holdtime is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage Each time the hello interval is updated, the hello holdtime is also updated, according to the following rules:

If the hello holdtime is not configured; or if the hello holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 * hello interval). Otherwise, it retains the configured value.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-holdtime 123
```

ipv6 pim hello-interval

This command configures a hello-interval value for PIM-SMv6.

Use the **no** variant of this command to reset the hello-interval for PIM-SMv6 to the default.

Syntax

```
ipv6 pim hello-interval <interval>
no ipv6 pim hello-interval
```

Parameter	Description
<interval>	<1-65535> The value in seconds (no fractional seconds accepted).

Default The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage When the hello interval is configured, and the hello holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 * hello interval). Otherwise, the hello-holdtime value is the configured value.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-interval 123
```

ipv6 pim ignore-rp-set-priority

Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

Use the **no** variant of this command to disable this setting.

Syntax

```
ipv6 pim ignore-rp-set-priority
no ipv6 pim ignore-rp-set-priority
```

Mode Global Configuration

Usage This command is used to inter-operate with older Cisco IOS versions.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim ignore-rp-set-priority

awplus# configure terminal
awplus(config)# no ipv6 pim ignore-rp-set-priority
```

ipv6 pim jp-timer

Use this command to set the PIM-SMv6 join/prune timer. Note that the value set by the join/prune timer is the value that the switch puts into the holdtime field of the join/prune packets it sends to its neighbors.

Use the **no** variant of this command to return the PIM-SMv6 join/prune timer to its default value of 210 seconds.

Syntax

```
ipv6 pim jp-timer <1-65535>
no ipv6 pim jp-timer [<1-65535>]
```

Parameter	Description
<1-65535>	Specifies the Join/Prune timer value. The default value is 210 seconds.

Default The default PIM-SMv6 join/prune timer value is 210 seconds.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim jp-timer 300

awplus# configure terminal
awplus(config)# no ipv6 pim jp-timer
```

ipv6 pim neighbor-filter

This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SMv6 will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering IPv6 access list.

Use the **no** variant of this command to disable this function.

Syntax

```
ipv6 pim neighbor-filter <IPv6-accesslist>
no ipv6 pim neighbor-filter <IPv6-accesslist>
```

Parameter	Description
<IPv6-accesslist>	Specify a Standard or an Extended software IPv6 access list name for the PIM-SMv6 neighbor filter. See **Chapter 61, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.

Default By default, there is no neighbor filtering applied to an interface.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config)# ipv6 enable
awplus(config-if)# ipv6 pim neighbor-filter filter1
awplus(config-if)# ipv6 access-list standard filter1 deny
fe80:20e:cff:fe01:facc
awplus(config-if)# ipv6 access-list standard filter1 permit
any
awplus(config-if)# exit
```

ipv6 pim register-rate-limit

Use this command to configure the rate of register packets sent by this DR, in units of packets per second. The configured rate is per (S, G) state, and is not a system wide rate.

Use the **no** variant of this command to remove the limit and reset to the default rate limit.

Syntax

```
ipv6 pim register-rate-limit <1-65535>
no ipv6 pim register-rate-limit
```

Parameter	Description
<1-65535>	Specifies the maximum number of packets that can be sent per second.

Mode Global Configuration

Default The default is 0, as reset with the **no** variant, which also specifies an unlimited rate limit.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rate-limit 3444

awplus# configure terminal
awplus(config)# no ipv6 pim register-rate-limit 3444
```

ipv6 pim register-rp-reachability

Use this command to enable the RP reachability check for PIMv6 Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

Syntax

```
ipv6 pim register-rp-reachability
no ipv6 pim register-rp-reachability
```

Default This command is disabled; by default, there is no checking for RP-reachability.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rp-reachability

awplus# configure terminal
awplus(config)# no ipv6 pim register-rp-reachability
```

ipv6 pim register-source

Use this command to configure the source IPv6 address of register packets sent by this DR, overriding the default source IPv6 address, which is the IPv6 address of the RPF interface toward the source host.

Use the **no** variant of this command to remove the IPv6 source address of Register packets sent by this DR, reverting back to use the default IPv6 source address that is the address of the RPF interface toward the source host.

Syntax

```
ipv6 pim register-source [<source-IPv6-address>|<interface>]
no ipv6 pim register-source
```

Parameter	Description
<source-IPv6-address>	The IPv6 address, entered in the form `X:X::X:X`, to be used as the source of the register packets.
<interface>	The name of the VLAN interface to be used as the source of the register packets.

Usage The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback IPv6 interface address, but can also be a physical IPv6 address. This IPv6 address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM-SMv6 enabled.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source 3ffe::24:2

awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source vlan2

awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# no ipv6 pim register-source
```

ipv6 pim register-suppression

Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

Syntax

```
ipv6 pim register-suppression <1-65535>
no ipv6 pim register-suppression
```

Parameter	Description
<1-65535>	Register suppression on time in seconds.

Mode Global Configuration

Default The default PIM-SMv6 register suppression time is 60 seconds, and is restored with the no variant of this command.

Usage Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the **ipv6 pim rp-register-kat** command on page 53.34 is not used.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-suppression 192

awplus# configure terminal
awplus(config)# no ipv6 pim register-suppression
```

ipv6 pim rp-address

Use this command to statically configure RP (Rendezvous Point) address for IPv6 multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for IPv6 multicast groups.

Syntax

```
ipv6 pimv6 rp-address <IPv6-address> [<IPv6-access-list>] [override]
no ipv6 pim rp-address <IPv6-address> [<IPv6-access-list>] [override]
```

Parameter	Description
<IPv6-address>	Specify the IPv6 address of the Rendezvous Point, entered in the form `X:X::X:X`.
<IPv6-access-list>	Specify a Standard or an Extended software IPv6 access-list name. See **Chapter 61, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.
override	Specify this optional parameter keyword to enable any statically defined RPs to override dynamically learned RPs.

Mode Global Configuration

Usage The AlliedWare Plus™ PIM-SMv6 implementation supports multiple static RPs. It also supports usage of static-RP and BSR mechanism simultaneously. The **ipv6 pim rp-address** command is used to statically configure the RP address for IPv6 multicast groups.

You need to understand the following information before using this command.

If the RP-address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP-address configured through BSR is chosen over the statically configured RP-address.

A single static-RP can be configured for multiple group ranges using software IPv6 access-lists (ACLs). However, configuring multiple static RPs (using **ipv6 pim rp-address** command) with the same RP address is not allowed. The static-RP can either be configured for the whole multicast group range `ff00::/8` (without using IPv6 ACLs) or for specific group ranges (when using IPv6 ACLs).

For example, configuring **ipv6 pim rp-address 3ffe:10:10:5::153** will configure static-RP `3ffe:10:10:5::153` for the default group range `ff00::/8`. Configuring **ipv6 pim rp-address 3ffee:20:20:5::153 grp-list** will configure static-RP `3ffe:10:10:5::153` for all the group ranges represented by permit filters in the defined named **grp-list** ACL.

If multiple static-RPs are available for a group range, then one with the highest IPv6 address is chosen.

Only `permit` filters in IPv6 ACL are considered as valid group ranges. The default `permit` filter `::/0` is converted to the default multicast filter `ff00::/8`.

After configuration, the RP-address is inserted into a static-RP group tree based on the configured group ranges. For each group range, multiple static-RPs are maintained in a list. This list is sorted in a descending order of IPv6 addresses. When selecting static-RPs for a group range, the first element (which is the static-RP with highest IPv6 address) is chosen.

RP-address deletion is handled by removing the static-RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by the **ipv6 pim rp-address** command. Commands with the **override** keyword take precedence over dynamically learned mappings.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus(config)# ipv6 pim rp-address 3ffe:30:30:5::153 G2

awplus# configure terminal
awplus(config)# no ipv6 pim rp-address 3ffe:30:30:5::153 G2
```

Related Commands

ipv6 pim rp-candidate
ipv6 pim rp-register-kat

ipv6 pim rp-candidate

Use this command to give the switch the candidate RP (Rendezvous Point) status using the IPv6 address of the specified VLAN interface.

Use the **no** variant of this command to remove the RP status set using the **ipv6 pim rp-candidate** command.

Syntax

```
ipv6 pim rp-candidate <interface>
   [priority <priority>|interval <interval>| grouplist <accesslist>]

no ipv6 pim rp-candidate [<interface>]
```

Parameter	Description
<interface>	Specify a VLAN interface name.
<priority>	<0-255> Specify this to configure the priority for an RP candidate.
<interval>	Specify a candidate RP advertisement interval in the range <1-16383> (seconds).
<accesslist>	Specify a Standard or an Extended software IPv6 access list name. See **Chapter 61, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.

Default The priority value for a candidate RP is 0 by default until specified using the **priority** parameter.

Mode Global Configuration

Usage Note that issuing the command **ipv6 pim rp-candidate** *<interface>* without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 0.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-candidate vlan2 priority 3
```

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit 2001:db8::/
128
awplus(config)# ipv6 pim rp-candidate vlan2 priority 3
group-list G2
```

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-candidate vlan2
```

Related Commands **ipv6 pim rp-address**
ipv6 pim rp-register-kat

ipv6 pim rp embedded

Use this command to configure and enable embedded RP (Rendezvous Point) in PIM-SMv6.

Note: This command only applies to the embedded RP group range **ff7x::/12** and **fffx::/12**.

Use the **no** variant of this command to disable embedded RP support. Since embedded RP support is enabled by default, use the **no** variant of this command to disable the default.

Syntax

```
ipv6 pim rp embedded
no ipv6 pim rp embedded
```

Mode Global Configuration

Default Embedded RP is enabled by default in the AlliedWare Plus implementation of PIM-SMv6.

Examples

The following example re-enables embedded RP support, the default state in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp embedded
```

The following example disables embedded RP support, which is enabled by default in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp embedded
```

ipv6 pim rp-register-kat

Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SMv6 Register packets.

Use the **no** variant of this command to return the PIM-SMv6 KAT timer to its default value of 210 seconds.

Syntax

```
ipv6 pim rp-register-kat <1-65535>
no ipv6 pim rp-register-kat
```

Parameter	Description
<1-65536>	Specify the KAT timer in seconds. The default value is 210 seconds.

Mode Global Configuration

Default The default PIM-SMv6 KAT timer value is 210 seconds.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-register-kat 3454

awplus# configure terminal
awplus(config)# no ipv6 pim rp-register-kat
```

Related Commands **ipv6 pim rp-address**
ipv6 pim rp-candidate

ipv6 pim sparse-mode

Use this command to enable PIM-SMv6 on a VLAN interface.

Use the **no** variant of this command to disable PIM-SMv6 on a VLAN interface.

Syntax

```
ipv6 pim sparse-mode
no ipv6 pim sparse-mode
```

Mode Interface Configuration for a VLAN interface.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode
```

ipv6 pim sparse-mode passive

Use this command to enable and disable PIM-SMv6 passive mode operation for local members on a VLAN interface.

Use the **no** variant of this command to disable PIM-SMv6 passive mode operation for local members on a VLAN interface.

Syntax

```
ipv6 pim sparse-mode passive
no ipv6 pim sparse-mode passive
```

Mode Interface Configuration for a VLAN interface.

Usage Passive mode essentially stops PIM-SMv6 transactions on the interface, allowing only the MLD mechanism to be active.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode passive
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode passive
```

ipv6 pim spt-threshold

This command turns on the ability for the last-hop PIM-SMv6 router to switch to SPT.

The **no** variant of this command turns off the ability for the last-hop PIM-SMv6 router to switch to SPT.

Note The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Syntax

```
ipv6 pim spt-threshold
no ipv6 pim spt-threshold
```

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold

awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold
```

ipv6 pim spt-threshold group-list

Use this command to turn on/off the ability for the last-hop PIM-SMv6 router to switch to SPT for multicast group addresses as specified by the given software IPv6 access-list.

Use the **no** variant of this command to turn off switching to the SPT.

Note The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Syntax

```
ipv6 pim spt-threshold group-list <IPv6-access-list>
no ipv6 pim spt-threshold group-list <IPv6-access-list>
```

Parameter	Description
<IPv6-access-list>	Specify a Standard or an Extended software IPv6 access-list name. See **Chapter 61, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold group-list G1
awplus(config)# ipv6 access-list standard G1 permit
2001:db8::/128

awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold group-list G1
```

ipv6 pim unicast-bsm

Use this command to enable support for the sending and receiving of unicast Boot Strap Messages (BSM) on a VLAN interface.

Use the **no** variant of this command to disable the sending and receiving of unicast BSM on a VLAN interface.

Syntax

```
ipv6 pim unicast-bsm
no ipv6 pim unicast-bsm
```

Mode Interface Configuration for a VLAN interface.

Default Unicast BSM is disabled by default on an interface.

Usage This command provides backward compatibility with older versions of the Boot Strap Router (BSR) specification, which directs unicast BSM to refresh the state of new or restarting neighbors. The current BSR specification defines a No Forward BSM to achieve the same result.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim unicast-bsm

awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim unicast-bsm
```

show debugging ipv6 pim sparse-mode

This command displays the status of the PIM-SMv6 debugging on your switch.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show debugging ipv6 pim sparse-mode`

Mode User Exec and Privileged Exec

Example To display PIM-SMv6 debugging settings, use the command:

```
awplus# show debugging ipv6 pim sparse-mode
```

Figure 53-2: Example output from the show debugging ipv6 pim sparse-mode command

```
awplus#show debugging ipv6 pim sparse-mode
Debugging status:
  PIM event debugging is on
  PIM MFC debugging is on
  PIM state debugging is on
  PIM packet debugging is on

  PIM Bootstrap BST timer debugging is on
  PIM Bootstrap CRP timer debugging is on
```

Related Commands **debug ipv6 pim sparse-mode**
undebug ipv6 pim sparse-mode

show ipv6 pim sparse-mode bsr-router

Use this command to show the PIM-SMv6 Bootstrap Router (BSR) IPv6 address.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 pim sparse-mode bsr-router`

Mode User Exec and Privileged Exec

Example To display the BSR IPv6 address, use the command:

```
awplus# show ipv6 pim sparse-mode bsr-router
```

Output **Figure 53-3: Example output from the show ipv6 pim sparse-mode bsr-router command**

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
  BSR address: 2001:203::213 (?)
  Uptime:      00:36:25, BSR Priority: 64, Hash mask length: 126
  Expires:     00:01:46
  Role: Candidate BSR
  State: Candidate BSR

    Advertisement interval 60 seconds
    Next C-RP advertisement in 00:00:43
```

Related Commands **show ipv6 pim sparse-mode rp mapping**
show ipv6 pim sparse-mode neighbor

show ipv6 pim sparse-mode interface

Use this command to show PIM-SMv6 interface information. Note that you can specify an individual VLAN interface with the optional parameter. Alternatively, you can display PIM-SMv6 interface information for all interfaces if you omit the optional interface parameter.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 pim sparse-mode interface`

Mode User Exec and Privileged Exec

Example To display information about all PIM-SMv6 interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode interface
```

Figure 53-4: Example output from the show ipv6 pim sparse-mode interface command

```
awplus#show ipv6 pim sparse-mode interface

    Global Address: 3ffe:192:168:10::53
    DR            : this system
```

Table 53-1: Parameters in the output from the show ipv6 pim sparse-mode interface command

Parameters	Description
`Address`	Primary PIM-SMv6 address.
`Interface`	Name of the PIM-SMv6 interface.
`VIF Index`	The Virtual Interface index of the VLAN.
`Ver/Mode`	PIMv6 version/Sparse mode.
`Nbr Count`	Neighbor count of the PIM-SMv6 interface.
`DR Priority`	Designated Router priority.
`DR`	The IPv6 address of the Designated Router.

show ipv6 pim sparse-mode local-members

Use this command to show detailed local member information on a VLAN interface configured for PIM-SMv6. If you do not specify a VLAN interface then detailed local member information is shown for all VLAN interfaces configured for PIM-SMv6.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 pim sparse-mode local-members [<interface>]`

Parameter	Description
<interface>	Optional Specify the interface. For instance, VLAN interface `vlan2`.

Mode User Exec and Privileged Exec

Example To show detailed PIM-SMv6 information for all PIM-SMv6 configured VLAN interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode local-members
```

Output **Figure 53-6: Example output from the show ipv6 pim sparse-mode local-members command**

```
awplus#show ipv6 pim sparse-mode local-members
PIM Local membership information

vlan1:

  (*, ff02::1:ff6b:4783) : Include

vlan203:

  (*, ff0e:1::4) : Include
```

Example To show detailed PIM-SMv6 information for the PIM-SMv6 configured interface `vlan1`, use the command:

```
awplus# show ipv6 pim sparse-mode local-members vlan1
```

Output **Figure 53-7: Example output from the show ipv6 pim sparse-mode local-members vlan1 command**

```
awplus#show ipv6 pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:

  (*, ff02::1:ff6b:4783) : Include
```

show ipv6 pim sparse-mode mroute

This command displays the IPv6 multicast routing table, or the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two source IPv6 addresses cannot be used simultaneously.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 pim sparse-mode mroute [<group-IPv6-address>|<source-IPv6-address>]

show ipv6 pim sparse-mode mroute [<group-IPv6-address> <source-IPv6-address>]

show ipv6 pim sparse-mode mroute [<source-IPv6-address> <group-IPv6-address>]
```

Parameter	Description
<group-IPv6-address>	Group IPv6 address, entered in the form X:X::X:X. Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.
<source-IPv6-address>	Source IPv6 address, entered in the form X:X::X:X. Based on the source and group IPv6 address, the output is the selected route if present in the multicast route tree.

Mode User Exec and Privileged Exec

Usage Note that when a feature license is enabled, the output for the **show ipv6 pim sparse-mode mroute** command will only show 100 interfaces because of the terminal display width limit. Use the **show ipv6 pim sparse-mode mroute detail** command to display detailed entries of the IPv6 multicast routing table.

Examples

```
awplus# show ipv6 pim sparse-mode mroute

awplus# show ipv6 pim sparse-mode mroute 2001:db8::

awplus# show ipv6 pim sparse-mode mroute 2001:db8::
        2002:db8::
```

show ipv6 pim sparse-mode mroute detail

This command displays detailed entries of the IPv6 multicast routing table, or detailed entries of the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two IPv6 source addresses cannot be used simultaneously.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 pim sparse-mode mroute [<group-IPv6-address>|<source-IPv6-address>] detail

show ipv6 pim sparse-mode mroute [<group-IPv6-address> <source-IPv6-address>] detail

show ipv6 pim sparse-mode mroute [<source-IPv6-address> <group-IPv6-address>] detail
```

Parameter	Description
<group-IPv6-address>	Group IPv6 address, entered in the form X:.X::X:X. Output is all multicast entries belonging to that group.
<source-IPv6-address>	Source IPv6 address, entered in the form X:.X::X:X. Output is all multicast entries belonging to that source.
`detail`	Show detailed information.

Usage

Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.

Mode

User Exec and Privileged Exec

Examples

```
awplus# show ipv6 pim sparse-mode mroute detail

awplus# show ipv6 pim sparse-mode mroute 2001:db8:: detail

awplus# show ipv6 pim sparse-mode mroute 2001:db8::
        2002:db8:: detail
```

show ipv6 pim sparse-mode neighbor

Use this command to show the PIM-SMv6 neighbor information.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax

```
show ipv6 pim sparse-mode neighbor [<interface>] [<IPv6-address>]
   [detail]
```

Parameter	Description
<interface>	Interface name (e.g. vlan2). Show neighbors on an interface.
<IPv6-address>	Show neighbors with a particular address on an interface. The IPv6 address entered in the form X:X::X:X.
detail	Show detailed information.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 pim sparse-mode neighbor
```

```
awplus# show ipv6 pim sparse-mode neighbor vlan5 detail
```

Figure 53-10: Example output from the show ipv6 pim sparse-mode neighbor command

```

show ipv6 pim sparse-mode nexthop

Use this command to see the nexthop information as used by PIM-SMv6.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show ipv6 pim sparse-mode nexthop`

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode nexthop
```

Figure 53-12: Example output from the show ipv6 pim sparse-mode nexthop command

```
awplus#show ipv6 pim sparse-mode nexthop

3ffe:10:10:5::153     .RS.  1       fe80::20e:cff:fe01:facc  2     30   110     1
```

Table 53-2: Parameters in output of the show ipv6 pim sparse-mode nexthop command

Parameter	Description
`Destination`	The destination address for which PIM-SMv6 requires nexthop information.
`Type`	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
`Nexthop Num`	The number of nexthops to the destination. PIM-SMv6 always uses only 1 nexthop.
`Nexthop Addr`	The address of the primary nexthop gateway.
`Nexthop IfIndex`	The interface on which the nexthop gateway can be reached.
`Nexthop Name`	The name of nexthop interface.
`Metric`	The metric of the route towards the destination.
`Preference`	The preference of the route towards destination.
`Refcnt`	Only used for debugging.

show ipv6 pim sparse-mode rp-hash

Use this command to display the Rendezvous Point (RP) to be chosen based on the IPv6 group address selected.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 pim sparse-mode rp-hash <IPv6-group-addr>`

Parameter	Description
<IPv6-group-addr>	The IPv6 group address used to find the RP, entered in the form X:X::X:X.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode rp-hash ff04:10
```

Figure 53-13: output from the show ipv6 pim sparse-mode rp-hash command:

```
awplus#show ipv6 pim sparse-mode rp-hash ff04::10
    RP: 3ffe:10:10:5::153
    Info source: 3ffe:10:10:5::153, via bootstrap
```

Related Commands **show ipv6 pim sparse-mode rp mapping**

show ipv6 pim sparse-mode rp mapping

Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 pim sparse-mode rp mapping`

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode rp mapping
```

Figure 53-14: output from the show ipv6 pim sparse-mode rp mapping command

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff00::/8
  RP: 3ffe:10:10:5::153
    Info source: 3ffe:10:10:5::153, via bootstrap, priority 192
         Uptime: 05:36:40
```

Related Commands show ipv6 pim sparse-mode rp-hash

show ipv6 pim sparse-mode rp nexthop

Use this command to display the RP (Rendezvous Point) nexthop information used by PIM-SMv6.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 pim sparse-mode rp nexthop <RP-group-addr>`

Parameter	Description
<RP-group-addr>	Specify the RP group address used to display nexthop RP information, entered in the form X:X::X:X.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153
```

Figure 53-15: Example output from the show ipv6 pim sparse-mode rp nexthop command

```
awplus#show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination           Type  Nexthop Nexthop Nexthop  Nexthop Metric     Pref    Refcnt
                            Num     Addr    Ifindex  Name
-------------------------------------------------------------------------------------
3ffe:10:10:5::153     .RS.  1       fe80::20e:cff:fe01:facc  2      30    110     1
```

Table 53-3: Parameters in output of the show ipv6 pim sparse-mode rp nexthop command

Parameter	Description
`Destination`	The destination address for which PIM-SMv6 requires nexthop information.
`Type`	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
`Nexthop Num`	The number of nexthops to the destination. PIM-SMv6 always uses only 1 nexthop.
`Nexthop Addr`	The address of the primary nexthop gateway.
`Nexthop IfIndex`	The interface on which the nexthop gateway can be reached.
`Nexthop Name`	The name of nexthop interface.
`Metric`	The metric of the route towards the destination.
`Preference`	The preference of the route towards destination.
`Refcnt`	Only used for debugging.

undebug all ipv6 pim sparse-mode

Use this command to disable all PIM-SMv6 debugging.

Syntax `undebug all ipv6 pim sparse-mode`

Mode Privileged Exec

Example

```
awplus# undebug all ipv6 pim sparse-mode
```

Related Commands **debug ipv6 pim sparse-mode**

undebug ipv6 pim sparse-mode

Use this command to deactivate PIM-SMv6 debugging. Note that this command is an alias of the **no** variant of the **debug ipv6 pim sparse-mode** command.

Syntax `undebug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [state] [timer]`

Parameter	Description
`all`	Deactivates all PIM-SMv6 debugging.
`events`	Deactivates debug printing of PIM-SMv6 events.
`mfc`	Deactivates debug printing of MFC (Multicast Forwarding Cache).
`mib`	Deactivates debug printing of PIM-SMv6 MIBs.
`nexthop`	Deactivates debug printing of PIM-SMv6 nexthop communications.
`nsm`	Deactivates debugging of PIM-SMv6 NSM (Network Services Module) communications.
`state`	Deactivates debug printing of state transition on all PIM-SMv6 FSMs.
`timer`	Deactivates debug printing of PIM-SMv6 timers.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebug ipv6 pim sparse-mode all

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebug ipv6 pim sparse-mode events

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebug ipv6 pim sparse-mode nexthop
```

Validation Output

Figure 53-16: Example output from the show debugging ipv6 pim sparse-mode command after issuing the undebug ipv6 pim sparse-mode all command

```
awplus#undebug ipv6 pim sparse-mode all
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:

Chapter 54: PIM-DM Introduction and Configuration

Introduction

Protocol Independent Multicast - Dense Mode (PIM-DM) is a data-driven multicast routing protocol, which builds source-based multicast distribution trees that operate on the Flood-and-Prune principle. It requires unicast-reachability information, but does not depend on a specific unicast routing protocol.

For details of the commands used to configure PIM-DM, see **Chapter 55, PIM-DM Commands**. For a general overview of multicasting, see **Chapter 47, Multicast Introduction and Commands**.

Characteristics of PIM-DM

PIM Dense Mode (PIM-DM) is a significantly less complex protocol than PIM Sparse Mode (PIM-SM). PIM-DM works on the principle that it is probable that any given multicast stream will have at least one downstream listener. PIM-DM is ideal where many hosts subscribe to receive multicast packets, so most of the PIM Routers receive and forward all multicast packets.

Where PIM-SM only forwards a multicast stream when requested, PIM-DM always floods any new multicast stream that arrives at the PIM Router and only stops flooding the multicast stream on a given link if it is explicitly told to, by receiving a Prune message from the downstream PIM Router.

PIM-DM does not include the concepts of Rendezvous Points, which are used in PIM-SM. PIM-SM explicitly builds unidirectional shared trees rooted at a Rendezvous Point (RP) per group. PIM-DM implicitly builds shortest-path trees by flooding multicast traffic domain wide, then Prunes back branches of the tree where no receivers are available. As with PIM-SM, so does PIM-DM also use Reverse Path Forwarding (RPF) to stop loops for packet forwarding for PIM Routers receiving multicast packets.

PIM-DM Terminology

See the below descriptions of the terms and concepts used to describe the PIM-DM protocol:

PIM Router Any Layer 3 routing device that is running PIM, such as an Allied Telesis managed Layer 3 switch or Allied Telesis router.

Reverse Path Forwarding Reverse Path Forwarding (RPF) is the mechanism that PIM uses to make sure it does not forward multicast streams around in loops. If a set of PIM Routers are connected in a loop, and each PIM Router is forwarding a given multicast stream, then eventually the multicast stream would be forwarded right around the loop.

To prevent this from happening, PIM makes use of the fact that the unicast routing tables in a set of PIM Routers should converge into a loop-free tree of paths to any given destination.

When a PIM Router receives a multicast stream from source address `SourceA` through an interface `IF1`, it checks whether `IF1` is the interface the PIM Router would use to reach `SourceA`. The PIM Router will only forward the multicast stream if `IF1` is the interface the PIM Router would use to reach `SourceA`.

RPF determines whether the interface is correct by consulting unicast routing tables. This ensure that the multicast stream is forwarded in a loop-free manner back up the tree of unicast paths that lead to the source.

Forwarding Multicast Packets PIM Routers forward a given multicast stream onto all PIM enabled IP interfaces that have not received a Prune for the given multicast stream. As with unicast routing, the PIM Router decrements the TTL (Time To Live) in each packet that the PIM Router forwards. The packet is discarded if the TTL is decremented to 0.

However, unlike unicast routing, the destination MAC addresses of the packets are not altered as they are forwarded by the PIM Router. The destination MAC addresses remain set to the multicast MAC addresses that correspond to the destination group address of the multicast stream.

Upstream Towards the Source.

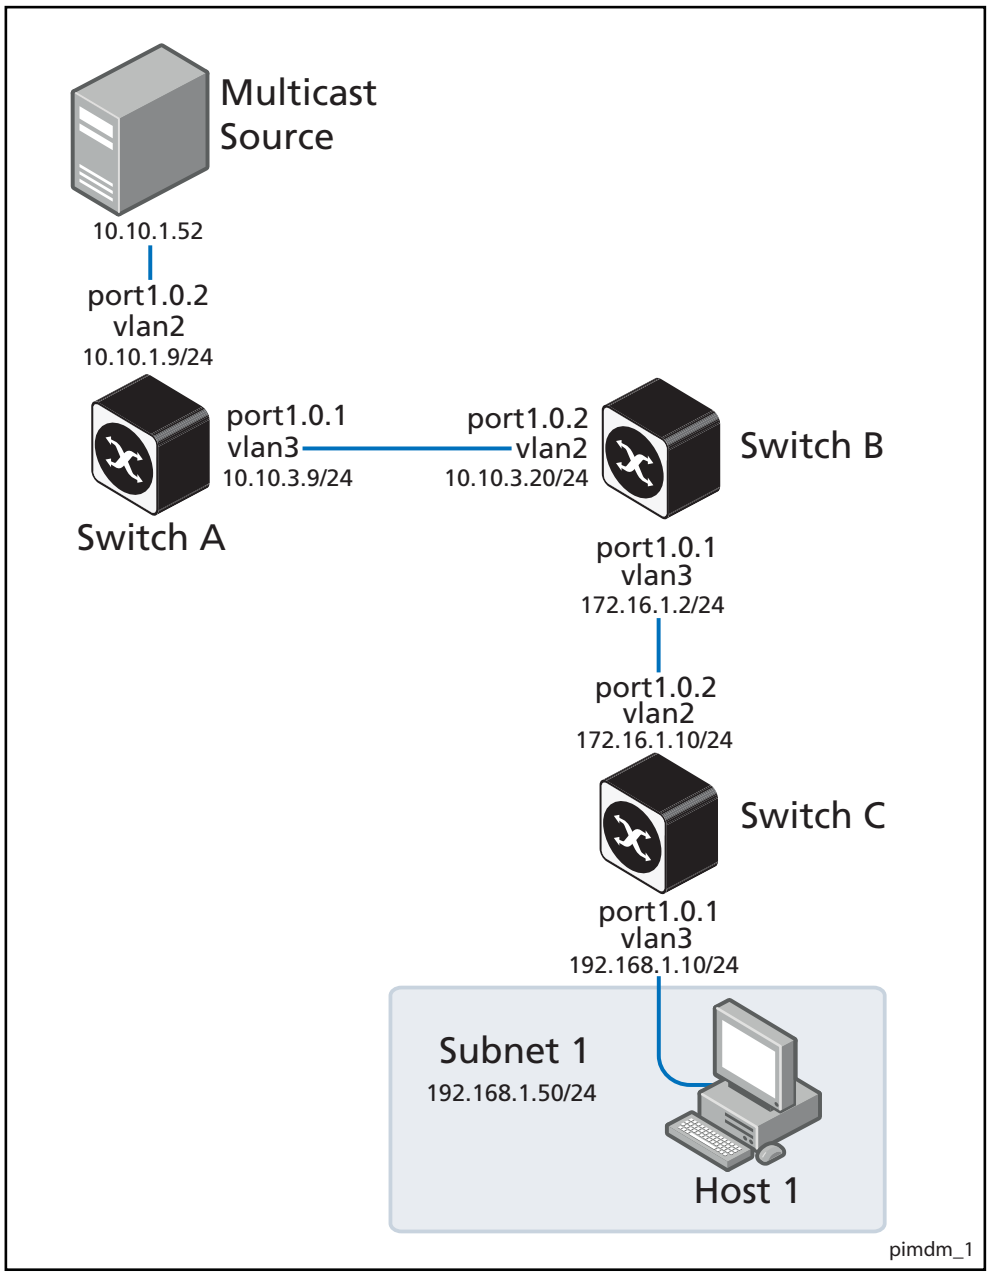
Downstream Anything other than the upstream interface for that group.

PIM-DM Configuration

The main requirement is to enable PIM-DM on the desired interfaces. This section provides a PIM-DM configuration example for a relevant scenario. The configuration uses Allied Telesis managed Layer 3 Switches as the PIM Routers. Three PIM Routers are connected in a chain, and a multicast client is attached to the third PIM Router.

Configuration Example

In this example, the address of the multicast source is 10.10.1.52. The following figure displays the network topology used in this example:



The steps involved in the forwarding of the multicast streams for this sample configuration are:

Switch A

1. When the PIM Routers start, they use the exchange of PIM Hello packets for PIM neighbor relationships with each other. Then each PIM Router becomes aware of the location of its PIM neighbors.

2. As a multicast stream arrives from the source to **Switch A**, it performs an RPF check on the source IP address of the multicast stream. **Switch A** determines the best route to the source IP address (10.10.1.52) is the receiving interface, so it forwards the multicast stream to its only PIM neighbor.

3. **Switch A** creates an (S, G) (Source, Group) entry in its PIM-DM forwarding table. Any further packets from the same source, which are destined to be forwarded to the same group, will be automatically forwarded without an RFP (Reverse Path Forwarding) check.

Switch B

4. When the multicast stream arrives at **Switch B**, it performs the same steps (2 and 3) as **Switch A**. This results in **Switch B** also having an (S, G) entry for the multicast stream in its PIM forwarding table, and the multicast stream is forwarded to **Switch C**.

Switch C

5. When the multicast stream arrives at **Switch C**, it will perform an RPF check on the multicast stream as it arrives, and accept it.

   This PIM Router does not have any downstream PIM Routers, but if **Switch C** has received an IGMP report from the client to request this multicast stream, **Switch C** will forward the multicast stream out port1.0.1, but no other ports.

   If the client leaves the group, and **Switch C** has no other attached clients requesting the group, then **Switch C** will send a Prune message upstream, resulting in **Switch A** and **Switch B** stopping forwarding the multicast stream to **Switch C**.

Switch A Configuration Output

See the following configuration output for **Switch A**:

```
hostname Switch A
vlan database
vlan 2 state enable
vlan 3 state enable
interface vlan2
ip address 10.10.1.9/24
ip igmp
ip pim dense-mode
!
interface vlan3
ip address 10.10.3.9/24
ip igmp
ip pim dense-mode
!
interface port1.0.1
switchport access vlan 3
!
interface port1.0.2
switchport access vlan 2
!
ip multicast-routing
!
```

Switch B Configuration Output

See the following configuration output for **Switch B**:

```
hostname Switch B
vlan database
vlan 2 state enable
vlan 3 state enable
interface vlan2
ip address 10.10.3.20/24
ip igmp
ip pim dense-mode
!
interface vlan3
ip address 172.16.1.2/24
ip igmp
ip pim dense-mode
!
interface port1.0.1
switchport access vlan 3
!
interface port1.0.2
switchport access vlan 2
!
ip multicast-routing
!
```

Switch C Configuration Output

See the following configuration output for **Switch C**:

```
hostname Switch C
vlan database
vlan 2 state enable
vlan 3 state enable
interface vlan2
ip address 172.16.1.10/24
ip igmp
ip pim dense-mode
!
interface vlan3
ip address 192.168.1.10/24
ip igmp
ip pim dense-mode
!
interface port1.0.1
switchport access vlan 3
!
interface port1.0.2
switchport access vlan 2
!
ip multicast-routing
!
```

Verifying Configuration

Use the following commands to verify the interface details and multicast routing table.

Interface Details

The **show ip pim dense-mode interface** command displays the interface details for **Switch C**.

```
Address          Interface VIFindex Ver/   Nbr
                                    Mode   Count
192.168.1.10     port1.0.1  0       v2/D   0
172.16.1.10      port1.0.2  2       v2/D   1
```

IP Multicast Routing Table

The **show ip mroute** command displays the IP multicast routing table (for **Switch C**).

```
IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.1.3), uptime 00:00:15
Owner PIM-DM, Flags: F
  Incoming interface: port1.0.2
  Outgoing interface list:
    port1.0.1 (1)
```

IP PIM-DM Multicast Routing Table

The **show ip pim dense-mode mroute** command displays the IP PIM-DM multicast routing table (for **Switch C**).

```
PIM-DM Multicast Routing Table
(10.10.1.52, 224.0.1.3)
  RPF Neighbor: 172.16.1.2, Nexthop: 172.16.1.2, port1.0.2
  Upstream IF: port1.0.2
    Upstream State: Forwarding
    Assert State: NoInfo
  Downstream IF List:
    port1.0.1, in 'olist':
      Downstream State: NoInfo
      Assert State: NoInfo
```

Chapter 55: PIM-DM Commands

Command List

This chapter provides an alphabetical reference of PIM-DM commands. For commands common to PIM-SM and PIM-DM, see **Chapter 47, Multicast Introduction and Commands**.

debug pim dense-mode all

This command enables PIM-DM debugging.

The **no** variant of this command disables PIM-DM debugging.

Syntax

```
debug pim dense-mode all
no debug pim dense-mode all
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode all
```

Output **Figure 55-1: Example output from the debug pim dense-mode all command**

```
PIM event debugging is on
PIM MFC debugging is on
PIM state debugging is on
PIM packet debugging is on
PIM incoming packet debugging is on
PIM outgoing packet debugging is on
```

Validation Commands **show debugging pim dense-mode**

Related Commands
debug pim dense-mode context
debug pim dense-mode decode
debug pim dense-mode encode
debug pim dense-mode fsm
debug pim dense-mode mrt
debug pim dense-mode nexthop
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode context

This command enables debugging of general configuration context.

The **no** variant of this command disables debugging of general configuration context.

Syntax

```
debug pim dense-mode context
no debug pim dense-mode context
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode context
```

Related Commands

debug pim dense-mode all
debug pim dense-mode decode
debug pim dense-mode encode
debug pim dense-mode fsm
debug pim dense-mode mrt
debug pim dense-mode nexthop
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode decode

This command enables debugging of the PIM-DM message decoder.

The **no** variant of this command disables debugging of the PIM-DM message decoder.

Syntax

```
debug pim dense-mode decode
no debug pim dense-mode decode
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode decoder
```

Related Commands

debug pim dense-mode all
debug pim dense-mode context
debug pim dense-mode encode
debug pim dense-mode fsm
debug pim dense-mode mrt
debug pim dense-mode nexthop
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode encode

This command enables debugging of the PIM-DM message encoder.

The **no** variant of this command disables debugging of the PIM-DM message encoder.

Syntax

```
debug pim dense-mode encode
no debug pim dense-mode encode
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode encoder
```

Related Commands

debug pim dense-mode all
debug pim dense-mode context
debug pim dense-mode decode
debug pim dense-mode fsm
debug pim dense-mode mrt
debug pim dense-mode nexthop
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode fsm

This command enables debugging of Finite-State Machine (FSM) specific information of all Multicast Routing Table (MRT) and MRT Virtual Multicast Interface (MRT-VIF) entries.

The **no** variant of this command disables debugging of Finite-State Machine (FSM) specific information of all Multicast Routing Table (MRT) and MRT Virtual Multicast Interface (MRT-VIF) entries.

Syntax

```
debug pim dense-mode fsm
no debug pim dense-mode fsm
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode fsm
```

Related Commands
debug pim dense-mode all
debug pim dense-mode context
debug pim dense-mode decode
debug pim dense-mode encode
debug pim dense-mode mrt
debug pim dense-mode nexthop
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode mrt

This command enables debugging of MRT and MRT-VIF entry handling (for example, creation and deletion of).

The **no** variant of this command disables debugging of MRT and MRT-VIF entry handling.

Syntax

```
debug pim dense-mode mrt
no debug pim dense-mode mrt
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode mrt
```

Related Commands
debug pim dense-mode all
debug pim dense-mode context
debug pim dense-mode decode
debug pim dense-mode encode
debug pim dense-mode fsm
debug pim dense-mode nexthop
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode nexthop

This command enables debugging of Reverse Path Forwarding (RPF) neighbor nexthop cache handling.

The **no** variant of this command disables debugging of Reverse Path Forwarding (RPF) neighbor nexthop cache handling.

Syntax

```
debug pim dense-mode nexthop
no debug pim dense-mode nexthop
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode nexthop
```

Related Commands

debug pim dense-mode decode
debug pim dense-mode encode
debug pim dense-mode fsm
debug pim dense-mode mrt
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode nsm

This command enables debugging of PIM-DM interface with NSM.

The **no** variant of this command disables debugging of PIM-DM interface with NSM.

Syntax

```
debug pim dense-mode nsm
no debug pim dense-mode nsm
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode nsm
```

debug pim dense-mode nexthop
debug pim dense-mode nsm

ip pim dense-mode

This command enables or disables PIM-DM operation from Interface mode on the current VLAN interface. This command also disables passive mode on the VLAN interface if passive mode has been enabled using an **ip pim dense-mode passive** command.

The **no** variant of this command disables all PIM-DM activities on the interface.

Syntax

```
ip pim dense-mode
no ip pim dense-mode
```

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dense-mode
```

ip pim dense-mode passive

This command enables PIM-DM passive mode operation from Interface mode on the current VLAN interface.

The **no** variant of this command disables passive mode.

Syntax

```
ip pim dense-mode passive
no ip pim dense-mode passive
```

Mode Interface Configuration for a VLAN interface.

Usage Configuring a VLAN interface as a passive PIM-DM interface indicates that the VLAN interface is connected to a stub network (i.e. a network that does not contain any PIM Routers). So, multicast streams that arrive on other PIM-DM interfaces can be routed to hosts on the passive PIM-DM interface, but no PIM neighbor relationships will be formed on the passive PIM-DM interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dense-mode passive
```

ip pim ext-srcs-directly-connected (PIM-DM)

Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

For a more detailed description of this command, see: **Chapter 51, PIM-SM Commands** - **ip pim ext-srcs-directly-connected (PIM-SM)** command on page 51.14.

ip pim hello-holdtime (PIM-DM)

This command configures a **hello-holdtime**. The PIM **hello-holdtime** on a VLAN interface is the period which the router will wait to receive a hello from neighbors on that interface. If the router does not receive a hello from a given neighbor within that period, then it will decide that the neighbor is no longer an active PIM Router, and will terminate the neighbor relationship.

You cannot configure a **hello-holdtime** value that is less than the current **hello-interval**. Each time the **hello-interval** is updated, the **hello-holdtime** is also updated, according to the following rules:

- If the **hello-holdtime** is not configured; or if the hello holdtime is configured and less than the current **hello-interval** value, it is modified to 3.5 times the **hello-interval** value.
- Otherwise, it retains the configured value.

Use the **no** variant of this command to return the hello-holdtime value to its default of 3.5 times the current hello-interval value.

Syntax

```
ip pim hello-holdtime <holdtime>
no ip pim hello-holdtime
```

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-holdtime 123
```

ip pim hello-interval (PIM-DM)

This command configures a PIM **hello-interval** value. The PIM **hello-interval** on a VLAN interface is the period at which the router will transmit PIM hello messages on that interface.

When the **hello-interval** is configured, and the **hello-holdtime** is not configured, or when the configured **hello-holdtime** value is less than the new **hello-interval** value; the **hello-holdtime** value is modified to 3.5 times the **hello-interval** value. Otherwise, the **hello-holdtime** value is the configured value. The default is 30 seconds.

Use the **no** variant of this command to reset the **hello-interval** to the default.

Syntax

```
ip pim hello-interval <interval>
no ip pim hello-interval
```

Parameter	Description
<interval>	*<1-65535>* The value in seconds (no fractional seconds accepted).

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
```

ip pim max-graft-retries

This command configures PIM-DM to send a limited number of Graft message retries, after which time the device will remove all information regarding the particular (Source, Group), or until the device receives an acknowledgment, whichever occurs first.

The **no** variant of this command configures PIM-DM to send Graft message retries until the device receives an acknowledgment, which is the default behavior.

Syntax

```
ip pim max-graft-retries <1-65535>

no pim max-graft-retries
```

Parameter	Description
`no`	Negate a command or set its defaults.
`ip`	Internet Protocol (IP).
`pim`	PIM Interface commands.
`max-graft-retries`	PIM Graft message retries.
<1-65535>	Graft message retries before ceasing Graft message retries.

Default By default, Graft retries are sent by PIM-DM until the device receives an acknowledgement.

Mode Interface Configuration for a VLAN interface.

Usage Graft messages are used to reduce the join latency when a previously pruned branch of the source tree must be grafted back, when a member joins the group after the PIM-DM device has sent a Prune message to prune unwanted traffic. Graft messages are the only PIM-DM messages that receive an acknowledgement.

If Graft messages were not used, then the member waiting for pruned off traffic would have to wait up to 3 minutes for the periodic re-flooding to occur to begin receiving multicast traffic again. By using Grafts, the Prune can be reversed much faster than waiting for periodic re-flooding to begin receiving multicast traffic again.

Examples To configure PIM-DM on the VLAN interface `vlan2` to send a maximum of 10 Graft message retries, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim max-graft-retries 10
```

To configure PIM-DM on the VLAN interface `vlan2` to send Graft message retries forever, which is the default behavior, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim max-graft-retries
```

Validation Commands

show ip mroute
show ip pim dense-mode mroute
show running-config

ip pim neighbor-filter (PIM-DM)

Enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-DM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

Syntax

```
ip pim neighbor-filter [<number>|<accesslist>]
no ip pim neighbor-filter [<number>|<accesslist>]
```

Parameter	Description
<number>	*<1-99>* Standard IP access list number.
<accesslist>	IP access list name.

Default By default, there is no filtering.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim neighbor-filter 14
```

ip pim propagation-delay

This command configures the PIM **propagation-delay** value. The PIM **propagation-delay** is the expected delay in the transfer of PIM messages across the VLAN interface that it is attached to.

Use the **no** variant of this command to return the **propagation-delay** to the default (1000 milliseconds).

Syntax

```
ip pim propagation-delay <delay>
no ip pim propagation-delay
```

Parameter	Description
<delay>	*<1000-5000>* The value in milliseconds. The default is 1000 milliseconds.

Default The propagation-delay is set to 1000 milliseconds by default.

Mode Interface Configuration for a VLAN interface.

Examples

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim propagation-delay 2000

awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim propagation-delay
```

ip pim state-refresh origination-interval

This command configures a PIM **state-refresh origination-interval** value. The origination interval is the number of seconds between PIM state refresh control messages. The default is 60 seconds.

Use the **no** variant of this command to return the origination interval to the default.

Syntax

```
ip pim state-refresh origination-interval <interval>
no ip pim state-refresh origination-interval
```

Parameter	Description
<interval>	*<1-100>* The integer value in seconds (no fractional seconds accepted). The default **state-refresh origination-interval** value is 60.

Default The state-refresh origination-interval is set to 60 seconds by default, and is reset using negation.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim state-refresh origination-interval 65
```

show debugging pim dense-mode

This command displays the status of the debugging of the system.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show debugging pim dense-mode
```

Mode User Exec and Privileged Exec

Output **Figure 55-2: Example output from the show debugging pim dense-mode command**

```
PIM-DM Debugging status:
    PIM-DM Decoder debugging is off
  PIM-DM Encoder debugging is off
  PIM-DM FSM debugging is off
  PIM-DM MRT debugging is off
  PIM-DM NHOP debugging is off
  PIM-DM NSM debugging is off
  PIM-DM VIF debugging is off
```

Related Commands **debug pim dense-mode all**

show ip pim dense-mode interface

This command displays the PIM-DM interface information.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show ip pim dense-mode interface`

Mode User Exec and Privileged Exec

Example To display information about the PIM-DM interfaces, use the command:

```
awplus# show ip pim dense-mode interface
```

Output

Figure 55-3:

```
Total configured interfaces: 24   Maximum allowed: 32
Total active interfaces:     22

Address          Interface VIFIndex Ver/   Nbr
                                    Mode   Count
192.168.1.53/24  vlan2     0        v2/D   2

```

1. **Only the top entries output by this command are shown in this example.**

Table 55-1: Parameters in the output of the show ip pim dense-mode interface command

Parameter	Description
`Total configured interfaces`	The number of configured PIM Dense Mode interfaces.
`Maximum allowed`	The maximum number of PIM Dense Mode interfaces that can be configured.
`Total active interfaces`	The number of active PIM Dense Mode interfaces.
`Address`	Primary PIM-DM address.
`Interface`	Name of the PIM-DM interface.
`VIF Index`	The Virtual Interface index of the VLAN.
`Ver/Mode`	PIM version/Dense mode.
`Nbr Count`	Neighbor count of the PIM-DM interface.

Related Commands ip pim dense-mode
show ip pim dense-mode neighbor

show ip pim dense-mode interface detail

This command displays detailed information on a PIM-DM interface.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show ip pim dense-mode interface detail`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode interface detail
```

Output **Figure 55-4: Example output from the show ip pim dense-mode interface detail command**

```
vlan2 (vif-id: 0):
  Address 192.168.1.53/24
  Hello period 30 seconds, Next Hello in 30 seconds
  Neighbors:
    192.168.1.152/32
    192.168.1.149/32
vlan3 (vif-id: 2):
  Address 192.168.10.53/24
  Hello period 30 seconds, Next Hello in 8 seconds
  Neighbors: none
```

show ip pim dense-mode mroute

This command displays the IP PIM-DM multicast routing table.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax `show ip pim dense-mode mroute`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode mroute
```

Output **Figure 55-5: Example output from the show ip pim dense-mode mroute command**

```
PIM-DM Multicast Routing Table
(192.168.10.52, 224.1.1.1)
  Source directly connected on vlan3
  State-Refresh Originator State: Originator
  Upstream IF: vlan3, State: Forwarding
  Downstream IF List:
    vlan2, in 'olist':
      Downstream State: NoInfo
      Assert State: NoInfo
```

show ip pim dense-mode neighbor

This command displays PIM-DM neighbor information.

For information on output options, see "Controlling "show" Command Output" on page 1.36.

Syntax

```
show ip pim dense-mode neighbor
```

Mode

User Exec and Privileged Exec

Usage

The total number of PIM-DM neighbors is restricted to 500 PIM-DM neighbors.

When the 500 PIM-DM neighbor limit is reached, as a result of receiving hello packets from new PIM-DM neighbors, a log entry will be issued to the log file in the below format:

```
<date> <time> <facility>.<severity> <program[<pid>]>: <message>
-------------------------------------------------------------------
2008 Dec 10 00:58:39 user.err x900 PIM-DM[1150]: [VIF] Nbr
Create: Cannot create more than 500 neighbours - ignoring
neighbour 100.0.1.247/32 on vlan100
```

Example

```
awplus# show ip pim dense-mode neighbor
```

Output

Figure 55-6: Example output from the show ip pim dense-mode neighbor command

```
Total number of neighbors: 500
Neighbor-Address  Interface          Uptime/Expires    Ver
192.168.1.152     vlan2                17:15:42/00:01:28 v2
192.168.1.149     vlan2                17:15:34/00:01:34 v2
```

show ip pim dense-mode neighbor detail

This command displays detailed PIM-DM neighbor information.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip pim dense-mode neighbor detail
```

Mode

User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode neighbor detail
```

Output

Figure 55-7: Example output from the show ip pim dense-mode neighbor detail command

```
Neighbor 192.168.1.152 (vlan2)
 Up since 17:16:20, Expires in 00:01:20
Neighbor 192.168.1.149 (vlan2)
 Up since 17:16:12, Expires in 00:01:26
```

show ip pim dense-mode nexthop

This command displays the nexthop information as used by PIM-DM. In the context of PIM-DM, the term '**nexthop**' refers to the nexthop router on the path back to the source address of a multicast stream.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ip pim dense-mode nexthop
```

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode nexthop
```

Output **Figure 55-8: Example output from the show ip pim dense-mode neighbor nexthop command**

```
Destination      Nexthop   Nexthop         Nexthop          Metric Pref
                 Num       Addr            Interface
192.168.10.52    1         0.0.0.0         vlan2            3      1
```

Table 55-2: Parameters in the output of the show ip pim dense-mode neighbor nexthop command

Parameter	Description
`Destination`	Destination address for which PIM-DM requires nexthop information.
`Nexthop Num`	Number of nexthops to the destination. PIM can only use one nexthop.
`Nexthop Addr`	Address of the current nexthop gateway.
`Nexthop Interface`	Name of the nexthop interface.
`Metric`	Metric of the route towards the destination.
`Preference`	Preference of the route towards the destination.

undebug all pim dense-mode

Use this command from the Global Configuration mode to disable all PIM-DM debugging.

Syntax `undebug all pim dense-mode`

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# undebug all pim dense-mode
```

Related Commands
debug pim dense-mode all
debug pim dense-mode context
debug pim dense-mode decode
debug pim dense-mode encode

debug pim dense-mode mrt
debug pim dense-mode nexthop
debug pim dense-mode nsm
debug pim dense-mode vif

Chapter 56: MLD and MLD Snooping Introduction and Commands

MLD Introduction

Multicast Listener Discovery (MLD) is used to exchange membership status information between IPv6 routers that support multicasting and members of multicast groups on a network segment. Host membership in a multicast group is reported by individual member hosts, and membership status is periodically polled by multicast routers. For a general overview of multicasting, see **Chapter 47, Multicast Introduction and Commands**.

MLD is defined in RFC 2710, "Multicast Listener Discovery (MLD) for IPv6." and MLDv2 is defined in RFC 3810, "Multicast Listener Discovery Version 2 (MLDv2) for IPv6." AlliedWare Plus supports both RFC 2710 and RFC 3810 for MLD and MLDv2 respectively.

Note 

There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing. x510 series switches have a 128 MLD group limit for (*, G) and (S,G) entries. See the limits for MLD interfaces depending on the number of VLANs, ports, static and dynamic groups as shown in the relevant product data sheet for your switch.

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Sample running-config showing MLD configuration on interface vlan2

```
!
ipv6 forwarding
!
ipv6 multicast-routing
!
interface vlan2
  ipv6 address 2001:0db8::12:252/64
  ipv6 enable
  ipv6 mld
!
```

Note 

IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Note 

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

Note

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306.The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

MLD Snooping

MLD Snooping is a feature whereby a Layer 2 switch listens to or "snoops" the MLD messages passing through the switch or from member hosts and multicast routers. The purpose of MLD Snooping is to provide efficient Layer 2 multicast forwarding, by sending only to hosts that have expressed an interest in receiving the multicast data.

Hosts express an interest in receiving multicast data for a given multicast group by sending an MLD join message. Without MLD Snooping, if one host expresses an interest in getting multicast data for a given group, by sending an MLD join for the multicast group, then all hosts connected to the same VLAN will also receive the multicast data. This wastes bandwidth on the switch ports connected to the host that are not interested in receiving the multicast data. Snooping takes note of exactly which ports have received joins for a given group, and send that group only to those ports.

MLD Snooping is enabled by default globally for the switch. It can be enabled and disabled on a per-VLAN basis.

For MLD Snooping to operate, both IGMP Snooping and MLD Snooping must be enabled globally on the switch. By default, IGMP Snooping is also enabled globally. To enable IGMP Snooping if it has been disabled, use the **ip igmp snooping** command on page 49.23 in Global Configuration mode.

MLD Snooping makes a distinction between Member ports, which are ports connected to members hosts, and Router ports, which are ports connected to, or directed towards, a Layer 3 router or a Layer 3 switch.

Figure 56-1: Sample running-config showing an MLD Snooping Querier set on vlan2

```
!
ipv6 mld snooping
!
interface vlan2
   ipv6 mld snooping querier
!
```

MLD Snooping Configuration Examples

For detailed information about the commands used to configure MLD Snooping, see **Chapter 56, MLD and MLD Snooping Introduction and Commands**.

The following examples configure MLD Snooping:

- **Enabling the MLD Snooping Querier on an interface**
- **Enabling MLD Snooping globally and on an interface**
- **Configuring a Multicast Router statically on an interface**
- **Enabling MLD Snooping Fast-Leave Processing on an interface**
- **Configuring MLD Snooping Report Suppression on an interface**

Enabling the MLD Snooping Querier on an interface

Use the MLD Snooping querier to support MLD Snooping in a VLAN where PIM-SMv6 and MLD are not configured and whenever you do not need to route IPv6 multicast traffic.

You can configure the switch to generate MLD queries on a VLAN interface if multicast routing is not enabled. For each VLAN that is connected to switches that use MLD Snooping to report multicast traffic, configure one switch as the MLD Snooping Querier.

To enable and show MLD Snooping Querier on VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping querier
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Note that the MLD Snooping Querier is configured in Interface Configuration mode only. You cannot configure MLD Snooping Querier globally for all VLAN interfaces on a switch.

Enabling MLD Snooping globally and on an interface

To globally enable and show MLD Snooping on the switch, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 mld snooping
awplus(config)# exit
awplus# show ipv6 mld interface
```

Note that entering `show ipv6 mld interface` without an optional interface parameter displays MLD information for all configured interfaces globally on the switch.

To enable and show MLD Snooping on VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Note that entering `show ipv6 mld interface vlan2` with the optional interface parameter displays MLD information for that specified configured interface on the switch.

Configuring a Multicast Router statically on an interface

To configure and show a static connection to a Multicast Router for VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping mrouter interface port1.0.2
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Note the VLAN interface to the Multicast Router must be administratively up and the line protocol must be up to configure a static connection to a Multicast Router on the VLAN.

Enabling MLD Snooping Fast-Leave Processing on an interface

To enable and show MLD Snooping Fast-Leave Processing on VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping fast-leave
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Configuring MLD Snooping Report Suppression on an interface

To enable and show MLD Snooping Report Suppression on VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping report-suppression
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Command List

This chapter provides an alphabetical reference of configuration, clear, and show commands related to MLD and MLD Snooping.

The Multicast Listener Discovery (MLD) module includes the MLD Proxy service and MLD Snooping functionality. Some of the following commands may have commonalities and restrictions; these are described under the Usage section for each command.

Note 

IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Note 

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306.The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Note 

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

clear ipv6 mld

Use this command to clear all MLD local memberships on all interfaces.

Syntax `clear ipv6 mld`

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Example

```
awplus# clear ipv6 mld
```

Related Commands **clear ipv6 mld group**
clear ipv6 mld interface

clear ipv6 mld group

Use this command to clear MLD specific local-membership(s) on all interfaces, for a particular group.

Syntax `clear ipv6 mld group {*|<ipv6-address>}`

Parameter	Description
`*`	Clears all groups on all interfaces. This is an alias to the **clear ipv6 mld** command.
`<ipv6-address>`	Specify the group address for which MLD local-memberships are to be cleared from all interfaces. Specify the IPv6 multicast group address in the format in the format X:X::X:X.

Mode Privileged Exec

Usage This command applies to groups learned by MLD Layer-3 multicast protocols and by MLD Snooping.

Example

```
awplus# clear ipv6 mld group *
```

Related Commands **clear ipv6 mld**
clear ipv6 mld interface

clear ipv6 mld interface

Use this command to clear MLD interface entries.

Syntax `clear ipv6 mld interface <interface>`

Parameter	Description
`<interface>`	Specifies name of the interface; all groups learned from this interface are deleted.

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Example

```
awplus# clear ipv6 mld interface vlan2
```

Related Commands **clear ipv6 mld**
clear ipv6 mld group

debug mld

Use this command to enable all MLD debugging modes, or a specific MLD debugging mode.

Use the **no** variant of this command to disable all MLD debugging modes, or a specific MLD debugging mode.

Syntax

```
debug mld {all|decode|encode|events|fsm|tib}
no debug mld {all|decode|encode|events|fsm|tib}
```

Parameter	Description
`all`	Debug all MLD.
`decode`	Debug MLD decoding.
`encode`	Debug MLD encoding.
`events`	Debug MLD events.
`fsm`	Debug MLD Finite State Machine (FSM).
`tib`	Debug MLD Tree Information Base (TIB).

Mode Privileged Exec and Global Configuration

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Examples

```
awplus# configure terminal
awplus(config)# debug mld all

awplus# configure terminal
awplus(config)# debug mld decode

awplus# configure terminal
awplus(config)# debug mld encode

awplus# configure terminal
awplus(config)# debug mld events
```

Output

```

Related Commands **show debugging mld**

ipv6 mld

Use this command to enable the MLD protocol operation on an interface. This command enables MLD protocol operation in stand-alone mode, and can be used to learn local-membership information prior to enabling a multicast routing protocol on the interface.

Use the **no** variant of this command to return all MLD related configuration to the default (including MLD Snooping).

Note 

There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing. x510 series switches have a 128 MLD group limit for (*, G) and (S,G) entries. See the limits for MLD interfaces depending on the number of VLANs, ports, static and dynamic groups as shown in the relevant product data sheet for your switch.

Syntax

```
ipv6 mld
no ipv6 mld
```

Default MLD is disabled by default.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld
```

ipv6 mld access-group

Use this command to control the multicast local-membership groups learned on an interface.

Use the **no** variant of this command to disable this access control.

Syntax

```
ipv6 mld access-group <IPv6-access-list-name>
no ipv6 mld access-group
```

Parameter	Description
<IPv6-access-list-name>	Specify a Standard or an Extended software IPv6 access-list name. See **Chapter 61, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.

Default No access list is configured by default.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Examples In the following example, the VLAN interface `vlan2` will only accept MLD joins for groups in the range `ff1e:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
ff1e:0db8:0001::/64
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

In the following example, the VLAN interfaces `vlan2-vlan4` will only accept MLD joins for groups in the range `ff1e:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
ff1e:0db8:0001::/64
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

ipv6 mld immediate-leave

Use this command to minimize the leave latency of MLD memberships.

Use the **no** variant of this command to disable this feature.

Syntax

```
ipv6 mld immediate-leave group-list <IPv6-access-list-name>
no ipv6 mld immediate-leave
```

Parameter	Description
<IPv6-access-list-name>	Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups in which the immediate leave feature is enabled. See **Chapter 61, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.

Default Disabled

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example The following example shows how to enable the immediate-leave feature on an interface for a specific range of multicast groups. In this example, the router assumes that the group access-list consists of groups that have only one node membership at a time per interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld immediate-leave v6grp
awplus(config-if)# exit
```

Related Commands **ipv6 mld last-member-query-interval**

ipv6 mld last-member-query-count

Use this command to set the last-member query-count value.

Use the **no** variant of this command to return to the default on an interface.

Syntax

```
ipv6 mld last-member-query-count <value>
no ipv6 mld last-member-query-count
```

Parameter	Description
<value>	Count value. Valid values are from `2 to 7`.

Default The default last-member query-count value is 2.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-count 3
```

ipv6 mld last-member-query-interval

Use this command to configure the interval at which the router sends MLD group-specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

Syntax

```
ipv6 mld last-member-query-interval <milliseconds>
no ipv6 mld last-member-query-interval
```

Parameter	Description
<milliseconds>	The time delay between successive query messages (in milliseconds). Valid values are from 1000 to 25500 milliseconds.

Default 1000 milliseconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example The following example changes the MLD group-specific host query message interval to 2 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-interval 2000
```

Related Commands ipv6 mld immediate-leave

ipv6 mld limit

Use this command to configure a limit on the maximum number of group memberships that may be learned. The limit may be set for the switch as a whole, or for a specific interface.

Once the specified group membership limit is reached, all further local-memberships will be ignored.

Optionally, an exception access-list can be configured to specify the group-address(es) that are exempted from being subject to the limit.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

Syntax

```
ipv6 mld limit <limitvalue> [except <IPv6-access-list-name>]
no ipv6 mld limit
```

Parameter	Description
<limitvalue>	<2-512> Maximum number of group membership states.
<IPv6-access-list-name>	Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups, which are exempted from being subject to the configured limit. See **Chapter 61, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.

Default The default limit, which is reset by the **no** variant of this command, is the same as maximum number of group membership entries that can be learned with the **ipv6 mld limit** command.

The default limit of group membership entries that can be learned is 512 entries.

Mode Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Examples The following example configures an MLD limit of 100 group-memberships across all VLAN interfaces on which MLD is enabled, and excludes groups in the range `ff1e:0db8:0001::/64` from this limitation:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard v6grp permit
ff1e:0db8:0001::/64
awplus(config)# ipv6 mld limit 100 except v6grp
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

Related Commands **show ipv6 mld groups**

ipv6 mld querier-timeout

Use this command to configure the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

Syntax

```
ipv6 mld querier-timeout <seconds>
no ipv6 mld querier-timeout
```

Parameter	Description
<seconds>	Number of seconds that the router waits after the previous querier has stopped querying before it takes over as the querier. Valid values are from `2 to 65535 seconds`.

Default 255 seconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example The following example configures the router to wait 120 seconds from the time it received the last query before it takes over as the querier for the interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld querier-timeout 120
```

Related Commands ipv6 mld query-interval

ipv6 mld query-interval

Use this command to configure the frequency of sending MLD host query messages.

Use the **no** variant of this command to return to the default frequency.

Syntax

```
ipv6 mld query-interval <seconds>
no ipv6 mld query-interval
```

Parameter	Description
<seconds>	Variable that specifies the time delay between successive MLD host query messages (in seconds). Valid values are from `1 to 18000 seconds`.

Default The default query interval is 125 seconds.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example The following example changes the frequency of sending MLD host-query messages to 2 minutes:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-interval 120
```

Related Commands ipv6 mld querier-timeout

ipv6 mld query-max-response-time

Use this command to configure the maximum response time advertised in MLD queries.

Use the **no** variant of with this command to restore the default.

Syntax

```
ipv6 mld query-max-response-time <seconds>
no ipv6 mld query-max-response-time
```

Parameter	Description
<seconds>	Maximum response time (in seconds) advertised in MLD queries. Valid values are from 1 to 240 seconds.

Default 10 seconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example The following example configures a maximum response time of 8 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-max-response-time 8
```

ipv6 mld robustness-variable

Use this command to change the robustness variable value on an interface.

Use the **no** variant of this command to return to the default on an interface.

Syntax

```
ipv6 mld robustness-variable <value>
no ipv6 mld robustness-variable
```

Parameter	Description
<value>	Valid values are from `1 to 7`.

Default The default robustness variable value is 2.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld robustness-variable 3
```

ipv6 mld snooping

Use this command to enable MLD Snooping. When this command is issued in the Global Configuration mode, MLD Snooping is enabled globally for the switch. When this command is issued in Interface mode for a VLAN then MLD Snooping is enabled for the specified VLAN. Note that MLD Snooping is enabled on the VLAN only if it is enabled globally and on the VLAN.

Use the **no** variant of this command to globally disable MLD Snooping in Global Configuration mode, or for the specified VLAN interface in Interface mode.

Note There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing. x510 series switches have a 128 MLD group limit for (*, G) and (S,G) entries. See the limits for MLD interfaces depending on the number of VLANs, ports, static and dynamic groups as shown in the relevant product data sheet for your switch.

Syntax

```
ipv6 mld snooping
no ipv6 mld snooping
```

Default By default, MLD Snooping is enabled both globally and on all VLANs.

Mode Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage For MLD Snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (Both are enabled by default).

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Examples To configure MLD Snooping on the VLAN interface `vlan2`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping
```

To configure MLD Snooping on the VLAN interfaces `vlan2-vlan4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interface `vlan2`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config)# no ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interfaces `vlan2-vlan4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config)# no ipv6 mld snooping
```

To configure MLD Snooping globally for the switch, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 mld snooping
```

To disable MLD Snooping globally for the switch, enter the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 mld snooping
```

ipv6 mld snooping fast-leave

Use this command to enable MLD Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing; the MLD group-membership is removed as soon as an MLD leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

Syntax

```
ipv6 mld snooping fast-leave
no ipv6 mld snooping fast-leave
```

Default MLD Snooping fast-leave processing is disabled.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This MLD Snooping command can only be configured on VLAN interfaces.

Examples This example shows how to enable fast-leave processing on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping fast-leave
```

This example shows how to enable fast-leave processing on the VLAN interface `vlan2-vlan4`.

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping fast-leave
```

ipv6 mld snooping mrouter

Use this command to statically configure the specified port as a Multicast Router interface for MLD Snooping within the specified VLAN.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to remove the static configuration of the interface as a Multicast Router interface.

Syntax

```
ipv6 mld snooping mrouter interface <port>
no ipv6 mld snooping mrouter interface <port>
```

Parameter	Description
<port>	Specify the name of the port.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This MLD Snooping command statically configures a switch port as a Multicast Router interface.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if `port1.0.1` and `port1.0.14` are ports on an EPSR data VLAN `vlan101`, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

Output **Figure 56-2: Example ipv6 mld snooping mrouter commands when static IPv6 multicast routing is being used and the destination VLAN is an ESPR data VLAN:**

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.14
```

Examples This example shows how to specify the next-hop interface to the multicast router for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping mrouter interface port1.0.5
```

This example shows how to specify the next-hop interface to the multicast router for VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping mrouter interface port1.0.5
```

Related Commands **ipv6 multicast route**

ipv6 mld snooping querier

Use this command to enable MLD querier operation on a subnet (VLAN) when no multicast routing protocol is configured in the subnet (VLAN). When enabled, the MLD Snooping querier sends out periodic MLD queries for all interfaces on that VLAN.

Use the **no** variant of this command to disable MLD querier configuration.

Syntax

```
ipv6 mld snooping querier
no ipv6 mld snooping querier
```

Mode Interface Configuration for a specified VLAN interface.

Usage This command can only be configured on a single VLAN interface - not on multiple VLANs.

The MLD Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as an MLD querier for faster network convergence.

The MLD Snooping querier does not start, or automatically cease, the MLD Querier operation if it detects query message(s) from a multicast router. It restarts as an MLD Snooping querier if no queries are seen within the other querier interval.

Do not enable MLD Snooping querier if you have already enabled MLD on your device. Do not enable MLD Snooping querier on your device and then enable MLD afterwards.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping querier
```

ipv6 mld snooping report-suppression

Use this command to enable report suppression from hosts for Multicast Listener Discovery version 1 (MLDv1) on a VLAN in Interface Configuration mode.

Use the **no** variant of this command to disable report suppression on a VLAN in Interface Configuration mode.

Syntax

```
ipv6 mld snooping report-suppression
no ipv6 mld snooping report-suppression
```

Default Report suppression does not apply to MLDv2, and is turned on by default for MLDv1 reports.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This MLD Snooping command can only be configured on VLAN interfaces.

MLDv1 Snooping maybe configured to suppress reports from hosts. When a querier sends a query, only the first report for particular set of group(s) from a host will be forwarded to the querier by the MLD Snooping switch. Similar reports (to the same set of groups) from other hosts, which would not change group memberships in the querier, will be suppressed by the MLD Snooping switch to prevent 'flooding' of query responses.

Examples This example shows how to enable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 mld snooping report-suppression
```

This example shows how to enable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ipv6 mld snooping report-suppression
```

ipv6 mld static-group

Use this command to statically configure IPv6 group membership entries on an interface. To statically add only a group membership, do not specify any parameters.

Use the **no** variant of this command to delete static group membership entries.

Syntax

```
ipv6 mld static-group <ipv6-group-address>
   [source <ipv6-source-address>|ssm-map] [interface <port>]

no ipv6 mld static-group <ipv6-group-address>
   [source <ipv6-source-address>|ssm-map] [interface <port>]
```

Parameter	Description
<ipv6-group-address>	Specify a standard IPv6 Multicast group address to be configured as a static group member. The IPv6 address uses the format X:X::X:X.
<ipv6-source-address>	Optional. Specify a standard IPv6 source address to be configured as a static source from where multicast packets originate. The IPv6 address uses the format X:X::X:X.
ssm-map	Mode of defining SSM mapping. SSM mapping statically assigns sources to MLDv1 groups to translate these (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.
<port>	Optional. Physical interface. This parameter specifies a physical port. If this parameter is used, the static configuration is applied to just to that physical interface. If this parameter is not used, the static configuration is applied on all ports in the VLAN.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to MLD Snooping on a VLAN interface to statically add groups and/or source records.

Examples The following examples show how to statically add group and/or source records for MLD:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10

awplus # configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
fe80::2fd:6cff:fe1c:b
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
ssm-map
```

The following examples show how to statically add group and/or source records for MLD Snooping on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
fe80::2fd:6cff:fe1c:b
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
ssm-map
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 interface
port1.0.8
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
fe80::2fd:6cff:fe1c:b interface port1.0.8
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
ssm-map interface port1.0.8
```

ipv6 mld version

Use this command to set the current MLD protocol version on an interface.

Use the **no** variant of this command to return to the default version on an interface.

Syntax

```
ipv6 mld version <version>
no ipv6 mld version
```

Parameter	Description
<version>	MLD protocol version number. Valid version numbers are 1 and 2

Default The default MLD protocol version number is 2.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols, MLD Snooping. Note this command is intended for use where there is another querier (when there is another device with MLD enabled) on the same link that can only operate with MLD version 1. Otherwise, the default MLD version 2 is recommended for performance.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld version 1
```

show debugging mld

Use this command to display the MLD debugging modes enabled with the **debug mld** command.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show debugging mld
```

Mode

Privileged Exec

Example

```
awplus# show debugging mld
```

Output

```
show debugging mld
MLD Debugging status:
  MLD Decoder debugging is on
  MLD Encoder debugging is on
  MLD Events debugging is on
  MLD FSM debugging is on
  MLD Tree-Info-Base (TIB) debugging is on
```

Related Commands

debug mld

show ipv6 mld groups

Use this command to display the multicast groups with receivers directly connected to the router, and learned through MLD.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax

```
show ipv6 mld groups [<ipv6-address> |<interface>] [detail]
```

Parameter	Description
<ipv6-address>	Optional. Specify Address of the multicast group in format X:X::X:X.
<interface>	Optional. Specify the Interface name for which to display local information.

Mode User Exec and Privileged Exec

Examples The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups
```

Output

```
MLD Connected Group Membership
Group Address Interface  Uptime  Expires Last Reporter
ff08::1     port2.0.1 00:00:24 stopped fe80::eecd:6dff:fe6b:4783
```

The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups detail
```

Output

```
MLD Connected Group Membership Details for port2.0.1
Interface:      port2.0.1
Group:          ff08::1
Uptime:         00:00:13
Group mode:     Include ()
Last reporter:  fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
  Source Address                Uptime    v2 Exp    Fwd  Flags
  2001:db8::1                   00:00:13  00:04:07  Yes  R
  2002:db8::3                   00:00:13  00:04:07  Yes  R
```

show ipv6 mld interface

Use this command to display the state of MLD and MLD Snooping for a specified interface, or all interfaces.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 mld interface [<interface>]`

Parameter	Description
<interface>	Interface name.

Mode User Exec and Privileged Exec

Example The following command displays MLD interface status on all interfaces enabled for MLD:

```
awplus# show ipv6 mld interface
```

Output

```
awplus#show ipv6 mld interface
Interface vlan1 (Index 301)
 MLD Enabled, Active, Querier, Version 2 (default)
 Internet address is fe80::215:77ff:fec9:7468
 MLD interface has 0 group-record states
 MLD activity: 0 joins, 0 leaves
 MLD robustness variable is 2
 MLD last member query count is 2
 MLD query interval is 125 seconds
 MLD querier timeout is 255 seconds
 MLD max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 MLD Snooping is globally enabled
 MLD Snooping is enabled on this interface
 MLD Snooping fast-leave is not enabled
 MLD Snooping querier is enabled
 MLD Snooping report suppression is enabled
```

show ipv6 mld snooping mrouter

Use this command to display the multicast router interfaces, both configured and learned, in a VLAN. If you do not specify a VLAN interface then all the VLAN interfaces are displayed.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 mld snooping mrouter [<interface>]`

Parameter	Description
<interface>	Optional. Specify the name of the VLAN interface. Note: If you do not specify a single VLAN interface, then all VLAN interfaces are shown.

Mode User Exec and Privileged Exec

Examples The following command displays the multicast router interfaces in `vlan2`:

```
awplus# show ipv6 mld snooping mrouter vlan2
```

Output

```
awplus#show ipv6 mld snooping mrouter vlan2
VLAN    Interface    Static/Dynamic
2       port1.0.2    Dynamically Learned
2       port1.0.3    Dynamically Learned
```

The following command displays the multicast router interfaces for all VLAN interfaces:

```
awplus# show ipv6 mld snooping mrouter
```

Output

```
awplus#show ipv6 mld snooping mrouter
VLAN    Interface    Static/Dynamic
2       port1.0.2    Dynamically Learned
2       port1.0.3    Dynamically Learned
3       port1.0.4    Statically Assigned
3       port1.0.5    Statically Assigned
```

show ipv6 mld snooping statistics

Use this command to display MLD Snooping statistics data.

For information on output options, see **"Controlling "show" Command Output" on page 1.36**.

Syntax `show ipv6 mld snooping statistics interface <interface>`

Parameter	Description
<interface>	The name of the VLAN interface.

Mode User Exec and Privileged Exec

Example The following command displays MLDv2 statistical information for `vlan1`:

```
awplus# show ipv6 mld snooping statistics interface vlan1
```

Output

```
awplus#show ipv6 mld snooping statistics interface vlan1
MLD Snooping statistics for vlan1
Interface:      port2.0.1
Group:          ff08::1
Uptime:         00:02:18
Group mode:     Include ()
Last reporter:  fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
  Source Address       Uptime    v2 Exp    Fwd  Flags
  2001:db8::1          00:02:18  00:02:02  Yes  R
  2001:db8::3          00:02:18  00:02:02  Yes  R
```

Part 5: Access and Security

Chapter 57: Access Control Lists Introduction

Introduction

This chapter describes Access Control Lists (ACLs), and general ACL configuration information.

See **Chapter 58, IPv4 Hardware Access Control List (ACL) Commands** and **Chapter 60, IPv6 Hardware Access Control List (ACL) Commands** for detailed command information and command examples about IPv4 and IPv6 hardware ACLs that are applied directly to interfaces.

See **Chapter 59, IPv4 Software Access Control List (ACL) Commands** and **Chapter 61, IPv6 Software Access Control List (ACL) Commands** for detailed command information and command examples about IPv4 and IPv6 software ACLs as applied to Routing and Multicasting.

See all relevant Routing commands and configurations in **"Layer Three, Switching and Routing"** and all relevant Multicast commands and configurations in **"Multicast Applications"**.

Overview

An Access Control List (ACL) is one filter, or a sequence of filters, that are applied to an interface to either block, pass, or when using QoS, apply priority to, packets that match the filter definitions. ACLs are used to restrict network access by hosts and devices and to limit network traffic.

An ACL contains an ordered list of filters. Each filter specifies either permit or deny and a set of conditions the packet must satisfy in order to match the filter. The meaning of permit or deny entries depends on the context in which the ACL is used - either on an inbound or an outbound interface.

When a packet is received on an interface, the switch compares fields in the packet against filters in the ACL to check whether the packet has permission to be forwarded, based on the filter properties. The first match determines whether the switch accepts or rejects the packets. If no entries match, the switch rejects the packets. If there are no restrictions, the switch forwards the packets.

Because filters in an ACL are applied sequentially and their action stops at the first match, it is very important that you apply the filters in the correct order. For example you might want to pass all traffic from VLAN 4 except for that arriving from two selected addresses A and B. Setting up a filter that first passes all traffic from VLAN 4 then denies traffic from addresses A and B will not filter out traffic from A and B if they are members VLAN 4. To ensure that the traffic from A and B is always blocked you should first apply the filter to block traffic from A and B, then apply the filter to allow all traffic from VLAN 4.

You can assign sequence numbers to filters. See **"ACL Filter Sequence Numbers" on page 57.14** for more information.

ACL Rules

- The source or destination address or the protocol of each packet being filtered are tested against the filters in the ACL, one condition at a time (for a permit or a deny filter).
- If a packet does not match a filter then the packet is checked against the next filter in the ACL.
- If a packet and a filter match, the subsequent filters in the ACL are not checked and the packet is permitted or denied as specified in the matched filter.
- The first filter that the packet matches determines whether the packet is permitted or denied. After the first match, no subsequent filters are considered.
- If the ACL denies the address or protocol then the software discards the packet.
- For software ACLs, if no filters match then the packet is dropped.
- For hardware ACLs, if no filters match then the packet is forwarded.
- Checking stops after the first match, so the order of the filters in the ACL is critical. The same permit or deny filter specified in a different order could result in a packet being passed in one situation and denied in another situation.
- One ACL per interface, per protocol, per direction is allowed. However, each ACL assigned per interface, per protocol, per direction may also have multiple filters.
- For inbound ACLs, a permit filter continues to process the packet after receiving it on an inbound interface, and a deny filter discards the packet.

ACL Source and Destination Addresses

Configure source addresses in ACL filters to filter packets coming **from** specified networking devices or hosts. Configure destination addresses in ACL filters to filter packets going **to** specified networking devices or hosts.

ACL Reverse Masking

ACLs uses reverse masking, also referred to as wildcard masking, to indicate to the switch whether to check or ignore corresponding IP address bits when comparing the address bits in an ACL filter to a packet being submitted to the ACL.

Reverse masking for IP address bits specify how the switch treats the corresponding IP address bits. A reverse mask is also called an inverted mask because a 1 and 0 mean the opposite of what they mean in a subnet or a network mask.

- A reverse mask bit 0 means check the corresponding bit value.
- A reverse mask bit 1 means ignore the corresponding bit value.

Hardware and Software ACL Types

Access Control Lists (ACLs) used in AlliedWare Plus™ are separated into two different types, **Software ACLs** and **Hardware ACLs**. You can define both types as either named or numbered.

Note

The filtering principles applied to software ACLs (those in the range 1 to 2699) are different to those applied to hardware ACLs (those in the range 3000 to 4699).
Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.
Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Numbered ACLs (for Hardware and Software ACLs)

Numbered ACLs are assigned an ACL number within the range 1 to 4699. ACL numbers are grouped into ranges, where each range denotes a specific functionality. The following table shows the number ranges and functionality that your switch supports.

Table 57-1: ACL Numeric Ranges and Functionality

ACL Number Range	Function
1 to 99	IP standard ACL [1]
100 to 199	IP extended ACL [1]
1300 to 1999	IP standard expanded ACL [1]
2000 to 2699	IP extended expanded ACL [1]
3000 to 3699	Hardware IP ACL
4000 to 4699	Hardware MAC ACL

1. **Software ACLs that use either the ranges 1-99, 100-199, 1300-1999, 2000-2699, or are named ACLs (that use the standard or extended keyword followed by a text string), are used in features such as SNMP, IGMP and OSPF.**

Hardware ACLs

These ACL types are applied directly to an interface, or are used for QoS classifications. They use the following ranges:

- 3000-3699 for Hardware IP ACLs
- 4000-4699 for Hardware MAC ACLs
- named hardware IPv4 ACLs

See **Chapter 58, IPv4 Hardware Access Control List (ACL) Commands** and **Chapter 60, IPv6 Hardware Access Control List (ACL) Commands** for detailed command information and command examples about IPv4 and IPv6 hardware ACLs that are applied directly to interfaces.

Software ACLs

These ACLs types can be either named ACLs, using the standard or extended keyword followed by a text string, or they can use the following ranges:

- 1-99 (IP standard ACL range)
- 100-199 (IP extended ACL range)
- 1300-1999 (IP standard expanded ACL range)
- 2000-2699 (IP extended expanded ACL range)
- named standard IPv4 ACLs
- named extended IPv4 ACLs
- named standard IPv6 ACLs
- named extended IPv6 ACLs

Software ACLs are used in features such as SNMP, PIM, IGMP and OSPF.

See **Chapter 59, IPv4 Software Access Control List (ACL) Commands** and **Chapter 61, IPv6 Software Access Control List (ACL) Commands** for detailed command information and command examples about IPv4 and IPv6 software ACLs as applied to Routing and Multicasting. See all relevant Routing commands and configurations in **"Layer Three, Switching and Routing"** and all relevant Multicast commands and configurations in **"Multicast Applications"**.

Defining Hardware MAC ACLs

These are used to filter traffic based on specific source or destination MAC addresses contained within the data frames. They can be applied to ports in the form of access groups.

A MAC access list requires the following components:

- an ACL number in the range 4000-4699
- an action, permit, deny etc. See **"Actions for Hardware ACLs" on page 57.7**
- a source MAC address. You can use the format, HHHH.HHHH.HHHH to filter on a specific MAC address (where H is a hexadecimal number), or you can filter on any source MAC address by entering the word "any".
- a source MAC mask. This mask determines which portion of the source MAC address header will be compared with that found in the incoming packets. The mask is configured in the format <HHHH.HHHH.HHHH> where each H is a hexadecimal number. In practice each hex number will normally be either 0 (to represent a match) or F (to represent a don't care condition). A mask is not required if the source address is specified as "any".
- a destination MAC address. You can use the format, HHHH.HHHH.HHHH to filter on a specific MAC address (where H is a hexadecimal number), or you can filter on any destination MAC address by entering the word "any".
- a destination MAC mask. This mask determines which portion of the destination MAC address header will be compared with that found in the incoming packets. The mask is configured in the format <HHHH.HHHH.HHHH> where each H is a hexadecimal number. In practice each hex number will normally be either 0 (to represent a match) or F (to represent a don't care condition). A mask is not required if the source address is specified as "any".

Example To permit packets coming from a specific MAC address of 0030.841A.1234 and with any destination address:

```
awplus# configure terminal
awplus(config)# access-list 4000 permit 0030.841A.1234
0000.0000.0000 any
```

Defining Hardware IP ACLs

These are used to filter traffic based on specific source or destination IP addresses contained within the data frames. They can be applied to ports in the form of access groups.

An IP access list requires the following components:

- an ACL number in the range 3000-3699
- an action, see **"Actions for Hardware ACLs" on page 57.7**
- a packet type:
  - « IP: This matches any type of IP packet. A source and destination address must also be specified, although they can be "any".
  - « ICMP: This matches ICMP packets. A source and destination address must also be specified, although they can be "any". An ICMP type can optionally be specified after the destination address.
  - « TCP: This matches TCP packets. A source and destination address must also be specified, although they can be "any". After the source address, a source port can optionally be specified and after the destination address a destination port can optionally be specified. The port matching can be done using **eq** (equal to), **gt** (greater than), **lt** (less than), **ne** (not equal to), or **range** (for a range of ports, which requires a start port and an end port).
