

Getting Started with the TQ6702 GEN2-R Wireless Router using the Device GUI

Introduction

The TQ6702 GEN2-R provides high-speed Wi-Fi 6 connectivity for wireless devices, and a secure Internet connection from the built-in VPN router. The single-unit design enables a simplified yet comprehensive network solution for a small business, or for enterprises with multiple locations, such as retail stores, cafes, and more.

Secure WAN routing ensures reliable connectivity to the Internet, head-office, and other branch locations. Critical data is protected with a zone-based firewall, remote access to cloud-based or head-office based business applications using secure IPsec VPNs.

What information will you find in this document?

The Device GUI provides graphical management and monitoring for VPN routers running the AlliedWare Plus™ operating system.

This guide shows you how to configure a TQ6702 GEN2-R Router using the Device GUI.

The Device GUI provides setup of the router, enabling the configuration of entities (zones, networks, and hosts) and then creating firewall, NAT, and traffic-control rules for managing traffic between these entities. Features such as the Intrusion Prevention System (IPS) and URL Filtering help protect the network, and manage website access.

The GUI also supports a number of other features such as interface, VLAN, file, log, and wireless network management, as well as a CLI window and a Dashboard for network monitoring. The Dashboard shows interface and firewall traffic, system and environmental information, and the security monitoring widget lets you view and manage rules and security features.

You can configure the complete AlliedWare Plus feature-set using the GUI's built-in industry standard Command Line Interface (CLI) window.

Products and software version that apply to this guide

This guide applies to all Allied Telesis TQ6702 GEN2-R Routers running AlliedWare Plus™ software version 5.5.3-1.1 or later.

Feature support may change in later software versions. For the latest information, see the following documents:

- The [product's Datasheet](#)
- The [AlliedWare Plus Datasheet](#)
- The product's [Command Reference](#)

These documents are available from the above links on our website at alliedtelesis.com.

Related documents

The following documents give more information about Wireless Management features using TQ6702 GEN2-R devices on AlliedWare Plus products:

- The [Wireless Management for the TQ6702 GEN2-R using the Device GUI](#)

Connecting to the wireless router

This section describes how to connect to your router using the Device GUI. Your router will have a GUI already loaded.

Supported web browsers for connecting to the Device GUI are:

- Google Chrome™
- Mozilla Firefox™
- Microsoft Edge™
- Apple Safari™

Connecting to the GUI

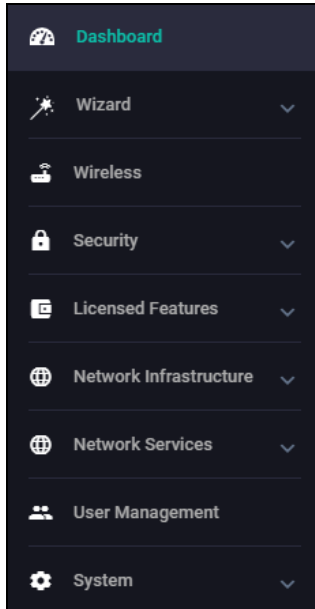

To connect to the GUI, use the following steps:

Note: You will need to manually assign your device an IP address in the 192.168.1.0/24 network.

1. Connect to LAN1 (in the firmware this port is called eth1).
2. Open a web browser and browse to the default IP address for Eth1.
 - The default IP address is 192.168.1.1
3. Log in with the default username of **manager** and the default password of **friend**.

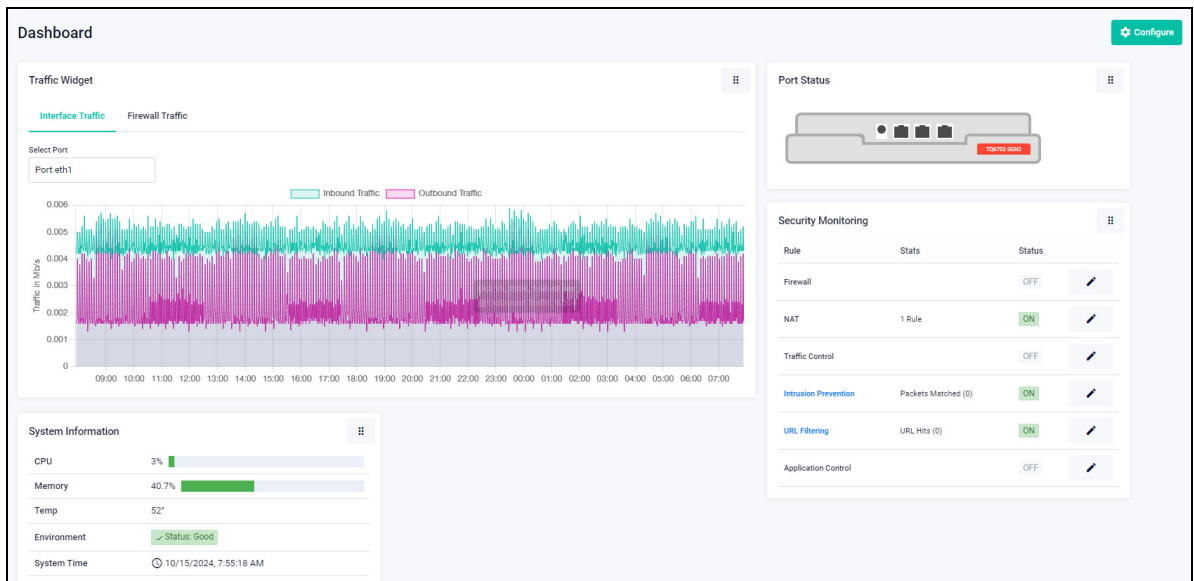

The Menu bar

From here you can access the **Dashboard**, **Wizard**, **Wireless**, **Security**, **Licensed Features**, **Network Infrastructure**, **Network Services**, **User Management** and **System** menus. More detail is covered later in this document when configuring your router and setting up your network using these menus.

The Dashboard

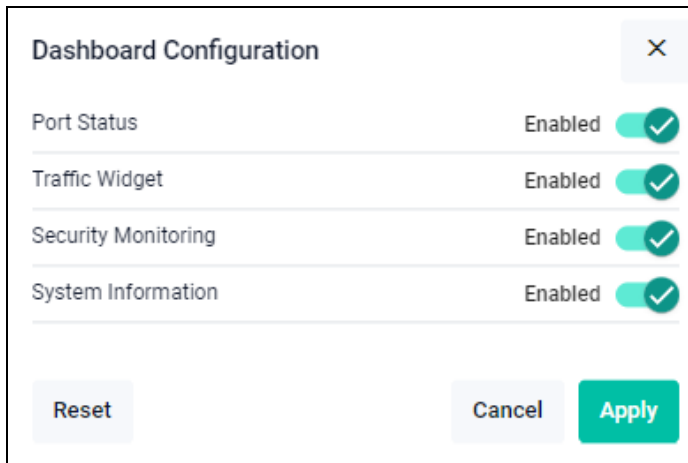

This section describes how to use the dashboard in the device's GUI. This is the first screen that you see after you log in.

The Dashboard has a number of useful widgets for monitoring the state of your router. On the left-hand side of the Dashboard page is the main navigation menu bar.

The **Port Status**, **Traffic Widget**, **System Information** and **Security Monitoring** widgets are switched on by default so that you can monitor router activity from the dashboard.

To enable or disable these dashboard features click on the **Configure** button from the Dashboard:

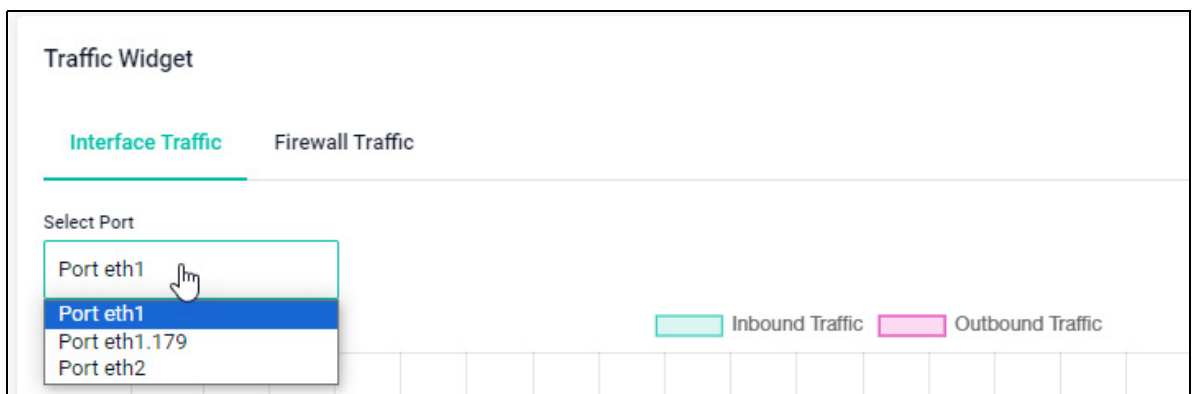

Choose what you want to monitor and turn them on or off, click **Apply**.

Port Status The **Port Status** widget shows port information. Click on the port to display the port number, speed, packet TX and RX, utilization, and interface.

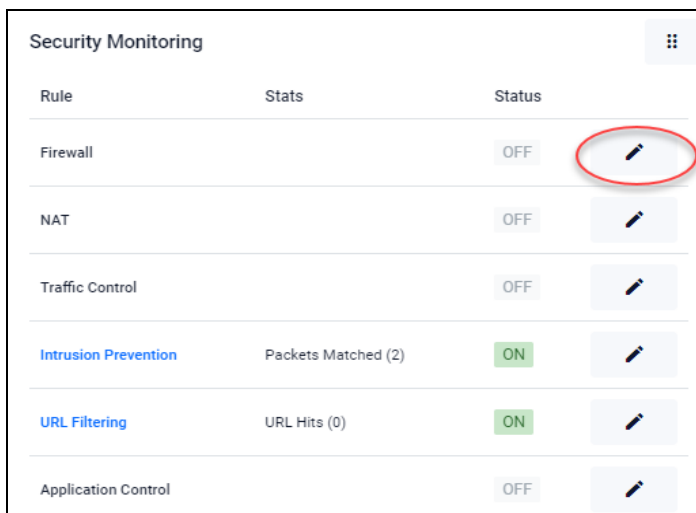

Traffic Widget From the **Traffic Widget** you can select an interface from the drop-down list to display inbound and outbound traffic information.

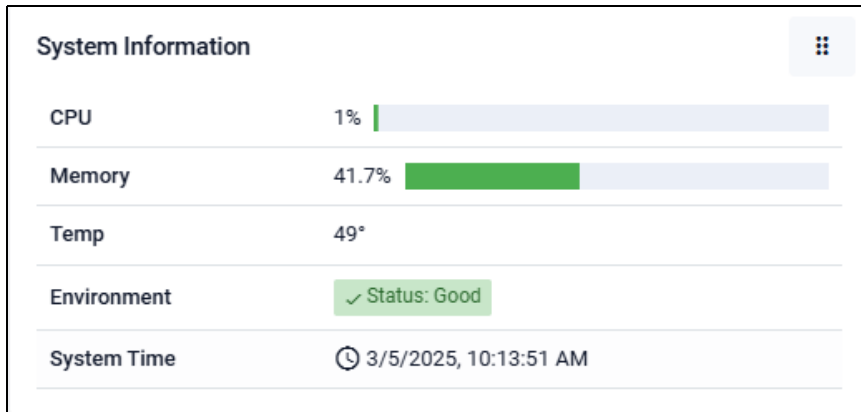

Click on the **Firewall Traffic** tab to display inbound and outbound traffic information for the firewall.

Security Monitoring From **Security Monitoring** you can create or edit rules, such as Firewall or NAT rules directly from the dashboard. For example, click on the **Edit** button to create or edit a firewall rule:

System Information

The **System Information** widget shows CPU and memory use, as well as device health and system time.

**Save your config**

If you have changed your dashboard settings, click the **Save** button at the top right of the GUI screen.

Tip: The **Save** button is orange anytime there is unsaved configuration and blue when it is saved.

If you are in another menu and want to return back to the dashboard, click **Dashboard** from the menu bar.

Product and system information

From the menu bar select **System > About** to show more detail about your router, such as the host name, model, MAC address, serial number, current software, software version, and also the GUI build and version.

About	
System Information	
Name:	tq6702-gen2r
Model:	AT-TQ6702 GEN2-R
MAC Address:	88-9d-98-53-ad-e0
Serial Number:	A10454RD9853ADE0
Current Software:	TQ6702GEN2R-5.5.4-2.3.rel
Software Version:	5.5.4-2.3
GUI Version:	2.19.0
GUI Build:	20241128_0749

The host name and model are also displayed in the top menu bar:

 Allied Telesis	TQ6702 GEN2-R	tq6702-gen2r	Up time: 0 days 04:27	 manager	 Save
--	---------------	--------------	-----------------------	---	--

Managing firmware and configuration

Check the firmware version

From the menu bar select **System > About** to show the current firmware and versions for both the firmware and GUI:

About	
System Information	
Name:	tq6702-gen2r
Model:	AT-TQ6702 GEN2-R
MAC Address:	88-9d-98-53-ad-e0
Serial Number:	A10454RD9853ADE0
Current Software:	TQ6702GEN2R-5.5.4-1.1.rel
Software Version:	5.5.4-1.1
GUI Version:	2.18.0
GUI Build:	20240724_1227

You can also use the **System > File Management** page to view all files stored on your device, including firmware and GUI files. On the **File Management** page, upload and download functions provide an easy way to add new files such as firmware, configurations, scripts, or URL lists to the device, as well as saving configurations for backup.

You can use this page to check and set the software release and configuration files, and reboot the device for an easy firmware upgrade.

From the menu bar select **System > File Management**:

File Management

Upgrade the firmware

If your wireless router is not running the latest firmware, use the following steps to upgrade it.

Step 1: Download the new firmware file.

Download it from the [Allied Telesis Support Portal](#) and save it on the device that you browse to the wireless router from.

Step 2: Use the Upload button to add the new firmware file.

Browse to where you saved the downloaded firmware file and click **Open**. You will see the uploaded file appear in the File Management page.

Step 3: Set the new firmware file to be the boot release.

Set Boot Release File	
Current:	flash:/TQ6702GEN2R-5.5.4-1.1-rc4.rel 

Click on the **Edit** button and then select the correct release file you want to use on reboot and click **Apply**.

Step 4: Backup Boot Config file.

Set Boot Config File	
Current:	flash:/default.cfg 
Backup:	Not Set 
Running:	

It is not possible to set a Backup Boot Config File. Currently this is not supported.

Step 5: Reboot the device.

File Management 	
Set Boot Release File	
Current:	flash:/TQ6702GEN2R-5.5.4-1.1-rc4.rel 
Set Boot Config File	
Current:	flash:/default.cfg 
Backup:	Not Set 
Running:	

Click the **Reboot** button to perform a system reboot so the new release is applied.

Back up the default configuration

Download a copy of the default configuration file so that you can revert back to the original if your configuration changes fail.

Save the configuration

When you configure the wireless router through its GUI, the configuration becomes part of its running-configuration.

Once you are sure your configuration changes work, you need to make them part of the boot configuration, so they can be backed up and will survive a reboot of the wireless router.

Caution: Back up the default configuration before you save the configuration.

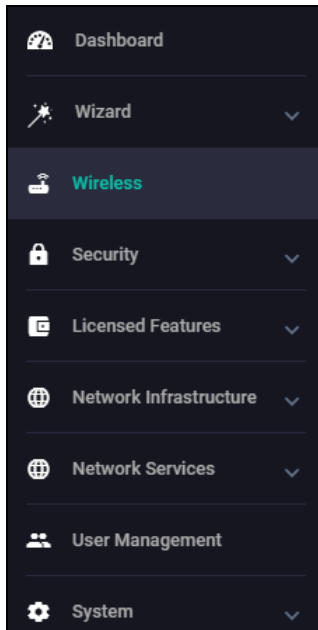

- Click the **Save** button at the top right of the GUI screen.

Tip: The **Save** button will be orange anytime there is unsaved configuration.

Configuring a Wi-Fi network

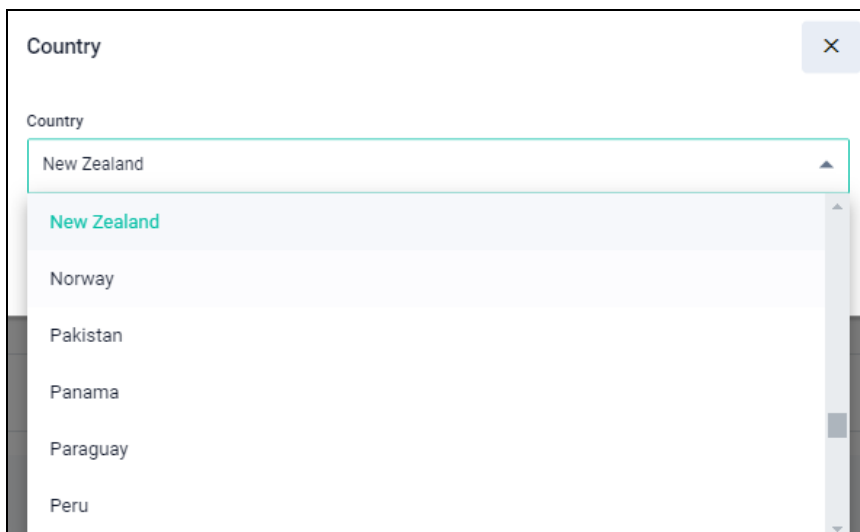

The device GUI includes a Wireless Management menu, which enables you to set up and monitor your wireless network:

The **Wireless** menu displays your wireless settings for General, Radio1, Radio2, Clients and Neighbor APs. When you click on Wireless, the General tab is displayed by default. The following steps show how to set up your Wi-Fi network.

Step 1: Select your country.

From the **General** tab, select your country from the drop-down list and click **Apply**.

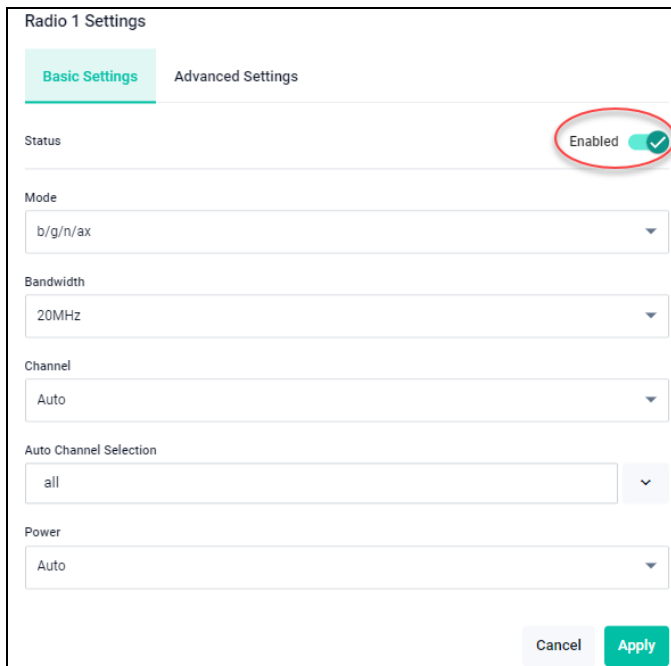

Step 2: Enable the radio.

From the **Radio1** tab click the **Configure** button from the Radio settings:

From the **Radio1 Settings** dialog click the **Enabled** button:

Click **Apply**.

Note: The radio channel defaults to automatic. Optionally, you can change the specific channel and reduce the transmit power to limit the range.

Step 3: Set up the VAP 0 interface.

Click on the **Edit** button from the VAP settings:

From the **Edit VAP 0** dialog **Basic Settings** tab enter the following:

- The SSID name.
- Enter a Description (optional).
- From the security drop-down list, select **WPA personal**.
- Set the key to a strong password.

The screenshot shows the 'Edit VAP 0' dialog box with the 'Basic Settings' tab selected. The 'WDS Mode' is set to 'None'. The 'SSID' is 'My-company-name Guest' and the 'Description (Optional)' is 'Office reception'. The 'Passpoint' is 'Disabled'. The 'Security' is set to 'WPA Personal' and the 'Key' is 'mysecretkey'. There are 'Cancel' and 'Save' buttons at the bottom right.

Click **Save**.

Step 4: Choose a different WPA version.

If required, you can work with different versions of WPA such as WPA2 or WPA3. To select a different WPA version from the **Edit VAP 0** dialog, click on the **Advanced Settings** tab.

Advanced settings defaults to the General tab, click on the **Security** tab:

The screenshot shows the 'Edit VAP 0' dialog box with the 'Advanced Settings' tab selected and the 'Security' sub-tab active. The 'Broadcast Key Refresh Interval' is '0'. 'Dynamic VLAN' and 'Pre Authentication' are both 'Enabled'. The 'Session Key Refresh Interval' is '0'. The 'Session Key Refresh Action' is 'Reauthentication'. The 'WPA Versions' section shows 'WPA2' and 'WPA3' selected in a list, with 'WPA' and 'Disabled' also visible in the dropdown menu.

From this dialog click on the down arrow to display the WPA versions available to select. Select the WPA version/s you want to work with and click **Save**.

Step 5: Create a QR code for clients to use.

From the **Wireless** page you can create a QR code that you can use to connect a device to join the wireless network.

To display the QR code, click the **display QR** code button:

The screenshot shows the VAP configuration page. At the top, there is a table with columns: VAP, SSID, Description, Security, Tx/Rx, Packets, and Bytes. The first row shows VAP 0 with a green 'Up' status, MAC address (88:9d:98:53:ad:e0), SSID 'My-company-name Guest', Security 'WPA2/WPA3 Personal', and Tx/Rx counts of 0. A red circle highlights the 'display QR' button in the 'Packets' column. Below the table, a 'QR Code' window is open, displaying a QR code and the following text: 'SSID: Virtual Access Point 0', 'Security: WPA2/WPA3 Personal', and a link 'Click here to see the key'. There are 'Close' and 'Download' buttons at the bottom of the QR code window.

From this window you can scan the QR code to your device or download it. Your device automatically connects to the VAP 0 interface.

Step 6: Save the configuration.

When you configure the wireless router through its GUI, the configuration becomes part of its running-configuration. Once you are sure your configuration changes work, you need to make them part of the boot configuration, so they can be backed up and will survive a reboot of the wireless router.

Caution: Back up the default configuration before you save and apply your configuration.

Once you are happy with the functionality of your configuration, you can then save it.

1. Click the **Apply Config** button to apply the settings to your device.

This step saves the wireless configuration to your device. (It is orange when it requires saving, with an orange triangle to the left):

The screenshot shows the 'Wireless' configuration page. At the top right, there is a yellow notification bar with an orange triangle icon and the text 'Configuration has changed'. Next to it is a green 'Apply Config' button. Below this, there is a blue information box with a white circle icon containing the text: 'You can configure the wireless settings. Press the "Apply Config" to apply wireless configurations to this device. Also, you can monitor clients information that connect to this device and neighbor APs information.'

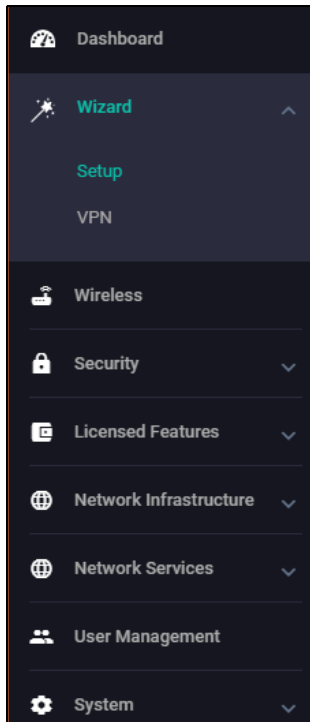

2. Click the **Save** button at the top right of the GUI screen (you may need to scroll up to see it).

The save button will be orange if there is unsaved configuration and blue when it is saved:

Using the Wizard to configure Internet and VPN connections

Using a wizard makes it easy to set up Internet and VPN connections.

Set up an Internet connection

You can use the wizard to set up a router's WAN interface along with creating a basic configuration for a LAN. There are three IPv4 methods available: DHCP, Fixed IP, and PPPoE, and one IPv6 method available IPoE.

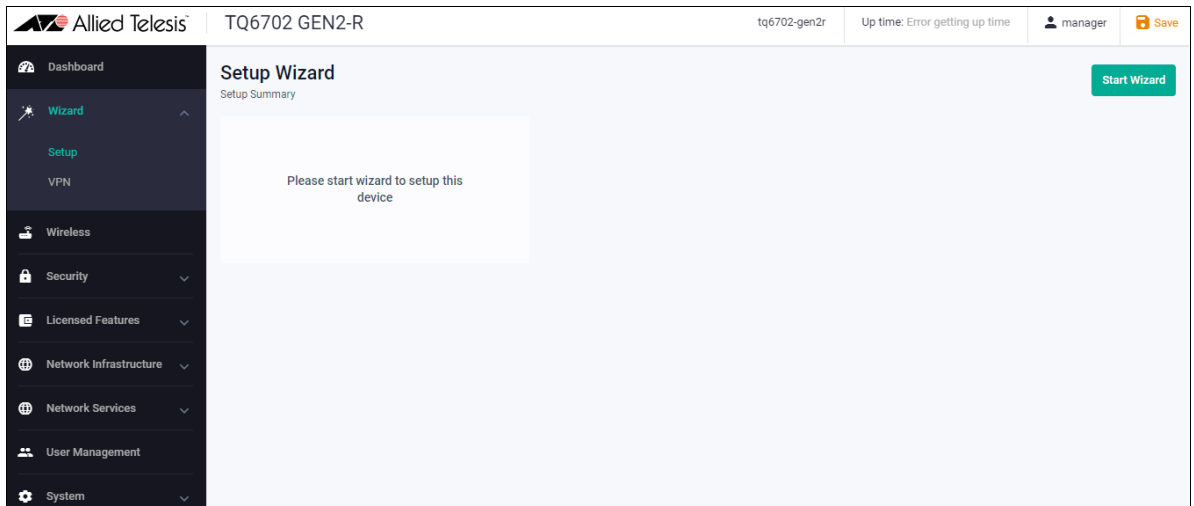

Once the wizard has run, the Setup Wizard summary page displays the current configuration. You can change other things in the GUI after having run the setup wizard, however if you choose to go back and run the wizard again, all your previous configuration will be removed.

The configuration steps are:

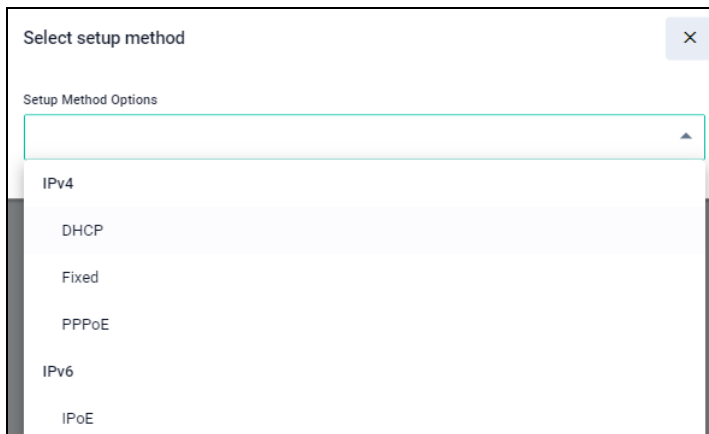

1. Start the Wizard
 - Click **Wizard > Setup** from the menu bar.

If you don't have an Internet connection configured, you'll see a blank **Setup Wizard** summary page. If you do have an Internet connection configured, then you'll see those details displayed in the **Setup Wizard** summary page. Click the **Start Wizard** button to reconfigure your current Internet connection settings, or in this example configure new connections:

2. Click the **Start Wizard** button.

3. Choose a connection method.
 - Select a method to connect to the Internet.

4. Configure the connection method.

This section describes the configuration settings for each connection method.

Note: If you turn on the DHCP server, it will assign clients addresses that are in the same subnet as the LAN interface's default address. This will not work if you have changed the LAN interface's address. In that case, select OFF for DHCP Server and manually configure the DHCP server from the Network Services menu after the Wizard is complete.

IPv4 - DHCP Connection

To configure the IPv4 DHCP connection, follow these steps:

1. Select **DHCP** from the **Select setup method** drop-down list.
 - Enter or select the **WAN Interface**.
 - Leave DNS Servers at the default (so that it automatically obtains a DNS server address).
2. Click on the **Next** button to check your settings:

DHCP Connection

WAN Interface
eth2

IPv4 - Fixed IP Connection

To configure the IPv4 fixed IP connection, follow these steps:

1. Select **Fixed** from the **Select setup method** drop-down list.
 - Enter or select the **IP Address**.
 - Enter or select the **Default Gateway** if required.
2. Click on the **Next** button to check your settings:

Field	Description
IP Address	Enter the IP address you want to configure for the WAN-side interface.
Default Gateway (optional)	Enter the IP address of the default gateway that you want to use to connect to the Internet (optional).
WAN interface	Select the interface used to connect to the Internet, in this example eth2.
DNS Servers (optional)	Specifies the DNS server to use for name resolution. Enter or select the IP address of the DNS server. Click the Add button.

3. Click the **Apply** button to confirm your settings.

IPv4 - PPPoE Connection

To configure the IPv4 PPPoE connection follow these steps:

1. Select **PPPoE** from the **Select setup method** drop-down list.
 - Enter the **Username**.
 - Enter the **Password**.
2. Click on the **Next** button to check your settings:

The screenshot shows a 'PPPoE Connection' configuration window. It contains the following fields and controls:

- Service Name (Optional):** A text input field with the placeholder text 'Please enter your service name'.
- Username:** A text input field containing the value 'Rodger'.
- Password:** A text input field containing the value 'mysecretkey'.
- WAN Interface:** A dropdown menu with 'eth2' selected.
- DNS Servers (Optional):** A text input field with '+ Add DNS Server' and an 'Add' button.
- Navigation:** 'Back' and 'Next' buttons at the bottom right.

Field	Description
Service Name (optional)	This is the PPPoE service name. You can usually leave it blank. Enter the PPPoE service name only if your Internet service provider (ISP) has specified it.
Username	PPP user name. Enter the user name for the Internet connection notified by your ISP.
Password	PPP password. Enter the password for the Internet connection provided by your ISP.
WAN interface	This is the interface used to connect to the Internet, in this example eth2.
DNS Servers (optional)	Specifies the DNS server to use for name resolution. <ul style="list-style-type: none"> ■ If you want IPCP to automatically obtain the DNS server address when connecting to PPPoE, you can leave it as the default. ■ If fixed settings are required, enter or select the IP address of the DNS server and click the Add button.

3. Click the **Apply** button to confirm your settings.

Configure a VPN connection

To configure a secure VPN connection, first make sure you have an Internet connection (as described on [page 18](#)), and then use the following steps:

1. Select **Wizard > VPN** from the menu bar.
 - If you don't have an existing VPN connection, you'll see a blank **VPN Wizard** summary page.
 - If you do have an existing VPN connection, then you'll see those details displayed in the **VPN Wizard** summary page.
2. Click the **Start Wizard** button.

3. Enter the **VPN Connection** information as described in the table below.

VPN Connection ×

Tunnel IP

Tunnel Source

Tunnel Destination

Tunnel Local Name (Optional)

Tunnel Remote Name (Optional)

Crypto Preshared Key

Destination LAN (Optional)

Field	Description
Tunnel IP	Enter the IPv4 address of the tunnel interface.
Tunnel Source	Select or enter the interface for the VPN connection.
Tunnel Destination	Enter the end IP address or host name of the VPN destination.
Tunnel Local Name	Enter the ISAKMP IP (local ID) for the local router.
Tunnel Remote Name	Enter the ISAKMP IP (remote ID) for the remote router.
Crypto Preshared Key	Enter the password (ISAKMP pre-shared key) for the VPN connection.
Destination LAN	Enter the LAN-side IPv4 address of the destination network.

- Click the **Next** button to check the settings you have entered.

The screenshot shows a 'Confirm VPN connection' dialog box with a close button (X) in the top right corner. The title is 'Confirm VPN connection'. Below the title is a section header 'Tunnel Confirmation'. The form contains the following fields:

- Tunnel IP: [blurred]
- Tunnel Source: eth2
- Tunnel Destination: [blurred]
- Tunnel Local Name: Tunnel1
- Crypto Preshared Key: mysecretkey

At the bottom right of the dialog, there are two buttons: 'Back' and 'Apply'.

- Click the **Apply** button to confirm your settings.
- Review your configuration.

Check that your configuration works because applying your configuration will overwrite existing configuration. The VPN Wizard displays a summary of the connection status that you can use to check that it is correct.

- Save your configuration.
 - The settings in the wizard are stored in the **running**-configuration and reflected in the operation, but are not automatically saved in the **startup**-configuration.
 - After confirming that there are no problems with the settings, manually save the settings to the **startup**-configuration using the **Save** button in the navigation bar. This keeps your settings if the wireless router reboots.

- You can run the Wizard again to make changes to your connection method settings.

Configuring firewall and NAT

The next sections describe the AlliedWare Plus firewall and how to configure it. The router's firewall, at its simplest level, controls traffic flow between a trusted network (such as a corporate LAN) and an untrusted or public network (such as the Internet). Firewalls determine whether traffic is allowed or disallowed based on characteristics of the packets, including their destination and source IP addresses and TCP/UDP port numbers.

Applications can be created using a combination of protocol and port numbers, and then be used by firewall, NAT, and traffic control rules to manage traffic.

Entities: zones, networks and hosts

Before we begin configuring, let's take a look at the building blocks that allow this advanced control of online network activity.

When the device is deciding how it should treat a traffic stream, among the questions it needs to ask are “**where is the stream coming from?**” and “**where is it going to?**”.

To help answer those questions, the device needs to have a logical map of the network environment, so that it can categorize the sources and destinations of the flows that it is managing. Allied Telesis firewalls and routers map out the network environment into regions, using three levels: **zones**, **networks**, and **hosts**:

Allied Telesis refers to these divisions as **entities**. This hierarchy of entities empowers organizations to accurately apply security policies at company, department, or individual level.

A **zone** is the highest level of division within the network. It defines a boundary where traffic is subjected to policy restrictions as it crosses to another region of your network. A typical network environment might contain a public (WAN) zone representing the Internet, a private (LAN) zone behind the firewall, and a Demilitarized zone (DMZ) containing publicly accessible web servers. Zones are divided up into networks, which in turn contain hosts.

A **network** is a logical grouping of hosts within a zone, for example, the sales network within the LAN zone. Networks consist of the IP subnets and interfaces over which they are reachable. The allocating of networks to zones is the core activity in dividing the network up into logical regions to which different security policies apply. A zone has no real meaning in itself until it has one or more networks allocated to it. Once networks have been allocated to a zone, the zone is then the entity that collectively represents that set of networks. Then rules can be applied to the zone as a whole, or to individual networks within the zone.

A **host** is a single node in a network, for example, the PC of a specific employee. The diagram above shows Host 1 is a host within the sales network within the LAN zone. Host entities are defined so that specific rules can be applied to those particular hosts - e.g. a server to which certain types of sessions may be initiated.

Using rules

Rules allow the advanced control of users, and the applications they use on the network.

Firewall rules: filter traffic, allowing or denying, between any two entities. This allows for granular control, as rules can be based on traffic sources that might be zones, networks, or hosts, and traffic destinations that might be zones, networks, or hosts.

For example, an organization may choose to block Skype™ company-wide (i.e. from ANY zone to ANY zone), or allow it only for the marketing department (i.e. allow Skype from the Marketing network to ANY zone, but block it from any other network, zone, or host).

Traffic control rules: control the bandwidth that applications use. For example, Spotify™ music streaming may be allowed, but limited in bandwidth due to an acceptable use policy ensuring company Internet connectivity is prioritized for business traffic.

Network Address Translation (NAT) rules: hide private network addresses for traffic bound for the Internet. All company traffic leaving the corporate office can share a public network address for routing through the Internet to its destination.

The firewall supports:

- NAT with IP masquerade, where private source addresses are mapped to a public source address with source port translation to identify the association. The single public IP address masquerades as the source IP on traffic from the private addresses as it goes out to the Internet.
- Port forwarding, to provide public access to internal servers. Port forwarding redirects traffic to a specific host, e.g. forwarding HTTP traffic to a web server in the DMZ.

Example: configure a standard 2-zone network

This section comprises two parts, and describes how to configure a standard 2-zone network:

If your router is new and unused, it will already have the Device GUI installed from the factory, with the IP address 192.168.1.1 on Eth1, and the HTTP service enabled.

This example assumes that you have already configured:

- the WAN interfaces, see ["Using the Wizard to configure Internet and VPN connections"](#) on [page 18](#) and
- the radio interface, see ["Configuring a Wi-Fi network"](#) on [page 13](#)

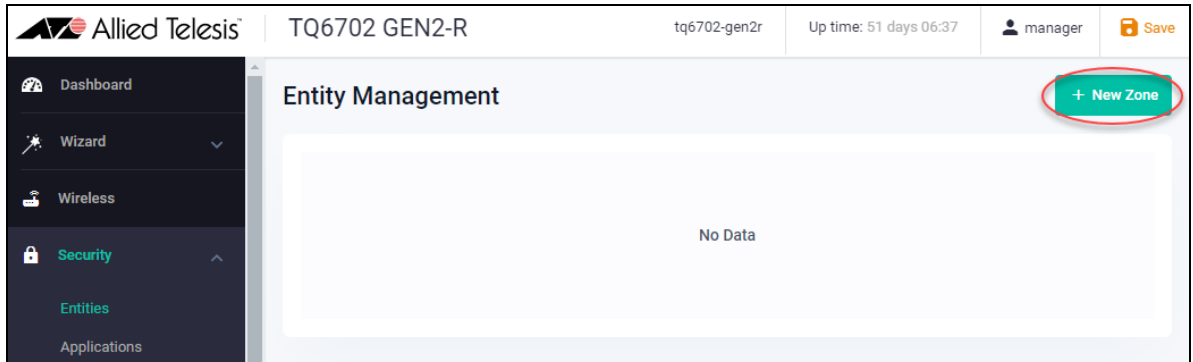

It uses the following IP addresses:

- eth1: 192.168.1.1/24
- eth2: 128.0.0.1/24
- vap1.0: 192.168.2.1/24

Step 1: Configure Entities

To configure the firewall and NAT, we will first create entities to which rules can be applied.

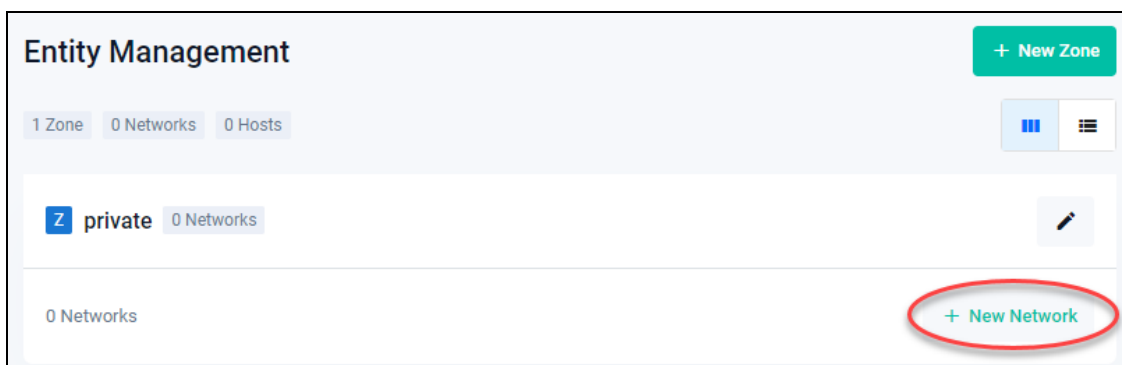

1. Select **Security > Entities** from the menu bar.
2. As no entities have yet been created, click the green **+ New Zone** button to add a zone.

The first zone we will add is the **private** zone to be used for wired clients that we want to be accessible from the Internet

3. Enter the new zone **private**.
4. Click **Apply**:

5. Click the **+ New Network** button from the private zone to add the wired network.

6. Enter the network **wifi**.
7. Add the IP subnet **192.168.2.0/24** and **vap1.0** as the interface over which this network will be reachable.
8. Click **Save**.

Repeat the same steps to create the public zone network for the LAN with the following details:

Public zone:

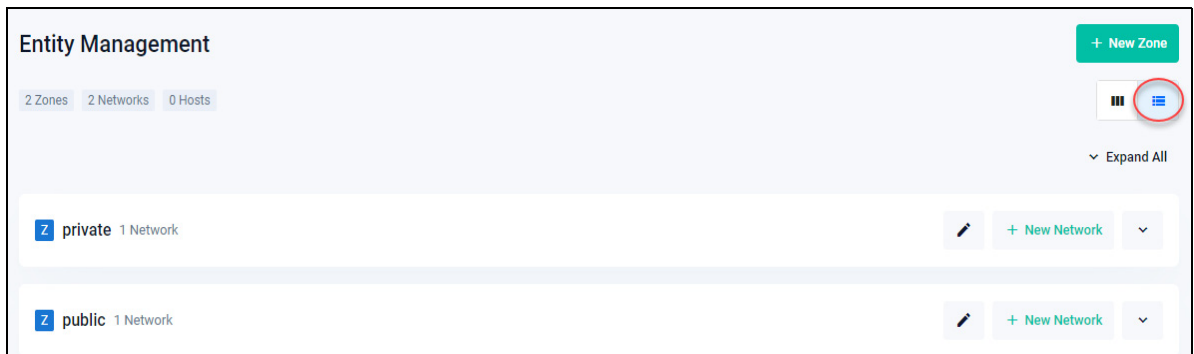

- Zone name = public
- Network name = Wired
- Network subnet and interface = 0.0.0.0/0, eth2

The Entities Management page now contains our 2-zone network:

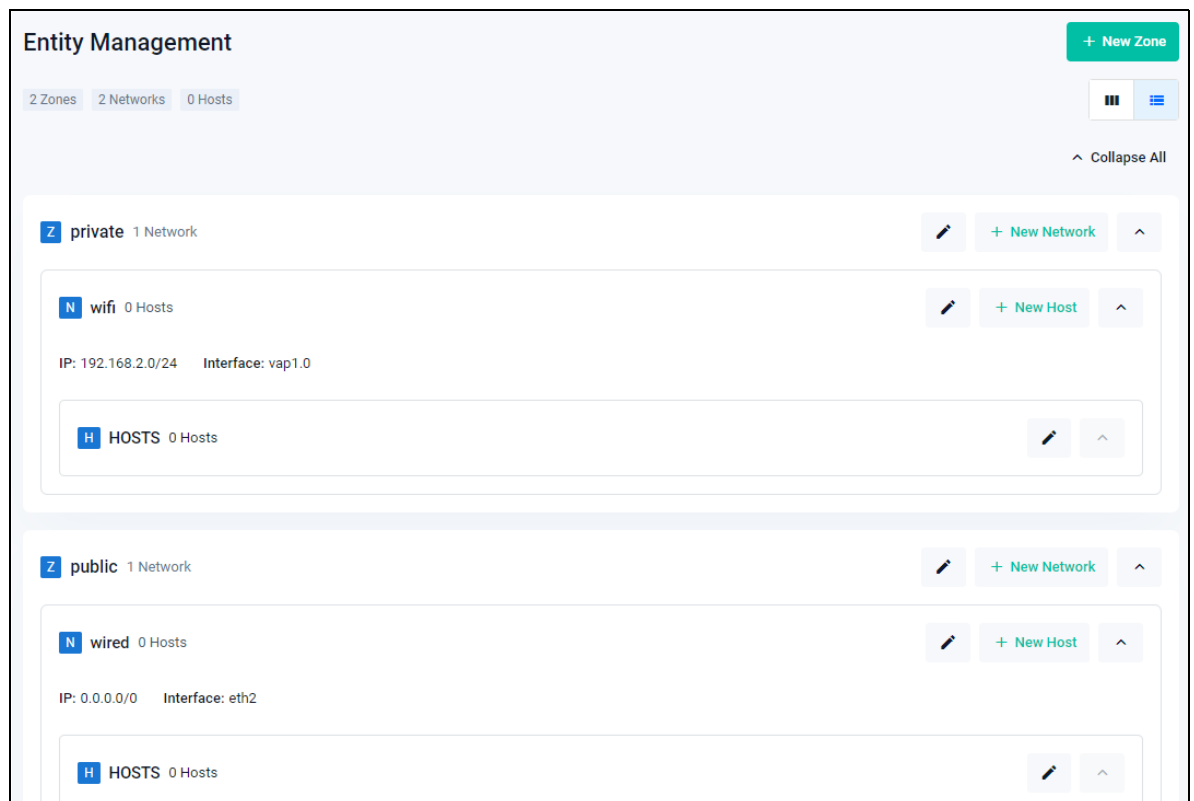

9. Click the **Save** button to save your configuration to the device and startup configuration:

Entity list view

An alternative view from the tiled view shown above, is the list view. To view and manage entities in a list view, click on the list icon on the right side of the page.

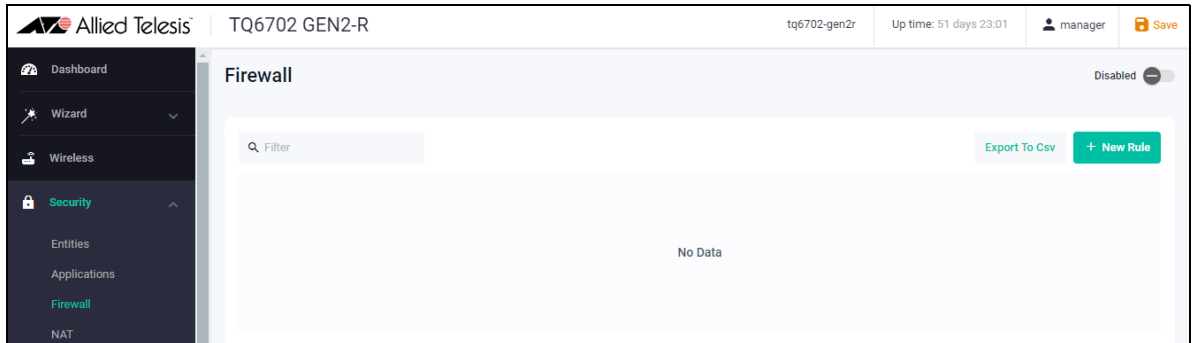

Clicking **Expand All** (on the right side of the page) displays all entities and their interfaces, IP addresses, and so on. The list view is a good option for an overall entity view:

Step 2: Configure firewall rules

We now have a 2-zone network (Public and Private), so we can now configure the firewall rules to manage the traffic between these entities.

1. Select **Security > Firewall** from the menu bar:

Caution: Enabling the firewall with the **Enable** switch will block all applications between all entities by default. No traffic will flow. It is therefore important to create firewall rules to allow application usage as desired **before** enabling the firewall.

Tip: To select an application such as 'any', simply start typing 'any' in the application field. If you don't see any applications, turn on the built-in list of applications, or create your own custom applications from the **Applications** page, under the **Security** menu.

Allow private side firewall zones to initiate traffic flows with each other and out to the Internet. First create a new rule to permit 'any' from private to private.

2. Click the **+New Rule** Button.
 - Select **Permit** as the Action.
 - Enter or select **any** for the Application.
 - Select **private** for the From network.
 - Select **public** for the To network.

New Firewall Rule

Action
Permit

Application
any

From
private

To
public

Cancel Apply

3. Click **Apply**.

Next, create a new rule to permit 'ping' from private to public:

4. Click the **+New Rule** Button.

- Select **Permit** as the Action.
- Enter or select **ping** for the Application.
- Select **private** for the From network.
- Select **public** for the To network.

New Firewall Rule

Action
Permit

Application
ping

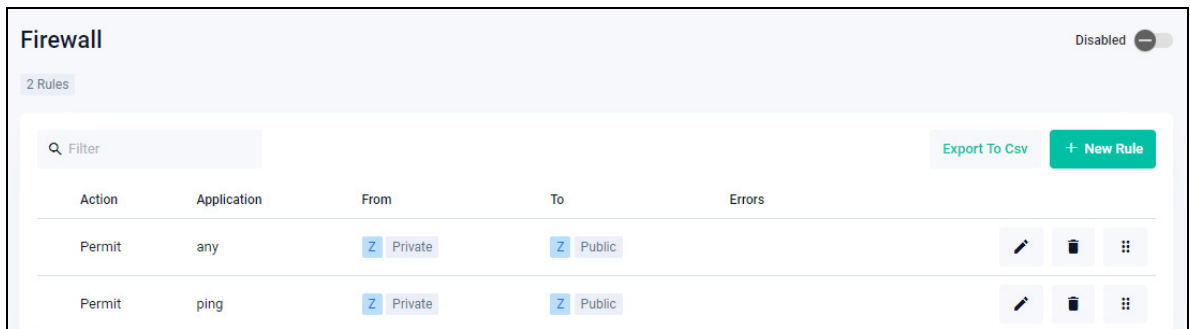

From
private

To
public

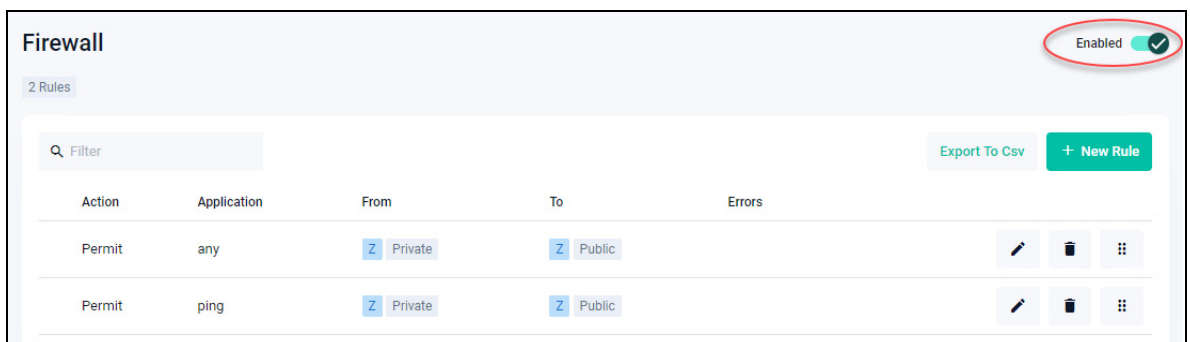

Cancel Apply

5. Click **Apply**.

We can now see the firewall rules displayed:

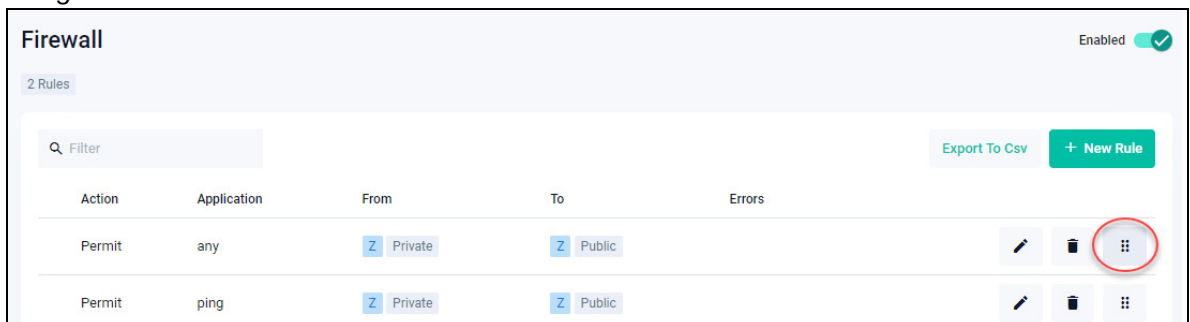

Now that the firewall rules are created, you can turn the firewall **on** using the **Enabled/Disabled** button at the top right of the Firewall page.

Firewall rule placement

The firewall rules are displayed in the order they were created, which is also the order in which they will be **actioned** by the router. If you need to change the order of any specific rule, it can be dragged to a different location in the list. Click on the move icon on the right to click and drag your rules to a new order.

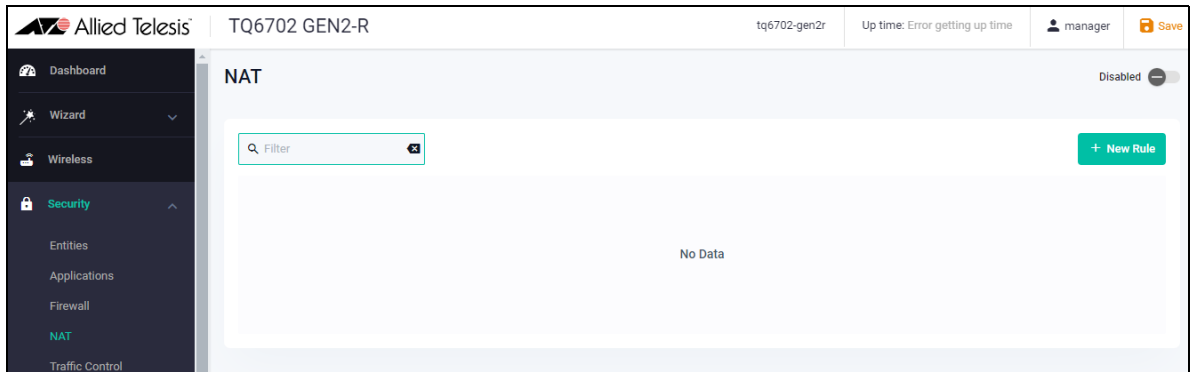

By default a new rule is added to the bottom of the list, and can then be dragged to a new location using the move icon:

Step 3: Configure NAT rules

Now let's configure NAT rules to manage IP address translation between the Internet and our internal networks.

1. Select **Security > NAT** from the menu bar:

We need a NAT masquerade rule for private to public address translation. Any traffic going from the Private zone out to the Public zone will have NAT applied, so that it appears to have come from the IP address of the eth1 interface.

2. Click **+ new rule**.
 - Select **Masquerade** as the Action.
 - Select **any** for the Application.
 - Select **private** for the From network.
 - Select **public** for the To network.

New NAT Rule
✕

Application

any

From

private

To

public

With (Optional)

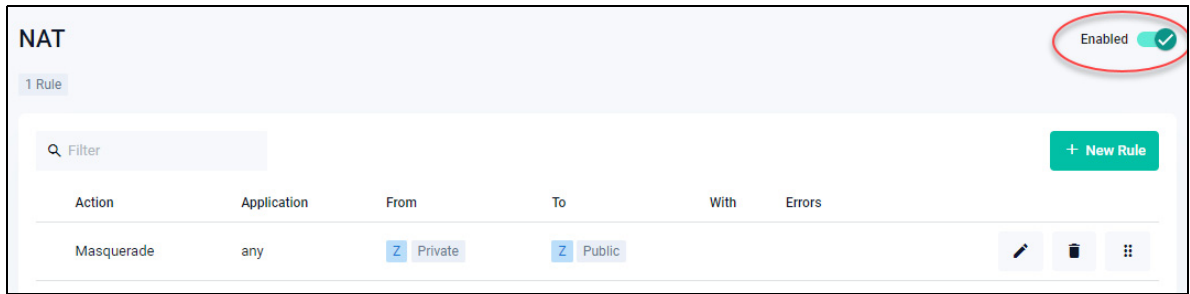

Cancel

Save

3. Click **Save**.

You can see the new NAT rule.

4. To activate NAT click the **Enabled** switch to turn it on.

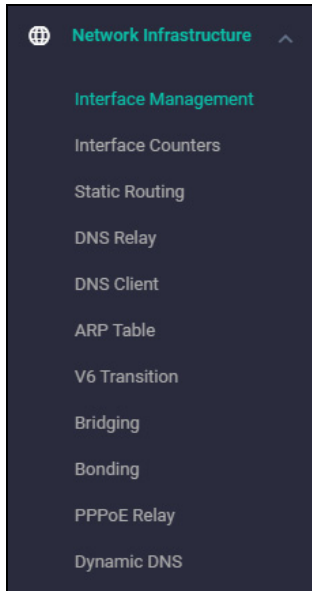

5. Click the **Save** button to save your configuration to the device and startup configuration:

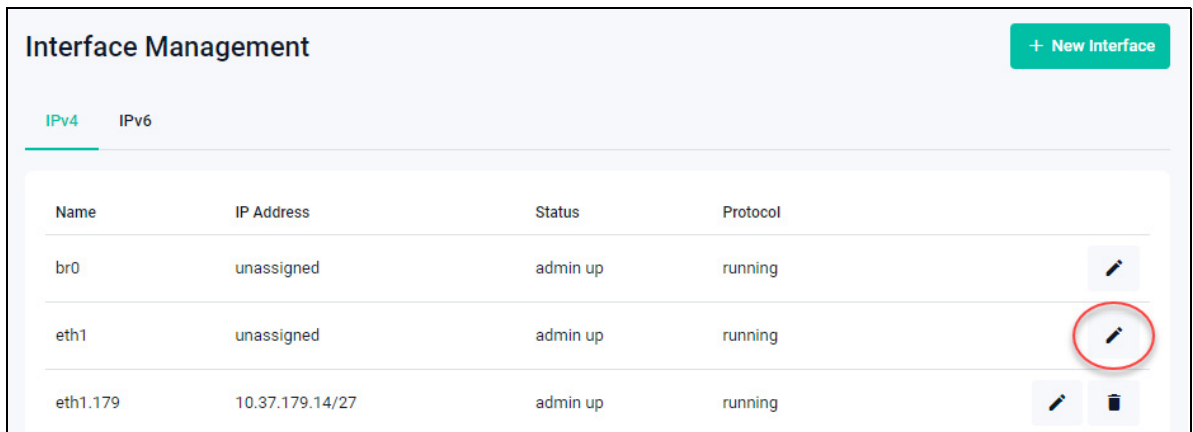

Network Infrastructure

From the Network Infrastructure menu you can access and configure information such as network interfaces, interface counters, static routing, DNS, ARP, Bridging, Bonding and PPPoE relay. Here are some examples:

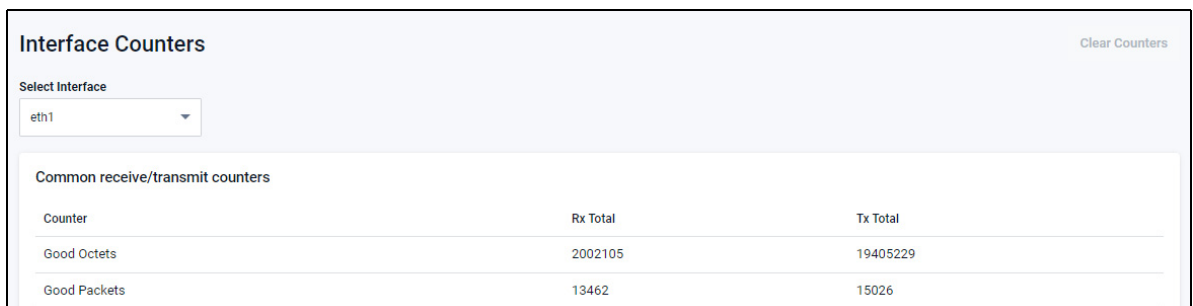

Interface Management

From Interface Management you can display IPv4 and IPv6 interface names, addresses, status and protocol. You can edit the DHCP or fixed IP address information by clicking on the **Edit** button or add new interfaces with the **+ New Interface** button:

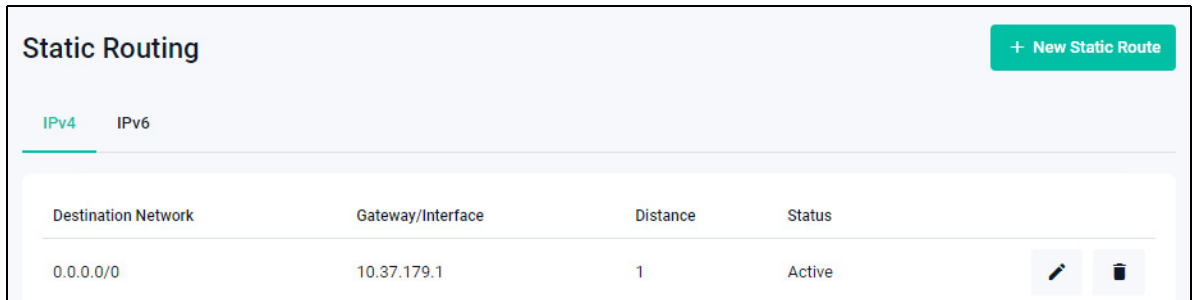

Interface Counters

From **Interface Counters** you can display receive/transmit information for common counters when the ports are available:

Static Routing

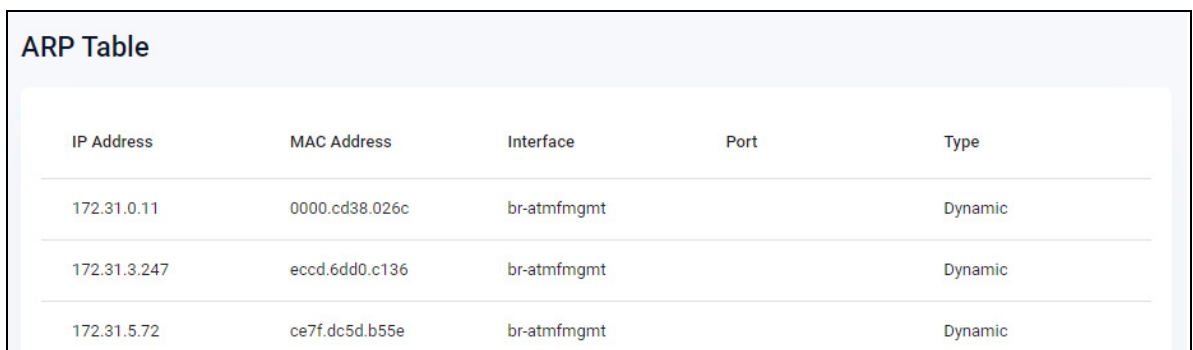

Static routing displays information about IPv4 and IPv6 destination and gateway interfaces, the distance and status. Click on the **Edit Static Route** button to change the destination network, gateway/interface or distance. To add a new static route click on the **+New Static Route** button:

Destination Network	Gateway/Interface	Distance	Status
0.0.0.0/0	10.37.179.1	1	Active

ARP table

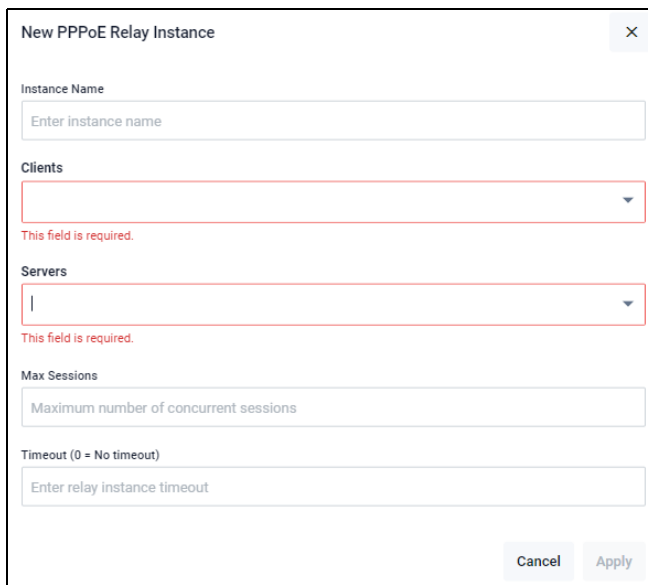

The ARP table shows address resolution records:

IP Address	MAC Address	Interface	Port	Type
172.31.0.11	0000.cd38.026c	br-atmfgmt		Dynamic
172.31.3.247	eccd.6dd0.c136	br-atmfgmt		Dynamic
172.31.5.72	ce7f.dc5d.b55e	br-atmfgmt		Dynamic

PPPoE Relay

To configure a new PPPoE relay instance click on the **+Add Relay Instance**:

New PPPoE Relay Instance

Instance Name
Enter instance name

Clients
This field is required.

Servers

Max Sessions
Maximum number of concurrent sessions

Timeout (0 = No timeout)
Enter relay instance timeout

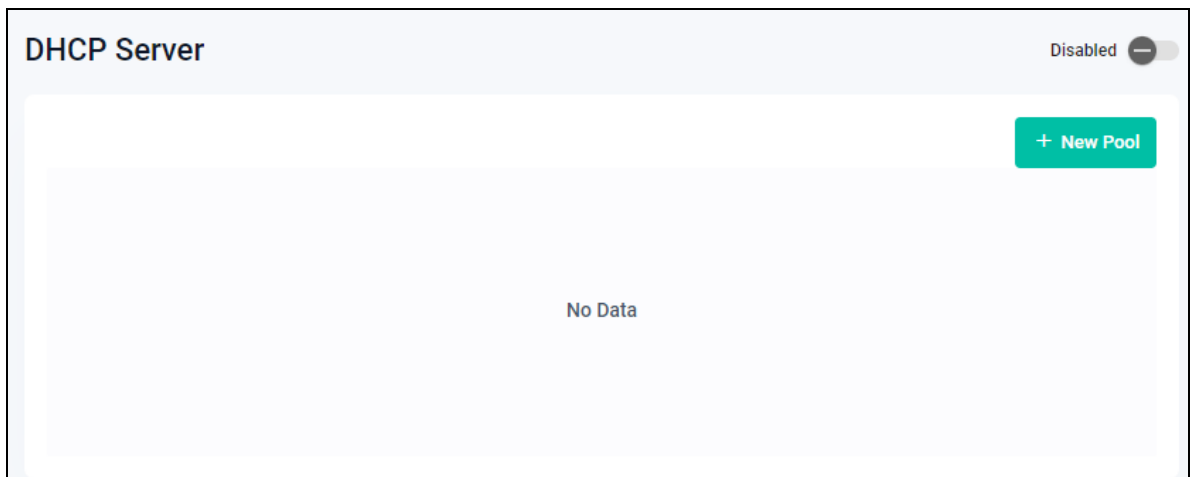

Cancel Apply

Network Services

From the **Network Services** menu you can configure features such as DHCP server pool, SMTP server, use traceroute or ping tools and configure RADIUS, AAA or SNMP.

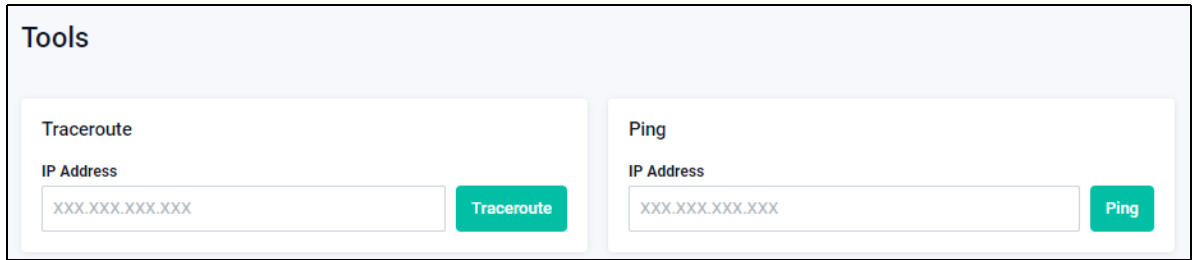

From the **DHCP Server** menu, you can display or configure a new DHCP pool:

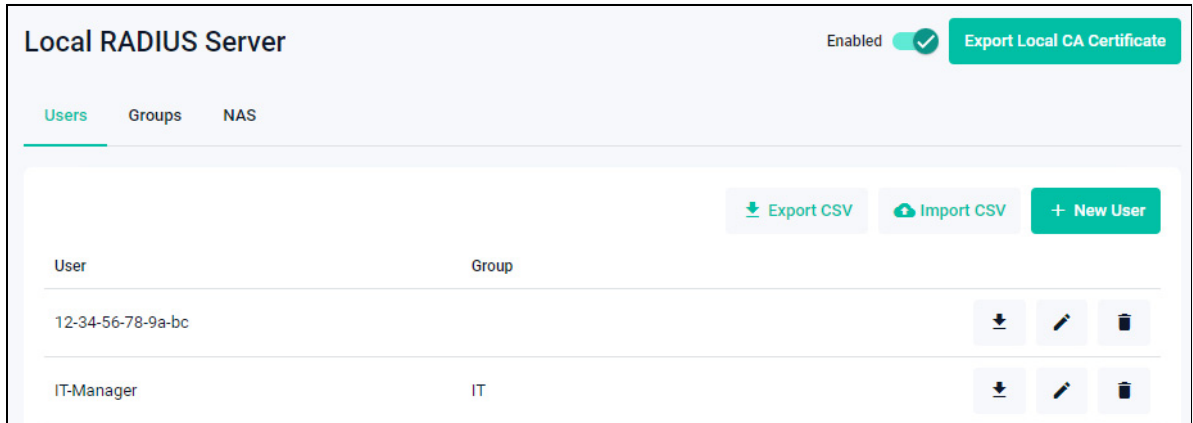

From the **SMTP Server** menu, you can display or configure the following information about sending and receiving email on the wireless router:

From the **Tools** menu you can use traceroute to trace the path to a device, or ping an IP address:

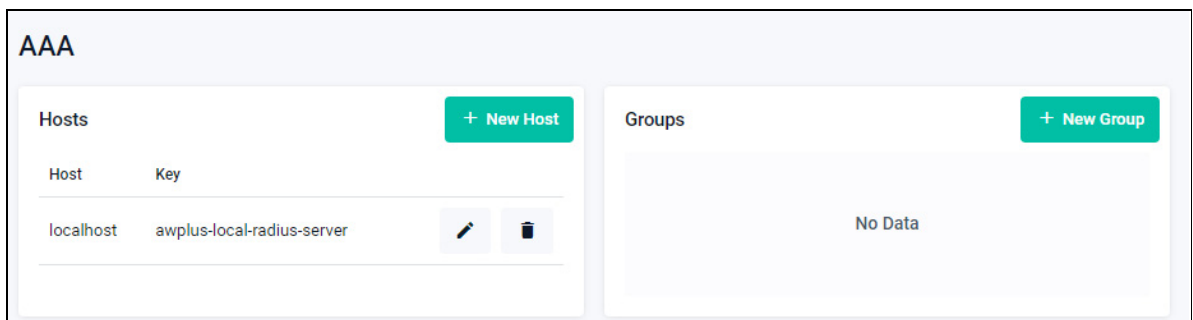

From the RADIUS menu you can display the following information about the wireless router’s inbuilt local RADIUS server:

From this page you can add new users, groups and NAS information and you can import or export CSV files about users, groups and NAS. You can also export local CA certificates.

From the AAA menu you can display and configure the following information about hosts and groups:

From the **SNMP** menu, the following information is displayed in the SNMP Configuration dialog:

SNMP Configuration

[Global](#) [SNMPv1 / SNMPv2c](#) [SNMPv3](#)

Source Interface

[Configure](#)

Interface Name: _____

Notification Type: _____

SNMP Server Contact Details

None

[Apply](#)

SNMP Server Location Details

None

[Apply](#)

Enable SNMP Traps

Trap Name	Trap Status
ATMF trap	Disabled <input type="checkbox"/>
ATMF Link traps	Disabled <input type="checkbox"/>

From this page you can configure the Source Interface, enter and apply SNMP Server Contact Details, and enter SNMP Server Location Details. You can also enable or disable SNMP traps and display OIDs for the traps.

Logging

The **Logging** page shows buffered and permanent log messages stored on the device.

Select **System > Logging** from the menu bar.

- There are three tabs to choose from, **Buffered**, **Permanent** or **Filter**.
- By default the **buffered** logs are displayed:

The screenshot shows the Allied Telesis TQ6702 GEN2-R GUI. The 'Logging' page is active, with the 'Buffered' tab selected. The interface includes a search bar, a severity filter set to 'All Severity', and a 'Total Messages 237' indicator. Below the search bar is a table of log entries with columns for Date, Facility, Level, Program, and Message. The table contains three entries:

Date	Facility	Level	Program	Message
2024-09-19 14:14:44	kern	notice	kernel	[0.000000] Linux version 4.4.60 (maker@maker35-build) (gcc version 12.2.0 (crosstool-NG 1.25.0.77_3020aca)) #1 SMP PREEMPT Fri Jul 26 06:10:20 UTC 2024
2024-09-19 14:14:44	kern	warning	kernel	[0.000000] Ignoring memory range 0x400000000 - 0x410000000
2024-09-19	syslog	notice	syslog-ng	syslog-ng starting up: version='3.21.1'

Sort and format options

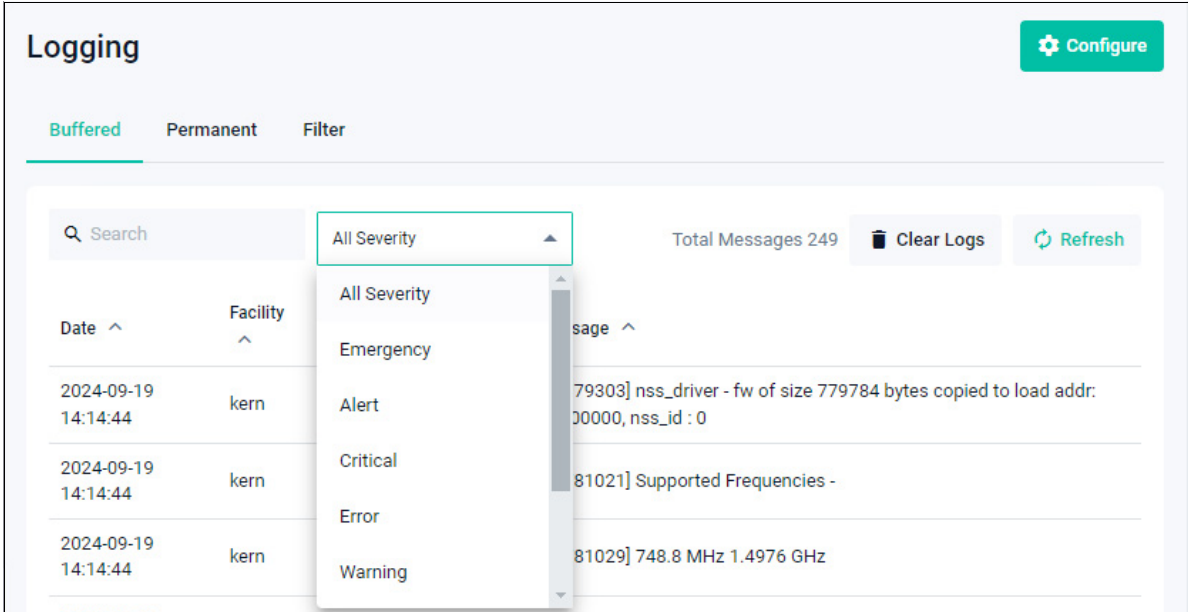

You can sort Buffered or Permanent logs from their tabs to focus your view and support easy analysis. You can sort in the following ways:

By **column title** in ascending or descending order:

The screenshot shows the 'Logging' page with the 'Buffered' tab selected. The 'Date' column header is circled in red, indicating it is the selected sort criterion. The table below shows log entries sorted by date:

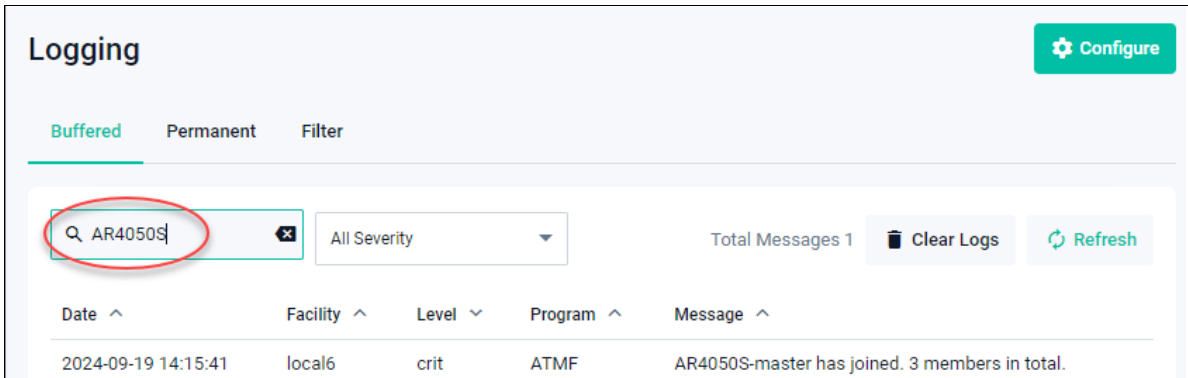

Date	Facility	Level	Program	Message
2024-09-19 14:14:44	kern	alert	kernel	[8.779303] nss_driver - fw of size 779784 bytes copied to load addr: 40000000, nss_id : 0
2024-09-19 14:14:44	kern	alert	kernel	[8.781021] Supported Frequencies -
2024-09-19 14:14:44	kern	alert	kernel	[8.781029] 748.8 MHz 1.4976 GHz

By **Severity** such as All Severity, Emergency, Alert etc:

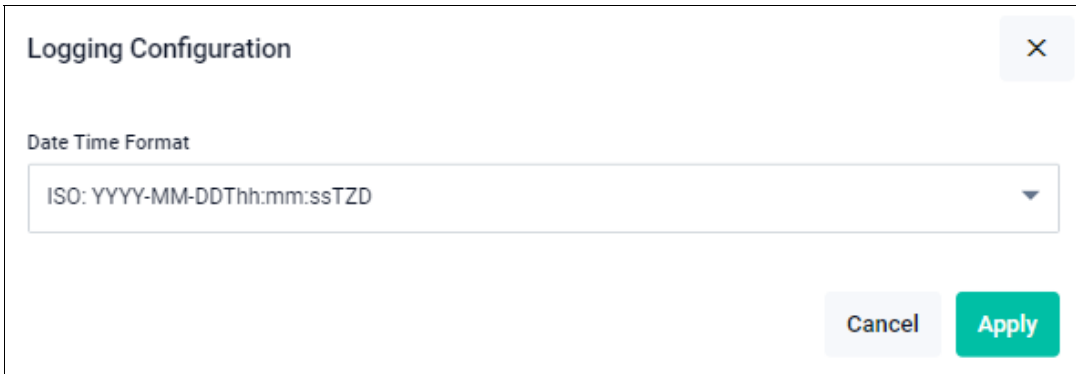

The screenshot shows the 'Logging' page with the 'Buffered' tab selected. A dropdown menu is open over the 'All Severity' filter, showing options: All Severity, Emergency, Alert, Critical, Error, and Warning. The log table below shows entries from 'kern' facility with messages like 'nss_driver - fw of size 779784 bytes copied to load addr: 00000, nss_id : 0' and 'Supported Frequencies - 748.8 MHz 1.4976 GHz'.

By **Search** where you can enter any text string found in the logs:

The screenshot shows the 'Logging' page with the search filter 'AR4050S' entered in the search box. The severity filter is set to 'All Severity'. The log table shows a single entry: '2024-09-19 14:15:41 local6 crit ATMF AR4050S-master has joined. 3 members in total.'

Click the **Configure** button to access the **Date Time Format** options:

The screenshot shows the 'Logging Configuration' dialog box. The 'Date Time Format' dropdown menu is set to 'ISO: YYYY-MM-DDThh:mm:ssTZD'. There are 'Cancel' and 'Apply' buttons at the bottom right.

You can delete the buffered or permanent logs using the **Clear Logs** button. Use the **Refresh** button to see the latest updated log activity.

Filter options

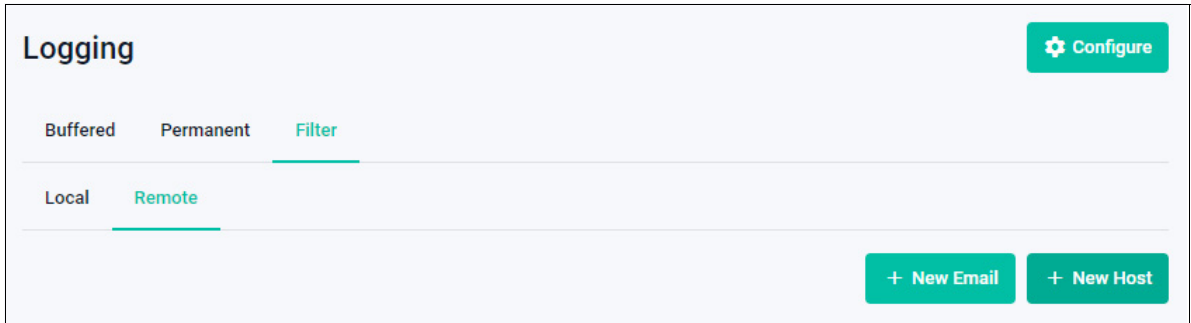

Click on the **Filter** tab to create filters to manage which logs are stored on the device and also set up a Syslog server(s) for remote log storage.

The **Filter** view has tabs for **local** and **remote** (syslog server) settings:

Use the **Local** tab (default) to create filters to manage the level of logs that are stored in the buffered and permanent logs on the device.

When you create a new logging filter you can specify any/all of level, facility, program, and message to be included or excluded in the log storage. This means you can configure log storage exactly as you want it.

Use the **Remote** tab and the **+New Host** button to set up a syslog server to send log messages for storage and analysis. Use the **+New Filter** button to configure filters that specify the type of logs to (include or exclude) to be sent to the syslog server.

Optional features

The following optional features are supported from release 5.5.3-0.1 onwards:

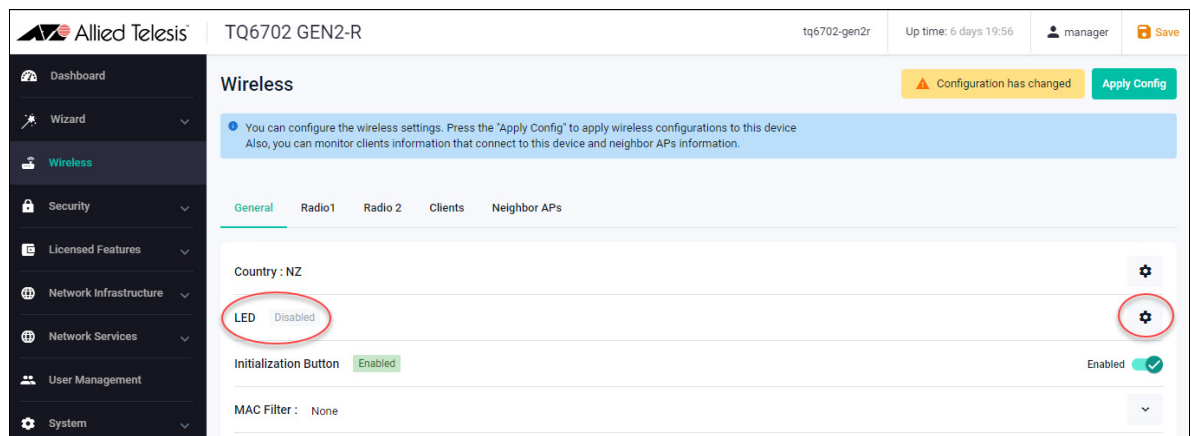

- **ECO LED**
- **Reset button**
- **Change the GUI timeout**
- **Set the time**
- **User Management**

ECO LED

This feature can be enabled or disabled. The LEDs are located on the top front of the device.

- The default is Disabled, so the LEDs are ON by default.
- Enable to stop LED activity.
- Disable to start LED activity.

Step 1: To set up ECO LED on your device, click on **Wireless** from the menu bar. The Wireless page is displayed defaulting to the **General** tab:

Notice that the ECO mode defaults to Disabled. This means that the lights are on.

Step 2: If you want to turn the LEDs off, From the LED options click on the **Settings** button.

Step 3: Click the ECO Mode **Enabled/Disabled** to toggle to Enabled.

From this LED dialog you can also choose the color of the PoE LED to be either Green or Amber when ECO Mode is Disabled (LEDs On). The default is Amber.

Step 4: Click **Apply**.

When you configure the wireless router through its GUI, the configuration becomes part of its running-configuration. Once you are sure your configuration changes work, you need to make them part of the boot configuration, so they can be backed up and will survive a reboot of the wireless router.

Caution: Back up the default configuration before you save and apply your configuration.

Once you are happy with the functionality of your configuration, you can then save it.

1. Click the **Apply Config** button to apply the settings to your device.

This step saves the wireless configuration to your device. (It is orange when it requires saving, with an orange triangle to the left):

2. Click the **Save** button at the top right of the GUI screen (you may need to scroll up to see it).

The save button will be orange if there is unsaved configuration and blue when it is saved:

Reset button

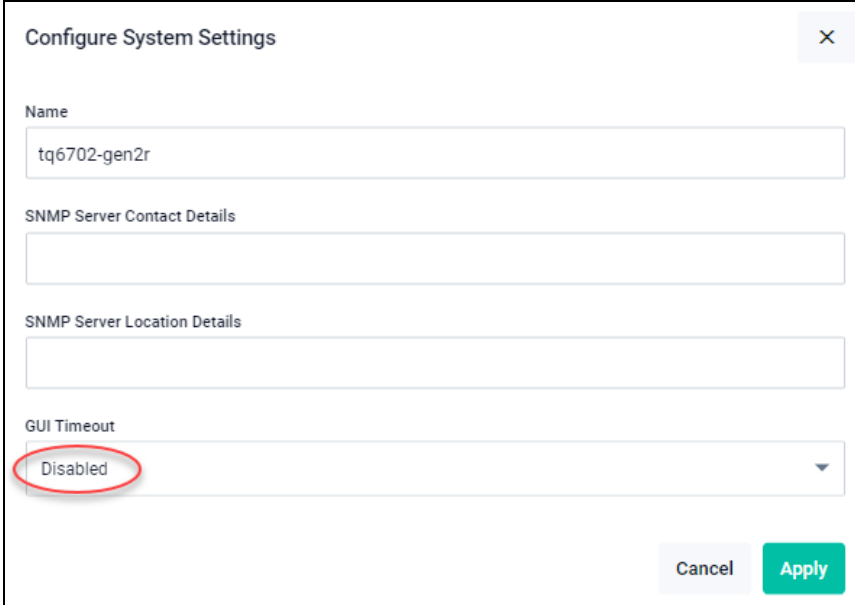

The Reset button is recessed and is located to the left of the Power button on the device. If you press and hold the **Reset** button for over five seconds, this results in a reboot that will restore the configuration back to the equivalent of a factory reset (ready for an AMF recovery). This means you will lose your configuration and any files stored on your device.

If you hold the reset button for less than 5 seconds it reboots your device.

The **Initialization Button** displayed in the Device GUI **Wireless** page performs the same function as the Reset Button, (factory reset). By default it is enabled.

Change the GUI timeout

To set the GUI timeout click **System > About** from the menu bar and then select the **Configure** button:

Configure System Settings

Name
tq6702-gen2r

SNMP Server Contact Details

SNMP Server Location Details

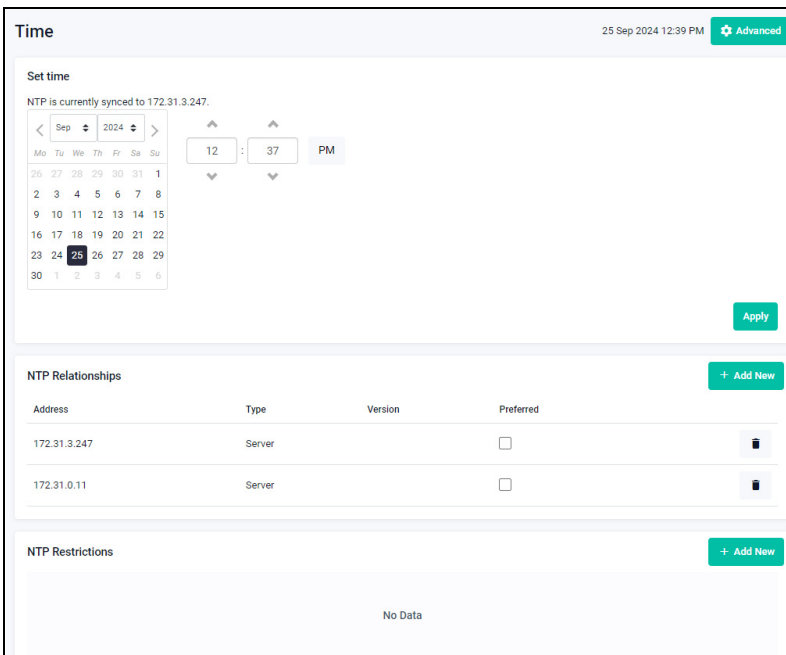

GUI Timeout
Disabled

Cancel Apply

You can select 5 minutes, 30 minutes, 1 hour, or disable the timeout completely. The default is 5 minutes.

Set the time

To set the time click **System > Time** from the menu bar:

Time 25 Sep 2024 12:39 PM Advanced

Set time

NTP is currently synced to 172.31.3.247.

< Sep 2024 >
